The Theme

A profound challenge that the social sciences, and sociology in particular, are now called upon to confront has to do with the depth and extraordinary acceleration of global processes of social and cultural change...

...Today's byword 'globalisation' only partially captures the full significance of these processes. Sociological knowledge therefore encounters a limitation: it is easier to see what is disappearing than what is coming into being. Yet this limitation can be overturned and become a resource: a stimulus to intensify our theoretical and empirical exploration of the world around us by relating everyday life to history, connecting individual experiences to major issues of democracy and justice, and viewing the exercise of agency in the light of processes of domination. Sociological imagination is the tool that our discipline has honed over the decades to accomplish this. But what are the major issues that the global sociological community now has the responsibility to tackle? First and foremost, they arise from the exponential increase in social inequalities, a process that the international economic crisis has exacerbated beyond measure. This situation threatens the very existence of democracy and calls for the construction of forms of social analysis which are strongly connected to the arena of public policy. Concurrently, these forms of analysis must also be capable of offering communities and individuals knowledge and insight that can help to stem the tide of fatalism and apathy. Yet an analysis of how inequalities are produced and reinforced would be incomplete without reflection on differences. Recognising and acknowledging the multiple expressions of difference – such as gender, social class, age, ethnic background, religion, and sexual orientation... - are vital when it comes to gaining insight into the 'multiple positioning' that characterises contemporary individuals. And this entails rethinking the meaning of integration today.
The President’s Welcome

Differences, inequalities and sociological imagination:
These three keywords of the ESA conference that is about to open in Prague connect us directly not only to the profound changes distinguishing this phase of history, but also link us with the answers to these processes that the discipline we practice is able to identify. Our era is one of unprecedented private wealth – wealth that has actually doubled in just over a decade – and the concentration thereof into very few hands. Moreover, it is also an era of human migrations of biblical proportions affecting the entire globe, increasingly linked to an intermingling of political instability, violence and material poverty. Together, these dynamics create new inequalities and new differences, which jointly put into doubt the very possibility of human coexistence on this planet. Of these specific differences, we can detect an increasingly ambivalent potential. They could have extraordinary transformative power, capable of challenging the past. At the same time however, they run the risk of violent implosion. The well-established global presence of terrorism reinforces this awareness.

In this difficult environment, we have an ever-increasing need for sociological knowledge, chiefly as an antidote to violence and the new winds of war that now threaten Europe itself. It should be emphasized that we also need to use this knowledge as a tool to overcome the temptation to reject those who are seeking asylum, the many displaced persons who put their lives at risk in order to survive in the long term. Sociology is capable of producing both the analytical tools that are able to grasp the scope and dynamics of these events, and – thanks to its close link to critical thinking – able to open the route for the construction of alternative scenarios. Our research and our knowledge can therefore help build new possibilities for human co-habitation on our planet, and adapt to the issues facing this century.

The Executive Committee and I, as President, are particularly proud of the contribution that the conference will bequeath through deep reflection on these phenomena, thanks to the employment of our sociological imagination. The conference’s rich program, built first of all thanks to the contribution of the Research Networks, is able to respond effectively to the need for analysis and comparison. The Prague conference, the twelfth in ESA’s history, promises to be one of the busiest ever organized by our association since its inception, with over three thousand participants expected. These positive results are the outcome of close collaboration between the Local Organizing Committee and its Chair, Tomáš Kostelecký, and the Conference Programme Committee and its Chair, Tiziana Nazio, supported by the entire Executive Committee. Warm thanks for this excellent work.

I would like to note one last observation. This conference unites us in a very special city. Not only is Prague one of the most beautiful cities in Europe, with its artful Gothic and Baroque architecture; but it is also the city of the Prague Spring, Jan Palach, Václav Havel and Charter 77. It is a courageous city that has never surrendered to totalitarianism. Prague’s message is one of hope, linked hand in glove to the power of ideas. There could be no better location from which to launch our labours.

Carmen Leccardi | President of the European Sociological Association
Plenary Sessions

Opening Ceremony

Out of Control and Running Wild; Or (Recent) History of Modern Inequality
Zygmunt BAUMAN (University of Leeds, United Kingdom)

Biography: Zygmunt Bauman, Emeritus Professor, University of Leeds, UK. Recent publications: “On God and Man” (with Stanislaw Obirek) and “Babel” (with Ezio Mauro).

Deep Stories, Emotional Agendas and Politics
Arlie HOCHSCHILD (University of California, United States of America)

I begin with a paradox. In the United States, as in Europe, the gap between rich and poor has recently widened. At the same time, right-wing groups have risen for whom such a gap poses no problem at all. Based on new fieldwork on the U.S. Tea Party (approved by some 20% -30% of Americans) I ask: what emotional needs does such a movement meet? More basically, how does emotion underlie political belief? In answer I propose the concept of a deep story. It’s an allegorical, collectively shared, honor-focused, “feels-as-if” story. A man is standing in line for a ticket he feels he greatly deserves and which confers honor. At the front of the line is another man behind a dark glass window handing out tickets. In front and in back are others in line. To the side, is an official supervisor of the line. Then some people “cut into” the front of the line, and the story moves from there. Tickets are for the American Dream. The supervisor is the American president, and a rumor is flying that tickets are running out. They -- and all of us -- see through allegory. And once established, we protect it by pursuing an emotional agenda. This determines what a person wants to feel and know. Liberals have a deep story too. Each story -- that of conservative and liberal -- implies a strategy of action for addressing global capitalism, and the frightening idea that American --and European --dominance and prosperity may be a “prophecy that fails.” The idea of “deep stories” may help us communicate across a widening political divide and address the issues of difference, inequality --with imagination and compassion.
Biography: A professor emerita of sociology at University of California, Berkeley Arlie Russell Hochschild is the author of eight books. The Managed Heart: The Commercialization of Human Feeling established the concept of “emotional labor” and helped initiate the field of the sociology of emotion. The Second Shift: Working Parents and the Revolution at Home and The Time Bind: When Home Becomes Work and Work Becomes Home explore the strains in work and family life that occur when women’s expectations rise, but society does not easily change to accommodate them, what Hochschild calls a “stalled revolution.” Both books illustrate the conflicts people struggle to resolve, and the strategies of accommodation which result when they don’t succeed in doing so — the development of family myths, notions of a “potential self” people would enact if only they had time, and strategies of needs-minimization, for example.
In Global Woman: Nannies, Maids and Sex Workers (co-edited with Barbara Ehrenreich) Hochschild explores the global migration of care workers and the “care chains” as she calls them, that result as care workers of the global South leave their children and elderly in the
hands of others, and migrate to care for children and elderly in the global North. In The Outsourced Self: Intimate Life in Market Times, she examines how, as we turn to the market to meet more of our intimate needs, we engage in the effort to keep personal life as personal life. The Commercialization of Intimate Life: Notes from Home and Work collects many of her articles. In So How’s the Family? And Other Essays, she lays out the powerful links between government policy, social class and family. Among many other awards, Hochschild has won the Jessie Bernard Award, the Charles Cooley Award, and the Award for Public Understanding of Sociology from the American Sociological Association, as well as Guggenheim, Fulbright, Ford, Mellon and Sloan Foundation fellowships. Three of her books have been named to the New York Times “Notable Books of the Year” list. Two of them have inspired plays written and directed by the Danish theater director Ditte Bjerg.

Hochschild has spoken at the World Economic Forum in Switzerland, at a seminar hosted by Pope John Paul II at Castel Gandolfo, at the Festival of Dangerous Ideas in Sydney, Australia, and at numerous universities in North America, Europe and Asia. She spent five months as a Fulbright Lecturer in India.

Her current research has taken her to Louisiana, a poor and deeply polluted state where she is interviewing members of an anti-government populist movement, the Tea Party, who oppose government aid or regulation. She has been exploring what she calls the “deep story” underlying their political beliefs and its attendant empathy agenda – which determines whom one seeks to “feel for” and what one seeks to know - the topic of her plenary talk.

Her work has been translated into sixteen languages.
Closing Plenary Session

The 'Squeezed Middle' in the Great Recession: A Comparative European Analysis of the Distribution of Economic Stress
Christopher T. WHELAN (University College Dublin, Ireland)

In this paper we analyse variation on the impact of the Great Recession on economic stress across income classes for a range of advanced European countries. Our analysis shows that conclusions relating to trends in polarisation versus middle class squeeze are highly dependent on specification of welfare regime and are significantly driven by exacerbation of the degree of within regime heterogeneity introduced by the changing circumstances in Iceland, Ireland and Greece. Each exhibited a substantial increase in level of economic stress. However, changes in the pattern of income class differentiation were somewhat different. In Iceland while all classes experienced significant increases in stress levels, a form of middle class squeeze was observed. For Ireland the pattern of change involved a contrast between the three lowest and the two highest classes. In this case polarization does not exclude middle class squeeze. For Greece we observe a more hierarchically differentiated pattern of change although, as in the Irish case, there is a contrast between the three highest and the two lowest income classes. Changes in the distribution of household equivalent income played no role in explaining the changing distribution of economic stress across income classes once the impact of material deprivation was taken into account. These findings bring out the extent to which the impact of the Great Recession varied even among the hardest-hit countries, and even more so between them and the countries where it represented a less dramatic, though still very substantial, macroeconomic shock. They also serve to highlight the advantages of going beyond reliance on income in seeking to understand the impact of such a shock.

Biography: Christopher T. Whelan is Emeritus Professor of Sociology at the School of Sociology and the Geary Institute for Public Policy, University College Dublin. He was formerly Professor of Sociology at the School of Sociology, Social Policy and Social Work, Queen’s University Belfast and Chair of the Standing Committee of the Social Sciences of the European Science Foundation and the European Consortium for Sociological Research. His research interests include the causes and consequences of poverty and inequality, social mobility and inequality and recently had a substantial involvement on the Growing Inequalities’ Impacts (GINI) project. He has published extensively on these topics and on economic and social change in Ireland during bust and booms.

Postcolonial Reconstructions of Europe
Gurminder K. BHAMBRA (University of Warwick, United Kingdom) | g.k.bhambra@warwick.ac.uk

The cosmopolitan cultural diversity of Europe tends to be counter-posed to that constituted by and through multicultural others. The latter are seen to import their diversity into (and against) the cultural plurality already present in Europe. Counter-posing cosmopolitanism and multiculturalism in this way demonstrates a Eurocentred particularism at the heart of the cosmopolitan European project. Habermas’s association of multiculturalism with what he calls ‘postcolonial immigrant societies’, for example, demonstrates a parochial understanding that limits the ‘postcolonial’ to those ‘others’ who migrate to Europe, and renders invisible the long-standing histories that connect those migrants with Europe. In this way, issues that refer to the ‘postcolonial’ are seen as beginning with immigration and carried by the non-European ‘other’. These multicultural others are not seen as constitutive of Europe’s own self-understanding and
as part of its history of colonialism (a history both of individual nation-states and the common European project). In this plenary, I take issue with the parochial historiography that underpins such accounts. In particular, I argue that insofar as the cosmopolitan project of Europe does not come to terms with its colonial past and postcolonial present, it establishes and legitimizes neocolonial policies both within and outwith Europe. Supposed ‘multicultural others’ are not seen as legitimate beneficiaries of a postwar social settlement, but as obstacles to its continuation and increasingly as targets of punitive policies. This is an outcome that subverts the very promise of cosmopolitanism and calls urgent attention to the necessary postcolonial reconstruction of (understandings of) Europe.

Biography: Gurminder K Bhambra is Professor of Sociology at the University of Warwick. For the academic year 2014-15, she was Visiting Fellow in the Department of Sociology, Princeton University and Visitor at the Institute for Advanced Study, Princeton. Her research interests are primarily in the area of historical sociology and contemporary social theory and she is also interested in the intersection of the social sciences with recent work in postcolonial and decolonial studies. She is author of Connected Sociologies (Bloomsbury, 2014) and Rethinking Modernity: Postcolonialism and the Sociological Imagination (Palgrave, 2007) which won the 2008 Philip Abrams Memorial Prize for best first book in sociology. She has co-edited three collections, Silencing Human Rights (Palgrave, 2009); 1968 in Retrospect (Palgrave, 2009); and African Athena (OUP, 2011). She also set up the Global Social Theory website for those interested in social theory in global perspective. She tweets in a personal capacity @gkbhambra.
Semi-Plenary Sessions

SPS01 - Family Formation and Practices of Life Quality: Inequalities and New Opportunities Across Europe

Displaying and Doing Family Life: What is ‘Good Parenting’ and Who Says So?

Esther DERMOTT (University of Bristol, United Kingdom) | esther.dermott@bristol.ac.uk

Interest in parents and their parenting practices is aligned with shifts towards more individualised personal relationships, the large-scale acceptance of neo-liberal views on the role of the welfare state, and the central importance of parent-child relationships both to individuals and society more broadly. This paper will draw out some of the key aspects of ‘good parenting’ in popular and political discourse and highlight how they are frequently associated with an overly narrow, and problematic, formulation of positive child outcomes that are centred on ensuring future labour market participation; one in which the quality of life of the child plays only a minor role. Drawing on the concept of ‘displaying families’ the paper then argues that this is as a result of the need for an audience for parenting practices: while family members are one form of audience, parenting also needs to be recognised by the state and significant players, such as educational establishments, in order to be classified as ‘good’. As a consequence of these arguments, the paper suggests that while there is a justification for a normative definition of deficient parenting and caring practices, this is better addressed through a focus on defining what is bad in terms of extreme neglect or abuse rather than attempting to categorise good practices. Finally, the value of family sociologists combining newer conceptual tools in exploring older forms of inequality is noted.

Biography: Dr Esther Dermott is Professor of Sociology at the University of Bristol, UK. A sociologist of family life, her research examines the culture, practices and policies associated with contemporary parenthood, and interrogates dominant views and measures of ‘good parenting’. She has a longstanding research focus on the practices and meanings of fatherhood. Recent research projects include the ESRC funded ‘Poverty and Social Exclusion in the UK (on which she is contributing analysis on gender and parenting) and ‘Post-separation fathering: negotiating intimacy and risk in parenting practice’ funded by the British Academy. She is the author of Intimate Fatherhood (2008, Routledge) and co-editor of Displaying Families (2011, Palgrave). Her most recent writing includes analysis of the relationship between parenting and poverty (in Sociology, 2015 and Social Policy and Society, 2014) and a special issue of Families, Relationships and Societies (2015) on patterns of change and continuity in fatherhood.

Quality of Life and the Family: A Multifaceted and Complex Relationship

Heinz-Herbert NOLL (The Social Indicators Research Centre of GESIS - Leibniz Institute for the Social Sciences, Mannheim)

Not only from research, but also from everyday knowledge, there is ample evidence that the family is key for people’s life quality across European societies. Departing from different notions and conceptualizations of well-being, in this presentation the family will be considered as an institution that produces and enjoys quality of life at the same time. The presentation thus
addresses in the first place the role of the family as a producer of well-being and also discusses different family-specific ways of consuming and enjoying quality of life. In its second part, the presentation will put the emphasis on subjective well-being as an important and currently particularly popular component of the "good life" by reviewing the available empirical evidence of how family characteristics as well as family related sorts of behaviour and events, e.g. marriage, child birth, divorce, seem to be associated with different levels and changes of individual subjective well-being. Moreover some particular challenges of researching subjective well-being from a family perspective will be identified and discussed.

Biography: Dr. Heinz-Herbert Noll was director of the Social Indicators Research Centre of GESIS - Leibniz Institute for the Social Sciences in Mannheim until his retirement in 2014. Currently he works as a freelance researcher and consultant. He graduated in sociology, economics and statistics at the University of Frankfurt and received his doctorate at the University of Mannheim. Noll has published widely on topics related to social indicators and social reporting, quality of life, subjective well-being and social inequality, including poverty. He was involved in several German and European projects addressing issues of well-being measurement, most recently the e-Frame project. He also has taught at various European universities. Noll served as President of the ISA - Research Committee “Social Indicators” as well as of the “International Society for Quality of Life Studies” and he was/is a member of the editorial boards of several international journals, e.g. “Social Indicators Research”. Currently he is also a member of the scientific advisory board of the Federal Government’s strategy on quality of life in Germany.

SPS02 - Public Policies and Solidarity in Women’s Lives: Differences and Inequalities

Changing Gender Policies in Ghana: The Journeys of Civil Society and State Actors

Akosua ADOMAKO AMPOFU (African and Gender Studies and Institute of African Studies, Ghana)

Contemporary women’s movements and organisations constitute an area of prolific output, especially in sociology and political science. In recent years feminist scholars in the global South have focused a lot of attention on the ways in which civil society organisations have addressed women’s rights as well as how they have expanded the concept of rights and contributed to the democratisation process (Moghadam, 2005). In Africa, and Ghana, women’s activism has a long history—from struggles under “so-called” traditional African states for specific conditions for women, to contemporary legal and social struggles. Steady has noted that women's collective activism in Africa is rooted in “indigenous mechanisms of female mobilisation and cooperation; the historical experiences of colonisation; and the present reality of corporate globalisation” (2006:1). In Ghana, unlike the experiences of many newly, independent African nations where women were usually ignored or their contributions downplayed, Kwame Nkrumah, made a conscious effort to recognize and validate the important contributions of women in nation building by including them in his government. Since then women have had more ambivalent relationships with the state, sometimes cordial through Women’s Machineries, at other times more confrontational. This paper seeks to speak to some of these journeys.

Biography: Akosua Adomako Ampofo is Professor of African and Gender Studies, and Director of the Institute of African Studies, University of Ghana, Legon. An activist-scholar, she is a member of several networks where her work addresses African Knowledge systems; Identity
Politics such as Gender-based Violence; Women’s work; Masculinities; and Gendered Representations in Popular Culture (music and religion). Her most recent publication is Transatlantic Feminisms: Women’s and Gender Studies in Africa and the Diaspora. Lanham, MD, Lexington Books (co-edited with Cheryl Rodriguez and Dzodzi Tsikata, 2015). She is a member of the African Studies Association (US); founding Vice-President of The African Studies Association of Africa; Co-president of RC32 on Women and Society, the International Sociological Association with Josephine Beoku-Betts; and an honorary Fellow of the Human Sciences Research Council of South Africa. She has been a Fulbright Junior & New Century Scholar, and in 2015-16 will be a Fulbright Scholar-in Residence at Concordia University, Irvine, CA. In 2010 she was awarded the Sociologists for Women in Society Feminist Activism award and in 2014 was a Mellon Fellow with the Centre for African Studies at the University of Cape Town.

Contesting Publics in Asian Contexts: Women and Activism for Social Justice
Glenda Tibe BONIFACIO (University of Lethbridge, Canada)

Since the tide of feminism and its ideals of women’s empowerment seeped through colonization, modernization and globalization, women in different parts of the world have continued their own brand of activism and forge solidarity to promote change and social justice. Their sustained activism across many fronts —liberation, independence, legal challenges, violence, etc.—are often unheard of or unrecognized in the West due to media selection of what is ‘good news’ that often reproduce stereotypical constructs of ‘Asian women’ or the ‘Other' orientalist paradigm of the passive victim. Representation of the ‘Other' to western women promotes the essentialist objectification of ‘Third world’ female bodies, and that the only way for their genuine empowerment is to follow the ‘western’ models that place in opposition ‘gender and culture.’

This presentation highlights the contested publics of women’s activism in selected Asian countries—from the local, national, and transnational—to advocate for change. Social justice is construed as the elimination of oppressive barriers, structures, and practices that deny women’s value as human beings. It argues that the conception of social justice and how it should be carried out depends on the socio-cultural milieu and particular histories of women in Asian communities. The discussion centres on key issues of women’s activism and the building of solidarity networks, mainly based on public policies that impede on the rights of women.

Asia is a hegemonic term that encapsulates geographic location, shared histories, and collective futures. Asia is presumed to converge with western models of development to be at par with modernity. But Asia is a diverse region with rich histories and complex pathways for change. Arguably, there is no singular, linear approach to carving out niches of women’s empowerment in all societies. In this presentation, the particular stories of violence, reproductive rights, labour welfare, and democratization are highlighted in the cases of the Philippines, Hong Kong, Malaysia, Thailand and Indonesia.

Biography: Glenda Tibe Bonifacio is an associate professor of women and gender studies at the University of Lethbridge. She has taught at the University of the Philippines for over nine years before migrating to Australia and Canada. Glenda is the author of Pinay on the Prairies: Filipino Women and Transnational Identities (UBC Press 2013); the editor of Gender and Rural Migration: Realities, Conflict and Change (Routledge 2014), Feminism and Migration: Cross-Cultural Engagements (Springer 2012); co-editor of Gender, Religion and Migration (Lexington Books 2010) and Migrant Domestic Work and Family Rights (forthcoming). At present, she is working on projects related to youth migration and feminism.
SPS03 - New Racisms, Differences and Agency in Europe: Perspectives on Islamophobia

Equality and Group Identity Revisited
Tariq MOOD (University of Bristol, United Kingdom) | t.mood@bristol.ac.uk

At the centre of my approach to ethnicity is that it is a group identity ‘from the inside’ but in much of social science ethnicity is understood as something that is ‘constructed from the outside’, namely that it is an ascribed identity which is a target of discrimination, or stronger still, is constructed as a form of ‘Othering’. I think that both these aspects of ethnicity have a real world existence and political significance, and cannot be reduced to each other, but I do not know of an existing approach which satisfactorily gives each its due within a unified theory. For example, multiculturalists like me argue that Muslims should be recognised as a group; but I am aware that for many egalitarians the issue is not recognition but defeating stereotypes about Muslims, not promoting a Muslim identity but protecting Muslims from anti-Muslim prejudice, discrimination, politics, violence etc. Indeed, many Muslims do not want to valorise Muslim identity and feel oppressed by its valorisation by others. The same point can be made about any inferiorised group or collective identity, such as ‘black’, ‘woman’ or ‘working class’. So, what is the relationship between challenging inferiorisation and promoting positive group identities? I want to explore these two understandings of group identity with a view to producing a unified theory and a normative basis for recognising group identities and accommodating group representation that goes beyond merely anti-racism, anti-sexism, anti-Islamophobia and so on. I make a plea for studying Islamophobia (and groups as negatively perceived from the outside, generally) within a normative framework which prioritises groups fighting outsider perceptions by boosting insider identifications (‘the struggle for recognition’).

Biography: Tariq Modood is Professor of Sociology, Politics and Public Policy at the University of Bristol and the founding Director of the Centre for the Study of Ethnicity and Citizenship. He is a regular contributor to the media and policy debates in Britain. He was awarded a MBE for services to social sciences and ethnic relations in 2001 and was elected a member of the Academy of Social Sciences in 2004. He served on the Commission on the Future of Multi-Ethnic Britain, the National Equality Panel and currently is on the Commission on Religion and Belief in British Public Life.

He has led many research projects on ethnic minorities and Muslims, having held over 40 grants and consultancies and has over 30 (co-)authored and (co-)edited books and reports and over 150 articles or chapters in political philosophy, sociology and public policy. His latest books include Multiculturalism: A Civic Idea (2nd ed; 2013) and as co-editor Global Migration, Ethnicity and Britishness (2011), European Multiculturalisms (2012), Tolerance, Intolerance and Respect (2013), Religion in a Liberal State (2013) and Multiculturalism Rethought (2015).

How Racialization Works? Ethnicnography of Ongoing Islamophobia
Abdellali HAJJAT (University of Paris-Ouest Nanterre, France)

Islamophobia is a complex social process of racialization leaning on the sign of (real or perceived) belonging to the Muslim religion, which vary according to national contexts and historical periods. This is a global and gendered phenomenon because it's influenced by the international circulation of ideas and people and by gender relations. Islamophobia is a "total social fact" according the definition of Marcel Mauss, since it deals with "all society and its institutions” (political, administrative, legal, economic, media and intellectual). Based on this definition, this paper focuses on what ethnography could bring to a better analysis of
racialization, since most of scientific accounts on Islamophobia rely on internal discourse analysis. A good knowledge of social forces that provokes ideological convergence about the “Muslim problem” invites us to analyze how social fields work: economy, politics, media, administration, academia and activism, etc. The sociology of social fields is a prerequisite for understanding not only of the production of discourse about Islam, but also the mobilization wanting to impose the idea of a “Muslim problem”. The construction of the “Muslim problem” is performed at the intersection of several social fields, which each obey rules and are traversed by specific tensions. We'll try to understand how a generalized heteronomy of social fields, as a consequence of neo-liberal austerity policies, favors the action of multi-positioned agents reaching to transform and circulate the idea of a “Muslim problem” in several social fields.

His research interests are threefold. He first focuses on the articulation of citizenship and race in French law, analyzing the “assimilation” requirement in the process of naturalization and the racialization of Muslims both in colonial and postcolonial contexts. He secondly studies urban uprisings and political mobilizations by postcolonial immigrants in France in working-class neighbourhoods, particularly in May 68 and afterwards. Thirdly, he launched a new research project on Islamophobia as a “total social fact”, the construction of the “Muslim problem” and the redefinition of French secularism, focusing on the complex social mechanisms that entail the racialization of Muslims in various social fields (politics, mainstream media, human rights law, academia, companies, care sector, etc.).

**SPS04 - A Generation Divided? Realities of and Responses to Inequality and Injustices Among Contemporary Young People**

Pathways to Adulthood, Intra-generational Differentiation and Life Course Policy
Walter R. HEINZ (University of Bremen, Germany)

In contrast to the popular notions like “Generation X” or the “Lost Generation”, which construct a superficial impression of a uniform youth, the concept of intra-generational diversity represents social reality much better.

I will argue that the state’s life course policy creates pathways from school to work that contribute to the social stratification of life chances and thus to an internal differentiation of generations.

Three cases will be presented in order to support this assumption:
- The traditional separation between vocational education and training (VET) and academic pathways in Germany.
- The reconstruction of academic pathways in the “Bologna Process” (BA and MA) and increasing university enrolment.
- The consequences of the Great Recession on young people’s transitions to adults.

Biography: Walter R. Heinz is Professor emeritus of Sociology and Psychology and Senior Faculty member of the Bremen International Graduate School of Social Sciences (BIGSSS), University of Bremen, Germany. Currently he is interim research director of the German Centre of Higher Education and Science Research (DZHW).
His research interests are sociology of youth, transitions from education to employment in cross-national perspective, biography and life course studies.

The Debt and the Doubt. A Generational Perspective on Inequalities
Cécile VAN DE VELDE (University of Montreal, Canada)

Are we witnessing the emergence of a new “generational” consciousness? As crisis affects in priority young people, this paper analyses how they perceive their own place within generational and social inequalities. It identifies to what extent they define themselves as a generation and with which arguments. This study is based on a large comparative inquiry in 5 cities (Montreal, Santiago de Chile, Madrid, Paris, Hong-Kong), mixing more than 120 in-depth interviews on young people from different social classes, statistics, observations of recent youth protests, and public debates. It shows that almost a century after Mannheim’s theory on “generational consciousness” as a marker of a “generation”, a feeling of belonging is actually emerging among young generations, but on a fragmented way and at an infra-generational level, especially among students and graduated people. The paper identifies two main “grammars” of generational inequalities: “debt” and “doubt”. These rhetorics are used very differently according to social contexts: the discourse of a burden of “debt” –financial and environmental– is more often used in liberal contexts, whereas the one of “doubt” -on governors and on future- is more frequent in central and southern Europe. The presentation will give an account of these contrasts in relation to the way welfare states, labour markets and demographic trends shape inter- and intra-generational inequalities since crisis.

Biography: Cécile Van de Velde is currently Professor of Sociology at the University of Montreal. Her main research interests cover youth, life courses and generational inequalities in contemporary societies, with a comparative approach. Her first book « Becoming an Adult. Compared Sociology of Youth in Europe » (Presses Universitaires de France, 2008) compares transitions into adulthood in Denmark, Great Britain, France and Spain, mixing a longitudinal analysis of the Europanel data and 135 qualitative interviews. She received the « Le Monde » Award for Academic Research for her work. Her new research tackles the issue of generational relationships in a time of “crisis”, and the way inequalities and solidarity between generations play out in contemporary societies. On these topics, she recently co-directed the special issue “Rethinking inter-generational inequalities » (Revue Française de Sociologie, 2013) and signed the handbook « Sociology of Life Course » (Armand Colin, 2015). Her ongoing study analyses the new subjective tensions within young people’s lives, their diverse reactions to crisis, and the perceptions of generational inequalities, in America and Europe.

SPS05 - Sociological Imagination and New Technologies

The Unbearable Lightness of Genomic Being
Stefan TIMMERMANS (University of California, Los Angeles, United States of America)

In this talk, I discuss the increased routinization of genomic testing for patients by examining how genotype-phenotype causality is established and its myriad consequences for disease management. Using ethnographic data, I follow the technology of exome sequencing from the laboratory where staff process and interpret patient samples to the clinic where clinicians inform patients of results and to the home where patients locate these results within the broader challenges of the disease. Because genomic test results reverberate through family trees, they reframe the past and the future, offering eugenic opportunities. Still, in the end, genomic
information is more abstract than effective, especially in the overdetermined situation of disability.

Biography: Stefan Timmermans is professor of sociology at UCLA. He is the author of Sudden Death and the Myth of CPR (Temple 1999), The Gold Standard: The Challenge of Evidence-Based Medicine and Standardization in Health Care (Temple, 2003, with Marc Berg), Postmortem: How Medical Examiners Explain Suspicious Deaths (Chicago, 2006), Saving Babies? The Consequences of Newborn Genetic Screening (Chicago 2013, with Mara Buchbinder) andAbductive Analysis: Theorizing Qualitative Research (Chicago 2014, with Iddo Tavory). He is also senior editor medical sociology for the journal Social Science and Medicine.

Lively Sociology in the Age of Lively Data
Deborah LUPTON (University of Canberra, Australia)

Humans have become digital data subjects, constantly emitting data as they engage with digital technologies and move around in sensor-embedded spaces. In the context of the digital global knowledge economy, digital data, both ‘small’ and ‘big’, have become invested with significant value. Digital data may be characterised as ‘lively’ in a number of ways. First, these data are about human life itself: people’s beliefs, behaviours, habits and bodies. Second, these data have their own social lives. They are dynamic, constantly being configured and reconfigured as people interact with online technologies and circulated and repurposed by a multitude of different actors and agencies. Third, these data have become an influential part of everyday lives, affecting beliefs and behaviours and increasingly, people’s life chances via the assumptions and inferences that are developed from predictive analytics. Finally, as contributors to the global knowledge economy, digital data are part of livelihoods. I argue in this paper that the vitality of digital data has major implications for sociology, both in terms of the types of topics that are addressed by sociologists and the research methods that they adopt. Sociologists need to come to terms with lively data and associated data practices. In doing so, they will contribute to and develop lively sociology.

SPS06 - Extending Western Views of the Social World: Eastern Europe, Social Science and Unequal Knowledge Production

Peripheral Redefinitions of Western Critical Thought: The Case of Poland as Seen in the Wider Context of Central and Eastern Europe
Tomasz ZARYCKI (University of Warsaw, Poland)

The paper will present a model of reception and re-contextualization of global intellectual ideas in the peripheral setting of Polish academia which, as it will be argued, may serve as a case study illustrating mechanisms characteristic for several other societies, in particular, these of
Central and Eastern Europe. The proposed model will be based on the concept of “field of power” drawn from Pierre Bourdieu. As it will be argued, a typical configuration of the field of power in peripheral countries may be seen as considerably different from one observed in most Western societies. Instead of a classical opposition between economic and cultural poles, the peripheral field of power is shaped by a specific cleavage effecting from different responses of a peripheral society to the pressure or hegemony of the global core (to use a notion drawn form the vocabulary of the world-system-theory). Such a cleavage may be seen as producing two opposite ideologies compensating a country’s dependence. While one is usually cosmopolitan and liberal (or “pro-core”) and the other conservative and nationalistic (or “anti-core”), both of them appear to eagerly adopt fashionable concepts of Western critical thought. This process of what can be seen as parallel appropriations and redefinitions of classical global concepts will be illustrated by the case of uses of post-colonial theory in contemporary Poland. It will be shown how its specific adaptations are shaped by the relation of their authors to particular sectors of the peripheral Polish field of power with the authors’ specific resources and strategies of facing the processes of globalization. Both modes of redefinition of post-colonial theory, as it will be demonstrated, could be seen as attempts at establishing a dialogue between peripheral intelligenstias and both their internal opponents as well as dominant Western intellectual elites.

Biography: Tomasz Zarycki is an Associate Professor and Director of the Robert B. Zajonc Institute for Social Studies at the University of Warsaw, Poland. He is a sociologist and a social geographer, specializing in sociology of politics, sociology of culture, sociology of knowledge, critical sociology, and discourse analysis with a particular focus on Polish and Eastern European societies. His most recent book is "Ideologies of Eastness in Central and Eastern Europe" (Routledge, 2014). His articles appeared in journals such as "Current Sociology", "Communist and Post-Communist Studies", "East European Politics and Societies", "Europe-Asia Studies", "GeoForum", "Journal of Communist Studies and Transition Politics", "Russian Education & Society", "Theory and Society", and several others.

The Invisible Gardener: Why Key Sustainability Lessons from the East are Being Ignored
Petr JEHLIČKA (The Open University, United Kingdom)

Between one and two thirds of East European populations grow some of the food consumed in their households. These food practices are significant in terms of food security, healthy diet and environmental sustainability and account for large volumes of household food consumption. These practises nurture social cohesion, resilience and informal food exchange networks which span the urban-rural divide. All social classes and age groups grow and exchange food. Significantly, some twenty-five years since the end of socialism the increasingly affluent East European middle classes continue to grow food. And yet, the burgeoning literature on home gardening and other forms of alternative food networks in the global North has failed to register this large scale non-market food production. Home gardening in the West is typically framed as innovative, modern and progressive practice. In contrast, post-socialist informal food production remains to be viewed as a path-dependent economic strategy of disadvantaged segments of society, set to disappear with the development of the market economy. This context-dependent conceptualisation highlights the unequal knowledge production and contentions arising from the endeavour to use insights from the post-socialist European “periphery” to unsettle the hegemony of concepts generated in the Western context. The aim of this address is twofold. First, to consider possible reasons for the negativity that riddles most of the existing research on East European home gardening. These include the tendency of much of the scholarship to consider personal relations in Eastern Europe as economic necessity and the overemphasis on the economy in analyses of post-socialism. Another reason is the dominant conceptualisation of
Eastern Europe as a backward, undeveloped “other”, in particular with regard to practices branded as “rural” and “traditional”. The second aim is to propose an alternative conceptualisation of East European informal food practices as “quiet sustainability” as exuberant, appealing and socially diverse, but also unforced, forms of sustainability which nurture cooperation and sense of accomplishment. These discussions are of particular significance in the context of widespread household food production and a rapid rise of affluent middle classes in emerging economies.

Biography: Petr Jehlička (RNDr in Geography, Charles University, Prague; PhD in Social and Political Sciences, Cambridge University) is Senior Lecturer in Environmental Geography at The Open University in the UK. His research, with a long-term focus on East European environmentalism, was initially concerned with the unintended consequences of the import of the western ideal of civil society in post-socialist societies and the divergence this represented from state-socialist and pre-socialist alternative culture and politics. This work was published in Environment and History, Environmental Politics, Czech Sociological Review, Nonprofit and Voluntary Sector Quarterly, Transactions of the Institute of British Geographers and several book chapters. Later the scope of his research broadened to study the process of “Europeanization” of environmental governance in new EU member states. This has led to the current interest in sustainable food production and consumption, the outcome of which was published in a range of co-authored book chapters and articles published in Social Indicators Research, Geoforum and Journal of Rural Studies. For open and free access to these publications please visit the Open Research Online repository at http://oro.open.ac.uk/.

SPS07 - Dark Networks

The Study of Extra-Legal Governance: Conceptual, Theoretical and Empirical Challenges, and Some Tentative Solutions
Federico VARESE (University of Oxford, United Kingdom)

This key note talk will address the conceptual, theoretical and empirical challenges in the study of extra legal organizations such as organized crime and Mafias. I will address the conceptual confusion over key definitions in this field, and offer a framework for the study of extra-legal phenomena, which places this field firmly within mainstream economic sociology. I will then discuss the importance of protection theory to understand the behaviour of organizations that try to govern territories and markets, such as States and Mafias. Finally, I will address research design and data collection challenges. In particular, I will stress the importance of 'not selecting on the dependent variable', and the possibilities afforded by the quantification of court records, in particular the application of quantitative content analysis, correspondence analysis and social network analysis. I will mainly draw upon my own research results.

Biography: Federico Varese is a Professor of Criminology at the University of Oxford and a Senior Research Fellow at Nuffield College, Oxford. He is the author of two monographs - The Russian Mafia (2001) and Mafias on the Move (2011) and an edited collected, Organized Crime (2010). His work has been translated in several languages. He writes mainly on organised crime and social network analysis. He has published papers in British Journal of Criminology, Law and Society Review, Archives Européennes de Sociologie, Low Intensity Conflict and Law Enforcement, Political Studies, Cahiers du Monde Russe, Rationality & Society, European Sociological Review, and Trends in Organized Crime.
He contributes to The Times Literary Supplement and, in Italy, the daily La Stampa. His work has been featured in The Economist, The BBC News & World Service, ABC, The Guardian, The New York Times, The Monkeycage Blog and Freakonomics blog, among others. Mafias on the Move was The Recipient of The International Association for the Study of Organized Crime (IASOC) 2012 Outstanding Publication Award. The Russian Mafia was The Co-Recipient, ED A. HEWETT BOOK PRIZE awarded by The American Association for the Advancement of Slavic Studies (AAASS).

Porous Borders: Legality, Illegality, and the Economy
Mathias DEWEY (Max Planck Institute for the Study of Societies in Cologne, Germany)

At first glance, identifying illegal markets and the illegal activities within them seems straightforward: illegal activities are those that violate the norms of the law. On closer inspection, however, the distinction between legality and illegality is rather more complicated. When we take into account the issue of legitimacy — that is, the contestation and acceptance of certain exchanges —, the category of illegality becomes much more intricate and finely nuanced.

In our presentation, we will examine the porousness in the distinction between legal and illegal and make it the starting point for understanding practices in the economy characterized as informal, illicit, and criminal. Based on a wide array of examples, spanning informal markets in Argentina to the poaching of Rhinoceros horn in South Africa and broker-practices in antiquities in London, we will show that a sociological assessment of illegal activities in markets needs to focus on the interfaces between legality and illegality, the interpretation of legal stipulations in communities of practice, and deviance-normalizing activities. Thus we demonstrate how “dark networks” often emerge by being interlinked with legal activities and organizations and become perceived as legitimate within specific communities.

Biography: Matías Dewey is senior researcher at the Max Planck Institute for the Study of Societies, Germany. He received his doctorate in political science from Rostock University, Germany, and received research grants from the Alexander von Humboldt and the Volkswagen Foundations. In addition, he spent time as a visiting fellow at Oxford University, MaxPo in Paris and at the University of Buenos Aires. He is a sociologist with experience in qualitative research and interests in economic and political sociology, criminal organizations and social theory. His research largely focuses on the connections between illegal markets, state agencies and society. In his current project, he is analyzing actors’ expectations and representations of the future in the context of the market for counterfeit and illegally produced garments in Argentina. From the perspective of economic sociology, this project is concerned with the structural principles governing illegal markets and the connections.
SPS08 - The Legacies of Stuart Hall and Richard Hoggart for the Future of Marxist Studies of Media and Culture

Stuart Hall and the Rise of the Black and Asian British Artists: A Sociology of Decentred Art in a Post-Colonial Frame
Angela MCROBBIE (Goldsmiths University of London, United Kingdom)

This lecture endeavours to create a framework drawing both on cultural studies and sociology for understanding the contribution of Stuart Halls writing in regard to the emergence from the early 1980s of a distinctive grouping of artists from British black and Asian backgrounds. The paper considers the preference for the term 'black cultural production' in Halls vocabulary bearing in mind the critique of high culture which marked something of a springboard for British cultural studies. The paper also reflects on the 'conditions of emergence' for these young artists in the context of the residue of social democratic institutions and pathways of support for disadvantaged communities which was curtailed and transformed with the New Labour government from 1997. The paper concludes by inquiring as to how the body of work or objects 'speak' given the subsequent transformations of both the art world and the entrepreneurialisation of higher education and the 'art school'.

Biography: Angela McRobbie is Prof of Communications at Goldsmiths University of London, she is author of many books and hundreds of articles dating back to her time at the CCCS in Birmingham in the mid 1970s. Her fields of specialism are gender sexuality and popular culture, the global fashion industry, the new creative economy, feminist theory, and most recently the emergence of 'creative labour'. Her most current books are The Aftermath of Feminism (2008) and Be Creative: Making a Living in the new Culture Industries (2015)

Hoggart, Hall and Contemporary Cultural Studies
Jim MCGUIGAN (Loughborough University, United Kingdom)

This paper looks at Richard Hoggart’s and Stuart Hall’s contributions to the project of cultural studies during its formation. Hoggart founded the Birmingham Centre for Contemporary Cultural Studies (CCCS) in the early 1960s and hired Hall as his assistant. Both were politically motivated socialists but differently so. Hoggart, an old-school English social democrat, was never a Marxist. He became a public intellectual as a result of his immensely successful and pioneering book, The Uses of Literacy (1957). As a marginal member of ‘the Establishment’, Hoggart was to serve on public bodies in the arts, broadcasting and youth services. He put the case forcefully for taking mass-popular culture seriously in the early-1960s with his ‘good of its kind’ argument, which called into question fixed hierarchies of cultural value. Hoggart was later, however, to repudiate his own egalitarian revision of F.R. Leavis’s ‘discrimination’ problematic. Albeit widely reputed to be a ‘Marxist’, Hall himself disagreed with ‘orthodox’ Marxism, especially its economic reductionism, and the typical priorities of the labour movement. He criticised the ‘traditional’ Left for its backwardness and, as the first editor of New Left Review around 1960, Hall began to pioneer fresh thinking on culture and politics. When Hoggart went to UNESCO temporarily at the end of the Sixties, never to return to Birmingham, as it happened, Hall acted and later succeeded him as Director of the Centre. Hall’s impact on the development of cultural studies became much greater than that of his predecessor. Unlike the British empiricism of Hoggart, Hall was a continental rationalist. He was especially alert to trends in mainly French theory. A great synthesiser and inspirational teacher,
Hall effectively formed a school of thought in the 1970s which might now be named in retrospect, ‘Hallian-’ or ‘neo- Gramscian cultural studies’.
Following Hall’s lead, the Birmingham CCCS’s focal concerns were with consuming practices and ‘the national-popular’ in culture and politics. Hall’s own highly politicised conception of popular culture informed the Centre’s distinctive yet problematic notion of ‘resistance’ on the terrain of everyday life.
Informally, Hall became the principal theorist of British communism during its final years. In the party journal, Marxism Today, he applied a neo- Gramscian framework of analysis to his own coinage of ‘Thatcherism’ and ‘authoritarian populism’, which had been signalled initially by the finest work of the Centre, Policing the Crisis (1978).
In addition to his participation in the project to construct a genuinely multicultural society in theory and practice, towards the end of his life, though very ill, Hall engaged collaboratively in the critique of neoliberal hegemony with the production of ‘The Kilburn Manifesto’. Incidentally, Hoggart had already commented twenty years earlier, in effect, on neoliberal transformation with his much neglected sequel to The Uses of Literacy, The Way We Live Now (1995).
Biography: Jim McGuigan is a freelance researcher, writer and artist. He is also Emeritus Professor of Cultural Analysis at Loughborough University, UK. He has written widely on the politics of culture from a multi-dimensional perspective. His books include Cultural Populism (1992), Culture and the Public Sphere (1996), Modernity and Postmodern Culture (1999, 2006), Rethinking Cultural Policy (2004), Cool Capitalism (2009) and Cultural Analysis (2010). Recently, he has published an edited collection, Raymond Williams on Culture and Society (2014), and added to a revised and re-titled version of Williams’s Towards 2000, A Short Counter-Revolution (2015). His forthcoming book, Neoliberal Culture, is currently in press.

SPS09 - Modeling Uncertainties, Producing Differences

The New Knowledge Infrastructures of the Turbulent Technology Market
Robin WILLIAMS (University of Edinburgh, United Kingdom)

New knowledge infrastructures have emerged to tackle market uncertainties. Would-be adopters seeking to differentiate competing vendor claims in the burgeoning Information Technology (IT) market cannot determine product properties and appropriateness by inspection. To exercise due diligence over multi-million pound procurements that will affect their performance for many years to come, adopters therefore turn to industry analysts who have built up extensive knowledge networks and methodologies and skills to tap user experience of existing products and pick up signals about shifts. Industry leader, Gartner Inc., in its signature output the Magic Quadrant, ranks vendors in terms of seemingly un-measurable properties: ‘completeness of vision’ and ‘ability to execute’. Gartner needs to be able to defend its assessments which have huge impact on the operation of the IT market.

How did this new form of expertise emerge? How is industry analyst knowledge produced and consumed - and in the process legitimated with various internal and external audiences and subjected to various forms of verification and test. Here we explore striking differences between industry analysts and other groups producing future-oriented knowledge in contexts of uncertainty, for example weather men (Fine 2006) or financial analysts (Knorr-Cetina 2011). We can relate these to the different exigencies – and temporalities – through which knowledge is produced, consumed and validated. Rather than treat this knowledge as performative we need to examine how it is performed and achieves influence.
Biography: Robin Williams is Professor of Social Research on Technology and Director of the Institute for the Study of Science, Technology and Innovation (ISSTI) at the University of
Edinburgh. He ran the Edinburgh PICT Centre under the ESRC Programme on Information and Communications Technologies (1987-95). Building on this he developed an interdisciplinary research programme on "the social shaping of technology" which culminated in the formation of ISSTI in 2000. His personal research has focused upon the development and implementation of a range of Information Technology systems and infrastructures. Recent outputs include two co-authored books with Neil Pollock How Industry Analysts Shape the Digital Future (2016, Oxford University Press) and Software and Organisation (2009 Routledge). He also coedited three special editions of the Journal of the Association of Information Systems on the topic of information infrastructures (Vol. 10, No. 5, 2009 on e-infrastructures [eds Edwards et al.], and Vol. 10 Nos. 4 and 5, 2014 on Innovation in Information Infrastructures).

Time and Risk in Climate Knowledge: An Infrastructure Perspective
Paul N. EDWARDS (University of Michigan, United States of America)

How does the time of infrastructure, including knowledge infrastructure, play into the time(s) of risk? Climate science focuses on temporal frames of decades to centuries, but individuals’ perception of climate change varies with the current state of weather — a temporal frame of days to weeks. Meanwhile, policymakers focus on a medium term of months to years, driven by election cycles and current events. The complex interactions among scientific understandings of risk, public perceptions, and the framing of policy choices are an old theme in the sociology of knowledge. The slow catastrophe of climate change brings these interactions into sharp focus. This talk will investigate these interactions through the lens of “knowledge infrastructures”: robust networks of people, devices, and institutions that generate, maintain, and iterate specific knowledge of the human and natural worlds (examples include national census bureaus, global disease tracking systems, weather forecasting, and climate science). It will explore such issues as the framing of long-term, gradually increasing risks (climate change) vs. short-term, catastrophic risks (nuclear meltdowns, hurricanes); the problem of projection (long term) vs. prediction (short term); and uncertainty in historical data vs. uncertainty in simulated futures.

Mid-day Sessions

MD01 - ESA Lecture (1) / ESA CANDIDATES FOR PRESIDENCY
PRESENTATION OF THE PROGRAMMES

ESA Candidates for Presidency. Presentation of the Programmes
TBA ESA PRESIDENT CANDIDATES (ESA)

Airi-Alina Allaste/Hans-Peter Mueller/Frank Welz

Due to the withdrawal in July of two candidates, ESA had to exceptionally reopen the call for nomination, which will be closed on August 15.

Biographies:
Airi-Alina Allaste is a professor of sociology at Tallinn University. She has been the director of the Institute for International and Social Studies for the last 7 years and vice president of the Estonian Sociological Association for the last 4 years.
In 2008 she was a Fulbright scholar and recently was a visiting professor at Griffith University, Australia and Åbo Akademi, Finland.
She has served as a National Coordinator and Working Package Leader for various international projects including the EC 7th FP project Memory, Youth, Political Legacy and Civic Engagement. She has also been responsible for organising several international conferences including NYRIS 12: Nordic Youth Research Symposium (Tallinn, Estonia, 2013).
She has published numerous peer reviewed articles and recently edited 5 books including 'Back in the West': Changing Lifestyles in Transforming Societies. Peter Lang 2013.

Hans-Peter Müller, Professor of Sociology at Humboldt-University in Berlin, studied economics and social sciences at the University of Augsburg, made his Ph.D and Habilitation at the University of Heidelberg and teaches at Humboldt-University since 1992. Since then he is chief editor of the „Berliner Journal für Soziologie“. He was J.F.K.-Fellow at Harvard University and Max-Weber-visiting Professor at NYU in the US and held visiting professorships at Budapest, Helsinki, Paris, Rome, Princeton and Berkeley. His research fields are social and political theory, social inequality, political and cultural sociology. His publications (both in 2014): „Max Weber-Handbuch. Leben-Werk-Wirkung. Stuttgart: Metzler Publisher“ (with Steffen Sigmund) and „Pierre Bourdieu. Eine systematische Einführung. Frankfurt a. M.: Suhrkamp Publisher“. M loves discourse and debate as well as networking the field of European sociology.

Prof. Frank Welz (Austria) teaches sociology at Innsbruck University. After studying sociology, history, philosophy and psychology at Freiburg he has taught and researched at Basel, Bielefeld, Cambridge, Freiburg, N. Delhi (Global Studies Program), Onati and Innsbruck. He publishes on social theory, sociology of law and the historical epistemology of the social sciences; empirically, he is currently engaged in an international project on governmentality and contemporary subjectivities. He served as organizer of ESA, ISA, OeGS (vice-pres.) and DGS conferences. Concerning ESA, during 2007-2011 he was coordinator for ESA RN29, Social Theory. He organized the network's midterm conference, Social theory and the sociological discipline(s), at Innsbruck, also coordinating meetings at the Lisbon, Prague, and Geneva Conferences. He has further served as ESA vice-president for two terms (2011-15), coordinating ESA’s 2013 Crisis, Critique and Change conference programme.
MD02 - Specials & Workshops (1) / THE COSMOPOLITAN IMAGINATION AND SOCIAL JUSTICE

Cosmopolitanism as a Critique of Neoliberalism
Gerard DELANTY (University of Sussex, United Kingdom)

In this lecture I would like to explore the relevance of cosmopolitanism for the analysis of the world today and in particular what it offers sociology. I argue that it is a normative and a critical concept that is highly pertinent to social struggles and to social justice. While it is a contested concept with at least three major traditions associated with it, it is relevant to critical social science in so far as it addresses alternatives within the present. Both its critics and its defenders frequently operate with reductive notions of cosmopolitanism as a societal condition, when it is better understood to express normative, cognitive and aesthetic shifts in the moral and political horizons of societies as they face global threats and problems deriving from, in particular, capitalism and climate change. Cosmopolitanism, understood as critical cosmopolitanism, has the potential to offer an alternative conception of the world to neo-liberalism, which until now has been a global hegemonic ideology. I argue that the widespread appeal of cosmopolitanism in the social sciences has often been directed against the wrong targets and frequently ends up as an affirmation of global currents. The lecture will seeks to clarify what cosmopolitism and what it is not and to outline its relevance in challenging and articulating an alternative to neoliberalism. Of particular importance in this respect is the challenge of recapturing the ground from neoliberalism and re-conceiving the relationship between capitalism and democracy. In rethinking cosmopolitanism central importance must be given to social struggles.
Biography: Gerard Delanty is Professor of Sociology and Social & Political Thought, University of Sussex, Brighton, UK. His most recent publications are The Cosmopolitan Imagination: The Renewal of Critical Social Theory (Cambridge University Press, 2009) and Formations of European Modernity: A Historical and Political Sociology of Europe (Macmillan 2013). He has edited the Handbook of Cosmopolitanism Studies (Routledge 2012). Recent articles on cosmopolitanism have appeared in The Journal of Sociology and Cultural Sociology. He has held visiting professor at many universities including Deakin University, Melbourne; Doshisha University, Kyoto; York University, Toronto; and the University of Barcelona. Gerard Delanty is editor of the European Journal of Social Theory. He is currently working on a Horizon 2020 project on cultural heritage. His other research concerns capitalism and democracy.

MD03 - Specials & Workshops (2) / WHAT DO SOCIOLOGISTS KNOW ABOUT ENERGY? EVERYDAY PRACTICES AND RENEWABLE ENERGY

Understanding Agency in the Co-construction of Everyday Practices and the Energy System
Kirsten GRAM-HANSSEN (Danish Building Research Institute, Denmark)

In contemporary European societies, like in all other societies, everyday life is closely related to the socio-technical organisation of the energy system. In this lecture, I will use historic cases and present data to highlight the co-construction of the energy system and households’ everyday life: from the first electrification of households to the possible future of smart grid
solutions and micro generation in households from renewable energy sources. The study of this co-construction is highly relevant both when dealing with how to tackle global climate challenges and for understanding how the transformation of the energy system may potentially influence the social life of ordinary citizens.

In sociology there is a long tradition for consumer studies. Previous studies have, however, highlighted how culturally-oriented consumer approaches cannot adequately capture the routinized and technology-bound aspects of energy consumption, and based on this practice theoretical approaches have emerged. Here focus is on the collectiveness of practices and individuals are seen as carriers of practices where the social have to be understood through the lens of practices. In this approach, energy is not consumed as such, but different practices are performed such as cooking, computer gaming or doing laundry, and it is the performance of these practices that causes the use of energy. Thus, consuming energy is not a practice, and consequently awareness of, or attitudes towards, energy and climate often have very little explanatory power when it comes to understanding why some households use more or less energy compared with others. In consequence, much practice theoretical energy research has focused on the collectiveness in practices and how practices develop over time, whereas less has focused on the variations of how practices are performed. The structural element in practices has thus been stressed rather than the agency. Theories of practices can be seen as a theoretical approach following the way in which both Giddens and Bourdieu tried to find a third way in the structure - agency debate. I will thus end by discussing how agency can to a greater extent be brought (back) into studies of practices and energy consumption.

Biography: Kirsten Gram-Hanssen is a Professor at the Danish Building Research Institute, and leads the Research Group on Sustainable Housing and Cities. Her research focuses on household consumption related to energy and environment as well as everyday life and the meaning of the home for different types of residents. She uses qualitative and quantitative methods, analysed within different theoretical approaches including sociological theories of consumption, practice theory and STS. Her research on energy and everyday life documents the variation in households' energy consumption and explores the explanations behind it as well as the drivers behind the growing energy consumption and how to deal with it. Kirsten Gram-Hanssen is currently PI at the project UserTEC, with a total budget of 3.2 mill euro, which aims at understanding everyday practices related to energy consumption in a way that can be utilised for technology development to achieve more sustainable housing. She has been project leader on national as well as international projects and has published in numerous international journals and serves as reviewer for them as well.

MD04 - Specials & Workshops (3) / THE STRUCTURE OF CIVIL SOCIETY

Civic Organizational Networks in UK Cities: A Mode of Coordination Approach
Mario DIANI (University of Trento, Italy) | mario.diani@gmail.com

Civil society is frequently conceived as a field of multiple organizations, committed to highly diverse causes and interests. When studied empirically, however, its properties are often reduced to the sum of the traits and attitudes of the individuals or groups that are populating it. Mario Diani shows how to move from an 'aggregative' to a relational view of civil society. Drawing upon field work on citizens' organizations in two British cities, he combines network analysis and social movement theories to show how to represent civil society as a system of
relations between multiple actors. ‘Modes of coordination’ enables us to identify different logics of collective action within the same local settings.
As a result, Diani exposes the weakness of rigid dichotomies, separating the voluntary sector from social movements, ‘civic’ activism oriented to service delivery from ‘un-civic’ protest, grassroots activism external to institutions from formal, professionalized organizations integrated within the ‘system’.

Biography: Mario Diani is Professor of Sociology at the University of Trento that he joined in 2001 and where he served as Head of the Department of Sociology and Social Research and as Dean of the Faculty of Sociology. Earlier, he was Chair of Sociology at the University of Strathclyde in Glasgow (1996-2001), where he served as Head of the Department of Government. Between 2010 and 2012 he was ICREA Research Professor in the Department of Political and Social Sciences, Universitat Pompeu Fabra, Barcelona. Recent research projects address the structure of civic urban networks in Cape Town, network theories of social movements and collective action, the structure of civil society in British cities, participation in the 2003 anti-war protests in Western democracies, social capital and multicultural democracy, global networks of mobilization on communication rights.

Helmut Anheier, Ondrej Cisar, Cristina Flesher Fominaya: discussants

Biographies:

Helmut K. Anheier is President and Dean at the Hertie School of Governance, and holds a chair of sociology at Heidelberg University. He received his PhD from Yale University in 1986, was a senior researcher at John Hopkins School of Public Policy, Professor of Public Policy and Social Welfare at UCLA’s Luskin School of Public Affairs, and Centennial Professor at the London School of Economics. Professor Anheier founded and directed the Centre for Civil Society at LSE, the Center for Civil Society at UCLA, and the Center for Social Investment at Heidelberg. He is currently working on projects relating to indicator research, social innovation, and success and failure in philanthropy.

Ondrej Cisar is Associate Professor at the Department of Sociology, Faculty of Social Sciences, Charles University and is also affiliated to the Institute of Sociology of the Czech Academy of Sciences. He is editor-in-chief of the Czech edition of Czech Sociological Review. He was research fellow at Columbia University; University of California, Irvine; and the CEU Institute for Advanced Study, Budapest. His current research focus is on political economy of protest and social movements’ relation to political parties.

Cristina Flesher Fominaya is Senior Lecturer at Department of Sociology, University of Aberdeen, and a Senior Marie Curie Fellow at National University Ireland, Maynooth. She has an MA and PhD in Sociology from the University of California, Berkeley. She won numerous international scholarships and prizes including the National Science Foundation Fellowship, the German Marshall Fellowship and the Leo Lowenthal Prize for Outstanding Paper in Culture and Critical Theory awarded by the University of California, Berkeley. She has a particular interest in autonomous social movement groups, and the possibilities and challenges of autonomous movement.
National Sociological Associations in Europe: a Survey
Maria Carmela AGODI (University of Naples Federico II, Italy) | agodi@unina.it
Luis BAPTISTA (NOVA University of Lisbon, Portugal)
Roberto CIPRIANI (Roma Tre University, Italy)

This Report presents the results of a survey on the National Associations of Sociology in Europe conducted in the years 2012-2013 by the European Sociological Association under the auspices of its Committee for National Associations. National Associations of Sociology were progressively established and institutionalized throughout the twentieth century, each one reflecting the political circumstances of the European Continent at the time. Based on the 40 associations surveyed, which gave the year of their constitution, only 10% were in existence in 1950, indicating that the consolidation of the associative movement of sociologists in the European area is generally quite recent and gradually built up over the course of a century or more. The size of each association in terms of numbers of members is a key dimension in understanding how sociology is organized throughout Europe. The same may be said when observing the difficulties encountered when institutionalizing the European Sociological Association (ESA), which was formalized as recently as 1992. The results of the survey show that the European sociological community is the aggregate blend of several parallel currents going back well over a hundred years with each current generating as many tributaries as there are individual academic (and other) corporations in action in dozens of the countries where sociology has been able to take root and develop, favoured by university and social policies and/or opposed by governments and public and/or private bodies. Moreover each country has its own story to tell about the particular claims and losses, its ups and downs, advances and setbacks that sociology as a discipline has experienced.

Biographies: Maria Carmela Agodi (Italy) is a full professor of sociology, teaching courses in methodology and sociology of science, at the University Federico II in Naples. Her research, essays, and books focus on institutional change, rationality, reflexivity, welfare and the “knowledge society.” She is currently in the Executive Board of the Italian Sociological Association (AIS) and in the board of ESA RN33-Women's and Gender Studies.
Luis Baptista (Portugal) is professor of sociology at the NOVA University of Lisbon and was the vice-dean of the faculty of social sciences and humanities. His teaching and research are mainly in urban sociology. He has directed research projects and published on the internationalization of the Portuguese language. He is director of the CICS.NOVA (Interdisciplinary Center of Social Sciences). He was the vice-president and president of the Portuguese Sociological Association(APS). He was a member of the LOC (Local Organizing Committee) of the ESA Conference in Lisbon. He is a board member of the ESA RN 27 on southern European societies and RN 37 Urban Sociology.
Roberto Cipriani is an Italian social scientist. He is professor of sociology at Roma Tre University. He has written extensively on popular religion, the sacred and secularization, and is known for his unconventional applications of the concept of "diffused religion" (religione diffusa) and then that of "religion of values" (religione dei valori). He is the author of more than fifty books and eight hundred articles and his work has been translated into English, French, Russian, Spanish, German, Chinese and Portuguese. He graduated from University of Rome "La Sapienza" in 1968. From 1990 to 1994 he was president of the "Research Committee" of Sociology of Religion in the International Sociological Association. From 1995 to 1998 he was editor-in-chief of International Sociology. From 1997 he has been a Professor of Sociology at
University Roma Tre, where since 2001 he has directed the Department of Education. From 2004 to 2007 he was President of the Italian Association of Sociology. In 2008 he has been Directeur d’Etudes at Maison des Sciences de l’Homme in Paris

MD06 - Specials & Workshops (4) / A VIEW FROM OUTSIDE (EVALUATION)

Sarah DE RIJCKE (Centre for Science and Technology Studies, Netherlands, The)

At present very little is known about the effects of research assessment mechanisms on the production of knowledge. This is surprising given the increased role of assessment in the governance of science. The growing use of indicators and their ‘constitutive effects’ (Dahler-Larsen, 2014) are subject of considerable debate. While some analysts welcome the possibility of increasing transparency through performance data, recent years have also seen high-profile initiatives drawing attention to perceived damaging effects of an increasing metric-orientation in research assessment (e.g. DORA). Researchers from different disciplines are raising concerns about how certain uses of performance metrics are overriding more intricate notions of quality and merit. These concerns include both a loss of the social in science - e.g. increasing competitive struggles and ‘benchmark masculinity’ (Thornton 2013), waning collegiality and community service - and a loss of epistemic diversity - e.g. goal displacement and task reduction. In this special session I will first share recent results from my group’s ethnographic projects in which we analysed interactions between evaluation and knowledge production on the ‘shop-floor’ of academic research. Secondly, I will consider the most pertinent issues for the community of sociologists from the Leiden Manifesto for research metrics (co-authored by Diana Hicks, Paul Wouters, Ludo Waltman, Sarah de Rijcke & Ismael Rafols for Nature, 22 April 2015).

Biography: Dr. Sarah de Rijcke is a senior researcher at the Centre for Science and Technology Studies (CWTS, Leiden University). Her work focuses on the growing use of assessment procedures and bibliometric indicators in academic settings. AT CWTS, De Rijcke leads a research group: Evaluation Practices in Context (EPIC). The group studies the effects evaluation systems have on the organisation and content of research in different disciplines. Current projects analyse empirically the processes around research evaluation that happen ‘under the radar’ of official policy documents, codified evaluation procedures, bibliometric analyses etc. -- including informal, decentralised ways in which evaluations are applied within the science system.

MD07 - Specials & Workshops (5) / IN MEMORY OF ULRICH BECK

A Participating Global Scientific Observer
Michaela PFADENHAUER (University of Vienna, Austria) | michaela.pfadenhauer@univie.ac.at

Value neutrality might be that postulate to which most sociologists in the German-speaking countries that are heavily influenced by Max Weber would subscribe to. This applied also to Ulrich Beck who, in his first book, treated the tense relationship between objectivity and
normativity. At the same time, he was triggered by a strong impetus to commit to an ethical standpoint in current issues, e.g. the economic crisis and a new Europe. Hence, in her obituary, Eva Illouz characterized Ulrich Beck as the embodiment of European citizenship, i.e. a “participant citizen” in the sense of Michael Barber’s address of Alfred Schutz. Like Peter L. Berger, Ulrich Beck claimed a “dual citizenship” as a sociologist, on the one hand, and as a political actor on the other. Unquestionably, Ulrich Beck is one of the most cited social scientists in the world. He is, however, most notably known for his books on (World) Risk Society and Theory of Reflexive Modernization. Since the beginning his work is heavily linked to the origin of the sociological question on social inequalities. In Germany, with his 1983 published article “Beyond Status and Class”, Beck evoked a longstanding debate on the usefulness of common models and methods for measuring social inequality. His concept of individualization, linked to the observation of an elevator effect caused by education and welfare state politics after World War II, until now remains a source of irritation and criticism in these parts. Ulrich Beck was not only motivated to raise his voice against the misleading global developments. Moreover, he was motivated by providing provoking analysis of the modern age from a world perspective. Stressing a "cosmopolitan turn", Beck progressively criticized the objective and value-free sociology for its blindness regarding the new transnational forms of domination and inequality. Last but not least, his aim was to constantly challenge mainstream sociology with its "zombie categories". As a sociologist by heart, his vision was to transfer sociology to a methodological cosmopolitanism, however, he suddenly and unexpectedly passed away on January, 1 2015.

Biography: Univ.-Prof. Dr. Michaela Pfadenhauer received her Master's degree in Political Science from Bamberg University (1994) and attained her PhD in Sociology from Dortmund University (2002). She was a senior researcher and lecturer at Ludwig-Maximilians-University of Munich, at the Technical University Dortmund and at the University St. Gallen, Switzerland. From 2007 to 2014 she held a professorship in Sociology of Knowledge at the Karlsruhe Institute of Technology. Since 2014, she is a professor of Sociology at the University of Vienna (research area Culture und Knowledge). She is the board member of the Research Network Sociology of Knowledge in the German Sociological Association and a member of editorial boards of sociological journals Soziologische Theorie and Soziale Interaktion. At ESA Conference in Prague, she coordinates the Research Stream RS 05 “Sociology of Knowledge” (together with Hubert Knoblauch and Bernt Schnettler).

MD08 - AUTHOR MEETS CRITIQUES I

From Intervention to Social Change
Trin VIHALEM (University of Tartu, Estonia) | triin.vihalem@ut.ee
Margit KELLER (University of Tartu, Estonia) | margit.keller@ut.ee
Maie KISEL (University of Tartu, Estonia) | maie.kisel@ut.ee

Contemporary societies in various parts of the world abound in projects and programmes, which attempt to effect change, to transform society, to make people think and act differently: in a healthier, more sustainable, innovative, responsible and capable way. Such interventions into people’s everyday lifestyles, often called “social change programmes”, assume that social change can be galvanised and pushed in the desired direction if people are organised and make concerted efforts. The book offers accessible hands-on guidance and theory-driven tools for professionals and volunteer actors who are designing and implementing programmes aimed at solving various problems related to people’s lifestyles and consumption: from reducing health-risk behaviour to “green” or financially literate decisions.
Authors offer a bridging alternative to the dominant individual behaviour change approach and behavioural economics by applying the rapidly developing and intriguing strand of sociological thinking: theories of social practices. The book is among the first ones that puts social practice theory into "practice" by providing step-by-step applied guidelines on how practitioners should actually use a practice theory-driven programme in real life by showing user-friendly ways to get in touch with the complexity of the mundane everyday life. This handbook has been co-created involving students from varying disciplines and different countries. It is illustrated with original conceptual drawings by graphic designers and provides "Think and Stretch" exercises, which call for critical thinking as well as challenge sedentary lifestyles.

Biographies: Triin Vihalemm is a Professor of Communication Research at the University of Tartu, a recent research fellow at Helsinki Collegium for Advanced Studies. Her latest work concerns mediation and change of consumption, health and environment related practices. Extensive research on ethnic integration in Estonia has provided her with rich experience in analysing the interface between structural conditions, institutional policies and people's everyday practices. She leads a social entrepreneurship incubator programme and several applied co-operation projects on social innovation and empowerment of vulnerable groups in society. She is member of Estonian Public Service Ethics Committee and Vice President of Estonian Sociologists' Association.

Margit Keller is a Senior Researcher at the Institute of Social Studies, University of Tartu. She is chairing the ESA Sociology of Consumption network. Her research fields are “Westernisation” of post-Soviet consumer culture, young people, marketing, change in social practices of everyday life and contested consumption. She is a guest editor of the Environmental Policy and Governance sustainable consumption special issue and an co-editor of Routledge Handbook on Consumption. She has published, amongst others, in Journal of Consumer Culture; Consumption, Markets, Culture and Marketing Theory. She has run several applied research projects and professional training programmes.

Maie Kiisel (PhD) is a Researcher of social communication at the same Institute. Her research areas are environmental and risk consciousness and communication, participation in decision-making, social movements and civic organizations. She has been active member of the Green Movement and acts as an editor of the webpage bioneer.ee that is the main platform of dissemination of pro-environment knowledge in Estonia.

MD09 - ESA Lecture (2)/ THE STATUS OF SOCIOLOGY TODAY

What Can the Sociological Analysis of Social Mobility Bring to the Immigration Debate? Examples and Reflections
Lucinda PLATT (London School of Economics and Political Science, United Kingdom) | l.platt@lse.ac.uk

There is extensive interest across Europe in ethnic and immigrant inequalities in the labour market, and the extent to which they persist into the second generation. These inequalities have been the subject of a vast array of sociological studies, which have changed how we think about processes of migration and enhanced understanding of migrant diversity. At the same time, sociological analysis of social stratification continues to advance our understanding of social mobility and how it varies across time and space, as well as its relationship to societal levels of social inequality. Social mobility remains a core policy agenda across many European countries and is widely discussed in the media. This demonstrates the continuing salience of this core strand of sociological research and how it has captured the public imagination - but also how it
has been co-opted as an alternative to more explicitly egalitarian agendas. In this talk I bring these two bodies of work together - and illustrate the wider implications of such a combined application. Specifically, I discuss the extent to which we can better understand inequalities and diversity across men and women of different ethnic and immigrant groups by taking proper account of social (class and national) origins. Building on existing research, I present a framework for the analysis of immigration/ethnicity and social mobility, which incorporates the contributory role of education. I then draw on new analysis of unique, large scale data sources from the UK and Europe to assess how empirical patterns map on to this framework. I conclude by considering what this means for future patterns of social stratification in European societies, even in the face of changing migration regimes. Acknowledging the limits to the political reach of sociological research, I nevertheless reflect on the ways in which such insights might help to reshape policy understandings currently focused on ethnic disadvantage or on simple dichotomies between 'good' and 'bad' migrants to a broader perspective on migration and minorities.

Biography: Lucinda Platt is Professor of Social Policy and Sociology at the London School of Economics and Political Science (LSE). Her research focuses on ethnicit y and immigration, including labour market and income inequalities and identity, and on child poverty and wellbeing, including child disability. Her most recent book was Understanding Inequalities: Stratification and Difference (2011, Polity); and she has recently co-edited a book on Social Advantage and Disadvantage for Oxford University Press to be published in 2016. She is co-author of Intergenerational consequences of migration: Socio-economic, family and cultural patterns of stability and change in Turkey and Europe, being published this year by Palgrave Macmillan. She specialises not only in the analysis but also the development of large-scale longitudinal surveys: she was, till 2013, Director of the UK’s Millennium Cohort Study, a study of over 19,000 children born in 2000-2001; and she is co-investigator with responsibility for ethnicity on Understanding Society, the UK Household Longitudinal Study.

MD10 - Specials & Workshops (6) / SOCIOLOGICAL IMAGINATION IN DARK TIMES

The Stranger and The Nation States of Europe.
Ágnes HELLER (New School for Social Research, USA)

Europe is the sole continent of nation states. Nation states developed first abruptly then slowly since the end of the 18 century and led to the dissolution of the European empires. Nation states won their final victory in 1914, when both internationalism and cosmopolitanism lost against nationalism. Nation became the most general “identity” and nationalism the dominating ideology. This is why nation states have a great difficulty to accommodate strangers, people who speak a different language, practice different customs. What was natural within the European empires, becomes a field of conflicts in nation states. They cannot integrate “others”, they want to assimilate them. Yet even if the “strangers” try hard to assimilate, they are still treated with suspicion. Due to failure in assimilation, some “strangers” begin to dissimilate. Contrary to the USA which is not nation state and thus integrates easily, Europe has to face the difficulties stemming from the domination of nationalist ideology. The question is whether the European Union can become the institution that leads Europe back to its own tradition, to its pre WW’1 self understanding, or it will enter a period of super nationalism which not easily confirms to liberal democracy.
Biography: Professor of Philosophy Ágnes Heller was born in Budapest. She was student of Georg Lukács. Since 1955 she served shortly as the first editor of the post-war Hungarian Philosophical Journal, but was dismissed from academic position for political reasons after the Hungarian Revolution. After spending several years in Hungary working in different professions she emigrated to Australia in 1977 where she got academic position in La Trobe University in Melbourne. In 1986 she moved to New School for Social Research in New York. Since the great change of 1989, she now spends half of the year in her native Hungary where she has been elected to the Hungarian Academy of Sciences.

She is a holder of numerous academic awards, Hannah Arendt Prize for Political Philosophy or Szechenyi National Prize in Hungary among others. She has served in numerous Editorial Boards, including that of Praxis International, Aut Aut, Social Praxis, or New German Critique. She is a member of International Research Group of Alienation, member of International Society of the Sociology of Knowledge, member of the College Internationale de Philosophie, Paris or member of Societe Europeenne de Culture, Venice.

MD11 - Specials & Workshops (7) / THE REPRODUCTION OF INEQUALITY: NEW WAYS OF EXPLORING THE ROLE OF STRUCTURE AND AGENCY

Educational Inequalities in Access to Higher Education: The Role of Networks, Institutions and Markets
Agnès VAN ZANTEN (Sciences Po, France)

Widening access to higher education has become an official priority for the 27 Heads of Government of the European Union who have agreed on the Europe 2020 strategy. However, existing studies show not only important inequalities between countries but also among social groups within each country in this domain.

Sociologists have generally analysed these social inequalities either as a result of differences in students’ socio-economic and cultural backgrounds and/or of the existence of a hierarchical system of higher education institutions enrolling students with different social and academic profiles. These factors are very important but provide an incomplete picture of social inequalities in access to higher education for at least three reasons.

The first is the need to take into account not only family background but the variety of agents with whom students have had and have close relationships (parents, siblings, other family members, friends, neighbours…) and the diverse forms of influence they can exert, from the strong framing of habituses to the informal sharing of information. The second is that the role of secondary and higher education institutions has frequently been considered separately without attaching enough importance to the ways in which institutional interdependency frames students’ options of study. Finally, the role of markets on students’ choices has generally been considered from an abstract and usually critical perspective neglecting the close analysis of the increasing influence of market devices such as rankings or higher education fairs.

Using data from an original, on-going mixed-method study in France but also from previous research on this topic, this presentation will highlight the importance of these three dimensions—networks, institutions and markets—on students’ HE choices. It will show their interrelation and the ways in which they affect the choices of students from different social groups.

Biography: Agnès van Zanten is a sociologist and senior research professor working for the Centre National de la Recherche Scientifique at Sciences Po, Paris. She is the co-director of the
research group on Educational policies at the Laboratoire Interdisciplinaire d’Evaluation des Politiques Publiques (LIEPP) of Sciences Po and the director of the series “Education et Société” at Presses Universitaires de France. Her main research areas are class and education, elite education, transition to higher education, school choice, competition and mix and educational policies. She is also interested in qualitative research methods and international comparisons. She has recently published (with G. Felozis and C. Maroy), Les marchés scolaires (PUF, 2013) and edited (with S. Ball and B. Darchy-Koechlin) The World Yearbook of Education 2015. Elites, privilege and excellence: the national and global redefinition of educational advantage (Routledge, 2015). She is also directing two main research projects on ‘Transition to higher education. The role of networks, institutions and markets’ and (with C. Maroy) ‘Accountability and governance of education in France and Quebec’.

MD12 - Specials & Workshops (8) / TRANSNATIONAL BIOGRAPHIES AND TRANSNATIONAL CULTURES

Bridging Cultures: Central Asian Care-givers in Russian Cities
Elena ZDRAVOMYSLOVA (University at St. Petersburg, Russian Federation)

This paper addresses the (trans) cultural bridging that is produced and performed in daily encounters of migrant careworkers from Central Asia in Russia. Care over children and elderly is ‘framed by gender’ (Ridgeway). Thus cultural bridging in caring work is also defined as women’s activity. Cultural bridging – navigating different patterns of interpretations and behaviour - is conceptualized here as part of the domestic work of the migrant paid caregivers (and care receivers). Due to the work of cultural bridging cultural boundaries become porous, some of them are transgressed, others – sustain. In cultural bridging ethnicity/ class/ gender/ age of the actors intersect and perform as a resource pool or barrier syndrom. Cultural bridging in the carework result in the creation of the class/gender divisions in the Russian society. Cultural bridging influence the identity of the migrant workers making them more reflexive here and there. In the daily encounters the generalized cultural otherness often formulated by prejudices and stereotypes is individualized, become tangible, transgressive and mutually accepted.

My particular focus is on the dialectics of control in the interactions between paid domestics and their employees when they belong to seemingly different cultures that at the same time share a lot of similarities. Cultural resources are enacted in the practices of distanciation, hierarchization and equalization revealed in the carework interactions.

The empirical data are biographical interviews with migrant women from Central Asia (Uzbekistan and Kyrgyzstan) who are employed as domestic caregivers and their employees. Analyzing the life stories I address questions such as:

- How cultural boundaries between accepting and receiving societies are re-constructed in the stories of migrant domestics from the Central Asia?
- How class/ gender/ race-ethnicity and age enact in these constructions?
- What resources are enacted in the successful social integration of migrants?

I claim that cultural bridging is part of the care work of migrants; and carework is a special asset for social integration of migrant workers.

Biography: Elena Zdravomyslova Dr. of Sociology, Professor at the EUSP, Co-director if the Gender Studies Program at the European University at St. Petersburg (EUS).

Areas of interest: gender in postsocialist societies, regimes of care, aging in the life course (institutions and practices). Methodological preference for qualitative life-story research.

MD13 - Specials & Workshops (9) / CULTIVATING DIFFERENCES AND THE SOCIOLOGICAL IMAGINATION

Similitude and the Social Imaginary
Scott LASH (University of London, United Kingdom)

This talk addresses not difference but similitude. And indeed if the symbolic, including Durkheim’s symbolic, works through a logic of difference, then the imagination or the imaginary operates in the register of similitude. Thus Walter Benjamin with David Hume understands the imagination in terms of a principle of mimesis, of imitation. Durkheim saw this as a problem, and castigated a (British) empiricism based on the imagination in contrast to a positivism whose register was the symbolic. For Benjamin the languages of humans (and of God) operates through the symbolic while the language of things works through the imagination and imitation. Max Weber, for his part, thought capitalism in China could not develop, that China could not modernize, because it could not reach towards level of the symbolic and rationalization. For Benjamin Chinese modernity is based instead on the imagination and the mimetic faculty. As children, we had and have now lost our mimetic faculty. But what about the space of hope, of the ‘what can we hope’ of is referred to variously as the messianic or the divine? Can our mimetic faculty, this a posteriori faculty - that sits among a series of a priori faculties, including the understanding and labour power - open up this utopian window? If the sociological imagination can be in some way a Prinzip Hoffnung, it may well be in its own register, not of difference, but of similitude.

Biography: Scott Lash is Professor and Research Director of the Centre for Cultural Studies at the Goldsmiths College of the University of London. Lash is well known for his contributions to cultural studies in relation to Social Theory and Globalisation. Scott Lash earned his PhD at the London School of Economics. Since then he has been teaching and researching at Lancaster University and since 1998 he is working at Goldsmiths College of the University of London. His work on Reflexive Modernity together with Anthony Giddens and Ulrich Beck belongs to the sociological classics.

From Inequalities to Differences: Retuning C. W. Mills’s ‘Sociological Imagination’ to the Post-Cold War Era

Frank WELZ (Innsbruck University, Austria) | frank.welz@uibk.ac.at

C. Wright Mills’ ‘The Sociological Imagination’ (1959) still ranks second among the most influential books in sociology ever published (according to an ISA survey). Mills called for ‘imagining’ how individual lives are interconnected with public issues. To transform sociology into a potentially liberating force, C. Wright Mills emphasized history as vital part of the sociological approach, and offered a trenchant critique of sociology’s ‘grand theory’ and ‘abstracted empiricism’ at the time. Since 1959, however, social reality has changed dramatically -- and so did sociology.

In particular, a Fordist regime of political economy has shifted to post-Fordist regulation, and the welfare state has been challenged by global neoliberal governance. As a consequence, in sociology, well-established categories for conceiving social reality have been fractured. Our understanding of collective institutions and ‘social’ circumstances, such as inequalities, has shifted to an individualized understanding of human lives in ‘risk society’ (Beck), in which chance, choice, agency, as well as ‘differences’ in fields such as gender, ethnicity and migration, are being emphasized. Following Foucault, analyses of power structures have shifted to a de-centered concept of power according to which actors prove to be governed “from inside”, as entrepreneurs of the self. What changes have taken place since C. Wright Mills’ analysis, what are today’s real-world concerns, and what do they mean for retuning our sociological imagination to contemporary society?

Biography: Prof. Frank Welz (Austria) teaches sociology at Innsbruck University. After studying sociology, history, philosophy and psychology at Freiburg he has taught and researched at Basel, Bielefeld, Cambridge, Freiburg, N. Delhi (Global Studies Program), Onati and Innsbruck. He publishes on social theory, sociology of law and the historical epistemology of the social sciences; empirically, he is currently engaged in an international project on governmentality and contemporary subjectivities. He served as organizer of ESA, ISA, OeGS (vice-pres.) and DGS conferences. Concerning ESA, during 2007-2011 he was coordinator for ESA RN29, Social Theory. He organized the network’s midterm conference, Social theory and the sociological discipline(s), at Innsbruck, also coordinating meetings at the Lisbon, Prague, and Geneva Conferences. He has further served as ESA vice-president for two terms (2011-15), coordinating ESA’s 2013 Crisis, Critique and Change conference programme.
MD14 - Contributes From National Associations (2) / MEETING OF THE COUNCIL OF NATIONAL ASSOCIATIONS

Report of the Chairperson of the Council of National Associations
Roberto CIPRIANI (Roma Tre University, Italy)

This Report presents the initiatives of the Council of National Associations in the years 2009-2015. The election of the Chairperson of the Council of National Associations was organized in an informal way during the ESA Congress in Lisbon (September 2nd-5th, 2009). An ESA meeting with National Associations has been organized in Paris (28th October 2010). A "Memorandum of Understanding" between European Sociological Association and National Sociological Associations has been signed in Paris, October 28th, 2010 and October 25th, 2012. New Guidelines for the Council of National Associations have been approved in Geneva (7.09.2011). New Statutes of the European Sociological Association have been approved in Geneva (9.09.2011), namely “Article 8: The Council of National Associations”, and article 6 (the Council of National Associations is a Governing Body). A NAs Conference has been organized in Paris (October 25th, 2012) on “European Science Policy and the Social Sciences”. The meeting of the Council of National Associations in Turin (August 28th-31st, 2013) has discussed the possibilities of harmonising their structures with that of the RNs. A questionnaire on “European Sociology Today” has been distributed in the years 2012-2013, in order to have a better knowledge of sociological presence in Europe. The Report has been presented in Prague (August 26th, 2015), and published in European Societies. A complete Report and data are available (see ESA website, “National Associations”). A NAs Conference together with ESA Executive Committee has been organized in Paris (November 6th, 2014) on “Research and Teaching in Europe”. Finally “Euro-Arab Meeting for Young Researchers in Social Sciences” (Manama, Bahrain, October 19th–25th, 2015) is an initiative to accommodate young Arab and European researchers in order to have their research discussed in a public forum. Reputed Arab and non-Arab researchers, experts in framing scientific research, will participate, too.

Roberto Cipriani is Full Professor of Sociology at the University of Rome 3, where he has been Chairman of the Department of Educational Sciences from 2001 to 2012. He has been visiting professor at the University of Berkeley. He is Past President of the Italian Sociological Association. He has been Professor of Qualitative Methodology at the University of Buenos Aires, of Sao Paulo (Brazil), and of Recife (UFPE), and of Political Science at the Laval University in Québec. He is also former Past President of the ISA Research Committee for the Sociology of Religion. He has been Editor-in-Chief of International Sociology (International Sociological Association official journal), and member of the Executive Committee of the AISLF (International Association of French Speaking Sociologists). In 2006 he has been “Chancellor Dunning Trust Lecturer” at Queen’s University of Victoria (Canada). He is member of the Executive Committee of the International Society for the Sociology of Religion. He has done research in Greece, Mexico, and Israel, and has produced many research-movies. His Handbook of Sociology Religion has been translated into English, Spanish, Portuguese, French, and Chinese. At the moment he is the Chairperson of the Council of National Sociological Associations of the European Sociological Association.

Chair: Howard Wollman
Howard Wollman is Honorary Fellow in the School of Social and Political Science, University of Edinburgh, and Chair of the British Sociological Association. He has been Head of School of Health and Social Sciences at Edinburgh Napier University. He has been at one time Vice Chair of the Educational Institute of Scotland - University Lecturers Association.

Election of the Chairperson of the Council of National Associations
Howard Wollman, Paula-Irene Villa and Siniša Zrinščak, Nominations Committee members
Are the SSH Disappearing from EU Research Policies?
Didier GEORGAKAKIS (University Paris 1- Panthéon Sorbonn, France)

What is going on within EU research policy for the SSH? On one side, there are many and obvious reasons for the EU to invest in the European SSH. The economic crisis and the situation of Europe in the global world raises an unprecedented number of human and social issues deserving (at least) to be better understood. Scientifically, European SSH have an incomparable common intellectual heritage, diversity and potential of talent, so there would be a lot to be gained (for education, social innovation, reflexive policies, etc.) to build on their qualities, make them more inclusive across the EU and spread their values abroad. On the other side, the implementation of EU research policy in the H2020 framework is taking the opposite direction. Whereas the need for much more SSH has been asked by the European Parliament and the Council of Ministers (and continues to be), the ‘competent’ Directorate General addressed a succession of alarming message: demise of the competent directory; claiming that autonomous SSH research is a waste of money and favouring a purely ideological embedding policy; highly problematic budgetary execution on SC6; not to mention condescending messages against the ‘Ivory Tower of SSH community’ (sic) and refusal to sit at the table with the representatives associations. All of this would not be important if the EU was a marginal actor for research. But this is far from being the case with the EU research policy design being, beyond H2020 itself, used as a template for most member states. In a context where many forces in the SSH communities think of taking action, the keynote aims at identifying this problem and its main socio-political features

Biography: Didier Georgakakis, 48, is a political science professor at the University Paris 1- Panthéon Sorbonne and member of the European Centre for Sociology and Political Science (CNRS-Paris 1-EHESS). An honorary junior member of the Institut Universitaire de France (IUF) and a Visiting Prof. at the College of Europe (Brugge), his teaching and research focus on the historical and political sociology of the EU, a field in which he is one of the principal promoters since the late 1990’s and in which he published extensively in French and English (lastly, The Field of Eurocracy. A Political Sociology of European Actors and Professionals, ed. with J. Rowell). Elected several times in associations representing political science in France, he is now an executive member of the European Confederation of Political Science Association, which he also represents within the core group of the European Alliance for Social Sciences and Humanities.

Social Movements in Times of Austerity. Is Anti- Capitalism Back?
Donatella DELLA PORTA (European University Institute, Italy)

In recent years, citizens from all over the world have protested against what they saw as a deterioration of democratic institutions as well as of the very civil, political and social rights once endowed to them. Beginning with Iceland in 2008, and then forcefully in Egypt, Tunisia, Spain, Greece, and Portugal, or more recently in Peru, Brazil, Russia, Bulgaria, Turkey or Ukraine, masses took to the streets against what they perceived as a rampant and dangerous corruption of democracy, defined as a source of inequality and people’s suffering. These protests have
been seen as part of anti-austerity social movements, mobilizing in a context of the crisis of neoliberalism. It is on them that this volume focuses, developing on the assumption that, in order to understand their main characteristics in terms of social basis, identity and organizational structures and strategies, we should look at the specific characteristics of the socioeconomic, cultural, and political context in which they developed.

Biography: Donatella Della Porta is professor of sociology at the European University Institute, where she directs the Center on Social Movement Studies (Cosmos) now moving to the Graduate School in Political Science and Sociology at Scuola Normale Superiore in Florence. She is also directs a major ERC project Mobilizing for Democracy, on civil society participation in democratization processes in Europe, the Middle East, Asia and Latin America. Among her very recent publications are: Methodological practices in social movement research (Oxford University Press, 2014); Spreading Protest (ECPR Press 2014, with Alice Mattoni), Participatory Democracy in Southern Europe (Rowman and Littlefield, 2014, with Joan Font and Yves Sintomer); Mobilizing for Democracy (Oxford University Press, 2014); Can Democracy be Saved?, Polity Press, 2013; Clandestine Political Violence, Cambridge University Press, 2013 (with D. Snow, B. Klandermans and D. McAdam (eds.). Blackwell Encyclopedia on Social and Political Movements, Blackwell. 2013; Mobilizing on the Extreme Right (with M. Caiani and C. Wagemann), Oxford University Press, 2012; Meeting Democracy (ed. With D. Rucht), Cambridge University Press, 2012; The Hidden Order of Corruption (with A. Vannucci), Ashgate 2012.. In 2011, she was the recipient of the Mattei Dogan Prize for distinguished achievements in the field of political sociology.

MD17 - ESA Lecture (3)/ THE STATUS OF SOCIOLOGY TODAY"

The Spectre of Sociology
Mark FEATHERSTONE (Keele University, United Kingdom)

In this paper I develop a theory of the spectrality of sociology under conditions of neoliberal capitalism through an exploration of the way in which neoliberal thought forecloses the space of the social imaginary and transforms relational thinking into a ghost or spectre. Under these conditions, my suggestion is that sociological thought becomes marginal to thinking about and understanding the human world. Thus sociology is transformed into a peripheral discipline in the social sciences while economy and economics takes centre stage. However, my thesis is that it is precisely because of this situation on the very margins of relevance in the neoliberal world that sociology should be considered the critical discipline in the contemporary period. Here, my argument is that sociology carries critical, utopian, value in the neoliberal post-historical society that screens out relational thinking and transforms the discipline that thinks the necessary and irreducible interdependence of self, other, and world into a spectre. In this respect I claim that sociology haunts neoliberal society which cannot think beyond individuals and conceives the social in terms of masses or collections of individuals. Against this vision, my view is that the challenge of the spectre of sociology is to continue to conceive of individuals in terms of relations, think through the interdependence of self, other, and world, and centrally oppose what I want to call the neoliberal resistance to social analysis because it is only on the basis of thinking in terms of relations that social justice will be truly possible.

Biography: Dr Mark Featherstone is Senior Lecturer in Sociology at Keele University, UK. He is a social and cultural theorist by specialism and also works in the area of psychoanalysis. His main research area is the study of utopias and dystopias and he has written ‘Tocqueville’s Virus: Utopia and Dystopia in Social and Political Thought’ (Routledge, 2007) and ‘Planet Utopia: Utopia, Dystopia, and Globalisation’ (Forthcoming, 2015) on this topic. He has also
written numerous articles for journals in Sociology and Cultural and Media Studies. He is currently writing on monograph on the intersections of psychoanalysis and social thought in a globalised world and working on another project on the social consequences of screen-based culture. Apart from his own work, he is also Reviews Editor for Sociological Review and Cultural Politics.

**MD18 - Specials & Workshops (11) / NEW FEMINIST MOVEMENTS, MAKING THE DIFFERENCE?**

**Feminism and the Crisis**  
*Sylvia WALBY (Lancaster University, United Kingdom)*

Europe is in crisis. What does feminism have to offer? The architecture of the European Union financial, fiscal and democratic institutions is being reconstructed in the shadow of the crisis. This highly contested restructuring is gendered. There will be fusion or fission: either greater concentration of power at the EU-level or fracturing and disintegration. Finance is gendered in its governance and redistributive consequences. The fiscal concerns the welfare state that is essential for the social democratic public gender regime. The depth of democracy is gendered. There is a struggle between two projects during this restructuring: either decreasing gendered democratic engagement over financial and fiscal institutions, or embedding gender equality principles into the new settlement. Feminist projects, such as the gender budgeting movement and trade unions, are defending a model of a social democratic public gender regime against an attempt to neoliberalise the gender regime. Not only is there a potential tipping point between fusion or fission in the European Union project, but also a tipping point in the form of gender regime and the form of capitalism in the European Union. Utilising complexity theory enables us to theorise the crisis more effectively.

Biography: Sylvia Walby OBE is Distinguished Professor of Sociology and UNESCO Chair in Gender Research, Lancaster University, UK. She was founding President, European Sociological Association, 1995-7. She has been President of Research Committee 02 Economy and Society, International Sociological Association, 2006-10. She is a Fellow of the Academy of Social Sciences, UK. She has conducted research for the UN, European Parliament, European Commission, European Institute for Gender Equality, and ESRC. Books include The Future of Feminism (Polity 2011) and Globalization and Inequalities: Complexity and Contested Modernities (Sage 2009). Her new books are Crisis (Polity 2015) and (with 11 others) Stopping Rape: Towards a Comprehensive Policy (Policy Press 2015).

Mia Liinason: discussant

Mia Liinason is a Senior Lecturer in Gender Studies at the University of Gothenburg. In 2014, she was a Research Fellow at the Gender Institute at the London School of Economics and Political Science. Mia is interested in feminist knowledge production in- and outside of the academy. Currently, she is engaged in research about feminist grassroot activism and women’s NGOs in Scandinavia.
MD19 - Specials & Workshops (12) / ART AS CULTURE, CULTURE AS ART

Can Art Change the World? Answers from a Gendered Perspective
Marie BUSCATTO (University of Paris 1 Panthéon Sorbonne, France) | marie.buscatto@orange.fr

Art is often perceived, in common sense as well as in theoretical discussions, as a wonderful way to change the world and to help unleash creative social forces. It is also often thought to be a major tool to unveil social inequalities and nurture social action to reduce them. What I would like to do in this session is to question such beliefs from a gendered perspective. Using empirical examples drawn from research into a range of art worlds - music, literature, visual arts, circus and cinema – I will try to show that art worlds do tend to function in quite normative ways that make it difficult for women to create, even more so when they are perceived as creating in “feminine” or, worse, in “feminist” ways! Main artistic actors do not differ much from other social actors and do tend to reproduce current gendered inequalities. But art worlds also allow for transgression, and sometimes even for subversion, for some original men and women who do create against all odds. Life is often difficult for those artists, but they do have room for action in our western countries to produce innovative works of art. I will then show when and how art may help change the world and even, sometimes, make it a more equal place to live in at the end!

Biography: Marie Buscatto is Professor in sociology at the University of Paris 1 Panthéon Sorbonne (France). Sociologist of work, gender and arts, she is equally interested in questions of method. Based on her initial research on the role of women in the world of jazz, her current work focuses on women’s problems of entry, retention and recognition in art worlds, and even more broadly in professions still male-dominated. She also studies ways artistic creation is shaped by gendered processes as well as ambivalencies affecting artistic practices, careers and professions. Finally, she reflects on the epistemological status of the ethnographies of organizational work.

Rethinking the Relationship between the Arts and Sociology of Arts
Rudi LAERMANS (University of Leuven, Belgium) | rudi.laermans@soc.kuleuven.be

Many authors within and outside the social sciences regard the arts as a crucial public sphere in which the pivotal meanings or presuppositions informing a common culture can be critically discussed or deconstructed. A well-established line of research within sociology supplements this view with the thesis that the arts reflect wider features of, or tendencies within, the surrounding society. Backed by recent personal research, the presentation will put into perspective both approaches through a focus on contemporary dance and performance practices.

On the one hand, many artists nowadays explicitly frame their practice in terms of research and address issues that are also discussed in the social sciences. They see themselves primarily as knowledge-producers in their own right and present the results of their research partly in formats known from the arts (e.g. a performance), partly in formats that have a direct affinity with the academic world (such as the lecture-performance). In this way, certain branches of contemporary art become genuine partners of sociology through the shared search for knowledge that has a wider public relevance. How can this mostly implicit partnership become more explicit and spill over into active collaborations?

On the other hand, collaboration or co-creation has become a reflexively addressed issue in the arts, particularly within the performing arts. A general societal evolution that is especially
outspoken within the so-called creative economy is thus actively reflected upon. Within contemporary dance, the tendency to engage in collaboration that go beyond the traditional forms of labour differentiation, is not just 'mirrored' but actively given shape and often coupled to a critical perspective on the dominant forms of organizing work. The notion of 'work of art' is thus profoundly renewed, which invites sociologists to develop new approaches when studying art.

Biography: Rudi Laermans is professor of social theory at the Faculty of Social Sciences of the University of Leuven (Belgium), where he also obtained his PhD in Sociology in 1992. From 1998 until 2008, he directed the Leuven-based Centre for Cultural Sociology and was actively involved in empirical studies on cultural policy, cultural participation, and the fields of contemporary dance, cultural heritage and the visual arts.

His current research is situated within the fields of sociology of culture (esp. institutionalized individualism), sociology of the arts (esp. contemporary dance) and contemporary social theory (esp. social systems theory and the post-Foucault line within critical theory). He has widely published on these and related topics in national and international academic journals and books; his new book-length study Moving Together: Making and Theorizing Contemporary Dance will appear in September. Laermans helped to found in 2005 the RN Sociology of Culture, of which he became the first chair and is still a honorary board member.

Athina KARATZOGLIANI (University of Leicester, United Kingdom)

This talk introduces four waves of digital activism and cyberconflict. The rise of digital activism started in 1994, was transformed by the events of 9/11, culminated in 2011 with the Arab Spring uprisings, and entered a transformative phase of control, mainstreaming and cooptation since 2013 with the Snowden revelations. Digital activism is defined here as political participation, activities and protests organized in digital networks beyond representational politics. It refers to political conduct aiming for reform or revolution by non-state actors and new sociopolitical formations such as social movements, protest organizations, and individuals and groups from the civil society. The latter is defined as social actors outside government and corporate influence. Cyberconflict is defined as conflict in computer mediated environments and it involves an analysis of the interactions between actors engaged in digital activism to raise awareness for a specific cause, struggles against government and corporate actors, as well as conflict between governments, states and corporations. The rationale for these phases is solely based on political effects, rather than technological or developmental determinants. During my talk, I provide a brief overview of the first (1994-2001) and second phase (2001-2007) of digital activism and cyberconflict. I provide a more detailed account of specific cases of digital activism in two further phases: between 2007-2010 and 2010-2014. In the first part of my talk I argue that the mainstreaming of digital activism will render it ineffective and inconsequential in the long term. I offer my thoughts on the future of network power and resistance in relation to high-level information warfare targeting infrastructure and grids rather than information content and network connections. My thesis is that there is a constant transformation of digital activism beyond its symbolic and mobilizational qualities, as we have experienced it since 1994. Digital activism has entered a phase of mainstreaming as ‘politics as usual’: an established element in
the fabric of political life with no exceptional qualities, normalized and mainstreamed by
governments through collaboration with corporations and the cooptation of NGOs. Digital
activism and cyberconflict more broadly will revolve more around high-level information warfare
of attacking infrastructure, rather than just using ICTs to mobilise or as a weapon for low-level
societal largely symbolic attacks.

Biography: Dr Athina Karatzogianni is a Senior Lecturer in Media and Communication at the
University of Leicester, UK. Her research lies at the intersections between new media theory,
resistance networks and global politics, for the study of cyberconflict and the use of digital
technologies by social movements, protest, and insurgency groups. She is the author of The
Politics of Cyberconflict (2006), co-author with Andrew Robinson of Power, Resistance and
Conflict: Social Movements, Networks and Hierarchies (2010), as well as edited collections
Cyber Conflict and Global Politics(2009), Digital Cultures and the Politics of Emotion (2012) and
Violence and War in Culture and the Media (2012). All publications can be read here in pre-
publication form as open access download:

MD21 - Specials & Workshops (14) / WORKSHOP: “HOW TO WRITE A
JOURNAL ARTICLE”

How to Write a Journal Article
Pertti ALASUUTARI (University of Tampere, Finland) | pertti.alasuutari@gmail.com
Ellen ANNANDALE (University of York, United Kingdom) | ellen.annandale@york.ac.uk
Ricca EDMONDSON (National University of Ireland, Galway, Ireland) | Ricca.Edmondson@nuigalw

Chair: Ricca Edmonson
Ricca Edmonson, D.Phil., is Professor of Political Science and Sociology at the National
University of Ireland, Galway. Her published work includes Ageing, Insight and Wisdom:
Meaning and Practice across the Life Course (Policy, 2015), Ireland: Society and Culture
(Distance University Hagen, 1998) and Rhetoric in Sociology (Macmillan, 1984). She has edited
or co-edited Politics of Practical Reasoning: Integrating Action, Discourse and Argument
(Rowan and Littlefield, 2012), Valuing Older People: Towards a Humanistic Gerontology (Policy,
2008), Environmental Argument and Cultural Difference: Locations, Fractures and Deliberations
(Peter Lang, 2008), Health Promotion: New Discipline or Multidiscipline? (Irish Academic Press,
2000) and The Political Context of Collective Action: Argumentation, Power and Democracy
(Routledge, 1997). She also belonged to the team editing the third edition of Family and
Community in Ireland by Arensberg and Kimball (CLASP, 2001). Her experience in journal
editing includes the active membership of several editorial boards, editing the Irish Journal of
Sociology, and now co-editing the European Journal of Cultural and Political Sociology. She is a
member of RN1 on Ageing and of the ESA Executive Committee.
Pertti Alasuutari / Ellen Annandale / Ricca Edmonson / Siobhan Kattago /
Eeva Luhtakallio / Charles Turner / Michalis Lianos / Marta Soler

Good ideas deserve to be put into the public sphere, while most people want their research to
be better known (and are under pressure to publish); journal editors are desperate for well-
written articles that have something arresting to say and that fit their remits. This session is
therefore designed both to encourage ESA members to write journal articles and to share some
ideas on how to do it.
The members of the panel can offer participants a range of long and varied experience in editing journals and in working with authors to help make their work clearer and more appealing. We would like to urge ESA members to attend the session in order to hear more about what journal editors are looking for in articles submitted to them, and to share any problems they may have experienced in getting published.

We shall try to offer constructive ideas about how to improve journal publishing from the standpoints of authors, editors and readers. Questions from the floor will be very welcome.

Biographies: Pertti Alasuutari, PhD, is Professor at the University of Tampere, School of Social Sciences and Humanities. He is editor of the European Journal of Cultural Studies, and his research interests include global and transnational phenomena, media, social theory, and social research methodology. Publications include The Synchronization of National Policies (Routledge 2015, forthcoming), Social Theory and Human Reality (Sage 2004), Rethinking the Media Audience (Sage 1999), An Invitation to Social Research (Sage 1998), and Researching Culture: Qualitative Method and Cultural Studies (Sage 1995). He has a total of 172 scientific publications, including 41 peer-reviewed articles in English. He is member of the ESA Executive committee and a board member of the ESA RN7: Sociology of Culture and RN15: Global, transnational and cosmopolitan sociology.

Ellen Annandale is Professor and HoD of Sociology at the University of York, UK. She has extensive experience of journal and book editing. For example, between 2004 and 2010 she was Editor-in-Chief of the journal Social Science & Medicine. She has also been Chair of the Board of the journal Sociology of Health & Illness. Currently she is co-editor of the ESA Book Series (with Maria Carmela Agodi). Additionally she has been editor of several edited books and special issues of journals. Her own research focuses on the areas of the sociology of health and sociology of gender, where recent publications include The Sociology of Health and Medicine, 2nd edn (Polity 2014), Women's Health and Social Change (Routledge 2009) and the edited collection Palgrave Handbook of Gender and Healthcare (edited with Ellen Kuhlmann, Palgrave 2012). She is a member of the ESA Executive Committee.

Siobhan Kattago is a senior research fellow in philosophy at Tartu University in Estonia and received her doctorate at the New School for Social Research in New York. Her academic interests include collective memory, social and political philosophy. She is book review editor for the European Journal of Cultural and Political Sociology, editor of The Ashgate Research Companion to Memory Studies (2014) and author of Memory and Representation in Contemporary Europe: The Persistence of the Past (Ashgate 2012) and Ambiguous Memory: The Nazi Past and German National Identity (Praeger 2001).

Eeva Luhtakallio is a university lecturer in sociology at the University of Tampere, Finland (on research leave 2015-16). She received her PhD at the University of Helsinki in 2010. Her fields of expertise and publication include comparative, political, cultural, and visual sociology, ethnographic research, social theory, and gender studies. She is editor-in-chief for the Finnish journal of sociology, Sosiologia, and editor for the European Journal of Cultural and Political Sociology, as well as member of the editorial board for Participations. She is the author of Practicing Democracy: Local Activism and Politics in France and Finland (Palgrave Macmillan, 2012).

Charles Turner teaches sociology at the University of Warwick. He is the author of Modernity and Politics in the Work of Max Weber (1992) and Investigating Sociological Theory (2010) and publishes mostly in the area of social and political thought.

Michalis Lianos is Professor at the University of Rouen-Haute Normandie and Editor-in-chief of the European Sociological Association journal « European Societies ». He was previously Lecturer at the University of London (Goldsmiths College) and Director of the Centre for Empirically Informed Social Theory (CEIST) at the University of Portsmouth. Michalis works on an empirically informed understanding of socio-economic and socio-cultural transitions in late modernity.
Marta Soler, Harvard PhD, is Professor of Sociology at the University of Barcelona, Director of CREA Community of Researchers and Vice-Chair of the RN29 Social Theory. Editor of the ISA journal International Sociology. Main Researcher of the Horizon-2020 project SOLIDUS which studies solidarity in Europe. She is the first SSH researcher at the ORCID Board of Directors.

MD22 - AUTHOR MEETS CRITIQUES III

The Existentialist Moment: Sartre's Rise as a Public Intellectual
Patrick BAERT (University of Cambridge, United Kingdom)

In this meet-the-author session, Patrick Baert presents his latest book The Existentialist Moment; The Rise of Sartre as a Public Intellectual (Polity Press, 2015). Jean-Paul Sartre was little known until 1944, but within two years he had become a celebrity in France and abroad. In this book, Patrick Baert traces Sartre’s sudden rise as a public intellectual and provide clues to why Sartre and the philosophy of existentialism became so prominent at that point in time. For this, he goes back to the Second World War, showing how the surrender of France in 1940, the occupation and the liberation changed the French intellectual field and altered the very notion of what intellectual life is about. It is within this unique French context that Sartre reformulated his philosophy in ways that resonated with the French public and the sense of collective trauma. Towards the end of the book Baert uses this story as a platform to introduce a new sociological theory about intellectuals and their work and to argue against the widespread view that public intellectuals are an extinct species.

Biography: Patrick Baert is Professor of Social Theory at the University of Cambridge where he is the Head of the Sociology Department. He was educated in Brussels and Oxford and is currently working in the area of the sociology of intellectuals. Amongst his books are The Existentialist Moment; The Rise of Sartre as a Public Intellectual (2015), Conflict in the Academy: A Study in the Sociology of Intellectuals (with Marcus Morgan, 2015), Social Theory in the Twentieth Century and Beyond (with Filipe Carreira da Silva, 2012) and Philosophy of the Social Sciences: Towards Pragmatism (2005).

MD23 - Contributes From National Associations (3) / THE MEETING OF CIVILIZATIONS: TOWARDS A EURO-ARAB SOCIOLOGY

The Meeting of Civilizations: Towards a Euro-Arab Sociology?
Tahar LABIB (Knowledge Transfer Project, Bahrain)

1-It takes a metaphor and an abstraction to say what is, sociologically, a "meeting" or a "clash" of civilizations. In fact, from a civilization, the sociologist can only treat her fallouts, residues or excrescences which are, at some point, collectively recovered and expressed in what is called a culture.

2-Both stimulating and surprising, the idea of a "Euro-Arab sociology' cannot, even in its interrogative form, but face the misunderstandings to be raised and clarified. Among other things, the why now? incites to contextualize this idea, if only to ask the epistemological question, and to specify what might be under the necessity or scientific value. Unprecedented and unequalled (a Euro-African and Euro-Asian sociology is not a common formula), a combinatorial formula of a "Euro-Arab sociology" refers spontaneously and as soon as the why...
is asked, to geopolitical circumstances, to "the Arab presence in Europe," even to the common threat of religious terrorism, which for now kills and suicides more in his homeland.

3- The Arabic culture is at the same time the closest, geographically, yet the most different from European culture. It is both too close and too distant. If he identifies himself as an Arab (which is common), the sociologist has the usual concern of questioning the relationship between the sociological knowledge (essentially "Western") and his social being, in the sense of critical belonging to a society. He is never really sure to have found "the good distance."

4- What to do? Even though the optimism of will confronts the pessimism of reality and although both sociology, Arab and European, seem to want to meet in a time of weakness, we can try to "sociologuer" together. This neologism need to be understood not in the sense of making "a" sociology that would be "Euro-Arab" but in the sense of doing sociology together. One of the initiatives is to create an institutional framework (center or group) for a work that would really be collective. This would correct the defects of the old approaches called cooperation, partnership, custom work, etc ... all hierarchical, fragmented and on a distance.

Biography: Tahar Labib - Tunisian Sociologist, former Professor of Sociology, Tunis / Beirut. Founder, Honorary President of the Arab Association of Sociology (Former Secretary-General and President). Director General of the Arab Organization for Translation / Beirut (2000-2011). Currently: Director of the "Knowledge Transfer Project" / Bahrain (one of whose activities is to organize the Euro-Arab meeting of young Researchers in social sciences: the first from 19 to 26/10/2015). Among his works: "La poésie amoureuse des arabes: contribution à une sociologie de la littérature" and "Sociology of Culture" (In Arabic).

He supervised a number of collective works, of which, in arabic: "Towards an Arab sociology", "The Image of the Other: Intersecting views" (selected texts have been published in English: IB Tauris 28 November 2007), "The Arabic intelligentsia", the "Arab Dictionary of Sociology" and in french" Gramsci in the Arab world".

Sari Hanafi is Professor of sociology and Chair of Department of Sociology, Anthropology & Media Studies at the American University of Beirut, and the editor of Idafat: the Arab Journal of Sociology (Arabic). He received his Ph.D. from Ecole des Hautes Etudes en Sciences Sociales-Paris, France. He is Vice President (for National Associations) of the International Sociological Association.

Maria Carnela Agodi, Ellen Annandale and Luis Baptista: comments
Volunteering and social networks in old age: a protective factor against loneliness
Nicole HAMEISTER (German Centre of Gerontology, Germany) | Nicole.Hameister@dza.de
Oliver HUXHOLD (German Centre of Gerontology, Germany) | oliver.huxhold@dza.de

Social integration is a fundamental human need (Baumeister & Leary, 1995): individuals require regular social exchange in a context of mutual appreciation. In addition, social relations commonly provide the resources to tackle life’s adversities (Uchino, Bowen, Carlisle, & Birmingham, 2012). If social integration is perceived as being insufficient, feelings such as loneliness might arise (Hawkley & Cacioppo, 2010). Being lonely in turn is related to health risks and can be compared with the negative influences of smoking, excess weight and high blood pressure (Luo, Hawkley, Waite, & Cacioppo, 2012). Identifying factors that contribute to social integration and antagonise the risks of loneliness therefore is important.
Our basic hypothesis is that voluntary activities might prove to be one protective factor against loneliness. Especially older individuals might profit from these buffering effects, as their social networks are usually smaller.
Data base is the third wave of the German Survey on Volunteering (conducted in 2009), a representative telephone survey of voluntary activities of 20,005 persons aged 14 and older in Germany. We focus on comparing older against younger individuals and describe whether volunteers display higher levels of integration (in terms of personal network, social support and local social cohesion). We multivariately analyse the impact of volunteering on individual integration factors and present how voluntary activities correlate with social resources, while specifically addressing age group/predictor interactions. Finally, we can conclude that (especially long-lasting) volunteering can serve as a protective factor against the hazards of not being integrated in older age.

The Third Age: Decline and Freedom, Risks and Resources. Evidences from a Case Study
Giulia MASCAGNI (Università degli Studi di Firenze, Italy) | giulia.mascagni@unifi.it

The paper presents some final reflections based on more than two years of research devoted to studying the dynamics among three dimensions closely (and circularly) linked to social inequality: age, poverty (material and/or relational, overt or hidden), and health (objective, perceived). The survey, organized typologically, was conducted on two socially and territorially defined areas of the city of Florence: a mainly working-class neighbourhood and a mainly middle-class one. The research focuses on residents over age 60, a time of life when - as amply shown by the field literature - the processes of social construction of differences and inequalities
as well as inter- and intra-generational dynamics become sharper, therefore sociologically more evident. The two case studies provided a new and clearer insight into the condition and perception of age in relation to health and quality of life, in that crucial phase of exit from work’s sphere. Particularly, there are two issues better defined by the research: 1) increased longevity presents a powerful but twofold value: stimulus and resource, difficulties and expectations of concern. 2) Today’s men and women in their sixties and seventies do not perceive themselves as comparable to their age peers of previous generations, making inapplicable the traditional “age paradigm” with its homogeneous and inexorable rhythms, valid “for all and forever”. Therefore, what forcefully emerges - beyond the different social categories – is a demand for more room for the many third-age dimensions and the importance (not just symbolic) of greater freedom of self-definition.

Expected socio-demographic changes among the Spanish elderly
Vicente RODRÍGUEZ (Spanish National Research Council, Spain) | vicente.rodriguez@cchs.csic.es
Gloria FERNÁNDEZ-MAYORALAS (Spanish National Research Council, Spain) | gloria.fernandezmayoralas@cchs.csic.es
Fermina ROJO-PEREZ (Spanish National Research Council, Spain) | fermina.rojo@cchs.csic.es
Maria Eugenia PRIETO-FLORES (National University of Distance Education) | meprieto@geo.uned.es
Joao FORJAZ (Carlos III Institute of Health) | jforjaz@isciii.es

Background. Socio-demographic characteristics of the older Spanish population, usually studied through cross-sectional data, need a longitudinal approach to better understand the changes that occur as they age. The aim of this paper is to examine their socio-demographic features that may help to foresee future trends and to assess the role of a future longitudinal study.

Methods. Data comes from the Ageing in Spain Longitudinal Study, Pilot Survey (ELES-PS), as a nationally representative sample of non-institutionalized population aged 50 and older. It was conducted in 2011 to 1,357 weighted cases, randomly drawn by sex and age and stratified by habitat, census tracts and households. An exploratory analysis was applied using health, socioeconomic and demographic variables.

Results. Future older adults in Spain might be in a better shape to face an ageing process more ‘comfortable’ than previous generations, as the analysis suggested (higher education level and income, better health and functional capacity), although social and economic conditions could influence. Changes in family and households structures will compound generations of older Spaniards different from the current ones (old people living alone, multiple households, less children and grandchildren), being age and sex key factors.

Conclusions. Developing a longitudinal study is an unavoidable challenge to identify important components of the social ground of the future older Spaniards. Special attention will deserve the structure of family and social networks, the basics of the intergenerational transfer systems or the adjustment of the residential environment as a vital geographical dimension in quality of later life.

The direction of help between family generations in Finland – Do baby boomers give more help to their adult children than elderly parents?
Hans-Mikael HÄMÄLÄINEN (University of Helsinki, Finland) | hans.hamalainen@helsinki.fi

The Finnish baby boomers (born 1945–50) are an exceptionally numerous generation: right after the second world war the rise in birth rate in Finland was remarkably strong but it lasted only a short period of years. Nowadays, when the baby boomers are approaching an old age and retirement, the question of generational relations and dynamics have become an important
subject in the ongoing academic and public debates. Using nationally representative data from the Generational Transmissions in Finland (Gentrans) project (n = 2,278 baby boomers) I will examine the financial aid, practical help and care given by the baby boomers to their own parents and adult children. I will concentrate on exploring the direction of given help between the family generations and ask whether Finnish baby boomers give more support to their adult children than elderly parents. According to the result baby boomers are more likely to give financial aid and care to their adult children but practical help is generally directed upward in the family line.

Labour Shortage or Stereotypes? Do Older Workers skip Prejudices
Judith Anna CZEPEK (Institute for Employment Research (IAB) of the German Federal Employment Agency (BA), Germany) | judith.czepek@iab.de
Martina REBIEN (Institute for Employment Research (IAB) of the German Federal Employment Agency (BA), Germany) | martina.rebien@iab.de

Due to the demographic change the importance of the job opportunities of older workers rises. The shortage in labour supply and the higher rate of older workers on the labour market lead to the expectation that the chances of new hires of older workers increase. Reasons that might be an obstacle are stereotypes of the Elderly and prejudices of companies in terms of their productivity. Employees may have a lower willingness to change the job. Our central thesis is a skilled-related selectivity among older workers. This means that just a certain group is looking for a new position. In addition, the general interest of companies is biased by qualification. According to this, results should show the preference for high-skilled older workers with specialized knowledge.

Data basis for the analysis is an establishment survey which is representative for the whole German economy. It contains detailed information about new hires. This includes age, gender, qualifications, previous employment status, and the successful way of staffing as well as made compromises, and wage. Thereby, we learn a lot about the chances of new hires of older workers and under which conditions firms hire Elderly.

A Coherent Perspective for Future Health and Social Care Planning
Filipe RIBEIRO (CIDEHUS.UE, Portugal) | fribeiro@uevora.pt
Maria Filomena MENDES (CIDEHUS.UE, Portugal) | mmendes@uevora.pt

Profound changes occurred in demographic paradigms, some resulted in an extraordinary life expectancy increase and now the high rates of mortality of the past are being experienced later in life. Currently, the economic crisis witnessed in Europe, especially in the south, might disturb demographic evolutionary trends. Evolutionary mortality patterns accordingly to different causes of death (CODs) are essential to give an insight not only for demographers, but also to policymakers and create robust foundations for future planning proposes.

In the past infectious diseases strongly affected entire populations, nowadays, neoplasms are leading in almost all of the developed countries but, still, the elimination of any preventable cause will result in better health and increasing lifespan. COD statistics recently published by the EUROSTAT (2014) show that between cancer related death rates (EU) diminished 8.4% and 4.8% (2004 to 2010) for females and males, respectively. Deaths caused by ischaemic heart diseases and transport accidents registered were reduced in more than 20%. These results correspond to a very positive evolution, but neoplasms and diseases of the circulatory system are still the leading CODs.

With our analysis we intend to understand the contribution of the different CODs in what concerns to the increase in life expectancy for different countries (Portugal, France, Sweden,
Spain and Italy), focusing specially at old ages. Consequently, we elaborate a coherent perspective of future mortality patterns by COD, proportionating significant information for preventive planning in what concerns to health and identify how recent turbulence may influence future mortality.

Learning in later life: using life biography to investigate the inter-relationship of learning and life course capital

Louise TAYLOR (University of Chester, United Kingdom) | p.kingston@chester.ac.uk
Paul KINGSTON (University of Chester, United Kingdom) | l.taylor@chester.ac.uk

Current demographics within the United Kingdom present a challenging picture, with older people forming a considerable proportion of the population. In particular, older people are spending a longer period outside paid work at a point in the life course constructed as retirement. Increasingly, some older adults are returning to learning as a means of remaining socially connected. Research which seeks to understand the relevance and importance of learning in later life remains quite disparate and, in addition, there is a lack of longitudinal or biographical research which seeks to explore this phenomenon.

This research provides new insights into later-life learning exploring how retired older people narrate their experiences of learning, and the interrelationship of this experience to life course capital. Data were collected from eight participants aged between 63 and 73. An experience-centred narrative method was employed to explore participant biography with a particular emphasis upon learning. Data were analysed.

The narrative data revealed that each participant had accumulated capital over their life course: at the point of retirement they were able to successfully deploy this capital as a means to gain new social connections through their return to learning. Learning for pleasure in later life is a mechanism to enhance retirement through the promotion of activity and engagement and consequently improve physical and mental health and well being.

Facing Old Age in Poland: In Search of a Paradigm for Life Satisfaction among Seniors

Łucja KAPRALSKA (Academy of Science and Technology, Poland) | lkapral@agh.edu.pl
Marzena MAMAK - ZDANECKA (Academy of Science and Technology, Poland) | mmamak@interia.pl

In Poland, elderliness constitutes a relatively new social problem. Illustrating it is official data: 14% of the general population is aged 65 or more, yet only 3.5% of these individuals is still active on the labor market. A “demographic panic” is provoked by an increase of seniors concurrent with a decrease in the birthrate. Nevertheless, there is a manifest absence of the elderly who are ghettoized, isolated, and marginalized in social life while the focus is centered on productive youth. Old age is not a positive value; connotations of the word “old” are negative. A longer lifespan overlapping with the transformation of traditional family models in which generations took care of one another, entails changes in the way elderliness is experienced. A burning issue associated with an ageing population is its activation and better management of its free time.

This paper aims to describe the ambiguous circumstances of Polish seniors. Current models for the elderly will be presented as well as social initiatives intended to render ageing a more satisfactory experience. The agents in this process are the state and local governments, NGOs, and religious communities which introduce programs to mobilize seniors. Moreover, attention will be drawn to the “silver economy” in which retired individuals continue to work and to the consumer market in which seniors do play a role. Investigation of the above-mentioned will
permit assessment of the situation of the elderly and retired in Poland – are they marginalized or are they active?

**Private care services in Finnish municipalities: Is there any local variation?**

Jiby MATHEW PUTHENPARAMBIL (University of Jyvaskyla, Finland) | jibymathewwp@gmail.com

Finland is often termed as a welfare state with an universal tax-funded care services system. However, economic setback in early 1990s has brought significant changes in welfare reforms, particularly in the care service for older people. Most prominent changes are the introduction of market like mechanism such as outsourcing of care services, purchase-provider model, tax rebate for domestic help and service voucher system in the care provision. Though, municipalities are solely responsible for whether or not to use market like mechanism in their locality. Presently, several municipalities have outsourced some of their ‘care’ responsibilities to the private sector, while others stayed in the traditionally practiced self-produced care system. In this context, this article tries to examine to what extent does characteristics of municipality determine the use of private home-care service and shelter housing for older people? How much local variation exists in the use of private home-care and shelter housing services? To answer these questions we used data from the SOTKA-net Indicator Bank, which is an information service provided by the National Institute for Health and Welfare (THL). Preliminary findings reveals that the use of service purchased from the private sector by the municipalities are entirely depend upon on the economic situation and the degree of urbanization. There is a steep increase in the number of home-care and shelter housing services purchased from the private sector in the past years. The trend shows that those municipalities already engaged in the public-private partnership are more likely intensifying their purchase from the private sector.

**Attitudes toward financial security in the second half of life**

Janna FRANKE (German Centre of Gerontology, Germany) | janna.franke@dza.de

Julia SIMONSON (German Centre of Gerontology, Germany) | julia.simonson@dza.de

:Objectives_: In Germany, the last two decades have been characterized by a change in the responsibility for financial security in old age: The policy of the activating welfare state entails an increasing individual responsibility and decreasing state responsibility. Until now, however, it has been rarely examined how attitudes toward the responsibility for financial security have changed over time in accordance with the transformation of the welfare state. Equally, the relationship of attitudes toward state and individual responsibility and its development over time remains unclear.

:Methods_: This paper addresses long-term trends in the mean endorsement of both state and individual responsibility and the relationship between these two attitudes. The data come from three waves (1996, 2002, and 2008) of the German Ageing Survey (DEAS), which is a nationwide representative cross-sectional and longitudinal survey of the population aged 40 years and older living in Germany. The data are analyzed by using ANOVA and multi-group models.

:Results_: The analyses show fairly stable attitudes toward both state and private responsibility over time. However, there is a negative relationship between the acceptance of state and individual responsibility. Surprisingly, this negative relationship increases over time. This development is in contrast to the increasingly important interplay between state and individual old age provision within the multi-pillar system of financial security, and was probably not intended by social policy.

:Outlook_: In a next step, we will analyze whether the development of attitudes varies between different groups (e.g. by income, age, education). Discovering these long-term trends can
indicate the specific groups with diverging attitudes toward the responsibility of financial security.

**Contemporary grandparenting in the Czech Republic: Relations, meanings and practices.**

Lucie GALČANOVÁ (Faculty of Social Studies, Masaryk University, Czech Republic) | galcanov@fss.muni.cz
Tatiana SEDLÁKOVÁ (Faculty of Social Studies, Masaryk University, Czech Republic) | t.sedlakova@gmail.com

While the gender aspects and gender differences have been studied in the Czech Republic with the results that roles, activities or experiences of ageing and older age as well as expectations are highly gendered, only limited attention was paid to men specifically. The aim of our project is to explore the contemporary situation of older people, who might be experiencing the situation of role overload (combining various roles in later life, such as paid work, home care etc.). The main research question was how are the structural aspects of changing roles (age of retirement, economic strains, work after retirement or providing care) incorporated, manifested, experienced and interpreted on the level of personal biographies. In this paper we would like to focus more particularly on the experiences of contemporary grandparenthood based on the 11 in-depth interviews with men and 21 interviews with woman. As we see the gender categories as relational and performative, we will focus not only on the self-perception of the grandparents themselves, but also on the ways they make gender meaningful in their narratives, how do they relate to other figures and partners and through which activities (or withdrawal from activities) is the gendered grandparental role performed on everyday level.

**RN01S01 - Social Inequalities and Discrimination**

**The Complicity of Ageism with Sexism and Class Discrimination in Turkey**

Berfin VARISLI (Maltepe University, Turkey) | vberfin@gmail.com

There is an observable increase in the old age in Turkey as in many contemporary European countries. The life expectancy of people in Turkey and in Europe increase rapidly and especially people of Turkey is not ready to adapt to this change. This paper has two arguments; first one is; most of the elderly people in Turkey are often exposed to ageism, which goes hand in hand with sexism; secondly; the severity of ageism in Turkey is bound up with the class discrimination. In other words, this paper aims to find an integrated answer to the following questions; firstly how does the gender affect the ageism in Turkey? Secondly is there a significant relation with the class analysis and ageism? For analyzing the influence of gender and class upon ageism, this paper adheres to feminist methodology and gets help from socialist feminism. For exploring this influence of class upon ageism, stratification theory and more specifically Pierre Bourdieu’s stratification theory in which he categorizes the people according to their positions within the society and their cultural tastes and life styles, is followed.

**The “norm of equality” in Swedish public eldercare: Care managers’ accounts on equal needs of the elderly**

Katarina ANDERSSON (Umeå University, Sweden) | katarina.andersson@umu.se
Stina JOHANSSON (Umeå University, Sweden) | stina.johansson@socw.umu.se
David FELTENIUS (Umeå University, Sweden) | david.feltenius@umu.se
The Swedish eldercare is a public responsibility and part of the welfare system, organized and administered by local politicians and care managers in each of the 290 municipalities in Sweden. An increase of the elder population and changes towards marketization, rationalisation and economizing of eldercare have resulted in restrictions of care. Political local guidelines on how care is to be distributed have a two-fold purpose – to keep costs of care on budgetary level and to distribute care equally to all the elder citizens in need of care. Lately, eldercare has become less generous and Nordic scholars have argued for a weakened universalism of care. The aim of the study is to analyse how care managers argue in relation to the needs-assessments that precede decisions of granted care. What is equal care according to the care managers?

Qualitative in-depths interviews with care managers were conducted in one of the bigger municipalities in mid-Sweden. Analysis indicates that the norm of equality is interpreted as common standards, referring to political guidelines, not in relation to individual needs of the elderly. Further, groups of elderly with other ethnic backgrounds and/or sex, are often ascribed different needs, according to these standards and therefore they do not always qualify for provision of care.

Thus, the norm of equality in eldercare creates inequalities in care provision between different groups and individuals, which challenge equal rights and justice of care and threatens universalism of eldercare.

Extending working lives in the Context of Gender Equality Mainstreaming
Clary KREKULA (Karlstads University, Sweden) | clary.krekula@kau.se

At the United Nation’s women’s conference in Beijing in 1995, gender mainstreaming was adopted as a strategy for equality when governments from 189 countries formally committed themselves to implementing the strategy and to “remove all obstacles to gender equality”. Thereafter many countries have also implemented versions of it in national documents. This applies, for example, to the Nordic countries, and means that contemporary ageing takes place in a political context where the aims for gender equality play a central political role. Hence there are grounds for empirically analysing gender politics as a context for ageing, and also how gender equality and age relations relate to one another.

In this paper I will provide such a discussion with focus on the Swedish context by illustrating how definitions of gender equality in the labour market, depend on the age groups that are in focus. The results are based on a comparison of two different national policy documents; the commission on Retirement-Age, and The Delegation for Gender Equality in Working Life. My analysis is inspired by Carole Bacchis “Whats the problem represented to be”- approach, a policy analysis that aim to identify the problematizations that are assumed by the solutions that are suggested in policy document.

The results reveal the challenges that gender equality policies are faced with in relation to a prolonged working life. In doing so, theoretical tensions, contradictions in public policy and socio-cultural discourses may be reconsidered.

Old Age in Poverty
Dana SYKOROVÁ (Palacký University, Faculty of Arts, Czech Republic) | dana.sykorova@upol.cz

The paper is connected to the article presented at the 11th ESA conference, i.e. it further develops the issue of “Old Age in Poverty”. It is based on an analysis of data obtained during the second stage of a qualitative research; its objective was to deepen the understanding of seniors’ everyday experience of poverty. It was already found in the previous research stage
that a typical part of the life of poor seniors was a housing crisis. Regarding the fact that then data saturated mainly the category of potential homelessness, this time we focused on overt homelessness. It is obvious that significant reduction of financial resources forces seniors to give control over their housing to the others. It is possible to talk of seniors’ endeavour to keep autonomy in this context. When having used their resources, or having significantly reduced the scope of their coping strategies, seniors became totally dependent and control was taken over by the others. Maintaining of human dignity and personal safety gets to the first place. The formal system of social support becomes more and more important in both the cases. Thus, poverty in old age is also viewed from the perspective of helping professionals – the analysis of data from unstructured interviews helped discover specifics or opportunities and limits of solving the situation of (extreme) poverty in old age.

The research was embedded in social constructivist paradigm; the analysis was carried out according to the principles of the grounded theory.

**RN01S02 - Ageing, Policies and Inequalities**

**Ageing processes in cross-national comparative perspective. Experiences from Argentina, Costa Rica, Mexico, France, Poland and Spain.**

Lukasz CZARNECKI (National Autonomous University of Mexico, Mexico) | lukasz@comunidad.unam.mx
Verónica MONTES DE OCA (National Autonomous University of Mexico, Mexico) | vmoils@gmail.com

The aim of the paper is to analyze ageing processes in Latin American and the European countries taking into account: Argentina, Costa Rica, Mexico, France, Poland and Spain. Those six countries from two regions present political, socio-demographic and economic differences on ageing process. Ageing in Latin America and Europe will be analyzed from theoretical, epistemological and ontological perspectives. A particular emphasis will be made on the differences in ageing processes. In Europe socio-demographic changes occurred slower than in Latin American and the Caribbean countries, where socio-demographic transformations occurred rapidly during the last three decades. There are differences in magnitude and velocity in population ageing. The most developed countries have historical and political experience, which may be useful for developing countries. Another difference is grounded in long-term patterns of persistent of multidimensional inequalities and poverty in Latin American and the Caribbean countries in terms of social classes, health services, access to education, races, ethnic groups, gender, and power relations, among others. Meantime Europe is considered as the region with the most developed policy with regard to ageing population. However, there are also similarities with Latin American countries in terms of exclusion of the elderly population from social and economic development. The cross-national comparison of six countries will be based on national survey and census data to analyze socio-economic characteristics of the older population. Moreover, the comparison of two regions will permit a development of new strategies for public policies.

**Does Ageing Cause More Inequality in Germany?**

Britta STÖVER (GWS, Germany) | stoever@gws-os.com
Thomas DROSDOWSKI (GWS, Germany) | drosdowski@gws-os.com
Marc Ingo WOLTER (GWS, Germany) | wolter@gws-os.com

In Germany, demographic change and ageing is mainly seen negatively. The perception is dominated by issues such as labour force shortage, instability of the pension system or
exploding costs for the health care system to name only few. With regard to private households, poverty among the elderly, inter-generation fairness or the wealthy prime agers are frequently mentioned. However, it is not entirely clear whether the distribution of income will become less fair and poverty among the elderly will be a severe problem of many households. The aim of this contribution is to answer the following questions: What are the pensioner households’ income composition characteristics? How will their income develop until 2030? What does it mean for the income distribution among all households and the social (in)equality?

To answer these questions, different sources of income for different types of households are projected until 2030 applying the macro-econometric input-output model INFORGE in combination with the socio-economic household module DEMOS. The data for the socio-economic module on households and their specific income situation are taken from the Households Budget Survey provided by the German Federal Statistical Office. The socio-economic modelling approach and the projection results are based upon a research project commissioned by the Federal Ministry of Education and Research, called soeb3 (Sozioökonomische Berichterstattung, Reporting on socioeconomic development, http://www.soeb.de/en/).

The results of the analysis will comprise insights into the future level and structure of household income, especially pensioner’s income. Further, conclusions on the income distribution and on social inequality are drawn. We expect the results on the total effect of ageing on inequality to be ambiguous. Shortages on the labour market will lead to comparably high wage raises that will not translate into an equally high increase in pension payments. As a consequence, pensioner households will be faced with slower income growth than other household types which will increase income differences. Simultaneously, the share of pensioner households in all household types will grow giving their income more weight in the average income. The (negative) distance of the pensioner households’ income to the average income will decline. This could be interpreted as a reduction of inequality.

The consequence of growing inequality for frail older people. Policy issues
Myra LEWINTER (University of Copenhagen, Denmark) | mle@soc.ku.dk

This paper wishes to raise questions concerning the growing economic inequality in European societies and in particular its impact on frail older people and explore relevant social policies. The case study in this paper will be Denmark, a country considered an ‘outlier’ in Europe in this regard in part because of its relative low inequality, a redistributive universal pension system and its universal (and gratis) care system. The paper will show how inequality is encroaching on the Danish pensions system, albeit slowly (a pending report for a pension committee may stimulate exacerbation of the system). Crucial in this regard are the cutbacks in the care system, cutbacks which are universal in Danish municipalities, and which impact on both rich and poor alike, since there is no means testing for care. Wealthier pensioners can relatively easily find help for practical assistance (by paying for it themselves) to deal with these cutbacks. Poorer pensioners on the other hand cannot employ this strategy. They must either forego certain things or turn to informal care as substitutes. While these problems are just beginning to appear in Denmark, they are more obvious in other countries. Therefore the paper will argue that it is vital for researchers to work together to elucidate this issue in several countries and develop suggestions for securing the situation of frail elderly people of all incomes.

Intimacy and obligations in LAT-relationships in Late Life: New Challenges for the Welfare State
Sofie G KARLSSON (Mid Sweden University, Sweden) | sofie.karlsson@miun.se
Demographic and economic trends in the past two decades, with an increased number of older people, market-orientation and cuts in public spending, has dramatically changed the conditions for elder care in Sweden (Sweden has one of the oldest populations in the world; more than 18 percent of the total population is 65 years of age or older). As a consequence of these trends, the boundaries between the areas that are the state’s obligation and responsibility, and those that lie within the personal/social domain have become subject to serious challenge. Within this new political context, the traditionally conservative ideology of a ‘caring society’, where family and other close relations are expected to participate in informal caring relations to a greater extent, regains popularity. Simultaneously, in comparison with previous periods, modern families today are more heterogeneous. People give priority to love and to move in and out of social relations on freer and more reflection-based premises, which means that the norms relating to responsibilities for giving care and support are currently under challenge. These tendencies also include the elderly who increasingly prefer to live in LAT-relationships. In this presentation we discuss the issue of care and support exchange in LAT-relationships among elderly living in Sweden.

Does retirement transition affect individual resources differently? The role of social class
Martin WETZEL (German Centre of Gerontology, Germany) | martin.wetzel@dza.de
Oliver HUXHOLD (German Centre of Gerontology, Germany) | oliver.huxhold@dza.de

Objectives. Retirement is a major life course transition which marks the transition into the third age. In the last decades, retirement research investigated foremost the adjustment processes in different well-being facets (mostly life satisfaction) and explained these dynamics with changes in individual resources and social status. However, investigating changes in the resources directly found only little empirical attention. This study examined retirement-related changes in economic, personal, and social-relational resources and how these changes differ by the labour market status prior retirement and education.

Methods. We used longitudinal data of the German Ageing Survey (DEAS 1996-2008). Within the DEAS, 311 retirees were identified with observations prior and after retirement. We estimated dual change score models for multiple resources (OECD income, health, activity, family and non-family network, social support). Using a multi-group approach, we differentiated between retirees who worked before and retirees who did not work before retirement. To predict the heterogeneous changes, indicators of social class were included.

Results. In general, even though retirement did not affect the mean level of the majority of resources, the developments within the transition groups are heterogeneous. Differences in levels between both transition groups were found only for income and for social network sizes. Those previously not working increase their income with retirement transition whereas those previously working show no changes in income. For both groups, retirement reduced social support. Education predicted differential development in most resources for those previously working.

Discussion. Retirement affects in average individual resources only modestly. However, retirement changes the distribution of resources especially within the group of those who worked previously. Accordingly, retirement marks a transition towards more inequality.

RN01S03 - Ageing Policies and the Welfare State
Creative Ageing Policy: Mixing of Silver, Creative, and Social Economies
This paper focuses on the aims and benefits of creative ageing policy in relation to domestic and international strategies. It argues that the roots of creative ageing policy are derived mainly from countries characterized by Anglo-Saxon capitalism and welfare states (in particular the United States and the United Kingdom). However, some important policy ideas, principles, and observations on the potential benefits and outcomes in this paradigm come from the countries of the European Union and the countries of the Asia-Pacific region.

This paper briefly introduces creative ageing policy and by using political economy of ageing theory compares it to other concepts of the ageing policy as principles of governance in the preparation of individuals and communities to the old age. Such concepts are, among others, successful ageing, productive ageing, healthy ageing, active ageing, positive ageing, ageing in place, and intergenerational policy.

The paper in particular will pay attention to a core idea of creative ageing policy, which refers to a possible mix of the silver economy, the creative economy, and the social economy in fostering seniors' activity. These concepts are popularized in recent years in the European Union. However, there is a need to focus more on their integration and possible outcomes of their mixes. The paper will show that this is possible by use approach of a "mixed economy of welfare" (focus on the cooperation between entities from the public sector, NGOs/civil society, and commercial sector). Increasing integration between these systems may lead to benefits such as technological innovations (gerontechnologies) and social innovations for ageing societies. The paper will show that local and regional development can also be fostered by integration of these ideas.

This paper will focus on in-depth analysis of three different socioeconomic systems to generate benefits and positive outcomes for ageing populations. Creative ageing policy is related to the silver economy (the "seniors' economy"), the creative economy (usually defined by the diversity of the cultural industries and the creative industries), and the social economy (and a more transformational concept of the "solidarity economy"). Each of these systems uses a different type of capital of older people (respectively: the human capital, the creative and cultural capital, and the social capital). The goal is to show how the creative industries and social enterprises may contribute not only to the creative economy and the social economy, but also to the silver economy, which is directly related to solving challenges of the population ageing.

This paper will suggest that the development of the silver economy is the most important in ageing the population, but only if it can be based on existing actions of entities from the creativity economy and the social economy.

The "silver economy," is a concept sometimes used interchangeably with the phrase the "silver market," which appeared in the early 1970s in Japan, with the gradual increase of available facilities for older adults. The silver market is a market segment that contains products and services for wealthy people over age 50, as well as unique solutions to trade between economic operators, enabling them to adapt to the ageing workforce. However, scholars of the phenomenon emphasize that the silver market is not based solely on marketing products targeted at older people; therefore, stressing the age of the users of goods and services should be avoided. Otherwise, this may deepen the age discrimination. The silver market also includes ideas for "universal design" and "transgenerational design," which can be understood as a desire of business entities to adjust the properties of their goods and services to the needs of people of different age, physical, and cognitive capabilities. This design may enable the social integration of users of new products and services.

The creative economy includes two processes: the "economization of culture" - economic use of artistic creation potential and the "culturalization of economy" - the application of artistic creation in industry and services to obtain innovations, increase added value, and turnover of enterprises. The core idea of the creative economy is the cultural sectors or industries and the
creative sectors or industries. These industries include the traditional fields of art and culture and the mass products and services, like music, video games, movies, books and fashion, press, radio and television, the advertising industry, design, architecture and related sectors, such as software development, education, tourism, electronics, and telecommunications. The creative industries contemporary are the most significant areas of growth in the modern global economy that generate growth and employment in the dependent industries contribute to the revitalization of spaces, innovations, and the growth of income and consumption. However, there is a lack of literature and studies on the relations between the cultural and creative industries with the creativity of older adults.

The social economy is a concept that after the J. Hausner (2007) and V. Pestoff (2008) can be understood not by its features, but by its location in the overall social system. The social economy is a space in which the crossover to the characteristics of the three segments: (1) the public sector, as employment policy and social inclusion; (2) the private sector, as corporate social responsibility (CSR); and (3) the civil society, in particular, entities of the "third sector" (NGOs). At the same time, each of these segments has its advantages and disadvantages. Recently this system is also described as the "solidarity economy," which is associated with social innovations such as Creative Commons' movement, Open Source, and Fair Trade.

Literature about the social economy and the solidarity economy is often focused on social care and services for older people. However, the social economy also contains relevant solutions in the arts and ageing field such as lifelong learning entities, cultural centers, senior Centers, community arts organizations, baby boomers' organizations, Third Age groups, Senior Theatres, Elderhostel, Universities of the Third Age, and other senior associations.

Adequate income and social participation of older persons

Jolanta PEREK-BiałAS (Warsaw School of Economics/Jagiellonian University, Poland) | jpek@sgh.waw.pl
Bérénice STORMS (Warsaw School of Economics/Jagiellonian University, Poland) | bereniceml.storms@uantwerpen.be
Maciej KUCHARCZYK (Warsaw School of Economics/Jagiellonian University, Poland) | maciej.kucharczyk@age-platform.eu

The paper will present findings from the pilot study which main goal was to define what an adequate old-age minimum income should entail in Poland, and in France, Ireland. To determine an adequate living standard for older people there were organized participatory group discussions with older people. The aim was to identify the essential physical and social needs that enable older people to participate fully in society. In case of Poland, where in total about 50 older persons in age of 60+ were experts in this research, there could be indicated that older people in Poland had difficulties in engaging with the concept of social participation, and even there is a negative perception of place in society for people with physical limitations, for example among the oldest old (85+). In Poland, in evaluation of the various level of income available for older people, there was perceived that the social assistance income for older people is far beneath the poverty line for all age reference groups (under and above 75 years old). The level of contributory pensions fluctuates around the poverty line for couples under 75 and for single older people aged 75 and over. On the contrary, for singles under 75 the pension level is still relatively far below the ARPT (23% below the poverty line), as it is for couples above 75 (13% below the poverty line). In conclusion, the Polish participants agreed that the ARPT level is low and incomes on this level only allow for basic needs: housing rent, utilities and food. Full participation in social life is not possible with income corresponding to the ARTP or below this level. As the methodology of research was common in these three mentioned countries, the comparison of results for Poland and Ireland and France will be presented either.
Ageing in Greece. Challenging the welfare system.
Christos PLIAKOS (University of Central Lancashire, United Kingdom) | cpliakos@gmail.com

According to Greek Statistical Authority (EL.STAT.) the percentage of the older population in Greece (aged 65 and over comparing to the total population) is expected to arrive in 2050 to about 32% (from 18.8% in 2010), speculated almost a doubling of the ratio within forty years’ time. The welfare system in Greece is traditionally classified as a mixed system with elements and features of both model Bismarck regarding the active role and presence of social security and the model Beveridge, as the main source of financing remains the state budget. Particularly, care for older people in accordance to the Mediterranean concept has been characterised a ‘family affair’ while public provision has been limited and unpaid family care work has played a central role in covering caring needs of older people and this pattern restrained further the development of formal care services, resulting to an extremely low number of older people living in specialized institutions, comparing to other European countries (1%, 2011 census data). However, Greek family and household structures are under modification due to the increasing participation of women in the labour market and in education, as well as of changes in gender roles and relations in addition to high youth-unemployment levels. The paper argues that the poor welfare structure and nursing home network that now operates in Greece will not be able to support in the near future the increasing needs and demand for institutional and non-institutional care resulting by population ageing and the westernization of the Greek society.

RN01S04 - Retirement Models and Debates

The effect of retaining bonuses on retirement timing — retaining older workers in Norway
Aasmund HERMANSEN (Fafo Institute for Labour and Social Research, Norway) | ahe@fafo.no
Tove MIDTSUNDSTAD (Fafo Institute for Labour and Social Research, Norway) | tim@fafo.no

The combined effect of rising life expectancy and declining fertility implies the looming financial crisis of the public pension systems and has made “ageing” a dominant topic on the policy agenda (Hofäcker, 2010, Walker and Foster, 2013, Walker and Maltby, 2012). The prominent solution being advocated to face the challenges arising with an ageing workforce and people “living longer” is “working longer” (OECD, 2006, Phillipson, 2013). Offering a retaining bonus to older workers with the option of withdrawing a contractual pension (contractual early retirement pension AFP) has become a widespread retention measure in Norwegian companies. The aim of this article is to examine whether offering a retaining bonus impacts the likelihood of opting for an early retirement.

We use a difference-in-differences approach in combination with a linear probability model and data for the period 2000–2010. The analysis shows an overall average increase in the likelihood of a 61- or 62-year-old worker retiring early in the next two years of their employment during the period under consideration. However, among older workers employed in companies offering a retaining bonus there has been a decrease in the likelihood of opting for an early retirement. The effect of offering a retaining bonus is evident both before and after controlling for selected individual and company characteristics.

Life expectancy at age 50 by labor force status and social class: recent period and cohort trends and projections for Finland

62
Taina LEINONEN (University of Helsinki, Finland) | taina.leinonen@helsinki.fi
Pekka MARTIKAINEN (University of Helsinki, Finland) | pekka.martikainen@helsinki.fi
Mikko MYRSKYLÄ (University of Helsinki, Finland; London School of Economics, UK; Max Planck Institute for Demographic Research, Germany) | Myrskyla@demogr.mpg.de

*Background:* Working longer could help in tackling the challenge of an increasing old-age dependency ratio. However, little is known about how increasing longevity is distributed between work and retirement.

*Methods:* We used Finnish register data for the years 1989–2012 to analyze period and cohort trends in life, work and retirement expectancies at age 50 by social class. We used the Lee-Carter method to complete mortality and information on previous cohorts to complete the labor force participation of partially observed cohorts.

*Results:* Over the period 1989–2012 life expectancy and statutory retirement expectancy at age 50 increased with several years. Work expectancy declined in the early 1990s but has since been on an upward trajectory. The proportion of the total life expectancy at age 50 spent in work decreased from 33% to 31% for men and increased from 26% to 29% for women. These trends were similar across the social classes. However, there were large level differences as the upper classes had the highest life, work and statutory retirement expectancies. In contrast to the period results, for cohorts born in 1938–1953 the proportion of years spent working over age 50 increased among both men and women, from 23% to 26% and from 20% to 25%, respectively. Among men this increase was largest in lower social classes.

*Conclusions:* Across successive cohorts an increasing share of remaining life at age 50 is spent working, despite steadily increasing life expectancy. However, the cohort analyses also reveal that the period perspective strongly overestimates the share of remaining life that is spent working, suggesting that assessments based on period approaches may be overly optimistic.

Build your own pension: the framing of choice in mass media debates in Norway
Anne Skevik GRØDEM (Institute for Social Research, Norway) | a.s.grodem@socialresearch.no
Anniken HAGELUND (Institute for Social Research, Norway; Department of Sociology and Human Geography, University of Oslo) | anniken.hagelund@socialresearch.no

Norway’s pension reform from 2011 implied three main changes: benefits can be drawn fully or partially between age 62 and 75 on actuarially neutral terms, pension rights are subjected to a life expectancy adjustment, and running benefits are to be indexed at a rate slightly below the development in wages. A key point is that the retirement age is made more flexible, but that individuals also have to make choices on when to retire and carry the costs of early retirement themselves. The element of choice is made even more complex considering that the state pension is only one part of the total pensions system, which also consists of a contractual pension scheme (AFP), occupational pension schemes and private pension insurance.

The new architecture of old age pensions implies that individuals are faced with a number of decisions to make, decisions that will influence their level of living as old age pensioners: when to retire, which employer to work for (given variations in pension schemes), whether to sign up for pension insurance. Individuals will have varying capacities, both in terms of knowledge and resources, to make such choices.

In this paper, we ask how the issues of choice for citizens in various situations are framed in the media discourse. Which choices are highlighted, are various capacities for choice discussed, and which subgroups – if any – create particular concern? Not least, who puts down the premises for this discourse? What is the role of democratically elected actors versus the social partners and commercial interests? Conceptually, we start from the ongoing debate in consumer choice in social policy, and the challenges the rhetoric of choice constitutes for social
solidarity and equality. Empirically, our material consists of newspaper coverage of the pension reform between 2004 and 2014.

Delaying retirement in changing institutional and workplace contexts: Comparing approaches and outcomes in Europe and Asia
Dirk HOFÄCKER (University of Duisburg-Essen, Germany) | dirk.hofaecker@uni-due.de
Braun SIMONE (University of Duisburg-Essen, Germany) | simone.braun@uni-due.de
Flynn MATTHEW (University of Newcastle, UK) | Matt.Flynn@newcastle.ac.uk

Ageing demographics are leading employers and policymakers to consider ways to encourage and enable older workers to delay retirement. On the political level, pension systems have been reformed to impede early exit, while targeted investments aimed to simultaneously increase the employability of older workers. Interventions at the workplace level include flexible working hours, lifelong learning, healthy workplaces, job rotation, and pension financial intelligence. The effectiveness of such changes is closely related to management process to raise awareness of, encourage and enable older workers to take up changes in work routine as an alternative to early retirement.

An important but largely unexplored question is whether and how the interplay of political and management interventions leads older workers to delay retirement. Using three datasets in the UK, Hong Kong and Germany, we will explore the relationship between these three factors. The first two datasets are from a bespoke survey of 1600 older employees. Data for Germany will be drawn from the German Ageing Study (DEAS). The three countries represent differences in welfare states (liberal, productivist and conservative) as well as VoC’s (LME, hybrid and CME). The UK and Hong Kong feature minimalist welfare states in which Defined Contribution pensions dominate while the German state pension is salary-based. Further, both the UK and German laws are shaped on EU regulations which require member states to promote extended working life through abolishing age discrimination and eliminating early retirement routes while Hong Kong has been able to maintain a largely volunteerist approach to employer engagement.

In our contribution, we first describe the differential approaches towards older workers in all three countries. Against this contextual background, subsequent empirical analyses provide a descriptive overview of retirement plans of older workers as well as multivariate analyses of their variation across workplace contexts respectively between different groups of employees.

Labour share and its hidden impact on pension system
Adam MÜLLER (University of Warsaw, Poland) | a.muller@is.uw.edu.pl

Proposed presentation is based on my studies concerning social debate about Polish pension system reform in 2012. Advocates of reform emphasized that in face of negative demographic changes retirement age should be extended, what was presented as only one solution that can safe pension system.. However economic literature according to Nicholas Barr (2001) shows that condition of pension system depends on various factors and that analysing the system one should include the significant impact of labour share in GDP. Granted that productivity growth implies increase in wages, rising GDP allows to increase government’s revenue and the negative demographic changes should be neutralized. However, if increase in productivity does not entail an increase in wages, funds for pensions do not rise as well. As labour share is a consequence of institutional choices and has profound impact on condition of social policy funds it constitutes an alternative for retirement age extension.

The analysis of institutional alternatives to financing pensions may be used as background for evaluation of democratic debate in modern societies. Comparison of those alternatives and arguments presented in the debate leads to conclusion about its nature. The debate was limited
to the presentation of government’s position to institutional changes and did not seek for optimal solution for citizens’ future.

Literature:

RN01S05 - Experiences of Work at Old Age and Retirement

Senior competence in a workplace setting
Anne Inga HILSEN (Fafo Institute for Labour and Social Research, Norway) | aih@fafo.no

Active ageing is about recognizing and valuing senior resources in working life. A step towards this goal is to promote an awareness of the potentials and resources of older employees, and thus prevent forced early exclusion from working life. If age and experience makes older workers valuable in working life, we need to understand in which ways this "senior competence" is valuable.

The competence of seniors is valuable for the enterprises for being more than and different from, the theoretical knowledge of e.g. employees straight out of schools and universities. In addition to the theoretical knowledge, seniors have practical knowledge acquired through experience. Göranzon (1990) argues that the practical and tacit knowledge of experienced workers is a necessary resource for good production. What this practical and tacit knowledge consists of and how it is being used needs to be explored in a workplace setting as it will vary with types of jobs and work tasks.

The empirical data for this exploration is a series of group interviews in a large Norwegian hospital over a period of three years. The question discussed was: “What are the particular senior competences in this workplace and how/when is it being used?”

Leaving passionate work: Retirement as an existential imperative
Marita FLISBÄCK (University of Gothenburg, Sweden) | marita.flisback@socav.gu.se

Retirement means the beginning of a new everyday where new practices must be established that could give room both for independence and for loss of meaning. From analyses of 10 qualitative interviews we ask what existential questions are posed at the entry of retirement, and what new social identities and belongings are considered and established. The interviewees' have been selected from various professions with different resources and qualifications. However, common to all respondents are that they are highly committed to work, and that retirement takes place in the near future (from a few days to six months). The aim of this paper is to analyse how these individuals – with a dedicated approach to their work that could be described as a "passion" – reason about the value in, and of, their work. In this way we draw a) a picture of what might characterize passionate work and its meaning and value, b) the different problems that may arise when people are leaving passionate work. The theoretical and methodological starting point is an existential sociology approach. By using the concept of existential imperative, developed by the social anthropologist Michael D. Jackson, we argue that retirement can be seen as a transitional stage in life where questions about meaning and identity are defined, redefined and redesigned depending on how the interviewees relate to past and present experiences as well as with regards to their future hopes and expectations.

Ageing, forms of capital and employment
Dina BOWMAN (Research and Policy Centre, Brotherhood of St Laurence, Australia) | dbowman@bsl.org.au
Extending workforce participation of older people has become a focus of policy concern in OECD countries which is driven by growing anxiety about the fiscal challenges of population ageing. A common policy response to the 'disappearing taxpayer' is an increase in the age of pension eligibility. For example, in Australia the pension eligibility age is gradually being increased to 70 by 2035. This policy response does not recognise the issue of mature age unemployment and underemployment. Older workers who lose their jobs often find it difficult to regain employment and face long-term unemployment. There are two common explanations for this situation. The human capital approach locates the source of older workers’ difficulties in their outdated job skills; with training, it is argued, these workers will develop skills suited to the modern economy. A second widespread explanation is that older jobseekers experience age discrimination, which can be addressed through education, backed by legislation.

In this paper, we draw on a study of Australian mature age unemployed and underemployed women and men to critically engage with both explanations. Using Bourdieu's interrelated concepts of field, habitus and capital we examine how class - as signified by occupation - and gender affects these mature age Australians' labour force participation. This analysis contributes to more nuanced understanding of mature age workforce participation.

40+, 50+, 60+ ? or just a PLUS. Age in the labour market.

Justyna STYPINSKA (Free University Berlin, Germany) | justyna.stypinska@fu-berlin.de

The paper presents the process of social construction of old age in the labour market in Poland, which manifests itself through different age distinctions, such as chronological, social, psychological or cognitive age. The analysis of 30 in-depth interviews with employers in Małopolska region from small, medium and large enterprises, as well as expert interviews with representatives of labour market institutions comprises empirical material to formulate an answer to a question about the consequence of age signifiers for the situation of an individual in employment. In addition, some analysis of European Social Survey will be provided. Moreover, the paper illustrates the functioning of some mechanism of exclusion of older people from labour market, which despite the fact that efforts are being made in order to increase the effectiveness of the anti-discrimination legislation in Poland, are still particularly prominent in certain sectors of economy. The analysis provide input into the debate about the omnipresent usage of chronological age thresholds, and especially about the “magical” 50+, being deployed in various types of social policies and other legislative documents, contributing to the creation of an image of members of those groups as needy, problematic and helpless. The paper argues to re-evaluate the chronologically based types of eligibility.

Retiring from a spiritual workplace – chances and challenges
Jenni SPANNARI (University of Helsinki, Finland) | jenni.spannari@helsinki.fi

Finding meaning and value has become more and more significant in work. Businesses worldwide have started to pursue thick value, to practice sustainable human resources management – and the current and potential employees to pursue significance and their personal values within the context of work. These changes are addressed also within the framework of workplace spirituality. It is evident in workplaces, which offer the possibility to find significance and transcend one’s personality (the vertical dimension) and to act according to personal and shared values for common good (the horizontal dimension of workplace spirituality).
But what happens, when an individual retires from a spiritual workplace? What are the chances and challenges of retirement to the individual and the work community? What are the options, best supporting the individual and the community, to on/off retirement transitions and policies? How does the spirituality or non-spirituality of the workplace relate to finding meaning in retirement?

This paper will present the preliminary findings of a Finnish research project 'The Revolutionary Power of Compassion', aiming to find and define compassion in the everyday life of organizations, for example in the context of workplace spirituality, to find out how it is born, sustained and strengthened, and to explicate its connections with business productivity.

**RN01S06 - Ageing and Workforce Participation**

**Ageing in the Spanish Labour Market: late entrance and early retirement**

Pau MIRET-GAMUNDI (Centre d'Estudis Demogràfics, Spain) | pmiret@ced.uab.cat

Pilar ZUERAS (Centre d'Estudis Demogràfics, Spain) | pzueras@ced.uab.cat

Spanish Social Security System released in 2004 a 4% sample of its registers, including the completed labour biography of the population who were contributing to Social Security for at least one day in that calendar year (Muestra Continua de Vidas Laborales; Continuous Sample of Labour Biographies). We presently have that information from 2004 to 2013. It includes data on the month and year of birth and sex, nationality and professional category, among others. By observing changes in the demographic pyramids for this decade we will be able to answer to what extent the age structure of the labour force is ageing in contemporary Spain. This situation has to be due by two factors: a lower and later entry in the labour force (by younger workers), and by a decrease of and a later exit from the labour force (by older workers). Through elaborating the first entrance rate in the system, and the exit from it due to death or retirement, we aim to show the degree of ageing process of the Spanish labour force in the last decade, in order to be able to conclude if ageing is due to demographic causes (less younger people because of low fertility, and more older people because of an increase in longevity), economic context (high unemployment, especially among younger people, and no so high in older people), or cultural values (as the extension in education or the patterns of leaving the labour market, related to the extension of a generous public pension system).

**Impact of employment and self-employment in the late 60s on income inequalities**

Sara Lynne ARBER (University of Surrey, United Kingdom) | S.Arber@surrey.ac.uk

Rob MEADOWS (University of Surrey, United Kingdom) | R.Meadows@surrey.ac.uk

Background:
Recent UK policy changes have had major impacts on people in their sixties. State pension ages have increased for women from 60 to 66, and mandatory retirement age has been abolished. The paper addresses UK government assumptions that older men and women will continue to work in their late sixties, and examines gender differences in jobs undertaken and income received.

Methods:
The paper analyses ‘Understanding Society’ for 2012-13 (wave 4), which interviews all persons in a large sample of British households, focusing on men and women aged 60-79 (n=11400), particularly aged 65-69 (n=3400). We analyse participation in paid employment and self-employment, the nature of employment, factors that predict being employed/self-employed, and income from employment/self-employment.

Results:
At ages 65-69, 21% of men and 18% of women are economically active. Employee jobs are more likely to be part-time, hourly paid and in the service/sales sector. Nearly half of men aged 65-69 who are economically active and a third of women are self-employed. Health and being more educated are key predictors of being employed/self-employed. Levels of income inequality from employment, and especially self-employment, are very marked. The top 10% of self-employed men earn 10 times more than the lowest 25%, and earn 20 times more than the lowest 25% of self-employed women.

Conclusions:
Being employed/self-employed in the late sixties is associated with health and educational advantages. Substantial income inequalities are evident among the employed and self-employed in their late sixties. Continued economic activity may compound gender and other inequalities in later life.

What comes after caregiving? Caregivers’ employment careers in Germany
Wolfgang KECK (Deutsche Rentenversicherung, Germany) | dr.wolfgang.keck@drv-bund.de

In recent years there has been a growing number of studies on the reconciliation of paid work and caregiving to frail elderly persons. But little is known about the situation of caregivers after their care obligations have ended. This article enquires into the post-care employment career of caregivers. Two research questions will be addressed: 1) Do caregivers face higher risks of not being employed or of receiving an invalidity pension? 2) What are the key predictors why caregivers have not returned into the labour market? To answer the first question the author applies a coarsened exact matching method (CEM) in order to estimate the causal effect of caregiving on employment and invalidity. For the second research question regression analysis is used to estimate the influence of sex, age, and duration of the caregiving period on the employment status after caregiving. The Data basis is a random sample of insurance biographies drawn from register data of the statutory German Pension Fund.

Generation diversity among women’s opinion on extending their professional activity in Poland
Karolina THEL (University of Warsaw; Academy of Fine Arts in Warsaw, Poland) | karolina.thel@gmail.com

Presented paper is a result of my PhD research project. Facing the consequences of society aging process, it seems to be crucial for the European labor market to prepare a proper strategy to lengthen the professional career of citizens. It is important to look at the problem in a longer perspective.

In Poland there is the necessity to deepen the diagnosis concerning the phenomenon of low professional activity of women being at retirement age by looking into intergeneration differences. The aim of my doctoral research was to get to know motivation (real of potential) to decide whether to finish a career or to remain in the job market. The task was to find out which motivating factors in what order and how influence, according to women, the possibility to lengthen their professional career. My own research model included deepened interviews with pairs of respondents (mothers-daughters). I was hoping to get an answer to the question if there is a change or generation inheritance of views among interviewees. I looked for answers for the following research questions:
• Is there an intergenerational inheritance attitude towards extending working life among women in Poland?
• What factors influence the acceptance of the possibility of a longer working life for women?
• How women from different generations differ in their reasoning?
• What practical recommendations for social and economic policy does it result in, especially for the labor market policy?

Conclusions show the importance of cultural background and pressure associated with balancing family life and professional obligations among women.

Organizational Culture And Its Influence On The Image and Professional Opportunities Of 50+ Employees At The Polish Job Market in the New Capitalism
Magdalena PANCEWICZ (Graduate School for Social Research IFiS PAN, Poland) | pancewiczmagdalena@gmail.com

The presentation is based on the framework for my diploma research in the situation of the employees 50+ at the Polish job market nowadays – in the New Capitalism as described by Richard Sennett. The presentation would serve as a great opportunity to discuss the assumptions and framework of a research for the Ph.D diploma.

Employees 50+ are a group which might be threatened with social exclusion – depending on their education, socioeconomic status and profession their situation is much different: perspective of the job change, promotion within a company or vocational training differs among various employee groups, branches and companies.

The idea behind the research is to define company cultures which are most supportive to hiring and managing employees 50+ and in which employees themselves feel most comfortable. To do so I shall investigate various organizational cultures form different branches with the use of in-depth interviews with the hr and management board, employees 50+ and via opinion pool with other employees. The characteristics used to identify organizational culture shall be based on combination of two typologies of 1)Terrence E. Deal & Allen A. Kennedy and 2) Kim Cameron & Robert Quinn. I would also like to investigate the situation of the workers/employees in the new capitalism as described by Richard Sennett and their ways of adaptation (maybe different depending on the organizational culture). I shall also try to identify characteristics most valuable in the nowadays time at the job market.

I believe the presentation would serve a great opportunity not onlyly to discuss the assumptions for the diploma research but also first findings of pilot study carried out with representatives of recruiting agencies.

RN01S07 - Ageing and Information and Communication Technologies

Internet Use in the Elderly - Findings from Switzerland
Alexander SEIFERT (University of Zurich - Center of Competence for Gerontology; University of Zurich - URPP Dynamics of Healthy Aging) | alexander.seifert@zfg.uzh.ch

For the elderly, the internet is potentially an important source of information and communication tool. However, the actual use of the internet and how providers of web content can best attend to the requirements of the elderly remains obscure. In two representative telephone surveys conducted from 2009 to 2014, a total of 2,200 persons aged 65 years and older were interviewed. In a third study (2013) based on focus group interviews (n = 36), views on the requirements for an “age-appropriate” web design were collected. In addition to socio-demographic characteristics, including age, education, and income, it was mainly personal attitudes toward technology, the proximal benefits, and support that promoted the internet use. Based on the results of the third study on age-appropriate web design, it was also shown that the elderly have particular web design requirements and requests. However, an exclusive focus on “websites only for the elderly” should be avoided. Thus, the findings show opportunities for
and barriers of internet use in the elderly and provide guidance to overcome the “digital gap” of the generations.

**Ageing, social media and social isolation**

Roser BENEITO-MONTAGUT (Open University of Catalonia, Spain) | rbeneito@uoc.edu  
Arantza BEGUERÍA (Open University of Catalonia, Spain) | arantza@begueria.net  
Nizaiá CASSÁN (Open University of Catalonia, Spain) | nizaiacass@gmail.com

The percentage of older people living alone has grown in the last decades, and is expected to continue growing. At the same time that the population ages social isolation is emerging as one of the major problems facing society. Social Media (SM), with Facebook and Twitter as its most popular applications, are becoming fundamental to our social lives. One of their main functions is to provide a mobile way to stay in touch with others. There are few studies so far that explore in depth interpersonal interaction processes on SM of the elderly, fewer that take into account the role of emotions in this particular communication process for this specific social group. This paper focuses on the role of emotions and on understanding to what extent and how older people use SM. An ethnographic study of elderly SM usage, conducted in Catalonia during two years (2013-2015), serves as the basis for an in-depth analysis of their social and emotional conduct in everyday life. Understanding how the elderly uses SM could inform the development of policies which foster SM engagement with a view to increase their possibilities for interpersonal relationships, and in turn, reduce social isolation problems. This perspective takes this paper away from simply studying what can or cannot be done online. Our interest is rather on how the elderly integrates the SM into everyday life, how emotions intervene in their social interaction processes and how to improve their emotional well-being.

**Digital inequalities and different experiences of ageing**

Cecilie GIVSKOV (University of Copenhagen, Denmark) | cecilieg@hum.ku.dk

The complexity of the emerging digital media environment inevitably raises questions about digital literacy and social inequality. However, a major shortcoming of the existing research on digital inequality in later life is that it tells us little to nothing about how and why media actually matters to different older people and how this intersects with dis- or empowerment in later life and social segmentation. The way people use (digital) media in everyday life therefore constitutes a critical access-point to the study of differences in ageing as well as to the study of what literacy - or the lack of such - actually means to different people.  

My research is based on the assumption that people’s access to (and use of) media is integral to the power relations of current social and cultural transformations. In order to contribute to user-centered and practice-based understandings of why and how media matters to older people I take an explorative bottom-up approach to the question of how mediated communication structures the social life of older people with different backgrounds. I do so by analyzing how people’s media life histories - ranging from letters to texts, from phone calls to video messages - interlink with the participation in private and public social networks. The analysis focuses on the meaning of the everyday media ensemble for social participation by looking into material, emotional and rational aspects of the media use. In my presentation I will elaborate on my method, the results of the study, and discuss the implication for ageing studies in modern society.

**Understanding digital inclusion/exclusion among elderly; the case of Norway**

Dag SLETTEMEÅS (National Institute for Consumer Research (SIFO), Norway) | dag.slettemeas@sifo.no
The digitalization of modern society leads to unprecedented growth in digital devices/services aimed at the general population. Digital participation is increasingly equated with traditional participation as digitalisation permeates all sectors of life. Consequently, political pressure intensifies to secure adequate competence and equal access to the information society to prevent a “digital divide”. The fear of excluding vulnerable social groups permeates political agendas, and the Norwegian digital agenda aims to halve the number of non-users of Internet by 2017. The paper is positioned in this debate. It draws on two recent studies; a literature review confirming that the elderly have the highest proportion of non-users and low-competence users in the population. Based on this, we devised a national survey in late 2014, including a representative selection of older citizens (61-100 years). The survey is unique in that those between 81-100 years are included (usually omitted from official European/Norwegian statistics). The survey questions relate to digital access, use, management, motivations, barriers and non-use. The data are discussed in light of theories on digital skills/digital divide. The primary focus on access when determining level of digital participation is problematized; although the access divide is diminishing, the digital divide gets deeper and more multifaceted due to widening relative gaps in skills needed to operate, understand, evaluate and produce digitally. Consequently, the paper claims that a relational perspective of inequality is fruitful (particularly regarding the elderly). Here, categorical differences between groups of people are emphasized, which are seen to potentially cause unequal participation in society.

Media and the Life Course: Usage and Evaluation of Information and Communication Technologies by Older Women in Austria
Barbara RATZENBÖCK (University of Graz, Austria) | barbara.ratzenboeck@uni-graz.at

How do older women (in Austria) use and evaluate information and communication technologies (ICTs) such as TV, radio, telephone, computers or the internet? And which processes and strategies are relevant in this context? These questions are being addressed in a current empirical study conducted within the frameworks of an interdisciplinary research project at the Center for Inter-American Studies of the University of Graz, Austria supported by funds of the Oesterreichische Nationalbank (Oesterreichische Nationalbank, Anniversary Fund, project number: 15849). This paper presents first results of the empirical study based on the analysis of life graphs, semi-structured interviews, and “walking interviews” conducted with women aged 60 to 70 years in the Austrian province of Styria on their usage and evaluation of ICTs. The study specifically explores the everyday meaning and usage of these technologies by older women and thus highlights the interrelatedness of media practices and other social contextualities, such as family structures or professional experiences prior to retirement. In doing so, experiences with ICTs are conceptualized as influenced by _both_ generational experiences as well as by more personal biographical experiences relating to something we might call “personal identity” (Müller 2011).

RN01S08 - Markets and Products for Older People

InTouch: a feasibility study of a new communication technology to reduce social isolation and loneliness among institutionalized older adults
Christian BEERMANN (University of Toronto, TAGlab, Canada) | christian@taglab.ca
Barbara Barbosa NEVES (University of Toronto, TAGlab, Canada);
Social isolation and loneliness are emerging risks for older adults, mainly for those institutionalized, frail, or living alone. Social isolation and loneliness predict a variety of health problems (e.g., cognitive and function decline, depression, and morbidity) and even mortality among this population. They also predict social disengagement and low levels of public participation. Research and policy suggest that increasing opportunities for social interaction and the use of new technologies can inform positive initiatives to tackle this issue. So in an action research approach, we developed an accessible software application called InTouch. InTouch supports asynchronous communication with family members and friends, using a non-language specific interface based on icons. As it was developed for older adults with dexterity problems resulting from motor impairments, no typing is required. To test the adoption and feasibility of InTouch to increase social connectedness and reduce the risk of social isolation and loneliness among frail older adults, we conducted two-month deployment studies in a retirement community (n=1) and in a long-term care facility (n=4, 80+ years old) in Toronto, Canada. These pilot studies included semi-structured interviews, field observations, and questionnaires. Drawing on Rob Stones’ strong structuration theory, we examined factors that facilitate and hinder adoption of InTouch but also its feasibility to combat social isolation and loneliness. Findings show that adoption of new communication technologies among institutionalized frail older adults is a complex interplay of social, cultural, physical, and usability factors. Factors that we are further exploring in a new study of 15 institutionalized older adults and will report herein.

The Age of the ‘Scammer’: New vulnerabilities for an Ageing Society in the 21st Century

A scam may be defined as:
“An unsolicited contact involving a deceptive business practice where false promises are made to con individuals out of money.”

In 2006, it was estimated that £3.5 billion was lost by UK consumers each year and that 48% of adults had been victims of ‘scams’ with almost four million UK residents being ‘scammed’ each year. Criminal gangs have developed means to identify and target individuals susceptible to scams.

Older people have been identified as especially vulnerable to ‘scams’. For some socially isolated older people, contact with a ‘scammer’ may be the only social interaction they have; ‘scammers’ take advantage of loneliness by befriending such individuals. Conversely, some older people know they are being ‘scammed’ but continue the interaction with the ‘scammer’ to avoid isolation.

Empirical analysis of this increasing phenomenon has thus far only utilised a ‘business studies’ and ‘technological focus’ (how ‘scammers’ target vulnerable individuals, and what mechanisms used’). This empirical study approaches ‘scamming’ through a socio-gerontological lens, in an attempt to understand the vulnerabilities of ageing, and mechanisms to intervene with targeted individuals.

Taking an ethno-geographic narrative approach researchers interviewed older people at risk of being ‘scammed’ to identify what (if any) benefits they gained from ‘scams’, how realisation they had been ‘scammed’ impacted on them and whether an intervention delivered by Trading Standards influenced their future behaviour.
Population Ageing and the Transport Sector – Level and Structure of Household Expenditures for Transport over the Lifecycle

Birgit AIGNER-WALDER (Carinthia University of Applied Sciences, Austria) | b.aigner-walder@cuas.at
Thomas DÖRING (Hochschule Darmstadt University of Applied Sciences, Germany) | thomas.doering@h-da.de

The level as well as the structure of private consumption is influenced by the age pattern of the population. A major part of a household’s budget is spent for the transport sector; in the European Union expenditures of households for transport range directly after those for housing and food and non-alcoholic beverages (Eurostat 2014). Hereby, the purchase of vehicles, costs for the operation of personal transport equipment, as well as expenses for transport services (e.g. public transport) are considered. Within the paper changes in the level as well as structure of consumption in transport are analysed over the lifecycle of a household based on data of European household budget surveys. According to German data and with respect to the changing shares of age cohorts induced by the demographic change the demand of goods and services in the field of transport will lose significance. This is especially true for personal transport expenditures such as the purchase of cars as well as the demand for goods and services related to the use of cars. In contrast, the expenditures for (public) transport services are perceived as relatively stable over the lifecycle of private households (Aigner-Walder/Döring 2014). Therefore, this paper aims to analyse if the reduction in consumption for transport goods and services by age can also be observed in other European countries, and to ask for reasons, as well as potential consequences of the ageing of the population for the transport sector.

Visions of Care, Visions of Life: Welfare Technology and the Ageing Welfare State

Gunhild TØNDEL (Norwegian University of Science and Technology, Norway) | gunhild.tondel@ntnu.no
Jenny Melind BERGSCHÖLD (Norwegian University of Science and Technology, Norway) | jenny.bergschold@ntnu.no

The development of Nordic health and care services has been followed by a fear of the end of the services. Since the 1970s, demographic projections of a growing number of seniors, new user groups and a shortage of “warm hands” have portrayed the future as insecure. To address the concerns of sustainability and quality of care, “welfare technology” has entered the vocabulary of health authorities, management, professionals and researchers. Welfare technology is often associated with things such as safety alarms, GPS sensors and smart house technologies. However, welfare technologies are not only things. They represent sociocultural projects aimed at specific groups of users and political goals, to minimize risk and maximize care. This makes “welfare technology” into a lens to study governmentality and society in the making – the ageing welfare state and its techniques to regulate problems. In this paper we explore the sociotechnical construction of welfare technology and how this process has been related to changing governmental visions of formal care/welfare for elderly citizens in Norway. Which configuration of people, tools and values did welfare technology emerge from? Which visions of care/welfare has been privileged, sorted out, transformed or forgotten through this process? We are not concerned with visions as facts or fictions, but as work material for stakeholders. The analysis builds on health and care policy documents from the 1970s to the present “welfare technology situation”, such as governmental papers, reports, hearings and technical documents concerning welfare technology.
RN01S09 - Care in Changing Societies

Care for the elderly in Slovenia: A combination of informal and formal care
Valentina HLEBEC (University of Ljubljana, Slovenia;
Faculty of Social Sciences;
Faculty of Health Sciences) | valentina.hlebec@fdv.uni-lj.si
Andrej SRAKAR (Institute for Economic Research) | andrej.srakar@ier.si
Boris MAJCEN (Institute for Economic Research) | majcenb@ier.si

Most care provided to the elderly living at home comes from informal caregivers: family members, friends and neighbours. With the development of community services such as community healthcare, personal lifeline systems for the elderly or the panic button, home care and similar, informal care is enhanced by formal community forms of care. We have used the data from the SHARE (Survey of Health, Ageing and Retirement in Europe) survey to estimate the number of people (over 65 years old) who receive an individual type of care (no care, only informal care, only formal care, a combination of the two) as well as the number of people who need care, but fail to receive it. We have also used the multinomial logistic regression method to evaluate the factors that influence the type of care. Similar to other European countries, the need and the availability of informal caregivers have the strongest influence on the type of care.

Social documentation in Swedish residential care for elderly with dementia:
Social representations of “best practice”
Maria SJÖLUND (Midsweden University, Sweden) | maria.sjolund@miun.se

Social documentation is one important aim in Swedish eldercare. An individual implementation plan corresponds to an agreement between the care recipient and the care staff. The implementation plan describes how care is to be provided for each care recipient. In residential care for elders with dementia, individual plans are of significance to assure the elderly’s needs. It is though a great challenge for the care staff to write social documentation. A sample of 31 ‘individual implementation plans’ were selected and analysed textually. The plans were recorded, as “best practices” according to care supervisors. The sample consisted of individual plans from 24 women and 7 men, living in the same municipality but in several different units. Analytical focus for the study were; what is in main focus in the individual implementation plans?; What images of social care emerges in the individual implementation plans?; What strategies were found in the sample of implementation plans to involve the care recipient and his or her family?
The analysis reveals that in none of the implementation plans, one can tell if the care recipient was present or asked to be present to take part in the meeting that resulted in the implementation plan. The study further reveals that there were few implementation plans that included detailed descriptions of individual meaningfulness or social care. The social representations of residential care recipients and individual meaningfulness in the social documentation are further described and discussed in this paper.

Gender and socio-economic differences in the use of caring resources – evidence from Austria
Andrea E. SCHMIDT (European Centre for Social Welfare Policy and Research;
Vienna University of Economics and Business, Austria) | andrea.e.schmidt@gmail.com
Background: With increasing life expectancy in European societies, the group of active older people is growing. At the same time, however, Europe is seeing a rise in the prevalence of chronic diseases and multi-morbid conditions in old-age. Disproportionally, these affect people of lower socio-economic status (SES). Reasons are that the latter face less favorable living conditions over the life course, and are less able to compensate health limitations at an early stage, for example through the use of formal long-term care (LTC) services or adaptive devices. Some groups, such as older women and single-living older people, are more affected by severe living conditions than others, making them particularly vulnerable to be confronted with complex health needs and less capable to identify the right support services. At a policy level, there is a tendency to regard older LTC users as consumers of care, for example by providing them with cash benefits instead of making services directly available to them (in-kind benefits), which can compound inequalities between users of different SES.

Rationale and objectives: Previous studies have identified some of the key individual determinants of the use of (home and residential) LTC services for older people, yet have often overlooked the linkages between socio-economic status, gender, and care. Others have focused mainly on health care services, or neglected the role of policy instruments in LTC. The objective of this paper is to address these gaps by adapting the Resource Triangle, developed by Arber and Ginn, as a theoretical framework to analyze (i) the ways in which health resources, material resources, informal caring resources, and gender impact on the use of formal LTC services, and (ii) which interdependencies exist between these factors. In addition, the narrow geographical scope of the study allows us to contextualize the findings within the Austrian policy context, in which unconditional cash benefits for older people in need of LTC are provided.

Research question: This paper addresses the question how socio-economic status, informal caring resources, and gender impact on differences in older people’s use of formal LTC services in Vienna against the backdrop of the Austrian system of LTC cash benefits.

Methods: We apply a Mixed Methods and Research Design (MMRD) approach, which consists of two parts. Firstly, we perform multivariate analyses of administrative data on older beneficiaries (60+) of the Austrian LTC cash benefit to identify patterns of LTC use, by comparing domestic LTC services to other forms of support (residential care and co-residential informal care). Methods of logistic regression and ordinary least squares analysis are used, and interaction terms are calculated between (a) gender and co-residence of a spouse, and (b) income and co-residence of a spouse. Secondly, 15 semi-structured interviews with LTC users are held in order to reveal mechanisms underlying differences in the use of LTC cash benefits. We use a maximum variation sampling strategy with regard to socio-economic status and gender. Interviews are transcribed and analyzed using the Framework Approach following Ritchie and Spencer.

Findings: Firstly, we find that higher care needs as well as being female are strong predictors of the use of domestic LTC services in Vienna, thus confirming results from other countries. In addition, we show that there is pro-rich inequality in the decision to use home care services, but pro-poor inequality in the amount of hours of home care use, when compared to residential care. Secondly, we find some interdependence between the availability of different forms of resources in old-age. The importance of material resources varies by co-residential status for the amount of hours of home care used. While single-living older people receive more hours of home care than single-living older people in high-income groups, we find no pro-poor inequality among those co-residing with a spouse, which could indicate that informal carers in high-income groups act as ‘agents of care’ while those in low-income groups tend to provide care themselves instead. Also, there is evidence of interdependence between gender and the availability of informal caring resources, confirming results from other countries. Women use more intensive LTC services than men, even when they have access to informal caring resources, such as a co-residing spouse, whereas men living alone use more of these services than single-living women. This highlights the importance of women as informal carers for their spouses, as is well-
known from the academic literature. Finally, the interviews reveal that gender stereotypes are influential for our findings, but SES per se appears to be a less decisive factor. Older people interviewed did not perceive cash benefits as an instrument of choice in the Austrian context, and no SES differences were found. Besides, the MMRD approach provides insights into the appropriateness of SES indicators in old-age.

**Conclusions:** We conclude that there are complex pathways between the availability of material resources, informal caring resources, and gender, which may impact on the use of formal LTC services. These interdependencies have not been fully explored hitherto, and deserve some further research. While cash benefits in the Austrian context do not seem to compound existing SES inequalities in the use of formal LTC services, they do contribute to gender inequalities in the use and provision of informal care.

**Explicit and implicit deinstitutionalization: Reforming long-term elder care in Finland**

Anneli ANTTONEN (University of Tampere, Finland) | anneli.anttonen@uta.fi
Olli KARSIO (University of Tampere, Finland) | olli.karsio@staff.uta.fi

Long-term care for older adults is under a profound redesign in Finland. Deinstitutionalization is one important policy aim that shapes long-term care practices. Institutional care in nursing homes and long-term care wards in hospitals is increasingly replaced by intensive service housing (ISH) units and supporting care at home. We described and evaluated the process of deinstitutionalization that aims at replacing nursing homes and care wards with homelike ISH units. The data consists of 37 interviews conducted in 2012-13 among municipal care administrators and was analyzed using thematic and discourse analysis.

The findings show a deep structural change characterized by deinstitutionalization in the publicly financed eldercare. We divide deinstitutionalization into explicit and implicit deinstitutionalization. Explicit deinstitutionalization discourse implied that the coverage of institutional care needs to be reduced and instead homelike ISH units are prioritized. Home is the word that transform the ISH as different from ‘old’ institutions. This discourse is in line with the official national and EU policy aims. Implicit deinstitutionalization discourse referred to unintended consequences such as a profound change in ISH fee policy and marketization of the ISH service. We also found references to ‘false’ deinstitutionalization. Some commented the transition from nursing homes to ISH rather as a cosmetic change where the level of institutionalization has in fact not changed as also our statistical data shows.

Deinstitutionalization needs to be discussed in a more critical way to understand the various aims and consequences of deinstitutionalization policy.

**Programs for caregivers of dependent elderly in Spain in times of economic crisis**

Alberto VEIRA-RAMOS (Universidad Carlos III, Spain) | alberto.veira@uc3m.es
María Silveria AGULLÓ TOMÁS (Universidad Carlos III, Spain) | msat@polsoc.uc3m.es

The Spanish Dependency Act was approved in March 2006 to provide with social services to an estimated two million dependent people as well as to provide relief to their relatives and informal caregivers. Economic crisis, however, has greatly contributed to halt the development of the planned measures. Within the frame of the research project “Carers for the elderly: situation before the Dependency Act and evaluation of programs for caregivers”, funded by the Spanish Ministry of Economy and Competitiveness (CSO2009-10290, VI Plan Nacional de I+D+i), a survey has been conducted in 2012 to collect information from organizations of different sorts (public, private and NGOs) working in the realm of the provision of social assistance to elderly dependent people and their relatives. The survey contains information about more than 400
programs provided by respondents who were actively involved in the implementation of programs aimed to help and support caregivers of old dependent people at interview time. About 54% of programs were provided by NGO’s, 26% by public institutions (mostly municipalities) and 20% by private institutions. Respondents answered to items specifically designed to measure the impact of each program. Regression models show that, after controlling for other relevant variables (level of formalization of the program, implementation of evaluative techniques, type of program), NGOs are managing to obtain similar results than Public and Private institutions despite having, on average, more limited resources. Further information regarding the research project can be found at the project’s blog http://cuidadoresdemayores.blogspot.com.es.

RN01S10 - Care and Caregiving

People used to care for each other: Nostalgic longing for imagined communities
Bernhard WEICHT (University of Innsbruck, Austria) | bernhard.weicht@gmail.com

When people talk about care for elderly people references to and comparisons with earlier times and generations are recurrent features. Times are imagined when care was delivered within the family and the local community. Community in this context describes a physical entity, often a particular living arrangement within a specific area, and, at the same time, refers to a conception and agglomeration of particular values, feelings, emotions and associations. In this paper, I discuss the narratives, emotions and values that constitute the positive feeling that community provides in the context of the construction of care. Drawing on political debates and public coverage of care discourses I will show how community is idealised as the realm where relational living is possible and can be performed. This idealisation inevitably leads to a longing for community. People imagine the existence of ‘real’ care always somewhere else or some time gone. (Caring) Communities will thus be described as nostalgically constructed, as representing the better care - either the other country/culture where care is still family based, or the other times when people still cared for each other. The nostalgic idealisation of care inevitably leads to challenges for current arrangements. This paper will evaluate several (social) policies in the realm of care, all of which have to be formulated against the nostalgic image of community care.

'Sod tomorrow': the perspectives of dementia carers on making plans for the future
Edward TOLHURST (Staffordshire University, United Kingdom) | e.tolhurst@staffs.ac.uk

Current dementia policy in England stresses the need to increase the rate of early diagnosis to enable people to make plans for professional support and care. This aim however is not predicated on a credible notion of the challenges faced by people with dementia and their carers. Findings from a qualitative study, which included 16 spousal carers, indicate that this policy principle is yet to be translated into practice: carers highlighted that they were not making plans for the future and preferred to live from 'day-to-day'. Alongside this temporal orientation, carers demonstrated a reticence to seek external support or contemplate the future requirement for residential care. Such perspectives are contextualised by cultural discourses on caring and gender, which position carers as committed and selfless 'heroes' who must place their own needs behind those of the person for whom they care. It can thus be discerned that planning for the future actually contravenes cultural standards of caring. Preparing for the time when
responsibilities will be ‘relinquished’ to an external agency, such as a residential facility, is incompatible with the moral principle that spouses should provide care for as long as possible themselves. Accordingly, seeking support cannot be a proactive process, and must be seen to occur only as a reaction to unmanageable circumstances. Policy and practice-based endeavours to assist people with dementia and their carers must therefore recognise the intense moral challenges that planning for the future presents.

Pathway to care(r)
Guro Wisth ØYDGARD (University of Nordland, Norway) | gwd@uin.no

Background: Next of a kin to persons with dementia is expected to contribute in the daily care for persons with dementia. It is therefore a need to investigate the next of a kin’s role due to cover the needs for persons with dementia help and care. This both within their daily life as next of a kin for the person with dementia, but also in contact with the public services when they discuss what kind of help the public services can offer.

Aim: This presentation will show how the next of a kin’s position change, and how their contact with the public health care system develops when the illness gets worse.

Methods: Qualitative interviews with 25 next of a kin.

Results: My presentation shows how the next of a kin goes from being a husband/wife or a child to a carer. At the same time the next of a kin also negotiate with the health services in order to get services from the public health system for the person with dementia. In my presentation I argue that even though it is the person with dementia that gets the service granted, the services is really made for the next of a kin. Because of this, I ask if the pathway to care must be seen as the pathway to care for the next of a kin in addition to for the person with dementia. I also discuss what implications this has for the next of a kin, the person with dementia and the content in public services.

Informal care as a way to meaningful and satisfied ageing?
Martin LAKOMÝ (Masaryk University, Brno, Czech Republic) | martinlakomy@seznam.cz

Nowadays, in many developed countries, there is implemented a policy of active ageing – inclusive policy redefining status and roles of older people to provide them the same opportunities and quality of life as to other age groups. One of the roles, which should be occupied by many older people, is role of carer. People older than 50 years are important providers of informal care for their grandchildren, spouses, parents and other family or nonfamily members. Due to population ageing, this provision of care becomes more and more important. Is provision of care in older ages associated with lower loneliness and more meaningful life, as expected by definitions of active ageing? Or is it associated with tiredness and overload? Using data from SHARE project, I investigate relation of these dimensions of life satisfaction with intensity and multiplicity of care provided to the different types of recipients. Provision of care generally does not prevent from loneliness, but is related, except of very intensive care, to the more meaningful life. Multiple caring responsibilities on the daily basis are also associated with overload, but this is not true for any less intensive provision of care. Older people caring for spouse are most vulnerable to negative outcomes of caring relation; on the other hand provision of care outside the family seems to have only positive consequences. Provision of informal care as one part of active ageing may promote quality of life, but help of professionals is also crucial under some conditions.
Who cares about the care-giver? The impact of informal care on the health of the care-giver
Sebastian LANG (University of Nuremberg-Erlangen, Germany) | sebastian.lang@fau.de
Antje BUCHE (University of Nuremberg-Erlangen, Germany) | antje.buche@fau.de
Andreas EBERL (University of Nuremberg-Erlangen, Germany) | andreas.eberl@fau.de
Katharina SEEBASS (University of Nuremberg-Erlangen, Germany) | katharina.seebass@fau.de

The demographic change and, related to that, the increasing number of elderly people in society raise the question on how care for senior citizens can be organized. *Informal care* remains the most common model among care options with relatives family members taking over care work in Germany. In our study we address the effects of informal care on health and *wellbeing* of the care giver by applying the stress health model (Pearlin 1990, Schulz/Martire 2004). Due to role conflicts arising from extra burdens and the very nature of care-giving tasks we expect negative effects of care-giving on the care giver's health. The duration of care, the extent of care giving and the extra burden of eventual (full time) employment might lead to additional strain for the care giver and his/her well-being. We also control for social inequality and gender effects on health as women and people with a lower socio-economic status usually take the task of care giving.

Empirically, our research bases on *panel data* from the Socio economic Panel (SOEP) (1992 – 2012).

RN01S11 - Well-being in Old Age

The effect of retirement on subjective well-being in Hungary
Márta RADÓ (Corvinus University of Budapest, Hungary) | marti.rado@gmail.com

*1. Background*
The focus of this paper is the impact of retirement on subjective well-being. The change in subjective well-being after retirement calls for empirical studies, since retirement has contradictory effects on different life domains. For example, retirement means drop in the income and health, but it also provides more leisure time. At the time of retirement people have aggregating experience from the previous stages, which provides opportunities and limitations for the agent. Therefore, besides the overall impact of retirement on well-being, this paper also focuses on how voluntarism of retirement decisions effects this transition. The observation of this dimension is especially important in Hungary, since it has been shown that Hungary has one of the highest involuntary retirement rates among the OECD countries. (Dorn 2007; Kohli 2014)

There are several theories that provide explanation of how well-being changes after retirement. According to the role theory, employment has the main importance in the formation of identity. Therefore, after retirement we can assume that well-being declines, since the individual loses his or her important role. In contrast, advocates of the role-strain theory argue that retirement relieves individuals from expectations, which leads to an increase of their well-being. And also we need to mention the continuity theory, which highlights the fact that individuals try to maintain their standard of living, their self-esteem and their values, therefore we can assume that their well-being is not affected by retirement that much. (Kim and Moen 2002) International research is inconsistent about the effect of retirement on well-being. There is some research which has found positive relationship. (e.g. Charles 2004, Gall et al 1997) Others suggest that the well-being diminishes right after retirement (e.g. Bosse et al 2004). And finally others have shown that indeed retirement has no effect on well-being (e.g. Bonsang and Klein 2001).
2. Data and Methods
This research is based on the dataset of the Turning Points of Life Course program (Hungarian GGS), which was a longitudinal research (between 2001 and 2004) done by the Hungarian Central Statistical Office.

The change in subjective well-being is calculated by the deviation between the life satisfaction in the first and second wave. It is known from the second wave who retired between 2001 and 2004 and whether this retirement was voluntary or not. All of the models found matches by the help of the following predictor variables: sex, have a partner or not, subjective health status, education, age, residence and income.

The aim of this paper is to draw causal conclusions. This is obtained by combining matching method by longitudinal data analysis. Matching method is a state-of-art methodological innovation, which enables researchers to draw causal conclusions without an access to experimental design. It tries to overcome the fact that the treated and the control group is different. So this method is especially useful in the field of demography, which predominantly deals with observational data. In this paper matching methid is combined by longitudinal data analysis. (Ho et al. 2007)

3. Findings
3.1. The effect of retirement on well-being
Firstly the effect of retirement on well-being was measured by simply comparing the mean of those who retired between 2001 and 2004 and those who were non-retired in 2004. On average those who retired between 2001 and 2004 has 0.76 points, whereas non-retired people gained 0.29 points. ANOVA shows that this difference are significant (P-value 0.03). So those who retired between 2001 and 2004 experienced significantly bigger increase in their subjective well-being between 2001 and 2004 than non-retired people.

So at first sight, one could conclude that those who retired also achieved a higher level of subjective well-being than those who did not by two-dimensional analysis. After this matching method and difference in difference was used in order to draw causal conclusion. By using matching and difference in difference method we can see that this correlation can be explained by the particular socioeconomic status of pensioners before retirement. According to this regression model in the matched dataset, retirement has no longer significant effect on subjective well-being. This finding supports the continuity theory (and it is contesting the role theory and the role-strain theory), which assumes that individuals’ well-being is not affected by retirement, since they try to maintain their standard of living, their self-esteem and their values during their entire life course.

3.2. The effect of voluntarism on well-being
First of all, a simple mean difference in subjective well-being is observed. The voluntary retired had significantly higher subjective well-being before and after retirement than the involuntary had. Moreover, the voluntary retired experienced increase (0.39) in their subjective well-being, while involuntary retirees' subjective well-being declined (-0.09) right after retirement. The difference between the changes in subjective well-being of these two groups is significant. (P-value 0.04).

After the matching, the voluntarism of retirement still has significant effect on subjective well-being change. This means that voluntary and involuntary retired people experienced different changes in subjective well-being even if we take into account that the compositions of these two groups are different.

By applying matching method, further steps have been taken in order to draw causal conclusion between voluntarism and subjective well-being. The very high involuntary rate is not only alarming, because of the waste of human capital, which deepens the financial problems of the pension system. But also, as this paper has demonstrated, it is also an important matter because involuntary retirement leads to a break in the individual life course, which raises equity problems.
Bibliography:
Xiangjun REN (University of Hamburg, Germany) | xiangzijj@hotmail.com
This article focuses on studying the Quality of Life (QoL) of elderly through a vision of family life. Main research question are how do Household related determinants impact on Senior’s Quality of Life in Germany, UK and Denmark? And how is it possible to explain the differences between countries, genders, age groups and types of Household on the basis of Household related QoL of older people? In this paper, relative data will be used to analyze and measure the influence from marital status, adult children, housework and informal family care of older people.
Theoretical framework
I defined quality of life as “a multiple evaluation of individual perception, psychological and emotional happiness and objective living standard in the senior’s family life, social life and institutional context” in this paper. Three hypotheses will be included. The first hypothesis (H1) is that household economic status, household size, marital status, relationship with adult children and other relatives play significant roles in affecting the QoL of elderly. Then the second hypothesis (H2) is that after getting old, housework brings more negative impact on QoL of elderly as age grows. The third hypothesis (H3) is Compare with male, QoL of female senior is easier to be influenced by household determinants and have lower happiness and life satisfaction.
Methodological approach
As a quantitative research, three times “European Quality of Life Survey” (EQLS) in 2003, 2007 and 2011 form the main database of this paper. Data analysis explains the differences between gender and types of household in three European countries. Logistic regression and comparative analysis will be used in the data analysis to get an effective result to support the hypotheses.
This study base on the former European Quality of Life Surveys and dedicate in a further research on quality of life of elderly through out the European countries, present and discuss the way of solution to improve the QoL of elderly in a vision of family life.

**Career instability and well-being in old age: A sequence analysis of the life course of the cohorts 1930 to 1950**

Valentina PONOMARENKO (University of Luxembourg, Luxembourg) | valentina.ponomarenko@uni.lu

A broad range of literature investigates career patterns and career instabilities via the transition from education to labour market or the transition to retirement of the aged population. The main results suggest negative effects of unemployment at the beginning of a career but few studies show if instabilities at the entry of labour market are indeed permanent or wear off during the working life. Furthermore, little research exists on career instability over the whole life course.

This study focuses on life course and career trajectories of the population 50 + in Europe. In the first step I use retrospective sequence data of the third wave of the Survey of Health, Ageing and Retirement in Europe (SHARE) to identify different profiles of career instabilities of the cohorts 1930-1950. I define instable careers as those deviating from a full-time employment career by recurring phases of unemployment or inactivity; thus phases outside the labour market. In a second step I connect these profiles with well-being in old age and test if instabilities in the life course are balanced out by welfare regimes in old age.

This study contributes to the existing research on career patterns in two ways. First, in contrast to many studies on career patterns, I use data on the complete career of a person, from age 12 to age 70. This way I can capture the dynamics of a career and do not focus on one transition. Second, I contribute to the fairly limited research on covariates of career patterns. The results suggest that instabilities at the exit of the labour market, especially phases of unemployment, are negatively associated with well-being in retirement. However, I find a north-south gradient in Europe.

**Life satisfaction of the elderly in Switzerland: perspectives on well-being and inequalities in aging**

Marie BAERISWYL (University of Geneva, Switzerland) | marie.baeriswyl@unige.ch

Michel ORIS (University of Geneva, Switzerland) | michel.oris@unige.ch

Numerous studies have focused on subjective well-being in old-age, particularly on the paradox of its conservation up to an advanced age despite the declining health conditions and the process of fragilization - if not the loss of autonomy – characterizing this stage of life. The originality of this contribution is to study the results of a psychological test, the life satisfaction scale of Diener and al. (1985), in a social sciences perspective. More specifically, we assess to what extent different individual and social characteristics can explain or are associated with subjective well-being in order to highlight the system of resources around life satisfaction with a particular emphasis on social inequalities issues. In this perspective, we establish different regression models taking into account basic demographical characteristics like sex and age, initial social inequalities (nationality, education) and personal traits (personality traits), elements of the individual life-course (professional and familial) and aspects of economic, health and social capital. Furthermore, the possible association between subjective well-being and different types of social participation will be incorporated to these analyses. Empirically, we will use data from the survey "Vivre-Leben-Vivere: Old Age Democratization? Progresses and Inequalities in Switzerland". This survey on the living and health conditions of people 65 and older in five
Swiss regions (Geneva, central Valais, Bern, Basel and Ticino) was carried out in 2011/2012 among a random sample of 3600 persons stratified by region, sex and five-years age group.

RN01S12 - Ageing and Migration

Retirement Migration to Turkey and Information Needs of European Residents
Esin Sultan OGUZ (Yıldırım Beyazıt University, Turkey) | esinsultan@gmail.com
Senol KARADENİZ (Ministry of Culture and Tourism, Turkey) | senolkdz@gmail.com
Erdinc ALACA (Yıldırım Beyazıt University, Turkey) | alacaerdinc.61@hotmail.com

While Turkey, the position of which gradually gains importance in the international movements of migration, is traditionally known to be a country with a population emigrating abroad, presently allows in a considerable number of immigrants. One of the most striking developments regarding immigration in Turkey in the recent years is the immigration of retired persons. Even though it has not been possible to determine the exact number of retired immigrants because most of them come to Turkey with tourist visa; it is known that the number of foreigners acquiring properties in Turkey’s coastal regions is approximately 60 thousand individuals buying estate is approximately 20 thousand individuals.

With the extended length of life and the lowering of the legal retirement age in Europe, important issues come to the fore such as the difficulties challenging foreigners who settle permanently in Turkey while living in this country with a different language, religion and culture; how they contribute to the local community in the economic, social and cultural fields; their willingness to participate in public life and level of their access to information they need to survive in the country to which they immigrated.

Public libraries are considered useful social instruments in the democratization of information; in the support of education and life-long learning activities; in the development of personal creativity; and in the promotion of local culture (Larsen, Jacobs and van Vlimmera, 2003, p.7). Although the number of immigrants to Turkey is undeniably on the rise, there is no short or long term plan to integrate a multicultural library and information services into immigrant communities, thus necessitating the current study. However, research on the converse (integrating European populations into the Turkish library system) is virtually non-existent. The latter is especially important given the growing sensitivity with respect to the four cornerstones of multiculturalism—equality, tolerance, understanding and diversity. The need for an overhaul of the Turkish library system with the aim of making it more immigrant-friendly can no longer be overlooked given the immigrant ratio in the country. The notion of equality implies equal access to resources and services available in the community. As it stands right now, foreigners in Turkey are at a huge disadvantage with respect to equal access to resources.

In this study, the roles of Turkish public libraries as regards intercultural communication and social integration, as well as the specific information needs of retired immigrants will be discussed. Research results of an ongoing project (“Information Needs of Retired Immigrants and Evaluation of Public Library Services: A Case Study for Antalya Region of Turkey”) supported by The Scientific and Technological Research Council of Turkey will be shared. General emphasis will be placed on the impact of inadequacies regarding Turkish public library policies on the needs and expectations of new users.

Old age in Norway through the eyes of elderly migrants
Katrine Mellingen BJERKE (University of Bergen, Norway) | katrine.bjerke@sos.uib.no

Old age in Norway through the eyes of elderly migrants. As part of a general aging of the population in Norway and Europe, cohorts of labour migrants and refugees, who came to Norway in the 1960s onwards, are now facing old age. The transition from middle age to old age implies a shift in one’s social status and social role, and there are culturally specific norms and expectations regarding which social functions elderly people are expected to fulfill, and what is considered age appropriate behaviour. The aims of this paper is to explore elderly migrants` experiences and everyday practices when old age occurs in Norway. Based on biographical interviews and ethnographic observation I explore how elderly migrants with a polish and pakistani background relate to, experience and practice aging in Norway. I employ a transnational perspective which serves to highlight the combination of cultural values, norms and practices concerning old age in the migrant’s country of origin and in Norway. In addition to the transnational perspective, an intersectional perspective is employed where lived experiences are seen to vary according to one`s gender, ethnicity and available resources. Biographical interviews and ethnography combined with a transnational and intersectionality perspective allows for the exploration of how elderly migrant`s experiences may vary according to gender, education, former migration and labour market experiences, and the norms, attitudes and beliefs about old age from the country in which they had their primary upbringing.

Migrant life courses and preconditions for retirement: new diversity, increasing risks and shifting challenges for ageing policies in Sweden
Andreas MOTEL-KLINGEBIEL (Linköping University, Sweden) | andreas.motel-klingebiel@liu.se
Kirk SCOTT (Lund University, Sweden) | kirk.scott@ekh.lu.se

Europe is facing social and economic challenges due to its ageing population. There is currently a body of knowledge about active and healthy ageing, but research is glaringly neglectful of vulnerable sub-groups such as Sweden’s ageing migrants. Little is known about them, and there has been no real attempt to see if well-known disadvantages of young and middle-aged immigrants remain constant, decrease or accumulate during the life course into old age. Consequently, this study deals with changing compositions, patterns and later-life consequences of migrant life courses in Sweden and is interested in inter- and intra-cohort disparities as well as new risks and potentials. To contextualise life course changes among migrants in Sweden, they will be contrasted with trajectories of non-migrants in Sweden. In addition, a comparison between Sweden and other European societies is of significance. Based on extensive registry information on all people, ever living in Sweden between 19968 and 2011, we asses longitudinal data in a cohort-sequential perspective, applying combined sequence and cluster analysis to identify changes in life course patterns and outcomes, hierarchical multi-level modelling to identify the impact of social contexts, and projections to discuss future changes in life course outcomes. First results from the project expect to find Swedish migrants as forerunners in overall relative declines in later-life economic positions, with increasing intra-cohort inequalities that may parallel with a greater degree of autonomy and self-government.
Who cares? Life satisfaction and family support amongst aging Turkish immigrants
Anika LIVERSAGE (SFI - the Danish national centre for social research, Denmark) | ani@sfi.dk

Based on interviews (done in Turkish and Kurdish) with 35 first-generation immigrants from Turkey, now in their 70s, this paper investigates satisfaction with living arrangements in old age. Having arrived to Denmark four decades ago, these labour migrants are today growing old “in exile” (“gurbet”) and are often poor and in frail health. Moreover, their knowledge about – and their openness towards – Danish welfare measures is limited, making them turn to their adult children for support. Applying a transnational perspective, this paper investigates how the aging immigrants combine different home and host country elements in their own “bricolage” constructions when presenting their life situations.

Extending Katy Gardners work (2002) on the polar opposition between home and host countries when narrating life in old age, this paper investigates interplays between different pathways into, and different narratives of, growing old: Interviewees who co-habited with or lived close by, adult children (receiving comprehensive family support) generally expressed pride over having successfully passed on the “good values” from Turkey. Immigrants without such family support, however, either distanced themselves from such practices (considered to overburden children in their busy lives). Or they mourned that a perceived Western corruption of family values had caused a post-migration break-down of family solidarity. The paper shows that while across these aging immigrants, country-of-origin norms and practices may be perceived differently, the next generation’s ability and willingness to provide family care overall seems centrally implicated in aging immigrants’ life satisfaction. This may entail a considerable strain on the adult second generation.

Ageing and care: the role of immigrant caregivers.
Ana Cristina ROMEA (University of Zaragoza, Spain) | romea@unizar.es
Carlos GÓMEZ (University of Zaragoza, Spain) | cgomez@unizar.es

Europe is suffering an important demographic ageing, which is especially pronounced in Spain. The Spanish traditional model of care -called Mediterranean and typical from countries like Italy and Greek- is defined by an assistance character and a strong family presence. Furthermore, some social changes occurred around Europe -particularly the incorporation of women into the labor market- have generated an increasing need for care.

The crisis of the traditional Spanish model, has reduced the number of potential caregivers – since they were mostly women-, which has produced a diversification in the caregiver profile in that country.

This study is focused on immigrant caregivers of older people aiming to identify the main features of the care they provide. Have been applied semi-structured interviews to caregivers immigrants -from South America and Eastern Europe- who are working in households with elderly dependents.

These caregivers, mainly women, carry out all kind of caring tasks, highlighting their poor working conditions. A greater social and institutional recognition of their work would be an improvement in immigrant-caregivers quality of life. As a consequence, this would increase efficiency of elderly care.

RN01S13 - Conceptualizing Ageing

Old Age as an Abject Class
Within contemporary European society, old age occupies a complex position. As the success of economically securing later life is increasingly being realised in most EU countries, new concerns have emerged about the dangers posed by an increasingly aged population. These anxieties suggest that the aged have become a new kind of 'dangerous' class, threatening the future well-being of society by the sheer weight of their numbers and their demands. Drawing upon George Bataille's idea of an 'abject' class, this paper will explore how old age is represented as both a dangerous and as an abject class, feared less because of the potential power of their collective agency than because of the very lack of agency. The result is a fragmentation of later life between a third age characterised by economic self-sufficiency and access to multiple sources of capital and a fourth age marked within the collective imagination by the weight of its dependency and the totality of its lack.

The transition between third and fourth age as a transition into a frailty and loss of agency
Marcela PETROVÁ KAFKOVÁ (Office for Population Studies, Faculty of Social Studies, Masaryk University, Czech Republic) | 55250@mail.muni.cz

The fourth age basically embodies all of the fears of ageing; it brings frailty, helplessness, and loss of autonomy. For an active individual in the third age, people in the fourth age are the “the others”. The greatest fear and concern for older adults is the loss of independence and personal autonomy according some studies. However from sociological point of view the definition and the lower boundary of fourth age is unclear.

Our paper is part of research project “The Fourth age: the Identity of Disability during the period of active ageing”. In this paper we will discussed the relation among agency, age, frailty and well-being. The core of our findings is based on secondary analysis of data from SHARE (Survey of Health, Ageing, and Retirement in Europe). Our results are reinforce by the first findings from qualitative interviews with fourth agers and their careers (formal as same as informal). We will follow the occurrence of incidence of frailty in the context of agency and well-being of ageing individual. The agency is operationalised using PGCMS and by the feeling of control over one’s life. The well-being is measured by life satisfaction and appropriate indicators of mental health. Previous research showed that women in general report worse subjective health then men and geriatric deterioration begins earlier with them and occurs more rapidly. For this reason the gender variance is searched. We focus too on possible variance in and degree of social, economic, and cultural capital; that is, whether the “third” to “fourth” age transition varies depending on these characteristics.

Elderly as a social / sociological construct
Alexandra DMITRIEVA (ITMO University, St. Peterburg, Russian Federation; St. Petersburg State University, St. Peterburg, Russian Federation) | alexandra.dmitrieva.uni@gmail.com
Irina GRIGORYEVA (ITMO University, St. Peterburg, Russian Federation) | soc28@yandex.ru

The phrase "policy of age" actualizes the same association as in former times "gender policy"/"sexual politics". In recent years similar processes happened to understanding of elderly, elderly age or aging itself. Elderly classified as a part of medical issue, but biologists and physicians recognize that in order to explain the aging their professional approach is completely inadequate. Social work is also frustrated by care-service technologies.
Social status of the elderly is not clear in today's society. Issue of socio-economic and political domination confused, especially in fragmented and unstable social structure. Symbolic domination of youth in a new media space contrasts to traditional economic and powerful advantage of the elderly. Formal equality of generations prescribed by "society for all (ages)" constantly violated arguments about value of children and risks of aging and excessive money spending, which it requires. Implementation of socio-cultural project "the elderly man" requires new institutional practices, which need a "policy of age."

Aging has become one of the most urgent problems of modern society and social policy. There is no social experience associated with life in an aging society, but thinking in terms of risks and threats is very widespread. It is not enough models of rational attitude towards aging society. The current set of stereotypes about older people in Russia does not change over the past 20-25 years.

It is necessary to change the perceptions of a society imposed by medicine, and fears of the elderly themselves that the elderly person is required to overtake illnesses and weakness. "Subjective construction of weakness" by elderly people provokes the development of "optics of care" - more acceptable to people not related to the 3rd age, but to 4th age. On the agenda is a realistic assessment of needs in nursing/care and opportunities for both the state and the commercial sector in offering inpatient and home-based care services for the elderly. There are many opportunities for flexible care, such as "day nurseries", cycled rehabilitation, neighborhood assistance (not to mention technical care-devices, greatly facilitates daily life of an elderly person and a person who cares for him/her). This requires a more extensive development of non-stationary care and informing the public about technical possibilities of care.

How and where is the “potential of ageing” to find?

Kai BRAUER (Carithia UNiversity of Applied Sciences, Austria) | k.brauer@fh-kaernten.at
Eva Maria LUTZ (Carithia UNiversity of Applied Sciences, Austria) | EvaMaria.Lutz@edu.fh-kaernten.ac.at
Julia GASSER (Carithia UNiversity of Applied Sciences, Austria) | Julia.Gasser@edu.fh-kaernten.ac.at

With the background of a research project in a community in the south of Carinthia, the presentation should firstly allow insight on the all-day-life reality of the elderly, who try to bring in their potentials to their local society in a community development project. Secondly, the initial consideration of this community project was not a short term action for the improvement of some living conditions, but to initiate a sustainable culture of engagement, whereby the position of the elderly in the local community is determined and created by them. With this empirical background some of the theoretical questions about the “productive” and “successful age” can be newly formulated and additional perspectives should be drafted. This can be interesting also for the social and political options for their promotion in an ageing Europe.

1. Elderly citizens in the so called “shrinking” regions are capable to define, develop and shape practical ideas for the improvement of their quality of life, if adequate moderation techniques (like Open Space, Community Organizing) will be used.
2. The political parties and their conception of ageing dominate the social space, discussions and a distinctive part of the local knowledge. Relatively much intention and time is needed to recognize that the new generations of the elderlies are not to use like a “forth colon” for a political party. Also the reduction of the aged on the deficits (dependence on care) and costs of ageing is in the local gossip and policies still a major topic - with depressing results for all.
3. Demographic projections, predicting for the own small regions an ultimately shrinking, aim directly against the elderly and bring those in defence who like to waken the potentials of civil societies.
4. It seems, that sociological perspectives on the theories on ageing should be re-embedding to normative conceptions. The future for ageing societies is less a question of money, care, productivity or workability, but of liveability: to find a place "where I like to living and ending" (K. Doerner). Maybe a convivial concept of ageing is needed.
An ambitious theoretical approach to the potential of ageing societies should not only manage empirically the enormous and growing social and cultural heterogeneity of the last phase of life, but to be able to answer the question, where the special value of ageing can be found. Could it be that the intention on topics like activation and productivity undermine the real potentials of the ageing populations? In our discussions about the findings from the Carinthian community study some other habits, competences and outcomes become uncovered as possible aspects for a sustainable future with increasing life expediency.

RN01S14 - Researching Old Age

Life course models: From deconstruction to diversity
Kathrin KOMP (Helsinki University, Finland) | kathrin.komp@helsinki.fi

Models are of central importance for the social sciences, because they facilitate the understanding of social realities and they simplify discussions. Life course models can help us to better understand the progression of lives, life situations, and social change during the process of population ageing. Currently, the tripartite life course model is predominantly used. This model splits life into the life phases of youth, middle age, and old age. These life phases are equivalents to the years before, during, and after workforce participation. However, the tripartite model is criticized on many grounds, for example because it neglects the structuring effects of informal care-giving, heterogeneity in old age, and gradual transitions in and out of work. Consequently, researchers deconstructed the tripartite model and they made several suggestions on how this model could best be updated. This presentation furthers the discussion on life-course models by suggesting the use of several instead of just one model depicting life-courses in modern Western societies. Moreover, it makes suggestions on which combination of models would be both, parsimonious and accurate. The analyses examine cross-sectional and longitudinal data from across Europe, using the “Survey of Health, Ageing and Retirement in Europe” and the “European Social Survey”. Findings enhance discussions in ageing and life-course research. Additionally, they help us to better capture social inequalities and social change.

Discussing Meaning and Ageing: Languages and Methods
Ricca EDMONDSON (National University of Ireland, Galway, Ireland) | Ricca.Edmondson@nuigalway.ie

To make ageing intelligible or inviting, gerontologists need to be able to discuss at least some positive meanings attached to older age. This paper starts by dissecting respects in which contemporary cultures occlude older people’s points of view and opinions, making it harder to appreciate and take them seriously.
However, in the study of ageing, a number of types of positive meaning are attributed to later life, even if they are often approached obliquely. This paper divides such approaches into three groups: those concerned with connectedness of different kinds; those concerned with time and the life course; and those concerned more directly with ethics, the human condition, and wisdom.
Each of these groups contains three further divisions. All demand attention to the ‘inter-human’ nature of social action if they are to be understood and analysed thoroughly, and thus have definite methodological implications.

This paper spells out some of these implications in relation to the last category, wisdom, discussing how it can be traced in connection with older people and what benefits there might be from doing so. It puts forward a model of wisdom suitable for use in gerontology: one stressing the social transactions of both daily and public life, and the capacity of small-scale behaviour to contribute to humane deliberation: one that responds constructively to the turmoil of everyday lives. Openness to wisdom of this kind could concentrate attentiveness to what older people do and say, emphasising the potentially illuminating nature of the meanings they have to offer.

**Dementia and the moral order**
Trude GJERNES (Nordland University, Norway) | trude.gjernes@uin.no

Dementia and the moral order
Dementia is a neurobiological condition with various social and behavioral consequences. Neurological progress of dementia leads under certain circumstances to social and cultural challenges. The aim of the paper is to study and discuss how institutions try to control the social and cultural manners of persons with bodily and biological restrictions because of dementia. People diagnosed with dementia are often inmates in social establishments or institutions meant to provide care for such patients. Part of this caring function is to control social situations through careful planning and governance of for instance eating situations. The study is based on observations from a day care center in Norway. We are concentrating on the meeting of such biological issues as neurological decline and need for nourishment on the one hand, and how these biological claims are met and handled socially and culturally in institutionalized eating situations. The study is informed by Norbert Elias ideas about civilization. The civilized is understood as the normal. The study is also informed by the sociology of the body. The body is understood as a biological entity with biological needs and limitations but also as a normatively regulated social body. Ordinary social environments presuppose a well-functioning body with no anomalies. The demented body have some anomalies and institutions like the day care center are faced with the problem of how to civilize or domesticate the “demented body”. Our paper focuses on how such challenges are managed in eating situations.

**Formalised research ‘ethics’ and the reproduction of social inequalities within ‘the field’: Othering practices, resistance and (dis)empowerment in research involving older ethnic minority people**
Maria ZUBAIR (University of Nottingham, United Kingdom) | maria.zubair@nottingham.ac.uk
Christina VICTOR (Brunel University London, United Kingdom) | christina.victor@brunel.ac.uk

Research involving older ethnic minority people, as with older people more generally, is often presented as being fraught with significant methodological and ethical challenges. A key concern has not merely been with the difficulties experienced in terms of access and recruitment, but also with the perceived vulnerability of these social groups within the research process. The ‘ethical’ conduct of research with this perceived vulnerable group in turn continues to be defined and regulated through formalised research ethics frameworks and structures. However, an emerging body of scholarly literature is now beginning to point to how official research ethics frameworks and regulations, and the assumptions that underlie these frameworks, are often incongruent with the realities of ‘the field’ for the researcher and the participant and their own lived experiences of research. In line with this literature, we will draw
on some of our own experiences of fieldwork with our older Pakistani Muslim participants in our ESRC New Dynamics of Ageing study: Families and Caring in South Asian Communities, to present a critique of the formalised research ‘ethics’ for engaging in a routine process of othering and disempowering of the older and ethnic minority participant. We will conclude the paper by arguing for the need for a more systematic and thorough consideration of how the formalised frameworks, and the agendas and processes employed by White, middle-class and bureaucratic institutions may be perceived and experienced (and hence often resisted) by certain older populations as putting them in a particularly vulnerable or less desirable position.

**RN01S15 - Ageing, Social Roles and Norms**

**Subjective well-being: social roles in older age in contemporary Poland**
Stella GROTOWSKA (University of Wrocław, Poland) | stella.grotowska@gmail.com

Although today the aging of societies is a fact, it is not obvious which direction societies will take in facing the phenomenon. Most likely, the needs of elderly people will become more visible and social institutions will not stay indifferent and will provide help to those people in almost every area of life – business, work, social services (especially medical and educational), culture and religion.

In the personal dimension aging and old age involve changes of social status, roles, and self-identification. One of the first rules an individual learns in their socialisation process is to “act your age.” This rule refers to social diversity in the context of age. It is related to particular social roles available to a member of society as well as the way these roles are played in various life stages. This raises questions about the place of senior citizens in society. Their place is defined by social roles. Do any roles referring to old age emerge as a result of demographic changes? How are social roles available to the elderly changing today? This paper aims at presenting a brief review of a basic repertoire of social roles intended for or available to elderly people, and of tendencies in the way those roles change. This paper is an attempt to analyse this process from the perspective of one of the elements of social structure, i.e. social roles. This analysis was to indicate the direction of the population aging process.

**Active ageing and the impact of values, norms and opinions in the European context**
Ladislav RABUŠIC (Faculty of Social Studies MU Brno, Czech Republic) | rabu@fss.muni.cz
Beatrice CHROMKOVÁ MANEA (Faculty of Social Studies MU Brno, Czech Republic) | manea@fss.muni.cz

Very low levels of fertility and the ageing of societies have been regarded as one of the most important population challenges of the 21st century. The increasing life expectancy corroborated with a sharp drop in fertility has significantly changed the demographic structure of population in many post-modern societies. Consequently, pre- and post-retirement period, as well as, health, quality of life and well-being issues have been taking a more significant position within both academic and policy-making debate. Last period has seen an increasing academic and policy interest in the topic of active ageing, which was crowned by the development of the active aging index (AAI). The active ageing index (AAI) is based on four main dimensions – employment, participation in society, independent living and capacity for active ageing (e.g. Zaidi, 2013). Latest results indicate that contribution of each component of AAI to the total value of the index differs among EU countries. Analysing active aging indicators in a cross-country perspective can help quantify and compare the various impacts of different aspects such as
values, attitudes, social, political and cultural context, policy measures or economic indicators. The focus of this paper is to map and test the association between various values, attitudes, norms and active aging indicators in the European context. We will answer the following research questions: 1) How are attitudes, values, norms associated to active aging indicators of population in Europe?; 2) What are the patterns of norms, attitude and values related to active aging index across Europe? We are interested in the cross-national perspective and the European Value Survey will be used to seek the answers to our research questions.

Are active-agers overloaded by their social roles?
Lucie VIDOVICOVA (Masaryk University, Czech Republic) | lucie.vidovic@seznam.cz

People coming from, and living in family structures are, later in life, more likely to be exposed to several highly demanding roles, with fluctuating resources for their successful fulfilment. The demographically and fiscally driven economic situation requires them to stay in the labour market longer than previous generations, while new social norms push them to express their youthful “third age” Self, pursue their own pleasures, and be socially productive. Yet, at the same time, the pressure created by family obligations does not fade away but rather intensifies. This situation challenges the classical notion of a bell-shaped distribution of role overload (Lee 1988), which suggests that, as an individual moves through his life course, possibly conflicting roles pile up in the middle years, while the complexity and size of the role sets tend to decrease in later life. This opinion is in some ways congruent with disengagement theory (Cumming, Henry 1961), but does not take into account more recent challenges creating new role expectations and pressures for ageing people in post-modern (Katz 2000), age non-integrated (Loscocco 2000) societies. In this paper, we look specifically at the young-old cohorts (aged 50-70) and their social roles. On the basis of a representative survey carried out in 2014 in the Czech Republic, we show that people at this stage of life contend with, on average, seven key social roles, about half of such people experiencing intensive levels of stress and role overload. We discuss both the structural and familial backgrounds to these role sets and their relation to well being in general.

Post retirement travel and the circulation of expectation
Russell Stephen HITCHINGS (University College London, United Kingdom) | r.hitchings@ucl.ac.uk
Susan VENN (University College London, United Kingdom) | s.venn@ucl.ac.uk
Rosie DAY (University of Birmingham, United Kingdom) | r.j.day@bham.ac.uk
Julia HIBBERT (University of Birmingham, United Kingdom) | j.f.hibbert@bham.ac.uk

This paper begins with how different social science traditions frame the topic of older person mobility and the tensions that exist between them. In particular we stage a dialogue between how travel on the part of older people is commonly understood by those in the fields of gerontology and tourist studies. Then we turn to the broader question of how expectations for post-retirement travel circulate within society at a time when older people are often taken to represent a growing area of travel demand. Where do ideas about where and why older people should be travelling come from, how are they received by older people themselves, and what does this all tell us about how change comes about?

In seeking to answer these questions, we draw on findings from a UK study of leisure travel and the retirement transition. In this we spoke with leisure and travel service providers (n=10), those aged 50-55 and not yet retired, recent retirees aged 60-69, and a third group aged 75 and over (n=60). We reflect on how representatives of the travel industry and these three groups discuss the changing role of leisure travel in older lives and highlight the implications in terms of what societal ageing will mean for future mobility.
The specifics of "Carnival space" – description of the intimate customs and social life of elderly in sanatoria

Urszula Anna SZCZEPANKOWSKA (University of Warsaw, Poland) | u.szczepankowska@op.pl

Behavioural aspects themselves generate ever more interest among researchers active in various areas of learning. In Polish research literature, contemporary customs are still presented in a fragmentary manner. I am of the impression that in Poland only marginal interest is evoked by intimate customs of older people. While the sexual and emotional life of senior citizens, particularly set in the context of life-span psychology is a popular topic of research, in Poland this aspect of life of the elder social group still continues to be taboo.

In this paper I'd like to present the results of my research – quasi-standardised individual interviews with elderly will be supplemented using 5 psychological scales and tests, observation (open and no-open) – in the 3 spas most popular with older people in Poland.

Holiday circumstances were defined by me as time of stays in sanatoria, when one “can afford to do more”. This, in a way, is the clash between something that can be termed as strictness, conservatism of customs with lust and somewhat liberal sensuality. Carnavalising culture and customs is nothing new – it was described by, among others, Bakhtin in his volume entitled Issues in Dostoyevski's Poetics. His literary expert approach may be related to liberalising attitudes, effacing the rules normally applicable in the world and officially adopted hierarchies. A stay in a spa understood in such context is as though 2-3 weeks of “letting one’s hair down”, return to days of youth, gowns, going outside the daily roles. The question is whether this is really so, and if so, what sort of behaviour is it and what is behind it. In sanatoria, besides lasting or short lived love, including romances, some friendships are also struck.

RN01S16 - Ageing, Images and Attitudes

A Different Type of Ageing? Self-concepts of Elder Gay Men

Lea Johanna SCHUETZE (Ludwig-Maximilians-University Munich, Germany) | lea.schuetze@soziologie.uni-muenchen.de

Current discourses about 'active ageing', old-age poverty or on deficits in elder care often mark age and ageing as universal experiences. To do justice to demographic differentiations in Europe, specific research about age in an intersectional perspective is needed. Following this approach my contribution at ESA 2015 would like to shed light on ageing processes of elder gay men. As there is no universal experience of 'gay ageing' and no common figure that implies certain ways of ageing for male homosexuals, my leading question is how gay men in the 'third age' (60-80) create concepts of their selves and how they individually integrate patterns and pictures of ageing. Within a qualitative research design, semi-structured Interviews with gay men were conducted. Focusing on my data, I would like to point out how their self-concepts integrate the dimensions and especially the intertwine of (male) homosexuality and age. Secondly, I want to ask if these ways of ageing seem to be different from non-homosexual ageing processes. Considering a queer /poststructuralist theoretical framing I would also like to discuss if findings of “other” ageing can be seen as a construction due to the dualism of hetero- and homosexuality. In a queer perspective common beliefs about what determines age and what is 'normal' and 'non-normal' about ageing can be challenged. Following this agenda I want to give insights in my empirical findings and follow the question if a somehow ‘different’ ageing can be found.
Paulina ŚWIĄTEK-MŁYNARSKA (Jagiellonian University, Poland) | paulina.swiatek@poczta.onet.eu

The aim of this paper is to analyze the image of elderly women and elderly men functioning in Polish popular culture texts (such as soap operas and TV commercials), which have a major impact not only on the development of the stereotypical image of seniors, but also the formation of social norms about how to live and displaying their sexuality in old age. Modern and developed (not only) European societies face the demographic challenge of an aging population. This process progresses most rapidly in developing countries, to which Poland is classified. In this context, it is important to understanding the problems of the elderly, very often seen through the prism of stereotypes associated with old age. Elderly people often are treated by social scientists as a homogeneous category in terms of gender. Seniors gender identity is not paying too much attention for gender studies, or social gerontology. The biomedical model is dominant - the old men and women is referred to as sexual beings, if you are considering the diseases associated with the male or female reproductive system. Images of elderly men and women have been analyzed in the most popular Polish TV series (last 10 years emissions), and commercial advertisements. The analysis focused on issues such as the very presence of men and women (makeup, clothes, etc..), exhibited social activity, and the context in which seniors are portrayed. It turns out that the way of presenting old men essentially no different from the young characters of the same sex, while the old woman (other than young and middle-aged) are presented through the prism of the role of grandmother. The paper is an attempt to explain the reasons for this situation.

Age Segregation as reflected in the Dutch news media
Dorota LEPIANKA (Utrecht University, Netherlands, The) | d.a.lepianka@uu.nl

The study to be presented in this paper rests on the assumption of an active role of the media in the processes of the (re-)establishment of boundaries between specific social groups, such as between older and younger people. Indeed, considering the prevalence of age segregation in virtually all domains of social life, including institutional and spatial arrangement and the resulting infrequency of direct contacts between younger and older people, it is plausible that it is predominantly through the media that a socially shared matrix of inter-generational relations is constructed and/or reinforced; if not directly – e.g. by disseminating specific patterns of behaviour, then indirectly – by propagating specific (group) stereotypes. Therefore, the central question to be addressed in the paper pertains to the nature of relations between the older and younger people as (re-)constructed in Dutch print media. A qualitative content analysis, conducted on a sample of articles from two broadly read Dutch newspapers at four different points of time (in 2010 and 2012) allowed distinguishing three main types of relationships between older and younger characters presented in press reports: (parallel) coexistence, (direct) interaction and (indirect) conflict. The nature of each form of media-constructed relationship and their social implications will be discussed.

Students’ attitudes toward old people: A comparison of Portuguese and African Students studying in Portugal
Stella BETTENCOURT DA CÂMARA (ISCSP - ULISBOA, Portugal (School of Social and Political Sciences - University of Lisbon)) | scamara@iscsp.ulisboa.pt

The increase of older population has two important implications for social work students: (1) an increase demand for social workers; (2) the need for social workers to be prepared for working with old people and their families and for dealing with the changes that this ageing will bring to all settings and fields of practice. Now, the attitudes of social workers toward old people can have a significant impact on the quality the services they render. Studies made in several European and non-European countries have shown that social work students have positive attitudes toward old people.

Is this also true of the Portuguese case? And, if so, are there any relevant differences between Portuguese and African students attitudes, given that they came from different cultural traditions regarding the role and status of the old?

In the present study the Kogan Attitudes Toward Old People Scale (1961) was applied to 36 social work university students (18 Portuguese and 18 African). The aim is to present some of the results thus obtained, namely with regard to the relationship between the students’ ethnicity and (a) age; (b) gender; (c) whether the student had lived with grandparents; (d) whether the student had regular contacts with senior adults outside their families; (e) whether they considered working with older adults after graduation. The results suggest that there are, indeed, some differences in attitudes between Portuguese and African students, despite of the fact that eight of the latter have lived in Portugal most of their lives.

RN01S17 - Experiences of Ageing

Experiences of exigencies and choices: meanings assigned to relocation in old age
Paula Helena VASARA (University of Jyväskylä, Finland) | paula.vasara@jyu.fi

Western welfare states aim to enable living a good life. One of the perimeters conditioning experiences of wellbeing is housing. In Finland, growing old at own homes is widely supported, but there have begun to appear tentative studies questioning this unilateral emphasis. Possibilities for financing and organizing public universal services are currently under scrutiny and new kinds of divisions of responsibilities and provisions of services are being proposed. Currently the decreasing public services are targeted at enabling continuing living at home, and mainly concentrate on ensuring only the physical health and safety of older persons, thus leaving little room for acknowledging other aspects of wellbeing, such as opportunities for participation and agency.

The purpose of this study is to explore the meanings assigned to housing in old age. The data consists of interviews gathered in MOVAGE Moving in Old Age: Transitions in Housing and Care research project. Narrative analysis is employed to consider how older people aged 75 or older perceive their housing issues in regard to their quality of life. What kinds of transitions or continuums are considered possible, expected, accepted or exigent? What kinds of meanings are attached to these possible continuums and transitions?

Identity talk from 'young' older workers
Karen Maria HANDLEY (Oxford Brookes University, United Kingdom) | khandley@brookes.ac.uk
The mainstreaming of compulsory education and state pensions in the 20C has shaped expectations about work, career and the lifecourse, institutionalising and reifying the temporal boundaries of a working life. ‘Younger’ workers – particularly those engaged in knowledge work – are encouraged to be entrepreneurial or climb the corporate ladder; whilst ‘older workers’ tend to be positioned as ‘on the decline’ before crossing the work-life boundary into retirement. This ‘unitary’ (and to come extent, gendered) identity is a product of a modernist capitalism (du Gay, 1996) that has since fragmented due to greater workforce heterogeneity, and increasing complexity of career pathways in post-Fordist organisations (Ainsworth and Hardy, 2004). Yet assumptions of a homogenous category of ‘older workers’ persist, leading scholars to call for more attention to the diversity which abounds within this group (e.g. Vickerstaff, Loretto and White, 2007).

Our paper contributes to this call by presenting a qualitative study of an under-researched 'missing middle' - those in their late 40s or early-to-mid 50s engaged in knowledge sectors of the UK economy. Workers in this age-group are subject to a range of discourses, for example about 'mid-career' plateaux, "weary women" (Pritchard, 2013), 'active ageing' and 'active retiree'. Using Clarke’s approach to situational analysis (2005), we use interview data to examine how workers position themselves as workers through the performative function of talk, and we map the identity positions enacted and resisted, as well as those expected-but-unseen among participants. Our paper discusses issues around [in]visibility, 'potential', agency, identity, and generational relations.

**Attachments of Feeling: The Significance of the Aesthetic for the Support of Older People.**

Joanna Eleanor CROSS (University of Bristol, United Kingdom) | j.e.cross@bristol.ac.uk

In gerontology aesthetics is acknowledged but under-theorized, or premised on representational practices rather than their source material. Hence the potential of an applied aesthetics within cultures of ageing, operationalised according to the Kantian legacy as much as the transformational aesthetics of Dewey (1934) and the contributions of contemporary theorists to environmental aesthetics and aesthetics of the everyday. I further develop Dewey’s pragmatist influence by conceptualising creativity in action theoretical terms (Joas, 1996). My aims have been to determine whether such positions deepen our understanding of later life identities, or de-humanisation in the meeting of need and the constitution of creativity in practice.

Fieldwork has involved a multicultural sample of 31, urban dwelling, older people, recruited from social hubs and groups for the visually impaired. Methods have integrated auto-driven, photo-elicitation or reflections with in-depth interviews, organized around themes exploring participants’ cultural attachments and social networks. Data was analysed through a synthesis of performative/dialogic and discourse methods (Reissman, 2008; Rose, 2007).
Findings include: firstly, the interstitial nature of both aesthetics and creativity, this consistent with the ‘aesthetics bonds’ that constitute individual authority and ontological security in later life. Secondly, an aesthetically grounded critique of art or nature-as-therapy discourses directed at older people. Thirdly, creative support and survival is a crafting of experience (Sennett, 2008), lending ‘truth to the materiality of later life’. I conclude that this applied aesthetics approach provides a challenge to culturally conditioned, normative assumptions of ageing and a relevant model for hybrid and divergent life styles and identities.

‘Is this really where home is?’: Experiences of ageing and ‘home’ in a revisited ‘homeland’ among Azorean returnees
Dora Sampaio (University of Sussex, United Kingdom) | d.sampaio@sussex.ac.uk

The literature on ageing commonly tends to associate ‘old age’ with ideas of decline, frailty and dependency. As a result, older people are often regarded as sedentary and immobile. International migration seems, however, to help put these ideas into perspective. This is for example the case of international labour migrants who face the dilemma of returning ‘back home’ in later-life. The proximity to retirement age emerges as an opportunity to a sometimes long-planned, long-delayed return, often prompted by idealised imaginaries of ‘home’ or the presence of older family members left behind. On the other hand, there is a life built in the host country where their children (and sometimes grandchildren) have put down their own roots. Combined, these factors add great complexity to the lives of later-in-life return migrants. Based on 30 in-depth life narrative interviews and a six-month ethnographic fieldwork in the Azores with later-in-life Azorean returnees (mostly from the USA and Canada), this paper aims to explore these migrants’ ageing experiences, integration paths and coping strategies upon return. In some cases return has represented self-realisation and the corollary of a hard working life abroad; in others, loneliness, absence of family and social isolation have led to narratives of disappointment and non-belonging. However, in most cases, and sometimes in light of major life events such as the death of a spouse or the birth of a grandchild, there seems to be an in-between situation marked by a permanent renegotiation of ‘here’ and ‘there’ and a re-hypothesising of later-in-life (im)mobility.

RN01S18 - Active Ageing

Patterns of activities among retirees in urban environment
Anna Pawlina (Cracow University of Economics, Poland) | anna.pawlina@uek.krakow.pl

Ageing and urbanisation are main trends that shape modern world. The population of European cities is getting older and this process has its consequences in different aspects of social life. One of the main challenges is created by the transition from professional career into retirement. The aim of this paper is to present what are the patterns of activities undertaken by retirees in urban environment. The main question is how the choices of young retirees (people who have been retired for no longer than 10 years) are linked with their situation in urban environment. The study was carried out in Cracow, one of the main polish cities in period between 2012-2015. There were 206 participants who answered the question in a survey. The statistical analysis (Hierarchical Cluster Analysis, and further cluster profiling) helped to distinguish 2 patterns of activities connected with demographical characteristics of young retirees and their attitudes toward the urban space.
The results of the research are interesting especially in the context of the concept of active ageing that seems to shape the urban social policy towards elderly as they help to understand how the choices in sphere of being active are constructed in urban environment.

Clustering of social and community participation for an active ageing and explaining factors in older adults in Spain
Fermina ROJO-PEREZ (Research Group on Ageing. Institute of Economics, Geography and Demography; Spanish National Research Council (IEGD; CSIC). Madrid, Spain) | fermina.rojo@csic.es
Vicente RODRIGUEZ-RODRIGUEZ (Research Group on Ageing. Institute of Economics, Geography and Demography; Spanish National Research Council (IEGD; CSIC). Madrid, Spain) | vicente.rodriguez@csic.es
Gloria FERNÁNDEZ-MAYORALAS (Research Group on Ageing. Institute of Economics, Geography and Demography; Spanish National Research Council (IEGD; CSIC). Madrid, Spain) | gloria.fernandezmayoralas@csic.es
Jose-Manuel ROJO-ABUIN (Statistical Analysis Unit; Centre for Human and Social Sciences; Spanish National Research Council (UAE; CCHS; CSIC), Madrid, Spain) | josemanuel.rojo@cchs.csic.es

*Background*. From the perspective of an active behaviour at individual and ageing contexts, this paper aims at assessing the profile of older-adults related to their involvement in social and community participation activities, which can promote an active ageing to enhance quality of life, and associated factors.

*Data and methods*. Data come from the Ageing in Spain Longitudinal Study, Pilot Survey (ELES-PS), a representative sample of 1,357 weighted community-dwelling people aged 50+ years in Spain. Clusters of homogeneous groups of individuals with similar patterns of social and community participation activities comprised the response variable. Socio-demographic, personal and contextual data were the independent variables. Bivariate and multivariate analyses (factor, cluster and categorical regression with optimal scaling) were run.

*Results*. The active ageing profile resulted in a model composed by four groups of older-adults, a main group with low overall level of performing activities and three differentiated clusters of more active people. Categorical regression explained an R²=0.157 through eight factors (p-values<0.05) related to socio-demographic and social features (activity status, educational level, face-to-face contact with friends), functional ability and accessibility to cultural, sport and recreational facilities. Satisfaction with leisure time and perception of problems in the neighbourhood completed the model.

*Conclusions*. This is a suitable starting point to knowledge the current active behaviour of older-adults. Nevertheless, as it is originated throughout the life-course, research on active ageing must be taken as a multidimensional phenomenon to obtain a greater proportion of variance explained and from a longitudinal approach to find out the causal determining factors.

Stay Active, Stay Well: Protection and Risk Factors in Later Life
Stefania Giada MEDA (Università Cattolica del Sacro Cuore di Milano, Italy) | stefania.meda@unicatt.it
Donatella BRAMANTI (Università Cattolica del Sacro Cuore di Milano, Italy) | donatella.bramanti@unicatt.it

In Europe the aging population is a major and irreversible phenomenon and a growing attention should be devoted to the conditions under which this transition occurs.
This work explodes the concept of active aging and aims to understand whether and to what extent being active in later life in one or more life domains is associated with well-being (anzianiinrete.wordpress.com). In particular, what life strategies individuals who report higher levels of well-being and satisfaction do put in place? In what areas are older adults more engaged and what modus vivendi brings about greater satisfaction and well-being? What factors are likely to determine the most satisfactory modus vivendi?

Through synthetic indexes, cluster analysis (SPAD software) and logistic regressions (Maximum Likelihood Estimation method) on a stratified and randomized sample, representative of the Italian population of people aged 65-74 years (N=900), we were able to show gender differences: elder men report higher levels of satisfaction and wellbeing in health and physical activity, while women are potentially more fragile. Elder women tend to define their well-being in terms of caretaking relations, while men invest more on their individuality. We were also able to outline different modus vivendi, from individualistic withdrawal (no activity) to selective engagement (activity only on some life domains) to social generativity (activity on all life domains), whose main predictor is cultural activity.

What emerges is of primary importance for those who now deal with ageing, both to understand the peculiarities of this population and redefine effective social policies.

'Active ageing' in transnational social spaces. Social remittances in transnational networks of Polish migrants

Łukasz KRZYŻOWSKI (Humboldt-Universität zu Berlin, Germany) | lukasz.krzyzowski@hu-berlin.de

Activity among the elderly is perceived by Polish migrants as one of the most differentiating attitudes which distinguish Polish society from British and German societies. Based on TRANSFORmIG’s first wave qualitative interviews (N=130) conducted in Germany, the UK and Poland, the paper considers transfers of socio-cultural practices related to the notion of ‘active ageing’ in transnational social spaces. The paper investigates transfers of practices that constitute the notion of ‘active ageing’ in transnational social networks and reactions to them among non-migrant members of the networks. The “Polish case” is instructive because of the differential context between Poland’s relatively culturally homogenous society and the comparatively heterogeneous (in terms, for example, of ethnicity, religion but also life-styles of elderly people) British and German societies. For people who have migrated from more homogeneous settings (such as Poland), it might be surprising that social practices of old people in UK or Germany are different than in the country of origin (Poland). The ‘surprise effect’ may have an influence on migrants’ practices, ideas, and norms identities (Levitt 1998, 2001, 2013), all of which might be transferred transnationally via social networks changing Polish old age culture(s). Research confirms that migrants sustain intense communication with their family members in Poland who change social practices related to old age because of migrants’ influence.

Active aging and Internet use among older adults

Marja J. AARTSEN (VU-University Amsterdam, Netherlands, The) | m.j.aartsen@vu.nl
Eugene LOOS (University of Amsterdam, Netherlands, The) | e.f.loos@uva.nl

Background:
Active aging is proclaimed by the WHO as a good strategy to combat the adverse consequences of the aging of societies (WHO, 2002, p. 12). New Internet and Communication Technologies may be in important mean to assist people with active aging. The current paper
investigates to what extent developments in physical, mental, and social well-being, and participation in social, economic, cultural, spiritual and civic affairs are enhanced by the use of Internet.

Data:
Data are from the Longitudinal Aging Study Amsterdam (LASA), an on-going longitudinal, multidisciplinary cohort study on a wide range of factors related to physical, cognitive, psychological and social functioning in older adults in the Netherlands. The baseline data collection was conducted in 1992–1993, with three-yearly follow-up measures and other additional data collections. For this study, data were used from respondents who participated in the fifth and sixth measurements; that is in 2005–2006 (N=1,257) and 2008–2009 (N=985).

Results:
Logistic regression analyses revealed that, while controlling for age, internet use in 2005/06 significantly changes the odds for a successful development from 2005/06 to 2008/09 in cognitive functioning (OR=13.2, p=.00), in the provision of emotional support (OR=3.31, p=.00), but not in functional limitations, depressive symptoms, provision of instrumental support, loneliness, satisfaction with life, self rated health and social activities. This positive effect of Internet use on cognitive functioning was sustained even when controlling for reversed causation.

Conclusion
Internet use is beneficial for cognitive functioning, and contributes to an active old age.

RN01S19 - Ageing, Education and Human Capital

Mind the gap: Global demographic ageing and elderly human capital from 1980 to 2010
Mustafa Murat YÜCEŞAHIN (Department of Geography, Faculty of Letters, Ankara University, Ankara, Turkey) | mmyucesahin@yahoo.com
İbrahim SIRKECI (Regent’s Centre for Transnational Studies, Faculty of Business and Management, Regent’s University London, United Kingdom) | sirkeci@yahoo.com

Population ageing is increasingly a global phenomenon and yet there is a great variation among countries and regions. While this demographic shift alarmed policy makers and researchers alike due to the likely threat for future social and economic well-being of societies, the ongoing trend characterised by improvements in educational attainment levels among the elderly populations is also of great importance for the potential future human capital imbalance across societies.

The paper focuses on restructuring shifts in global aging patterns and related country-specific changes through a cross-sectional analysis in the years 1980, 1990, 2000, and 2010. Firstly, factor analyses were carried out to both identify the underlying dimensions that shape and reshape global aging patterns and analyse the structural differences at the country level. Factor loadings were used to map the structural changes of global aging patterns by ten-year intervals. Secondly, Multidimensional Scaling Analysis was applied to reveal changes in the position of countries by selected variables between 1980 and 2010. In addition to conventional aging indicators taken from the United Nations, we used IIASA-VID updated country-specific data on the proportions of educational attainment of the elderly population.

It is found that while overall, educational attainment levels among the elderly have increased across the world, the pace of development was significantly different between the countries ranked at the bottom of the Human Development Index and others. As a result, the gap in terms of human capital between the less developed countries and others has grown.
Changing regional school infrastructure in the wake of ageing and declining populations
Walter BARTL (Martin-Luther-Universität Halle-Wittenberg, Germany) | walter.bartl@soziologie.uni-halle.de

Many European regions have seen waves of falling birth rates and outmigration during the last decades resulting in ageing and declining populations while others continue to grow. The trends of ageing and declining populations are most concentrated in countries of South and Eastern Europe but on a regional level other countries are affected as well. On the one hand, in the context of significant budget constraints for many states these demographic trends create political pressure for educational downsizing. On the other hand, the commitment of the welfare state to provide equal education opportunities sets normative limits to thinning out the net of schooling facilities. One could even argue that the decline of the economically active population (in the long) run creates even political pressure for additional investments in human capital in order to sustain high productivity levels of the future workforce and in order to avoid social exclusion of vulnerable groups. Hence, the strategies of adapting school infrastructure to a declining target population are usually highly contested between interest groups. What are the patterns and outcomes of these political struggles?

The proposed contribution investigates this question based on data for the East German state with the most pronounced population decline since re-unification. In a first step the two types of data (official statistics [1991-2009] and regional press [1991-2014]) are analysed separately. In a second step these two types of data are combined using event history analysis.

Unequal social participation in later life: Disparities in volunteering and educational activities in Germany
Julia SIMONSON (German Centre of Gerontology, Germany) | julia.simonson@dza.de
Claudia VOGEL (German Centre of Gerontology, Germany) | claudia.vogel@dza.de
Christine HAGEN (German Centre of Gerontology, Germany) | christine.hagen@dza.de
Andreas MOTEL-KLINGEBIEL (National Institute for the Study of Ageing and Later Life (NISAL), Linköping University, Sweden) | andreas.motel-klingebiel@liu.se

The concept of active ageing comprises the maintenance of societal participation throughout the life span into old age. ‘Good’ ageing in line with this activity paradigm develops into a starting point of social inequality rather than being its result. In our study, we investigate the access to and dynamics of volunteering and educational activities depending on social and spatial aspects of inequality. Our analyses (descriptive and multi-level analyses) are based on two waves (2008, 2011) of the German Ageing Survey (DEAS), which is a nationwide representative cross-sectional and longitudinal survey of the population aged 40 and older in Germany.

Results reveal that societal participation is socially and spatially structured: Individuals of a lower social class are less often involved in educational activities or in volunteering - both, in middle and later life. Moreover, our findings indicate that individuals living in economically disadvantaged regions are less likely to participate than in economically strong regions. Longitudinal analyses show that individuals living in advantaged districts more often remain active over time than individuals living in less advantaged districts. In addition, disadvantages cumulate in case that low individual resources overlap with poor economic conditions in the living area.

Therefore, aiming to improve the participation of individuals of lower social classes in later life, measures to facilitate participation on the local level should be taken to enhance opportunities for volunteering and educational activities.
Learning in Higher Age - Social and Educational Aspects
Claudia GERDENITSCH (University of Graz, Austria) | claudia.gerdenitsch@uni-graz.at

Europe is concerned with age-related demographic shifts and effects of increased expectation of life: more and more people reach increasingly great age. Thus, it is common to speak of Europe as an ‘ageing society’. Yet, this metaphoric figure is not the only one meant to describe Europe’s societies. Regarding to self-description and concerning political strategies Europe, too, has to be considered as a ‘knowledge society’, with ‘lifelong learning’ as one of the key-concepts. The combination of both figures in discourse – ageing society and knowledge society – introduces a challenging perspective to research not as yet fully taken into account in research and practice, especially in education.

Within the concept of knowledge society several hopes are put on _knowledge and learning_ (e.g. concerning the reduction of social differences and inequalities ascribed to industrial production). But several studies show that these hopes did not come true: traditional differences and inequalities increased and social tensions did not diminish either. Efforts in promoting Lifelong Learning/Education either have not yet developed their full power or have come to their limits for several reasons.

From an educational point of view, the paper discusses the following topics:
- 'Social Participation' and 'Inclusion' typically apply to social education or special education. However, these concepts offer promising approaches for educational gerontology/gergogy.
- Most of the research dedicated to lifelong _learning_, in fact, focusses on lifelong _education_ in terms of courses and institutionally shaped provisions. At the same time, it is well known that learning in higher age increasingly takes place in _informal settings_, and a huge group of learners in higher age does not participate in formal courses. Thus, research itself neither is inclusive nor representative with regard to learning activities on the whole. This has (problematic) effects on the science-based construction of age-related stereotypes. Furthermore, scopes of educational support for learning in higher age remain unused.
- Many theorists of ageing claim that a complete understanding of human life required a full understanding of ageing. My claim is that this also applies to education: research into learning in higher age offers new insights into learning as a human activity over the lifespan. Thus, education in theory and practice will benefit from ageing studies in education, in that ageing may reveal yet unseen aspects of learning in younger ages. It will allow a better understanding of what it means to grow old in an ageing knowledge society.

The paper deals with theoretical and conceptional aspects of ageing and fits into the thematic area of _Ageing and the Lifecourse_.

RN01S20 - Inter- and Intra-generational Relations of Older People

Local Centers for Support Elderly as an example of social and intergenerational integration
Grzegorz Piotr GAWRON (University of Silesia, Poland) | grzegorz.gawron@us.edu.pl

The aging population is a challenge for the present. This means the necessity meets the needs of the growing group of people with specific requirements and legitimate aspirations for worthy
quality of life. An interesting response to the observed process are the Local Centers for Support Elderly – initiatives undertaken in many polish cities during last few years. The Centers provide daily support for seniors who are feeling lonely, suffering from various health problems, wishing to stay in a group, make new social contacts, spend their free time in a friendly environment and take care of their physical and mental condition. Many times Centers operate with Daily Support Centers for Children giving the possibility of integration between generations. Seniors visiting children during occasional meetings and daily activities. Acting together, they are broken down the stereotypes about older people and also changes the way of think about being old. Prepared description of the Centres initiative will show how to effectively activate seniors and keep them in a good mental state; to ensure their active participation in social life; how to connect generations; and how to organize trilateral cooperation between: government, NGOs and members of local communities. It will be a source of scenarios initiatives how to increase seniors autonomy and to maintain or enhance their health and quality-of-life as long as possible. They enhances the knowledge and skills enabling older people to fully participate in society as well as intergenerational integration.

Older adults’ contact frequencies with siblings, nieces and nephews in Finland:
The role of genetic relatedness
Antti Olavi TANSKANEN (University of Helsinki, Finland) | antti.tanskanen@helsinki.fi
Mirkka DANIELSBACKA (University of Helsinki, Finland) | mirkka.danielsbacka@helsinki.fi

Based on evolutionary kin selection theory individuals are predicted to have more contacts with full than half siblings, and more with nieces and nephews via full siblings than via half siblings. To study these hypotheses we use data from the Generational Transmissions in Finland project (n = 2,278 older adults between age 62 and 67 years). We found that older adults have more contacts with full than with half siblings, and more with nieces and nephews via full than half siblings. The results show support for the prediction based on the kin selection theory.

Changing patterns of intergenerational transfer in Spain
Beatriz JIMÉNEZ-ROGER (University of Granada, Spain) | bjmenez@ugr.es

Population ageing represents one of the biggest demographic changes of the 21st century. This situation is characterized by increased longevity, with older people living longer and healthier. The new social and demographic patterns are affecting family types, intergenerational relationships and the social meaning of old age. At European level, data confirm the important weight of the elderly population; being more remarkable the population projections for that group in the short term. The increase in the elderly population leads to an overload in the economic system of the Welfare State, which is increasingly facing a transfer of income to the non-productive population. These issues therefore take on special interest, both empirically and theoretically. The study of transfers, private and public, is affected in a particularly relevant way by the changes in the age distribution of the population since they are conditioned by age (Lee, 1995). Under these circumstances, it has become crucial to analyse the implications of this phenomenon and how it will affect intergenerational relationships and transfers. Several studies have addressed the key role of the family as an important factor in these dynamics and, more specifically, its function as a mechanism of intergenerational solidarity, especially in Mediterranean models, where the traditional family generates high levels of regulation and functional solidarity. However, more recently scholars have highlighted the concept of ambivalence, or the significance of conflicts in the process of understanding intergenerational relationships.
Data from The Survey of Health, Ageing and Retirement in Europe (SHARE) will be a first approach to show how these mechanisms (intergenerational ambivalence and solidarity) operate in Mediterranean context, focusing on the case of Spain. Although different authors have underlined the important role of the family in this context, we need to pay attention to the comparative aspects of different countries and their Welfare State systems to understand how, in light of the changing demographic trends, intergenerational solidarity and ambivalence could operate in different Welfare State regimes.

This phenomenon could be extended to most European countries, so this topic has a special interest at different levels, including both national and comparative analysis. The proportion of people over 65 reaches almost 20% in some European countries, and it will increase in the future. Thus, societies have an unprecedented challenge and chance for current and future generations around the world. Increased life expectancy means that family members should spend more time living together as partners, as brothers and sisters, as parents with their children, or grandparents with their grandchildren. The combination of a longer life cycle and the existence of a smaller number of family members has led to a strengthening of the younger generations and a “verticalization” of family structures in which people can grow up having familiar links more vertical than horizontal. Studies have to pay attention to these changes and identify the economic and social impacts on individuals, communities and society.

To exemplify this issue, as it has been said before, we will focus on Spain. In this country, between 16.5% and 17.3% of the population is over 65 (Eurostat, 2008) and the consideration of the ageing is connected with special characteristics of the Welfare State. According to the intergenerational solidarity model of Bengtson and Roberts (1991) and their classification explaining the patterns of solidarity, the importance of familial support in the Mediterranean model generates high levels of functional solidarity in this regime. This situation linked to present day postmodernist culture creates a condition of ambivalence in the intergenerational patterns. As Lüscher and Pillemer (1998) argue, intergenerational ambivalence causes contradictions at subjective and social structure levels.

The specific objectives focus on three key aspects of this subject: 1. Approach to literature and available demographic data on the ageing societies and their future trends; 2. Corroborate the social change in today’s society and its influence on families and family relationships; and 3. To examine the role of transfers, especially those that occur between different age groups - intergenerational transfers - to support different groups of the population and its distributional effects in the short and medium term objective.

This research will adopt a multidisciplinary approach which will allow us to approach and apprehend the study problem holistically. In any case, without prejudice to use economic, demographic, anthropological considerations, etc., the approach that will guide this study will be mainly from Sociology.

Therefore, for its relevance and future prospects, in light of this changing demography and according to the different Welfare State regimes, we will study changing patterns of intergenerational transfers from a comparative perspective, focusing on Spain.

RN01S21 - Intergenerational Relations in European Context

Between Bottom-Up and Top-Down: Intergenerational Solidarity of the Middle Generation in Europe

Bettina ISENGARD (University of Zurich, Switzerland) | isengard@soziologie.uzh.ch
Ronny KÖNIG (University of Zurich, Switzerland) | koenig@soziologie.uzh.ch
Marc SZYDLIK (University of Zurich, Switzerland) | szydlik@soziologie.uzh.ch
Intergenerational support is an important characteristic of parent-child relationships in contemporary ageing societies, especially in times of societal crises and the withdrawal of the welfare state. Despite the consequences of social and demographic changes during the last decades, the social relations and bonds between adult family generations are impressively strong. Of special importance is the ‘middle generation’, having both older parents and adult children. Against this background, the proposed presentation addresses intergenerational solidarity of 50-70-year-old Europeans. The focus is on those respondents who at the same time support both their parents and adult children, in other words: bottom-up and top-down. We will investigate all forms of functional solidarity, namely space, time (help, care and grandchild care) and money.

The analyses are based on the Survey of Health, Ageing and Retirement in Europe (SHARE) including 14 European countries: Austria, Belgium, the Czech Republic, Denmark, France, Germany, Greece, Ireland, Italy, the Netherlands, Poland, Spain, Sweden and Switzerland. The empirical results reveal the importance of intergenerational support – including space, time and money – in all European societies. Yet, there are striking differences between the countries in regard to functional solidarity in general and the specific transfer patterns in particular. The empirical results show that opportunities and needs of givers and recipients as well as family structures are crucial for explaining differences between the transfer directions (bottom-up, top-down or both) and the various forms of functional solidarity.

Social Exclusion and Intergenerational Transfers
Christian DEINDL (University of Cologne, Germany) | deindl@wiso.uni-koeln.de
Martina BRANDT (TU Dortmund, Germany) | martina.brandt@tu-dortmund.de

Family members help each other in case of need but also due to love and concern for each other. We know that most exchange happens between parents and their adult children and functional solidarity is a crucial dimension of intergenerational relations. We also know that the family often has an insurance function. Until now, however, little attendance is given to exchange patterns within deprived families in different welfare states. We thus assess how transfers between older parents and their adult children are linked to social inclusion across Europe; i.e. do socially excluded give less and receive more money and practical help from their relatives, and do different policy regimes play a role in this? Using the new social inclusion items from the fifth wave of SHARE we focus the effects of deprivation on exchange patterns between older parents and their adult children in a cross-sectional analysis. We distinguish between different kinds and flows of assistance (financial, time, given and received), and consider the possible impacts of different welfare state arrangements on the links between solidarity and inclusion. Multilevel models indicate that less socially included respondents more indeed give less and get more money and help from their adult children all over Europe and thus indeed need seems to play an important role. Moreover, different social policies matter: In countries with higher social inequality and more deprivation not only fewer transfers of time and money are given to but also less is received from adult children.

Intergenerational support to non-coresident ageing parents: the role of family experience, family norms, and country context
Cornelia MURESAN (Babes-Bolyai University, Romania) | cmuresan8@yahoo.com
Paul Teodor HARAGUS (Babes-Bolyai University, Romania) | tpharagus@yahoo.com

Family-life experience during childhood and current family situation could shape both filial norms formation and support behavior of adult children toward their aging parents. In this study we are especially interested on the situation of families where children and parents do not live in the
same household, since family solidarity in the case of intergenerational co-residence is often driven by other motivations and the direction of the help given is rather unclear. With rising parental divorce, proportion of children growing up without their both biological parents increase, and later on this could generate weaker filial responsibilities and less actual support given to aging parents.

Using GGS data from ten European countries (seven from Eastern Europe and three from Western Europe, the latter taken as benchmark countries) we model, first, the strength of filial norms among non-co-resident adult children and, then, the actual support given to mothers and to fathers taken separately. Our main hypothesis is that family experience during childhood has an impact both on filial responsibilities and on helping behavior, but the direct connection between filial obligations and support behavior is stronger. The latter is especially true in Eastern European countries (family-step-in-hypothesis) where the public support is reduced, since it is more critical to act upon beliefs about filial responsibilities because of the more severe consequences that may occur if one fails on obligation norms.

We distinguish between three types of support offered (practical, material and emotional) and we control for other known determinants as: children’s own family situation, their practical possibilities, age, education, and religiosity. Parental needs are also controlled.

Transfers between adult children and elderly parents: Hungary in European context
Márton MEDGYESI (TARKI Social Research Institute, Hungary) | medgyesi@tarki.hu

In times of population aging and its pressure on social security programmes it is particularly important to understand the determinants of intergenerational family transfers. Here we study exchanges of support between elderly parents and their children in Hungary, which is a rapidly ageing country with relatively low state involvement in elderly care. We describe patterns of time transfers and financial transfers using data from the Survey of Health Ageing and Retirement in Europe (SHARE) wave 4. One aim of the analysis is to situate Hungary among the transfer regimes typical in European countries and the other is to describe the main determinants of private transfers and compare Hungary to other EU countries. The occurrence and the determinants of both upward and downward financial and time transfers were studied. Multivariate models of the probability of transfers were constructed with both parental and child characteristics as explanatory variables. Results showed that time transfers (personal care and household help) were received by the more „needy” parents, those living alone and having health problems. A gender bias in support was also evident: parents were more likely to receive help and care from daughters compared to sons. The analysis revealed that time transfers given to children are determined by parental availability (relatively young, not in employment) and also proximity to children. Financial transfers given to children are most importantly determined by parental status (high education, income, employment).

RN01S22 - Ageing, Health and Socioeconomic Factors

Explaining the socioeconomic inequalities in health among the Swiss elderly: a life-course approach
Michel ORIS (University of Geneva, Switzerland (CIGEVE & LIVES)) | Michel.Oris@unige.ch
Rainer GABRIEL (University of Geneva, Switzerland (CIGEVE & LIVES)) | Rainer.Gabriel@unige.ch
Delphine FAGOT (University of Geneva, Switzerland (CIGEVE & LIVES)) | Delphine.Fagot@unige.ch
Given the paradox of continuing persistence of socioeconomic inequalities in health in European countries, we focus on investigating the factors that are associated with physical and mental health in old-age. We use a dataset based on a survey named Vivre/Leben/Vivere which harvested the health and living conditions of the Swiss elderly aged 65 and more in 2011-2012. The sample was stratified by region, sex and by five years age group. Some 3080 individuals filled a life calendar.

First, we measure the deep social differentials in both physical and psychic health among the Swiss aged 65 and more. Then, we look at the life course construction of those inequalities, testing several hypotheses: the social stratification or early life conditions; the accumulation of (dis)advantages; social mobility; selection; and the ‘biographization’ hypothesis which insists on the impact of critical life events. Following Mackenbach, we also analyze the impact of personality traits.

Our results support the social stratification, the selection, and to some extent the critical events explanations, but not accumulation, maybe because of the institutional filters of the welfare state. They also demonstrate a strong effect of some personality traits. However, the socioeconomic inequalities in health are never affected, suggesting a relative independence.

Health and social stratification in an ageing society - how education and economic status influence health
Beatrice CHROMKOVÁ MANEA (Faculty of Social Studies, Czech Republic) | manea@fss.muni.cz

Inequalities in health indicators among various groups in a population represent one of the main challenges for national public health systems. Scholars and policy makers aim to study and identify the main causes and opportunities for reducing such inequalities. In this paper we examined whether measures of social stratification are able to explain and predict self-reported health status and other indicators of health in the context of ageing society. Two main variables are used to operationalize social inequalities in health: social stratification and social class. Present paper deals with indicators of social stratification, which refer to attributes such as education and employment status. We draw on stratification theories of education to hypothesize about the role of education in creating and perpetuating differences in health status of a population. Data were obtained from the Survey of Health, Ageing and Retirement in Europe (SHARE). We use data from the last wave of measurement (wave 4).

Ageing, health and socioeconomic conditions: a multidimensional approach on frailty from an Italian case study
Stefano POLI (University of Genoa, Italy) | stefano.poli@unige.it
Valeria PANDOLFINI (University of Genoa, Italy) | valeria.pandolfini@unige.it

The progressive ageing population all over Europe represents a demographical matter in terms of social burden and welfare expenses. By 2020 the first cohort of baby boomers will have reached or passed 65 years, bringing with them a history of mental disorder and substance abuse distinct from the histories of earlier cohorts. With this population bulge, the sheer number of older adults will expand and the positive aspect of a diffused longer life expectancy will encounter a negative consequence for an increasing part of elderly population suffering disability, physical frailty and progressive cognitive decline, worsened by the risk of social exclusion and marginalization.

The contribution focuses on the results of a research, conducted both in sociological and medical approach, combining a quantitative survey with clinical observation, on a sample of elderly people in Genoa, Italy. With the objective to realize and validate proper methodological tools to evaluate frailty in ageing in a multidimensional approach, the study represents the first
validation in Italy of the Morley scale (2012) to evaluate physical frailty and combines its application with different tools exploring the relationship of health with socioeconomic conditions, life styles, social and relational capital, services availability and emotional well-being of elderly people.

**Are socioeconomic position and working conditions before retirement age related to physical function 20 years later after retirement?**

Ingemar KÅREHOLT (Institute of Gerontology, School of Health Sciences, Jönköping University, Jönköping, Sweden; Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden) | ingemar.kareholt@ki.se
Charlotta NILSEN (Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden) | charlotta.nilsen@ki.se
Darin Mattsson ALEXANDER (Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden) | alexander.darin.mattsson@ki.se
Andel ROSS (School of Aging Studies, University of South Florida, Tampa, Florida, USA; International Clinical Research Center, St. Anne’s University Hospital, Brno, Czech Republic) | randel@usf.edu

**INTRODUCTION:** Socioeconomic position and working situation are two factors associated to health inequalities and to each other.

**AIM:** To study how socioeconomic position and working conditions 20+ years earlier associates to physical functioning after retirement age.

**DATA:** Swedish nationally representative samples, from 1968, 1981, and 1991 were re-interviewed 1992, 2002, and 2011 (76+) with 20-24 years follow-up time (women, n=431; men, n=450).

**METHOD:** Ordered logistic regressions, censored normal regression, and ordinary OLS regressions will be used.

**VARIABLES:** Physical function: Self-reported mobility, objective tests of lung function and general physical function.
Socioeconomic position: Education, income, cash margin, social class based on occupation, and an index based on all measures.
Psychosocial working conditions: job control, psychological demands, high strain (low control+high demands) and work complexity regarding data (information), people, and substantive (general) complexity.
Controls: age, sex, follow-up year, mobility at baseline, and hours worked.

**RESULTS:** Job control, work complexity with data and people and all measures of SEP, were significantly associated to the three measures of physical function. Controlling for working conditions, the only significant associations was between general physical function and cash margin and the socioeconomic index respectively. When controlling for socioeconomic position, job control was significantly associated to less limitations in mobility and general physical functioning, substantive complexity and complexity with data were associated to less mobility limitations.

**CONCLUSIONS:** Both socioeconomic position, work related stress, and work complexity were associated to physical function in old age, but only partly independent of each other. The strongest single factor is job control.

**RN01S23 - Ageing and Health**

**Reproductive histories and deprivation inequalities in Europe: Long-term health consequences for gendered cohorts**
Gender and cohort specific biosocial mechanisms are supposed to play a substantial role in shaping the fertility-health nexus at older ages. However, previous evidence from national studies is mixed, and little is known about the influence of reproductive histories on health when contextual variation is controlled for. Do reproductive life course influences or rather societal inequalities prevail after reaching the age of 50? What kind of similarities and differences arise for gendered cohorts?

This study aims at answering these two questions and has three objectives. The first objective is to explore the long-term impact of reproductive histories on physical and mental later life health, controlling for past and contemporary individual characteristics. The second one is to address the lack of cross-national research and test whether and to what extent contemporary context – using the example of material deprivation inequalities – is supposed to contribute to the observed differentials within the nexus. Finally, the third one is to provide findings across gender and age cohorts, separately for men and women at pre-retirement (50-64) and post-retirement (65+) age.

I apply the integrated life course approach. This framework – though it “still lacks the status of a systematic theory” (Huinink and Kohli 2014: 1316) – is indispensable for understanding how biological, behavioural and social dynamics that unfold over time and across generations (Kuh et al. 2003), “act independently, cumulatively and interactively to influence health” (Mishra et al. 2010: 93). This study is based on a general theoretical assumption that cumulative risk exposures throughout life may cause gradual, long-term damage to health. This corresponds to accumulation of risk models (Kuh et al. 2003) and is similar to the stress-related concept of allostatic load (McEwen and Stellar 1993; Ben-Shlomo and Kuh 2002; see also Grundy and Read 2015). Accordingly, unequal incidence, severity, and duration of reproductive exposures may lead to health inequalities at older ages.

I use data from the Survey of Health, Ageing and Retirement in Europe (Börsch-Supan et al. 2011, 2013; Schröder 2011). The initial sample for this study is based on the third wave of SHARE – the retrospective SHARELIFE survey (Schröder 2011) – which provides detailed individual health, work, fertility, and partnership life courses for respondents who participated either in the first or in the second wave. SHARELIFE was conducted from 2008 to 2009 in 13 European countries: Switzerland, Germany, Austria, Belgium, the Netherlands, Sweden, Denmark, France, Spain, Greece, Italy, Poland, and Czech Republic. The final sample consists of 10,821 men and 13,460 women who are representative of the non-institutionalized populations over 50 years of age and who were divided into pre-retirement (aged 50-64) and post-retirement (aged 65+) cohorts.

I conduct multilevel logistic analyses, separately for each cohort by gender, controlling for demographics, socio-economic status, particular aspects of the intergenerational transmission of health risks, and the percentage of severely materially deprived men and women at country-level. Random intercept and fixed slopes models for binary outcomes are estimated (Guo and Zhao 2000; Gelman and Hill 2007).

The results indicate that neither men’s nor women’s health seems to be affected by childlessness at age 50+. For pre-retirement fathers, high parity and parenthood before 24 years of age are linked with physical limitations, whereas for pre-retirement mothers, only adolescent parenthood turns out to be an important risk factor for multiple health impairments. Deprivation inequalities do not seem to play a significant role in explaining health at age 50-64. However, findings change fundamentally for post-retirement cohorts: At age 65+, except for the impact of contact with biological children on physical health, reproductive life course influences are no longer persistent. At this age, it is the societal context and later life socio-economic status that matter.

Jiří VEVODA (Palacký University Olomouc, Czech Republic, Faculty of Medicine and Dentistry, Department of Social Medicine and Public Health) | jiri.vevoda@upol.cz

Alcohol is a causal reason of many accidents, traffic accidents, suicides and diseases. Priority of the national health policy is to reduce potential risks of alcohol consumption and economical, health and social impacts in their using by an individual and society as well. The aim of the national study was to analyse the file of autopsy reports of deceased people with focusing on the blood alcohol concentration (i.e. ethanol) according the sex, age, nationality, place of death, education, marital status and a reason and a way of death. The sample was created of 1024 deceased people in age more than 65 from 2377 dissected in years 2003-2013 at the Department of Forensic Medicine and Medical Law at Palacký University in Olomouc. Data from
the survey of each autopsy report were written into a single structured protocol. Data were evaluated statistically.

**Older people’s beliefs about cancer in Poland. Implications for health promotion and cancer prevention**

Małgorzata SYNOWIEC-PląT (Wroclaw Medical University, Poland) | m.synowiecpilat@gmail.com

Anita MAJCHROWSKA (Medical University of Lublin, Poland) | anita.majchrowska@umlub.pl

Anna PAŁĘGA (College of Management “Edukacja” in Wroclaw, Poland) | drpalega@gmail.com

Poland is among the countries with the highest rates of mortality from cancer, and 75% of deaths from cancer occurs after the age of 60. In the case of cancer, particular attention should be paid to the existence of excessive anxiety and fatalistic beliefs that reduce the likelihood of an individual commitment to health behaviors.

The study was carried out in 2012 with a sample of 910 adult residents of Wroclaw, Poland. An interview questionnaire was used. The article presents data on the older adults (56+) (N = 188). The aim of the study was to assess the level of anxiety and older people’s beliefs about: cancer-related pain, the effectiveness of medicine in the fight against cancer, treatment and curability of cancer, cancer prevention trials, personal responsibility for getting cancer, and the etiology of cancer. The vast majority of respondents experience fear of cancer (81%). The level of anxiety increases with the age of respondents. A large number of respondents manifested fatalistic beliefs: ¼ does not believe in the efficacy of medicine in the fight against cancer; 70% say "cancer always hurts, is associated with suffering"; 27% say that "cancer can not be cured, it always ends in death." The level of fatalistic beliefs increases with age in the case of the respondents beliefs relating to: the effectiveness of medicine in the fight against cancer and cancer pain; surgical treatment of cancer.

The results will help to develop more effective health promotion and cancer prevention approach focused on older adults.

**Online health information seeking and Italian families in the ageing societies**

Alessandro LOVARI (Università degli Studi di Sassari, Italy) | alovari@uniss.it

Elisabetta CIONI (Università degli Studi di Sassari, Italy) | cioni@uniss.it

Paola TRONU (Università degli Studi di Sassari, Italy) | p.tronu@gmail.com

In the European ageing societies, family care came out as an important complement to the safety net provided by welfare systems for the frail elderly. In the digital age family caregivers can use Internet and social media to improve his/her own caring activity (Reinhard et al. 2012). Indeed, individuals with long-standing illness or health problems can also ask other persons, such as relatives or friends, to search for online health information on their behalf. Research evidence (Lupiañez-Villanueva et al. 2012) indicated that this new scenario entails new social inequalities, due to persistent barriers for online health information seeking and for the proper use of health information, pertaining mostly to older women, inactives, and those with lower levels of education. Our study focused on Italy, a peculiar case study within the European context, characterized by a prominent role of the family for the healthcare of the growing-up segment of the elderly and oldest-old population (Saraceno 2008). We extracted two data samples from the 2011 e 2013 ISTAT Comprehensive Survey on “Aspects of daily life”. Using binomial logistic regression models, we highlighted the correlations between being in poor health conditions, or caring/cohabitating with relatives or loved ones with health problems, and the likelihood of being an active online information seeker. The analysis confirmed the relevance of socio-demographic variables such as gender, age, and level of education for taking
advantage of the opportunities provided by Internet, but it also confirmed the specific strength of kin ties characterizing the Italian families.

RN02P01 - Poster Session

The designer profession. Idea of the contemporary meaning of designer in the opinion of Polish design students.
Paulina Katarzyna ROJEK-ADAMEK (Andrzej Frycz Modrzewski Krakow University, Poland) | projek@interia.pl

Thinking about social development we can not ignore the fact that the driving force of modern society are multidimensional dispositions of personal capital. One of the major shareholders in terms of the knowledge economy is the creative capital and the branches of the creative sector are naturally articulate new approaches to economic growth. This development is driven by people who - wrote Richard Florida - prefer tolerant, highly diverse place, open to new ideas. A region that boasts a diverse resident of creative people will probably generate more innovative combinations and solutions (Florida, 2010: 257). One of the profession that is on the list of creative sector are designers. The problem arises, however, when we need to clearly define what is the meaning of contemporary designers’ work. It would seem that it is sufficient to refer to the descriptions of the various professions and their classification. In practice, however, that the longer the term design is open to a multiplicity of interpretations and there is no clear interpretation of the definitional. Thus, the concept of professional designer from the ground raises a number of ambiguities. This presentation is to attempt systematization of these terms in the field of polish designers. The presentation has three goals: first - to show the definitions and interpretations of the concept of Design; secondly - define the profession designer and place it in the light of the current classification of occupations in polish system; thirdly - through empirical research carried out among design students from the Academy of Fine Arts in Katowice to show an idea of the characteristics of the profession.

"Space of Positions" and "Space of Position-Takings" in the Bourdieu's Literary Field as Multiplex Networks: An Exponential Random Graph Models Approach
Marko LUCIĆ (Zarez, Croatia) | marko.lucic15@gmail.com

Pierre Bourdieu's theory of artistic fields has a long history of theoretical revision and operationalization by Social Network Analysis (Gerhards and Anheier, 1989; Anheier et al., 1995; de Nooy, 1991, 1999, 2008; Crossley and Bottero, 2011). Following Wouter de Nooy's work, this paper aims to further develop SNA approach to "symbolic struggles" that happen in the "space of positions" and "space of position-takings", the second being distributions of different capitals, and the latter being speech acts of agents in the field. Drawing on rudimentary secondary analysis of a chunk of de Nooy's data (binary network of interindividual mentions of 35 Dutch authors in 1976), first specific aim of this paper is to show that Exponential Random Graph Models (Wasserman and Pattison, 1996), are particularly appropriate to model "space of positions" and "space of position-takings" as networks of interactions, because this method assumes simultaneous modeling of endogenous network structure and exogenous covariates or predictors of ties. Speech acts in literary essays as interindividual classifications and evaluations (de Nooy, 2003) are considerably more complex information than single binary or signed relations. Thus the second specific aim of this paper is to propose a multiplex network approach to literary field,
where classifications, as labels of e.g. different literary styles or political orientations, would be edge covariates or separate networks. Social capital would then be a specific set of networks. ERGMs provide us with a way to model relationships of multiple networks (e.g. Heaney, 2014), together with endogenous structure and exogenous covariates of particular networks.

**How do the Kogis balance the hegemonic culture of ecotourists with their traditional expressions?**

**Luisa BRAVO (University of Innsbruck, Austria) | Luisa.bravo-Rodriguez@studentuibk.ac.at**

Diversity has been one of the most important factors enabling humanity to have survive so long on this planet. It is maintained through expressions of common visions of the world in the art of a diverse array of cultures, especially minority cultures. A global hegemonic culture threatens our species' diversity. Ecotourism can induce social changes in both host and tourist populations. A significant example is the Kogis of SNSM, Columbia. They became one of the most advanced indigenous populations in America. This can be accredited to their ability to maintain their social structures and culture through oral literature. My contribution examines how the Kogis partially adapt to ecotourists' cultures without losing their indigenous culture and traditional forms of artistic expression. My work is based on method-grounded theories, and I have utilized semi-structured interview, direct observation and anecdotal experience to gather data during my research visit to a Kogi community. The results indicate that current ecotourism practices have not drastically altered the lifestyle nor culture of the Kogi. The soul of the Kogi people is in their culture, and it is incorporated into all dimensions of daily life, their understanding of the human organism and the environment, as well as the “Aluna,” a Kogi concept meaning the essence of being. Aluna is a supernatural force; it dwells not only in humans but in everything intangible, including thoughts and intentions. Finally, my contribution outlines ideas to demonstrate that differences in the structure of societies are legitimized through artistic expression.

**The Potential of Art and Cultural Industries for Improving the Quality of Life of Young People in the Kola Peninsula**

**Marina MAGUIDOVITCH (Saint Petersburg State University, Russian Federation) | socioart@hotmail.com**

The chronic outflow of young people from the Kola Peninsula to Russia’s capital cities and Finland and Norway is exacerbated by dissatisfaction with the social and cultural sectors. Can we stop the outflow of young people from the region through systematic development of the arts and cultural industries?

In spring 2013—fall 2014, we ran a study describing the social and psychological traits of students in Murmansk, how they consume art and culture, and their practices and beliefs. The study was based on questionnaires, semi-formalized focused interviews with students, and expert interviews.

Most of our hypotheses were confirmed. According to respondents, the symbolic capital of local art was lower than the symbolic capital of imported events and artworks. The young people of Murmansk have a low opinion not only of local events but also of Russian contemporary art. This is due not only to preferences but also to cultural self-identification on a larger scale than the local and national.

Respondents identified the negative impacts on quality of life as “climatic conditions” (27%); “lack of career opportunities” (18%); “lack of cultural activities” (15%); and “housing problems” (15%). This points to the untapped potential for cultural industries in the region, which includes the architectural/construction business, and youth recreation centers. Development of cultural
industries could diversify the region’s labor market and assist young people’s career growth, given that the largest cohort of respondents (24%) saw themselves as working in art in the future, while 18% preferred working in the service sector.

Feudalism or creative communitarism? An ethnographic field study about the functioning of cultural organizations.
Julia Ricarda ZIRN (Zeppelin University, Germany) | J.zirn@zeppelin-university.net

Cultural organizations are hybrids in which very different principles, values and perspectives collide. Therefore the questions about organizational structures deployed in these specific organizations and about which of them prove to be successful, are of peculiar interest. By conducting a case study about a reputable independent German theater, using the theoretical framework of Rothschild-Whitt (1979), the present study aims to answer these questions. The results show, that in the observed theater, structures are dominant, which can be classified as collectivistic organizational elements. The integrative element is primarily the strong organizational culture. However, contrary to the self-perception of the members of the theater, processes do not run properly without bureaucratic elements, such as power differences or strict control devices. The bureaucratic structures are rather collectively veiled in order to perpetuate the existing self-perception inside the organization. By this, any bureaucracy can be neglected without threatening the functioning of the organization.

RN02S01a - Developments in Music, Opera, and Theatre

The Game for Growing the Top Stars of the Theater Company
Yuko OKI (Kyoto Sangyo University, Japan) | oki@cc.kyoto-su.ac.jp

The Takarazuka Revue (TR) is a unique, all-female theatrical company that performs musicals and shows in Japan. The objectives of this paper are: first, to introduce the game among TR fans to make up top stars; second, to examine the open education system for TR performers; and third, to explore the implications of the TR successful model for the growth of other performing arts. There are several studies about TR from a historical and gender perspective (Tamanoka 2004, Brau 1990) but there is no prior study about their profit-making system. The research methods are a literature search and personal interviews.

TR model could be analyzed as follows. 1) Game participants are mainly committed users, but the TR is open to newcomers. Once you become part of the audience, the community of supporters helps you to devote yourself to an endless loop in which you become a core supporter. 2) Education system is open to the performers as peer review, senior performers as OJT and supporters as mentor. 3) The TR’s five groups encourage competition among the students, improve performance characteristics, and help to avoid losing top stars. This kind of effective resource management makes the TR profitable.

The difference between TR and the traditional performing arts is the former’s power to create and maintain core supporters, a situation that is based on the supporters’ community and networks. The implication of this paper is that the performing arts company should find the way to activate a community of supporters.

In-Yer-Face: Theatre, Politics, and Social Transformation
Somayeh KHANI (Griffith University, Australia) | somayeh.khani@griffithuni.edu.au
By the early 1990s, Britain had experienced significant cultural, political, and economic transformations due to local and global socioeconomic changes. The resulting waves of de-industrialization and neo-liberalism that followed, initiated a decade of social and cultural conflicts in response to which new forms of art began to emerge. Among these was an innovative style of reactionary theatre which was in market, contrast to the more mainstream theatre of the time. At the heart of this new movement were a number of young playwrights whose plays were blatantly provocative, relentless, confrontational and aggressively shocking in terms of their imagery as compared with the established realm of British drama. In response to the explicit violence and interminable cruelty often depicted in such plays, in 2001 the British critic Aleks Sierz coined the term ‘In-Yer-Face’ theatre.

Although ‘In Yer Face’ has been examined critically, notably by Sierz himself, to date there has been little sociological attention paid to this genre of theatre. This paper will subject In-Yer-Face theatre to a sociological reading using Beck's concepts of risk and uncertainty (1992 - 1997) and Furedi's notion of a culture of fear (1997). More specifically, the paper will discuss how, when applied to In-Yer-Face, Beck and Furedi’s respective ideas about “Individualization” and “Risk” reveal the significance of this genre of theatre as a form of critical engagement with the socioeconomic dislocation that characterized broad aspects of British society during the post-Thatcher years.

The ‘mixed economies’ of music-making: Well-being, citizenship and arts praxis in post-crisis Ireland
Eileen Elizabeth HOGAN (University of Liverpool, University College Cork) | e.hogan@ucc.ie

Drawing on ethnographic research on everyday music -making practices in Cork city, Ireland, this paper focuses on the interrelationship of music-making and well-being, identity and place. Over the last few years, Ireland’s global reputation has been associated with the collapse of its banking sector. This paper discusses the effect of subsequent austerity measures on music producers’ position-taking as creative labourers, revealing their reactions to deepening neoliberalism within the post-crisis Irish context, and its impact on their identities and praxis. Extending Bourdieusian theory (and contrary to the typically gloomy, economistic interpretations of his work) this paper argues that his conceptualisation of the logics of social practices as reward-oriented offers hope for social transformation. It demonstrates how music producers’ motivations for engagement in creative labour are shaped by a range of values and interests, both material/instrumental and post-material/altruistic, which are premised upon a doxic prioritisation of individual and collective well-being. Offering a new concept for understanding social relations in the field of cultural production, it proposes that music producers’ interdependence is constituted and reconstituted through a ‘mixed economy of favours’. Conceptualising the local music ecology as a ‘mixed economy of music-making’, it evidences how the collaborative strategies music producers deploy for sustaining music-making practices in the local context are oriented towards the liveability of the city. This relational understanding of music-making and well-being, identity and place holds significant implications for cultural policy, signalling a more optimistic future and opening up new possibilities for citizenship-oriented thinking within arts management and urban planning discourse.

Traditional High Arts in a Contemporary Context. The Case of Animated Opera.
Olga KOLOKYTHA (The European Opera Centre, United Kingdom) | okolokitha@gmail.com

Janáček’s work was turned into an animated film, was recorded separately in various languages with young professional singers, the Deutsches Symphonie Orchester under Kent Nagano and the BBC singers, and released on DVD worldwide. The project, a collaboration between the European Opera Centre and major cultural organizations such as the BBC, Opus Arte, Los Angeles Opera, Gran Teatre del Liceu Barcelona, Opéra de Lyon and the Česká Televize, among others, won several important international awards and brought opera closer to numerous people around the world. Knowledge developed through it led to recordings planned in other languages, various uses based on the development of the existing material (television broadcasts, DVD, cinema screenings and ciné-concerts), and a similar animated project currently underway. This project, almost certainly the first of its kind producing an hour-long animated treatment of an opera, is the subject of this paper: its aims, particularities, impact and value. The paper discusses the integration of the most traditional of high arts, opera, within the mass media and its interaction with modern forms of art diffusion. It also examines the shift in the position of opera within the society, and in different contexts. Discussion includes areas such as, among others, cultural policy and management, cultural economics, audience development, new trends in developing arts projects, added and intrinsic value of supporting innovative arts projects and the role of different stakeholders (arts funding bodies, arts organisations, artists, audiences, etc.).

**RN02S01b - Developments in Cinema**

**The use of found footage at the Ecuadorian documentary filmmaking, from personal to political and viceversa**

Orisel CASTRO (UDLA, FLACSO) | ori.selcl@gmail.com

Since the boom started with My Heart In Yambo by Maria Fernanda Restrepo in 2011, the Ecuadorian documentary film has been renewed, producing pieces of art capable of moving wide audiences with unprecedented strength. Films such as Great Parents by Carla Valencia; The Death of Jaime Roldós by Manolo Sarmiento and Lisandra Rivera and the brand new Cesar's Grill by Darío Aguirre, share some aesthetic features with the mentioned movie by Fernanda Restrepo, and that makes me think of a common language to the emergent Ecuadorian documentary film. In this paper, my goal is to pursue those marks of style and theme which put these films within a unique and dynamic corpus and which make them part of a decisive movement for the cinematography of the country. Through the dramatic analysis of the selected films, I’ll try to prove the possibility of this aesthetic movement in order to understand the momentum of Ecuadorian filmmaking.

**Reflection of student life in the Iranian cinema**

Masoud KOUSARI (University of Tehran, Iran, Islamic Republic of) | mkousari@ut.ac.ir

Mina EINIFAR (Student in University of Tehran) | mina.einifar@gmail.com

In this article, the student life of Iranian students is studied through its reflection in the Iranian cinema. The article is written from perspective of sociology of cinema. According to I.C. Jarvie, one of best ways to understand a society is to study movies which are made for consumption at home. Using this theory and a qualitative method of film analysis, in this article the reflection of Iranian student life in cinema is examined. The hypothesis is that the problems indicated in movies can be considered as real problems in society. In order to assess this hypothesis, the
findings of film analysis will be compared to the issues raised about student life in Iranian newspapers. The movie called “Darband”, which portraits a young female moving student that has moved to Tehran (Capital city of Iran) for study at university, is selected to be analyzed as a case study. This movie is among those films which represent student life and has gained prize in the Fajr Festival of Iran. The findings show that some of problems which are reflected in this movie are also discussed in newspapers in Iran. In other words, the represented problems are related to the social changes occurring in the society. Therefore, it is concluded that cinema is an important medium which can be studied in order to gain knowledge from its contemporary society.

Urban image and its cinematic representation: The case of Ankara
Duygu TANIŞ ZAFEROĞLU (Middle East Technical University, Turkey) | duygutanis@gmail.com
Zeynep BAYKAL (Beykent University, Turkey; Middle East Technical University, Turkey) | zbaykal83@gmail.com

Cinema offers an opportunity to form, reform and elaborate on the image of a city in the memory of collectivities. Various appearances that consists of socioeconomic and cultural aspects of social life in a city can be the object of cinematographic imagery. Films about cities provide an image for those who recognize the city or not. In 1970's and 1980's, movies filmed in the capital city of Turkey, in Ankara's neighborhoods, which is usually named as the "gray city of state bureaucracy" has taken migration and life of migrants in a city, capitalism and the accumulation of capital, inequalities in the city, human rights, justice and poverty. After 1990's, especially in 2000's the outdoor image of the city has been replaced by indoor scenes which can be identified by the spatial sprit of Ankara.

This work deals with the responses to the following questions: Does cinema in Ankara reflects city dwellers' fears of modern Urbanism? To what extend movies of Ankara answer some of the questions posed in urban studies? What kind images do these films offer? What are the changes this image undergone through time?

The purpose of the study is to describe the relationship between the cinema and the city image of Ankara and to evaluate the changes and transfiguration in the representation of of the social life in the capital city of Turkey from the mid 1960's to 2000's through the analysis of representative movies filmed in Ankara.

Cries and Whispers or the game of repressed spaces
Mara-Georgia LIXANDRU (University of Bucharest, Romania) | mara.georgia.lixandru@gmail.com

The following paper aims to analyze, from a Bachelardian perspective upon the spaces of a house, Ingmar Bergman's play “Cries and Whispers” staged by a Romanian director Andrei Şerban. In his view, the play recomposes the period of filming, the time spent with the actresses and the actual film, a theatrical reproduction. Bergman's film works with materials that come directly from the environment, however he restates it metaphorically, bringing it into its own proper dimension. What makes this media special is its ability to make visible imagination, and this is one of the reasons, if not the main, which allows it to spread at all levels.

Andrei Şerban succeeds in reproducing the atmosphere of Bergman’s house-studio, in which this analysis will lead, because the house holds a special symbolism, both in film and in play. The house, where the protagonists gather, owns the function of “oneiric house” term used by Gaston Bachelard in his essay on images of intimacy, "Earth and Reveries of Repose". The oneiric house is a more profound theme than the native house. It corresponds to a need that comes from further. The house of memory, the native house is built on the crypt of oneiric
house. The crypt is the root, link, depth, immersing dreams (Bachelard, 1999). Built like a mosaic whose pieces are windows that open and close upon the minds and the hearts of four women, the film is one of the most symbolic of Ingmar Bergman's filmography, conceived on a clear polarity: the whispers and cries reflect opposing relationships that exist between the protagonists.

RN02S02a - Music Composing and Diffusion

The Interplay of Various Forms of Artistic Knowing
Tasos ZEMBYLAS (University of Music and Performing Arts Vienna, Austria) |
zembylas@mdw.ac.at

In my presentation I will elucidate the interplay of several forms of knowledge in composing process in art music. As a general term, “knowledge” includes forms of explicit, propositional knowledge as well as several forms of implicit, embodied practical knowing. My main epistemic aim is to move from the description of artistic practices to a deeper understanding of artistic agency.

The empirical material originates from a research project called “Tacit Knowing in Musical Composition Process”. Using qualitative empirical methods we accomplished five case studies to document composition processes from the beginning of the work up until the last rehearsal. At the moment I cannot anticipate the results of my analysis, which is still ongoing. However, I can broadly outline the way that I would like to propose: a threefold configuration of knowledge, cognitive and material tools. This configuration is efficacious and generative, that is to say it initiates and sustains artistic creative processes. Because knowledge and tools are per definition socially shared the configuration mentioned above is always embedded in socially established musical practices. Theoretical musical knowledge, beliefs including aesthetic ideas, formal knowledge of notational systems become actionable knowledge, because in the particular case of music composers all these kinds of explicit knowledge are established in specific “artistic paradigms” (Heinich) that shape the actual role of explicit knowledge. Furthermore, the vast sensory and instrumental experience of composers sustains an intelligent embodied mind that becomes manifest in tacit understanding and intuitive reasoning, which is usually expressed in words like “I feel it fits”. All the various forms of knowledge and knowing are bounded in a teleo-affective intentionality that is related to the object of composer's efforts: the final artwork. Affects therefore accompany the creative process on various levels and guide thinking and acting. Finally, as Nicolas Cook among others underlines, every particular composition process is practically and socially situated, and thus context-bounded. Taking contextual aspects seriously will promote an understanding of the particularity of creative artistic actions.

The practice of art music composing
Martin NIEDERAUER (University of Music and Performing Arts Vienna, Austria) |
niederauer@mdw.ac.at

This presentation explores the practice of art music composing by focusing on three components of it: doing, understanding and analyzing. Practices can be described as “an organized collection of activities performed by different people” (Schatzki, 2014, 17) that contain a material, temporal and corporeal dimension. Art music composers, for example, try out different ways of handling instruments and explore their “affordances” (Gibson 1977). These actions are informed by explicit knowledge (composition
theories) and rules (conventions related to instruments) that composers share with other practitioners. But although practices are collectively organized, they are finally realized by the "doings" of individuals. Furthermore, composers have to generate an "understanding" of what they are doing and how they are doing it. As reflexive practitioners, they develop a synthesis of what they already know and what they just have done in order to get a picture of the historical and cultural context in which they are composing. Additionally, experiments with instruments need to be traced in order to gain a deeper understanding of their peculiarities or to invent previously unknown things. This highlights an epistemic dimension of composing that requires "analyzing": that is, it requires a commitment to development that has to raise questions on the subject matter in order to go further.

My presentation is based on empirical data consisting of interviews with Austrian art music composers and also includes composition diaries and participant observation in rehearsals.

Everyday participation and cultural value in DIY music
Mark Richard TAYLOR (The University of Sheffield, United Kingdom) | m.r.taylor@sheffield.ac.uk

Contemporary research on the social network structure of music scenes suggests that the key actors tend to be those whose role is explicitly to professionally broker and mediate: promoters, managers, and so on. However, not all music scenes acknowledge the legitimacy of these roles, and in some cases such expertise is ideologically rejected. This paper examines such an example - of the, or a, DIY music scene in the nearby British cities of Bristol and Cardiff. Our data has been coproduced by professional researchers and by several actors within this music scene itself, consisting of information about 47 bands, 15 venues, and 43 individuals, with seven different categories of relationship. While the results do not overturn existing knowledge about the network structure of music scenes - those people with brokerage roles such as gig promoters have higher measures of network centrality - the structure of this network differs from that of others in several ways. First, measures of network centrality are more evenly distributed than in other networks. Second, related to the first, many actors in this network hold a number of different roles; as there are so many, when all different relational characteristics are considered in the representation of the network, there are fewer structural holes for these people to bridge than in others. Third, we have also collected data from actors in their own words about the ideology of their practice; this helps to illuminate the quantitative results.

Resisting the vortex of digital online music diffusion – DIY recording and distribution strategies
Paula ABREU (Faculty of Economics/Center for Social Studies - University of Coimbra, Portugal) | pabreu@fe.uc.pt

In the last decade the forms of production and distribution of recorded music have undergone sweeping changes as a result of the development of digital systems of audio and video recording, infrastructures and broadcast technologies through the World Wide Web. Simultaneously, we witnessed the revival of vinyl editions and the survival of CDs and tapes as material supports to the registration and distribution of recorded music. The paper seeks to discuss the phenomena of resistance and revival of traditional media phonograms against the dominant culture of digital distribution and convergence of audiovisual
productions. In particular, we consider the example of the production of different variants of punk music in Portugal in order to debate the current meaning of independent phonographic edition and the resistance to digital distribution. Grounding our analysis on a large data set produced through a relevant research project about the development of the Portuguese punk manifestations and scenes, the discussion seeks to relate the relevance of punk musical performance and the importance of local music scenes, where a continuous update of social networks takes place, producing a sense of identification and cultural belonging. Those networks constitute unique devices for the non-capitalist dissemination and distribution of sound recordings (records, cassettes and cds), able to nourish the main philosophy of resistance to the new spirit of capitalism running through the phenomenon of digital music distribution and the global network (WWW).

**RN02S02b - Artists, Fabricators and Art Markets**

**Collateral Authorship and 'Background Artists'**  
Karen VAN DEN BERG (Zeppelin Universität, Germany) | karen.vandenberg@zu.de

The art field is constantly expanding. This is not only due to the expended notion of art, the rise of creative industries or the growth of the art market. Rather the very scale of artworks is growing as well. For about 30 years, gallery spaces have become bigger and bigger and accordingly been filled with larger art pieces and installations. Within the resulting battle for attention it has become common to focus on ‘wow factors’ generated by highly complex material surfaces and technically elaborate art works. As a matter of course, most of the large-scale installations cannot be produced by one single artist alone. Consequently we can observe a new manufacturing branch today, art fabricators, who are essential to gallery owners and curators of big exhibition houses.

In my presentation I would like to introduce some findings of an interview–based research project on these ‘background artists’, as we would like to call them. The role of these fabricators, as I will show, is delicate as well as important. Many of these businesses remain almost ‘undercover’, some even without an online presence. Against this background I will present some insights on how knowledge production takes place and how authorship is configured in the collective working processes necessary to realise large-scale art projects.

**Continuity and contingency in the “emerging” art markets: comparison of the stories about opening an art gallery in Russia and India**  
Nataliya KOMAROVA (University of Amsterdam, Netherlands, The) | n.komarova@uva.nl

The paper develops an alternative perspective to study emerging contemporary art markets outside of the US and Western Europe. In order to understand how these markets develop, looking at similarities in growth rates and institutional forms is not enough. Even though contemporary art galleries across the world might look surprisingly familiar, the functioning of art markets varies significantly behind white-cube walls, since new art markets do not develop from scratch. On the contrary, markets emerge in interaction with existing institutions, artistic trends and socio-economic processes within countries. To understand this interaction, the paper looks at the individual level of art dealers and analyzes their stories about starting a commercial gallery. Empirically, it is based on semi-structured interviews with 62 art dealers from New Delhi, Mumbai, Moscow and Saint Petersburg conducted in October 2012 – June 2013. The paper analyzes recurring elements in the stories and reconstructs the socio-cultural contexts of two
countries relevant for markets’ development. Indian art dealers stress the relation of natural continuity between the post-independence Indian art scene and the emerging contemporary art market of the 1990s and refer to the tradition of art appreciation embedded in their families for several generations. Russian art dealers, on the contrary, emphasize changes that were happening in the country and their private lives. A decision to open a gallery is explained by the constellation of contingent factors and as an attempt to discard preexisting artistic traditions and institutional structures of the art scene.

Developing artistic talent: causes and consequences of the flow experience
Koen VAN EIJCK (Erasmus University Rotterdam, Netherlands, The) | vaneijck@eshcc.eur.nl

In order to support the development of young creative talents, the Dutch Fund for Cultural Participation carries out an evaluation of a project called Talent Development and Manifestations which runs from 2013 and 2016. Seventeen projects are evaluated each year, covering the disciplines of theatre, pop music, classical music, urban arts and a multidisciplinary art competition. Some 1,000 talents have been surveyed during the first two evaluation waves. Information was gathered on their background, schooling, motivation, time investment, evaluation of the projects and the expected effects of the projects. During the second measurement wave, the concept of flow was measured as well. The paper focuses on the flow experience and relates it to all other characteristics of the participants and the projects. Preliminary analyses have shown that flow differs between the disciplines, but also that different types of flow experience are typical of different participants. The theatre talents and younger participants tend to score highest on the loss of self-awareness and sense of time, whereas the classical musicians, boys and older participants report more control and a higher ability to estimate their own proficiency. The results suggest that the development of creative talent yields qualitatively different experiences that help us understand why some creative talents are more likely to be successful than others.

Becoming an Artist in the Material, Symbolic and Spatial Conditions of Cities
Martin Graham FULLER (Technische Universität Berlin, Germany) | fuller@tu-berlin.de

The ‘international art world’ is largely based in cities, with higher concentrations of prominent social actors and institutions in cities like New York, London, Los Angeles and Berlin. These cities are not merely sites through which international artists pass, nor are they transposable and equivalent, but rather cities shape the ways that artists develop their careers. Through ethnographic findings from New York and Berlin I argue that the material, spatial and symbolic conditions of cities shape the formation of art careers. It is not merely the material conditions of cities that shape the ways careers are formed, such as the cost of living, but also city space and symbolic ideas about cities and careers. Artists living in these cities perceive different constellations of what is possible and what is probable in forming careers. Drawing on cultural sociological concepts, it is stressed that artists contribute to, reproduce and challenge collectively shared representations about what it means to be an artist in Berlin and New York.

RN02S02c - Explorations in Modern and Contemporary Art

The Space Production of Contemporary Artists in Beijing: A case study of Caochangdi Art District
Xiaoxue GAO (Technische Universität Berlin, Germany) | xiaoxue.gao@campus.tu-berlin.de
This paper focuses on the space production of contemporary artists in China, by drawing on an illegitimized art district named Caochangdi, which naturally grew from a suburb village in Beijing, highly mix used by galleries, alternative art spaces, artist studios and living spaces of local peasants and migrants as the study case.

As in a country pervaded with cultural dictatorship, the culturally dissident contemporary artists have never gain focal status in cultural world, neither in the commercial art market. These artists tend to agglomerate their living and working place, since 1980th there are several artist village/district emerged/relocated in marginal urban area of Beijing. By observing the everyday life, events and conflicts for a year; tracing the oral history of the area, analyzing social network among local artist and organizations, the paper examines the ways that cultural capital, social relations and artists’ habitus are played out in the process of forming the physical and conceived space. The paper argues that the specific spatiality of the locale coincides not only with the artists’ habitus but also with collective cultural identity of the local community; meanwhile, the embodiment of the physical space manifested the social structure of the local art world.

**Art and progress in biology (biotechnology) at the common laboratory bench**

Magdalena Ewa LANGE (Jagiellonian University, Poland) | lange.magdalena@gmail.com

There are many believes that art is able to combine important issues in science and technology and make them noticeable to the wide range of audiences. But is this path transparent? Which of the issues need to be considered to achieve best practices, despite of the licenses for the galleries allowing to present living matter to undertake the discussion with audience. The majority of the debates, primarily the presentation of the works, relies on the conceptual demonstration of the descriptions and bio-tech procedures used in the creative process, but not on the demonstration of the bio-art work itself. Should these things like laboratory procedures be brought up at all and do we really need to precisely know what is going on in the modern biotechnological laboratories, or should we be more attracted by the aesthetical aspects of these kinds of art forms in the first place.

**Reassembling 3D printing technology into artistic assemblages: A case study of Taiwanese artist Hung-Chi Peng's 'The Deluge' in the 2014 Taipei Biennale**

Chia-ling LAI (Graduate Institute of European Culture and Tourism, National Taiwan Normal University, Taiwan, Republic of China) | muse.chialinglai@gmail.com

3D printing technology as a new emergent technology has been considered a transforming trend in the 21st century. This new technology not only has been widely applied in the design world but now also appropriated by some influential contemporary artists and the 3D printed artworks are recognized their artistic value while being accepted in Biennale art exhibitions. Drawing upon Latour’s ANT and Assemblage theory, this research traces the association of heterogeneous artistic assemblages by the way 3D printed artworks are produced, valued, displayed and appreciated. It analyzes the controversy and discussion surrounding the performativity of artistic practices engaged with 3D printing technology that hybridizes digital art and new materialities, particularly focusing on issues of authenticity, experiments and new artistic crafts.

Based on one case study of Taiwanese Artist Hung-Chi Peng's 3D printing assemblies work 'The Deluge', which is a 3D printed twisted Noah’s Ark exhibited as a studio that produces and assembles pieces into the whole ship during the 2014 Taipei Biennale exhibition period. Through fieldworks, media discourse analysis and interview methods, I explore how the new
technology has been appropriated by the artist and the way 3d printed artwork has been exhibited as a studio working in process, its appreciation by the Biennale guest curator Nicolas Bourriaud and Taiwanese museum curators, related art reviews and media reports, and different types of art viewers' perceptions toward 3D printed art works in the artistic assemblages.

The social significance of the Maltese modern art movement
Valerie VISANICH (University of Malta, Malta) | valerie.visanich@um.edu.mt

Works of arts reflect the social setting of their time in their aesthetic form and content. This is very much evident when examining the changes in artistic practices and the aesthetic value judgement in Malta, as a case study. The aim of this paper is to address the sociological significance of these changes within the context of the ambivalent position of Malta, between tradition and modernity. Artists in the first half of the twentieth century lived in a highly charged Catholic society, held together by a homogeneous lifestyle of shared values and beliefs, anchored in religion. Societal expectations of artists were clear for everyone and often unquestionable to those involved in the art world. This paper looks at the collective activity of artistic networks in the post war years, what Zolberg (1990) calls the ‘artistic midwives’, which determined and limited artistic expression. Young aspiring artists were highly constrained by the Malta School of Arts that influenced substantially their artistic production. Also, external communal factors, such as ecclesiastical authorities, had an indirect influence on defining what makes ‘good’ art works through granting commissions only to conformist artists. Moreover, artists started breaking away from such constraints after being exposed to training abroad and witnessing firsthand different artistic scenes. The changes in modes of expressions by the Maltese modern art movement reflected wider social changes during the post second world war period. This runs parallel to the increased importance given to an individualised culture that fosters a belief in self-reliance and self-expression.

Performance Art through the ephemeral flux: Explorations in associative sociology
Daniela Félix MARTINS (UFBA - Federal University of Bahia - Brazil, Brazil) | danifelixcm@gmail.com

The sociological study of the arts locates itself in the first instance in competition with the humanist perspective that amalgamates the history of art, aesthetics, and criticism. The fundamental question in this confrontation, for the sociological approach, lies in its accusation of a lack of acknowledgment of the scientific process by the rival analysis. In other words, the humanist perspective is tributary to the erudition of intellectuals, and their almost esoteric capacity for the analysis of formal elements, being as it is, weak in guarantees of objective parameters capable of generalization.

The heart of its preoccupations, for the historians of art, is the work of art understood from the “internalist” point of view. The properly formal elements of the work(s) in question are analyzed: the content of the images, the techniques and other means of creation, and the influence of other works from the same tradition. In this way, we understand the work as a singular expression significant of its creator.

For this tradition, the personality and psychology of each artist are intrinsic to the works and styles. One considers them spontaneous expressions of individual genius, responsible for master works that make evident a universally acknowledged greatness. As a consequence this tradition put into common currency the idea of the genuine that attracts to itself the original and
the authentic. The accusation of sociologists of the arts is that usually, this tradition mixes itself with a psychological formulation for the study of art as a social phenomenon. The social sciences established other bases for understanding art: an “externalist” perspective. That is to say, one investigates how the relationship between the two fields of art and society, recognized as distinct, establishes itself. The fundamental point of this analysis is the presentation of the artistic as immediately and directly referent to something external to the aesthetic or to art itself. Delineating the social as an autonomous field through a controllable method, art becomes in this way a means to ask sociological questions. One refers artistic productions to social causes: through considering these, one investigates how the artistic is the reflection of a determined group or certain social forces. The sociology of art should see in its object, specifically a representation, more or less precise, of the social. Art would reveal in this manner a structure, the interests of certain groups, as a reflection or form in which the social transfigures itself.

The social sciences produced, starting from the 19th century a new style of thought: the causal style of explanation based in the prior existence of a given structure, fairly inaccessible, in which one encounters already established, all the social actors and their roles. One deals here with the explicative status of the analysis, the search for the final causes which phenomena have, as a characteristic necessity of an image of thought that makes regularities, the logical chains innate to social facts, emerge. Consequently, a panoramic vision capable of incorporating great conjunctions or macro models is fundamental. In this way, the alternative to the dilettantism that conceived art as creation ex-abrupto, fruit of subjects bequeathed with free will, acting according to their wishes, is a species of sociological determinism in which creation becomes impossible. The artistic phenomena appear to be the expression of a march in single file arbitrarily traced through successive phases.

For sociologists, the humanist perspective accepts a conventional definition of art, without questioning the socially constructed nature of such a definition. In the first instance, art for the sociological perspective never has anything to say, it is derivative of these extra-aesthetic aspects located in another dimension. Work, author, reception, etc. are the representations of this “macro-reality” that is the social context. Interest is not in what art does, but in what is possible to analyze through art but outside of it, that is to say society. Artistic phenomena in this perspective are immutable and a temporal. One deals with a type of social science which, as an inheritor of hylomorphism, thinks form and matter as ontologically separate conditions that a given creator could unite and, putting occidental thought at the disposal of the imaginary, ramify itself in such a way that “form came to be viewed as imposed by an agent with a certain intention or objective in mind regarding a passive and inert matter” (INGOLD, Tim)

A one-way street, either artistic creation is the emanation of an exceptional individual and we respond in general terms to the questions that confront us, for example: how to comprehend the late artistic status of various works? What are the parameters for conceiving determined works as artistic and others as not? Or, no creation is possible because art is the reflex of a determined social order, submitted to an evolutionary process that transcends particular events and situations. One deals with the dichotomy between individual and society, in which the emergence of one hides the other. Individual and society, as with the corpus of Newtonian physics, cannot occupy the same time and space, or as Gabriel Tarde argued:

The interminable battle between free will and determinism, the epic duel between these two adversaries [...] is the most admirable spectacle, whose surprise, however, diminishes if one observes that in general there is a profound equivocation, a reciprocal incomprehension, at the base of these “eternal problems”. (TARDE, Gabriel)

In this sense, the initial methodological effort is to found an alternative territory, by saying goodbye to thought sustained by interrogations such as “who made it; what does this signify; what is it?”, and moving instead toward the space of the problem, “how does one make it?” One will define the research then as confidence in this adventure of launching oneself together with
artists, producers, the public, as well as public policy makers, galleries and museums. The methodological dimension of this research is distinct from the classical sociology of art. In this sociology, the researcher assumes a distanced position as a privileged observer capable of identifying the truth of the social, starting from the artistic phenomenon. In my case a less aseptic posture is fundamental; it is necessary to be amongst events and get your hands dirty, or, thinking along with Stenger in her reflection about the ecology of practices:

"(...) An ecology of pratice may be an instance of what Gilles Deleuze called ‘thiking par le milieu’, using the French double meaning of milieu, both the middle and the surroundings or habits. ‘Through the middle’ would mean without grounding definitions or no ideal horizon. ‘With the surrounding’ would mean that no theory gives you the power to disentangle something from its particular surroundings, that is, to go beyond the particular towards something we would be able to recognize and grasp in spite of particular appearance.”(STENGER, Isabelle)

One understands performance art in this research as a confluence of associations between artists, audience, producers, public policy makers, galleries, museums, etc. Each of these agents manifests elements of performance art in the world, and through them, we can follow its existence by the singularization that performance art demands in terms of practices from these agents. Therefore, the research is a kind of ethnography of artistic practices.

RN02S02d - Artistic Canon and Rankings

**Artistic canon in the times of liquid modernity**
Przemyslaw KISIEL (Cracow University of Economics, Poland; The Pontifical University of John Paul II in Cracow, Poland) | kisielp@uek.krakow.pl

The process of social reception of works of art has always been heavily linked with the current artistic canon. It was canon that constituted context for the interpretation of the works of art and thanks to it symbolic significance of works of art became unambiguous enough, that they can be shared by multiple recipients. This allowed the selected works of art to fulfill the important social functions (i.e. integrating function and the constructing and expressing of social identity function) within a particular community and to serve as a universal context for social communication. However, the contemporary cultural processes caused that the artistic canon ceased to be a source of explicit references and lost its universal character, and thereby changed its role in contemporary culture.

In my presentation, I would like to show how the artistic canon changes its social functioning in the times of liquid modernity. Based on empirical data I would like to show how the contemporary artistic canon ceases to be universal and collective and becomes a liquid and individual. And this change affects both the choice of the works making up the artistic canon, as well as their ability to transmit unambiguous content within the community. Referring to examples from the area of visual arts, literature and music, I also want to show what are the concrete implications of the transformation process of artistic canon for the place of art in public space. It is important because as a result of this process the artistic canon ceases to be able to integrate the community and to express its collective identity, and also it ceases to be a significant context of social communication.

**But is it a Masterpiece...?! Social Construction and Objective Constraint in the Evaluation of Excellence**
Stoyan V. SGOUREV (ESSEC Business School - Paris, France) | sgourev@hotmail.com
Niek ALTHUIZEN (ESSEC Business School - Paris, France) | althuizen@essec.edu
Masterpieces represent what standard products are not – unique and exceptional. Their nature is somewhat paradoxical: standing for “the best of a kind” - of a genre or an oeuvre, they are celebrated for their unique constitution and impact. Representative and exceptional at the same time, difficult to define and measure, masterpieces have received very little attention in sociological research. But as an embodiment of excellence and a key reference point, masterpieces are essential in evaluation. The paper addresses a principal question in sociological research on evaluation – the degree to which subjective estimates are constrained by objective factors. In an online experiment with 222 participants we manipulate the status of the painter, the rank of the painting and complexity of the composition. Our findings confirm the basic expectation that the status and label of excellence shape estimates, but the impact is contingent on a work’s complexity: the masterpiece label sticks only under high aesthetic complexity. Unlike previous experiments, we provide direct evidence that an objective factor matters, conditioning the social construction of estimates. Evaluation is not a passive process - depending on the perceived credibility of a work as a masterpiece, respondents approve of the use of the label and apply it in evaluation. The recognition of masterpieces is based on the degree to which a work of art is perceived as open to interpretation. The lack of clarity is discouraged for standard products, but is fundamental in the process of singularization by maintaining the relevance of masterpieces over time.

The Role of Periodicals in a Literary Field: Fantastic Fiction Magazines in the Polish Periphery
Stanisław KRAWCZYK (University of Warsaw, Poland) | krawczykstanislaw@gmail.com

OVERVIEW
Contemporary sociologists have hardly been interested in literary periodicals, at least not in the English- and German-speaking academia (English, 2010; Parker & Philpotts, 2009, p. 3). The paper contributes to filling this gap by demonstrating the role of periodicals in the Polish field of fantastic fiction in the 1980s and 1990s. This role is examined with regard to the peripheral status of Polish literature in the global fantastic system at that time.

The study follows Franco Moretti’s application of Immanuel Wallerstein’s world-systems theory to the sociology of literature (Milner, 2012, pp. 155–177). Moreover, the paper draws on the field theory of Pierre Bourdieu (1996) and on the work it has inspired among literary scholars interested in periodicals (Parker & Philpotts, 2009; Philpotts, 2010). The research is also informed by sociological investigations of various art fields (Becker, 1982; Jankowicz, Marecki, Pałęcka, Sowa, & Warczok, 2014; Thompson, 2012; Warczok & Wowrzeczka-Warczok, 2009).

SUBJECT MATTER AND SIGNIFICANCE
The neglect of periodicals has caused sociologists to miss an important opportunity to study amateur literary criticism—the corpus of non-academic commentaries on fiction that circulate among readers, writers, and editors. Working on essays, discussions, reviews, columns, or readers’ letters may allow researchers to recognise how literature is understood in communities and networks that have an effect on its production and reception. Other sociologically relevant texts include publishing news, convention reports, items on local initiatives, etc. Taken together, all kinds of materials found in periodicals contain a wealth of information on aesthetic and social dynamics of the respective literary field.

What is more, periodicals are not just a source of data on other developments in the field; they are significant institutions in their own right, actively shaping the literary life. It is this role of journals and magazines that is explored in the current paper. While based on historical data, the study is also relevant to the present: many periodicals are still published online, and other sites providing space for amateur criticism—blogs, message boards, Facebook groups, fan-managed
The world system of fantastic fiction offers an illustration of how periodicals may work. One of the ways to conceive of fantastic prose is to treat it as a distinctly modern phenomenon which took form as a separate body of literature in the United States of America between the 1920s and 1950s. The so-called pulp magazines—cheap periodicals printed in high circulations—played a key role in this process, not in small part due to critical commentaries whose authors shaped the collective awareness of the new type of prose. The abundance of periodicals has long remained a marked feature of fantastic fiction fields around the world (Westfahl, 1999).

To ground the study in a concrete empirical setting, a particular component of the world fantastic system has been selected: namely, the field of fantastic prose in Poland. As a non-central element within the system, it is structurally similar to those of Australia, Japan, Brazil, Germany, Russia, or Czechoslovakia, all strongly influenced by North American and in part British fields which have come to form the global fantastic core (Milner, 2012, pp. 166–175). Naturally, more studies would be needed to determine the extent to which the Polish example is representative of other peripheral or semi-peripheral fantastic literatures. In the same vein, it cannot yet be established how similar this field is to other fields of popular literature (crime fiction, thriller, romance). Nevertheless, the present research may facilitate further studies, and the paper will inspect a national phenomenon that is important in itself. Fantastic fiction in Poland has been quite popular at least since the 1970s, and it has had a rich social context—from fan clubs, to awards, to the dozens of conventions currently held each year.

OBJECTIVE AND METHODOLOGY

The goal of the paper is related to that of Stephen Parker and Matthew Philpotts, whose study of the long-standing East German journal "Sinn und Form" aimed 'to lay the foundations for a new and systematic approach to ... research into journals as agents in literary in cultural history'. Whereas the authors sought ‘to identify the generic, “anatomical” dimensions of the journal ... and to explore the contribution made by each of these dimensions to the functioning of that institution’ (Parker & Philpotts, 2009, p. 3), the objective of the current study is to distinguish and analyse the main ways in which periodicals can influence the dynamics of a peripheral literary field. The attempts of social actors to exert this influence are also regarded as efforts to accrue resources (such as symbolic capital) with a view to strengthening the actors' own positions in the field.

Two vastly different decades are investigated in order to encompass two contrasting situations as well as the transition between them. In the 1980s the number of translations from English was very limited in the Polish fantastic field. This was caused mostly by the socialist ideology and economy that hampered the inflow of Western popular genres. In the 1990s, after the fall of Soviet regimes East of the Iron Curtain, the new capitalist book market in Poland was filled with fantastic works by North American writers. The role of periodicals in each decade differed accordingly, even though Polish fantastic fiction occupied a peripheral location in either case.

The study is based on an array of historical data gathered from periodicals themselves, scholarly publications, reading surveys, club brochures, anthology introductions, writers' memoirs, award nominations and laureate lists, and so forth. The acquired body of quantitative information is then applied to examine the significance of periodicals in selected areas, such as introducing new genres, building the strong position of translations from North American prose, and shaping the careers of Polish writers. Furthermore, several key critical texts are analysed to highlight the evolving literary tastes underlying these processes.

Power of rankings. What do they say about the art world?
Agnieszka Natalia SZYMANSKA (Adam Mickiewicz University, Poland) |
agnieszka_szymanska@vp.pl

Rankings are a tool taken from the area of popular culture for structuring of what is happening in the art world. Rankings are trying to prioritize different issues like: artists, dealers, galleries, exhibitions, events, etc. They are usually made by the editors of art magazines or websites dealing with art in any form and moreover are based on the media knowledge. Different criterions are used while making rankings, more or less objective, but complete objectivity seems to be impossible.

However, rankings in fact are interesting source of information about the condition of the art world. They are an attempt to quantify what is not quantifiable - an artistic value. They have cultural and performative power. Economic and institutional decisions are often based on rankings or (depending on the context) those decisions are being rationalized on their basis.

There are four interesting aspects of rankings I would like to introduce: What is actually being measured by rankings? Is it an artistic value, power or publicity? How do they affect the functioning of the art world? What is the opinion about different rankings among the art world officials? What are the differences between Polish and Western rankings?

I will answer these questions using information gathered during the in-depth-interviews with the art world officials and analyzing the structure and methodology of rankings that were published in Polish art magazines over the last ten years as well as comparing them to Western rankings (e.g. Power100 by ArtRewiev).
RN02S03a - Cultural Entrepreneurship, Legitimacy and Appropriation

Cultural Entrepreneurship in the 20th century: The establishment of the art historical ideology in the US art world
Laura E.A. BRADEN (Erasmus School of History, Culture, and Communication, Netherlands, The) | Braden@eshcc.eur.nl

Though the importance of a legitimating ideology for artistic classification is well established in sociological studies of culture, how important field actors and organizations unite to develop a shared ideology is largely undefined. This paper illustrates how field actors in two important cultural institutions, academia and museums, developed the ideology of art history in the early 20th-century. I use the establishment of the modern art movement in the USA to show how these legitimating institutions structured the understanding, valuation, and display of modern art through the art historical ideology. In doing this, I extend DiMaggio's seminal 1982 work on the rise of US cultural organizations and the separation of high culture during the late 19th-century. I conceptualize three important processes, accreditation, evaluation, and coalescence, in how the art historical ideology institutionalized and structured understandings of artistic worth. First, I argue an accreditation system established professional positions in important field organizations. Second, these professionals used the art historical ideology in establishing new evaluative standards for artistic worth. Finally, field actors coalesced as ideological authority moved from elites to professionals.

Appropriation of visual art
Merete Hermansen JONVIK (International Research Institute of Stavanger, Norway) | Merete.Jonvik@iris.no

Identifying different forms of valuation of culture is a widespread field of study within cultural sociology. Visual art is no exception (see f.i. Bennett et al. 2009, Bourdieu & Darbel 1991, Halle 1992). These studies conclude that appropriation of visual art are influenced by people’s social background, education level and cultural capital, more or less in line with Pierre Bourdieu's work on art and culture (1984). Large parts of the research on appropriation of art focus on the experts of art, those who are already in the category ‘the audience for art’ (see f.i. Halle 1992, Zolberg 1992), i.e. forms of valuation from the inside of the exclusive art field (Solhjell & Øien 2010). Some exceptions are the studies of Bennett et al. 2009 (focus groups with dispersed sample) and Newman et al. 2013 (older adults).

In a study of appropriation of visual art among a dispersed sample of nonprofessionals from Stavanger, Norway, various forms are detected (emotional-spontaneous, knowledge-based, and art as ownership). Level of knowledge about art emerge as pivotal. Knowledge is essential both to the experience of art and to understand differences between manners of appropriation. Further, the knowledge-dimension is intensified by virtue of what characterizes the field of contemporary art.

The paper illustrates the different manners of appropriation, and explores their relations to so-called legitimate art and legitimate ways of appropriating art. The paper sets out to be a contribution to the sociological understanding of the relation between culture and inequality.
Legitimacy Sources of the Literary Criticism
Zdeněk STASZEK (Faculty of Social Studies, Masaryk University, Czech Republic) | zdenek.staszek@gmail.com

Literary criticism is a crucial and constitutive part of the notion of public sphere, at least in the theoretical framework developed by Jürgen Habermas. Discussions, held in the age of Enlightenment since the end of 18th century in the aristocratic salons and coffee houses, which would lately in combination with the institutional changes of a modern state (e.g. expansion of suffrage) form the public sphere, were concerned mostly with literature. Most of the participants of these debates were litterateurs themselves. As the principle of open and unregulated discussion colonized other fields and discourses, literary debates transformed into an institution of literary criticism. The latter still gained its legitimacy to criticize, to evaluate and to articulate moral or political values from the former. The development of the media industry, technology, entertainment, role of literature in the society and the public sphere itself turned literary criticism into a specialized discourse and exclusive, almost scientific institution with a very limited impact on the public sphere. The purpose of this article is to analyze sources of legitimacy of literary criticism in age of late modernity and its ability to constitute new cultural forms and fields of public sphere due to the transformation of the latter during the last decades and due to the evolution of literature: postmodern aesthetics, dissolving the principle of high and low culture, in combination with new forms of political activism and technology allow literary criticism to rebuild its position within the public sphere.

The Many Face(t)s of Nefertiti
Voica PUSCASIU ("Babes-Bolyai" University - Cluj-Napoca, Romania) | voicapuscasiu@gmail.com

This research focuses on a very well-known piece of Ancient art whose particular journey offers a unique opportunity to observe the way artifacts are used in a symbolic manner. Historical circumstance made it so that the "Bust of Nefertiti" passed through several political regimes, but unlike most symbols which have usually been discarded when ideologies changed, the bust has been recontextualized over and over, and given entirely different meanings in order to better suit each establishment. It has been used in contradictory discourses by politicians, curators, imams, and contemporary artists, all the while thriving under every label. The practices that have been applied make us question society’s willingness to forgive/forget the past uses of certain symbols in order to be able to reuse the exact same object. Does this perhaps mean that some objects are irreplaceable so that people go to great lengths in order to appropriate them by bending logic and erasing history? And if so, what is it that sets them apart? How come Hitler’s favorite artwork is now displayed in a setting so similar to his vision, albeit less grandiose and accompanied by a dose of German remorse? The explanation may be found in the sculpture’s Ancient origins, much too far and mysterious to comprehend for most, or in its fascinating imperfection which strikes an aesthetic chord, but most of all, the reason behind its versatility may come from its capacity of creating an affectionate connection with the viewer, reaching out in a subjective, personal manner.

RN02S03b - Art Criticism, Taste and Changes in Audience

Some Critical Reflections after Exploring an Unknown Group of Israeli Women Art Critics
Graciela TRAJTENBERG (The Academic College of Tel Aviv-yaffo, Israel) | gtraj@mta.ac.il
Jewish women have always participated in the field of Israeli visual arts, and some gained considerable recognition in the contemporary art scene. Until the late 1960s, however, women seem to be absent from the realm of "serious" art criticism. This impression changes when the search is broadened to include women's journals. These Israeli journals of the 1940s and 1950s reveal an extensive presence of women art critics.

Women's history has been habitually described as developed through distinguished intervals or "waves": each wave indicates a peak in feminist (s) activism(s) and awareness (Archer-Mann and Huffman). This is also the case in feminist art historiography. Within this paradigm, each feminist wave reveals a stage in which women's liberation intensified. Thus, for instance, this framework ascribed the emergence of feminist artistic practices to the 1970s (Brodsky and Olin) in a way that effectively addressed feminist scholars' difficulty to identify continuous and linear development of women's artistic practices. Nonetheless, what was meant to describe a social dynamic turned into a reified dichotomy. This unintended development has deeply affected feminist theory and research. My analysis of Israeli women critics draws mainly on Michel Foucault's concept of history of the present and his genealogical methodology.

I will first explain the difference between presentism and the history of the present; I will then demonstrate how this distinction influences our understanding of two main presentist forces: malestream presentism and feminist presentism. Second, I will utilize the concept of comprehensive genealogical feminism to analyze the case of Israeli women art critics.

Book reviews and discussion about books in the age of browsing culture: the case of nonfiction
Maaria LINKO (University of Helsinki, Finland) | maaria.linko@helsinki.fi

The Internet and mobile technology has changed the reading-habits everywhere. Quality newspapers are faced with declining numbers of subscribers and consequently culture sections are contracting in many newspapers. This paper looks at the publicity of non-fiction in Finland concentrating on newspapers and the Internet. It is a follow-up study which gives the possibility to compare data from 2009 to a new set of data from 2014. This is an interesting period of time since smartphones, e-readers and small laptop computers are currently used almost everywhere. Presumably, this has led to a browsing habit instead of the tendency of being absorbed in reading. This paper analyzes if there still is a place for reviews of nonfiction books or discussion on books in newspapers and magazines. Furthermore, the paper addresses the following questions: If this discussion on books has moved more or less to the Internet, does it take place on literary blogs, on newspapers webpages or on other forms of social media such as Twitter? Does the same media material appear in different formats? Which genres of nonfiction or what kind of writers have adjusted to these changing forms of publicity? The data of this ongoing study consists of media publicity of nonfiction books and their writers in several newspapers and magazines (2014 and 2009), and in in more than a hundred blogs and websites and tweets (2014). Concepts from media studies and science communication will be used as analytical tools.

Highbrow culture for high-potentials? Cultural orientations of an economic elite in the making
Janna MICHAEL (Erasmus University Rotterdam, Netherlands, The) | michael@eshcc.eur.nl

Considering the discussion on the changing constitution of legitimate cultural capital, this study investigates discursive practices and takes a qualitative approach to understand distinction. Using in-depth interviews, conducted in North-Western Europe with young business
professionals or ‘high-potentials’, leisure consumption practices are explored with a focus on music, arts and choice of apparel. This study explores the relevance of highbrow taste and arts consumption for the social networking and the lifestyle of this distinct group. Young business professionals are particularly interesting because they are establishing themselves in the business world. This ‘working their way up’ in multinational firms requires strong personal commitment and makes them prone to be aware and reflexive about the rules and codes of conduct within the field. Making their way into the managerial class, they have to live up to high expectations, build professional networks and prove themselves to leaders in the field. Earlier research ascribes a rather conservative highbrow taste to economic elites, and more recent studies have shown the benefits of omnivorousness for business professionals. Nevertheless, the interviews bring forward that cultural consumption takes a relatively minor role in the lives of the interviewees and set light on what is perceived as important to the interviewees when it comes to casual conversations, networking and leisure activities. This study thus enlarges our understanding of the relevance of music and arts in everyday life and of how they are embedded in identity performance.

Social characteristics of popular and modern painting’s audiences in Iran
Azam RAVADRAD (The University of Tehran, Iran, Islamic Republic of) | ravadrad@ut.ac.ir
Hamid JAFARI (Forsat Emrooz Newspaper) | hamidjafari83@gmail.com

This article is based on findings of research in the field of audiences of Iranian modern and popular paintings which examines the problem of difference or indifference of the personal and social characteristics of Iranian modern and popular paintings’ audiences and their artistic taste. Moreover, factors effective on shaping these differences are examined. The theoretical framework of the study is based on Pierre Bourdieu’s artistic fields and the research method is both qualitative and quantitative. In terms of qualitative research, in some selected galleries, audiences of paintings and their behavior were observed directly by the researcher. In terms of quantitative research, questionnaires were filled by all willing audiences of these galleries.

The general finding of the research showed that the audiences of modern and popular paintings were different in terms of cultural and social characteristics. They were also different not only in terms of their difference in the amount of capital they have gained in relation to the field, but also in terms of demographic characteristics such as their father’s occupational status and their life style. Moreover, the main hypothesis of the research was accepted and showed that there exists a meaningful relationship between the audiences and their taste judgment in general.

National Saturday Art & Design Clubs: A way in and a way up.
Katherine APPLEFORD (Kingston University London, United Kingdom) | k.appleford@kingston.ac.uk

In 2009 John and Frances Sorrell established The Sorrell Foundation’s National Art&Design Saturday Club programme. This scheme offers young people aged 14 to 16 the opportunity to engage in a wide variety of art and design activities, working with professional designers, artists and architects at their local college or university for free. Starting with just 4 clubs, the scheme has quickly expanded and it now operates in 32 educational institutions across the UK, and at the Victoria and Albert Museum in London.

In a short space of time, the scheme has been hugely successful in raising young people’s aspirations and providing them with routes into creative training and industry. But this idea is not particularly new. In fact, throughout 1950s, ’60s, and ’70s, it seems that hundreds of British children attended free Saturday morning art classes at their local art schools and colleges, as a
way of encouraging creative individuals into higher education, employment and industry. Art and design, at this time, was recognised as a form of vocational training, and as such offered individuals a means of social mobility whilst boosting the country’s economy.

Based on qualitative research conducted as part of residence with The Sorrell Foundation, this paper explore the experience of those who attended these early Saturday Clubs. It highlights in the value of art education for the baby-boomer generation in terms of social mobility and self-development, and explores the crucial role Saturday clubs played in setting individuals on creative career paths.

RN02S03c - Art Festivals and Exhibitions: Symbolic Production and Social Implications

Art Factories as Change Agents? The RuhrTriennale as case study
Jennifer Post TYLER (Université Paris 8, France; ISCOM Paris, France) | jenn.post.tyler@gmail.com

The transformation of former industrial spaces into places for the arts is an established phenomenon across Europe and beyond, one that continues to grow in popularity. Such adaptive reuse projects range from bottom-up grassroots initiatives launched by squatters and activists to top-down enterprises founded by established political leadership. These “art factories” aim to re-value abandoned spaces and provide new working places for visual and performing artists, authoring new story lines about the prospects of a depressed city or region.

How effective are these projects at initiating a liminal (or liminoid) space to effect transformation - both for the event attendee and for the surrounding environment? Which constituencies are most affected, and how? What additional social and cultural issues are raised by such projects? As a case study, I analyze the RuhrTriennale International Festival of the Performing Arts in the Ruhr region of northwest Germany. Founded in 2002, the festival animates nine former industrial sites with performing arts productions and visual art installations for 100 days each year. Via a series of site visits, observations and interviews over a two-year period, the research assesses the goals and outcomes of the event for various constituencies, expressed in subjective and objective terms. Based on this data, we begin to explore other social implications for such spectacular forms of mediated experience in disaffected sites – to what extent do such events engage hero narratives, reflect the “ruin porn” trend in visual culture, or symbolize the instrumentalization of art?

Biennial world: symbolic production in the art biennale
Monica SASSATELLI (Goldsmiths, University of London, United Kingdom) | m.sassatelli@gold.ac.uk

Biennials or biennales – periodic, independent and international art exhibitions surveying trends in contemporary art – have with startling speed become key nodes in linking production, distribution and consumption of contemporary art. The proliferation of these cultural displays and organizations in hegemonic and instrumental ways constitutes a practical and interpretive problem through which it is possible to address cultural change on a global scale. What some argue is a global phenomenon opening up spaces for reflection and cross-fertilisation, others regard as the ultimate proof of the standardizing and banalizing effect of a culture industry intensified by globalization. This paper focuses on biennials as a new empirical context to address such long-standing debates in cultural critique.
Art festivals have received scant sociological attention, arguably because they straddle a key distinction in art scholarship between production and consumption. Challenging that distinction, this paper proposes to study biennials’ role in the symbolic production of art through curatorial practice, art theoretical discourse and festive sociability. With their roots in the 19th century encyclopedic exhibitions based on international representation, biennials have become sites that experiment with alternative forms of cultural representation and territoriality, challenging earlier classifications of cultural influence and diffusion. This paper proposes a cultural sociology of biennials, focusing on the Venice Biennale, founded in 1895 and the first of the genre, through which we can trace biennials’ rise and transformations as key sites of both the production of art’s discourse and where that discourse translates into practices of display and contexts of appreciation.

The exhibition space as the public sphere: the exhibiting of contemporary art in China
Linzhi ZHANG (University of Cambridge, United Kingdom) | lz337@cam.ac.uk

This article provides a sociological account of the development of contemporary art in China. Contemporary art emerged in the late 1970s in China as a rebellion to the state-sponsored official art. In its early stage, contemporary art experienced difficulties in exhibiting, because the official art owns monopoly of exhibitions in the state-owned public museums and galleries. Advocates of contemporary art get out of these difficulties by building their own exhibition spaces. In the new millennium, a great number of private galleries and private not-for-profit museums mount shows of contemporary art even when sale of art is impossible. Recent discussion in sociology of art raises the issue of art and the public sphere. Researchers have challenged the Habermasian concept of the public sphere. However, most studies postulate a public sphere external to the art world and examine the interaction between art and the public sphere. In this article, based on the case of contemporary Chinese art, I propose to understand the exhibition space as the public sphere. That is to say, I argue that, the efforts to exhibit contemporary art in China have created a space between the market and the state, and this space can be called the public sphere. The public sphere in this sense is not external to the art world, but becomes the essential part of the art world. Moreover, this public sphere is indispensable for the consecration of contemporary art.

People Meet in Art. From Object Encounters to Temporary Communities in the Exhibition Context
Luise REITSTÄTTER (University of Applied Arts Vienna, Austria) | luise.reitstaetter@sbg.ac.at

In 2010, the director Kazujo Sejima from the renowned Japanese architecture firm SANAA declared the slogan “People meet in Architecture” to the motto of the 12th International Architecture Exhibition of La Biennale di Venezia. Underlining the socio-spatial aspects, it becomes evident that architecture is not only the mere composition of materials, a progress of styles or a sample of star concepts, far more it is the trivial place where people meet in today’s society. To my mind the same goes for the exhibition as it offers a setting to experience art and, not to undervalue, a site to gather with other people. In this perspective the exhibition works as a space of interaction or one could say as a social occasion (Goffman) where different views from curators/artists/educators etc. and visitors clash mediated through objects but also face-to-face communications. In the context of these inter-objective as well as inter-subjective encounters the paper defines the social of the exhibition and inquires its potential to establish object relationships or even (temporary) communities. Based on an extensive field research in exhibitions of contemporary art with the methodology of Grounded Theory and in reference to
art-theoretical and sociological concepts of communities the paper discusses the exhibition as individual versus collective ritual. A main focus lies on the exhibition’s specific sociability dealing with issues of shared space and time, representation and diversity as well as cultures of participation.

The Feminisation of Artistic Work. Ways and Reasons
Marie BUSCATTO (University of Paris 1 Panthéon Sorbonne, France) | marie.buscatto@orange.fr

While all legal and formal barriers limiting women’s access to art worlds have disappeared in western countries, getting access to artistic work, maintaining oneself in one’s art world, and getting recognized as an artist remain more difficult for women than for men in all observed art worlds - music, film, literature, theatre, dance, visual arts or circus. Recent empirical research has identified several key social processes which cumulate over time to produce gendered differences between women’s and men’s career paths – gendered networks, norms, stereotypes, roles and conventions. But research has also shown that women do get more and more access to artistic work and to artistic recognition over time, thanks to several tools and resources which they use, consciously or not, to do so – art schools, families, collective and individual “feminine” strategies… Based on numerous empirical examples drawn from several art worlds, this talk will try to describe resources, strategies and tools women, consciously or not, use to transgress such gendered limiting processes in order to become and to remain artists over time, and sometimes, even to become famous worldwide artists!

RN02S04a - Artistic Career Paths

The freelance network model: a study on the career paths of professional actors
Astrid VAN STEEN (Ghent University, Belgium) | astrid.vansteen@ugent.be
Jessy SIONGERS (Ghent University, Belgium) | jessy.siongers@ugent.be

For those employed in the performance arts, extreme flexibility becomes an increasing reality. Audiovisual production companies, broadcasters and theatre companies rely more than ever on temporary workers and freelancers. Unquestionably, professional actors have become real job hoppers and their work differs strongly from traditional employment. Their project-based working in a so called freelance network model is characterized by a succession of short term contracts and the simultaneous participation in various projects. Our article examines what it implies to work in a freelance network model, both professionally and personally. We map actors’ careers and the associated socio-economic and financial situation of professional actors based on recent survey material. During the months of December 2013 and January 2014, we organized a survey among professional actors in Belgium. As many as 457 performers filled out an online questionnaire. Based on this survey material we will first give a detailed description of the professional situation of Flemish actors. Questions that will be answered are: What are the consequences of a freelance network model for the employment and working conditions of actors? What financial rewards and/or compensation do actors receive in such a network model? Next, on the personal level we look at job satisfaction and relate this to employment status. In addition, we address whether the freelance network model gives actors more freedom and flexibility or whether it results in increased job insecurity. Our regression analyses will pay special attention to female actors who prove to be a particularly vulnerable group.
From community arts to artistic career: cultural expression as a way of life
Rui Telmo GOMES (CIES-IUL / Centre for Research and Studies in Sociology – University Institute of Lisbon, Portugal) | ruitelmogomes@gmail.com

Eventual opportunities for professional artistic careers stemming from creative participation in youth cultures scenes have been addressed in recent research. This paper specifically considers community arts practice and local associations (or youth clubs) involvement as possible pathways merging artistic professionalization and political activism. Case studies data from an ongoing research in Lisbon will be presented.

Pathways for emergent musicians with immigrant background in Norway
Mariko HARA (Hedmark Univesity College, Norway) | mariko@marikohara.net

My research project aims to look at how well the currently music education in host countries support musicians with an immigrant background who want to embark on a professional music career. I will examine the formal/informal music learning and development of their professional musicianship. This paper will discuss the theoretical framework.

The informants will range from young people born in Norway who are involved with hip-hop to musicians who re-establish themselves in Norway after moving here. I want to investigate whether and how the musicians with an immigrant background negotiate their musicianship and identities according to the paths they take, the term paths refers to the concept of “musical pathways” (Finnegan 2007).

I also intend to examine the informants' musicianship, that is, the procedural and situated knowledge they have as musicians (Elliott 1995) that is learned through interactions with others (Green 2009). These informal settings can be understood as "the field" as defined by Bourdieu (1993). I see these fields being connected with other fields through the paths developed by the actors' movements across multiple fields (Hara 2013; Crossley & Bottero 2014). I will explore the resulting networks of paths and fields, which resonates with the idea of an “art world” (Becker 1992) where people's collective and spontaneous actions in a network of people are responsible for the production of art.

Overall, these concepts will help to highlight how the music world(s) of musicians with an immigrant background emerges and how and where it links to music education.

RN02S04b - Professional Development in Music and Visual Arts

Two-Mode Tie Formation in Creative Collaborative Networks
Considerable scholarly interest within the field of social network analysis has addressed the subject of tie formation. This topic seeks to explain why ties form between particular actors in a social network, yet not others. While this subject has gained traction with respect to collaboration networks, the majority of such work falls short of considering collaboration as a two-mode, affiliation process. For this study, we conceptualize collaboration as an affiliation process comprised of the relationship between individual actors and the projects that result from their contributions.

Following the treatment of tie formation in the existent literature, we hypothesize that collaborative ties form in accordance to preferential attachment norms, whereby popular actors become more popular as newcomers enter the network; homophily principles such that actors collaborate with those of a similar age and the same organizational affiliations; heterophily effect based on working with others who fulfill a different role in a project; propinquity effects; as well as nodal covariates. Further, while we expect that individuals who have collaborated on previous projects in the past to continue to collaborate in the future, we provide rival hypotheses regarding the likelihood of cycles involving three actors. To demonstrate, consider a situation of an actor, “ego,” and her collaborator’s (“alter one”) prior collaborator, “alter two,” who has not previously been ego’s collaborator. On the one hand, alter two is much closer to ego than most others in the social network. On the other hand, social prohibitions as well as prior conflict may prevent ego from collaborating with alter two.

We test these assertions on two longitudinal networks composed of musicians as well as the albums (and sessions) on which they perform. We collect our data from online archives on jazz and metal discographies. Within the context of two-mode social network analysis, we treat musicians as the primary mode and their albums (and sessions) as the secondary mode. Further, these data sources afford us the ability to collect attributes on both the musicians and their collaborative endeavors. We analyze our data using both p* models along with other simulationist techniques. Findings from our study contribute to research on the subjects of two-mode networks, collaboration, and closure in affiliation networks.

The rise and decline of musical societies in Sweden 1790–1865
Boel LINDBERG (Linnaeus University, Sweden, Sweden) | boel.lindberg@lnu.se

Between 1790 and 1825 a considerable number of musical societies emerged in Swedish towns outside the capital. They became settings where a select group of men and women from the three higher estates (nobility, clergy and burgers) met to play and enjoy the modern symphonic and chamber music of the time. How can we explain the emergence, function and demise of those societies? In this paper I will attempt to answer these questions. The societies were established in provincial towns that housed a county administrative board, a court of law, an upper secondary school, and in most cases also a military camp. Usually a prerequisite also seems to have been a landowning gentry living on estates close to those towns. With the exception of professional musicians, only persons belonging to the upper classes (the nobility, burgers and clergy) could apply for membership, either as a “working member” or a “listening member”. In some societies women of rank were admitted in both categories. The “working members” were as amateur musicians expected to take part in the society’s performances of instrumental and vocal music at closed assemblies (usually one per week from October to April) but also at public concerts given for the benefit of pauvres honteux.
Good amateur musicians were often found among the nobility where the ability to play an instrument had been highly appreciated since the early 18th century. By 1840 most of those musical societies were no longer active. One reason seems to have been that they no longer could recruit amateur musicians for the kind of music that was appreciated by the members (symphonic music, chamber music and vocal pieces by domestic and continental composers of the time). Changed preferences among the nobility and the other high estates as regards the necessity to learn to play music is one explanation. The societies also had difficulties in recruiting “listening members” due to shifts in taste as how to enjoy music. In several towns the musical society was replaced by a new “soirée society” with much more diverse programs for the assemblies like conversation, performance of light theatrical pieces, embroidery for the women, smoking for the men, dancing to music played by professionals and occasionally music making by the amateur members. The activities in those “soirée societies” resemble in many ways the kind of events that took place in the literary and musical salons of the larger cities in Sweden and elsewhere in Europe during the romantic era.

The demise of those early musical societies in Swedish provincial towns can on another level be explained as the consequences of a changing society where the political and economic power of the established estates began to crack. In 1864, when the old type of parliament, based on four estates was replaced, new types of musical societies in which vocal choral music had a more prominent place had already been established in towns all over Sweden. Those societies drew members from a broader section of the towns’ inhabitants. They became, however, also more dependent on professional musicians as musical leaders and organisers.

International artistic career within the network society. The case of Polish visual arts.
Anna SZYLAR (University of Warsaw, Poland) | a.szylar@is.uw.edu.pl

Manuel Castell’s theory of the network society, despite being formulated almost twenty years ago did not lose its relevance. Rising number of concepts proposed by Castells find their reference in current shape of the Polish society. According to Castells a network, understood as a specific form of social relations is sustained by permanent negotiations of its elements, who are (re)defining not only a whole system but also one’s position within it. Mostly recognized realm in which one can observe network processes is a division and organization of work. Vertical hierarchy makes space to flexibility and autonomy of cooperating actors. What is often recalled in that context is a rising meaning of international cooperation supported by new communication technologies enabling actors unhampered exchange of resources and boosting their opportunities on the global market.

The aim of this article is to show the influence of the network work organization within contemporary visual arts on the Polish visual artists’ presence in the international art field. The author focuses on i) analyzing possibilities of international cooperation offered by public cultural institutions, ii) analyzing founding opportunities dedicated to the international projects booted and coordinated by artists and iii) analyzing actions undertaken by grassroots movements gathering visual artists in Poland. On the one hand the article is based on the critical reading of strategic documents released by the leading Polish cultural institutions, on the other it analysis selected international projects in which Polish visual artists took place.

Multiple Job and Other Strategies for Professional Musicians in Barcelona
Marta CASALS (Universitat de Barcelona, Spain) | martacasalsbalaguer@gmail.com
The purpose of this research is to analyse artistic practices of modern music and jazz musicians living nowadays in Barcelona and the strategies they articulate to work as professional musicians. The study material will focus on musicians working on these stylistic areas, modern music and jazz, that are professionals in the current art scene in Barcelona. Through this case, we will be able to observe and discuss the existing professionalization processes and ways of transition between different stages of professionalism. Therefore, we will try to make an analysis of how musicians currently articulate their activities to practice as professionals and we will focus on four specific aspects. The first aspect will be the role of teaching as a parallel activity to the music practice. The second one, understanding high-school studies as an attempt to achieve autonomy and recognition and generate thus greater job options. The third will be the consideration of multiactivity (Menger, 2005), and therefore versatility and flexibility, as forms of job optimization to reach professionalism. The fourth and final aspect to analyze will be the DIY method as an entrepreneurship strategy (Rowan, 2009) that enables the production of works beyond the prevailing movements in the current art market (Moulin, 2012). All these aspects will determine the different valuation criteria which, in turn, will be established as a method of professional recognition within the music industry.

**RN02S04c - Artistic Life: Uncertainty and Dilemmas**

**Is It Possible To Be a Commercial Artist? Dilemmas of Advertising Industry Employees with an Artistic Background**

Kamil LUCZAJ (Jagiellonian University, Poland) | kamil.luczaj@gmail.com

As it is often demonstrated (J. Dewey, P. Willis, J. Gibbons) affinities between the art world and advertising industry are strong (professional critique, encoding/decoding process; artistic quality). Moreover, many “creatives” have an artistic background. Similarities between the “bohemian” artistic ethos and the “bohemian-bourgeois” ethos (D. Brooks) of the creative class are also visible. Yet, when creatives decide to work outside the field of art, or outside the academia, they have to agree upon the market rules. Here the problem of their artistic identity begins. As C. Wright Mills put it, the designer is a man in the middle, because “his art is a business, but his business is art”.

The paper is based on a series of qualitative in-depth interviews with art directors and copywriters who work in Poland. I discuss how the creatives deal with their dual roles (as professionals and as artists). Some of interviewees pointed out that they strongly differentiate between their nine-to-five job and making “real” art after hours, others believed that the arts make them feel that they do something meaningful, some believed that being an artist make them more competitive in the industry.

From the semantic perspective it was interesting to observe how many different meaning the word an “artist” can have. The interviewees used this term to describe someone who creates the arts, someone who is good at his/her work, but – surprisingly – there was also an opinion according to which being “an artist” in the advertising industry is a kind of a handicap.

**From the shadow to the centre: tensions, contradictions and ambitions in building graphic design as profession**

Pedro QUINTELA (Faculty of Economics University of Coimbra, Portugal) | quintela.pedro@gmail.com
Traditionally, design was understood as a hinge area between the art and production system, which took, on the course of the twentieth century, a peripheral place in the context of the artistic and cultural production. Design as a profession was built in this permanent tension between a commercial vocation and an aesthetic sense, and it was often despise or ignored by the academia and the ‘art world’. Sociologists like C. Wright Mills (1958), for instance, saw designers as the "men in the middle", alienated and frustrated, caught between the worlds of creativity and commercialism. However, this view has been changing considerably during the recent decades – including by sociology. In late capitalism, design has acquired a new role in society, due to the massification of its presence in economies that have become more and more “design intensive” (Lash & Urry, 1994). Designers have become key-figures that look at themselves as cultural operators and creative agents. Simultaneously, the profession became massified, in a process which was accompanied by a greater structuring of the design education and research system. Paradoxically, in this process of affirmation, design as a profession has been increasingly degraded and became precarious. In this paper, I’ll analyze the tensions and contradictions on the construction process of graphic design as profession. Methodologically, I will analyse and confront several interviews conducted with Portuguese graphic designer from different generations and with different professional paths.

The artist’s autonomy between esthetical experience and research activity: an analysis in the Swiss art-education context.

Drilona SHEHU (Hochschule der Künste, Bern, Switzerland) | drilona.shehu@gmail.com

Through an ethnographic fieldwork in three different Art Universities in Switzerland, this paper proposes to track the emergence, articulation and transformation of esthetic and research categories in regard to the art-student’s autonomy, in the context of Bologna Reform. The latter was imposed in all third-cycle educational institutions in the country, including the artistic-field. These institutions having the status of Universities of applied Arts, which differentiated them substantially from other Universities, they regarded this Reform as a will of academization of their studies and as a sign of a more hostile political environment against artistic activities. In this context, we observed that a general economic orientation of the public space affected on one hand the concept and activity of research: While, students and professors would claim the research category as their common and usual activity process referring to the exploration of materials, ideas, or even historical, sociological and political subjects, research appears to be regarded more and more as an academic and scientific practice. It begins to oppose to esthetical experience; the later reflecting instead an immediate form of experience that resists explanation or even description. The autonomy of the art-student emerges as a constant at-stake in the articulation of these problematics in our field. Our analysis will show how artist’s autonomy is being defined in the up-mentioned context as the students are confronted with what an art-work is, how should they stand for it as well as how does it integrate in a historical and contemporary context.

Uncertainty of Artist’s life?

Blahoslav ROZBORIL (Masaryk University Brno, Czech Republic) | 5221@mail.muni.cz
Jana PISARIKOVA (Moravian Gallery Brno) | pisarikova.jana@seznam.cz

The paper focuses on fine art producers, their subjective experience of their existential situation and the strategies used to solve it. The text is based on empirical material – a survey in a written form, in which Czech artists born in 1970s and 80s who entered the art scene after the year 2000 are being interviewed. The respondents answered a set of 20 questions via email.
The paper puts the research in a diachronic context by comparing it with a similar survey carried out in the 1930s (On the Social Position of Czechoslovak Writer. A Survey by the U-blok magazine). The comparison suggests that the changes between the two periods in focus only apply to several parameters entering the situation. However, most elements of the living situation of an art producer seem to be constant. Similar practices and strategies in the solving of various situations have been repeated over decades, even though art producers perceive everydayness as the challenge to employ their creativity. The most frequent (and researched with a priority focus) solution of an artist securing their living is by working in an educational institution. Many authors nevertheless perceive their pedagogical activities as a mission extending their attention to the external world into another dimension of their authorial undertakings. Part of the respondents see the lack of security in their lives as an ambivalent element interconnecting freedom with a voluntary acceptance of limitations. It seems artists are better equipped for the confrontation with social inequality or economic crisis thanks to their accepted uncertainty. However, they see some aspects of their situation as a privilege.

**RN02S05a - Museums, Galleries and Alternative Art Spaces**

**Art Museums Facing Their New Public**  
Diana LENGERSDORF (University of Cologne, Germany) | diana.lengersdorf@uni-koeln.de  
Julia HEIDLER (University of Cologne, Germany) | jheidler@uni-koeln.de

In interviews we conducted with directors of museum, they elaborate a change of their museum as a change of their visitors, which in particular challenges the presentation of their exhibitions. In the scientific literature there can be observed an increasing interest in the phenomenon of a ‘new public’, in the sense of younger ages and especially persons with low educational and/or cultural achievement. This diagnose could not be approved that clearly by first findings of our research project “Dramaturgy of the Museum”, which is supported by the German Research Foundation. What we do find instead is a new boundary within an education-oriented visitation between ‘those who feel’ and ‘those who know’. Our main thesis is that with the attempt to fulfill the (supposed) needs of this ‘new public’ by bringing in elements of events into presentation concepts, it is less reached a ‘new public’ but it rather helps the ‘old public’ to carry out new distinctive practices.

In our presentation we will focus different dimensions of social inequalities in museums that are of main interest in our research project. Besides interview data our argumentation will be based on visual data and sequence analysis of rooms. With our talk we would like to contribute to the empirical exploration of art museums as producers of social differences, not only in a subjective dimension in the narratives of the directors, but also in its material and spatial dimension.

**Art Associations and Institutions in Iran; Sociological Study of the Group Activities of Contemporary visual Arts in Iran**  
Mohammad Reza MORIDI (Tehran University of Art, Iran, Islamic Republic of) | moridi@art.ac.ir  
Masoomeh TAGHIZADEGAN (PhD student, Tehran University, Iran) | taghizadegan@ut.ac.ir

Avant-garde artists need institutions which foment and support their innovative artistic creations; they reach such support, approval and stability via social activities as well as establishing art societies, groups and associations. A glance at history also indicates that vanguard artists like Kandinsky, Mondrian, Surrealists and Expressionists all participated in artistic group activities. Nevertheless, modern art group activities are impeded by a number hurdles; among these are the artists’ romantic seclusion or the introversion that they seek away from the society which
alienate them from its core. The article at hands scrutinizes the mechanisms of the art associations and unions as the institutions of art and the impediments on their way. Furthermore, in another part of this article, the history of these associations and unions are surveyed and the reasons for their lethargy and dormancy have been analyzed in interviews with painters. The results of the survey illustrate that the lack of solidarity in the Iranian art community has not only resulted in their inability of expressing their artistic and civic demands, but also thwarted the formation of styles or schools of art within the art community of Iran. In the final part of the article a number of suggestions to ameliorate the management and policy making processes in the art currents in Iran

From institutions of critique to extra-institutions? An enquiry into the possibilities of contemporary alternative art spaces
Franziska BRÜGGMANN (Zeppelin Universität gemeinnützige GmbH, Germany) | f.brueggmann@zeppelin-university.net

Since the 1970s, alternative art spaces and – from an artistic viewpoint – movements such as institutional critique have been continuously challenging the widely accepted notion of the art institution by criticising its structures and frameworks. In the past decade this criticism has shifted, as part of the New Institutionalism, from the outside to the inside of the institution: So-called institutions of critique incorporated institutionally critical practices but only a few of these newly formed or re-formed institutions managed to become an enduring alternative to the ‘mainstream art institution’. Recently, this institutionalized institutional critique has been frequently accused of having lost its critical potential due to its co-option by institutions. The question then arises how we might think of alternative art spaces that are capable of operating self-reflexively and critically. This paper firstly proposes the presumption of differentiating between institutional critique as a genre and institutional critique as a methodological tool. Secondly, I will test the hypothesis that a further development can be observed from institutions of critique to extra-institutions. These latter pursue the goal of operating outside the institutional framework. But are these extra-institutions capable of facilitating a change of the common notion of the art institution? Are they able to escape the frames of the art system or do they remain within the paradox of depending on the institutional framework in order to criticise and change it? Based on case studies I will analyse strategies and characteristics of these extra-institutions. I will show how, by adapting practices from social and artistic activism and putting itself up for discussion, an art space can make use of institutional critique as a tool to position itself critically.

The Art Museum as the focal point of basic values of National Culture
Ekaterina POTYUKOVA (The State Russian Museum, Russian Federation) | ekaterinkap@gmail.com

The analysis of sociological surveys at the State Russian Museum (SRM) – the largest museum of National Art – shed light on a correlation viz.: the artistic preferences of the National Art museums visitors reflect the dominant basic values of the national culture. After the collapse of the Soviet ideology the Russian museums were given an opportunity to acquaint their audiences with a great variety of artistic styles of Art. A number of studies shows that on the one hand in the early 1990s those preferring the Traditional Art took a negative view of concurrent social changes and adhered to the values of respect of traditions. On the other hand those preferring the Contemporary Art took a more positive stance towards the changes and espoused the values of personal independence. Thus the Art style preference has a certain social significance.
Nevertheless according to the data the Art preferences of the SRM audience have been stable for last 25 years. This is demonstrated by a clear pattern emerging from the researches: in assessing the Russian Art exhibitions of different periods the overwhelming majority of respondents consistently assign high value to traditions. Furthermore the older the artistic tradition the higher the number of positive opinions. There is undoubtedly an adherence to traditions.

The results of research of Artistic preferences of the Museum audience is consistent with those of the Basic Values of national culture (according to Shalom H. Schwartz classification) conducted by Russian scientists: in today's Russia traditional values prevail over those of independance.

**Artist-run galleries in the Irish Republic – the emergence and evolution of a field.**

*Alexandra MURPHY (Trinity College Dublin, Ireland) | murpha10@tcd.ie*

This paper focuses on the development of artist-run gallery spaces within the Republic of Ireland. It draws on interviews with key practitioners, undertaken as part of my doctoral research. It explores artist-run spaces both as the culmination of social action and as a framework for action.

Since emerging in 1950s New York, the concept of ‘artist-run gallery’ has become an international phenomenon. However, its emergence within the Irish context is belated. Despite several notable organisations, a population akin to a field does not begin to emerge until circa-2006. It is of note that this occurred against a backdrop of significant cultural change, resultant from unprecedented surge (circa 1995-2007) and then decline (2008) in the national economy. This paper considers the development of the phenomena at field level since the turn of the millennium.

The interview narratives are considered collectively and thematically to identify both common and novel experiences. Key areas of interest are the ideologies and ideations that motivate these organisations, major purposes to which they are directed, operational models and structures therein engaged, and how and why change occurs in these areas. The paper identifies the current challenges that are being experienced at field level, how organisations are responding to these, and the potential impact that they could have on the future of the field and in turn the broader arts ecology within the ROI. The paper focuses on the experiences and circumstances within a local context. However the emerging discussion resonates with international literature and research.

**RN02S05b - Arts Organisations: Theatres and Orchestras**

**“Back-to-the Past”**: Habitus and Hegemony in a Modern Theatre

*Tova GAMLIEL (Bar-Ilan University, Israel) | tova.gamliel@biu.ac.il*

The lecture proposes an explanation from the world of art for the persistence of a cultural hegemony in Israel’s repertory theatre. Its members are veteran artists and actors of European origin who co-founded this theatre in the 1920s–1960s and retain status and influence on the Israeli art scene. The main question is why “voicing hegemony” practices in various Israeli media and theatre settings ignore the lively public debate over ethnocultural pluralism that has been broadening the limits of the politically incorrect.

In view of a cultural-studies literature that challenges cultural hierarchy and following Gramsci’s and Bourdieu’s conceptualization, the lecture analyzes this hegemony from the inside, probing the deep contents of this theatrical culture that underlie the identity of veteran members of the
elite as unchallenged representatives of a haute couture. These contents belong to the artistic habitus that mainstream theories of the theatre characterize as “back-to-the-past.”

Ethnographic research in 2007–2012 identified “pioneering,” “ghosts,” and “classics” as dominant dispositions of this habitus and stressed their contribution to the construction of performative capital. The lecture describes these dispositions, their connection with the end phase of one’s theatrical career, and the adult orientation of the Israeli bourgeois theatre. Concluding, it considers the artistic habitus inseparable from the exceptional positive image of the artists’ agedness and the theatre’s conservative elitist image as a current archaic institution. Immortalizing these actors in the Gramscian role of “traditional intellectuals,” the habitus lets them monopolize the translation of this world for limited social elite audiences.

The New Opera House Meets Management. Lights and Shadows of Managerialism Entering Cultural Organizations
Paola TREVISAN (Ca’ Foscari University, Italy) | paola.trevisan@unive.it

What happens when a managerial logic enters in performing arts organizations, where cultural values and public service vocations are traditionally put on the forefront?
To investigate this question I applied a grounded theory approach on an ethnographic study conducted in an Italian Opera House. The case is interesting since it is praised to be one of the few Italian examples of successful implementation of “good management”, after years of unconditional support by the State.
Preliminary results show that the organization adopted some of the managerial principles that can be detected in the wider discourse of New Public Management (NPM), and, indeed, the financial results achieved suggest us to recognize the successfulness of the managerial turn.
According to the official version, provided by managers, the “good management” didn’t arrive thanks neither to the reforms of the opera legislative framework, nor to professional managers or NPM specialists, but rather from people coming from the cultural sector, without managerial background, and with long experience within the same organization. It can be noticed, however, the large recourse to the language of management (or management-speak) to reinforce the official position with objective and rational reasoning, and to minimize conflicts between artistic/cultural and financial/commercial goals.
However, some thought-provoking aspects of the managerialization process emerged when the official version is confronted with less official voices (from behind the scene). Such aspects highlight the inherent conflicts existing between management and artistic logics in cultural policies, in cultural organizations, and among cultural workers.

Dealing with Arts Partnerships Conflicts: A Case Study of the Managerial Processes Leading to a Merger in the Dutch Cultural Sector
Xavier CASTAÑER (University of Lausanne, Switzerland) | xavier.castaner@unil.ch
Alexander ALEXIEV (VU University Amsterdam, Netherlands, The) | a.s.alexiev@vu.nl
Jori GERRITSEN (VU University Amsterdam, Netherlands, The) | aalexiev@feweb.vu.nl

How do art organizations deal with conflict in a partnership arrangement? Few studies have focused at the managerial level on how the representatives of the individual partner organizations cope with efficiency issues, i.e. how they perceive the conflict from their own individual and organizational perspective, which actions they propose and which decisions are implemented. We approached this gap by examining the case study of the governance transformation of a network of Dutch theatrical organizations. More precisely, we examined how five performing art organizations’ partnership network evolved in dealing with an efficiency conflict, leading to a merger. We chose this case study not only because it led to an unusual
merger in the sector studied (cultural sector) but also because its unfolding revealed a particular sequence in which partners decided to deal with the interorganizational arrangement as well as with their own organizations. The cultural sector in the Netherlands experienced significant shift following the decision of the government to reduce subsidies for artists and cultural organizations. Theatres, in particular, have undertaken important strategic changes such as revisions of their programming intended to reach more potential visitors, as well as an emphasis on the commercial exploitation of the venues under their management and establishing partnerships with other theatres. Thus, this case study provides a fertile soil to reveal dynamics of how partners in such arrangements deal with coordination problems, leading to a major arts organizational governance change.

Orchestrating solidarity: symphonic diplomacy as a musical act of citizenship
Lisa MCCORMICK (Haverford College, United States of America) | lmccormi@haverford.edu

This paper explores artistic practices that cultivate the experience of civil sociality that characterizes “citizenship beyond the state.” Like international music competitions, symphonic orchestras can create forums for various political projects to be pursued. My focus here will be on the interplay between national citizenship and global values in three organizations – the Simón Bolívar Symphony Orchestra of Venezuela, the Gustav Mahler Jugendorchester, and the New York Philharmonic – and how they fashion themselves as musical ambassadors when they embark on high-profile concert tours abroad. Through a discourse analysis of media coverage and publicity materials, I will examine how these collective actors use the freedom of “room for manoeuvre” to make claims for inclusion and attempt to relate musically across differences. The paper works towards a cultural pragmatics of global citizenship by considering events such as the debut of the Simón Bolívar orchestra at the Proms in 2007 and the New York Philharmonic’s invitation to perform in North Korea in 2008.

Managing an artistic theatre – a case study of theatre management in Warsaw
Wojciech Jacek SOBOLEWSKI (University fo Warsaw, Poland) | wojciech.j.sobolewski@gmail.com

Warsaw is a city full of theatre institutions. After the economical and political transformation of 1989, a new era of free market based issues arose. Many theatre institutions became municipal in the mid 90’s. In the early 2000’s many private theatre were brought to life. Ever since two ways of thinking about culture are fighting each other. Commercial or artistic profile of the institution defines the way of thinking of the managers and the policy of the institution. Each type has its unique goals and ways of achieving them. Depending on the type of funding and profile theatre directors aim at different audience and type of sponsors. A qualitative study of a Polish public theatre shows the management technics and problems of a public artistic theatre. In this presentation I would like to describe the map of theatre institutions in Warsaw based on their funding, artistic/commercial profile and their management style. Howard Becker’s “art world” consists not only of actors and directors, but also of managers, producers and other professions necessary for the creative production process to take place. Analysis of managers and types of funding allows us to better understand different elements of the creative process. Creativity is thus required not only in the core of artistic occupations but also of the service industry.
RN02S05c - Arts Organisations: Discourse, Management and Creativity

Folklore Festivals, Communist and Post-
Joseph Grim FEINBERG (Institute for Sociology, Slovak Academy of Sciences; Philosophy Institute, Academy of Sciences, Czech Republic, Czech Republic) | jgrimfeinberg@gmail.com

This paper traces the shifting role of folklore festivals in Communist and post-Communist discourse, focusing on the case of Slovakia. The paper begins with a discussion of Communist discourse on festive culture, as first elaborated in the Soviet Union during the early decades after the October Revolution, and then as the discourse became established and domesticated in Communist-led Slovakia after World War II. The paper subsequently turns to the present, post-Communist moment and considers major discursive shifts that have taken place alongside changes in political regimes. The paper argues that in Communist discourse folklore festivals offered a conceptual means for overcoming the gap between rulers and ruled, between the Party and “the people”—and, by extension, between the city and the country, the modern and the traditional, the inauthentic and the authentic—by providing a space in which the masses of people could actively participate in cultural expression and at the same time could observe their own activity spectacularly represented and reinterpreted on the festival stage. In the post-Communist period, Communist attempts at overcoming the contradictions of modern life have generally been perceived as a failure, and a new discursive system has been established in which city and country, modern and traditional, authentic and inauthentic are kept strictly apart, while each is deliberately preserved.

Professionalizing Future Arts Managers: The Case for Transition Courses
Brea M. HEIDELBERG (Rider University, United States of America) | brea.heidelberg@gmail.com

Transition courses help students translate skills and knowledge learned in the classroom into real-world contexts. These courses, often situated after a number of core courses and before an internship, focus on practical application of knowledge alongside consideration of the impact a workplace environment can have upon its workers. Transition courses have had considerable success in medical schools, helping future doctors and nurses grapple with ways in which the social context of a hospital environment may impact how they do their work. In this paper I discuss the need for such courses in arts management curricula. Currently, many practicum and internship requirements do not have a classroom component or related prerequisite. This assumes students already have the knowledge to successfully navigate various working environments, which is not always the case. Through the lens of social learning theory I argue that these courses assist with both the socialization and professionalization of students, better equipping them to enter an increasingly competitive internship and job market.
To demonstrate how these type of courses might function I present a case study of the development and management of two transition courses, offered as a two-part professional development series in an undergraduate arts management curriculum. I first discuss course structure, how each course works individually as well as cohesively. I then discuss how theories of professionalization and workplace socialization were used to make curricular decisions. Finally, I consider how transition courses may look in other contexts, offering suggestions and insights gained from the case study.
“Exporting” systemic transformation in the field of culture?: The replication of social innovation across geographic boundaries
Rocio NOGALES MURIEL (University of Barcelona, Spain) | gefiri@gmail.com

Social innovation replication has attracted a lot of scholarly and political attention in Europe recently as a way to leverage initiatives that address inequality and increase social cohesion in specific settings by adapting them to other contexts. Social enterprises, as a specific type of institutional arrangement, have been recognized as vehicles for social innovation: beyond market distribution, they mobilize mechanisms based on reciprocity and redistribution to carry out a sustainable economic activity; they are embedded in their local context, where they foster cooperation among actors; and they offer participation mechanisms for internal and external stakeholders. Social enterprises are emerging in the fields of culture, the arts and the creative industries where the status of their professionals is often characterized by intermittency and precariousness. Such status threatens not only their day-to-day subsistence and the sustainability of their work but also the potential of articulating the sector so as to publicly voice demands, contest the status quo, and collaborate with other public and private actors. Research conducted on organizational replication has focused mostly on market-based firms although recent attempts at developing specific frameworks for social enterprises exist. However, the fields of culture, the arts and the creative industries continue to be under researched with regard to the conduciveness of contexts and the factors affecting replication across geographic settings. This paper addresses this gap by presenting the first case of social enterprise replication in the field of culture as a means to determine the context and the factors influencing its emergence and consolidation.

Entrepreneurship and Innovation in Creative Industries: A Review of Organizational Perspectives
Ozge CAN (Yasar University, Turkey) | ozgecan22@gmail.com

This study seeks to explore how organization theories and different research perspectives are adopted to understand entrepreneurship and artistic innovation in the domain of creative industries. As Jones, Svejenova and Strandgaard (2011) define them, creative industries encompass individuals and collectives engaged in originating, developing, and distributing artifacts and experiences with aesthetic properties and symbolic functions. Since the “socio-cultural turn” in the field of organizational research, scholars have become increasingly interested in understanding creative actors, art organizations and the environments surrounding them. Even though both a theoretically and methodologically rich literature have emerged as a result of this attention, very little systematic investigation has been made to evaluate the accumulated knowledge.

The aim of this study is to establish an integrated framework by which the possible contributions of organizational approaches to artistic production and art fields could be assessed in a through manner. Specifically, I would like to address the two important questions of: 1) how entrepreneurship develops and 2) innovation happens within creative industries including traditional fields like theatre, opera, music, film as well as contemporary domains such as video-games, haute cuisine, design and fashion. By reviewing the academic articles published in top tier organizational journals from 2000 to 2015, I will portray the dynamics of entrepreneurial efforts for change and the drivers, nature and distinct paths of introducing new artistic genres, styles or products. The study will also suggest opportunities for future sociological research of art that could draw upon the available organizational theories and arguments.
Design and art in a creative workplace
Cecilia SERRANO MARTÍNEZ (University of Zaragoza, Spain) | cserran@unizar.es

This paper aims to contribute to knowledge of the factors which inform the grouping of creative workers in particular places. It is based on a case study of the Aragón, a region of Spain, and draws on a period of nine months of ethnographic work among a particular group of creative workers. The main hypothesis is that there are visual and artistic components in the work environment that are stimulating for workers and there are a number of creative flows in these workspaces. We have selected one office that is occupied by two different groups of creative professionals: web designers and programmers. The research concludes that there is evidence that a shared set of cultural values, ideas about work organisation and a hybrid work-life balance are significant to the location choices of creative workers. The research is relevant as a contribution to knowledge about how creative places work.

Creativity is not a new research topic; Csikszentmihályi (1998) considered what the purpose of studying creativity was. The author concluded that there are two main reasons why it is useful to examine the lives of creative individuals and the contexts of their achievements. The first reason is the most obvious: the results of creativity enrich the culture and thereby improve indirectly the quality of our lives. He indicates that prior knowledge can help us to make our lives more interesting and productive. However, Florida (2002) indicated that there are a number of difficulties in analyzing these creative contexts. He said that creative work is often intensely subversive, because it disrupts thinking patterns and existing life. For this reason, it is even more interesting to approach the analysis of a creative environment through concepts related to the imaginary and cultural values.

In order to reach the magma generated in the creative process, the researcher must experience it and feel it in situ. The ethnographic technique allows us to dive into the space of creation and the processes that are generated. Also, research about the imaginary process violates the established order, because this type of research goes beyond the generated words that appear in one discourse. Our interest to include an analysis of the imaginary is because we want to understand the different systems that are generated beyond the purely functional. These institutions cannot be understood if they are located out of the whole of social life, as a simply functional system, integrated set of arrangements subject to the satisfaction of the needs of society (Castoriadis, 1983). Furthermore, Morin (1998) said that if we want to understand the problem of this complexity, we have to understand the paradigm of simplicity first. The relationship between the symbolic and the imaginary allows us to think about the same facts, because they must use symbolic imagery to express that both of them exist. To understand the influence of the imagination on the symbolic, Castoriadis (1983) argued that the symbolism has the ability to place a link between two terms. This ability is constant, so that it is simultaneously representing each other.

The idea of using this technique is to go beyond what the researcher realizes that it is able to visualize. Ethnography is useful to show to the researcher, that the world that we see every day is nothing more than a description (Castaneda, 2009). Researchers have to see, not only to look, and go in search of these imaginary situations that are generated in the environment. Hence different senses of observed situations must provide it, since the meaning is what is already given and the sense is what is constantly changing. This means, that different statements can express similar meanings. In addition, each of them can be granted a multiplicity of meanings. Therefore, if we investigate the different senses, we can know various ways to observe the reality (Montañés, 2001). From the point of view of Villasante (2006), in nonverbal analysis appear the concept of what is observed and the experience of sensations, images and intuitions associated with each space-time.

Ethnographies, among their different characteristics, are developed in natural situations that are not forced and consist in participant observation and in conducting interviews as conversations.
Goldthorpe (2010) indicated that the purpose of these techniques is to reach a better understanding of those meanings experienced by people in their context. Although ethnography does not observe the totality of possible realities, Goldthorpe said that ethnographies are regarded as descriptive basis for generalization, because the number of the cases can be considered representative of the population in which there are include. The importance of the ethnographic representation can be interpreted in the sense that these techniques focus on cases that bring strategic advantages for research, since the nature of the cases are deviant, outstanding, critical, or these cases “minimize or maximize certain crucial contrasts” (Goldthorpe, 2010: 58, 59). The greatest difficulty in the study of the processes generated in a working group is to control all variables that are relevant in the interaction (Sawyer, 2011). The most important thing is to observe these interactions in the real setting in which they take place, as it is the natural beginning of the conversations and actions that take place in the native environment.

One of the objectives to be achieved by this ethnography is to find those common features observed in the creative workers. Csikszentmihályi (1998) said certain traits in creative people, such as, genetic predisposition for a given field, interest in the field, field access, and access to a field. Similarly, another main objective is to observe how creativity develops in a group of individuals. The interest of responding to this is based on the hypothesis that tries to compare the perceptions of Joas (2005), concerning the social order is being collapsed by autonomous processes based on collective action. Also, numerous theories have emerged, regarding new bonds of solidarity that arise through the development of collective action against to the social order autonomous approaches.

**RN02S06a - Government's Arts Policy and Institutional Gatekeepers**

**How far does God endure with the arts?**
Laura VERDI (University of Padua. Italy, Italy) | laura.verdi@unipd.it

What could a member of the Florida’s creative class have to share with the mentality of a citizen of the Middle Ages? It might be, among other points, a different degree of sophisticated symbolic knowledge, able to guide individuals through anthropological no less than sociological imagination, to distinguish in a very tangled forest of meanings, including religious ones. It is indeed a very huge object, in our contemporary culture, where the symbolic aspects of these peculiar meanings are at the same time social and political, to learn how to correctly interpret the strength and the inner potential power of these vehicles of expression. They can act, as a matter of fact, following an identical chemical formula, as poison or medicine. The recent tremendous results of what the misunderstanding of the use and interpretation of religious symbols is able to produce is in front of the whole world.

While the empire of the West has greatly overestimated its own economic destinies, underestimating those of the so-called third and fourth world, a new war is being waged against it, focused on the paradoxical power of religious symbols or underestimated symbols. Following a monologic rather than dialogic method, the West foolishly failed cultural self-reflexivity and forgot to properly apply the 3T theory (Florida 2002) as much as that of 3C (Carta 2007) to other cultures. This serious lack sparked off frantic reactions from fundamentalist cultures, no less retrograde than liberticide. The relationship between art forms and use of religious symbols becomes thus not free since it can not be rationalized.

**Classical Music and Popular Music: the Japanese Government’s Cultural Policy**
Naomi MIYAMOTO (Ritsumeikan University, Kyoto, Japan) | nmiya@sd5.so-net.ne.jp
This research illustrates the characteristics of the Japanese government’s cultural policy for music, and examines the policy’s function in maintaining the distinction between Western classical music and popular music. The policy allows Western classical music to achieve a dominant position, while it provides popular music with no support. In the background, there have been discussions on the cultural policy in which the externality of economic and social effects, the sustainability of high culture, and the non-profitability of culture are considered as reasons for the official support. These arguments can also be applied to popular music. However, the reality of the policy’s application does not always reflect such discussions; there is no reason to exclude popular music from support, particularly in the categories of regional and amateur activities. Instead of such theoretical arguments, a kind of ‘old paternalism’ still exists in Japan; the established genre, classical music in this case, is considered most suitable for the nation, and therefore it is supported by the government’s cultural policy. Furthermore, application procedures and screening processes may contribute to the differentiation of classical music from popular music. Although such a distinction now seems invalid in practice, the government’s cultural policy continues to give official support to classical music.

**Government grants as a tool of cultural policy: challenges in goal setting and attainment**

Sari KARTTUNEN (Cupore, Finland) | sari.karttunen@cupore.fi

Within the Finnish Government, the Ministry of Education and Culture is responsible for the development and implementation of cultural policy. The objectives of cultural policy are realized by means of different programmes, steering and management of the sector, and financing. In the 2014 Government Budget, the total funding of culture approached EUR 455 million. Most of the allocations are directed at national art institutions and municipalities as statutory and discretionary State subsidies. A substantial part of cultural funding is covered by the proceeds of the National Lottery.

The presentation draws upon a commission that CUPORE carried out for the Ministry in 2014. The task was to map out the system of discretionary grants in cultural policy to point out weaknesses in strategic goal setting and attainment. The request was motivated by the pressure to demonstrate effectiveness within the framework of performance guidance.

We focused on discretionary subsidies that the Ministry allocates under the rubric ‘arts and culture’. They consist some 50 different grant forms, amounting to EUR 55 million in 2014. We looked into minuscule details in the grant allocation practices, starting from formulations of grant targets in the calls for applications and wordings on the grant application forms. We also made a questionnaire on civil servants.

We concluded that discretionary grants make up a very heterogeneous system. Some grant forms derive from the 19th century, prior to any cultural policy proper, while others are the product of recent policy programmes. The strategy for cultural policy launched by the Ministry in 2009 is reflected only in places in the grant system. Many individual sectors of cultural policies have their own logic deeply rooted in their history. They form silos that resist strategic alignment.

**Art House Cinema in a Global Age. Strategic selection and exhibition of foreign films in European cinemas**

Kimberly VAN AART (Erasmus University Rotterdam) | vanaart@eshcc.eur.nl

Susanne JANSSEN (Erasmus University Rotterdam; Erasmus Research Centre for Media, Communication and Culture) | s.janssen@eshcc.eur.nl
Cultural policies of national, regional and institutional gatekeepers provide insight in the social process of cultural globalization. In a globalized art world, it is argued that gatekeepers negotiate boundaries, deciding what artwork is worthy of display and distribution, and what is not. In art house cinema, the strategies of programmers and marketers ultimately determine which films are imported and how these films are presented to their (potential) audience. How do these professional gatekeepers select films for exhibition and decide on their promotion? Previous research suggests that gatekeepers of a particular country employ different strategies when diverse cultural products are concerned, presenting foreign cultural products as authentic representations of another culture or as novel artwork in the importing market. However, so far no empirical research has investigated such strategies in-depth, as is done here for the case of art house cinemas.

This paper seeks to examine the strategies and selection criteria employed by programmers and marketers of art house cinemas in Belgium, Germany and the Netherlands, when they select and exhibit foreign films. A qualitative content analysis of in-depth interviews with 15 programmers and marketers provides insight in how gatekeepers select films for exhibition, when competing with other venues such as multiplex cinemas and film festivals, while also illuminating how culturally distant or peripheral countries' productions are appreciated – for their authentic, novel or representative value – in countries focused mainly on the import of films, such as those under investigation here.

Cultural policy issues and choral-historical identities of the choral/musical life of Oxford University colleges and halls: Music directors’ and organ scholars’ perspectives of present and future challenges
Sigrun Lilja EINARSDOTTIR (Bifröst University, Iceland) | sigrunlilja@bifrost.is

This paper introduces an on-going socio-musical study on cultural-political issues and challenges of the historical choral/musical tradition within Oxford University colleges and halls in the 21st century. Its main objectives are twofold: Firstly, to investigate the social structures of members of the collegiate choirs and how the historical tradition affects and shapes the identities of the choirs. Secondly, to study cultural-political and administrative issues that may influence future decision-making of the collegiate choirs in terms of perspectives that include: the politics of admission; musical excellence/competitiveness; musical direction; gender perspectives; financial distribution; musical hierarchies and the possible impact of cuts in public funding to musical activities in state schools. Preliminary analysis of interviews with 6 organ scholars and 14 music directors indicate that the tradition at Oxford is quite unique, in terms of history and ritual and the impact on individual and collective identities among students and alumni, although there is considerable cultural diversity among the colleges and halls themselves (musical quality-related hierarchy, history of musicianship and international reputation). These aspects are linked to historical contexts and traditions; access to funding; administrative and cultural policy issues; competition in terms of musical talents and the ‘politics’ of vocal auditions. The future of the organ scholar programme was addressed in relation to cuts in funding for music in state schools. Furthermore, the choral tradition has undergone changes in the last decades in terms of musical activities, musical direction and involvement in decision-making within governing bodies and the increasing female participation in choral activities.

RN02S06b - Arts Policy: Funding, Hierarchy and Participation

Public funding of the performing arts and the cultural hierarchy
Tally KATZ-GERRO (University of Haifa, Israel) | tkatz@soc.haifa.ac.il
Tal FEDER (University of Haifa, Israel) | talfeder@gmail.com

Patterns of government funding of the arts over time are driven by cultural policy and represent cultural priorities, indicating types of art realms and types of organizations that should be publicly funded. Building on this premise, we construct a cultural hierarchy of arts organizations based on government funding in Israel. We further investigate how this hierarchy corresponds to the social hierarchy among ethnic and national groups and between the centre and periphery of the country, and whether changes in funding over time in the centre and the periphery are differentially associated with the changing socio-demographic characteristics of the society. Our data include public funding allotted to 32 arts organizations in the domains of theatres, orchestras, and dance companies from 1960 to 2011. Our findings demonstrate that theatres are at the top of the funding hierarchy, orchestras in the middle, and dance companies receive the least funding. Significant differences in funding exist between organizations with different ethnic or national orientations such that the social hierarchy, in which Jews of European descent are more privileged than Jews of North African descent, and the latter are more privileged than Israeli Arabs is reproduced in arts funding. Finally, the disparity in funding favouring organizations in the centre has been decreasing since the mid-1990's and funding trends have similar associations with economic and demographic changes in the societal make-up.

Public art against the ‘public’: Does state funded art, participatory art practices and socially-engaged art benefit the public?
Andrew Thomas HEWITT (University of Northampton, United Kingdom) | andrew.hewitt@northampton.ac.uk

Socially engaged art practices connect with a tradition of avant-garde perspectives on art’s potential for emancipatory change and for democratic politics. These have been variously named as socially engaged art practice, community-based art, experimental communities, dialogical art, littoral art, and participatory art. Socially engaged art is associated with an impulse to democratize both art production and society. Participation is a term commonly used in both cultural policy and in the theories and practice of socially engaged art. In this paper I address the question, “What do funders and commissioners want from socially engaged art practice and what forms of participation are produced?” I reflect upon ‘participation’ in art in the context of Third Way cultural policy; forms of practice, theories of participative art and the expectation of commissioners and policy makers. I propose, that, forms of participation and participative art, produced via Third Way cultural institutions, aim to promote affirmative social relations and hence operate as steering media for the state. Therefore, cultural policy colonizes the public sphere with official state culture in order to funnel citizens’ behaviour and to limit dissensus. I propose that such cultural production has negative repercussions for democracy. I argue for a social art practice that is ‘properly’ public, this includes understanding the public as a contingent body of citizens with a degree of shared purpose rather than a placid community of abstractly equal individuals.

Can heritage digitisation increase cultural participation and influence social inclusion? Evidence from Poland.
Wojciech KOWALIK (AGH University of Science and Technology, Poland) | wojtekkowalik@tlen.pl

Digitisation of cultural goods id not only a way of preserving the heritage but is also important from economic and social points of view. As Internet becomes used by more and more members of society, it provides a possibility to make cultural goods more accessible and allows to increase cultural participation in societies. Availability of cultural resources and cultural
competence leverage the development of a society. In culturally disadvantaged regions digitised heritage available through Internet might be a substitute for physical cultural institutions. Poland has joined the global trend of digitising the cultural heritage. Five years ago two big government programmes aimed at digitisation and sharing of cultural goods on the Internet were launched. Organisations from the whole country can apply for financial support for their projects every year.

However, the real influence of digitised heritage on social and economic development depends on how much the government programmes affect social and cultural practices of the Poles. The paper presents the findings of a research regarding different aspects of using the digitised heritage in Poland. It also investigates the relations between technology-mediated cultural practices and the real-life participation in culture among various groups of society. These two areas will be presented in the context of social diversification and they will serve as a basis for analysing, to what extent digitised cultural resources can diminish the barriers to access culture and increase cultural participation among the unprivileged social groups. The presented data comes from a representative quantitative research conducted in 2015.

Justification modes of public arts funding: linking arts policy and arts consumption
Tal FEDER (University of Haifa, Israel) | talfeder@soc.haifa.ac.il

This paper links the study of two central issues related to arts policy - the study of the justifications for arts policy and the study of its consequences - by looking at arts funding which is one of the main instruments of arts policy. The study of the justifications for arts policy looks at the rationales that drive governments to intervene in the art field to the extent of prescribing an arts policy and funding arts organizations. This question has occupied scholars from diverse academic backgrounds, from law and philosophy (e.g., R. Dworkin) to economy (e.g., W. Baumol). However, the rich literature about the justifications and rationales for arts funding is lacking a general, unifying theoretical background. In addition, there is an “empirical deficit” in the study of justifications for arts funding since the scant empirical research on this question maintains the discussion on this topic mainly in the theoretical level. Another research issue is the study of the consequences of arts policy. Public arts policy is supposed to cater in some way to the general public. It is especially the case for the performing arts where art production is directly linked to its performance in front of a consuming audience. However, key questions such as the link between arts funding and arts consumption did not receive sufficient attention in the scholarly work about arts policy, possibly for reasons of lack of appropriate empirical data. This paper’s theoretical contribution and empirical study is meant to shed light on these two aforementioned issues.

I ask in this paper two interrelated research questions; (a) what is the relation between public arts funding and arts consumption, and (b) what perceptions of the role of art in society and the justification for governmental involvement in the field of art are reflected in this relation between funding and consumption? In order to answer these questions, I look in this paper on public funding allocated to arts organization in Israel. Looking at the relation between public funding and consumption from the perspective of the arts organizations, as this paper does, evokes two possible hypotheses. The first hypothesis asserts that arts funding enables art organizations to increase access and promote higher levels of arts consumption while the second hypothesis asserts that arts consumption itself affects the level of funding that is received, since funding agencies tend to give more funding to arts organizations that are able to attract more audience. These two hypotheses pertain to different directions of the link between funding and consumption and therefore are not mutually exclusive and potentially could be both either confirmed or rejected.
The second move of the paper is theoretical and seeks to place the empirical findings within a general theoretical framework. The theoretical framework I suggest is based on the premise that behind the link between public arts funding and cultural consumption rests cultural predispositions, perceptions of the place of art in society and ideas about the role of the government in relation the field of art. I refer to the philosophical work of Alain Badiou on art in order to offer a conceptual framework to approach the question of the motives behind governmental involvement in the field of art. Following the work of Badiou, the paper makes a theoretical distinction between three different types of justifications for public arts funding: romantic, didactic and classical. Romantic justifications conceive the arts as having inherent value of its own and sees the merit of their existence in the artistic expression itself. Didactic justifications relate to the arts as an instrument which could and should be used by the state. Finally, Classical justifications conceive the arts as a kind of amusement or leisure time activity which the government helps to provide. Each of these justification modes stems from a different point of view regarding the place of arts in society and therefore has different practical implications that can be tested empirically.

In order to answer the research questions empirically, I analyze data of public funding and other indicators pertaining to the operation of 92 performing arts organizations (i.e. music, dance and theater) in Israel between the years 1999-2011. All of these organization received public funding from the Israeli Ministry of Culture. I estimate cross-lagged panel data models in order to study the way arts organizations are responding to changes in arts funding and to scrutinize the way arts funding is both affecting and being affected by the levels of consumption of the organizations’ productions. The results of the research answers the research questions and show a complex pattern in which: (a) art funding and consumption have a mutual impact on each other; however, (b) the existence and the magnitude of that impact is dependent on the type of art, the public source of funding and the type of consumption; In addition, (c) different art types present different configurations of relationships between funding and consumption; and (d) these configurations can be shown to have an affinity to the different types of justifications of public arts funding presented in the theoretical section of the paper. The novelty of the research is in: (a) the kind data which is made use of in the study - longitudinal data pertaining to funding and consumption in the organization level which is rarely used in prior research; (b) the attention given to the question of the justifications for arts funding and the link between funding and consumption which was treated in prior research on the theoretical level alone and not in an empirical manner as I do here; and (c) its theoretical contribution to the study of arts policy by suggesting a new typology of the ways states gets involved with arts funding. This new typology is both related to elaborate philosophical ideas about art’s place in the society and has testable empirical implications. This enables us to learn about the justifications for public arts funding not only from the public declarations on policy makers and funding advocates but from its actual operation in the field of art.

RN02S06c - Arts Policy and Sustainable Development of Cities

Agri+art communitys
Cláudia Maria Guerra MADEIRA (FCSH-UNL, Portugal) | madeira.claudia@gmail.com

The Wasteland Vegetable Garden, Horta do Baldio, arose from the artistic programme More for less than for more, which was elaborated by the portuguese choreographer Vera Mantero and the Cultural Association Rumo de Fumo and produced jointly by the Teatro Maria Matos and Culturgest. It was one of four community gardens that this cultural programme planned to
develop with the participation and training of volunteers, under the thematic banner of a vegetable garden on every corner, with the objective that they would serve as a "temporary stage" for the artistic programme that took place in the period from April to June 2014. The particular characteristics of the Wasteland Vegetable Garden were that, firstly, it was set on an empty lot, a piece of wasteland near Campo Pequeno in Lisbon and, secondly, it managed to gather around itself an active and creative community. This article aims to reflect not only this process of participatory citizenship but also the role of art and culture in the sustainable development of a city.

Karolina WERETA (Warsaw University, Poland) | karolinawereta@wp.pl

The paper aims to extend current knowledge on cultural community development. The theoretical frame of the discussion is based on a classification of Carl Grodach and Anastasia Loukaitou-Sideris who complemented the approach dividing the cultural development strategies into three categories: entrepreneurial, creative class and progressive. While the first two focus on flagship projects for most affluent populations (e.g.: spectacular events, cultural tourism, arts/entertainment districts creation), the latter concentrate on underserved neighborhoods, are most pertinent to the grassroots initiatives and seek goals of community development in arts education and local cultural production.

The majority of the scientists and policy-makers focus on the practices adapted in the US and Western Europe (predominantly "entrepreneurial" and "creative class" ones) discounting the occurrences of the other parts of the world. Consequently, available literature lacks profound studies about an interesting yet neglected "progressive" trend, particularly popular in Latin America.

On the basis of a research recently conducted in Bogota (Colombia), this paper will discuss the potential and limits of the progressive development strategies, focusing on the factors that most boost or impede the improvement of socio-economic growth of local communities. In the early ‘90s, the Colombian capital was tormented by violence, corruption and narcoterrorism. Nevertheless, over last two decades the city has been an area of huge structural transformation. The success is attributed to various participatory initiatives, most of which reflect the idea of the progressive strategies of cultural development.

The evolution of Carriageworks: A case study of the relationship between the changing urban landscape and contemporary arts in Sydney
Nina SEROVA (University of Sydney, Australia) | nser6876@uni.sydney.edu.au

This study critically examines the specific relationship between the changing urban landscape and the contemporary arts in inner Sydney, by investigating the conversation of inner Sydney arts organisation ‘Carriageworks’ from a 20th Century railway site into a contemporary arts precinct.

The Carriageworks site was previously a key railway hub for the state, known for significant advances in labour, women’s and immigration rights. Decades later, the repurposed building is located in a rapidly gentrifying area, in a city of escalating land value that is increasingly relying on the creative industries and cultural policies for growth.

Taking from the theoretical frameworks of Harvey (1989), Smith (2002), Jacobs (1964) and Zukin (2000), the study is a robust account of the site’s rich history, presented in the context of global processes that influence its change – globalisation, de-industrialisation and ‘cultural cities’. 
Qualitative research methodologies including in-depth interviews and document analysis reveal the site’s complex and multi-layered transformative process involving physical, political and ideological tensions. By examining the power play that occurred between the various agents involved and investigating the significance of Carriageworks’ physicality, programming and positioning, the study reveals how this major policy intervention impacted the local area, arts producers and audiences.

RN02S06d - Arts Policy and the Status of Artist

THE LABOUR MARKET STATUS OF ARTISTS IN FINLAND
Pauli RAUTIAINEN (Foundation for Cultural Policy Research, Finland) | pauli.rautiainen@uta.fi
Taija ROIHA (Foundation for Cultural Policy Research, Finland) | taija.roiha@cupore.fi
Kaija RENSUJEFF (Arts Promotion Centre Finland) | kaija.rensujeff@minedu.fi

In spring 2011 the research unit of the Arts Council of Finland (since renamed the Arts Promotion Centre Finland) commenced a survey on the status of artists in Finland. In addition to producing demographic information about artists and their income level, the aim of the survey was to present phenomena connected to income formation and labour market status. A similar survey, which comprised artists in all fields of art, was conducted for the first time ten years ago. The research population comprised members (22,000) of professional artist associations and unions (39) and artists who were awarded state grants in 2010. The survey in particular considered the following: 1) the structure of the artist community and its development; 2) the labour market status of artists and changes connected to this; 3) the share of artistic work, arts-related work and non-arts work; 4) income formation and changes connected to this; 5) the significance of public support within various fields of art; 6) income level (taxable income, grants and total income) and the development of the income level. In our presentation we will report the main findings of the survey. We will concentrate to the findings on the labour market status of artists in Finland.

What kind of ‘sustainability’ in arts policy? The case of Latvian Song and Dance Festival
Jānis DAUGAVIETIS (Central Statistical Bureau of Latvia, Latvian Academy of Culture) | janis.daugavietis@gmail.com

The word ‘sustainability’ is often used in Latvian arts policy and in discourse about the Latvian Song and Dance Festival (which is included in UNESCO list ‘Masterpieces of the Oral and Intangible Heritage of Humanity’), but the objectives of it differs from the policy of sustainable development accepted at the national level. The participation of the inhabitants of Latvia in amateur arts is one of the most popular mass pastimes supported and maintained through the investment of considerable state and local government resources. State supports ‘the traditional’ forms of amateur arts – choral singing, amateur theater, folk craftsmanship, etc., and the state also took care of the whole process of Song and Dance Festival. Sustainability is often used term in Latvian policy documents on culture and arts. However this concept in arts policy is basically orientated to the reproducing of certain processes of arts itself, rather than applied to the use of arts as a tool to support goals of sustainable development, e.g. social, economic, and ecological. The Song and Dance Festival in Latvian national discourse and ideology is seen as an value in itself, because of its central role in the creating of Latvian nation and the state, and reproducing them ever since. The main goal of the policy is to sustain this tradition and its social
instrumentalisation is relatively marginal political task. This causes several political and practical problems. Firstly it neglects the social potential of The Festival and narrows the term 'sustainability'. Secondly it contradicts with the heterogeneous values and cultural needs of traditionally multi ethnic Latvian society.

An Intervention to the Institutionalization of Turkish Cultural Policy: The case of Draft TÜSAK Law
Emek Can ECEVIT (Brunel University, United Kingdom) | ecevitemek@gmail.com

Cultural policy practices should be analysed as the structural backbone of the institutionalization processes of artistic field in any one country. In relation to this, cultural policy models indicate how ‘different models of financing of art’ and ‘infrastructures within different models’ influence the institutionalisation of the artistic field. For an integrated analysis of Cultural Policy of Turkey and its relationship with the institutionalization processes of contemporary art scene, there should be a valid cultural policy document or text approved by the National Assembly or protected under the constitutional law. Although this is the case, at present, there is no official cultural policy document apart from the 2013 draft law of Art Council of Turkey (TÜSAK). Within such a context, in this paper, cultural policy practice and its deferred documentation will be discussed through the TÜSAK.

Intervention of the agents of the political system to the means of production, distribution and consumption of cultural products, services and experiences for the realisation of the policies necessitates questioning of the relationship between political system and its corresponding cultural field. Such a problematization demands an ideological, normative, economic and organisational inquiry. Centred on the problems of power distribution and funding policies proposed in TÜSAK, this paper also critically analyses how Justice and Development Party (JDP) understands ‘cultural democracy’ on the grounds of citizens’ ‘right to access to culture’, as well as questions the reasons why JDP’s cultural policy has been deteriorated within the period of four sequential cabinets formed since 2002.

Constructing artist definition in arts policy: focusing on the case of Korean Artist Welfare Act
Pil Joo JUNG (Seoul National University, Korea, Republic of (South Korea)) | piljoojung@daum.net

This paper examines the social construction of artist definition in arts policy by focusing on the narratives of the street-level bureaucrats who are required to identify artists in order to carry out their social service work in South Korea. Although the context-dependency of the artist definition has widely been agreed, few empirical studies have taken interests in the construction of artist definition in arts policies in terms of power relations. In a welfare policy, which is characterized by the limited resource allocation, the use of operational definition leading to identification of artists is essential in drawing social consensus on the allocation process. However, the operational definition or the policy-level definition of artist is not always perfectly satisfactory in distinguishing the artist welfare recipients from others, not to mention the ambiguous artist definition. Census classification of artists, for example, usually verifies occupations according to an individual's recent chief job activities to obtain income. As many scholars noted, however, most artists hold several jobs. Consequently, individuals who earn their living through non-artistic jobs but are still involved in art activities would be counted as non-artists during the Census week even if they identify themselves as artists. Moreover, artists are usually involved in temporary employments or project-based contracts. This makes most of them self-employed, which is in the shadow of the modern Census system. In addition, artists, especially the young, are frequently situated to put priority on earning prestige in the art world instead of on simply
earning money. Identifying artists for providing social protection to them therefore might be invalid if the process is based on general labour market behavior. Aware of the difficulty of identifying artists, this paper would like to regard the welfare state as a particular discursive regime (Foucault, 1977, 1980), where artist definition refers to a complex interaction of struggles as recognition and exclusion, which is created by the power relations of the actors in the welfare politics with their own historical context and social relations. As “inclusion entails exclusion”, the identification process inevitably involves exclusion of “others” from the policy recipients, who are accordingly identified as “you are an artist”. This paper assumes that the operational definition, which was conjured up during the policy formation process, can be implemented only through the street-level bureaucrats’ concept of “artists” while the bureaucrats are involved in the decision-making over “who shall benefit” or “who become the welfare recipients.” In that sense, this paper discusses this subject in the implementation process of a specific artist legislation case, Korean Artist Welfare Act (KAWA), formed in 2011 and went into effect in 2012. It declares legal status of artists and social protection on them in South Korea.

From the interviews with the street-level bureaucrats who are involved in the qualification of applicants claiming KAWA’s benefit in the implementation process of KAWA (2012–2015), this paper intends to show that the bureaucrats are exercising power, reinforcing or weakening the legitimacy of “KAWA recipients”, who can be “KAWA artists” and also can be “(not) true artists”. When the bureaucrats have clear image of what they call “true artist”, the gap is observed between the collective recipient-artists who receive the benefit of the policy and “true artist.” Another finding of this paper is that the street-level bureaucrats are judging and making decisions despite or regardless of the existence of the officially-presented criteria of KAWA. For example, when the bureaucrats meet individual applicants face-to-face, they make decisions on “who is a true artist” based on their prior careers, educational backgrounds or professional experiences concerning artists. “The artists in their minds” could be different from KAWA recipients or the operational definition in KAWA. It thus becomes possible that the gap itself exists—some bureaucrats say that some recipients are not true artists. This paper focuses on the bureaucrats’ certain actions: their power-exercise in “shaping certain kind of artists” seems to lead to some consequences, which are sometimes reducing the gap. In that sense, this paper argues that the bureaucrats do participate in the struggle for dominating the discourse of “who is an artist”.

Since the street-level bureaucrats’ qualification judge process is a kind of identification process, it entails not only inclusion but also exclusion of those who are not entitled as the artist. As Jenkins (2004) noted, “Defining ‘us’ involves defining a range of ‘thems’ also.” And this kind of defining work is the struggle, which appears to be shared by artists and street-level bureaucrats in the field, both of whom try to seize the limited common resources according to their needs. On the one hand, the recipients of KAWA have existed as a direct product of the implementation of KAWA since 2012. The criteria set out by KAWA have also been fixed and visible in the statute. As of 2015, there are about 15,000 KAWA recipients, who passed the criteria of KAWA to prove their artistic activities. On the other hand, as mentioned above, in the implementation of the welfare policy, the actual recipients are not the final product of social construction of artist definition; KAWA recipients should be understood not as a product of welfare politics but as a continuum of welfare politics, where decisions are made over specific identifications required for the provision of welfare resources.

In conclusion, this paper proposes the concept of “KAWA artist” as a collective social definition, through which the actual construction of artist definition can be empirically observed in the policy implementation field of South Korea. It guarantees not only material resources but also advantageous economic and political status, which is distinguished from that of the rejected from KAWA’s benefit. “KAWA artist” is a direct product of the complex interaction between street-level bureaucrats and artists as a political actor in the ongoing struggle for dominating the
discourse of “who is artist” in the welfare state. With this finding, this paper would like to contribute to explaining the social construction of artist definition as social identity of the society which asks its members to judge the value of artists’ work.

**RN02S07a - Subversion and Normalization in Artistic Practices**

**Children’s literature in reconstructing and deconstructing the dominant discourses**  
Jaana PESONEN (University of Oulu, Finland) | jaana.pesonen@oulu.fi

Through language we make sense of things and language enables communication. However, it also defines what can be said, as it forces its users into its patterns. Art, such as children’s literature, is a symbol system in which language becomes an essential constituent “of the reality of everyday life and of the common-sense apprehension of this reality (Berger & Luckmann, 1996, 55). In terms of children’s literature, language has even more intricate role, as in these texts questions of pedagogy, even control intertwine with aesthetical and other values. In this paper texts and images in children’s literature are examined as representations of social, cultural, political, economic and historical circumstances. The literature is analyzed by examining how the contexts can reconstruct the structures of power and domination. The analyses has included also a critical multicultural perspective, meaning that the ideologies embedded in children’s literature, especially in relation to dominant discourses, are deconstructed. Consequently, the paper focuses on discussing how literature for children is socially constructed, but also re- and deconstructing the reality. The theory of intersectionality is utilized as an approach to examine how different social categories (e.g. ethnic, gender, ideology, age and, for example, class) interact on multiple and often simultaneous levels influencing individuals identities. The results show that different (binary) oppositions that are presented in relation to differences represent - intended or unintended – the dominating culture and support (in most cases) those values and worldviews. Some categories (for example race or religion) become more easily presented as fixed than others.

**Graffiti: Perception and impact on the urban sphere. Innovative approaches for a phenomenon between art and crime.**  
Sebastian KLEELE (sine-Institut gGmbH, Germany) | sebastian.kleele@sine-institut.de  
Marion MÜLLER (sine-Institut gGmbH, Germany) | marion.mueller@sine-institut.de

Initiated by the European Commission, the Project “Graffolution - Awareness and prevention solutions against graffiti vandalism in public areas and transport” seeks to counteract the increase of graffiti vandalism in public areas and transportation networks by focusing on smart awareness and positive prevention solutions for all affected stakeholder groups. This includes also those who have utilised street art as part of city regeneration and placemaking strategies. Based on the actual findings of the project, the different perceptions of and approaches towards graffiti are presented. On the one hand, graffiti is described as “criminal damage” and as “degenerative” for the respective environment – an estimation that is strongly linked to the “Broken windows theory” (Kelling / Wilson 1982). On the other hand, graffiti is described as personal expression and a natural element of the public sphere with positive effects on the cityscape. This perception is especially linked to “street art”, a highly artificial part of the graffiti phenomenon that is rated positively by a wider general public and advancing to an established part of the modern pop culture.
Regarding these counteracting positions, new approaches are demonstrated to combine the existence of graffiti as a part of the public sphere and the right for self-expression with the legal right to preserve the integrity of one’s property. Thereby, one promising aspect is the implementation of legal graffiti and street art projects at spaces that are often affected by graffiti vandalism – an approach that uses art to prevent vandalism.

Performing Contracts: BDSM, Performance Art and Aesthetics of Complexity
Sacha Jérôme KAGAN (Leuphana University, Germany) | sachakagan@gmail.com

With an exploratory case study of an art center in Berlin, our paper aims to initiate an exploration of relationships between performance art and BDSM practices (i.e. practices of bondage, discipline, domination and submission, sadomasochism) with relation to their social and cognitive effects.

Schwelle 7 is a venue in Berlin organising workshops and events on the threshold between the arts and sexuality, with specific focus on BDSM practices as well as other embodied practices such as yoga. Felix Ruckert, a well-known choreographer and dancer from the art world of contemporary dance, is the founder of this experimental venue.

Our paper will focus on Schwelle 7's venture into BDSM practices, and will base itself in an exploratory phase of participant observation (of about 6 weeks), qualitative interviews and analysis of recent writings of Felix Ruckert on the subject.

This empirical exploration is theoretically located at the intersection of several academic fields: sociological and inter-disciplinary research on BDSM, queer studies, performance studies, and some elements from the sociological tradition of symbolic interactionism. It embeds itself within a transdisciplinary exploration of aesthetics of complexity.

Our research questions will address the interplay between power relations and social roles, on back-stages and front-stages (Goffman) of society, of performance art, and of BDSM scenes, the remapping of sexual sites on the body (Foucault), the deconstruction and reconfiguration of dichotomies – regarding sensations and power relations (Easton & Hardy), a complex aesthetic experience of reality (Kagan), and potential artist and queer critiques of social contracts through BDSM performance.

Photoicon: Between Art, Culture and Politics
Kamila Alicja ZAREMBSKA (Jagiellonian University, Poland) | kamila.zarembska@gmail.com

Every day we browse through hundreds of photographs in newspapers or websites. Some of them go down in history and become icons of history – while others do not. An image can constitute a powerful source of information about society – its values, ideals and social memory.

Photoicons are photographs that hold particular and important significance in society. Symbols carried by photoicons are appealing, easy to decode, and therefore habitually interpreted – it is a visualization of common knowledge. On the one hand they convey meanings and myths as a result of the dominant ideology in society, provide values that are being transferred in culture and represent patriotism, honor, pride, success, resistance – they generate a significantly larger number of meanings than regular photographs. On the other hand, the signification carried by them is so strong that they have the power to break away from the original meaning, forming a gap, which creates a field for semiotic guerrilla warfare. This makes contesting the dominant ideology possible through a remake of the popular symbols and myths carried by photoicons.

This work aims to analyze a subjectively selected set of photoicons in order to deconstruct and identify their hidden significations and indicate the function of the photoicon in society.

RN02S07b - Identities, Stories, and Emotions
Barcelone, departure point. The imaginary of the city from contemporary writers’ perspective regarding immigration, exile and traveling
Maria PATRICIO (Universitat de Barcelona, Spain, Université Paris 8, France) | mariapatriciomulero@gmail.com

In our actual globalised society, population movements are constant and motivated by different reasons, and hosting societies are confronted with these changes and take different positions. Literature is one of the arts with a wider capacity to explain reality through human stories. For that reason, contemporary writers portray our cities from their personal point of view, and are aware about the challenges our urban societies deal with when they integrate people from other contexts.

From a qualitative methodology mixing text analyze and sociological interview, three novels have been studied in order to discover how writers portray the city of Barcelona in three different contexts of the XX century: Spanish immigration for economic reasons, reintegration of exiled republican in postwar society, and contrast with other European countries under dictatorship through travel. The works of Carme Riera “The half of the soul”, Maria Barbal “Bolívia Street” and Jordi Puntí “Lost luggage” are statements of historic memory that can still give us some lessons about how to cope with changes in XXIst century.

The imaginary of the city in these novels show the values from the writer’s position, which has clear influence in reader’s perception of the urban space and local society, especially important in topics such as the other, dealing with differences and the challenges of a democratic society. The analysis also focuses on the process of identification of those writers with the city of Barcelona, where they have migrated.

Emotions, Art Autonomy and the Freedom of Speech
Målfrid Irene HAGEN (MI Hagen, Norway) | moliren@online.no

Art may influence our emotions enjoyably. However, sometimes art may appear offending and become an emotional burden, as told by employees in my PhD-research on corporate art and architecture. Most work organizations like to appear democratic and will not risk being accused for censoring art, which might happen if they reject or remove potentially offending art. For example art commissioned to decorate the Norwegian Governments Ministry of Health, where a painting shows falling paper between flying buildings and a skeleton. Employees experienced the artwork as an emotional burden, because it gave associations to the terror attacks in Norway 2011, conducted by one terrorist. After killing eight people by bombing government buildings, he massacred 69 youths at Utøya Island. Therefore it was decided to remove the art, which led to massive debates. Many artists claimed this meant art censorship. The winning project of an art competition for a memorial monument for terror victims at Utøya, was art integrated in nature; a cut in a headland on the landside of the island. The neighbors protest against the artwork, because it reminds them too much about the massacre. They were the first who started to rescue youths from Utøya. When they became aware of the shooting and saw youths swimming towards land, they went out in their boats to pick them up, risking their lives among the bullets of the terrorist. To them, the artwork appears as a wound in the nature that forever will tear up their wounds from the massacre. They criticized the decision makers for being excluded from selecting and locating the artwork. Therefore the implementation of the artwork is extended, and the neighbors have announced lawsuit to stop the implementation of the art. Emotions versus idealism create a paradox, and a conflict between emotions of terror victims, art autonomy and the freedom of speech.
The Challenge of Developing a Joint Artistic Vision: Communication Patterns in Three Art Communities

Nikita BASOV (Center for German and European Studies, St. Petersburg State University – Bielefeld University) | n.basov@spbu.ru
Aleksandra NENKO (Center for German and European Studies, St. Petersburg State University – Bielefeld University) | al.nenko@gmail.com
Anisya KHOKHLOVA (Center for German and European Studies, St. Petersburg State University – Bielefeld University; St. Petersburg State University) | anisya_khokhlova@mail.ru

The goal of this paper is to investigate the ways in which artistic communities generate joint artistic visions and form collective identities through communication. We examine three cases of St. Petersburg artistic communities, members of which intensely interact and strive for unique collective identities important for their positioning in the contemporary art scene, though are not always able to construct such. Comparing different patterns of the day-to-day communication process of the communities, the study shows that to develop artistic ideas together it is not enough for artists to join in one place and to regularly interact with each other. Certain communication properties are crucial, including types of emotional ties, volume of collective reflection and narration, extent to which norms of communication in the art-world are followed, character of spatial localization. Consideration of ongoing micro-level communication activities gives more insight into the logics of joint artistic vision and identity development, which cannot be fully explained by the strive of the artists to become more visible in the art market.

Young Publics In Marseille Culture 2013 Big Events

Valerio ZANARDI (University of Barcelona, Spain) | valerio_zanardi@yahoo.es

This communication focus on the behavior and reception of young publics observed in big events that opened and closed Marseille Culture 2013 and during the big Festival “La Folle histoire de l’Art de la Rue” and try to grasp some sociological and methodological considerations from the ethnographic fieldwork I’ve realized while joining the Aix en Marseille University research “MP2013 publics and practices”.

In this attempt, I tried to crystalize some elements that result interesting for further research and theoretical considerations.

1) The relation with publics and the use of public space is a prior analytic frame
2) Traditional analytic elements as individual adscription, motivation and taste become almost obsolete, while a classic phenomenological perspective can successfully highlight the ongoing ritualized activity of collective self-recognition and definition of young publics during big events.
3) Despite the artistic content and style of events turn relatively secondary, young publics deserve a noteworthy importance to astonishment provided by big sized shows, often accounted with some rough recall to rationalization of “la vie quotidienne”.
4) As long “engagement” and “distanzierung” are concept widely useful to describe young publics, “Game” and “play” can refer to newer perspectives in sociological studies on publics.
5) The use of the microsociological tradition, with special reference to Randall Collins definition of interaction ritual chains is almost necessary in the studies on young (and non ) publics.

Some data and images related to Marseille Culture events will drive the exposition of the theoretical frame proposed.

RN02S07c - Arts, Creativity and Urban Identity

Serhat KURKLU (Yildirim Beyazit University, Turkey) | serhat.kurklu@gmail.com
The purpose of this study is to understand the underlying mechanisms of Central Anatolian Music performed in Ankara pavyons (a specific type of night club in Turkey). The distance/affinity of this music with traditional music, arabesk and other genres allows the researcher to posit it as a distinct musical genre, especially given its socio-historical context which covers the dilemmas of the republican era related to domestic migration. Music videos, songs and dances in pavyons are seen as major elements of the construction of urban Ankaraian identity featuring the city as capital and also a center of attraction for immigration. Furthermore, this urban identity regarding Ankara music has a masculine character considering the sexist nature of performances, such as a paid dance performed by an audience member with a dancer woman who combines “western” dance figures with male “folk dance” figures. This masculine urban identity has become a popular image on mainstream media, with its peculiar music, in the form of TV series such as Behzat C. and Ankara’nın Dikmeni and also movies like Yolunda A.Ş. and Çalgı Çengi. Bearing in mind that the reproduction area of the type of music in question is likely to change due to the ongoing urban renewal projects, the study has an historical significance. The study has been conducted through in-depth interviews and two focus groups with dancers, musicians and audience members as well as some 200 music videos and a four-month period of participant observation in 2014.

Place and Creativity. Working towards the sociology of culture’s creative processes in urban context.
Matías Ignacio ZARLENGA (University of Barcelona) | matiaszarlena@ub.edu

The aim of this presentation is to communicate the main results of my PhD Thesis. Based on empirical analysis of visual art, design and audio-visual production in the districts of Poblenou in Barcelona (Spain) and Palermo in Buenos Aires (Argentina), I developed an alternative sociological framework to explain the impact of ‘place’ in culture’s creative processes. Based on the works of Randall Collins (2009; 2005; 2012), Erving Goffman (Goffman 2006; 2009) and Thomas Gieryn (2006; 2002), I elaborate on the concepts of Creative Rituals (CR), Creative Frames (CF) and Creative Settings (CS). (1) CR refer to creative ‘situations’, face-to-face interactions focused on specific aspects of creative processes (such as technical, aesthetic, conceptual or evaluative, etc.). (2) CS is a key concept that allows me to articulate the spatial and social dimensions of the creative process from a situational perspective. (3) CF are affected by and influence CR and CS; they are perceptions and rules that guide creative processes.

As a result of the analysis, I define three types of Creative Settings (CS): open, closed and dissonant. These types of CS permit us to understand the influence of the ‘place’ in the cultural creative processes. First, Open-CS have weak limits; they are hybrid settings with low creative oversight and multiple purposes. These places are perfect for experimentation because they create unique frames that I call experimental-creative frames. In contrast, Closed-CF have strong limits; they are homogeneous settings with clear creative supervision, which configure professional-creative frames. Finally, CS-dissonant are places where there are conflicts between creators about the limits and settings of the place. These places usually have various creative guidelines, but they are potential places in terms of content and forms of cultural productions.

Cultural Resonance and creativity processes
Arturo RODRÍGUEZ MORATÓ (CECUPS, University of Barcelona) | rodriguez.morato@ub.edu
Matías Ignacio ZARLENGA (CECUPS, University of Barcelona) | matiaszarlena@ub.edu
The general objective of this paper is to analyze the incidence of place on urban cultural creativity processes from a sociological perspective. We seek in particular to understand the social mechanisms through which certain characteristics of the urban environment are incorporated into cultural productions under the conditions of contemporary cultural dynamics (Rodriguez Morato 2012). Taking inspiration from Harvey Molotch (1996, 2002) and Randall Collins (2005, 2009, 2013) among others we elaborate the concept of cultural resonance. We understand cultural resonance as a process in which, first, some characteristic elements of place are incorporated into cultural products turning them unique, and then, secondly, those products participate in turn as content in other cultural creativity processes. As an illustration, from a qualitative methodological approach, based on interviews and observation, we analyze some resonance processes occurring in the case of designers located in Palermo, Buenos Aires and visual artists located in Poblenou, Barcelona.

Art that changes the city. Between art, public space and civil society
Katarzyna NIZIOLEK (University of Bialystok, Poland) | katarzyna.niziolek@gmail.com

In recent years, artistic practices have become the object of a growing theoretical interest that trespasses the boundaries of arts criticism. To some extent, this trend results from the breakout of these practices from the art world, both in spatial (from the gallery), and social (from elitist publics) sense. In the urban context, the present-day interest in art takes two perspectives: economic and sociological. On one hand, it is focused on the material and financial aspects (effects) of artistic practices, seen as serving economic development and urban revitalization. On the other hand, it attends to the social and political impacts of art, considered not in terms of economic but social development, as reflected in civil activity or social inclusion. The presentation is focused on the urban artistic practices which take the public space as their immediate context. It introduces an analytical framework of ten formally and functionally distinct types of such practices: (1) monuments and sites of memory, (2) traditional urban sculptures, (3) “old” public art, (4) critical art in the public space, (5) billboard art, (6) utilitarian art, (7) “new” public art, (8) community art, (9) performative, theatrical and Situationist practices, and (10) street art, graffiti and post-vandalism. This typology is intended to shed some light on the role of art in the social construction of the city, which in turn, following J. Beuys’s extended understanding of art, might be looked at as an artistic endeavor itself.

RN02S07d - Music, Identities and Social Fabric

Young Art in Russia after «Pussy Riot»: Civic Culture of Young Artists with Dissimilar Educational Background in St. Petersburg
Margarita KULEVA (National Research University Higher School of Economics, Russian Federation) | ZHENEVSKAYA@MAIL.RU

During the 2010s Russian art-world has been stressed because of the appearance of several leftist initiatives such as the «War» («Voina») art-group and Pussy Riot, which became known outside the local art scene. Many artists have expressed their «for» or «against» these political art phenomena as public persons or through their works. Probably the most famous performance is Peter Pavlensky «Seam»: the artist sewed up his own mouth in protest of Pussy Riot imprisonment.
Based on 20 in-depth interviews with recent graduates or senior students of major artistic educational institutions in St. Petersburg, the presentation attempts to trace the influence of this debate on the young artists of St. Petersburg and their understanding of the artist's career. The research showed that the debate on civil functions of art, art and politics does not play a significant role in understanding of artist's career, or wider, social function of artist by young artists. Moreover, as shown in the interviews, not all young artists even heard about «Pussy Riot» and could hardly remember what the meaning of their action in Moscow Cathedral was. The main findings of the research are connected with distinction in forms of civic engagement regarding educational background. Hence, students of the classic fine arts universities deny the ideas of political art and civic functions of art mainly because they associate artistic production firstly with technical perfection and do not recognize the importance of the production of meanings and other immaterial labor. Students of contemporary art institutions understand the significance of political art and are able determine its place in art history. Thus, the interviewees created their own work related to social problems and political issues. However, despite the fact that they act as an artist-citizens, they are not ready to be a part of political protest personally - most of them have never been to any protest action, despite the fact that they share the ideas voiced by protesters.

**Cultural Inequality Leading to Social Change: The Case of Andalusian Art Music in Israel**

Simona WASSERMAN (Open University, Israel, Israel) | simonawa@openu.ac.il

Throughout the 20th century Israeli musicians from Islamic countries were excluded from artistic central institutions, which attributed low-value to their music. Yet at the beginning of the 90s a group of cultural mediators from North African descent engaged in a struggle for equality and initiated a process of legitimization, which eventually helped transform the status of Jewish liturgical, folklore and classical North African sounds into Art Music. In this presentation I will demonstrate how the Israeli Andalusian Orchestra has revolutionized the local field of symphonic music and introduced Oriental sounds into mainstream culture. These musical entrepreneurs have assimilated non-Western instruments, sounds and traditions into symphonic orchestration, rendering their music classical character and obtaining institutional support. While striving for virtuosity in performance, their claim for recognition was also discursive: they presented their repertoire as equally valuable to Western canonized corpuses, and consequently imposed cultural pluralism in Israeli society. Ultimately their venture culminated in receiving the prestigious Israel Prize in 2006. This endeavor should also be considered as a cultural project of Mizrahi identity-construction. While subjecting their previously marginal music to highbrow-culture aesthetic criteria, Andalusian musicians, general managers and cultural gatekeepers have constructed – both outwards to Israeli dominant culture and inwards to micro-communities – a new self-concept of Mizrachi identity, based on high self-value and claiming access to cultural resources granted by state. This innovative bricolage that ranged from Berber tribes and Casablanca synagogues in Morocco to Western opera and string ensembles – established a legitimate and unique elitist position within Israeli social fabric.

**Baltic Song and Dance Celebration as Cultural Strategy and its Social Impact**

Anda LAKE (Latvian Academy of Culture, Latvia) | lake.anda@gmail.com

Agnese HERMANE (Latvian Academy of Culture, Latvia) | gnese.hermane@lka.edu.lv

The Song and Dance Celebration is the most characteristic and most unifying cultural tradition of Baltic States which is included in the Representative list of the Intangible Cultural Heritage of
Humanity by UNESCO. Vast majority of society of these countries is involved in the preservation of this tradition through various forms of participation. In the research tradition is perceived as cultural strategy (Saimon J.Bronner) with specific goals and impacts. The social impact research is based on the recommendations for EU member states by the Centre for European Policy Studies (CEPS, 2010). The study aims to identify and to compare the most important groups of social impacts and categories of celebration and to investigate their qualitative and quantitative expressions in Estonia, Latvia and Lithuania. Empirical study is based on both - quantitative and qualitative data. The research focuses on several specific social impact groups of Celebration: inhabitants of Latvian regions; participants and leaders of amateur arts groups, diasporas; ethnic minority residents, seniors, young people, families. Each group is studied in five impact categories: awareness and participation; integration; social inclusion; patriotism and identity; inheritance of traditions and cultural values. The study reveals significant social impacts of Song and Dance Celebration in the cultural praxis of people, however the effects of social impacts differ between the groups and categories. Each country is implementing different management strategy of and applying different cultural policy instruments making it difficult to find comparable indicators of this tradition.

An Archaeology of Critical Perspectives on Fado
Ana GONÇALVES (University of Lisbon, Portugal) | goncalves-ana@campus.ul.pt

Instead of assuming the heritage as a given, in this paper I intend to illustrate how the recognition of a particular musical form as cultural heritage is not only a social-historical product as a discursive construction. Thus, it is considered that this process is far from being linear and consensual, as it is highly charged with conflicting emotions and shifting social values.(1) If Fado today is almost inevitably identified with heritage — especially since the announcement made in Bali on 27 November 2011 by UNESCO’s Intergovernmental Committee for the Safeguarding of the Intangible Cultural Heritage that this musical genre would be included in the Representative List of Humanity’s Intangible Cultural Heritage — it should be noted that this is the outcome of a meandering and almost two hundred year-old historical process. The retracing of the singular path that led to the recognition of Fado as one of the outstanding exponents of the culture of Portugal, and in particular of Lisbon and its historic neighbourhoods, through the wealth of literary production devoted to it, reveals that from around 1870 onwards this musical genre featured on numerous occasions in controversies in the public sphere (that is to say, in publications), and pitted its fans and opponents against each other in arguments back and forth. In this paper I propose to deal with that considerable literary output, not by examining it in minute or exhaustive detail, but rather by offering a short overall guide which goes beyond some of the main works of reference in question (which oscillate between sacralizing and demonizing the Fado, frequently blending impressionistic description with caricature, or historical, sociological and ethnographic notes with commentary of a moral nature), with a view to identifying, defining and above all making a value judgement of those aspects which are reckoned to make Fado and fadistas (its performers) special. A special emphasis will, however, be placed on material most critical of Fado and which, in an attempt at a form of moral sterilization, sought to denounce and counteract its significance. The rise of antifadismo (“anti-Fadoism”) seems to have gone hand-in-hand with the emergence and popularization of the Fado as song in Lisbon from the 1830s onwards. It can be most clearly observed, however, in periods of ideological crisis or turnaround, when people were examining the national consciousness and questioning their identity, such as: the period following Generation 70 (2), enmeshed in a fin-de-siècle reflection on the topics of national decadence and decline; in the years before and after the establishment of the Republic [in 1910], which
featured dissonant political doctrines like Portuguese Republicanism and Lusitanian Integralism (3); after the establishment of the Estado Novo (4), in line with the nationalist vogue involved in the process of giving Salazarism a folkloric veneer, and its opponents’ alternative, which resisted “official folklorism”; and in the transition to democracy, which witnessed the critical renunciation of a culture which had been actively promoted and exploited by the previous regime.

Antifadismo thus came out into the open from the post-romantic era onwards in works of fiction, essays and scientific works, in the daily and periodical press, both general and specialist, and in speeches, lectures and interviews (which were sometimes published and, after 1935, when the National Broadcasting Company — Emissora Nacional — was set up, broadcast on radio).

Paradoxically, the considerable impact of this cultural point of view had the undoubted effect of turning Fado into a public issue, in which various parties in the realm of politics and ideology became involved, sometimes corroborating, at other times antagonizing each other (“Fado-phobes” were diligently opposed by “Fado-philes”), consequently producing an increasing number of pages devoted to this urban popular song.

In summary, the aim of this bibliographical review is to document the fact that antifadismo is a lasting but discontinuous phenomenon, and that it dates from, or rather is tied to this particular time, albeit that we can update it insofar as it was part of broader cultural debates or fell outside them. The various works in which antifadismo is found agree on the overall conclusion that Fado is not interesting enough to be the national song, but there are differences in their assumptions and parameters, often reflecting different political and ideological alignments. For right-wing conservatives, Fado fails on several counts: in nativist terms (it is spurious); in terms of antiquity and roots (it is a recent graft); in terms of universality and respectability (it is nothing more than a Lisbon plebeianism, even if it is a dolled up one). For leftist progressives, Fado fails in the areas of rusticity, authenticity and aesthetic quality (it is urban, counterfeit, corrupted by the music industry, standardized by commercialism and touristification) and it is devoid of merit because it prostrates the soul and encourages inaction, complaining and self-pity.

In addition to these aspects, there is what one might call a related side issue which fluctuates over time, and that is the image of the fadista (Fado performer) as someone reprehensible and repulsive, a presumed member of a licentious urban class. The fadista label started out in current usage as anathema, designating primarily a marginal class of persons of ill repute, which included pimps, whores, ruffians and villains, their eccentric life-styles and their disreputable haunts. As this original description became less appropriate over time, this line of argument gradually subsided.

(1) The constructive character of heritage and the link between patrimonial objects, emotions and values has been discussed by Nathalie Heinich (2009, 2011, 2012).
(2) Geração de 70 (Generation 70) is the name given to a nineteenth-century Portuguese literary generation which led a post-romantic ideological and cultural movement which sought to regenerate Portuguese culture and laid the ground for the republican revolution of 1910.
(3) The movement known as Integralismo Lusitano (Lusitanian Integralism) was a Portuguese integralist political movement, critical of the Republic and supportive of the ultra-nationalist doctrines.
(4) The authoritarian regime of Estado Novo (New State) was the longest right-wing European dictatorship of the 20th century: it was consolidated during the 1930s and it was overthrown through a military coup on 25 April 1974.

RN02S07e - Arts, Activism and Social Change

Art in Protest: Artistic Expression of Turkish and Kurdish Protest in Turkey
Ozan GÜNEL (Beykent University, Turkey) | ozzygunel@gmail.com
In the last couple of years Turkey faced a lot of protests both from the west side also from the east side. While Kurdish protest at the east side is a common thing for Turkey, protest from west side of the country is a fairly new phenomenon especially after military coup in 1980s. Protest in the west which incarnated by Gezi Protest differs from protest in the east. These protest of middle-class citizen which mostly Turkish and highly educated is aim for preservation of life styles more than nationalist concern. These protestors with high social-economic profiles will create cultural outcomes. Thus both during and after protests art reflected to society. On the other hand Kurdish protests with its nationalist identity use culture as a tool for national structure. Not just art but whole culture of that area become part of the protest. This study will try to draw a frame to art of protest in these land with covering their similarities and differences of these cultural and artistic identities which summed up above.

Promoting Diversity in Designing Memorials
Karen FROSTIG (Lesley University, Brandeis University, United States of America) | karen.frostig@gmail.com

The Vienna Project, conceived as a social action memorial project situated on the streets of Vienna, opened with Austrian President Heinz Fischer on 23. October 2013 at the Odeon Theater. The project concluded with first lady Margit Fischer at the Austrian National Library at the Hofburg Palace, on 18. October 2014. The Closing Ceremony was followed by a “Naming Memorial,” which displayed 91,780 victims’ names representing seven different victim groups, projected onto the historic facades of buildings surrounding Josefsplatz.

The Vienna Project was the first public art memorial of its kind in Europe and the first public naming memorial in Vienna to symbolically represent, in a differentiated format, multiple groups of persecuted victims and dissidents of National Socialism, on record within a given country, murdered between 1938-1945. Interim programming included performance art, video projections, street art, web design, archival research, Smartphone app, oral history interviews, social media platforms, guided tours, a “reading marathon,” and new Holocaust education curricula. Occurring at 38 designated memory sites across the city of Vienna as an enduring performance of memory, The Vienna Project reached diverse audiences. Over the course of one year, hundreds of people of all ages participated in memorial activities taking place at the 38 memory spaces to produce new conversations about public memory in Vienna. Hundreds more from 45 countries, participated on our online networks. To date, The Vienna Project is the most critical national public memory project in Austria to be fully endorsed by the Austrian government. Ironically, The Vienna Project occurred at a time when levels of anti-Semitism were on the rise across the rest of Europe.

The project focused primarily on issues of accountability, dismantling the victim myth to put forth an undeniable national narrative about National Socialism in Austria that was inclusive and differentiated. At the center of the project was the premise that creating an inclusive, non-hierarchical memorial need not erase history. Names referencing the different victim groups were depicted as equal. However, group identities were preserved. This level of transparency allowed visitors to think about relationships between the different groups without marginalizing any one group.

The relationship between diversity and integration is still under development across Europe. While there is no way to predict the future, The Vienna Project set the tone for a proactive memorial project that included diverse voices. “Promoting Diversity in Designing Memorials” delivers a discussion about the project’s interactive design wedded to historic rigor, and public response to this 21st century model of memorialization.
Artistic Activism in Contexts of Social, Political and Economic Transformation
Raphaela VON WEICHS (University of Lausanne, Switzerland) | raphaela.vonweichs@unil.ch
Monika SALZBRUNN (University of Lausanne, Switzerland) | monika.salzbrunn@unil.ch
Serjara ALEMAN (University of Lausanne, Switzerland) | serjara.aleman@unil.ch

In recent years, creative activism or “artivism” has become a popular mode of social critique against neo-liberal capitalism, post-fordism and global consumerism. Social actors who may or may not be professional artists, link art and activism to raise awareness, criticise and ridicule anti-democratic, anti-environmental and totalitarian regimes, measures and decisions. Such artistic acts of dissent and resistance include a diversity of modes of expression such as street performances, flash mobs, one-standing-man-demonstrations (Taksim Square Istanbul), the creation of participatory digital platforms, the organisation or détournement of (carnival) parades, or the drawing of cartoons and comics strips. In our contribution we propose a discussion on the performative dimension of creative activism and the transformative power of artistic acts, modes of expression and events, particularly those on situations of precarity, stress, repression and exclusion.

Our paper fits into the 07RN02 session on "Social and cognitive effects of the arts" since it deals with ethnographic aspects, art for social transformation, arts in communities and arts as part of urban culture.

Dealing with War in Times of Peace Through Art
Andreas HUDELIST (Alpen-Adria-Universität Klagenfurt, Austria) | andreas.hudelist@aau.at

How does contemporary art happen outside the walls of the museum? Due to considerably increased degree of entanglement between creative cultural activities and everyday practices both the meaning and the experience of art once tied within the constraints of one particular space at one particular time begin to dissolve as they merge in other, more heterogeneous ways. Art ‘happens’ and, in doing so, opens, extends and moves its aesthetics to the outside, into the social realm of lived experiences. It is precisely this ‘liveness’ of art and its openness to the dimensions of the unpredictable that have led to the establishment of Nicolas Bourriaud’s „relational aesthetics” project during the 1990s. As a curator, he promoted interactive art forms in which art production and reception occur simultaneously. In the foreground is the event in which both sides are involved. If art produces human relations outside the museum, then, as Claire Bishop puts it in Antagonism and Relational Aesthetics, „the next logical question to ask is what types of relations are being produced, for whom, and why”. Further more Bishop criticises that many contemporary art projects find themselves in the logic of neoliberal structures, although some of them argue to expound the problems of it. For Bishop the concept of spectacle is central to the debate about participation. Following Guy Debord, Bishop claims that we can think contemporary art without spectators because today everybody is a producer.

As an example I would like to discuss, is the case of RAUBZUG VLAK STRAHRU TRAIN OF JUSTICE, a six hour “railway drama” to different places in the south of Austria to thematize special sites of the Second World War and the deportation of the carinthian-slovenian minority. On the railway line between Klagenfurt/Celovec and Rosenbach/ Podrožca the bilingual theater group TROTAMORA thematizes the landscape of economic decline and cultural contradictions. The spectators as travellers play the role of a noble travel company who get confronted with social misery and anger of the exploited.

In this paper I want to focus on the visual and performative potential of deconstructing norms, the confrontation with the immediate history and poverty of the region. So the question I am interested in, is not, what is relational art. It is neither about approaching relationality as a
theoretical concept, nor defining art as relational aesthetics. It is about the question of what does relational art do, or how does relational art come to its force as a practice.

**Can we abolish the culture of war? A critical analysis of Krzysztof Wodiczko’s newest project**  
Anna Dobrochna WANDZEL (University of Warsaw, Poland) | ankawandzel@gmail.com

In this paper I examine the merits of the „Institute for the Abolition of War”: the newest work of Krzysztof Wodiczko, one of the most accomplished Polish artists, currently teaching at Harvard Graduate School of Design. In his newest project, Wodiczko proposes a complex plan for an ambitious artistic and institutional intervention, aimed at putting an end to all wars, forever. In order to evaluate whether Wodiczko’s efforts can really bring about such a massive social and political change, I analyse both the inner workings of his project, and the few reactions it inspired, all through the lens of current scientific discussions on contemporary warfare, the ethics and limits of participatory art, and the global renewal of nationalistic movements. In my exploration I also make use of the interviews which I conducted with the artist and his contributors. Finally, I answer Wodiczko’s own call for help and cooperation. Borrowing heavily from sociology, anthropology and cultural studies, I examine how his project could be improved, if the artist was willing to reconsider his methods and the role of art in creating social change.

**RN02S08a - Power Relations, Inequalities and the Artistic Imagination**

**New publics of art in Brazil: the appropriation of spaces of exhibitions**  
Lígia DABUL (Universidade Federal Fluminense, Brazil) | ligia.dabul@gmail.com

In Brazil, the value recognised by the state and the artistic field of spaces for exhibitions and pieces of art, curators and artists does not correspond to the appropriation made by the public of these spaces. The historical absence of this public can be linked to different factors or their merging, such as localisation of places of exhibition, the prices of entrance tickets, the nature of the exhibition, the identification of these spaces with the upper classes, among others. This paper will talk about the process of these spaces being increasingly occupied by the public originated from poorer backgrounds. It is possible to note the reconfiguration of curatorial lines and efforts being made by the educational sectors in museums and cultural centres to redefine their uses and their relationship to the city, and their political and economical importance in the hierarchy of spaces used for art. However, this occupation has recently happened driven by other factors linked to changes provided by the Brazilian government since 2003 -the increasing of the income of the working class, as well as their access to higher education and to information from the internet, and political mechanisms of supporting the access to cultural goods. This recent occupation of spaces of exhibition by the working class has many consequences, one of them being the creation of new social practices related to art and to the visiting of spaces traditionally used by the upper classes, such as the Museum of Modern Art in Rio de Janeiro.

**The Staging of Cultural Diversity at Performing Arts Festivals**  
Lisa DR. DES. GAUPP (Leuphana University of Lueneburg, Germany) | gaupp@leuphana.de
The planned talk analyzes how curatorial strategies at urban performing arts festivals regarding the (de-)construction of cultural diversity function. The curatorial strategies at “transnational” festivals will be compared with the curatorial strategies at “intercultural” festivals. “Intercultural” festivals stage cultural diversity mainly as “exotic” or “traditional”, while at “transnational” festivals these and other ascriptions (e.g. national classifications) recede into the background, when instead, cultural diversity is mainly presented in an “innovative”, “urban”, “cosmopolitan” or “transcultural” way. Accordingly, transnational festivals have a good reputation of being “up-to-date” and to stage the state of the art in performing arts. “Transnational” festivals address global questions and topics and present artists, which are not associated with a certain location or nation. By deconstructing mechanisms of staging cultural diversity as exotic and by constructing dynamic, contradictory, ironical, affirmative and anti-hegemonic identities, curators “play” with diverse self-images. These are no “patchwork-identities” but rather can be seen as performative hybridity, which rules out a reduction of artists to their cultural backgrounds. These curatorial strategies are nevertheless almost non-existent in the scientific debates on diversity, immigration and cosmopolitanism. The planned presentation therefore asks through which curatorial strategies, structural circumstances, lifestyles and social practices of artists and through which practices of performing arts it is achieved to (de-)construct the respective meaning of cultural diversity. The focus of the proposed talk will be set on curatorial strategies understood as a discursive social practice, which (de-)constructs identities, symbols and relations. Thus, the interactions between urbanization, globalization, cultural practices and curatorial strategies will be sketched.

The Whirling Dervish in the Cartoon: Sufism, Power and Satire in 21st Century Turkey
Nevin ŞAHIN (Yildirim Beyazit University, Turkey; Middle East Technical University, Turkey) | nevinsahin@ybu.edu.tr

Once the de facto art school of the Ottoman Empire, the Mevlevi lodges were the places where significant composers and poets were educated. This tradition came to a strict end by the new republic’s law on the closure of Sufi lodges. The literary and musical productivity of the tradition virtually ceased to exist but Mevlevi Sufism instead became an important image fostering satirical productivity. The changing social and political positionality of Mevlevi Sufism resulted in different reflections on popular culture such as TV series and cartoons. The close contact with the popular representations of whirling dervishes and the conservative government tells about the power relations dominating the cultural aura of the 21st century Turkey. Concerning the cartoon debate within the Islamic context following the Danish cartoon controversy in 2005 and Charlie Hebdo attack in 2015, it is crucial to look at the social and political reflections on the "cartoonification" of a mainly Islamic Sufi tradition so as to have a better understanding of local experiences of Islam and Sufism in this regard. How Mevlevi Sufism becomes both the object and the subject of the power relations in the cultural domain, how the ritual performances represent and reproduce these relations and how they find their reflections in popular culture are the questions to be discussed in this paper. The data to be analyzed under these questions, including works of cartoonists like Yiğit Özgür and Umut Sankaya, have been collected throughout an 18-month ethnographic research among Mevlevi circles in Turkey.

Inequality and the artistic imagination: how the Portuguese culture is dealing with the Portuguese crisis
Paula GUERRA (University of Porto, Portugal) | paula.kismif@gmail.com
Augusto Santos SILVA (University of Porto, Portugal) | asilva@fep.up.pt
Helena SANTOS (University of Porto, Portugal) | hsantos@fep.up.pt

Subsequently to the 2008 international crisis, Portugal and other countries of the Euro Area were forced to comply with programs of adjustment, as a condition to financial support from the IMF, the ECB and the European Commission. The Portuguese adjustment program ran from 2011 to 2014, key decisions in budgetary and economic policies depending upon a previous agreement by that ‘troika’.

This three-year period was traumatic, in social and political terms. It was also traumatic in symbolical terms. Four topics were critical: the loss of sovereignty; the failure of the European integration; the ‘moral issue’, concerning the so-called ‘Southern’ habits of ‘conspicuous expenditure’; the responsibility of Portuguese elites.

The issues of difference and inequalities were central to the national debate on the positioning and the future of Portugal in Europe. It also pervaded the arts and culture. In performing and visual arts, in literature and music, or in the cinema, the circumstance experienced by the Portuguese state and population; the ‘ontological’ threat to Portugal as one of the most ancient nations of Europe; the need to react and the role of the artists in that reaction; and the vision of a different future, those were topics addressed by many intellectuals, novelists, musicians, performers and visual artists.

This paper aims to provide a panoramic view of this debate, framed by the general theme of the Conference: how the artistic ‘imagination’ has been dealing with issues of difference and inequality that were so dramatically pointed out in the Portuguese ‘troika years’.

RN02S08b - Global and Local: Cultural Cosmopolitanism, Glocalisation and New Arts World Structures

‘Western’ architecture and urbanism seen by Czechoslovak architecture magazines 1950s to 1989
Slavka FERENCUHOVA (Masaryk University, Czech Republic) | ferencuh@fss.muni.cz

Much writing about architecture and urbanism in socialist-times Central and Eastern Europe and in Soviet Union has focused on specificities that defined the practice and ideas of architects and urbanists in this context. As specific design of buildings and public spaces has been depicted (Hirt 2012; Häussermann 1996; Alexander 2007; Ladd 2001; Czepczyński 2008), academic literature created a picture of socialist era architecture and urbanism as different and disconnected from practice in other countries. Although several authors recognized that socialist architects referred to ‘Western’ modernism (e.g. Molnár 2005; Musil 2002), only few researched the actual connections and exchanges that existed between architects and planners across the borders (e.g. Stanek 2012; Ward et al. 2013; Ward 2012; Cook et al. 2014).

This paper attempts to add to this body of writing by analysing how architecture and urbanism from Western capitalist countries was presented in Czechoslovak magazines for professionals and how it was used as inspiration or criticised. Arguments are based on analysis of selected media published between 1950s and 1980s. The paper points out to what extent the local ‘socialist’ architecture and planning referred to ‘Western’ practices, how it developed in parallel to international production, and how the ideological context influenced the way this practice was discursively framed. Although it works with historical materials, it aims to debate issues of broader relevance: especially the travelling of ideas between professionals working in geographically distant places, and the role that political and ideological context plays in perceiving and judging architecture and urbanism.
Tina Marjukka LAURONEN (University of Helsinki, Finland) | tina.lauronen@helsinki.fi
Riie HEIKKILÄ (University of Helsinki, Finland) | riie.heikkila@helsinki.fi
Irmak KARADEMIR HAZIR (Middle East Technical University) | irmakka@metu.edu.tr
Semi PURHONE

Cultural globalization is one of the key processes affecting cultural classifications and hierarchies in national contexts. The significance of national borders may have decreased during the last decades (at least in the sense of the abundance of global cultural items circulating across countries), but the influence and amount of global cultural flows are hardly similar everywhere. Distinctions between global and local might also have become more salient in novel ways. This paper presents an analysis of the changes in the relative weight of national and global culture and the arts in the cultural sections of nationally leading newspapers from five European countries – ABC/El País (Spain), Dagens Nyheter (Sweden), Helsingin Sanomat (Finland), Le Monde (France) and The Guardian (UK) – from 1960 to 2010. Through content analysis of samples of the newspapers (the unit of analysis being an article, altogether over 7,000 cases), the paper examines how the composition of national and geographical origin of the artists and cultural products discussed has changed in 50 years. Thus, the paper asks whether there are traces of increase in “cultural cosmopolitanism” or whether national culture remains dominant, to what degree there is variation according to the cultural area or art form discussed, and whether the five newspapers embedded in their national contexts are different in these respects. The analysis will cover several cultural areas, including music, literature, cinema, television and the fine arts. The results are in line with the supposed trend towards globalization of culture, but not as straightforwardly as one might expect.

Museums, design and identity. Contemporary Polish ethno design as the example of glocalisation.
Dominik PORCZYŃSKI (University of Rzeszów, Poland) | dporzynski@gmail.com

This paper has three objectives. Firstly, it articulates modern Polish design grounded in traditional folk aesthetics as an example of glocalisation. Secondly, it presents an analysis of the process by which folk aesthetics have moved from the peripheries to the centre of Polish culture and relates this movement to Poland’s historical struggle for independence. Thirdly, it describes the role of ethnographic museums in the process of constructing national consciousness. A predicted result of the globalisation process has been the unification of life-styles as well as a reduction in the importance of nation-states. According to Wallerstein (2004), the contemporary world may be divided into ‘core’ states (for example, the USA and UK) in which cultural patterns are produced and transferred to ‘semi-peripheral’ and ‘peripheral’ states. According to this theory the system of museums as well as definitions of art might work similarly in different countries. However, the analysis of Robertson (1992) shows that through processes of local cultures are not always supplanted but in fact sometimes revive, a phenomenon he calls glocalisation. The growing popularity of folk-inspired artistic practices in Poland will be discussed as an example of glocalisation. This phenomenon may be perceived in music (for example, rap-musician Donatan’s performance during the Eurovision 2014 Festival) as well as in design. The latter may refer to various spheres of aesthetic production – architecture, clothing and everyday objects – and is commonly defined as ethno design, the focal element of this paper.
Although the intensification of events related to folk-inspired artistic production has been noted only recently, discussion about it began as far back as the second half of the 19th century and it might be called a Polish contribution to the issue raised for the first time by Ruskin and Morris which was the objection to a low quality of mass-produced goods and the appraisal of handicraft. However, in case of Poland, which had been dissolved as an independent state during that period, a very important element was the drawing of inspiration from traditional aesthetics, specifically the aesthetics of dozens of ethnic sub-groups resident in Poland. The main reason for this strategy was to build a national consciousness in relation not only to aristocratic culture but also in relation to traditional cultures (Huml, 1976).

Pursuing this topic, the paper demonstrates the role of folk art inspirations in design during three periods: 1) during the inter-war period when traditional aesthetics became an element of formal, ‘national’, style in handicraft, painting and architecture; 2) during socialism (Polish People’s Republic) when support of folk-culture rooted activities was an element of official state policy; and 3) after year 2000 when folk aesthetics became understood as a way of expressing uniqueness in the increasingly uniform world. This conclusion will be discussed in relation to official (state supported) practices such as exhibitions (e.g. EXPO 2010 or “Unpolished”) which aim at promoting Poland abroad. The issue to be addressed is therefore whether such a strategy is just one of the voices in the discourse of polyphonic, late modern art which draws from a variety of different aesthetics or instead an example of a metanarrative. According to Giddens (2009), tradition in late modern societies demonstrates deliberative and reflective traits. Polish ethno-design is comprised of diverse folk related aesthetics (e.g. Krakowiacy, Górale, Kurpie). Products related to them are, however, presented abroad as Polish. The discussion, then, will consider whether such a practise is an example of simplification and stereotipisation of group culture which – as Cohen (1985) noted – is a common pattern in contact with outsiders, or whether it is an intentional strategy of creating a ‘national’ style similar to those of 19th century and inter-war period.

Since the main actors of the aforementioned process are museums, their role in particular will be analysed. The main assumption in this part of the argument is that with the ennoblement of folk aesthetics the role of ethnographic museum has also changed. The system by which modern societies collected and exhibited cultural artefacts may be identified as colonial. Different aesthetic systems were rendered subordinate to the aesthetics of the Western elite. The strict division between traditional and fine arts was institutionally sanctioned through the establishment of ethnographic museums and art galleries. The former were constructed to collect and exhibit objects related to folk or tribal communities (as the objects related to past and primitive cultures) while the latter concentrated on the sphere of fine arts which, in fact, are the result of cultural production fitting with the framework of art defined by the Western elite (Clifford, 2000; Ossowski, 1966). In contemporary museums, however, this division seems to blur. Traditional aesthetics entered the main art discourse and popular culture. Objects inspired by folk production are displayed in galleries or may be watched on television. Ethnographic museums are no longer repositories of ancient testimonies but rather active participants in the construction of regional and national consciousness. The regional and ethnographic museums of Opole, Cracow and Bydgoszcz organise events (exhibitions, festivals, museum lessons and workshops) that familiarise their guests with the past of their region but also show that the traditional still lives in contemporary artistic production thus becoming an element of national consciousness along with ‘fine’ artworks such as Chopin’s Polonaises or Matejko’s paintings.

The paper is based on both historical and empirical data. The author followed qualitative methodology based on social anthropology of Geertz (2005) with references to sociological grounded theory (Charmaz, 2009) and symbolic interactionism (Blumer, 2007). To describe the processes related to folk aesthetics’ and museums’ transformations references to literature are made, however in the analysis of museums’ role in the regional and national consciousness process construction the argument is structured by outcomes of existing data analysis (museum
Different interrelated Events in the Structures of Art world
Gerhard PANZER (TU Dresden, Germany) | gerhard.panzer@tu-dresden.de

Two types of events could be observed in the development of art world e.g. in Germany from 1913 to 1945. The first type includes the crucial events like two world wars ended with defeats, one revolution followed up by democratization and the takeover of the nazi party. What role do these events play at the processes of devastation or transformation of structures of the art world? The second type contains the local exhibitions of art work organized by art institutions. How do these events reflect the crucial events or how do they reproduce structures? This historical period provide us with a focused view on the coincidences between structures and the two types of events.

The structures of the local art world are generated within a historical process. The theoretical concept of art world analysis (Becker) will be used as a heuristic instrument to examine empirically which role plays networks of actors with different affiliations to institutions, organizations and events in art world of visual arts across the period. In order to reconstruct the relationship between the events and the local art worlds it is necessary to combine the different qualities of affiliation together in a suitable model to catch the significant transformations in the local art world.

The data has been collected from exhibition catalogue, literature and investigations in archives. In the center of the investigation stands an art world with an art academy, artist groups, an art society and some large-scale exhibitions in particular during 1913 to the 1930s. The main question is to develop an approach for actors as well in institutions as at events.
RN02S09a - Theoretical Development in Arts Sociology: Revisiting Weber, Becker and the Role of the Author

Telling About Society – Howard S. Becker revisited
Dagmar DANKO (Albert-Ludwigs-Universität Freiburg, Germany) | dagmardanko@yahoo.de

More than 50 years after the seminal publication Outsiders (1963) and over 30 years after the publication of Art Worlds (1982), which has become a major reference in the sociology of art, it is time to revisit Howard S. Becker’s oeuvre and importance for our research area. The use of the term and notion of art worlds comes naturally to sociologists of art, yet few of them are really familiar with his work and especially his more recent writings. Also, reducing Becker’s findings to his concept of “art as collective action” is not doing justice to the large variety of his studies and publications – not to mention how the persistent misunderstanding of cooperation taking place in art worlds as being conflict-free is altering his very ideas in an all too simplistic way.

Also, Becker’s research allows for a consideration of what a “sociological imagination” – a notion used in the main title of the conference – really is, or what it could or should be. In his much less known book Telling About Society, Becker compares the “sociological imagination” to the “imagination” offered by the different arts. Both, says Becker, tell us something about society. In this sense, sociology and the arts can tell about “differences” and “inequalities” as well. In my presentation, I wish to elaborate on this point.

Generally speaking, my presentation will be based on my own work about Becker, which takes the form of an introduction to his writings and which is to be published (in German) this summer.

‘Beyond Bourdieu?’ Back to Weber!
Isabelle DARMON (University of Edinburgh, United Kingdom) | Isabelle.Darmon@ed.ac.uk

Music is once again proving to be a fertile ground for explorations and programmatic attempts for a renewal of the sociology of the arts and of cultural sociology as a whole. In part under the influence of actor network theory and in the midst of interrogations as to Bourdieu’s legacy for the sociology of art, the social and cultural sciences are questioning their capacity to give an account of engagement with art that is not reduced to analyses of the social reproduction of taste.

Drawing on my analysis of Max Weber’s music writings, presented in Turin in 2013, I propose to explore further the potential of Weber’s approach for theoretical renewal today, by contrasting Weber’s notions of domains, logics and momentum with Bourdieu’s structure of artistic field. I will suggest that this discussion ultimately hinges on the distinction between homology and affinity; as well as on a conception of fields as organised by relations between elements vs. by tensions between forces (e.g. of rationalisation). Through this confrontation between Bourdieu’s and Weber’s approach to the artistic field or the domain of music I hope to contribute to current debates on the ways forward for the renewal of the approach to the arts and art works in cultural sociology.

Kundera Effect – the Role of the Author in the Sociology of Arts
Miroslav PAULÍČEK (Charles University in Prague, Czech Republic) | mPaulicek@email.cz

Milan Kundera is well known (beside his famous novels) because of his struggle for “the death of the author”. In his brilliant essays, he often repeats (with Gusteve Flaubert) that the author should be considered as he never was alive. That means we have to interpret works of art without the intention of the author. Simultaneously, Kundera writes prefaces and epilogues
(explaining how to read his text), forbids translations of his books and forbids film processing of his novels. Shortly he acts as a living author while writing that the author should be dead. This is what I call the Kundera effect. The same ambivalence we can find in the field of the sociology of arts. For the sociology of arts the author is one of the most important actors (along with the work of art, the public or the society) but he is usually viewed as a socially constructed genius (Heinich’s Van Gogh), product of institutions (DeNora’s Mozart) or at best a part of the art world (Howard Becker). In my contribution I would like to emphasize the role of the author and suggest how to strengthen his position in the sociology of arts.

Ambivalence of category of "success" on the example of biographical stories of polish émigré artists
Tomasz FERENC (University of Lodz, Poland) | tomasz.ferenc@wp.pl

I would like to present research perspective based on the idea of biographically oriented sociology of art. I will refer to the biographical research that I carried out in 2008-2012 among the polish artists who settled in London, Berlin, New York and Paris. In the first part of presentation I will try to describe various reasons of leaving home country and different strategies of adaptation abroad undertaken by artists. Artistic mythologies dispose us to believe in the uniqueness of each of the authors, not only their works, but also their life. It seems to be interesting to reconsider the question about this what is common and typical in their life and what is unique. I will try to point some of those typical and repeatable elements of biographies of émigré artists. Also I want to show how settling outside the country of origin affects the work of artists and how it impacts this what can be called as an success. This aspect become the main subject of the article. What factors determines artistic success? In presentation both literature sources and empirical data are presented. Success in almost every narrative story is defined differently. Sometimes artists in their narratives mention its objective dimensions, such as publications in prestigious journals, important exhibitions, sales of their works or placing the works in prestigious collections, good reception among audience and critics. In other cases, success is defined by achieving state of independence, a strong position in the art world, achieving social and financial security. What is important objective evidence of success doesn’t necessarily represent the subjective feel or treating it as important. By invoking to biographical stories of the artist I am showing ambivalence of category of ‘success’. This concept is so variously interpreted, each time requiring a precise definition and concretization in relation to the biography and the circumstances in which live every particular artist. Main idea of this approach is based on a attempt of breaking the dominance of institutional determinants and ways of defining artistic success and the associated with this hierarchy of artists constructed by participants and decision-makers in the art world.

RN02S09b - Theoretical Development in Arts Sociology: Rethinking the Aesthetic, the Artistic Imagination, the Field and the Museum

Museum Sociology - Approaches to an Important Societal Institution
Volker KIRCHBERG (Leuphana University of Lueneburg, Germany) | kirschberg@uni.leuphana.de

The study of museums is not yet an established field of sociological research, or even an acknowledged sub-discipline of sociology of art in most countries. The influence of society on museums and, vice versa, the influence of museums on society does not necessarily have to be researched from a sociological perspective; museology is usually considered part of the field of museum philosophy. Nevertheless sociology can be considered a highly relevant approach to museum studies. This presentation will describes the state of the art of a sociology that
analyses the interrelationships between museums and society. This includes studies on the overall societal macro- and the individual micro-perspective, production, e.g. on the causes and development of exhibitions and collections, consumption and reception (e.g. on the causes and effects of museum visits and the visitors’ perception and evaluation of exhibitions), the contextualization of museums in a space-time continuum (e.g. the consequences of globalization, historicity and post-colonialism), the polarizations of museums between change and affirmation, changes from a traditional (hegemonic and heterotopic) localization to a postmodern (polysemic, polyvalent and non-heterotopic) relativism, and methodological categories of a museum sociology, with specific phenomenological, etymological, historiographical and critical-rational approaches. As a result, I will locate the museum in a sociological space bifurcated in a textualistic and in a contextualistic area. This phenotypical dichotomization characterizes as well museums as museum sociology.

Genesis and Structure of the Field of Theatre in Hungary
Ádám Kornél HAVAS (Corvinus University of Budapest, Hungary) | huvasadam@hotmail.com

In providing an account on the historical process of autonomy of the fields of artistic production in the framework of a historical sociological approach, Bourdieu argues that the evolution of artistic fields in the broader Western context is governed by similar principles that might be interpreted on the basis of the field theory. By focusing on the evolution of the genesis and structure of the field of theatre in fin-de-siècle and early 20th century Hungary, this paper considers issues at stake associated with Bourdieu’s account on the social principles of aesthetic hierarchization, as a result of ongoing struggles between competing agents, in order to conserve or transform the field. The analysis of the historical process of differentiation of institutions and genres manifested in them, makes possible the designation of the socially determined laws affecting the evolution of the autonomous field of theatre. By concentrating on the Hungarian case, it will be intended to test the Bourdieuien theory in a different socio-cultural context, which holds the prospect of specifying the interdependencies between economic and political forces in structuring the field of theatre. Finally, by taking into account the emergence of the international field of theatre marked by the founding of the European free theaters in the last third of the 19th century, the impact of the international theatre field on the transformation of the Hungarian field of theatre will also be analyzed. This historical sociological project clarifies the universality and limits of the field theory by analyzing the Hungarian theatre field.

Art in the Sociology of Art: Conceptualizing the Aesthetic as Field of Action
Victoria D. ALEXANDER (University of Surrey, United Kingdom) | v.alexander@surrey.ac.uk
Anne E. BOWLER (University of Delaware, United States) | abowler@udel.edu

In this talk, we argue that the work of art is often neglected in sociology of art. This is not the case in fields such as art history or literary analysis, and while these fields have incorporated sociological ideas via attention to social history, sociology of art has been slower to adopt ideas from the arts and humanities. We briefly discuss some reasons for this, arguing that the ethic of value neutrality sits at the heart of sociology’s frequent refusal to engage with questions involving aesthetic judgment (also, to lesser extent, aesthetic meaning). We then turn to the more important project, asking what a sociology of art that takes art seriously would look like. We suggest that it would include several elements and, for the purpose of the talk, focus on two: 1. Attention to the object/work of art is necessary, including discussions of form and content, and an explicit attention to aesthetic judgment. 2. Particular works then need to be contextualized within what we term an ‘aesthetic field’. This includes systems of production, distribution, and reception; aesthetic objects and practices; and
aesthetic discourses. We argue that, like Bourdieu’s social fields, the aesthetic field is a field of action in which aesthetic ideas are socially constructed, and value is created and contested. While Bourdieu discussed art and aesthetics, he did not explicitly theorize the aesthetic as a field of action. We illustrate these arguments with a case study on the nude in visual art.

Rethinking the artistic imagination: from formalistic ‘innovation’ to productive potential for social and political change
Ian BRUFF (University of Manchester, United Kingdom) | ianbruff@gmail.com
Melanie JORDAN (Royal College of Art, United Kingdom) | melanie.jordan@rca.ac.uk

Contemporary art has long been accepted as the space in which limits are boundless; from Duchamp’s ‘Fountain’ to Manzoni’s can of ‘Artist shit’, there is no doubt that art has been articulated as anything one wants it to be. However, this obsession with expanding the category of art as a function of the avant garde has conversely restricted the transformative potential of art. We argue that a key consequence has been, somewhat ironically, for the avant garde to reproduce the formalism of earlier, elitist paradigms such as those advocated by Clement Greenberg.

Instead of the form-heavy focus on ‘innovation’, the artistic imagination needs to be rethought in favour of a renewed focus on the productive potential of art. Returning especially to Walter Benjamin’s classic essays on the author as producer and art in the age of mechanical reproduction, we argue for a conception of art practice that moves away from preoccupations which emphasise the formal (re)arrangements of the object. While this may superficially seem close to contemporary discussions of art and society (e.g. the radical aesthetics perspective), our approach is founded upon the notion that a sociology of art ought to have at its core a discussion of what it is doing rather than what it is. This more materialist conception of art makes it possible to consider art practices as embodying the potential to contribute to wider processes of social and political change.

RN02S10a - Everyday Aesthetics and Organisational Life

Applications of Everyday Aesthetics in Daily and Organizational Life
Dan Eugen RATIU (Babes-Bolyai University, Romania) | daneugen.ratiu@gmail.com

Recently, the idea of practical aesthetics has gained interest in a variety of disciplines, such as arts management and arts policy (DeVereaux 2009) as well as sociology of arts. My paper aims to explore new applications of everyday aesthetics, examining in particular everyday life decisions and actions prompted by our sensory experiences, emotional states, and aesthetic preferences or taste. A significant research question will be how aesthetic methods provide new ways of conceptualizing and answering significant questions in these domains. This paper will also tackle two other important problems. Firstly I investigate how the concept of “aesthetic knowing”, that has informed training and practice in a variety of disciplines, produces improved arts management and policy processes. Other open problem is that of the role of aesthetics in motivating individuals and the way in which aesthetic responses prolong in actions. This includes explorations of the aesthetic dimension in the sphere of consumption and leisure (in line of Molotch 2003; Scott 2007), and in organizational life (in line of Witkin 1989/2009, Guillet de Monthoux 2000, and Strati 2000). The hypothesis is that individual decision-making and action can also be explained through the concept of “aesthetic choice”, which differs significantly from the assumptions of models framed in terms of “rational actors” or “utility”. The concept of
aesthetic motivation requires elaboration, especially in terms of how it operates in individual and communal action including the ways in which rationality and utility diminish in significance as explanations for behavior.

Ileana-Nicoleta SALCUDLEAN (Babes-Bolyai University, Romania) | nicoleta.salcudean@gmail.com

The study of organizational symbolism in the ’80s tackles issues regarding image, feelings and values that are representative in an organization, pointing to that aesthetic sensibility that could generate meaning and significance. Art and aesthetics are remodeling “a way of knowing an organization” (Carr, 2009).
The paper seeks new methodological development models related to organizational aesthetics, an inventory of those "non-rational elements" (Warren, 2008), which construct "sensitive knowledge" (Strati, 74, 1999).
Based on the research categories for organizational aesthetics proposed by Taylor and Hansen in 2005 (intellectual, artistic, aesthetic and instrumental), the paper will analyze a contemporary art space, Paintbrush Factory, Cluj-Napoca (2009-2014), focusing on the aesthetic leadership and the everyday cognitive and sensory experience of the people involved. The Paintbrush Factory is creating a “central imaginary” (Castoriadis, 1987) both by provided a new memory of the past (the conversion of a communist location) and by establishing a leading role in the contemporary art (the network developed by this spontaneous, contextual space). The presence of the individuals (involved in management, artists or regular participants to the events) is observed through the “intelligence of the feeling” (Watkin, 1974) and symbolic effects.
The Paintbrush Factory models the following: industrial space conversion, creative cultural management, a cultural brand, and a unique organization as federation.

On the Social Nature of Everyday Aesthetic Experience
Cristian HAINIC (Babes-Bolyai University, Romania) | cristihainic@gmail.com

The notion of aesthetic experience undisputedly rests at the foundation of everyday aesthetics as a philosophical movement. However, the unitary aspect of everyday aesthetic experience as Dewey construed it (i.e., everyday situations do not form aesthetic experience unless they are brought to completeness in a sensory and cognitive sense) has received a lot of criticism in other groundlaying works in the field. Unitary aesthetic experience is seen as a standpoint still loyal to traditional aesthetics, where the artwork worked as a disruptor of the everyday. Irvin, Melchionne, and Saito proposed that everyday aesthetics take interest in fragmentary experience, arguing that Deweyan everyday aesthetics takes out specific complete events from the borderless everyday flux of events, thus rendering them exceptional and not so “everyday” from the outset. In this paper I propose a propitiatory solution to the unitary/fragmentary debate over aesthetic experience. The answer I provide consists in considering everyday objects and events as social and time-indexed entities, meaning that they correspond to the specificity of a given society, culture, and set of beliefs during a certain period of time. The criteria used for establishing that something is an instantiation of everyday aesthetic experience would, then, allow for both complete and fragmentary features, depending on the awareness of the subject undergoing the actual experience.

Civic environmentalism in Romania and everyday social aesthetics: a framework for assessing environmental protests as ‘aesthetic social situations’
Stefan Sebastian MAFTEI (Babes-Bolyai University, Romania) | stmaftei@yahoo.com

Our study has a fourfold aim: a. To provide an overview of recent theories of civic environmentalism as related to the nowadays theories of ‘everyday aesthetics’ (EA). Our thesis is that both environmental theories and EA theories proceed from the same holistic, ‘ecological’ (Arnold Berleant, John McDermott) theoretical model, informed by a non-dualistic understanding of the individual's consciousness as being connected to its ‘environment’. Thus, the quality of ‘everydayness’ can be attached not only to EA, where the issue of aesthetics boils down to ‘recovering the continuity of aesthetic experience with normal processes of living’ (John Dewey), but also to civic environmentalism; b. To analyze the social implications of Dewey’s and Berleant’s theories of ‘aesthetic experience’, theories which share the same penchant towards seeing the individual's aesthetic experience as part of its social context. In Berleant’s as well as Dewey’s case, there is a ‘perceptual common’ (Berleant) in aesthetic experience that renders it immediately ‘public’ (Dewey); c. To assess the environmental protest (EP) from the perspective of EA, knowing that human ‘experience’ in general can possess ‘aesthetic character’ even when it is not ‘aesthetic’ per se (Dewey). EP, which is basically a human performance, a meaningful, creative ritual, usually pervaded by artistic elements, may thus be looked at from the perspective of EA as an ‘aesthetic social situation’ (Berleant). d. Finally, to apply Berleant’s explanatory model of ‘aesthetic social situations’ to environmental grassroots protests in Romania, by pointing out concrete illustrations, both artistic and non-artistic.

RN02S10b - Arts and Everyday Life

On the Enactment of Roundabout Art - A Case Study
Michael JONAS (Institute for Advanced Studies, Austria) | jonas@ihs.ac.at

Roundabouts are an integral part of the landscape in Austria. Especially in Lower Austria, one of the federal states, traffic circles have been built both in the urban road networks as well as in the entrance and exit areas of towns and villages. Since a couple of years this seemingly useless space has been increasingly transformed into a site where and in which popular art is enacted. In a specific sense roundabouts function more and more as a kind of businesscards of the respective towns or villages. This enables it that expeditions from artists, landscape architects and engineers but also from politicians and other actors start to hoist their flags in the middle of the roundabout. My planned contribution follows the aim to offer an understanding how and in which multiple ways the mentioned popular art is enacted through various social practices and arrangements. On the basis of extensive ethnographic research various data forms generated in qualitative interviews, document analysis, observation trips, participant observation of car drivers, photo trips, informal talks, internet forums, artifact analysis and others have been used to present a praxeological analysis of the mise en scène of roundabout art. After a short overview about the multiple enactment of this popular art, I present a case study of one roundabout art in a small Lower Austrian town. Here I would like to demonstrate, that the enactment of roundabout art is something multiple. It depends not only on the activities of the individuals involved in the planning and implementation practices of roundabout art. Instead not only relevant practices of art reception have to be taken into account, in which car drivers, bikers or pedestrians are engaged in using the respective roundabouts, but also the activities of the roundabout art itself.

Everyday Aesthetics: The Case of Humor
Noel Edward CARROLL (Graduate Center City University of New York, United States of America) | knollcarroll@gmail.com

One of the most pervasive examples of the role of aesthetics in everyday life is presence of humor. In this essay, I will characterize humor, emphasizing that it is the object of the positive emotion of comic amusement. I will go on then to show how by marshaling this positive emotion, we are able to alleviate the pressure of negative emotions and moods including fear, anger, stress, and grief. I will show how this operates in concrete situations like bereavement. I will also attempt to show that the power of the emotion of comic amusement fosters social cohesion and detachment in ways that serve the social agency of groups dealing with emergencies, disasters, and conflict situations such as medical workers, doctors, police and military forces, fire teams and so forth. I will also emphasize the role of comic amusement as a persistent social lubricant among strangers and even rivals. Although the theory of humor is much studied, it is not usually conceptualized under the category of everyday aesthetics. That will be the contribution of this essay.

This is being submitted to 10RN02 -- the session on everyday aesthetics

The Stream of Life: Aesthetic Vitality and Pathologies of Form
Arthur Oliveira BUENO (University of Sao Paulo, Brazil) | artbueno@gmail.com

This paper explores the relevance for today's aesthetics and social theory of the 'artistic-vitalist' approach that Georg Simmel developed in his late works. It does so by examining how his notion of life – understood as something that "vibrates, resonates, radiates, pulses, propagates, oscillates, diffracts, shimmers, scatters and dissipates in fluxes" – plays a crucial role and is elaborated by the author in several domains: his philosophy of art and his Lebensphilosophie, but also in his essays on money and modern culture. Strongly influenced by Nietzsche and Bergson, Simmel strives to devise forms in which the "stream of life" can be adequately expressed, whether in particular artistic experiences or, with regard to "the life of society," in critical moments during which social relations are "suffused with a passionate vitality bursting forth as if from one common source of energy." Such moments – brought forward especially in periods of crisis – provide the counterpart to pathological phenomena manifested in mechanical, non-vital social forms which tend to reduce life to strictly logical schemes and thus fail to realize its characteristic fluidity, lively pulsation, and intensive undifferentiation. The reconstruction of Simmel's energetic perspective on art and society allows moreover to establish fruitful connections, until now unexplored, with more recent social-philosophical endeavors, such as those of Deleuze, Simondon and Massumi. It constitutes thereby a significant resource for critically investigating not only the artistic movements of the last century (several of which were examined by Simmel himself), but also modern and contemporary forms of life.
RN03 - Biographical Perspectives on European Societies

RN03S01a - General Session I

Using a biographical methodological approach to explore infant feeding choices in Newcastle-upon-Tyne, England.
Justine GALLAGHER (Northumbria University, United Kingdom) | justine.gallagher@northumbria.ac.uk

Breastfeeding provides significant health benefits to both mother and child. The average rate of breastfeeding in the UK is around 67%. Rates in areas of high social deprivation are lower than this. In the wards of Walker and Byker in Newcastle-upon-Tyne, just 47% of women breastfeed their children at birth.

This paper explores how a biographical methodological approach has been used to elicit women’s ‘infant feeding stories’ in Newcastle-upon-Tyne, helping to “make sense of what has been and what is happening in…lives, cultures, communities and societies” (O’Neill, Roberts and Sparkes, 2015 p.1). These stories are part of a research study which aims to explore socio-cultural factors relating to infant feeding decisions. To date six women have been interviewed.

The use of one ‘generative narrative question’ (Riemann and Schütze, 1987, p.353 cited in Flick, 2009, p.177) has allowed the women to be in control of the interview process; to tell their story without interruption and through the use of their own frame of reference and vocabulary. This approach has allowed the women space to introduce others into their stories. These social actors, friends, family members and health professionals are often included though the use of direct speech (James, Hall and Collins, submitted). It is argued that this method produces ‘a richer version of the events’ (Flick, 2009, p.179) than by using other methods.

To conclude, this paper will map some of the women’s stories. This will demonstrate the complexity surrounding influences present for women during this important decision making process.

James, Hall and Collins (submitted) The use of direct speech and scene enactment by participants in research interviews: A window on the site of practice?

Continuity in the families of owners of private capital and big business in Russia
Elena ROZHDESTVENSKAYA (National Research University Higher School of Economics, Russian Federation) | erozhdestvenskaya@hse.ru

The study was initiated by the Moscow School of Management SKOLKOVO, Wealth Transformation Centre. Submitted report is the segment of this study - family factors that determine the transfer of wealth and business to successors, the next generation in the family. Target group - owners of private capital, the owners of big business, which lead its operations in Russia. The sample (30) is constructed on a public list of the richest businessmen in Russia, on average state about 300-500 million Dollar.

Method of research - a semi-structured and narrative interview.
Meaningful results. The families of business leaders are dual: the family as an economic actor, but also as non-economic category, there is a demand for "optimal" strategy and principles of coexistence of the two "arenas" - business and family. Respondents lay primarily on themselves as responsible for the formulation and transmission of values. They appreciate the closeness of their own worldview and values with their children, consider themselves as the main carrier of values and behavior patterns, but also call parents and wife. The conditions of successful transmission of values to children as a guarantee of continuity are: to talk with children about life and business, to discuss the interests of children and their problems, to build a common way of life, to create the right context for growing and nurturing, educate by example, to form the experience of independence, to build the suitable environment of communication. The closeness of values depends on family strategies. The typology of families to engage in the business is following: "isolation" (the family as the beneficiary of business activity of the entrepreneur), "cooperative autonomy" (the entrepreneur involved in the affairs of the family as an investor), "clan history" as a resource for the family and business ties, "business university" (employer provides opportunities for the implementation of the biographical challenges of family members), "the family business" (quasi-organization in which kinfolk work). The volume of tasks to engage the next generation in to business stimulates the creation of a set of rules or relation's protocol, their degree of formalization varies.

Connecting lived lives and social policy change in Europe – a review of the biographical approach to disability
Rune HALVORSEN (Oslo University and Akershus College, Norway) | rune.halvorsen@hioa.no

This paper examines how the lived experience of persons with disabilities can be linked with the changing institutional conditions for full and effective participation in society. The paper explores the interlinks and relationships between the lived experiences of persons with disabilities and social policy reforms with consequences for their lives. First, the paper presents in brief the historical background for biographical research in sociology. Second, the paper discusses the concepts of 'life-course' and 'generation' and their relevance to interpreting the lived experience of persons with disabilities. Third, the paper presents early experiences from data collection of life-course interviews with three age cohorts of persons with disabilities in nine European countries in 2014. The paper concludes by identifying theoretical and methodological issues of relevance for how we collect and analyse life-course interviews.

Women's lived experience of coping with domestic violence: vulnerability and agency
Annele TETERE (University of Latvia, Latvia) | annele.tetere@inbox.lv

The paper is being elaborated in the perspective of interpretative sociology, giving a voice to women and applying structural and thematic narrative analysis. The central theme of the paper is the women's lived experience of coping with domestic violence. The aim of the study is to investigate the dynamics of women’s lived experience of coping with domestic violence. The key issue that the author seeks to illuminate in her research is to understand the ways in which women survive their social and psychological vulnerability to domestic violence in their everyday lives and how narratives allow women to represent their experience of coping according with their own frames of meaning. The theoretical framework of the research is based on anthropology of experience. The research strategy is the biographical research. The presentation of the epistemology of the theoretical framework is being provided by means of analytic description, along with assessing possibilities for applying this framework in the context of studying lived experience of women coping with domestic violence.
The empirical part of the research presents narrative analysis of biographical interviews with ten women who were victims of domestic violence. Intersectionality of different aspects of vulnerability and variety of agency strategies are being analysed. Continuity and dynamics of women’s agency, ranging from helplessness, distancing, manoeuvring and opposition to resistance indicate their everyday practice in coping with domestic violence.

**RN03S01b - General Session II**

**Historical sociology of the biographies of recognized Czech Elites**
Nicolas MASLOWSKI (Charles University in Prague, Czech Republic) | nicolas.maslowski@gmail.com

Since 1860, dictionaries and who's who types publications are proposing list of recognized Czech Elites, presenting shortly their life. We are conducting a research, on the argumentation of their worth that is constituted by these biographies. All those personalities, taken together, are proposing a symbolical system of the profiles that can be taken by the Great Citizens. The changes of contexts, of the technical capabilities, of the political situation are explaining only partly these changes. Our analyses is based on more than 150 years of publications, taking into account around 1500 biographies.

**I wish I could turn back time: Understanding social vulnerability of early school leavers**
Jelena OGRESTA (Faculty of Law, University of Zagreb, Croatia) | jogresta@pravo.hr
Tanja VUČKOVIĆ JUROŠ (Faculty of Law, University of Zagreb, Croatia) | tanja.vuckovic.juros@gmail.com

In today's international economic crisis, various groups confront growing vulnerability. Recent studies have stressed how educational deficits, underachievement and skill gaps among young people are both a cause and effect of unemployment, low incomes and other multiple deprivations and social exclusion. The youth that has dropped out from secondary education are in a particularly precarious position. This group has been at the margins of society even during prosperity, but now their life chances are increasingly shrinking and they face enduring social exclusion. Therefore, we examine a group of young people in Croatia who had dropped out of secondary education. By conducting life story interviews focusing on their educational paths, we pinpointed the critical junctures of these young people's educational (drop-out) trajectories. We also examined how they perceived their life chances and the consequences of their decision to drop out. Our preliminary findings, based on six interviews, suggest a wide array of specific circumstances that, combined with the lack of support in their environment, resulted in these young people's decision to leave the secondary education, which they all now regret. Results illustrate an early school leaving as a process resulting from a complex interaction of factors and emphasize the contextual situations that can truncate educational attainment and work prospects. This study is ongoing, but even these preliminary results, based on life story interviews, outline a complex picture of the cycle of marginality as well as social uncertainty of these young people, that other methods of research would not easily have found.

**Is It All About the Money? Autobiographical Narratives in the Transition to Adulthood**
Filipa C. CACHAPA (University of Lisbon, Institute of Social Sciences, Portugal) |fccachapa@gmail.com

This paper explores the social meaning of adulthood as well as the role of money during the process of becoming an adult. Based on autobiographical narrative interviews from higher education young European students (from Portugal and Italy) it analyzes individual experiences with money throughout life (childhood, adolescence and youth) as a lead to the sociological comprehension of adulthood and financial independence. Variations in 'future plans' as a postmodern experience are analyzed in relation to familiar and social backgrounds and field of studies (Fine Arts, Medicine and Law). This paper aims to contribute to and expand the debate on the application of micro level methods within the course of life and transition to adulthood research.

Biography, ethno-mimesis and emergence in mobile refugee groups
Maggie O'NEILL (Durham University, United Kingdom) | maggieoneill5@hotmail.co.uk

Through arts based biographical methods [ethno-mimesis] we are able to get in touch with emergent phenomenological and affective experiences in ways that connect with the biographical sociological imagination. Drawing upon biographical and arts based research with refugee groups and referencing the work of young film makers this paper asks: to what extent can taking an ‘emergent analysis’ help in ‘working through the past’ in ways that connect to issues of difference, inequalities, democracy and social justice?

RN03S02 - The Process of Transformation in East European Countries in the Everyday Experiences of their Ordinary Citizens - A

Normalisation of precarity? Biographical experiences of young workers with the flexible forms of employment in Poland
Adam MROZOWICKI (University of Wroclaw, Poland) | mrozowicki@gmail.com

This paper explores interpretive practices and life strategies related to the flexibilisation of employment in Poland. The socio-economic background for workers’ biographical experiences and coping patterns can be defined in terms of a shift from the socialist variety of Fordism to the capitalist, neoliberal, flexible labour regime. As of early 2015, Poland was the leader in the EU in terms of the share of employees with temporary contracts. Yet, despite the expansion of precarious jobs, the Polish workers were until recently not too much prone to collectively protest against it. This paper presents an attempt to explain this apparent paradox by analysing the meanings given to the changing nature of employment by workers themselves in the context of their overall biographical experiences. The empirical basis are (24) biographical narrative interviews collected within a mini-research project on non-unionised young (18-29) workers in services in the city of Wroclaw, in South-Western Poland (in 2013-15). The analysis documents some level of “normalisation” of labour market flexibility among young precarious employees for whom instable employment became an important aspect of their “taken-for-granted” assumptions about the shapes of contemporary occupational careers. Simultaneously, the research demonstrates the biographical and social limits of “normalisation of precarity” and suggest that the “disenchantment” with flexibility can (in some cases) contribute to greater support for various collective counter-movements (K. Polanyi). In the paper, both the
normalisation and disenchantment with the effects of labour market flexibility are discussed with the reference to selected biographical cases.

**Systemic transformation "loosers" – biographical experiences of social welfare clients in post-industrial Polish city**

Agnieszka Golczyńska-Grondas (University of Lodz, Institute of Sociology, Poland) | agrondas@uni.lodz.pl
Malgorzata Potoczna (University of Lodz, Institute of Sociology, Poland) | matmalmar@poczta.onet.pl

Since 1990, the sociologists from the University of Lodz have been conducting multidimensional analyses of poverty and social exclusion. In 1998-1999, within the framework of two projects, “The Social Cost of Economic Transformation in Central Europe - Social History of Poverty in Central Europe” and “Forms of Poverty and Social Risks and Their Spatial Distribution in Lodz”, 40 family life histories with 3 generations of the families supported by social welfare agencies were collected. In Polish People’s Republic the narrators from the generation named as „the basic” (40-50 years old) belonged to (lower) working class and represented the collectivity of socialism beneficiaries; at the moment of the research they were experiencing traumatic trajectories of unexpected impoverishment resulting i.a. in specific coping strategies. In our paper we will come back to the data from 1990. and discuss biographical experiences of the “basic generation” narrators within the context of their understanding of transition process. Some information regarding the analysed sample on the basis of follow-up project conducted in 2008-2010 will also be presented.

**The 'transition to democracy' in biographical perspective**

Ina Alber (University of Göttingen, Germany, Herder-Institute for Historical Research on East Central Europe) | ialber@uni-goettingen.de

The changes of 1989-91 have often been interpreted and remembered as the “transition to democracy” (Linz/ Stepan 1996) or the victory of civil society in Western scientific discourse. The hegemonic discourse states that transition to democracy and a vivid civil society are something morally good – that could either be reached or not. But on which and whose experiences are these narrative patterns based?

In my approach using discourse analysis in the tradition of the sociology of knowledge (Berger/ Luckmann 1967, c1966; Keller 2012) and biographical research (Rosenthal 2004) I am interested in the interdependency of discourses and biographers in creating these narrations. Generally, I would like to argue that the hegemonic discourse has influenced and shaped the (collective) memory about the transition/transformation processes. However, collective memory is not only constructed by discourse, but also by social actors (‘ordinary people’) who through their everyday acting reproduce and transform these discourses. The way in which they do this is influenced by their biographical experiences. The questions I would like to discuss in my paper are: how do people who are engaged in democracy promotion today remember and interpret this period of time in their biographical narrations? Which biographical significance does the “transition to democracy” have in their memories? How do they narrate the transition? And do they offer an alternative, non-hegemonic contribution to the scientific discourse? Analysing these questions I would like to draft a theoretical generalisation on the interdependency of discourses and biographies.

**From ‘kolhozniks’ to ‘riabs’. The reconstruction of the identity of post-socialist farm workers.**
The aim of the paper is to present changes of workers identity which were caused by transformations in post-soviet farming. The dissolution of USSR brought farming in Kazakhstan, its former “eastern granary”, into deep crisis. Most of state farms (‘sowhoz’) disintegrated while only some of cooperatives (‘kolhoz’) survived, though faced financial problems for long. In the farm I conducted research the relative economic success of the company was accompanied by feudalization (Verdery 1996) of economic relations. Nowadays this kolhoz is a privatized company which pays a substantial part of wages in form of commodities which makes the survival of workers possible thanks to keeping livestock in small homesteads. Moreover, finding a job outside agricultural the sector (e.g. in cities) is challenging for former kolhozniks due to lack of ability to speak Kazakh language. Thus international migration is often perceived as the only way out of this uneven power relations.

My aim is to show how current transformations are understood in peoples narrations and how they shape their identities. What strategies do farm workers use to maintain their self-esteem and the sense of agency in spite of the changes, which degrade them almost to the status of serfs? I will also present main differences in narrations between those who left the farm and those still living in Kazakhstan. The basis of the paper is analysis of biographical interviews with former members of four cooperatives (now merged into one company) made in northern Kazakhstan as well as in Poland, Russia and Germany.

RN03S03 - Marginality and Social Exclusion in Biographical Research

Paradoxes and Traps of the Transnational Mobility Porcess. “Wasting” of One’s Biographical Capital and Potential of Marginalization
Katarzyna WANIEK (University of Lodz, Poland) | k.m.waniek@gmail.com

The paper aims at exploring situations that are supposed to “add” to one’s biographical development, but paradoxically lead to disorientation and biographical traps in one’s life history; i.e. expected “enrichment” of one’s biographical experience (for instance gained abroad or at home country academic title or gathered professional experience, improved language fluency (i.e. cultural and social capital) cannot be used in another country because they are (usually unfairly) defined as “too poor” (also “too good” – that is usually treated as some sort of a threat to the existing “status quo”). The finding to be presented are based on an in-depth analysis of autobiographical narrative interviews (Schütze 1981, 1983, 1984; 2012) with individuals who have temporarily or permanently resided (work and / or study) in another European country and who either in a receiving country or after returning their home country wished to accomplished their biographical plans, but were not able to. It would be claimed that although (as Park argued) they become individuals with the wider horizon, the keener intelligence, the more detached and rational view-point and are relatively more civilized human beings (Park, 1961: xvii-xviii), their loyalty becomes doubtful and their knowledge too “vague” to be taken seriously or too good to be taken fairly. Therefore, instead of starting successful careers they become marginalized and usually suffer.

The role and relevance of migrants’ biographical experiences for the meaning-making of the meeting with the Danish welfare state
Barbara FERSCH (University of Southern Denmark, Denmark) | fersch@sam.sdu.dk
Karen N. BREIDAHL (Aalborg University, Denmark) | knb@dps.aau.dk

In the context of our research project, qualitative interviews with migrants in Denmark have been collected that on topics like the migrants’ experiences with the welfare state programs and their interpretation of them. Additionally we have encouraged the interviewees to include topics from their own biography in their narration. Concerning the choice of interviewees the logic of “maximizing differences” (Glaser & Strauss 1999) has been applied – i.e. migrants with quite different backgrounds have been interviewed. Thereby, one aim was to get a grasp on the role and relevance of their different biographical experiences for the meaning-making of the meeting with the Danish welfare state. In this paper we are focusing on this question – what role do their particular biographical experiences (like the experience of societal transformation processes in countries in the case of the Ukrainian and Hungarian interviewees or the severe economic crisis in the case of the Greek interviewee) play for the individual interpretation of the welfare state in their host country? In our analysis it becomes clear that the interviewees use the diverse biographical experiences from their country of origin as a “contrast foil” for the new experiences and, despite their diverse backgrounds, reach to similar conclusions about the Danish welfare state.

Going beyond standard categories and routine thinking: understanding crisis through the lens of biography
Antonella SPANÒ (Università degli Studi di Napoli Federico II, Italy) | spano@unina.it
Markieta DOMECKA (independent, UK) | markieta.domecka@gmail.com

In the paper we will demonstrate how biographical data and analysis help us to go beyond standard indicators in order to discover differences within seemingly similar social categories and explain the different ways of acting people choose confronting the crisis. On the basis of the empirical material (autobiographical narrative interviews) recently collected within the PRIN project, Sustainable Practices and Everyday Life in the Context of Crisis, we will show how differently life is constructed by young people living under the conditions of crisis in the south of Italy. In the project, the rich biographical data and meticulous analysis allowed us to go beyond the ‘objectively similar’ (is a sense of similarities in age, gender, educational attainment and life context) and to prove the crucial role played by biographical work and sociological imagination in overcoming the crisis conditions and finding one’s place in the world. Biographical work is understood here as the capacity to reflect upon one’s life in order to establish and re-establish ultimate meaning for one’s existence, for everyday life situations and significant social relationships. When biographical work is combined with sociological imagination, understood as the capacity to link one’s life situation with broader social and political processes, it results in better understanding of reality, which is then decisive for self-understanding, identity construction, orientation and planning. We do not ignore here the amount and type of capital possessed but we argue that the use of resources is conditioned by additional biographical skills, which are crucial for defining and pursuing one’s life projects in spite of the negative potential of macrostructural crisis. These processes will be demonstrated empirically through comparative case analysis.

Belonging at the Margins of Society: How do the Long-Term Unemployed tackle Experiences of Exclusion and create Belonging?
Marliese WEISSMANN (SOFI Goettingen, Germany) | marliese.weissmann@sofi.uni-goettingen.de
My proposal addresses the question of belonging regarding a group which is typically considered with respect to its experiences of social marginalisation and exclusion: the long-term unemployed. In contrast to previous research, I draw attention to their active efforts to be included and to belong to society, while ‘objectively’ being excluded from employment as a paramount form of individuals’ societal integration (Vergesellschaftung). How do they find ways to participate in society and create belonging? Which social fields, practices or affiliations do they conceive as important? What are their individual strategies of inclusion? The paper presents typical subjective modes of inclusion and examines how they are related to biographical processes, experiences and resources. The study is based on biographical narrative interviews with German welfare recipients, conducted within the project “Worldviews in Precarious Conditions of Life” funded by the German Research Foundation (DFG). The analysis, using the Grounded Theory and Objective Hermeneutics (Oevermann) methods, reveals that the stigmatized actors’ inclusionary efforts serve as identity claims and take on different forms. Some unemployed emphasize normality in their everyday life practices, while others stress uniqueness by e.g. engaging in virtual spaces or communities. Therefore they refer to various biographical resources as social or cultural capital. Moreover, I can demonstrate that enduring dependency on helping institutions corresponds to the subjects’ expectations that these institutions create and should create their societal belonging.

RN03S04 - Online/Virtual Biographies

Doing biographical research – ethical dilemmas in changing social contexts.
Kaja KAŻMIERSKA (University of Lodz, Poland) | kajakaz@uni.lodz.pl

When biographical research started rapidly developing in recent decades of 20th cent. ethical problems of biographical interviewing were focused more on the very relationship between a narrator and interviewer, the promise of anonymity and methodological responsibility. Nowadays in times of digital archives, interdisciplinary approaches, great popularity of narratives in public discourse as well as changes in social definitions of public vs private spheres, biographical researchers must face ethical problems going far beyond methodological aspects of used tools or collected data which status may also change in time. In my presentation I would like to comment on all these issues referring to my research experiences.

Video-recorded essays: interaction between the imaginary and the biographical
Lyudmila NURSE (Oxford XXI, United Kingdom) | lyudmilanurse@oxford-xxi.org

Technological advancements of the 21st century in digital recording, gadgets and accessibility of camcorders not only provided a new variety of qualitative methodology (Shrum, W., Duque, R. & Brown, T. (2005), but also increased the variety of documentary information on the life experience of individuals. An increasing number of those video-recorded auto-biographical essays could be regarded as sources in biographical research. Video-recorded essays by transnational migrants are materials that enable exploration of complexity and dynamics of their identities. To a large extent these self-identifications are deeply rooted in cultural memories and practices which make sense in a strictly time-dependent, contextualised environment of the political discourse in which the real lives took place; video-recorded self-identifications therefore offer more than merely biographical narrative for analysis and interpretation. In my comparative analysis of the video-recorded essays and video-recorded biographical narrative of a European transnational migrant artist I argue that when research materials involve video-recorded essays of transnational artists we should consider the imaginative material in which the artist’s
biography “acts” first as means of artistic (imaginary) expression and secondly as a “documentary” source.

**Migrants at the ordeal of “bidonvilles” in France. Biographical consequences of a residential experience**

Margot DELON (Sciences Po - Paris, France) | margot.delon@sciencespo.fr

In this presentation, I will focus on “bidonvilles” (slums), a residential experience known by many migrants arriving in France in the 1960's. Since bidonvilles have recently known a renewal with the arrival of migrants from Romania and Bulgaria, it seems relevant to look at the biographical consequences of such an experience of marginality for the previous "children of bidonvilles", namely people of migrant origin who spent a significant period of their youth time in slums. To do so, I will analyze the effects of three main factors:

- familial strategies and trajectories, anterior and posterior to the bidonvilles experience
- national and local political contexts
- contemporary patterns of sociability in their interplay with memory dynamics

In this perspective, I will distinguish between three types of trajectories and memories, drawing the boundaries of three distinct groups. For some migrants, living in slums had little consequences on their later lives, while for others, it had long lasting and negative ones. For a last group, bidonvilles’experience seems to have had short but nonetheless negative consequences. For each of these groups, I will describe and analyze the effects of this residential experience, looking at both patterns of trajectories and memories.

Empirical materials are from an ongoing PhD research in the cities of Nanterre and Champigny-sur-Marne, that both hosted bidonvilles after the Second World War. It includes in-depth interviews with 60 previous inhabitants from Portuguese and Algerian/Moroccan origins, ethnographic data and various written sources analyses.

**Media and Mobility: (new ) portraits of departure and arrival**

Emília Araújo ARAÚJO (University of Minho, Portugal) | emiliararaujo@gmail.com

This paper aims at examining the role that broadsheet media – mostly on line newspapers - have been having in narrating the more recent mobility flux of Portuguese towards other countries of Europe and other continents. Additionally, the paper aims at showing until hat extent and trough what processes and mechanisms national identities, as well as individual decisions to emigrate or move to another country can be influenced by mainstream narratives on the phenomenon. The authors take into consideration literature on migration, mobilities and media studies. Developing a methodological strategy based on critical discourse analysis of international mainstream media, the authors sustain that media tend to follow through a dramaturgical narrative describing current mobility flows from Portugal following a line or argumentation which is deep-rooted in colonial and imperialistic frames of representation. The paper presents some insights concerning the role the same media may have on portraying individual images about other European countries.

**RN03S05 - Biographies of Work and Working Lives**

Biographical narratives on habitus transformations – Migrant industrial workers and transformations of the stranger
Lars MEIER (Institute for Employment Research (IAB), Nuremberg, Germany) | lmeier@ifs.tudarmstadt.de

Migration is also to bring in biographic and social identities that are inscribed into the habitus (Bourdieu 1984). The feeling to be a stranger is also connected with having an unsuitable habitus. Former experiences leave their traces also in the body, its sense and in unique bodily actions. But these traces are tested and transformed with new everyday activities in a new setting. Encountering a host country is a challenge on the level of everyday life and it is also a challenge to make suit oneself to the needs of a new working place. I want to analyse ways the habitus of migrants is transformed by encountering a new working sphere and a new urban realm on the example of migrants working in the industrial sector in Nuremberg (Bavaria). Working in industry means also to make oneself fit into a place with specific rules, like work regulations, time rhythms, new colleagues or challenges for the body. For those growing up in a family with a tradition of industrial work, this is a less demanding task than for those without a family background in industrial work. In the early stage of industrialisation, the task to adjust oneself to the rules of industrial work was hard for those who had migrated from rural agricultural areas. But this requirement also had to be met by those migrants and refugees who had arrived in Nuremberg since the 1960s, for example from rural areas in Kurdistan. Based on biographical interviews such transformations of the habitus and of being a stranger are examined. Starting to work and being included in the workers community also means to adapt one’s habits, the bodily practices and other elements of everyday activities to the new demands. By doing so, identities are transforming, from a rural farmer to an industrial worker. My presentation will demonstrate migrants feeling of being a stranger (G. Simmel) in Nuremberg is shifting together with transformations of the habitus.

Clients, Norms and Egos: Constructs of Professionalism in Autobiographic Narratives of Russian Lawyers
Rafael MROWCZYNSKI (Institut für Kulturwissenschaften, Universität Leipzig, Germany) | rafael.mrowczynski@uni-leipzig.de

The paper presents the first findings of an empirical study of practicing lawyers who consult and represent individuals or legal entities in Russia. It is based on autobiographic narrative interviews with advocates, in-house lawyers and “private-practice lawyers” from three different regions of the country and from two different generations—those who started to practice during the Soviet period and those who entered the professional field only after the collapse of the USSR. The aim of the analysis is to develop a typology of ways how interviewees construct their self-conceptions as legal professionals when narrating their biographical experiences in a period of societal, political and economic transformations. A combination of the grounded theory (Glaser & Strauss), the narrative analysis (Schütze) and the documentary method of interpretation (Bohnsack; Nohl) was used in the process of data analysis. Three different constructs of legal professionalism are identified in the analyzed narratives: a client-centered one, a norm-centered one and a self-centered one. These three types are described in detail based on twelve cases which were selected for in-depth comparisons from a pool of 44 interviews. In conclusion, it is hypothesized that the client-centered type is on the rise among the post-socialist generation of legal practitioners.

Social workers’ views on biographical approaches
Johanna BJÖRKENHEIM (University of Helsinki, Finland) | johanna.bjorkenheim@helsinki.fi
The empirical data for this paper consist of 16 essays written by social work practitioners attending a piloting course within the EU Leonardo project INVITE in 2005-2006. The essays were analysed using content analysis. The work fields represented were psychiatry, rehabilitation, addiction treatment, gerontology, pre-adoption counseling and vocational education. In the essays, the respondents reflected on the use of biographical approaches in their practice.

In discussing the use of biographical approaches in professional practice, two levels of approaches can be distinguished: first, specific techniques for eliciting and analysing users' biographies and second, a general holistic attitude, ‘biographical lenses’. In social work, strict biographical narrative interviewing, as done in research, is seldom possible or even necessary. However, more interactive thematic biographical interviewing was found to be productive and promote biographical work. According to the respondents of the study, biographical approaches provide spaces for users’ reflection and social workers’ listening and deepen the understanding of users’ life situation. Biographical interviewing is often performed in, for example, psycho-social and work capacity assessments. Biographical approaches can also be used as tools for service users to change their life situation. In addition, the use of biographical approaches was seen to affect the social workers’ views of their own professional role and strengthen their professional identity.

The challenges in using biographical approaches pertained to the user/social worker relationship, ethical considerations and the prerequisites for working with service users’ life stories.

**Between social exclusion and social recognition. Analysing biographies of welfare recipients becoming self-employed.**

Lisa ABBENHARDT (Ludwig-Maximilians-University Munich, Germany) | lisa.abbenhardt@soziologie.uni-muenchen.de

In my presentation I want to focus biographical experiences and coping strategies of long-term unemployed people who aim to overcome the risk of social stigmatization and exclusion by becoming self-employed.

Since employment is one of the central vehicles for social recognition and societal participation, being unemployed can have massive consequence for individuals, such as social exclusion and defiance. Especially when people are long-term unemployed and depending on welfare benefits it is likely form them to become socially isolated due to their limited financial means and probably even more due to the stigmatizing effect of being a welfare recipient. The labour market reforms in Germany at the beginning of the 20th century intensified the stigmatizing effect for welfare recipients insofar as the responsibility for unemployment was increasingly communicated as an individual rather than a social failure.

Becoming self-employed can be a strategy for long-term unemployed people to avoid social marginalization through stigmatization but at the same time it implies an enormous risk of facing (another) failure. Referring to biographical interviews conducted for the research project “Between self-employment and social welfare. Analysing ‘Einstiegsgeld’ a public aid for business start-ups”, I want to reconstruct how individual meanings of work and societal expectations come to effect in the aim of becoming self-employed. Doing that, the contradictory influence on individuals of social welfare institutions on the one hand and market demands on the other hand should be analysed.

**RN03S06 - Biographies of Performativity, Healing and Belonging**
Speaking Through Silence. Working with Paradox in Buddhist Biographies.
Thea D. BOLDT (Kulturwissenschaftliches Institut, Essen, Germany) | thea.boldt@kwi-nrw.de

The 19th century saying states, that when speech is silver, silence is golden. Whereas narrative accounts are at the empirical and theoretical focus of biographical research, there is still a limited knowledge about the meaning of silence in the biographical reflexion. The paper encounters this question on the example of people in the West, who has been introduced to buddhist meditation technics, in which learning how to be silent is crucial. Drawing from these experiences, the paper examines the role of silence in the biographies of Western Buddhists as well as the paradoxical issue of speaking through and about silence.

“Memory of Time” and “Social Embodiment of Violence” in Serbian and Italian gender relationship
Ignazia Maria BARTHOLINI (University ofo Palermo, Italy) | ignazia.bartholini@unipa.it

The contribution has the aim to analyse the phenomenology of violence in intimate relationships and in proximal relationships of second generations post-conflict in Serbia and comparatively in Italian generations of adults and young people. The intersectional perspective allows to identify elements of continuity between the “Memory of Time (M.T.)” as "long" and "short" durée and some practical aspects in production and re-production of the "Social Embodiment of Violence" (S.E.V.) in the gender-based relationships. “S.E.V.” has different characteristics in “M.T.” of Italian people or in “M.T.” of Serbian and Bosnian populations crossed by the 1990s war. This proposal analyses the effect of “M.T.” as “durée of Bergson” into a “S.E.V.”, identifying the elements of continuity and discontinuity in violent relationships among adults and young trough narrative interviews to sample of 40 adults and young people of these different Countries. The intersection between “S.E.V.” and “M.T.” permits a different definition of the categories and “action fields” of the violence. The effects of “M.T.” as durée (diachronic time) and the crystallization of “social embodiment of violence” in intimate relationships or in peer relationships becomes essential for an heuristic analysis of violence in Eastern and Western Europe. The interconnection of the two concepts allows to define a complementary tool for more wider understanding of phenomenology of violence in a comparative perspective between Italian people - that has a “Past Memory” of the Second World War - and the people of ex Yugoslavian that has a most “Recent Memory”- of the 1990s conflict.

Ideology of talent and the lives of artists
Piotr SZENAJCH (Polish Academy of Sciences, Poland) | piotrszenajch@gmail.com

This paper aims to present one of possible solutions to the problem of how C. Wright Mills’ famous appeal can be answered today: how sociologists can try to inseparably grasp ‘the problems of biography, of history and of their intersections within social structures’ while developing a palpable sociological object. My research project confronts life stories of renowned visual and performance artists with a genealogical critique of contemporary, individualistic language used to describe human abilities and achievements. This language was considerably inspired by concepts deriving from the reflection on art of the Enlightenment and Romanticism (such as ‘talent’, ‘genius’, ‘gift’, ‘taste’ or ‘expression’). Now commonplace, this idiom has its role in supporting social reproduction, especially within educational systems, where pupils are today still judged as ‘talented’ or ‘untalented’ – a
distinction which seems to be sustained by quantitative testing, competitive selection and tracking practices, and at the same time parallel to class differences. Nevertheless, this individualistic language played an emancipatory role in defending the development of the artistic fields within the European bourgeois societies from the XIX century onward.

The art world is a field of research particularly well suited to show how life histories, perhaps especially in elite milieus, are entangled in and influenced by both history and social structures – also in ways further from the familiar meanings of these words. For instance, a scholar studying the art world should take into consideration the structural and relational aspect of the field of cultural production (as described by Pierre Bourdieu). Likewise, the previous states of a local field should be taken into account, as well as the memory of the field’s self-reflection. However, an artist’s life can be influenced even more by the history of artistic work itself.

To grasp this influence, I have employed an interpretation of modern art as a discourse in the Foucauldian sense. Art can be perceived as a multi-generational discussion, a dialectic of gestures, attitudes, forms and practices, in which a work of art constitutes a further step (or a next move), gaining significance in relation to the previous ones. One can reconstruct its lineages of inspiration, development, gradual modifications, as well as recognize its ruptures, irregularities and contingency. Thus defined, the discourse of modern art has invariably shaped and re-shaped the artistic field.

There is another important aspect of the discussed artists’ life stories that I provisionally label with the category of ‘trajectory of subjectivation’ – to underline the multidimensional aspect of the biographical path of an artist: through social strata and social worlds, positions within the artistic field, discursive formations of modern art and, finally, understood as individuation or development of subjectivity.

In my paper I would like to focus on a series of concepts that I have developed, stemming from this initial interpretative model. These concepts are a secondary result of a ‘thematic’ analysis of my interviews. They helped me name and describe certain particularly interesting elements of what my interviewees had told me. Therefore, they are rooted in a certain theoretical tradition (of French political philosophy and social sciences), as well as in a detailed analysis of the interview material. I use them to describe perhaps the most mysterious moment of the biographical path of distinguished artists: the stage of entering this path of subjectivation, which can be observed in the early stages of the life histories of my interlocutors.

The notion of an ‘initiator’ serves me to characterize a figure (discovered in many of the interviews) whose influence strongly led certain interviewees of mine to develop an interest in high culture and the discipline of modern art. Encountering an initiator opens up a new world of possibilities: life choices, strategies of career, acceptable ways of building a life for oneself, spending time, experimenting; it also broadens the horizon of one’s imagination. These options were not necessarily easy or intuitive from the social starting point of the individual.

The ‘initiator’ is usually a clearly understood significant figure in the life stories of my interlocutors. However, I have also come to understand that it is not a single person that ‘initiates’ an interest in art, but rather an entire network of heterogeneous actors that interact with an individual while constituting his or her environment. That is why I made an attempt to describe this phenomenon from the standpoint of the Actor-Network Theory and, even more productively, by referring to the original concept of rhizome by Gilles Deleuze and Felix Guattari, that inspired the A.N.T. authors.

With the metaphor of ‘infection (with discourse)’, I attempt to describe a clearly remembered moment in the life history when an artist encounters contemporary art for the first time (as the event was related in a number of my interviews and pointed out as very important). The term ‘infection’ would suggest that this first encounter is a brief moment (like when a sneeze transmits the virus of flu). However, if we take into account the scholarship on
socialisation, social reproduction, educational environments, etc. – this stage seems less to be a moment, but rather a longer process. That is why the metaphor of ‘incubation’ is, perhaps, more fitting. It underlines continuity, over some period: from the moment the first microbes of the ‘virus’ of the current, recognized contemporary art are injected into the ‘organism’, that is, become attached to the initiating rhizome until the patient develops ‘symptoms’ – artistic work rated as valuable.

I believe that these metaphors, that I will attempt to elaborate upon using the language of the field theory, the theory of Foucauldian discourse analysis and Actor-Network Theory, can prove helpful in studying life histories shaped in other professional environments.

Suitcase of Survival SOS
Jane Louise ARNFIELD (Northumbria University, United Kingdom) | jane.arnfield@northumbria.ac.uk

Live witness testimony is an integral tool to accessing further testimony. Working with host, testimonial witnesses seeking to uncover new and engaging ways to demonstrate how testimony can continue to have a living presence through a series of surrogates. Through physical and intellectual exercises Suitcase of Survival investigates and excavates how resilience is formed and how resilience is maintained. The work of SOS depends on defining core values - personal, individual core values which contribute to building of personal resilience, helping both the development of the individual and the individual operating with a group. Utilising drama based approaches, the participants activate a personal opportunity to reflect on their life, explore their own decision making and construct or deconstruct their one value systems with the single aim of developing and nurturing themselves as active citizens - as citizens of activism. The multimodal creative programme Suitcase of Survival not only provides participants with the tools to meet the challenges and responsibilities of active citizenship and an awareness of global communities but its themes provide a fertile ground for innovative art making. Central to Suitcase of Survival (SOS) is the exploration of memory and personal history, diversity, human rights, empathy, identity and interdependence.

RN03S07 - Biographical Perspectives on Cultural Diversity

Collective memory and identity through life stories of different generations of Russians in the Czech Republic
Tatiana KOSYAEVA (CERGE-EI, Czech Republic) | eva-sib@mail.ru

This research in progress is based on interview-in-depth and participant observations within Russian diaspora in the Czech Republic since 2006. I also employ Critical Discourse Analysis of local Russian-language mass-media and other diaspora-related publications.

This study aims to track life-stories of representatives of different generations of Russian-speaking diaspora in the Czech Republic, seeking to shed light on their varying understanding of ethnic identity.

Collective memory forms the basis of any collective identity such as ethnic identity, and national identity. I use a concept of distributed version collective memory due to Wertsch (2002), who writes: "The distributed version of collective memory assumes that a representation of the past is distributed among members of a collective".

In this paper I will present the life stories that are most representative for different generations: “children” of the first post-revolutionary wave of immigration out of Russia, “wives” coming in 60-70es, “professionals” moving in in 90es, and “students” of 2000es.
"Sacred curriculum vitae" in the in the postcommunist times. The biographies of the contemporary Siberian shamans.

Wojciech POLĘC (Warsaw University of Life Sciences SGGW, Poland) | wpolec@wp.pl

The crucial problem for the contemporary Siberian shamanism after the break of tradition in the communist times was the lack of shamans and the lack of the knowledge about the tradition. The interruption of the tradition is usually interpreted in frames of the “clerical” or “ecclesiastic” interpretation, it means the main problem is the discontinuity of the shamans’ teaching. The transitory period was hard because “supply did not match demand” for shamanistic practices and rituals, there was the problem of the “proficiency” of shamans, the level of their knowledge, renown and reputation.

Every shaman is considered as exceptional person and he must have an exceptional biography. The shaman biography should be “standardized” in the sense of having a traumatic episode (e.g. an illness, an accident) and other typical for the “model of shaman” life events needed for creating the “sacred curriculum vitae”.

Taking into account the communist ideology claiming that the last “true” shamans stopped their activity in the thirties of the twentieth century, many people were suspicious about the “authenticity” of the contemporary shamans. One way of solving this problem was the claim that “somewhere else” the true shamans have survived, that there was easier to preserve the true shamanism (and survive the persecution) for instance in Mongolia.

Another solution was the creation of formal organization of shamans, which can contact authorities at various levels and can try to expose impostors, “false” shamans in a diverse society, in which the only traditional social control ceases to be sufficient.

Siberian identity in the biographical narratives of the descendants of Siberian exiles.

Alla Aleksandrovna ANISIMOVA (Novosibirsk State University, Russian Federation; Far Eastern Federal University, Russian Federation) | alla.anisimova@inbox.ru

Being based on the narrative analysis of biographical interviews with children and grandchildren of Stalin-time exiles (“kulaks”, ethnic Germans from Volga region, prisoners of the World War - 2) and descendants of pre-soviet period exiles to Siberia, conducted in 2014 in Tomsk (Siberia), the paper explores the peculiarities of their "versions" of Siberian identity.

The ways of the Siberian identity formation, its content (self-descriptive concepts and ways of their interrelating in the course of "biographical work"), as well as it's "scale" (regional or local) are in the center of the analysis. The paper provides a number of versions of Siberian identity along the dimensions mentioned above and explores complex interrelations between the “version” of identity of the narrator and the family story of exile as a part of her/his individual biography.

The paper also attempts to draw comparisons (based on the previous study of Siberian regional identity conducted in three Siberian cities (Omsk, Novosibirsk and Irkutsk) in 2012) between identity formation and content of exiles’ descendants and that of Siberians who do not have exile as an episode of their family story. For instance, the results of the study demonstrate that unlike “not-exiled” Siberians the children of exiles less tend to share so-called “soviet” identity.

Different model of collective memories in post-soviet region. Case of Polish minority in Ukraine
Solidarity is a base to create thinking about another people like “my compatriots”. But in different historical region, as in case Ukraine, some differences have deeply consequence for minorities: for their individual self and whole community.

During the process of transformation this regionally features have a great means in process of development the society as a whole.

In my research from summer 2014 I was trying to find general community features, collective ideas and practice in commemoration historical fatherland (Poland and polish influence in Ukraine). And in general I can use few rules and request:
- Local society in Ukraine have often very individual memory practice
- Polish minority history is reinterpreted in a way that almost the same as among Ukrainians
- In means of local identity, activity vary considerably as over in Ukraine. I would like to tell about it in the point of view my research.

**RN03S08a - Creative Applications of Biographical Research: Telling Ordinary Stories of Everyday Lives I**

‘Snowed in!’: offbeat rhythms and belonging as an everyday practice

Julia Margaret BENNETT (Manchester Metropolitan University, United Kingdom)

Using elements of Lefebvre’s rhythmanalysis to interpret a diary written during a week of snow in north west England (a relatively rare event), I will illustrate how belonging is created through the activities of everyday life, such as being a neighbour or a grandparent. The diary was written, and accompanying photos taken, as part of a larger research project into senses of belonging of those who have remained living in one place all their lives. Repositioning the ‘sense’ of belonging as an activity with tangible consequences brings with it associated responsibilities for neighbourhood and the people who live there, including children and grandchildren. Belonging is usually seen as a taken-for-granted, and perhaps ill-defined, aspect of everyday life. Using the voice of the participants through written diaries shows instead that belonging should be recognised as an active and everyday practice, creating and recreating relationships and an associated ethic of care between people, place and history.

"I have a story to tell and I need to somehow help others by telling it" Living with HIV/AIDS and the usefulness of life histories as an educational tool for the wider community.

Andrew DALTON (University of Sunderland, United Kingdom)

Working alongside the local HIV/AIDS support charity; Body Positive North East, and with funding from the National Lottery: Awards for All scheme, Drew Dalton is undertaking the first known life histories approach in order to document the experiences of people living with HIV in the North East of England. This project aims to document (but is not limited to) people’s experiences of childhood, stigma, parenthood, status disclosure, HIV transmission emotions and mental health as well as respondents hopes for the future. So far, 14 respondents have
been interviewed and the project aims to interview 20 in total with a completion date (for interviews) set for 2015.

The aim of this conference paper is to highlight the issues and complexities which I have come across so far with using biographical research methods when interviewing people living with HIV; as well as casting light on some of the difficulties people who live with HIV face within the North East as they live day to day lives with their status. After some initial analysis, this method and research has led to questions of safety, security, identity and the difficulties in discussing HIV in an area, and a much wider society within the UK, where HIV has ‘fallen off the radar.’

This climate of 'HIV silence' has posed unique questions as to whether educational campaigns are effective and widespread enough amongst the public.

Key to this conference paper is the exploration of the emerging themes of concept of ‘having a story’ to tell to others and the ‘need for education’ around HIV/AIDS for young people. This paper will address the usefulness of a life histories approach in contributing to HIV/AIDS awareness amongst both young people, practitioners and the wider community.

“Life in two parts” – An inquiry about migration in and through a theatre play in Sweden and Serbia

Erica RIGHARD (Malmö University, Sweden) | erica.righard@mah.se

This presentation links arts-based research with social science. It draws on a theatre play, “Life in two parts”, that narrates the biographies of two persons. The play tells about their life stories from childhood up until today, which involve, in different ways, migration between Sweden and Serbia/former Yugoslavia. As the play goes on, it gradually turns clear that the two actors are also man and wife, and that they are playing their personal life stories. The piece is a one-act play and the actors create close contacts with the audience. It ends with the question “What do we tell our children?” [about ourselves] and an invitation to the audience to have soup and bread and share their life stories with the actors.

The presentation focuses on migration in the Swedish-Serbian context, and in particular on tacit and implicit knowledge about, as well as on emotional and embodied experiences of, this. It builds on field notes taken during the preparation and the set up of the play, and during audience conversations, in Sweden (2013, 2014) and Serbia (2014, 2015), with empirical focus on the actors, the audience and the interaction between the two. Relying on arts-based methodology in a transnational societal context, the analysis seeks to contribute with tacit forms of knowledge about migration, as this is manifest and experienced in its varying forms in the everyday life of individual migrants and non-migrants in both the sending and receiving context.

Filming My Parents: Methodological Challenges of Visually Documenting Domestic Intimacy in the First Months of Retirement

Ileana Gabriela SZASZ (National School of Political and Administrative Studies, Hungary) | ileanaszasz@gmail.com

How do two people, who spent over twenty five years working in the same state controlled enterprise, cope with the retirement moment? After three years of rejected retirement applications, a sixty years old couple finally got the answer they so much hoped for. The research is based on a visual documentation which looks at the reactions, the daily activities, the thoughts and feelings that emerge in the first months of retirement of my parents. What happens to the time they used to spend at their job? Is this experience the reword they were hoping for? Their stories about the efforts they've made to keep a job in the past decade and the openly expressed desire to start this new stage in their lives are in strong contrast with the
way they manage time and activities. The discourse about an idealized projection of retirement shifts towards resignation.

Unraveling the pedagogical role of educational practitioners through lived experiences of youngsters
Caroline JANDEKINDEREN (Department of Social Welfare Studies, Ghent University, Belgium) | caroline.vandekinderen@ugent.be
Rudi ROOSE (Department of Social Welfare Studies, Ghent University, Belgium) | rudi.roose@ugent.be

This paper draws upon a research project in Ghent, a city in Belgium, in the context of the system of part-time vocational education and workplace learning (PVEWL). This system is confronted with many challenges with regard to disadvantaged youth, as illustrated by the high truancy rates and unqualified drop-out. Although these rates give an idea about the kind and extent of the problems, they say nothing about which initiatives are set up to work with these young people, nor about the underlying logics of these practices. Based on the theoretical framework of the Capabilities Approach, developed by Sen and Nussbaum and the methodological perspective of the life world orientation, a biographical research was set up in the context of the PVEWL system to explore the educational career and lived experiences of disadvantaged youngsters about what they have reason to value in relation to policy and practice. In our findings, we link endogenous aspirations and concerns of youngsters in the system of PVEWL with exogenous dynamics at play in the system. The vital issue at stake is the pedagogical role of the practitioners in the system of PVEWL while they shape the relationship between the youngster's aspirations and society's expectations. This role balances on the tension between emancipation and control, engaging with the life world of students and supporting them on an individual level while at the same time keeping open the discussion on the structural dimensions of social problems and the broader social and political context in which practitioners operate.

RN03S08b - Creative Applications of Biographical Research: Telling Ordinary Stories of Everyday Lives II

Communicational and Integrative Function of “Radio Majdanek” in Nazi Concentration Camp Prisoners’ Accounts
Łukasz POSŁUSZNY (Adam Mickiewicz University, Poland) | posluszy.lukasz@gmail.com
Joanna POSŁUSZNA (Maria Curie-Skłodowska University, Poland) | joa.posluszna@gmail.com

"Radio Majdanek" was an experimental form of sustaining social life and communication among inmates of Majdanek concentration camp. Institution of the radio was reconstructed by a group of prisoners, who only with a power of their voices and imagination, without the use of antennas and equipment, broadcasted programs on live. In presented auditions they talked about the situation in the camp, gave pieces of advice concerning survival, but also shared news about fashion, played concerts, read books, and had educational discussions on various topics. The main objective of the radio was to provide prisoners with the opportunity to focus their thoughts on positive aspect of life, and at the same time to distract their attention from the cruelty of everyday life in captivity, which could have easily led to demoralization. It was a form of opposition to the merciless of torturers, and the futility of camp life.
How did these activities restore faith in a human being, integrate groups, and fight hopelessness and apathy? To which point radio was also a form of clandestine struggle and resistance, and how irony, satire, and ridiculing torturers helped in breaking free from the paralyzing fear? Despite the fact radio existed only for the period of few months, it gained much popularity among inmates, and has left the trace both, in biographies of its creators, and the audience. Since the only data related to this extraordinary phenomenon is kept in prisoners’ accounts, presentation will be based on biographical materials only.

Interaction of Personal and Social within the Lifestory Interviews
Maruta PRANKA (Latvia University, Latvia) | pranka@latnet.lv
Ilze TRAPENCIERE (Latvia University, Latvia) | trapenciere@inbox.lv

The paper discusses the relationship between social changes and the biography as well as how the biography accommodates itself to a changing cultural and social environment during changing times. The analysis will be based on lifestory interviews from the Latvian National Oral History collection of the Institute for Philosophy and Sociology of Latvia University. The paper deals with lifestory interviews with ordinary people of different ethnicities living in Latvia. Their experience of biographical disruption in the context of great social changes after 1989 will be analyzed. Biographical disruption is analysed as the process brought about by a turning point (Strauss) or fateful moment (Giddens) that is the basis for subsequent changes in a person's identity. The authors have used Giddens' concept of a fateful moment to expand on the content of the biographical disruption concept by stressing aspects of the individual's opportunities corresponding to the changed situation during fateful moments, when the individual, having involved the system of experts may be presented with certain opportunities. Fateful moments put in motion a process in which the individual may become a completely different person and can potentially provide experience opportunities as well as develop self-identity and future action. Experience in the field of biographical researches argues that in biographical narratives the very personal events and emotions are revealed in connection with radical political and social changes. Personal and historically important events interact and even intensify each other.

Restoring the violated life story
Thomas KAMPEN (University for Humanistic Studies, Netherlands, The) | t.kampen@uvh.nl

Like in other European countries, Dutch social policy is increasingly based on the notion of reciprocity. A typically Dutch example of this development is mutual obligation policy which requires welfare clients to do volunteer work in return for their welfare benefit in order to improve their employability or to empower them. The effects of this policy were studied qualitatively in five Dutch municipalities. This paper argues that for welfare clients volunteering is a way to restore their ‘violated life story’. They do so in two ways which are described as types of ‘biography management’. First, they manage to ‘turn the page’ by either finding out what is possible within the limits of physical or psychological limitations or by considering volunteer work as a new chapter in life and thereby erasing the regret which dominates their life story. Second, volunteering is a way to prove themselves again in an ‘improved sequel’ by using volunteer work to take revenge for a defeat suffered in the past or to pay back the help they have received in the past. It is concluded welfare clients provide a counterweight to the future orientation of the activating welfare state with its emphasis on social investment and policy aimed at developing responsibility, skills and confidence. They consider their volunteering as a
gift and as part of a cycle, rather than as part of a ‘transaction’ thereby contrasting it with the ways in which Dutch society presents their obligation to volunteer in return for a benefit.

Research on Social Capital of Children and Adolescents with and without Disabilities: theoretical and methodological issues.
Eleni KOUTSOGEORGOU (Department of Special Education, University of Thessaly, Greece) | e_koutsogeorgou@hotmail.com
Anastasia VLACHOU (Department of Special Education, University of Thessaly, Greece) | anavlachou@uth.gr
Panayiota STAVROUSSI (Department of Special Education, University of Thessaly, Greece) | stavrusi@uth.gr

Recent studies have shown the significance of exploring social capital and its impact on various sectors of a person's life, such as health, education, and employment. Despite the increasing number of studies on social capital of adult populations, it has been repeatedly argued that there is need for a larger number of studies on younger populations too. Furthermore, social capital for children and adolescents with disabilities is even more under-studied, despite the fact that studies indicate a potential positive impact of social capital on the everyday lives of persons with disabilities and health outcomes in general.

The aim of the present paper is to explore theoretical and methodological issues around research on social capital for children and adolescents with and without disabilities. Based on an extensive literature review, the current study presents key issues that should be considered when assessing social capital for children and adolescents. The theoretical ambiguity among the terms and indicators or outcomes of the notion of social capital causes difficulties in forming a universal definition and an established tool for the measurement of social capital as well. The fact that social capital flourishes in inclusive environments makes the assessment of social capital for persons with disabilities even more complex. There are also negative critiques about the usefulness of social capital building and bonding which should not be overlooked. Future studies which reflect on these issues would contribute to the development of tools which will be applicable to children and adolescents with and without disabilities.

Between the voice of conscience and bonds of friendship. Behaviour of bystanders of bullying and group structure.
Agata KOMENDANT-BRODOWSKA (University of Warsaw, Poland) | komendanta@is.uw.edu.pl

The aim of the presentation is to analyse group characteristics related to the problem of school bullying. Bullying is a group phenomenon – the bystanders' reaction can either encourage or discourage potential bullies. I analyse a game-theoretical model of bystanders' behaviour in order to show how a structure of interaction can block the intervention even if all witnesses are willing to help the victim. It is assumed that bystanders feel morally obliged to defend the victim but they also want to conform. In order to analyse the factors that can influence the scope of group reaction, a structurally embedded sequential coordination game was played for different initial conditions. Computer simulations were conducted for networks of a specific type (ER random graph). The main aim was to identify structural features of the group that can enable or block the intervention of bystanders. There is a non-linear relationship between network density and the scope of reaction. Both low and high density can make it harder for the bystanders to
oppose the bully. There is a positive relationship between the scope of group reaction and the strength of the internalised norm, whereas the level of conformity affects the chances of group intervention in a negative way. Interactions between structural and non-structural features of the group have been observed: depending on the strength of the internalised norm and conformity level, different structural characteristics may improve or lower the chances of group intervention. The results may be applied to improve prevention programmes.

Children’s experience of poverty and their subjective well-being
Mia HAKOVIRTA (University of Turku, Department of Social Research, Finland) | miahak@utu.fi
Leena HAANPÄÄ (University of Turku, Institute for Child and Youth Research, Finland) | leena.haanpaa@utu.fi
Mirka KUULA (University of Turku, Department of Social Research, Finland) | mmkuul@utu.fi

It is well established that childhood poverty is a hugely damaging experience for children and it has negative impacts on well-being of the child. However, some studies have shown minimal or no association between child poverty and child well-being. One possible reason for that is that many parents try to protect their children from material impacts on poverty and income poverty measured on household level is not able to capture how poverty affects on children. Therefore, to be able to analyse what effects poverty has on children’s well-being we need to distinguish household level and child level poverty. In this study we examine the relationship between childhood poverty and children’s subjective well-being from children’s own perspective. Child poverty is measured using the child derived index of material deprivation (by Bradshaw & Main 2012; Main 2013) and children’s own experience of the making their ends meet. The data is drawn from a survey called Youth under Focus which targets adolescents at school grades 5, 7, and 9 (N = 1803). The survey is part of a wider survey that aims at gaining understanding about the living conditions of youth in Finland. The survey was carried out in November 2014 by Webropol, the web-based data collection method. Findings show that poverty is an important predictor of subjective well-being.

Children with a difference: Exploring the production of inequality in the daily-life of preschool
Mari VUORISALO (University of Jyväskylä, Finland) | mari.vuorisalo@jyu.fi

International studies show extensive evidence of inequalities prevailing among young children. In recent years, inequalities have become more prevalent also among children in Finland, as the number of families and children affected by a range of disadvantages has increased. The general trend in modern welfare states is towards increasing provision of Early childhood education and care (ECEC) services. ECEC is increasingly seen also as a means by which disadvantages that tend to be reproduced across generations could be disrupted. While evidence is slowly gathering on how ECEC services may benefit young children, considerable less attention has been put on the ways in which the services handle the social diversity and individual differences of children. The focus of this research project is precisely here. The study problematizes the tradition of preschool as a self-evident provider of equality in contemporary society and looks at processes which construct disadvantage out of difference in ECEC settings.

The poster will present a coming research project. The research explores what actually happens in the preschool arena designed for young children with respect to questions of difference and disadvantage. The data for this study will be derived from an ethnographic involvement with the children and professionals of one municipal preschool group in a Finnish ECEC institution and with the children’s families. The aim is to examine whether the diversities and individual
differences with which young children daily enter the preschool are transformed into advantages and disadvantages – and finally inequalities between children.

**Social participation of children and youth from low-income families: How much evidence can we find?**

Juliane ACHATZ (Institute for Employment Research, Germany) | juliane.achatz@iab.de

Economic deprivation among children and youth is an important policy issue in Germany, as children face a higher risk of living in relative poverty than adults. A growing body of literature shows, that the experience of poverty during childhood and youth is not only related to material deprivation but to social deprivation and school deprivation as well. While some empirical studies show disadvantages of poor children regarding social participation, other studies point out that low-income parents nevertheless manage it to enable their children to take part, for example, in school and leisure activities.

This paper investigates whether there is a gap between low-income children and youth and more affluent groups in terms of their opportunities to participate in social activities with peers, like school trips, organized sports or cultural activities. The empirical analysis explores to what extent social participation of youth is affected by the family’s financial restrictions and to what extent it is associated with the parent’s aspirations, reflected by parent’s educational level and leisure activities. Results and policy implications will be discussed against the background of the implementation of “Education and Inclusion Subsidies” for low-income children in Germany.

The analysis is based on representative micro-level data from two waves of the German Panel Study “Labor Market and Social Security” (PASS). It is a novel dataset in the field of labor market, welfare state and poverty research in Germany, providing comprehensive information on the income and living conditions of different types of households.

**Birth order, Socio-economic Deprivation and Height Development in Early Childhood – Empirical Evidence of 21st Century Flanders**

Lieselot DE KEYSER (Ghent University, Belgium) | lieselot.dekeyser@ugent.be
Ronan VAN ROSSEM (Ghent University, Belgium) | ronan.vanrossem@ugent.be

Objective. Height is not only considered as an anthropometric detail, but it is also generally accepted as an alternative measure of well-being and standard of living in a specific context. Historical research shows a negative association between living in large families and the growth pattern of individuals before and during the demographic transition. This thesis is frequently explained by the resource dilution hypothesis. We, however, question this negative effect of birth order on growth patterns in present day society, whereas the fertility decline has stabilised and policies supporting the family are well established. Therefore, the first aim of this study is to investigate the influence of birth order on the early child development – expressed in length/height – in today’s society. Secondly, we control for socio-economic and socio-demographic parameters.

Methods. We studied a longitudinal dataset of near all births in Flanders between 2006 – 2009 (N = 294,495), which covers N = 2,951,024 check-ups. We used both linear regression, logistic regression and growth curve models to estimate the five-step-model. WHO-standards, based on the LMS-method, were used to standardize the height measures.

Results. Results show that the effects of birth order is significant at the 5% level but explain very little of the variation in height growth. Socio-economic indicators like educational level of the mother and deprivation of the household seem to be a part of the possible explanation.

Conclusion. This contribution improves the understandings of the present-day link between birth order and early child development in Flanders. In light of historical trends, our results indicate
that the effect of birth order is almost non-existent in contemporary Flanders. A part of the explanation for the changing role of birth order at the macro level can be found in the demographic transition, the fertility decline and family policy.

Main trends in reading of Russian children and youth: comparative sociological research
Elena KOLOSOVA (Russian State Children's Library, Russian Federation) | the_shmiga@mail.ru

Over the past twenty years in the life of society there have been cardinal changes which influenced reading status, its role, attitude changed dramatically. The information revolution continues to exert a strong influence on the reading of children and families, so the changes are global in nature. Modern children read differently on the number, and repertoire, and on perceive and understand of texts in compare with previous generations. 
A comparative study of the Russian State Children’s Library commissioned by the Federal Agency showed that the appearance of the child-reader and reader-teen is constantly changing. Thanks to the development of information and communication technologies new readers are more independent, informed, selective and demanding in reading and their reading becomes rather sketchy, fragmented and kliping.
 Participation of parents and other family members in the process of reading is an important factor of initiation of reading in the early stages of child development. Parents today began to pay more attention to children's reading and actively participate in joint reading with a child.
Major changes in the genre and thematic preferences of both children and adolescents is not observed. In primary school age are increasingly popular folk tales along with other traditional works of foreign and native classics. The most popular among teens are fantastic, "magic" books (56%), adventure literature (55%), and fun book (37%), entertaining, informative literature (30%), scary, mysterious books (25%) .
Main sources of books are bookstores (78%), libraries (42%), Internet (29%).
Age of entering the information space of the Internet each year decreases. One-third of primary school children and two-thirds of teens actively read books on the Internet. In addition to reading e-books, they are interested in information on various topics related to school, leisure, entertainment, hobbies.
Features of children's reading in the 2000s. associated with the advent of Internet in the region, and that young people are actively developing new electronic tools for reading and searching for information about books on the Internet.
Reading circle of children and teenagers today consists of two main parts: the reading of printed (paper) books, magazines and reading books and periodicals on the Internet. Proportions gradually changed toward preferences "screen" reading, but at the same time "paper" books while still dominate.

Social exclusion through categorization and classification: some propositions
André TURMEL (Laval University, Canada) | andre.turmel@soc.ulaval.ca

Social exclusion refers to complex social processes, many of which being investigated in classic sociological topics: gender, social class, ethnicity, etc. All those are appropriate to generate relevant knowledge in regard to social exclusion. Most investigations focused their attention on social policy issues. I propose a different modus operandi to this difficult albeit central question. 
In line with both Hacking’s proposition around categorization as ‘making up people’ and with Douglas’ argument about classification as the fundamental cognitive process, I put forward that category shows – make visible and convey - the social world. Firstly, it shows a form of social reality through classifications used by public/private authorities to ordain childhood. Secondly, it
shows the main cognitive process with respect to children: category impinges upon children so classified. Therefore, classification of children, far from being a neutral-bureaucratic activity, bear significant outcomes that affect them in pivotal ways. But one must bear in mind that classification is not a one-way process, as children and those monitoring childhood do react in a number of ways.

Institutional categories are a fundamental sociological device for analyzing how children are taken care of by monitoring supervisors. How social processes put them on non-determinist cognitive rails. Drawing from Hacking’s analysis of the category ‘child abuse’, I will track down the socio-historical trajectory of the umbrella category of ‘orphan’, from its inception in mid-nineteenth century western institutional thinking to its modern understandings. The same can be asserted of the category ‘Muslim’.

Who cares? Children left behind and their everyday life
Joanna BIELECKA-PRUS (Maria Curie Skłodowska University (UMCS), Poland) | prus@pronet.lublin.pl
Marzena Sylwia KRUK (Maria Curie Skłodowska University (UMCS), Poland) | marzenkak1@gmail.com

In the view of increasing number of labour migrations associated with broadly understood economic crisis, many families experience migration separation. The consequences of these changes affect directly the left-behind children. Sociological analysis of the phenomenon in most research focuses on the description of the negative effects of the loss of physical and emotional contact with one or both parents. In great deal of debate conducted in many environments, political, educational and welfare, specific numbers, figures, statistics or psychological descriptions of the phenomenon and its impact on children's development are presented. Rarely, however, is the phenomenon of migration described from the child's point of view or the changes that parents’ migration brought to their lives. So far, the studies on left-behind children have mainly focused on the problems of children living in developing countries (according to IMF classification), e.g. Mexico, Indonesia and the Philippines. Few studies in this area were conducted in Europe (e.g. in Albania, Romania). The paper will present the results of research carried out in Norway (Polish female migrants N = 20) and Poland (children left behind and their caregivers N = 40 and teachers N = 10). On the basis of in-depth interviews (or narratives) it will be shown how they interpret their own situations and problems and how they are solved by children and related social actors: mothers, caregivers and teachers.

More Participation for children in low-income families? (Non-)Take-up of the “Education Package” in Germany
Claudia WENZIG (Institute for Employment Research, Germany) | claudia.wenzig@iab.de
Juliane ACHATZ (Institute for Employment Research, Germany) | juliane.achatz@iab.de

In most European countries, children and adolescents are still at greater risk of poverty and social exclusion than the rest of the population. Growing up in poverty might have detrimental effects on the child's development. In order to tackle child poverty and prevent children from its negative consequences the so-called “Education Package” have been introduced in Germany in 2011. These additional means-tested benefits are aiming at improving material welfare of children in low-income families as well as social inclusion, e.g. through covering costs for school trips, daily meals or cultural activities. In this paper, we analyse the (non)take-up of the new subsidies by the entitled families. Our main research questions are as follows: Are there groups like children in large families, with migration background or in rural regions that are left behind due to lack of information or
opportunity costs? Does the new benefit contribute to enlarge social inclusion for needy children by opening up participation?
For our analysis we are able to use two waves (6th and 7th) of the panel study “Labour Market and Social Security” (PASS), which is an annual household panel survey for research on unemployment, poverty and the welfare state in Germany. The questionnaire includes several items concerning knowledge and usage of “Education Package”. It also contains comprehensive information on the income and living conditions of different types of households.

Child Poverty in Turkey: Risks and Problems
Fatih KAHRAMAN (Süleyman Demirel University, Turkey) | fatihkahraman@sdu.edu.tr

Poverty has been a global problem that affects many countries in a serious measure. Children rights, especially having a secure future and healthy development are interrupted by the treat of poverty. Families who forced to emigrate from rural to urban place have a high risk to face with poverty and children are the most effected group from this risk. Poverty has not only caused deprivation of certain resources but it also brings alone deprivation of children human rights. Yet children who are living in poor conditions have been deprived from both rights for health, education, healthy feeding, and right for protection from social inclusion, exploitation, violence, and discrimination Child poverty has become one of the important social problems that Turkey has faced since 3 decades. Some of the triggering factors of the child poverty are immigration from rural to urban place, lack of prevention policies, and unequal income distribution based on unequal economic growth. UNICEF reports emphasized that Turkey have a bad mark on child poverty even though Turkey are not classified as poor country. Similarly, European Union Development Report indicated that the proportion of child poverty for under age 15 have been increased in Turkey and child poverty in rural places has reached an extensive level. In the current global recession, it is indicated that children have entered job marketing as a result of family poverty. Regarding effects of income poverty on children, there is a consensus among international organizations which Turkey is one of the countries that they have the highest probability for falling families with children into below the poverty line. The aim of this study is to reveal an outlook of child poverty in poor families who are not only socially disadvantage group but also a high risk group to face with rural and urban poverty in Turkey.

Differences in academic achievement and family background as determinants of friendship formation among primary school students
Gábor HAJDU (Institute for Sociology, Centre for Social Sciences of the Hungarian Academy of Sciences; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary) | hajdu.gabor@tk.mta.hu
Tamás HAJDU (Institute of Economics, Centre for Economic and Regional Studies of the Hungarian Academy of Sciences) | hajdu.tamas@krtk.mta.hu

In this research we will analyze social contacts (friendships) within Hungarian primary schools among 8th graders (at age 14). Using a unique Hungarian database that measures friendship networks in 160 school classes (3200 students) in 2010 and linked with the Hungarian National Assessment of Basic Competences (NABC) we will explore the determinants of friendship formation.
In this study the friendship or potential friendship dyad is the unit of analysis. Our main research question is whether differences in academic achievement, social and economic background are associated with friendship formation, i.e. how differences between peers in income, family background, cultural capital, ethnicity and school performance affect friendship nominations. Our second research question is whether determinants of friendship formation differ between
intra-ethnic (non-Roma – non-Roma or Roma – Roma) and inter-ethnic (Roma – non-Roma) contacts. Besides classroom composition, actual connections between classmates might also affect individual student outcomes; on a broader level, connections between groups with different social and economic background are important for a well-integrated and cohesive society. Thus, our research has implications for educational policy regarding school integration and for broader social policy regarding social integration and social inclusion.

**Contextualizing Children’s empathy: individual abilities embedded in social processes**
Simone ROERIG (VU University, Netherlands, The) | s.roerig@vu.nl
Floryt VAN WESEL (Utrecht University, Netherlands, The) | f.vanwesel@uu.nl
Sandra EVERS (VU University, Netherlands, The) | s.j.t.m.evers@vu.nl
Lydia KRABBENDAM (VU University, Netherlands, The) | lydia.krabbendam@vu.nl

In neuropsychological and neuro-scientific research, empathy is often approached as an individual ability, whereas researchers in the field of anthropology focus on empathy as a dialectic process between two (or more) people. In our study we work as an interdisciplinary research team combining and comparing these theoretical frameworks within an especially developed three-level design: (1) Lab-life: children’s individual abilities based on empathy components measured using self-reports, psychological tests, and behavioural tasks, (2) ‘As if’ life: children’s individual abilities to engage with other children’s enacted emotions examined in a controlled but interactive research setting by means of an innovative Theatre Test, (3) Daily life: we investigate whether and how individual children participate in empathic processes as they occur in their classrooms hereby using participant observation and social network analysis. Preliminary results suggest that the contextual information as collected on the daily life level, is crucial to understand children’s individual social actions. In general a difference between concrete ways in which children interact socially - doing - and empathy as understood through cognitive ability - knowing - occurs. More particular children’s individual motives to express empathy were influenced by either the supervision of their teacher and the related ‘school rules’ or the presence of their in-group peers. In this regard, both the dialectic processes in and outside the classroom and children’s individual abilities were relevant. Furthermore, the social network data enhanced the interpretation of our three-level findings.

**0 violence since 0 years: dialogic recreation of knowledge**
Esther OLIVER (University of Barcelona, Spain) | estoliver@gmail.com
Lidia PUIGVERT (University of Barcelona, Spain) | lidia.puigvert@ub.edu
Teresa MORLÀ (University of Barcelona, Spain) | teresa.mofo@gmail.com

In this paper, we present the relevance of the preventive socialization of violence since 0 years through the successful educational actions (SEA) in which the dialogue acquires a very significant role. This is a dialogue which enables the recreation of the SEA analysed by the FP6 INCLUD-ED integrative research project in different contexts which is the only project of Social Sciences identified as one of the ten success stories in the Framework Programs of Research (European Commission, 2011). INCLUD-ED contributes to prevent violence since 0 years through the implication of all the educational agents together with the researchers in this recreation. Previous research demonstrates that any exposure to violence at an early age becomes part of the vision of the world that children learn and internalize (Mayes & Cohen, 2002). In order to educate in a 0 violence since 0 years, the INCLUD-ED project emphasises the relevance of the collaboration between members of the community (family members,
teachers, volunteers of the community) and the researchers in the implementation of the actions which have scientifically proved to be successful in preventing and overcoming violence since 0 years. In this way, this paper is focused on the relevance of the dialogic recreation of knowledge where the researchers together with all educational can contribute to dismantle myths and false assumptions and to prevent this violence through positive interactions.

### Differences in the treatment of twins in families of diverging social situation

Rita HEGEDŰS (Corvinus University of Budapest, Hungary) | rita.hegedus@uni-corvinus.hu
Zsófia DRJENOVSZKY (Károli Gáspár University of the Reformed Church in Hungary) | drzsofi@gmail.com
András PÁRI (Hungarian Central Statistical Office) | andraspari@gmail.com

The arrival of twins in a family generally implies enhanced financial, physical and psychological burden. While treating and educating their twins, parents should pay individualized attention to them, and at the same time, it is worth to exploit the power of the dual relationship. Our study is based on a questionnaire survey, conducted in 2012, of parents of Hungarian twins (N=553) and focuses on the handling of such unique impediments in families of different social background. Our assumption is that families of higher social status report smaller numbers of hurdles, pay more attention to the particular personality of their kids, so twins, overall, are better off if they are born to such families.

Social status is measured by parents’ education, since in Hungary there exists an extremely strong relationship between education and status. We examined parents' attitude towards their twins. We tried to capture the advantages and disadvantages of twinship by asking respondents to evaluate some typical life situations as well as by eliciting from them a summary score that indicated how they feel towards twins. We also used open questions, where parents had the opportunity to describe their experiences with their own words.

Differences between the two status groups has been analyzed with both quantitative and qualitative methods. Our results only partially support our hypotheses: differences between the two groups could not be identified for all the examined areas.

### The role of social and affective components in educational achievement and further education of children in foster care

Attila RAUSCH (University of Szeged, Hungary) | rausch@edu.u-szeged.hu
Timea TÖRÖK (University of Szeged, Hungary) | torokt@edu.u-szeged.hu

In Hungary more than 10 thousand children live in foster care and after ageing out of the system they have to face with several problems related to lack of education or marketable profession which makes their social integration difficult (Racz et al., 2010). Therefore it is essential to support their achievement considering that education could be the key to compensate the lack of healthy family background. Previous researches show that peer relations, motivation, and self-esteeem could play an important role in school success (e.g. Finkelstein et al., 2002). The aim of our research was to examine which affective and social characteristics influence educational achievement and further education of these children.

In our study we asked children from age 9 to 18 living in foster care (N=498). We used a complex online questionnaire, which contained 3 scales to assess mastery motivation, 2 scales from self-description questionnaire, Rosenberg self-esteem scale and scales related to school climate. The assessment tool proved to be reliable (Cronbach’s alpha ranged between .74 and .91).

With SEM we identified that mastery motivation and general self-concept have influence on the factors of school climate which has significant impact on educational achievement and self-

210
esteem. And these two factors determine the plans of further education. The model fitted well (CFI=.93; SRMR=.05).

Results show that we need to draw more attention peer relations and improve self-esteem of children in foster care to facilitate them continuing education. Furthermore higher level of motivation and self-concept contributes to a favoured school climate.

Child Marriage: Snatching the innocence of Childhood
Ritu SHARMA (National Law University, Delhi, India, India) | ritups2803@gmail.com

Marriage is a basic and an important institution of any society providing a base to the social structure and stabilizing the personality of the individual but this beautiful institution has taken a shape of social evil in the form of Child Marriage. Child Marriage is a gross violation of all categories of Child Rights. A Child Marriage legally means a marriage to which either of the contracting party is a child, i.e a male who has not completed 21yrs of age or a female who has not completed 18yrs of age. Child Marriage is common all over the globe and has inflicted dangerous and devastating effects on young children who are compelled to tie the knot in the most cases.

There are various factors related to Child Marriage like Social, Economic, Religious and Cultural. At the Social and Cultural level, the customary practices of the society, the patriarchal structure, notion of morality & honour forces parents to push their children into marriage. The Economic factors also play an important role as poverty stricken families sell their daughters off which many a times gives way to trafficking. The paper will try to examine and understand the history & culture of the society practicing Child Marriage and will try to analyse the various socio-economic and cultural factors leading to Child Marriages. The paper will also focus on the differences and inequalities faced by the children who are married as compared to the other children.

RN04S01 - Adult-child Relations

Exploration of biographical disruption in young people living with liver disease
Shahreen BASHIR (Aston University, United Kingdom) | bashirs6@aston.ac.uk
Pam LOWE (Aston University, United Kingdom) | p.k.lowe@aston.ac.uk
Elizabeth PEEL (University of Worcester, United Kingdom) | e.peel@worc.ac.uk

The extent to which children with a chronic illness can experience biographical disruption is debated. Originally developed to explain the onset of chronic illness in adults, it has been claimed that either children do not experience biographical disruption at all (as they have no previous identity) or that it is experienced differently to adults. This research paper draws from a wider qualitative PhD research project examining the transition to adulthood of young people with liver disease. Some participants had been born with liver disease and others were diagnosed later on in life. The interviews indicated biographical disruption was experienced in many ways during childhood. For some participants diagnosed at a younger age, the extent of the disruption became more prevalent during secondary school where the identity they had created for themselves was disrupted by prolonged school absences for health reasons. The sudden onset of a chronic illness can result in profound changes to the way children conceptualise themselves and subsequently manage lifestyle changes. Managing visible markers such as scars were crucial for some young people. Biographical disruption can be both personally and socially derived. Young people exercised agency through efforts to reduce the disruption to their lives via carefully managed illness disclosure, concealment of symptoms and
maintaining their social lives through contact with peers. Overall, our research shows that biographical disruption is a concept relevant to the lives of children and young people diagnosed with a chronic illness and reinforces the need to recognise children as social actors.

**Adult–child power relations, and the changing emotional identifications with the child in Ireland during the twentieth century**

**Paddy DOLAN (Dublin Institute of Technology, Ireland) | paddy.dolan@dit.ie**

Following Elias’s figurational perspective, this paper examines changing forms of difference and inequality between children and adults in Ireland. Elias argues that the heightened demands on people associated with civilizing processes creates greater adult–child distance. But there is also a convergence around principles of privacy and individual dignity in Ireland accelerating from the 1960s. The valorisation of the child, and the adult responsibility to protect children from damage, is a very uneven process due to rapid social change from the mid-twentieth century. Such change involved developing social relations between adults across national spaces, which were partly planned in response to the unplanned continuing demise of the national group through emigration. Commercialisation, industrialisation and cosmopolitanisation created new social relations between parents, children, teachers, and moral specialists (clergy). As intergenerational morals and social standards were increasingly scrutinised in the wake of broadening interdependencies with other national groups, power relations between such moral specialists and other functional specialists in Ireland shifted in favour of the latter. Whereas children were previously targeted as objects of cultural continuity and nationalisation, they were increasingly respected as future subjects required to navigate the uncharted waters of new social functions forming in the nexus of international economic and political relations. Drawing on data from teaching manuals, curricula, and child protection campaigns, the paper further argues that former shaming practices perpetrated on children in primary schools, including corporal punishment, became unacceptable as moral certainty subsided in the face of changing social relations and unknown futures.

**Negotiating kinship responsibilities in difficult times: Children’s experiences of grandparents’ responses to domestic violence**

**Lucas GOTTZEN (Linkoping University, Sweden) | lucas.gottzen@liu.se**

**Linn SANDBERG (Stockholm University, Sweden) | linn.sandberg@gender.su.se**

Grandparenting is a burgeoning field of inquiry within research on intergenerational relations. In this paper we posit that sociology of childhood may expand and advance this research by studying how children contribute to grandparenting. We also argue that it is essential that childhood sociologist explore circumstances where children are particularly vulnerable, such as domestic violence, in order to fully understand how children and their grandparents negotiate kinship relations and responsibilities. Based on qualitative interviews with 15 children (12-18 years of age) exposed to domestic violence, this paper studies how grandparents respond to domestic violence, how children experience the responses, and how they negotiate their roles and responsibilities.

We understand kinship relations not merely as biological ties but as a set of social expectations; that is, ongoing negotiations that develop over time and in relation to one’s biography. The ways responses are narrated are consequently both reflections of what children expect grandparents to do and what they experience is possible to do in different situations. Although kin are often expected to help out in times of crisis there is no given model for how, in this case, grandparents should respond. Domestic violence may be a particularly complicated case given the stigma and shame that often accompany. Children may consequently employ different
strategies to involve their grandparents, and grandparents may respond in different ways depending on gender, kinship position, and over time.

Absent fathers: how children understand and negotiate their relationship to their imprisoned fathers
Helene OLDREP (SFI, Denmark) | heo@sfi.dk

Many children live with absent fathers and one such group is children whose fathers are in prison. Indeed, prisoners are not the ‘lone male’, as sometimes made out, but have partners, ex-partners, and, indeed, children. Thus, in Denmark appr. 6-7% of children experience father’s imprisonment at some point in their life. Until recently, little attention was given to this group of children (Scharff Smith), but existing research suggests that children of prisoners have greater risk of behavioural problems, mental health problems and of committing criminal acts themselves (Murray, Farrington), thus seeing this group of children as victims of parental imprisonment. However, children’s own views and positions are rarely included. The paper draws on the sociology of childhood to explore these children’s experiences, particularly the ideas of children’s agency, and with a view to the limitations for such agency.

The paper draws on qualitative interviews with 15 children and young people whose father is imprisoned (and their mothers/main carer) to explore how they make sense of the imprisonment, in particularly how they handle and negotiate their fathers absence in their daily life and how they negotiate their emotional connection to him. The socio-cultural conditions that the children have for understanding and negotiating their relation to their father are understood as practises of fatherhood. One dominant practise is characterised by reflexive fatherhood, however, this may not always fit the experience of this group of children. Another practise may be ‘monstrous masculinity’, a term coined by Gottzen in a study of men exhibiting violence in families.

RN04S02 - Care and Protection

Practices and perceptions of discrimination in the Hungarian adoption system
Maria NEMENYI (MTA TK, Hungary) | nemenyi.maria@tk.mta.hu
Judit TAKÁCS (MTA TK, Hungary) | takacs.judit@tk.mta.hu

Examining adoption families – i.e. families where adoption occurs as an important factor in family formation – in the context of pluralisation of family forms can highlight the socially constructed nature of family life on the one hand, and challenge the normative concept of the family, on the other. Through successful adoption practices the ethnic homogeneity of Hungarian families can be altered, and planned one-parent families as well as families including same-sex couples and a child or children adopted by one of the partners can be constructed.

Our presentation, based on qualitative and quantitative data (key informant interviews with representatives of adoption agencies; in-depth interviews with adoptive parent candidates; and document analysis of 249 adoption applications), will focus on the potential occurrences of discrimination in the adoption process in Hungary. First we examine the relationship between adoptive parent candidates and representatives of (state and private) adoption agencies, followed by the examination of how the preferences of adoptive parent candidates relate to the realities represented by children who are available for adoption. On the basis of analysing all the adoption applications submitted within one calendar year (2011) to the Budapest based main state adoption agency (TEGYESZ), it can be seen that there are certain pre-selection
mechanisms in place that adversely affect mainly older (than 2-3 years), not completely healthy and non-white children.
Discrimination in the Hungarian adoption system is a multidimensional issue: discrimination is done by the law that prioritises certain family forms, while it excludes others. Discrimination can be done by the official persons participating in the process of who decides on the eligibility of the applicants; it can also be done by the adoptive parent candidates who tend to reject older, not completely healthy and non-white children; and ultimately class-based discrimination can also be observed, when children of the disadvantaged can get into more well-to-do families.

Exploring the interplay between the narratives of a child placed in care and the surrounding adults
Manon Alice LAVAUD (Roskilde University, Denmark) | manon@ruc.dk

This paper explores how a narrative approach can be used to examine the construction and implications of notions of normality and difference in the interactions between children placed in care and the professionals around them. Understanding children as actors in their own life and not merely passive recipients of the thoughts and actions of their surroundings, the paper demonstrates how the narratives of and about the children affect their experiences and actions in everyday-life, and vice versa.
The paper presents the analysis of a single case that is part of an on-going research project based on narrative interviews with 15 children placed in care in Denmark, interviews with three adults around every child (i.e. caseworker, foster parent, teacher), combined with observations of the everyday life of the children. More specifically, the paper looks into whether and how categories such as age, gender, psy-diagnosis and notions of ‘ideal childhood’, ‘ideal development’ come into play in the narratives and everyday-life experiences of the child. First, the paper shows how the narratives that the child tells about himself, and the stories that the adults tell about the child convey notions of normality and difference. The paper then focuses on how the child negotiates his position in relation to the storylines and identity positions available in relation to these notions. Subsequently, the paper shows how this affects the everyday life and well being of the child. The papers sums up with concluding remarks concerning the potentials and possible weaknesses in using a narrative approach.

Redistributing care from the perspectives of children and young people and their (mis)recognition by magistrates in contested child protection cases
Briony HORSFALL (Swinburne University of Technology, Australia) | brionyhorsfall@optusnet.com.au

Applying Nancy Fraser’s (2009) integrated theory of justice, this paper presents a content analysis of 27 unpublished judgements by magistrates in contested child protection court cases in Victoria, Australia. It focuses on the instructions of 35 children and young people who had legal representation and how magistrates responded to their status as participants.
My starting proposition is that child protection functions as a field of State power where ‘redistribution’ of care for children and young people occurs. Realising justice for children and young people in this context relies upon access to effective legal representation for participatory parity and recognition via due weight in judicial decision-making (UNCRC Art. 12). This paper builds upon my previous ethnographic study showing how lawyers conducted power relations with children and young people in ways that scaffolded participation behind the scenes in child protection proceedings (Horsfall 2013).
My analysis of the unpublished judgements is presented in three parts. Patterns in children and young people instructing about parental care and out-of-home care will be reported first. Next,
themes are distinguished by their negative out-of-home care experiences and sense of belonging with biological family compared with ongoing fear and safety concerns about their parents and positive experiences of out-of-home care. Finally, magistrates are shown to recognise and misrecognise children and young people to varying extents when attributing due weight, with themes including age and perceived maturity, consistency with evidence from witnesses, stability of instructions over time, and their expressed sense of safety with parents or out-of-home care.

Repositioning understandings of inequalities in child welfare interventions
Geraldine BRADY (Coventry University, United Kingdom) | g.brady@coventry.ac.uk
Paul BYWATERS (Coventry University, United Kingdom) | p.bywaters@coventry.ac.uk
Tim SPARKS (Coventry University, United Kingdom) | T.sparks@coventry.ac.uk
Elizabeth BOS (Coventry University, United Kingdom) | E.bos@coventry.ac.uk
Nicola STANDEN (Coventry University, United Kingdom) | nicola.standen@coventry.ac.uk

Large differences in rates of out-of-home public care for children or child protection interventions have long been identified. Since 2000, the central focus of research on child welfare services in the UK has been on improving the identification, assessment and management of children at risk and outcomes for children in out of home care or examined inequalities in intervention rates between local authorities (Oliver et al., 2001; Dickens et al., 2007, Owen and Statham, 2009) but has focused on systems rather than fundamental causes.

In this paper we present findings from a recent study of 10% of looked after children (LAC) and Children on Child Protection Plans (CPP) in one region in England. We will also introduce a major extension to this study (2015-2017) which seeks to explore inequalities in intervention rates within and between the four UK countries (England, Wales, Scotland and Northern Ireland). We present new evidence about the extent of child welfare inequalities between local councils and between small geographical areas within local councils in England and demonstrate that these large differences in children’s chances of being involved with welfare services are systematically related to deprivation: they are social inequalities.

In re-framing child welfare as a site of social inequality, our research seeks to focus more attention on populations, social structures and welfare systems and less on individual ‘risk’, parenting and professional behaviours. The underlying intention of which is to contribute to a fundamental shift in the evidence base for child welfare policy and practice in the UK and internationally (254 minus refs)

RN04S03 - Child Welfare Discourses and Heterogeneous Childhoods

The impacts of European family law reforms on Japanese policy-making on child’s contact with non-resident parent in post-divorce/separation life
Mutsuko TAKAHASHI (Kibi International University, Japan) | mutsuko@kiui.ac.jp
This research aims to discuss how the Western family law reforms and related discourses have influenced Japanese policy reforms on child’s contact with non-resident parent in post-divorce/separation. It will be questioned how realistic it is to ensure proper child’s contact with non-resident parent especially in the cases with some conflicts between parents. Various interpretations on parental responsibilities and the best interest of child will be examined by analyzing European and Japanese discourses on child’s contact. Under the U.N. Convention on the Rights of the Child, co-parenting after divorce or separation has become a mainstream norm since the 1990s in most of European societies where family law reforms have been encouraging child’s contact to non-resident parent. Since the 2000s more careful consideration has been addressed in some societies such as Sweden. In Japan these most recent reforms on child’s contact in the West has been mostly neglected among policy makers, and the court practice tends to force all the children to contact “equally”. It would be argued that the value conflicts between family norms of adults and the child-centred approach in child’s contact be made explicit in Japan by taking lessons from the West, in order to promote the readiness for listening to children with different socioeconomic and cultural backgrounds.

Unequal childhoods and social reproduction. On the relation of family life and primary school from children’s perspectives
Laura B. KAYSER (Goethe-University, Germany) | l.kayser@em.uni-frankfurt.de

Educational opportunities in childhood are not equally distributed, as already apparent in primary school. This has been discussed in regard to children’s class specific family life that brings about not only different, but ‘unequal’ childhoods and their specific ‘fit’ to school (Lareau 2011; on the latter: Kramer 2011). While the last years have seen a growing interest in questions of social inequality and its reproduction in childhood studies (for example: Bühler-Niederberger 2011), as to yet, little is known about the meaning of these unequal childhoods and their relation (‘fit’) to primary school in children’s daily life, from children’s own perspectives. In my presentation I address this relation empirically by linking the generational perspective of childhood sociology with inequality theory following Bourdieu. Passages about family life and primary school from two interviews with German primary school children of differing social background (part of my ongoing Ph.D. project at Goethe-University in Frankfurt, Germany) will be analysed. Using the Documentary Method (Bohnsack 2008) I reconstruct the practical sense underlying the children’s everyday practices in both settings and elaborate on their relationship as well as children’s according experiences. This illustrates how children’s socially embedded family life and respective childhoods become meaningful in the primary school context at the level of habitus. Showing the interplay of generational and class order and how children hereby become actors of social reproduction in their everyday life with (primary) school, sheds new light on the micro processes of the reproduction of inequality in the context of childhood.

Seeing Heterogeneity of Childhoods: A Historical Analysis on Multitiered Discourses on Juvenile Protection Systems in Japan
Eriko MOTOMORI (Meiji Gakuin University, Japan) | motomori@soc.meijigakuin.ac.jp

This presentation attempts to question the homogenous image of childhood which is still prevailing when we refer to “socialization” or “Invention/Disappearance of childhood.” Alan Prout discusses that childhood sociologists have to show the plurality of childhoods and the heterogeneous network of the social. I analyze discussions in the formation of juvenile protection systems in pre-war Japan as a case study.
Japan had established a “tutelary complex” (Donzelot) for children in the early twentieth century. The modern school education system reached provisional completion in 1907, and the juvenile justice system was established through the 1911 Juvenile Act. Along with this process, some typical discourses on children, such as “protection for developing bodies” and “care for children’s inner minds”, had appeared, and then discussions such as “freedom or guidance” and “protection or responsibility” had been repeatedly brought up. This shows the convergent but still heterogeneous “Invention” of modern discourses.

Furthermore, a close reading of enactment and amendment processes of three systems, e.g. the Factory Act, the Act Prohibiting Alcohol for Minors, and Public Licensed Prostitution, indicates that there were varieties of images on children. While the systems were ostensibly parts of the complex and the proponents repeated the typical educational discourse, many still use children for factory labor, sell them alcohol to gain profit or collect revenue, and abuse them to satisfy sexual drives. I will show these varieties of meanings used referring to children and their connection to technologies and institutions, showing how our images of childhood has been heterogeneous.

“Rescue our children”?: the public discourses to reform residential care for disabled children in the post-Soviet countries
Victoria SHMIDT (Masaryk university, Czech Republic Institute of inclusive education studies) | 320753@mail.muni.cz

The campaigns around children operate as an indispensable driving force of welfare policy in the Global North. The bad moral panics (initiated by pro-state interest groups) regarding pedophilia, arbitrariness of child protection professionals, and deviant youth claim to rely on the responsibility of parents and reinforce familialisation of social policy (Clapton et al 2013). The good moral panics (brought into action by NGOs) disseminate the feeling of guilty towards Global South and legitimate symbolic participation (Well 2013). This landscape systematically maps by academics, whose analysis amongst other tasks critically revises the discourses and the impact of moral panics on policy-making (McRobbie and Thornton 1995; Critcher 2011).

Even various public campaigns focused on child protection thrill the post-Soviet public over the last two decades, their analysis remains on the margins of social studies – despite the obvious mutual influence of recent initiations (enhancing parental responsibility in criminal law, introducing special censorship regarding under age, the ban on the adoption by foreigners, and etc…) and public policy. In line with the discourse institutionalism, we aim to highlight the role of public campaigns and civic journalism in the current reform of residential care as either connecting the claim of institutional changes with upgrading the approaches to disability or leading the public concern to tokenism due to reproducing developmentalism inherent to Soviet special education.

Media framing research permeates three consequential comparisons. Firstly, we demonstrate the compatibility of the Soviet defectological discourse and the ideological platform one of the earliest moral campaigns (2008-2009), around the case of Kristina A. the 8-year girl who was transferred step by step from mainstream orphanage to the setting for children with multiple disorder of development. Even the moral panic attacked residential care, paradoxically the activists reproduced the discourse resemble with that Soviet defectology which precisely legitimated the development of special education in the 1970s. Building the activists’ discourse into developmentalistic vision on the norm, professional assistance and the contrast of family placement with residential care, we recognise the limits of good moral panic as inevitably reproducing the discourses relevant to the audience’s expectations and simultaneously segregating the children with disability. Then, derived criteria for evaluating discourses are applied to the analysis of two documentary films, Mama I’m Gonna Kill You (2013) and Anton's
right here (2012), and their postfilmic life. While the first movie has attracted the attention of the authorities and set the reform of residential care, the second has recruited liberal elites to the local initiations targeted to preventing children with autism from placing into residential settings. We discuss two different sorts of tokenism accompanying these movies in order to identify the interrelations between particular discourses and the shortcomings of public participation as the prerequisites of reform. The last comparison, the reporting by Julia Vishchnevetsksya (2011-2012) and the blog by Dmitry Markov (2007-2015), presents two different genres of civic journalism and answers the question “What stipulates the formation of new discourse free from developmentalistic cliché, universalised solutions and taking-for-granted suggestions?”. We focus on the diverse reframing of the dilemma of human capital vs. human rights as the core for transforming the system of procedures around the children with disability. By public demand, moral panics continue affecting policy-making, but civic journalism could not be led to opposing to simplified constructions and the simulacrum of citizen participation. The last part discusses the options for cooperation between academics and civic journalists in order to achieve the sustainable reproduction of relevant ideas within the projects towards providing the rights of children with disabilities.

**RN04S04 - Education**

Narratives of memories and dialogue in multicultural classrooms. An action-research based on the use of photography.

Claudio BARALDI (University of Modena and Reggio Emilia, Italy) | claudio.baraldi@unimore.it
Vittorio IERVES (University of Modena and Reggio Emilia, Italy) | vittorio.ierves@unimore.it

The presentation concerns the social construction of children's memories during classroom activities. At present, social interest seems to be focused on present time rather than on the past. Moreover, the focus on globalisation processes obscures the influence of differences and inequalities in the social construction of memory. Against this background, in multicultural societies, different social constructions of memory can be source of different, if not separated, constructions of cultural identity. This presentation concerns an action-research concerning facilitation of narratives and dialogue, which is based on photographs collected by children, regarding their personal memories. This action-research is performed in four classes of 9-10 year-old children, including a large number of migrant-background children. Facilitation of classroom interactions regards: (1) narratives of photo contents; (2) reflections on differences and commonalities among the memories and identities that the photos evoke. Three meetings for each class, involving the children and one facilitator, will be videotaped, transcribed and analysed, in order to study: (1) the narratives and forms of dialogue that are produced in children-facilitator interactions, and (2) the method of facilitation that can promote these narratives and forms of dialogue. The expected outcome of the analysis is achieving new knowledge on (1) children's different narratives of memory and identity, and (2) ways of enhancing dialogue by comparing these narratives. The presentation will include a description of both the theoretical and methodological background of the action-research, and its results, which will be available at the time of the conference.

**Actors of Unequal Childhoods**

Aytüre TÜRKYILMAZ (University of Wuppertal, Germany) | tuerkyil@uni-wuppertal.de
Doris BÜHLER-NIEDERBERGER (University of Wuppertal, Germany) | buehler@uni-wuppertal.de

In Germany, students who leave secondary school without a qualifying examination have rare professional opportunities. While educational courses have become increasingly important,
parents intensify their educational efforts, using strategies of social positioning and adapting these continuously to school responses. Despite this children themselves play a crucial role for the success of these efforts as well, as the presented research results of the longitudinal study “SEBI–Self-orientation and Self-directed Learning: An Analysis of Socialization and Learning Environments of Primary School Children”, will reveal.

In the study, qualitative data was used to develop a typology of family interactions in which the child is represented as a relevant actor. The findings demonstrate how children are able to take social responsibilities into account, and how they mostly remain their parents’ accomplices, regarding their aspirations, their self-assessment and a whole repertoire of adjustment strategies to fit into predetermined educational arrangements. Children also need to develop strategies to help these arrangements persist: strategies, which include a high self-orientation, self-regulation or even self-restriction, depending on the expectations that they are addressed with. It will be argued that children as actors can also reduce this cooperation more or less, that they can introduce their own interests and needs and thereby provoke adaptions of the educational program.

Supplementing Western sociological imagination with children and young people's Ibasho
Mizuho OZAKI (University of Bath, United Kingdom) | M.Ozaki@bath.ac.uk

Many children and young people in urban Japan attend Juku, a private tuition in after-school-hours. Juku supplements school education or prepares students for entrance examinations. This research looks at the influence of such activity on child well-being, and one of the focuses is on their experiences in each life space, such as home, school and Juku. Considering the life space, the notion of Ibasho, a physical and emotional location in which a person can feel herself, is explored. It is extremely significant concept and social concern for Japanese people, especially for children.

The method of research involved interviews with girls aged 10 to 18 about their experience at life spaces, and the cartographic analysis inspired by Deleuze and Guattari’s rhizome theory. The finding suggests that Ibasho requires close people, feeling relaxed and being oneself. Ibasho has significance at school the most, where collective harmony is valued and children keep making efforts to maintain it. It has a relevance to the Japanese concept of seken that is constituted of acquaintances, and which acts as a middle ground between individual and the society. From these points, this paper argues that the Western sociological imagination has a limitation in considering children’s lives in other regions of the world. Japanese children’s everyday lives are extensively relational, and the sense of ‘an individual’ is much more obscure than in the West. Thus, this paper finishes with suggestion that Western sociological imagination could learn from the others.

Imaginations of Children in the social space. Future positions in the perspectives of Italian and German teachers
Claudia DREKE (University of Applied Sciences Magdeburg-Stendal, Germany) | claudia.dreke@hs-magdeburg.de

Teachers are part of the generational order in primary schools, and they have the power to distinguish and evaluate students. What are the criteria in doing that, and how do they construct inequalities? In which way national systems of education shape selective perceptions and criteria of teachers? Focused Interviews with German and Italian teachers are the empirical object of the phenomenological-constructivist study according to Grounded Theory. The evaluations of students and school structures by teachers as they are found in the interviews
are analyzed in view of underlying basic concepts, and in relation to their specific social, cultural and political contexts.

In this presentation, I shall present results of my interpretation of interviews and observations in classroom. The spatial metaphor of “way” was found as an organizing concept: The teachers interviewed had used this metaphor to present different images of social spaces, of directions children – as students – should take and positions they could achieve as adults. Four different patterns of social inequality, identified both in Italy and Germany, include different ideals of children and adults with specific qualities. These ideals, based on historical concepts like Enlightenment or Romanticism, are the first criteria to distinguish children with regard to their future ways, and they are strongly connected to social categories like social class, gender, nationality, ethnic background, religion and common ideas of school and society.

**RN04S06 - Early Years**

*Children’s participation to a research on ECEC services: a methodological device for a plurality of voices*

Pascale GARNIER (University Paris 13, France) | pascale.garnierx@free.fr

Based on an empirical inquiry in four early childhood education and preschool services for 2-3 years old in France, this communication tries to show the place and the role of children’s voices among the voices of their parents and the voices of the professionals. Using standpoint theory, and more precisely the concept of “situated and embodied knowledge” (Haraway, 1988) stressing the importance of visual methodologies, we engage a critical and reflexive thinking of the research process with very young children.

First, we present the main tools used for investigating children’s point of view concerning their daily life in early childhood services: observations and moments when they take pictures all around and were, at the same time, tape recorded. We show how children engaged in the situation and the limits of this kind of data, particularly in terms of researcher’s interpretations.

Then, for each child, we used these visual data as a support for interviews with their parents and with the staff. The confrontation between the adults and this visual material that involves the embodied life of the child in the services goes hand in hand with operations of decentration. Adults realize that children have their own point of view and may emphasis the reality and singularity of children’s standpoint and agency.

The importance of this methodological device is not only scientific but ethical: it tends to create and support a conception of children as real participants to the services in the eyes of the parents and the professionals. It offers also space for “dispute” (Garnier, 2014) inside the research itself, in which the main question is not the age itself (Punch, 2002), but the model of competences of the actors and its negotiations.

Multi-Layered Positioning in Care Arrangements – an Ethnographic View on Social Inequality in Day Care
Sylvia NIENHAUS (University of Luxembourg, Luxembourg) | sylvia.nienhaus@uni.lu

Despite its small size, Luxembourg is a socio-culturally diverse country. Moreover, its day-care system ranges from day-care parents to preschools as to the care of 2- to 4-year-olds (Honig and Haag 2011). Considering that children at this age are not only positioned in different settings, but care arrangements created by their parents’, carers’ and their own daily practices and decisions, they experience different day-care realities. Based on this assumption, my paper argues that social inequality in care arrangements can only be understood from the view of children’s multi-layered positioning in day care: First, parents position their children in more or less complex care arrangements drawing on specific, often class-related, care strategies (Stefansen and Farstad 2010, Vincent et al. 2007). Second, carers position the children in daily routines often based on class-related ideals and norms (Nelson and Schutz 2007). Third, children are positioned and position themselves within their care arrangements in taking part in everyday practices that may be relevant to social inequality, e.g. practices of distinction (Kalthoff 2006). Aiming at showing how the assumption of such a multi-layered positioning of children in day care could contribute to researching social inequality with ethnographic methods (Diehm et al. 2013) my paper presents extracts of two ethnographic case studies which are part of my ongoing PhD-project embedded in the Luxembourgian CHILD-study. Based on interviews and participant observations, these case studies focus on the interaction between parents, carers and children involved in care arrangements and describing children’s unequal positioning in the Luxembourgian day-care system.

A twofold concept: ‘disadvantage’ in the hegemonic discourse on Early Years Education in England
Federico FARINI (Middlesex University, United Kingdom) | f.farini@mdx.ac.uk
Angela SCOLLAN (Middlesex University, United Kingdom) | a.scollan@mdx.ac.uk

Since the report produced by the Effective Provision of Pre-School Education project (2003), mainstream pedagogical research in England has been advocating the inclusion of Early Years Education in the strategies to narrowing the gap of educational achievement, countering socio-economic disadvantage. This claim underpins legislation (Every Child Matters 2003, Children Act 2004, Early Years Foundation Stage 2008/2012, Children&Family Act 2014) and was recently renewed by a report commissioned by OFSTED (2014). The hegemonic discourse which permeates the field of Early Years Education, particularly with regard to the relationship between educational achievement and economic status, is the object of our research.

The results of the research suggest that such discourse is framed by the distinction ‘advantaged/disadvantaged’. This presentation argues that mainstream research and the political system cooperate in conceptualizing ‘disadvantage’ as a form of deficit in socialisation that can be overcome employing pedagogical techniques.

The other possible meaning of ‘disadvantage’, relating to objective conditions of economic deprivation is marginalized in the hegemonic discourse. Within the dominant ‘deficit approach’ it is Early Years Education, rather than the reduction of economic inequalities, that should tackle disadvantage, while the cultural capital of children from low Socio Economic Status (SES) is observed as a problem to be solved.

In the conclusion section, the valorisation of personal diversity in educational activities is discussed as an alternative to cultural assimilation, towards the inclusion of low SES children in education. In particular, it is discussed the possibility of a change of paradigm, from ‘filling the
gap’ to ‘building on diversity’ where low SES children are conceptualized as active contributors rather than disadvantaged users of educational programmes.

**RN04S08 - Food and Bodies**

**Body weight and inequality in residential child care: the athletic body as an expression of good care**  
Florian ESSER (University of Hildesheim, Germany) | florian.esser@uni-hildesheim.de

This paper will present an empirical analysis of the differentiation between and the regulation of children’s bodies in residential child care units. Proponents of so-called Fat Studies claim that while it has become less socially accepted to disrespect people because they belong to a certain gender, class or ethnicity, this is not true for being overweight. Even though an increased body weight has a high statistical correlation with other categories of social exclusion, “fat” people are easy to blame themselves for being lazy or lacking self-control. At the same time children are the target of a wide range of nutrition, sports and other health programmes to ‘protect’ them from being or becoming overweight. Drawing on Science and Technology Studies (STS) this paper will explore how body weight works as a hidden and at the same time very present category to produce and reproduce social inequality in the everyday live of residential child care and thus provides an insight into the corporeality and materiality of inequality in public welfare services. Observations from ethnographic field work in German residential homes show how children are differentiated and valued based on their body weight by members of staff as well as by other children. However, children’s (athletic) bodies also act as a sign of good care. While a well-fed body traditionally symbolised proper nourishment, today a slim and athletic body is regarded as being particularly healthy. This is why members of staff try to influence children’s everyday food practices according to this ideal.

**“Inspired by Nature”: Childhood, bodies and the normalization of infant orality tools**  
Lydia D MARTENS (Keele University, United Kingdom) | l.d.martens@keele.ac.uk  
Emma HEAD (Keele University, United Kingdom) | e.l.head@keele.ac.uk

This paper presents an analysis of how “what is ‘natural’ … in relation to infant” (Brownlie and Leith 2011:206), maternal and tool bodies is performed on the webpages of brand-companies that sell infant orality tools. In our definition of infant orality tools, we include all those tools/toys that may enter the baby’s mouth, including feeding bottles & teats, and soothing and teething tools. Operating in the highly moral terrain of infants and their feeding, which has been characterised by the mantra that ‘breast is best' for more than 20 years, poses clear challenges for such brand-companies, and we are therefore interested in the cultural work that is undertaken to normalise the products on which the profitability of these brand-companies rests. We identify three tool purification strategies and discuss how these understand young children, parents, the practice of breastfeeding and tools in ‘natural’ and embodied ways. The theoretical purpose of the paper is to offer a contribution to emerging debate in childhood research on very young children, infantile bodies and interembodiment (Brownlie & Leith 2011; Doucet 2013; Lupton 2013), on bio-social dualism in the sociology of childhood (Lee & Moutzkau 2011; Prout 2005; Taylor 2013), and to consider the potential political consequences of embodied ways of thinking about infants.
In the last century there has been intense anxiety in academic and media debates regarding the early sexualization of young children, especially girls, that presumably leads to the loss of “the innocence of childhood”. These arguments indicate concerns about the sexualization of children, focusing mostly on issues such as psychological effects, increasing risk of sexual abuse and the negative impact on children’s development. However, these debates mostly represent adults’ concerns and do not reflect the voices of young girls and boys who are active participants in the sexual consumerist cultures and messages. Therefore, children’s own views and experiences on the “sexualization” debates are absent or ignored.

This paper tries to cover this knowledge gap by focusing on children’s own voices and understandings of their gender, beauty and sexual identities and cultures. It is based on an ethnographic approach and it aims to explore the connection between childhood, media and sexualization and detect children’s views and attitudes regarding the meaning they provide to the concepts of “beauty” and “sexy”. It also aims to shed light on cultural and social procedures that influence children in adopting “beauty” practices, including practices of “self-sexualization”. The major contribution of this paper is that it attempts to link feminist theory on beauty and sexualization with empirical data, based on children’s experiences and expressions of agency on these issues.

Ten boys and ten girls of primary school age in Cyprus, coming from urban and rural places, were interviewed in their home environment. Children were asked to share their favorite fashion items, cosmetics, toys and books and talk about their favorite celebrities. Items such as fashion magazines, school pictures, and dolls dressed by “Dollz Mania” online dress-up game were used as a starting point for discussing the desirable “beauty” ideal. Subsequent interviews with children’s parents provided additional information on parental intervention strategies with regards to how children shopped for clothes, how they dressed and what they were allowed to watch on television or the internet. Data were also gathered through observations in the school setting and other children’s social activities such as birthday parties.

My research questions are:
1. How do children understand the concepts of “beauty” and “sexy”, that is, what do they identify as a beauty ideal and what role do the media play in shaping these ideals?
2. What is the kind of agency that children develop to oppose media pressures concerning promoted beauty ideals models?

In general, this project investigates how the concepts of “beauty” and “sexy” influence children’s construction of identity, their self-sexualization and self-conception and how these concepts affect their educational success, their aspirations and future plans. Moreover, the study examines the role that parental involvement plays in shaping these meanings.

This study confirms other studies’ findings that beauty ideals are often exemplified, transmitted, and maintained through cultural products such as music industry, movies and literature. More specifically, results indicate that children’s understandings of “beauty” and “sexy”, from a very young age, are deeply influenced by mass media models, something that displays the powerfulness of media in communicating beauty ideals in modern societies. More specifically, “beauty” is often conflated with “sexy”, which means that many girls’ attempts to become beautiful lead to practices of early self-sexualization. Exposure to pop culture increases girls’ desire for thin and feminine bodies and boys’ ambition for toned and muscled bodies that helps them to perform a “tough” and “hard” masculinity. Therefore, it becomes obvious that children face intense pressures to conform to and express a socially acceptable gendered body. In addition, it seems that, from a very young age, children develop a strong sense of the beauty
style they want to adopt. There are also strong stereotypes about the fashion a boy or a girl is “allowed” to follow. Therefore, there is intense self- and peer-policing regarding children’s choices on appearance, style and body type. Moreover, data show that children moralize “beauty” and they relate beauty and sexy with popularity, friendship and social acceptance. However, factors such as age, gender, socioeconomic background, urban/rural locale and religion shape the ways children address beauty and sexiness media messages and seem to be related with different levels of children’s media critical thinking skills and agency. The study concludes that it is necessary to develop media literacy programmes and reflective thinking in order to enhance children’s critical skills on beauty messages. Media-critical literacy pedagogy programmes centred on the promoted beauty ideal can contribute to the critical deconstruction of the media messages’ content, preventing the internalization of harmful depictions and practices of beauty, like sexualized behaviours, and reducing the comparisons with promoted unhealthy models. It is also necessary to empower children to appreciate more other aspects of their personality, beyond the superficial “beautiful” and “sexy” model that the media promotes, avoiding, in this way, the negative effects on children’s psychological world and socialization.

Cooking Aesthetics and Lunch Discipline: How lunch-time staff influences children’s experience of food
Sidse Schoubye ANDERSEN (University of Copenhagen, Denmark) | sisan@ifro.ku.dk

The vast majority of children in developed democracies eat at least one meal a day in an institutional context, such as in school, but research about the ways in which school contexts influence children’s perception of food is limited. This paper analyzes how two very different contexts shape the way the same group of children relates to food in school. Both contexts are new inventions at the school, introduced through a school meal intervention to promote better health among the children. Field observations, focus group interviews with participating children, and interviews with participating adults document the experiences in both contexts, and results reveal new evidence on the relation between context structure and children’s perception of food. In one context, the children prepare their daily school meal, and this context offers a playful and sensory handling of foods. The adults (school chefs) engage the children playfully and involve them in, for example, decisions about food preparation, tastes, and presentations of the meal. In the other context, the children eat the school meal they just prepared in the first context, but this second context is predominantly rule structured, insisting on the traditionalism of appropriate table manners. Here, in stark contrast to the first context, the adults (teachers and school chefs) control and regulate social interactions firmly. Results suggest that adults’ preconceptions of what constitutes a “proper” meal inhibit the children from gaining an aesthetic and joyful meal experience.

RN04S10 - Methodology

Playing with Socially Constructed Identity Positions: Accessing and reconstructing children’s perspectives and positions through ethnographic fieldwork and creative workshops
Hanne WARMING (Roskilde University, Denmark) | hannew@ruc.dk

This presentation is based on two research projects in which the researcher played with socially constructed identity positions in different ways. It explores how children’s agency in both projects influenced, and was influenced by, the research process, notably the ways in which it
positioned and represented the children involved; and it documents how their agency shaped the project’s results. Overall, the analysis shows that although children’s (and others’) agency is framed by power relations that cannot be totally suspended, playing with socially constructed identity positions opens up possibilities for new, ‘thicker’ and more nuanced alternatives to existing representations of children’s agency and their perspectives than would be possible in more naturalistic inquiries, as well as enabling them to actively influence the research process. Moreover, the analysis suggests that some of the ‘techniques’ that were deployed to play with social identity positions may have the potential to empower children to produce collective critique and to draw on new resources which they can use to re-negotiate their identity positions.

Telephone Versus Face-to-face Interviews: Mode Effect on Semistructured Interviews with Children

Susanne VOGL (University of Vienna, Austria) | susanne.vogl@univie.ac.at

Usually, semistructured interviews are conducted face-to-face, and because of the importance of personal contact in qualitative interviews, telephone interviews are often discounted. Missing visual communication can make a telephone conversation appear less personal and more anonymous but can also help prevent some distortions and place the power imbalance between adult interviewer and (child) respondent into perspective. In this article telephone and face-to-face interviews are compared in order to analyse the general applicability of telephone interviews and their peculiarities when researching children. The data consists of 112 semistructured interviews with 56 children aged 5, 7, 9 and 11, conducted in Germany. Each child was interviewed twice; once on the telephone and once face-to-face. By triangulating qualitative and quantitative analytical steps, both interview modes are compared from a number of perspectives. The results showed very little difference between the two modes of interview and therefore challenge the reluctance to conduct semistructured telephone interviews, both in qualitative research and with children. Dependent on the research question, relevant distinctions could be the lower interviewer involvement, the lower number of opinions and suggestions stated by respondents and fewer signs of tension and tension release in telephone interviews.

Placing one’s self in an out-of-school learning facility – videography at a children’s university

Miriam BÖTTNER (Bergische Universität Wuppertal, Germany) | boettner@uni-wuppertal.de

In Germany, participating in out-of-school learning facilities has become more popular. Nevertheless, there has been little qualitative research on this issue. In a quantitative and qualitative project about different socialization contexts (“SEBI – Self-Orientiation and Self-Directed Learning”, University of Wuppertal) we focus on - amongst other things, a - children’s university. This is an institutional context where children can participate voluntarily on different thematic courses. Based on video data collected at a children’s university we discuss how generational order is produced and shaped into different constellations. Our video analysis of this out-of-school learning facility shows three findings: First, how children grasp, work out and modify rules in this unfamiliar context and how they become accomplices in the production of generational order. Second, how children paradoxically are ‘doing pupil’ even in this out-of-school setting, revealing the dominance of ‘school order’. Third, by contrasting different courses, a variety of ordering processes can be found. This concerns the ways children are addressed and the way they present themselves.
As theoretical reference point we use the concept of socialization as ‘generational ordering’ (Bühler-Niederberger). Thereby we gain further insights in producing and reproducing differences between adults and children and elucidate children’s contributions to processes of social ordering. Methodical insights into the process of analysis will be given and results will be discussed.

Innovative Methodological Perspectives for Surveying Online Sexual Practices of Adolescents
Agnese PASTORINO (Université Paris V René Descartes, Paris, France) | info@agnesepastorino.com

The everyday use of Internet by digital natives (Prensky, 2001; Helsper and Eynon, 2010) represents a revolutionary change in family life, characterized by the «growing autonomy» of children from adults (Martin, 2006). Furthermore, the use of mobile devices increases the possibility to escape from parental control and, through new technologies, communication among peers become central in the so-called «bedroom culture» (Livingstone – Bovill 2001). By consequence, some authors describe the change in the interaction norms either among children themselves and between children and adults as the «disappearance of childhood» (Postman, Meyerowitz, 1985 ; Buckingham, 2000)1. In the intimate space of the house, forbidden images and messages (such as pornography, sexting and grooming) are now freely accessible (Boyd and Hargittai, 2010). This change raises forms of «public anxiety» or «moral panic» towards the innocence of children, which implies a polarisation between protectionist and libertarian positions in the public and political debate (Livingstone and Haddon, 2012). The aim of this research paper is to present the recent debates in sociology of childhood, sociology of family and sociology of media on the exposition of children to online sexual risks (online pornography, grooming, sexting). We will first present the results of a field study conducted in Italy in 2012, on the reception of online pornography among youth (16-19 years old) from different social contexts; then, we will examine the most innovative methodologies for surveying children online, paying particular attention to the pieces of research based on the intimate life of adolescents; finally, we will introduce the experimental methodological protocol we have developed within our PhD research project at Sorbonne University (2012-ongoing).

RN04S11 - Identity and Difference

Dare we say racism? Exploring silence, difference and the potential for shared social citizenship through participatory research with young people have offended
Cath LARKINS (University of Central Lancashire, United Kingdom) | CLarkins@uclan.ac.uk
John WAINWRIGHT (University of Central Lancashire, United Kingdom) | JPWainwright@uclan.ac.uk

This paper presents findings from participatory research with young people (aged 11-17 years) in contact with local authority youth offending teams in the north of England. Within the broad aim of seeking to identify ‘what works in stopping offending’, four young people in custody took a lead in shaping the research and data analysis. The research tools they created were used by adult researchers to interview 46 young people attending locality based teams. We focus on the differences which were articulated at the start of the project and which continue to emerge from the silences in the data we generated. Differences in relation to confinement (in custody, localities and employment status) limited the extent to which young people were permitted to
engage in co-research, their access to services and their experience of services. Differences in relation to race, ethnicity, class, gender, sexual orientation and identity tended to remain unspoken but on reflection became apparent both in how we performed ourselves, as researchers, and in between the silences of some young people’s accounts of their experience. Despite these differences, the research participants shared many common priorities for the youth justice services they received. Their aspirations for these services reveal the importance of individual and familial social rights, the potential role of responsibilities that are not attached to conditions and the centrality of relationships and resources. These findings reveal commonality and difference in young people’s experiences of social citizenship and the need to dare to name issues of identity when negotiating change.

Children’s experiences in Roma communities
Lynette ŠIKIĆ-MIĆANOVIĆ (Institute of Social Sciences Ivo Pilar, Croatia) | lyn@pilar.hr
Marica MARINOVIĆ GOLUBIĆ (Institute of Social Sciences Ivo Pilar, Croatia) | Marica.MarinovicGolubic@pilar.hr

The research that informs this paper grew out of the need for authentic qualitative research with Roma children who are frequently the most disadvantaged children in Croatia. This study attempts to focus on the child and constructs the child as co-constructor of knowledge, culture and identity. The lives and experiences of Roma children living in different Roma settlements throughout Croatia are explored in this paper. Apart from relying on parental perspectives, this research also aims to give power and voice to child research participants while taking ethical considerations into account. It also examines structural inequalities associated with socio-economic class, gender and ethnicity while presenting knowledge and insight into Roma communities. Based on research in their home settings, this study reflects on how everyday life is structured and constructed for children. By providing insights into their subjective world, exploration of how Roma children ‘see the world’ around them is highlighted in this paper. Considering aspects of their complex daily lives, this paper examines children’s school life, work, play, and aspirations. It also analyses Roma children’s experiences of inclusion and exclusion as well as their feelings of safety and vulnerability.

Negotiating Difference: Childhood and Transracial Adoption in Contemporary Norway
Kjersti GRINDE (NTNU) | kjersti.grinde@svt.ntnu.no
Randi Dyblie NILSEN (NTNU) | randi.nilsen@svt.ntnu.no

Historically, Norway has been relatively homogeneous in terms of ‘race’ and ethnicity with a firm political and cultural base in an ideology of equality, while in later years this has been challenged. Limited, but increasing immigration is making Norway more ethnically and culturally diverse. Refugees and asylum seekers of non-white persons contribute to this change within a restricted and debated immigration policy. Despite the majority of Norwegian adoptions being transracial, ‘race’ and ethnicity are largely omitted from adoption politics and the children are granted Norwegian citizenship without question. According to earlier research a ‘color blindness’ that disregard race and ethnicity is prominent within adoptees’ families and neighborhoods, where “these children are fully accepted as belonging to the category of ethnic Norwegian identity” (Howell 2006:128). In an ongoing PhD project situated within Sociology of childhood (e.g. Prout and James 1997) it will be explored how ‘race’ and ethnicity are constructed and negotiated (Tizard and Phoenix 2002) by and for transracial adopted children. Of particular interest in this paper are experiences
of how ‘race’ and ethnicity are made relevant in encounters with strangers, and how such childhood experiences fuels constructions of ethnic identities. It is further an aim to illustrate how biographies of the studied group intertwine with the wider social and cultural context. Apart from an analysis of political documents, life history interviews, emphasizing childhood, will be conducted with young adults; in this paper a preliminary analysis will be presented.

**Becoming ‘normal’ and different: the construction of embodied self- and social identity of the first recipients of childhood liver transplant in the UK**

Karen LOWTON (University of Sussex, United Kingdom) | k.lowton@sussex.ac.uk  
Paul HIGGS (University College London, United Kingdom) | p.higgs@ucl.ac.uk  
Chris HILEY (King’s College London, United Kingdom) | chris.hiley@kcl.ac.uk

In the mid-80s the world’s first paediatric liver transplants began in an attempt to halt early deaths of children with severe liver disease. Although many recipients died shortly after surgery, the surviving children can be conceptualised as a pioneer group. Based on in-depth interviews with 27 now-adult transplant recipients, we consider how these children constructed their self-identity, and how they experienced social relationships with others at home, in hospital and at school. We demonstrate how, in the construction of a ‘normal’ yet pioneer childhood, children’s bodies mediated between their self-, social-, and felt identities. In constructing their self-identity most respondents stated they were not aware of receiving a human donor liver, with few reference points being formed at that time as to what was ‘normal’ or ‘healthy’. Participants recalled thinking it was ‘natural’ for every child to be unwell and have regular clinical tests and visits, yet as they grew, comparisons with other children’s bodies revealed their own (yellow, hairy, round, scarred, unreliable), to be ‘different’. School was a salient environment for the creation of social identity, this being negotiated, shaped and contested more publicly than in hospital or home environments. In school, name-calling was reported to take place most commonly when children’s master status, constructed through bodily appearance or prolonged absence, was as a sick or ‘different’ child. However, being known to others primarily as a ‘school friend’ was reported to foster a sense of childhood ‘normality’ in this context.

**RN04S12 - Migration**

**Discovering possible childhoods: insights from a multimethod research with children**

Giulia STORATO (University of Padova, Italy) | giuliastora@gmail.com

In this paper I discuss the preliminary results of my PhD thesis which focuses on children’s multi-layered belongings. Moving from the assumptions developed within childhood studies, therefore considering the child as an expert social actor (James, Jenks, Prout, 2002), this study aims at exploring where children actively displace their belongings. Particular attention will be placed on the role assumed by their primary relationships and by the institutions (such as family and school) in shaping these belongings. In order to reach these aims, I organised a series of multimodal workshops, combining different qualitative and visual techniques. I collected their narratives both in the written and in the oral form, starting from their everyday artefacts such as toys, mementoes and pictures of their favourite places. Artefacts can, in fact, materialize experience, creating new spaces for storytelling (Pahl, Roswell, 2011) and evoke different memories, cultures, and belongings (Pahl, 2012). I involved about 70 9-10 years old children.
attending primary school in two different social contexts in Veneto region (Italy). I worked within their classroom, which might be considered as a social microcosm reflecting the differences of the wider society. The children had in fact different social, regional, national, linguistic backgrounds. Therefore, within their narratives linked to their artefacts, I could explore various aspects of their everyday life, discovering also the different physic and symbolic places in which they build their belongings.

**Children's transnational narratives in a school setting. The relevance of positioning in producing narratives in the interaction.**

Sara AMADASI (Università di Padova, Italy) | samadasi@yahoo.it

In the last decades transnational mobility has involved a high number of people and transnationalism has become an important concept through which migrants’ experiences can be analysed. However when these transnational experiences involve children with a migration background and included in a school setting, these journeys represent a break in the structure of the schooling institution, allowing us to observe how meanings of concepts like culture, identity and belonging, usually taken in their fixed and reified daily use inside school, are called into question.

Based on video recordings of workshops and focus groups with children realized during a research year in two primary schools and one first grade secondary school, this paper aims to reflect on how children deal with and play with these transnational experiences in their daily school life.

I will focus therefore on children's active contribution in producing narratives concerning these transnational experiences in the interactional process. In particular, through analysis of interaction and positioning theory it will be possible to observe how positioning strategies activated inside the group by children on one side and narratives concerning their travelling experiences on the other, are interrelated and create an interactional play through which children together with adults becomes co-constructors of meanings linked to identity, culture and belonging.

Ekaterina Aleksandrovna OREKH (Saint-Petersburg State University, Russian Federation) | ek.orech@mail.ru
Elena Sergeevna BOGOMIAGKOVA (Saint-Petersburg State University, Russian Federation) | elfrolova@yandex.ru
Olga Vjacheslavovna SERGEYEVA (The Sociological Institute of the Russian Academy of Science) | sergeyeva.olga@mail.ru

Our paper focuses on the results of the research of lookism in modern national children's cinema (2000-2014). Lookism is a kind of discrimination based on estimation of person’s appearance. Attractive or unattractive appearance often becomes the basis for attributing to person positive or negative qualities that are often implemented in behavior that restrict rights of the person or people, who are compared with him. With the help of view, we perceive not only appearance, clothing, body condition, but also gender orientation, age, national and ethnic affiliation.

Stereotypes as well as evaluation criteria of a person’s appearance are constructed and therefore vary within and between social groups that eventually leads to a variety of discriminatory practices. In the modern world, visual images play a significant role in
transmission and perception of the information, and children's cinema is one of the most important instruments of socialization. The lookism reproduction in the children's cinema discourse by means of visualization and positive labeling of behavior as well as stereotypes associated with person's appearance estimation, leads to increase of discrimination. Using methods of semiotics, iconography and content analysis we research visual film's content and answer the question, what the discriminatory discourse is: what are the stereotypes associated with the evaluation of person's qualities on the impression of his appearance, and what kind of appearance features are evaluated in the films.

Transnational childhoods: Methodologies for studying children’s perspectives on migration
Laura ASSMUTH (University of Eastern Finland, Finland) | laura.assmuth@uef.fi
Aija LULLE (University of Latvia) | aija.lulle@gmail.com

Transnational childhoods and children’s experiences of migration consist of extremely varied and dynamic elements and conditions. Transnational life-ways and environments create novel realities that demand methodological imagination and non-standard solutions so that the social realities of children can be captured, described and understood. The paper presents and discusses methodological approaches that we have taken in our collaborative research about children’s perspectives on family migration in Europe. Some of the approaches, such as interviews and participant observation, are more traditional for the social sciences while others, such as examining of children’s visual arts activities, ‘observational collaboration’ with children with the help of the story crafting method (e.g. Karlsson 2013), or preparation with children of theatrical performances, are less conventional. Time, places and various mobilities are at the very core of transnational childhoods. Therefore, mobile methods such as travelling with children yield specific insights into children’s worlds on the move. Moreover, we particularly emphasise the value of a long term engagement with families over several years, which compellingly reveals children’s agency and allows researchers to unpack the structures of difference and inequality that children adopt, resist and negotiate in different places and times. Based on our research experience, we strongly argue for creative and multi-methods oriented ethnographies as a productive way to study children’s perspectives on contemporary migration.

RN04S13 - Place and Adversity

Urban inequalities from below. The perspectives of 7-9-year-old children living in disadvantaged neighbourhoods
Michele PORETTI (University of Geneva, Switzerland) | michele.poretti@unige.ch

In many European cities, the past decades have witnessed the progressive gentrification of city centres and the growth of suburbs characterised by the prevalence of large apartment buildings, often inhabited by a predominantly immigrant population. These evolutions have gradually reinforced social divisions, making the integration of migrant communities, and especially of young people, one of the main public concerns of contemporary Western societies. While marginalized adolescents have attracted the attention both of researchers and policy-makers, little is known about the experiences of younger children living in low-income
neighbourhoods. Indeed, confined in dedicated places, such as kindergartens, schools or playgrounds, these children seem to inhabit a space located outside the polity. Yet, not only do children explore the city from an early age and represent it in their own terms, but the quality of their environments, especially in terms of housing, spaces, infrastructures and public services, has a crucial influence on their lives and on how they conceive their present and future place in society.

Based on a participatory ethnographic inquiry with 7-9-year-old children living in the disadvantaged neighbourhoods of Sion, a town located in the French-speaking Alpine region of Switzerland, the paper will examine children’s representations of their environments and their assessment of spatial, social and economic inequalities. It will show, in particular, how children’s daily experiences of these inequalities are accompanied by deep-rooted interrogations about their place in society and the legitimacy of the social order.

Young children’s favorite places – a comparison between Kyrgyzstan and Germany
Jessica SCHWITTEK (University of Wuppertal, Germany) | j.schwittek@uni-wuppertal.de

Questions on children’s use of space, on the types and qualities of spaces available to them have long been an interest of childhood researchers. Behind that interest lies the notion, that social structures and conditions are connected to specific patterns in the distribution of space (and access to it) to different age groups. The here presented research shares this notion and offers an innovative methodological approach by comparing data from children (aged 3-7) in two rather different societies: Germany and Kyrgyzstan.

During a larger research project on children’s lifeworlds, the participants were asked to draw their favorite places and to comment on their choice. Data analysis focused on two dimensions:
1) On the character of the places depicted – Were they in the public or in the private space, were they allocated to children by adults or were they ‘self-conquered’, can they be regarded as age-specific (‘child-centered’)?
2) On children’s views: What did they particularly like about a place and when, how and with whom would they spend time there?

Besides children’s (positive) choices, the data also included their critiques and comments on scarcities of spatial resources and options. To interpret the results on a more abstract theoretical level, the concepts of ‘generational order’ and ‘agency’ as well as ‘complicity’ were used.

The paper will present the differences as well as similarities between the German and Kyrgyz subsamples and will discuss in how far the children’s spatial choices, preferences and critiques are associated with different generational arrangements in those two societies.

What’s in a life phase? Cross cultural visions of adolescence in floodprone areas
Cecile DE MILLIANO (University of Groningen, Netherlands, The) | ceciledemilliano@yahoo.com

By the year 2020, 175 million children and adolescents, especially those from the Global South, are annually expected to be affected, by natural disasters. The young are a significant group of those who need to respond to, recover from and adapt to disasters.

By drawing on cross-case study research, this article sets out to explore the plurality of young people’s lives in flood-prone areas in Bolivia, Burkina Faso and Indonesia. Using the theory of generational construction, it explores the complex set of social processes that ‘construct’ adolescence in these three contexts. It subsequently questions how these constructs influence the abilities of adolescents to cope with adversity. The research predominantly draws on qualitative and some quantitative empirical evidence (N=1887 adolescents) from Indonesia, Burkina Faso and Bolivia. Qualitative data were gathered through adolescent-centred
participatory activities, interviews, focus group discussions and observations during fieldwork (around 4 months in each case study).
The findings firstly show discrepancies between the three countries, in terms of the structural, symbolic and individual dimension of this life-phase. Secondly, three inextricably related societal issues are found to influence adolescents’ behaviour. This is the societal perception of adolescents as ‘economically priceless’ or ‘economically worthless’, the level of their participation in society and the interrelated space for inclusion provided to them.
The study concludes that when aiming to enhance adolescent resilience, it is of great importance to understand the transactional nature of the relationship between adolescents and adults. This will help acknowledge and appreciate adolescents’ agency and allow supporting them constructively when dealing with adversity.

**Children and the perception of urban spaces in a city of southern Europe: an analysis of the crisis**
Deborah DE FELICE (University of Catania, Italy) | defelice@unict.it
Carlo COLLOCA (University of Catania, Italy) | carlo.colloca@unict.it

The paper provides an analysis of the perception and representation that children have of public spaces in a city of southern Europe (Catania), focusing, in particular, on the feelings of insecurity and autonomy that arise in their daily lives. Specifically, the testing of a mixed methodology was carried out to study the complex production and demonstration needs of this specific portion of the population.
The theme of urban security is a privileged field of analysis of the perception of risk, as a result of the practices of interaction and selection of social systems.
The organization and use of physical spaces become central issues in the models used by social sciences to explain the factors and action processes that are at the origin of the spread of a feeling of insecurity.
From this scenario, it becomes interesting to ponder on how children perceive the urban space, how dangerous they consider the territory of their city, and if they suffer a number of limitations in the use of some places, as a result of the choices of local institutions.
Referring to the social category of the child means proposing an interpretative perspective, summarizing one of the social conditions that seems to be most involved in the continuous negotiation process of socio-spatial frameworks.
The research carried out in Catania highlights that along with the emotional and behavioral aspects, it is important to focus on the cognitive dimension of insecurity, which can have tangible consequences on the use of the city by minors.

**RN04S14 - Place, Belonging and Children's Perspectives**

**Day care life from children’s perspective**
Maarit ALASUUTARI (University of Jyväskylä, Finland) | maarit.alasuutari@jyu.fi
Kirsti KARILA (University of Tampere, Finland) | kirsti.karila@uta.fi

In the paper, we apply a Foucauldian framework and consider early childhood education and care as an agent and a technique of government. We argue that the regulation of children towards particular subjectivities is founded on the institution’s dominant discourses and exerted in the daily practices in which the discourses are embodied. Moreover, we draw on a constructionist view of institutions. The approach argues that while an institution aims at producing specific subjectivities, it is also produced by its actors. We study how children, as one of the main actors of early education institutions, construct the institution and their position(s) in
The data were collected in 24 early education settings – day care in vernacular – in Finland. They include photographs that 48 children took of their day care in pairs, and audiotaped and transcribed discussions in which the children present their pictures in a small group. In the analysis, the photos and the talk were examined side by side, applying thematic and discourse analysis as analytical tools. The results show that in children’s photos and talk day care is constructed on three foundational blocks. First, it is built on children’s peer relations. Second, the institution is founded on child-adult relations. Third, the data shows that the institutional environment has an important role in the children’s notions of day care. In each of the three ‘elements’ somewhat different activities are emphasized, and consequently, different aspects of governance and regulation become salient.

**Children’s perceptions of cities: different patterns of children’s agency lead to different forms of child friendliness**

An PIESSENS (Childhood and Society Research Center, Belgium) | apiessens@k-s.be

Child friendliness of cities has become a policy issue in itself. In this study we used a lifeworld approach to investigate with children their framework about ‘good living’ in cities. Children were addressed as fellow citizens, able to reflect upon life in their cities. We explored what ‘the city’ could mean for them as a useful framework. The results informed the development of a tool, allowing policy makers to gauge children’s perceptions about their cities. Using data from 15 workshops with children aged 7 to 14 in three Flemish cities, we were able to clarify the different ways children perceive their neighborhood and the city. The range in which children can exert some agency in their surroundings informs the way they speak about and deal with matters of mobility and (social) safety. This range of agency differs between children and groups of children, and has implications for thinking about child friendliness as such. Child friendliness is more than arranging provisions for children. Any child-friendly policy will have to deal with these differences, and should address both the agency and empowerment of children.

**Spatial practices and governing in daycare**

Anna Laura Elina SIIPPAINEN (University of Jyvaskyla, Finland) | anna.siippainen@jyu.fi

Intergenerational relations between children and adults are going through changes. The turn from governing to governance has also reached children and new kinds of intergenerational relationships are being constructed. According to many researchers, the same tendency has reached the Finnish educational system. Institutions regulate children for example with the spatio-temporal structuring (James and James 2008). This qualitative case study concerns the physical closeness and/or distance between adults and children: how do the spatial organization of activities and child-educator closeness and/or distance function in the government of children in daycare?

The research is part of my PhD study in which I research intergenerational relations in daycare with extended opening hours. The data is comprised of ethnographic and interview material collected in Finland in a daycare group that offers daycare with evening service for 3–5-year-olds. The daycare center was open from 5.30 a.m. to 22.30 p.m. and children were present based on their parents working hours. Theoretical ideas are adopted from childhood studies (Alanen 2009) and governmentality research (Foucault 1991, Rose 1999).

Based on the analysis, daycare routines and spaces were classed in categories according to the ‘freedom’ they allow for the children. Categories can be linked with different practices of child-educator closeness: the closer to an educator a child is located, the increasing of the amount of adult surveillance and control. This paper takes one of the categories, called as “free
play”, under closer scrutiny. The closeness to the educator is primarily actualized in spaces that are ‘free’ to children throughout the day. Finally, the analysis suggests a spatial logic where the physical distance between children and adults diminishes as activities take more academic features. Results presented in this presentation show a constant tension between autonomy and surveillance. As mode of power varies, vary the ideas of child and childhood. Positioning in space can also be interpreted as expressions of current discourses about the ideal childhood.

Space, place and relationships: exploring belonging and connection with young people with cognitive disability in regional communities
Sally ROBINSON (Southern Cross University, Australia) | sally.robinson@scu.edu.au
Anne GRAHAM (Southern Cross University, Australia) | anne.graham@scu.edu.au
Karen FISHER (University of New South Wales, Australia) | karen.fisher@unsw.edu.au

A sense of belonging and connection is fundamental to young people's identity. For young people with cognitive disability who live in regional Australia, very little is known about what helps and what hinders belonging and connection in their communities. Using an accessible, photo-rich research approach grounded in social geography, we worked collaboratively with thirty young people with cognitive disability in three communities to explore what helped them to feel like they belong and they are connected, and what makes it hard. Young people described their connections and relationships using pictorial mapping, and explored the facilitators and barriers to belonging and connection through photo research methods and interviews. As well as individual spaces, places and relationships, this specifically included the effects of living in a regional community. The views and experience of young people about participating in research of this nature were also gathered through the research process.

This paper describes the research and discusses the key emerging themes, which centre on how conceptions of belonging and connection shape identity, the importance of relationship and recognition, and the impact of isolation, loneliness and harm in these young people's lives. Implications arise from the results for young people’s participation, for their support through services, for communities more widely, and for disability and childhood studies theory.

RN04S15 - Play

Play activity through the paradigm of sociological imagination
Maria SIBIREVA (North-West Institute of Management of the Russian Presidential Academy of National Economy and Public Administration, Russian Federation) | vesna172@yandex.ru

Play and games are the areas which sociologists can research through the paradigm of sociological imagination, because in this sphere we can show empathy, research the games and play as constantly varying objects and interconnect “simple” play activity with wider socially historical context.

The play of children is a social activity which is directed on the construction and reconstruction of the modern practices. At the same time children’s play and games reflect social reality, existing values and even socially spatial characteristics of concrete places. By addressing to the different periods in the history of mankind, we can see that the needs, wishes and fears of people generate the inquiries of different types of play and games.

During centuries the games and play give the community of people to feel the unity: adults and children played together. Now this tendency is decreasing – the given circumstance leads to the lack of intergenerational relationships. In the modern world the technologies are becoming the
agents of socialization and play a great role in the development of children and in the lives of adults.

So, how is the social world mirrored in games and play of children and can we describe society while observing and researching children’s play and games?

All of these problems are in the sphere of sociology. The conducted research which includes the analysis of literature, art, and, certainly, children’s pictures and interviews of the children, who are 4 - 7 years old, attempts to answer these questions.

**Making monsters: Inscribing the ludic on the racialised bodies of children**

Rachel ROSEN (UCL Institute of Education, United Kingdom) | r.rosen@ioe.ac.uk

As critical scholars of race have pointed out, racism does not reside in the realm of the extraordinary but is part of the fabric of British history and the contemporary (Redclift, 2014). Despite the recognition that racism roosts in the routine, however, relatively little attention has been paid to the ways everyday practices and embodied relationships with young children are involved in sustaining, and potentially shifting, the coordinates of racial inequalities. Seeking to contribute to an emerging body of work in this area, this paper considers the way that responses to young children’s playful activity, specifically about the monstrous, are implicated in the process of racializing bodies and the production of accompanying inequalities.

Drawing on data generated in an ethnographic study in a London-based nursery, the paper will demonstrate the ways that imaginary characters became resources for some children – recognised for their creativity, imagination, and ability to ‘move the play on’ by taking on monstrous characters – whilst similar play characters became inscribed on the bodies of others beyond the imaginative world. It will be argued that this happened when the attributes of ludic characters coincided with reified assumptions about the raced, as well as classed, gendered, and ‘generationed’ (Alanen, 2011) body.

The paper will conclude by discussing the implications of this argument for theorisation of the relationship between childhood and intersecting inequalities.

**Gender play in school interactions: how children, adolescents and adults manage differences and stereotypes**

Elisa ROSSI (University of Modena and Reggio Emilia (Italy), Italy) | elisa.rossi@unimore.it

Over the last thirty years, sociological studies with an ethnomethodological and performative approach, often inspired by Judith Butler’s work, have increasingly considered gender differences and identities as accomplished, performed, displayed, but also negotiated, adapted, and sometimes subverted. Gender “doing” and “undoing” take place in everyday interactions: under the influence of images, models, symbols, discourses and narratives available in a society under specific historical and political circumstances, individuals construct and reproduce the gender difference, or they can negotiate and change it, challenging traditional representations. Children and adolescents certainly learn from adults and society, but they do it actively through their agency: they confirm or ignore borders and differences, or they pass through and play with them. In the end, gender difference is situated, i.e. created in some circumstances, ignored or subverted in other. Combining childhood studies, gender studies, dialogue and mediation studies, with a theory of social systems and forms of communication, and a theory on narratives, this contribution examines in research data if and how children and adolescents, and an adult interacting with them, invoke and orient to gender, manage differences and stereotypes. Data are drawn from evaluative researches in primary and secondary schools, which I personally supervised. They concern discussion activities conducted by an adult (teacher or mediator), who had a twofold task: 1) to promote children’s social
participation and reflection about cultural and gender differences; 2) to promote respectful and constructive relationships in the classroom. Activities were video-recorded and data were transcribed following a simplified version of the conventions developed by Conversation Analysis.

‘Care Bear Bombs’: Getting Gender ‘Right’ in Preschoolers Talk-in-Interaction
Olivia FREEMAN (Dublin Institute of Technology, Ireland) | olivia.freeman@dit.ie

The development of consumer preferences has received much attention from marketing academics (McNeal, 2007) and critics of children’s consumer culture have argued that the pressure on children to consume in order to maintain social links with their peers is relentless and exploitative (Linn 2004; Mayo and Nairn; 2009).

This paper takes a discourse analytical approach to pre-schoolers’ talk-in-interaction produced in a focus group setting. The ‘stuff’ of consumer culture comprises the putty of interaction as characters and products derived from commercial culture are evaluated through interactive sequences recognisable as ‘assessment sequences’ (Pomerantz, 1984). Here product evaluations are understood to be fluid and shifting social constructs produced through talk-in-interaction and not inner mental states revealed through language.

Consumer objects are made sense of in terms of age and gender (in)appropriateness with some popular characters from consumer culture variously constructed as being ‘babyish’ or as being ‘just for girls’ or ‘just for boys’. The ‘for girls’ label can be attached to boys by other boys resulting in interactive work such as the construction of a hyper masculine narrative evoking ‘fire bombs’ and ‘shooting’ in the context of a discussion around ‘Care Bears’. It can also be attached to boys by girls as girls take ownership of areas of consumer culture deemed to be their gendered spaces.

This paper demonstrates how commercial products can be employed as a form of social currency by children as young as three for age and gender based social ends.

RN04S16 - Policy and Citizenship

Young people’s Daily Lives and Policy Making
Asma KHALID (University of Wollongong, Australia) | ak996@uowmail.edu.au

There are millions of children and youth facing different forms of inequality. Moreover social inequality is further exacerbated when it is combined with the financial inequality. This was very evident in an ethnographic study of children and youth which was conducted in Rawalpindi and Islamabad – Pakistan. The young people in the studied group live with their impoverished families but also work daily on the streets. In interviews and other ethnographic research exercises, it became readily apparent that the children and youth working on the streets demonstrated a clear and deep understanding of their daily lives, including their roles in their families. However, as the children asserted, that policymakers lacked understanding of their daily lives, so that not surprisingly public policies were poorly designed and so do not work to improve their lives. It also appeared that the policy makers gave little heed to the potential value of good policies for these disadvantaged children and youth. This is disappointing especially since the children in the study also expressed a strong desire to raise their voices and concerns to policy makers in important matters such as schooling choices, technical education, employment opportunities, better working and living environment among other things. It seems possible then that the children’s and youths’ lives can be improved if policy makers gained a deep insight of the daily lives of those target groups for whom they formulate policies It is also concluded that children and youth have the right to raise their voices and make choices about
their lives, if opportunities are given to them. But at heart this means that policy makers need to acknowledge and respect the views of children and youth to make policies effective and successful.

**Participatory action research with unaccompanied girls: Pedagogy between oppression and hope**

Mervi KAUKKO (University of Oulu, Finland) | mervi.kaukko@oulu.fi

Brazilian educator Paulo Freire’s ideas have been used as a foundation for critical pedagogy, participatory action research and also, as some authors agree, for promoting children’s participation. In Pedagogy of the Oppressed (1970), Freire claimed that visible and invisible mechanisms in the society ‘oppress’ people, which means prohibiting them from growing to their full personhood. Instead of adjusting with this oppression, practitioners and researchers who work with these groups should promote ‘conscientisation,’ a shared process of becoming aware of the injustices in the world and engaging in critical activities towards transformation.

Children’s participation is stated as a goal of the care and education of unaccompanied asylum-seeking children. In this presentation I discuss Freire’s ideas of ‘conscientisation’, transformative participation and emancipation concerning the lives, experiences and emotions of unaccompanied asylum-seeking children. The presentation is based on a participatory action research with twelve unaccompanied girls (8-17 years of age) from Somalia, Angola and Democratic Republic of Congo, who lived in a Finnish reception centre. Although Freire’s assumptions of oppression have rightly been criticized for reproducing social inequalities and strengthening marginalization, the participants of my study can in many ways be seen as ‘oppressed’ by societal mechanisms due to their special status. Nevertheless, they are also extremely resourceful and enthusiastic in their attempts for integration and participation, and have found ways to encounter, adjust or resist the ‘oppression’ in individual ways. That is why my research adds an updated lens to the phenomenon of unaccompanied children’s participation, combining Freire’s theory by feminist ideas of intersectionality.

**Theorising Children’s Social Citizenship: New Welfare States and Intergenerational Justice**

Tom COCKBURN (Edge Hill University, United Kingdom) | tom.cockburn@edgehill.ac.uk

Dympna DEVINE (University College Dublin, Ireland.) | dympna.devine@ucd.ie

Welfare research has traditionally viewed children as objects of social investment in areas such as education, childcare and family support. However, this paper aims to theorize welfare provision and policy from the perspective of children. We raise questions about new welfare states and children’s social citizenship. In doing so, we foreground the impact of neo-liberal economic policies, especially during a period of economic retrenchment, on children’s experience of welfare, as well as their construction as citizens. The paper adopts a theoretical model that allows children’s everyday lives and the diversities and inequalities of children and childhoods to be the central focus of analysis in understandings not only of their experiences of social citizenship but also their contributions to that citizenship. Building on our previous work in this area (Devine 2002/2011; Cockburn 2013) we utilize a variety of concepts, including Bourdieu’s concepts of capital, habitus and field; Foucault’s framings of power and ‘governmentality’; and the important characterizations of different forms of citizenship by Delanty. Crucially, we consider children as social, economic and political actors, rather than passive recipients of welfare. We seek to understand them as contributing citizens in the present, building and exercising their citizenship through intergenerational relations of care, solidarity and contribution. We explore how these are being reshaped and redefined drawing
exemplars from the wider field of policy on child care and institutionally in education. We are especially interested in exploring how new forms of exclusion and inclusion permeate these neo-liberal shifts.

**Children and young people's participatiaption in social change: Reflections on findings from an EU evaluation.**
**Barry PERCY-SMITH (University of Huddersfield, United Kingdom) | b.percy-smith@hud.ac.uk**

As European countries experience significant social and economic change consequent upon the global recession and austerity the impacts on children and young people has been profound. With levels of youth unemployment in some regions of Europe exceeding 50% and social inequalities within an across EU countries widening, it is timely to reflect on the extent to which children and young people's views and experiences are included in political responses to austerity and in navigating a way forward towards more inclusive, equal and sustainable futures. This paper reports on a recently completed evaluation of children's participation across all EU member states for the EU Commission (DG Justice). The evaluation involved country mapping in each member state to understand better the situation concerning children's participation with regards to legislation, structures, impact, effectiveness, barriers and good practice. The country mapping was supplemented by a child peer research process in 5 countries. The paper will discuss some of the key findings from the evaluation which highlight variations in patterns of good practice as well as challenges in achieving impact and effectiveness in practice across different member states, across different sectors and settings and for diverse groups of children and young people. In spite of increasing provisions for children's participation in legislation, there are significant challenges in realising meaningful participation in practice and in addressing fundamental inequalities for children and young people across Europe. Drawing on findings from the study, this paper will open up to critique assumptions underlying prevailing models of participation that emphasise the representation of children and young people’s voice in representative democratic structures and instead open up debates about the need for alternative discourses of participation which focus on the empowerment, active roles and creative articulation of the sociological imaginations of young people as drivers of change in confronting the systemic inequalities within and across EU countries and that can play a more influential role in constructing alternative futures.

**RN04S17 - Poverty and Wellbeing**

**The go-between: low-income children negotiating relationships of money and care with their separated parents.**
**Tess RIDGE (University of Bath, United Kingdom) | T.M.Ridge@bath.ac.uk**

Recent UK child maintenance reforms have resulted in a radical move towards increased private ordering, the withdrawal and recasting of state services and the removal and renegotiation of existing child maintenance agreements. In this new policy landscape children may play their own often hidden and unacknowledged part in maintaining and managing relationships of money and care with each of their parents. This aspect of children's involvement with and between parents is rarely acknowledged or explored through research. While there is increasing recognition in UK policy that children are social actors and bearers of rights, there is still little understanding of the roles and responsibilities that children may hold or undertake within families, and the ways in which policies, ostensibly developed with children in mind can
have both intended and unintended consequences for children. Child maintenance policies reach deep into the heart of family life, and yet in policy terms children remain essentially passive objects of policy intervention rather than recognised as active family participants who contribute in a range of ways to producing and reproducing family life and family practices. To understand the implications of new child maintenance policies for low-income children this presentation draws on findings from children and young people taking part in an ongoing qualitative longitudinal research study which explores work and care in low-income working lone-mother households. The Family Work Project: earning and caring in low-income households provides a unique child-centred insight into low-income children’s experiences and strategies in relation to their separated parents and issues of money and contact.

Towards an Index of Child Well-Being
Alexandra N. LANGMEYER (German Youth Institute e.V., Germany) | langmeyer@dji.de
Susanne GERLEIGNER (German Youth Institute e.V., Germany) | gerleigner@dji.de

Since the UN Convention on the Rights of the Child committed themselves to create a world in which “all children get the best start in life” by promoting “the psychological, social, emotional, cognitive and cultural development of children” (UN, 2002, p. 5) the term “Child Well-Being” becomes more and more popular. While it is widely acknowledged, that child well-being is a multidimensional concept, which includes objective factors (e.g. physical health) and subjective factors (e.g. how children experience their lives) (Axford, Jodrell, & Hobbs, 2014; Ben-Arieh & Frønes, 2007; OECD, 2009), there is a broad range of perspectives on different dimensions, which have to be considered for child well-being. Furthermore, studies often focus on only one aspect of child well-being or analyse a number of dimensions, separately from one another. Using data from the representative survey “Growing up in Germany II” (AID:A II, 2013/2014), we intend to create an index of child well-being, which includes physical, psychological, social, cognitive and educational well-being as well as socio-economic factors. In AID:A II, children from the age of 9 to 18 answered a children’s questionnaire (N = 3,500) by themselves, added by information about the socio-economic situation and the household composition, provided by one parent (mainly the mother) living with the child. We assume the included aspects do all have impact on child well-being, but in a different amount.

Breaking intergenerational transmissions of poverty: rights based research to understand the lives of street connected adolescent girls in Nairobi
Vicky JOHNSON (University of Brighton, United Kingdom) | vicky.johnson@brighton.ac.uk

This paper draws on the life histories of young street-connected girls living in some of Nairobi’s poorest communities. Starting from the perspectives of girls (aged 8-13), this retrospective research funded by the UN Girls Education Initiative (UNGEI) identifies strategies that have helped street-connected girls to integrate into education and escape from abuse, crime, poverty and gender inequality on the street in their transient lives. Policies and services provided by local non-governmental organizations in partnership with government include reaching out to girls and their families in the places where they live and work, including on rubbish dumps and in street markets in slums around the city. Interventions include creating temporary spaces away from their current situation for rehabilitation and reintegration, remedial education in preparation for school, skills training, providing temporary loans and increasing access to services for family members, many of whom have HIV/AIDS. Participatory visual methods in the research include journeys to the street, mapping safe and unsafe places and photo narratives. The analysis examines the girl’s subjective indicators of wellbeing as they and their families received support, their perspectives of changing intergenerational and peer relationships, and
their sense of belonging in educational and living spaces. The paper shares lessons about the strategies that girls prioritise in improving their lives and considers how these contribute to breaking intergenerational transmissions of poverty (Moncrieff 2009) and helping them to realise and shape their rights in their complex lives (Hanson and Nieuwenhuys 2013).

What is important for child well-being in different family types?
Christine S. ENTLEITNER-PHLEPS (German Youth Institute, Germany) | entleitner-phleps@dji.de
Alexandra N. LANGMEYER (German Youth Institute, Germany) | langmeyer@dji.de
Sabine WALPER (German Youth Institute, Germany) | walper@dji.de

Child well-being has been subjected in many empirical research in sociology, psychology and education. Whereas previous studies based on objective criteria of well-being such as economic situation or health, the resent literature extended research on a subjective dimension of child well-being. The aim of this paper is to examine main factors influencing child well-being with a special focus on different family types, namely lone-parent families and stepfamilies. Using data from the survey “Growing up in Germany” (AID:A, 2009), a large representative data set from Germany with respondents age 0 to 55, we include also the children’s point of view. We have extended information about the household composition, socio-economic background of the family as well as subjective indicators for child well-being and information about the relationship quality between mothers and children. At age 9 to 17 children were asked to answer a children’s questionnaire whereas the information about the socio-economic situation and the household composition is provided by a parent, mainly by the mother living in the same household. To answer our research question we selected a sample of 2.152 children age 9 to 12, who answered the children’s questionnaire. First results of regression models highlight the importance of a sophisticated look at family types, especially at children living in different types of stepfamilies. Further, the relationship quality within the family is a non-negligible factor. Together with the educational level in the household, these factors seem to be the important ones for child well-being from a children’s point of view.

RN04S18 - Poverty, Imagination and Crisis

Routes out of (child) poverty: Key strategies of parents and professionals
Tineke SCHIETTECAT (Ghent University, Belgium) | tineke.schiettecat@ugent.be
Griet ROETS (Ghent University, Belgium) | griet.roets@ugent.be
Michel VANDENBROECK (Ghent University, Belgium) | michel.vandenbroeck@ugent.be

Internationally, child poverty is a persistent social problem, which has also gained political and scientific attention in recent years. Although it can point out existing inequalities of power and resources, the attention paid to child poverty in contemporary anti-poverty strategies often coincides with a more narrow focus on equalizing developmental opportunities of future adults, parental support and labour market participation, rather than on tackling structural inequalities in the current lifeworlds of both children and their parents. The goals, processes or outcomes of these interventions are, however, rarely negotiated with the families involved. Moreover, there exists a lack of attention to the (interactions between) strategies parents, children and professionals develop in order to realize families' mobility out of poverty and an existence worthy of human dignity. In this presentation we discuss insights of a PhD research project that aims to identify – from different perspectives – the conditions under which social work interventions are interpreted and experienced as supportive leverages in order to realize the welfare of parents and children in poverty situations, and how this relates to the concept of mobility out of poverty. The contribution will discuss some of the results of this research venture, based on the retrospectively documented life trajectories of parents with young children who are living in poverty.

Children and the crisis: indicators, representations
Ana NUNES DE ALMEIDA (Instituto de Ciências Sociais, ULisboa/University of Lisboa, Portugal) | ana@ics.ul.pt

The research project "Children and the Crisis in Portugal: voices of children, public policy and social indicators" (2013) was commissioned by the UNICEF Portuguese Committee and prepared by a team at Instituto de Ciências Sociais, University of Lisbon. It aimed to provide a thorough and updated picture of childhood in Portugal in times of crisis. To give visibility to children's everyday lives and how they are being affected by the crisis meant, first of all, to listen to the children themselves and know their experiences and perceptions about how their everyday experiences (family, food, school, leisure, etc.) have been affected by the drastic drop in family income and rise in unemployment levels in the country. A second purpose was to analyze, based on available recent studies and statistics, the current situation of children in Portuguese society. This more extensive analysis highlighted the evolution of some key indicators over the last few years in the context of economic crisis and austerity measures. The presentation will be based on the qualitative field approach: 77 face-to-face in-depth interviews to children aged 8-12, 14-17, a sample ensuring heterogeneity of childhood conditions (boys and girls, living in urban,sub-urban and rural areas of the North/Centre/South, different family forms (biparental, reconstituted and monoparental families), higher, middle and lower classes. We'll demonstrate that as a word and as a situation, the "crisis"is fully perceived by children, who are able to mention and exemplify impacts in the country and in the life of the Portuguese, but also on their own lives and the lives of those who they know. Several dimensions will be illustrated. However, their appropriation of the crisis does not fit into a single formula,as the context matters: social, age and even gender divides are visible.

Social crisis drawn by crisis: imagination and social knowledge
Gabriela de Pina TREVISAN (CIEC - University of Minho (Portugal), Portugal) | gabriela.trevisan@gmail.com
Manuel Jacinto SARMENTO (CIEC - University of Minho (Portugal), Portugal) | sarmento@ie.uminho.pt

The social and economic crisis that has been underway since 2008, particularly in Southern European countries, has had a special impact in childhood with the rise of poverty and vulnerability indicators and exposure to social risk and loss of rights. Analysis on these incidences has been the focus of a significant number of reports from International NGO’s and academic studies. Less usual however are researches that aim to interpret children’s representations on the crisis and on its specific expressions on their daily lives. This paper looks at children’s representations on the social and economic crisis and is based on previous studies that authors have been conducting on childhood and crisis in Portugal. Here graphic narratives made by children aged 6 to 10 years old, from working class families are analyzed, from two different contexts: children’s after school activities programs and foster care centers. Through these narratives, children express using visual forms their imaginative ways of representing the crisis in which they are simultaneously positioned: as observers, as interpreters and as actors. The methodological device applied to the interpretation of these graphic narratives allows the understanding of meanings only possible through visual expression deriving from children’s ways of imaginative interpretation and transfiguration of social reality. Hence, children’s imagination is a means to access knowledge on society.

Child poverty in the cultural imaginary: digital photographs, dominant stereotypes and the media
Janet FINK (University of Huddersfield, United Kingdom) | j.fink@hud.ac.uk
Helen LOMAX (University of Northampton, United Kingdom) | helen.lomax@northampton.ac.uk

This paper examines the nature and currency of digital images of child poverty in contemporary Britain and explores how particular stereotypes of, for example, blighted urban landscapes and ‘broken families’ have come to dominate depictions of disadvantage in online media reportage. Our argument is situated in a context of rising social inequality across Europe and increasingly punitive and derogatory discourses around poorer people’s lives in the media. The aim of the paper, however, is to consider not only the significance of context for reading images of child poverty but also the value of different theoretical approaches for interrogating processes of interpretation and meaning making. In this we suggest how the language and method of social semiotics (Jewitt and Oyama, 2001) offer useful tools through which to articulate how images of child poverty might provoke particular readings. At the same time, we identify how images are always in internal dialogue with the texts in which they are embedded and in external dialogue with their times (Trachtenberg, 1989). By illustrating the insights to be gained by holding these two approaches in tension within analyses of ‘found’ images, the paper seeks to extend an often neglected theoretical field in the sociology of childhood literature and to encourage more critical reflection on practices of image based research with children and young people.

RN04S19 - Sports and Leisure

Inequalities in children’s participation in organised leisure activities
Daniel STOECKLIN (University of Geneva, Switzerland) | daniel.stoecklin@unige.ch
Jean-Michel BONVIN (University of Geneva, Switzerland) | jean-michel.bonvin@unige.ch
Ayuko SEDOOKA (University of Geneva, Switzerland) | ayuko.sedooka@unige.ch

The paper aims to analyse effective participation in leisure activities through a combined use of the children’s rights (UNCRC) and the capabilities approach, and with a focus on differences
and inequalities among children regarding their agency in formal leisure structures. The first results of an ongoing research in Switzerland are presented. They show that the right to be heard (art. 12 UNCRC) is a formal entitlement that is not transformed into real freedom for all children. In this paper, the authors explore new way of thinking about children's citizenship and participation. The study highlights child participation as a sequential process whereby the actor's reflexivity plays an important role as a converting factor, and thus enriches the theoretical model used in the capabilities approach. A former phase of the research identified four factors (economical, political, organisational and personal) that convert or obstruct the child’s entitlement to participate in the definition of organized leisure activities Two ideal types of participation – top-down and bottom-up – are consolidated along these four factors. Innovative methodology and theoretical framework allow specify child participation and agency through the prism of vulnerability. The results have important implications for the paradigm of the social actor and specifically the theory of child participation.

Leadership culture and the position of girls and young women within elite gymnastics
Jonas STIER (Mälardalen University, Sweden) | jonas.stier@mdh.se
Maria ERIKSSON (Mälardalen University, Sweden) | maria.eriksson@mdh.se

Mainstream discourse on sport and young people brings positive aspects, such as enjoyment, development and health promotion to the fore. Sport is also presumed to be secure. Drawing on a study of leadership culture within Swedish elite gymnastics, the paper examines how coaches and gymnasts approach issues such as food and diet, weight and weight control, injuries and pain, sport relationships (coach-gymnast, coach-gymnast-parents, coach-sport association, etcetera), knowledge and competence, as well as the relationship between leadership culture and policy documents such as the National guidelines for elite gymnastics and the UN convention on the rights of the child. The analysis brings the gendering practices of the coaches – often an adult man - to the fore and indicates that girls and young women are subjected to more control, verbal abuse, and stricter demands on both obedience and diet than boys and young men. Boys and young men seem to be treated more democratically and receive more positive feedback and social support. These results are discussed in relation to the intersection of age and gender inequality, as well as constructions of both gender and the child, for example, how the treatment of girls and young women is associated with a well-established notion that female gymnasts need a child-like body to be able to perform at the elite level. Furthermore, prevailing conceptions of the optimal body of a successful gymnast is discussed, particularly in the light of the pubertal development of girl's' and boys' bodies.

The Role of Youth Clubs in Local Communities: Inclusion or Exclusion of Children and Adolescents?
Vadim VOSKRESENSKIY (National Research University "Higher School of Economics" (Saint Petersburg), Russian Federation) | vadimvoskresenskiy@gmail.com
Svetlana SAVELIEVA (National Research University "Higher School of Economics" (Saint Petersburg), Russian Federation) | sv.savelieva@gmail.com

In the presented paper we discuss the social exclusion/ inclusion mechanisms of children and adolescents forming in communities with different characteristics. We view youth clubs as common places created by local community for children and adolescents with different socioeconomic background where they can communicate, feel a sense of cohesion and support and be controlled by adults.
We use data from the qualitative research in two towns of Leningrad region (Russia): 40 interviews with children and adolescents, their parents and community leaders. This data were completed by results of anthropological observation. Two towns were chosen as contrast cases. One of them (community K) has well developed industry, high level of economic development and social order. Another one (community S) is characterized by economic decline, high unemployment rate and social disorder.

In community K there is a great differentiation between children from high-income families who visit extracurricular activities and children from low-income families visiting free youth clubs. In community S socioeconomic composition is more homogenous and the majority of children go to youth clubs because their parents haven't enough economic resources to pay for special extracurricular activities. As a result, in community K clubs' activity is connected primarily with excluded group of children and directed to support and control them. In disadvantaged community S youth club activities address to children with different social background and characterized by inclusion in community life. Analyzing youth clubs’ daily-life organization, local social and institutional context we explain why youth clubs play such different roles in two local communities.

RN04S20 - Theorising Childhood

**Generagency: Bridging Structure and Agency in Childhood Studies**
Madeleine LEONARD (Queen's University, United Kingdom) | m.leonard@qub.ac.uk

The problematic relationship between structure and agency continues to vex and influence theoretical and empirical articulations of children and childhood. While the 'new sociology of childhood' sought to reposition children as active agents, their location within the structural component of childhood limits their scope for autonomous action. While children are undoubtedly agents, nonetheless they continue to be widely influenced by adults' ideas about childhood and these ideas and the structural generational framework poses limits on children's agency and actions, thereby calling into question their status as autonomous agents. The paper will review how the concept of generational order was an important advance in sociological thinking around adult-child relations and suggests that children's agency needs to be framed within and between generations. This argument will be developed through the author's conceptualisation of generagency which is further subdivided into inter/intra generagency. Intergeneragency sheds light on the macro framework within which children's agency is expressed and practiced. The concept of intra-generagency will be used to suggest that children do not simply internalise adult society but actively select, dilute, contest and challenge aspects of the adult world through creating their own peer cultures. These peer cultures do not exist independently of the adult world and at times they may become appropriated by the adult world but they also have the ongoing ever-present potential of directly and indirectly influencing that adult world. The paper will provide a range of examples to illustrate inter/intra-generagency in action and will assess its potential for moving forward the traditional structure/agency debate.

From childhood to elite professional football: sociological explorations of inclusion and exclusion
Kay TISDALL (University of Edinburgh, United Kingdom) | K.Tisdall@ed.ac.uk
Carole EWART (Ewart Communications) | carole@ewartcc.com
Children’s participation in football (soccer) and especially elite football, is rarely looked at from a children’s rights perspective. It is usually perceived as something to promote – for encouraging social inclusion, community involvement and cohesion (Sanders et al. 2014), for encouraging children’s physical activity and preventing obesity (Dohle and Wansink 2013) – and considerable investment from sports scientists to investigate how to improve training and ultimately sports performance (Haugaasen et al. 2013).

But a more critical view emerges from a Public Petition to the Scottish Parliament, concerned with children’s registrations with professional football clubs. The paper draws on research commissioned by the Scotland’s Commissioner for Children and Young People, which explores children’s experiences and views of such registration, to contribute to the Parliamentary consideration.

As children sign player agreements/contracts with football clubs, the control and interests of the commercial world become prevalent rather than the more usual influences in children’s policy such as education, public health and social inclusion. This raises issues of: children and their families’ legal understandings and relationships; children’s role, responsibilities and identities as current or future workers, celebrities and professional athletes; regimes of ‘elite’ training and surveillance and children’s separation off from school and community participation in sports; and human rights and the state’s relationships with businesses and sports. Sociological resources allow for particular aspects of social inclusion and exclusion to be highlighted, and their implications explored, which are under-recognised in the research literature.

Recognition and capability: alternative or complementary ways of understanding children’s participation and intergenerational relations?
Nigel Patrick THOMAS (University of Central Lancashire, United Kingdom) | npthomas@uclan.ac.uk

Recognition theory, particularly as developed by Honneth, has been put forward as a ‘useful way of thinking’ about children’s participation in society, and more broadly about intergenerational relations. Honneth’s account of the struggle for recognition as the motor both of individual development and of social progress, and his articulation of three distinct modes of recognition, have been seen by a number of authors as providing powerful analytic tools and opening up questions about these questions. At the same time Sen and Nussbaum’s development of capability theory, which brings physical and social resources together with individual capacities to provide a nuanced and complex explanation for social inequalities and an account of what is needed to overcome them, also appears to have great potential for understanding children’s position in societies. Both theories also have an important ethical content. This paper will examine the differences between the two theories and also the potential for using them in combination to provide a richer sociology of children, childhood and intergenerational relations, especially in conditions of local and global inequality.

Childhood Studies and the Sociological Imagination
David OSWELL (Goldsmiths, University of London, United Kingdom) | d.oswell@gold.ac.uk

This paper argues that Childhood Studies has made a profound contribution to the sociological imagination. The paper considers what that contribution has been and whether it is apposite to rethink the form and the medium of that contribution in what many consider to be the social world that we now inhabit.

Firstly, the paper discusses the pre-history to Childhood Studies (late nineteenth century to early 1980s) in terms of its diverse contribution to a sociological imagination. The paper briefly considers this in the context of paediatrics, psychology, anthropology and a normative
sociology. Secondly, the paper looks at the contribution of Childhood Studies (from 1982 to mid-1990s) inasmuch as it provides a particular conceptual underpinning to a social imaginary regarding children and childhood. Central to this second part of the paper will be a question of the co-relation between Childhood Studies and the UNCRC regarding their separate or joint contribution to a sociological imagination. And finally, the paper considers Childhood Studies now in terms of its conceptual engagement with a hybrid ontological world, a methodological complexity, and a biopolitical understanding of social organisation and political agency. Running throughout the paper, and central to the investigation of each sociological moment, will be a consideration of the form and medium of the articulation of Childhood Studies with the sociological imagination.

**JS_RN04+RN28+RN30 - Sport Participation: Means of Social Inclusion or Social Exclusion?**

*When sport is helpful. The role of sport in the after earthquake at L’Aquila (Italy)*

Geraldina ROBERTI (University of L’Aquila, Italy) | geraldina.roberti@univaq.it
Ariela MORTARA (IULM, Italy) | ariela.mortara@iulm.it

The current economic crisis is having very heavy consequences on young people, causing an increasing risk of marginality and social exclusion; at the same time the connections that allowed the sense of belonging and social bonding are loosening, weakening the same youth social integration. In such a framework sport ends up filling a place as never in the past (Dunning, 1999), fostering the ways of youth growth. Indeed, sport plays an important role in the growth and socialization process of young people, letting them explore new perspective of social relations inside peer group (Horne, Tomlison, Whannel, 1999).

In order to investigate the elements characteristic of young sports training, we carried out a qualitative research by means of semi-structured interviews on a specific target group. Our informants are young athletes members of a sport team from a medium Italian town, L’Aquila. This is a very peculiar framework, because in 2009 the town was hit by a serious earthquake that caused hundreds of victims and destroyed sports facilities nearly thoroughly. Our main aim was not only assessing the role of sport in the pathway of social and identity reconstruction after the earthquake, but testing how much sports training can also increase the capability of young people resiliency.

The preliminary results highlighted that sport has been a mean of social integration for the young in L’Aquila indeed, helping them to reconnect those social links that the earthquake had destroyed.

**Anti-radicalisation as aim – social exchange as outcome – an intervention using sport as a means to antiradicalisation**

Annette MICHELSSEN LA COUR (University of Southern Denmark, Denmark) | amlacour@sam.sdu.dk

For decades, sport has been assigned a central role in the promotion of health and social inclusion, in crime prevention etc. Recently, public funding in Denmark has become increasingly directed towards involving non-state actors in welfare policy through sports. Using the perspective of event management and the concept of social exchange this paper describes the
ways in which the DGI, an umbrella association for local sports clubs, in cooperation with civil society actors involves itself in an intervention (Playground) enrolling ethnic children and young ethnic people as participants. The DGI uses sports events to activate children and adolescents in so-called socially disadvantaged areas (DGI Playground) aiming at anti radicalism and at reducing crime rates. The article points to the heterogeneous motives of the actors involved in the events, the social exchange processes leading to the establishment of a social exchange relationship, which offer various subject positions for (the predominantly ethnic minority) children and adolescents participating in the event. The data were generated during a three year long process evaluation using qualitative methods including interviews, focus group interviews, observations and document analysis. Further, the paper discusses the social exchange transactions in which the civil and public rationalities intermesh with the private rationalities and create balanced forms of exchange relationships, during which the participants through their own rationalities act in order to meet their own needs. In doing so the outcome of the event is balanced processes of social exchange between the event managers and the participants. For the participants the outcome is meeting their conditions and this leads to an evaluation of the events as being socially beneficial for them, but not for the event managers nor for the DGI. The needs of the event managers are partly met and they are left with an imperfect outcome and a negative evaluation.

**Visions of Normality: Body Pictures of Boys and Girls**

Nicole KIRCHHOFF (TU Dortmund, Germany) | nicole.kirchhoff@tu-dortmund.de

Boys should be strong, girls should wear skirts - and both should be sportive. In this way I cautiously sum up the first group discussions, which take place within the framework of my dissertation. It is about body pictures of boys and girls in puberty.

My question is originated from a project of the TU Dortmund, which is based on quantitative and qualitative data. This research project studies socialization mechanisms that contribute to varying participation rates of adolescents with migrant backgrounds in schools, in extracurricular exercise and in sports practices. The goal is to evaluate how gender, social class, migration and their intersections predict the socialization process of teenagers in school sport as well as extracurricular sport. The socio-somatic cultures of migrants will be investigated with regard to their construction processes, their possible ethnic connotations accomplished in practices of self-attributions and attributions by others as well as their realization in everyday life. Furthermore we ask how migrants perceive, judge and influence physical education, school sport and extracurricular physical activities through their own decisions.

In my dissertation project I focus on the field of physical culture and body images of adolescents. First experiences in the field show, that talking about the body is difficult - especially for teenagers. Because of that I expand the group discussion by adding the collage as a visualized approach. In this way, results could be gained, which show an idealized orientation of the boys to “neo-traditional” forms of masculinity and femininity. At the same time the model of the petty-bourgeois nuclear family seems to determine the normality of these boys. In my contribution I foremost want to discuss patterns of body-images which I could find in the collages.

**New Alternative Masculinities in Physical Education and school sport**

Guiomar MERODIO (Universitat de Barcelona, Spain) | guiomar.merodio@gmail.com
Marcos CASTRO-SANDÜA (Universitat de Barcelona, Spain) | marcos.castro@ub.edu

Research has provided many evidences that Physical Education (PE) and sport have traditionally privileged certain forms of hegemonic masculinities which contribute, through
concrete behaviours, practices and conceptions, to build an hostile environment in which violence (bullying, harassment) is perceived as normal (Hickey, 2008; O’Connor & Graber, 2014). Girls and boys that do not respond to this hegemonic model are mainly the victims of this violence.

Gathering the contributions of research on masculinities initiated by Gómez (2004), the meta-research conducted by Flecha, Puigvert and Ríos (2013) revealed the difference between Dominant Traditional Masculinities (DTM) and Oppressed Traditional Masculinities (OTM), as the two sides of the traditional and patriarchal model of relationships. In the same vein, the New Alternative Masculinities (NAM) were presented as an alternative model, radically opposed to OTM and DTM, as they are represented by men who are egalitarian, but who are also confident, strong and courageous to confront abuses and inequalities.

Here we present the promotion of NAM through physical activity based on the principles of dialogic learning as the cornerstone for creating a safe environment in PE and school sport, thus turning this area into a means of social integration instead of discrimination or exclusion for children and adolescents. As successful educational actions has demonstrated in schools (Flecha & Soler, 2013), initiatives based on dialogic learning are currently contributing to promote NAM, overcome traditional hegemonic models of masculinity and improving coexistence (Gomez, Munté and Sordé, 2014).
RN05 - Sociology of Consumption

RN05S01 - Food: Meals and Eating Patterns

Changes in the context and conduct of meals in Nordic everyday life
Lotte HOLM (University of Copenhagen, Denmark) | loho@ifro.ku.dk
Drude Skov LAURIDSEN (University of Copenhagen, Denmark) | dl@ifro.ku.dk
Thomas Bøker LUND (University of Copenhagen, Denmark) | tblu@ifro.ku.dk
Johanna MÄKELÄ (University of Helsinki, Finland) | johanna.m.makela@helsinki.fi
Mari NIVA (University of Helsinki, Finland) | mari.niva@helsinki.fi
Jukka Olavi GRONOW (University of Helsinki, Finland) | jukka.gronow@helsinki.fi

Following the sociological idea of the meal as the epitome of the social, this paper addresses social aspects of eating in modern everyday life. Meals are guided by norms and conventions for table manners varying with social status and class, and meal practices may range from the loose and informal to the strict and regulated. Although hypotheses about grazing and individualization have flourished during the last decades, empirical evidence rather points to stability in, e.g., the sharing of meals in families. However, less is known as to whether the etiquettes surrounding the eating situation and the conduct of meals are changing.

In this paper we analyze changes in the social context of and the activities during eating in four Nordic countries since the late 1990s. We investigate where and with whom people eat, the duration, sitting arrangements and parallel activities to eating, and analyze social differentiations related to these. Inspired by post-Elias-theories of informalization (Cas Wouters) and flexibilisation (Stephen Mennell) we ask: Are table manners becoming more informal? Are social differentiations diminishing?

The analysis is based on two comparative surveys studying meals in Nordic everyday life, conducted in 1997 and 2012 respectively. Representative samples of four Nordic populations (N=4823 and 8248) were interviewed about details of one day of eating.

Food consumption at the intersection of gender and marital status: the case of vegetable consumption in a large epidemiologic cohort in France
Marie PLESSZ (INRA, France) | marie.plessz@ivry.inra.fr
Alice GUEGUEN (Inserm, France) | alice.gueguen@inserm.fr

Over the last decades, a way of reinventing the study of social inequalities has been intersectionality. This theoretical framework has highlighted that women experience various forms of domination according to their class position, ethnic origin or age. The related studies, however, focused mainly on the public sphere (discriminations, civil and political rights, labour market).

How is this approach relevant for the study of domestic practices such as food consumption? Food practices differ according to gender, age, class and ethnicity, as well as according to marital status.

In this communication we use the intersectionality approach to analyse the interplay of gender and marital status in the quantitative analysis of food practices. Specifically we study vegetable consumption in the GAZEL cohort, consisting of 16,000 people who were employees of the French national gas and electricity company in 1989 and who have been followed-up since then.

Repeated data on respondents’ food practices allow to examining whether eating vegetables everyday depends on marital status for men and for women. We are able to estimate the impact
of losing one’s partner, according to gender. Our conclusion is that men’s vegetable consumption depends more on the presence of a spouse. This suggests that vegetable consumption is influenced by the intersection of gender and marital status. Existing research on longevity and morbidity of men and women according to their marital status suggests that such approach could be relevant for a wider array of practices related to health.

**Places of work or places of eating? Canteens and the everyday practices of workplace food**

*Jonathan EVERTS (University Bonn, Germany) | jeverts@uni-bonn.de*
*Christine WENZL (University Bonn, Germany) | cwenzl@uni-bonn.de*

This paper examines and contextualises the practices of eating in workplace canteens. We consider canteens as places, where highly complex practices of food provisioning and eating are orchestrated. We seek to understand the making of canteens as places of work and as places of eating through social practices. More specifically, we propose to analyse canteens from two angles: First, as a site of eating, comprehended as a manifold social practices linked to and organized around the consumption of canteen food, and second, as a microcosm in itself. Drawing on the vocabulary of Schatzki’s (2002) site ontology, we highlight the multiple entanglements of social practices and material arrangements of the canteen. Our research is embedded within the ERA-Net project on Food, Convenience and Sustainability (FOCAS) with a strong focus on empirical research in different contexts of convenience/convenient food. We will present some preliminary findings of on-going ethnographic research within workplace canteens in two mid-sized German towns.

**Spending and time management in households: deciding to eat out**

*Cecilia DÍAZ-MÉNDEZ (University of Oviedo, Spain) | cecilia@uniovi.es*
*Elio CASTAÑO (University of Oviedo, Spain) | cecilia@uniovi.es*

Eating away from home is usually analysed like an economical and individual behaviour. This point of view is partial because it forgets its more social and dynamic dimension. With data gathered in Spain, we can show that eating out is a decision associated with the general food organization at home. It is a strategy for saving or spending money and an assessment about the time used shopping, cooking and eating. This decision reproduces the home role structure. Eating out could have parental, leisure or work motivations, and be quite different, but they are all integrated in the household domestic logic.

This essay shows the results of a national study, with both qualitative and quantitative techniques, carried out in Spain in 2014. In this paper we present the data obtained with in depth interviews to household members living in cities of different sizes. This research was funded by the 2012 Research National Plan of the Spanish Government.

**RN05S02 - Ethical and Political Consumption**

**Taking a stand through food choices? Characteristics of political food consumption and consumers in Finland**

*Mari NIVA (University of Helsinki, Finland) | mari.niva@helsinki.fi*
*Piia Tuuli JALLINOJA (University of Helsinki, Finland) | piia.jallinoja@helsinki.fi*

In western societies, the politicization of food and eating can today be seen not only in food policies but also in everyday life and practices of eating. People increasingly take a stand on the
politics of food by boycotting or boycotting foodstuffs based on ethical, social or environmental considerations. Unlike other Nordic countries, political consumption of food has been an understudied subject in the Finnish context. In this study, we examine the characteristics of political food consumption and political food consumers in Finland.

The analysis is based on an Internet-based population survey collected in December 2014 (N=1021). The data are representative of the Finnish population in terms of age, gender and region. By means of multivariate statistical analysis, we will look at how socio-economic background factors, food consumption patterns as well as political and food-related attitudes are associated with practices that can be characterized as ‘political’.

Our preliminary exploration of the data suggests that a minority of the respondents can be characterised as political consumers: only 14% reported often boycotting or boycotting certain food products because of ethical, political or environmental reasons. Approximately one-third reported doing this occasionally. Women, the highly educated and those with a left-wing political orientation were more often political consumers than others. Political food consumption was also related to buying organic foods and fair trade products, and to supporting political measures for improving environmental, animal welfare and societal justice aspects of food production and consumption.

Towards an Integrative Explanation of Fair Trade Consumption: Moving beyond NAM, VBN and TPB

Patrick SCHENK (University of Zurich, Switzerland) | schenk@soziologie.uzh.ch

In the last two decades, sociologists have established a new field of research at the intersection of the sociology of consumption and political sociology, the field of political consumption. One specific example of political consumption is the consumption of Fair Trade (FT) products. Up to this point, a large body with the aim of explaining FT consumption has developed. However, most of the research on FT consumption has focused on different explanatory variables without investigating the interrelations between behavioral determinants such as attitudes, norms or values. In the few cases where a mechanism based explanation has been attempted, no comparison of different theoretically derived models has been undertaken. In my contribution, I address this gap by firstly testing three different theories for the consumption of fair trade products: The Norm Activation Model (NAM), the Value-Belief-Norm Model (VBN) and the Theory of Planned Behavior (TPB). I will argue that although each of these theories identifies crucial antecedents of FT consumption, each of them suffers from a theoretical blind spot. Therefore, I secondly propose an integrative explanation of FT consumption that draws on each of these theories. This paper thus contributes to current research in that it not only provides a comparison of different structural models but also moves towards an integrative model that allows a mechanism based explanation of FT consumption which goes beyond an additive list of explanatory factors. I use data from a random sample of inhabitants of Zurich (Switzerland) and Structural Equation Models for model testing.

Does political orientation associate with consumer attitudes? Examining Finnish consumers, 1999–2014

Aki KOIVULA (University of Turku, Finland) | akjeko@utu.fi
Pekka RÄSÄNEN (University of Turku, Finland) | pekka.rasanen@utu.fi
Arttu SAARINEN (University of Turku, Finland) | aosaar@utu.fi

According to Max Weber, an individual’s position in the social strata results from three equally important factors. These factors can be conceptualized in terms of class, status, and political party. For Weber, party membership was an expression of power, which did not necessarily
associate with class or status. At the same time, however, the explanatory mechanism of party was considered very similar to that of class and status. Party, class, and status groups consist of people that, in terms of specific interests, have the same preference. In more recent discussions in the sociology of consumption, the original distinctions between class, status and party have largely been rejected. It has also been suggested that party membership, or political orientation, has very little to do with consumption. In this paper we argue that political orientation continues to be highly effective factors when analyzing individuals’ consumer attitudes. Our data are derived from comparable surveys, collected in Finland in 1999 (n=2,492), 2004 (n=3,448), 2009 (n=1,202), and 2014 (n=1,351). All samples consist of respondents aged 18 to 74 years, thus providing an extensive look at the phenomenon. The analysis focuses on temporal and socio-demographic differences in attitudes towards media and daily consumer practices. In addition to political orientation, our independent variables include age, gender, education, residence, and income.

Smartphone apps as ethical consumption tools: Materialities, moralities and agency
Christian FUENTES (University of Gothenburg, Sweden) | christian.fuentes@cfk.gu.se
Niklas HANSSON (University of Gothenburg, Sweden) | niklas.hansson@cfk.gu.se

In this paper we examine ethical consumption apps as market devices. Drawing on an ethnographic study of three Swedish ethical consumption apps this paper argues that these apps work to promote various forms of ethical consumption by socio-materially encouraging and enabling the formation of ethical consumers.

More specifically, these smartphone apps work to encourage a number of ethical consumption practices while simultaneously affording consumers the resources needed to carry out these practices. The apps are designed to equip consumers with the cognitive, moral, affective and symbolic resources required to become an ethical consumer. They are scripted to (and also function to) solve a number of problems connected to ethical consumption by adding to consumers’ capacities in various ways.

The analysis shows the dynamics involved in the dispersion and successful implementation of ethical consumption apps. But it also contributes to existing research by bringing to fore the importance of acknowledging the materiality and practices in the analysis of ethical consumption. To become an ethical consumer, the analysis shows, one needs to develop a range of practical and symbolic capabilities. The formation ethical consumer agency is carried in relation to a socio-material landscape and often with the assistance of material tools. Ethical consumers are thus in this analysis neither individual decision-makers with a specific set of ethical beliefs nor socio-cultural beings producing ethical identities but instead hybrids: human-machine assemblages configured to accomplish ethical consumption practices.

“Ethic by the Shopping Trolley“— Sustainable Awareness or elitist Lifestyle and differentiating Characteristic?
Jelena HENKEL-OTTO (Justus-Liebig-University Giessen, Germany, Germany) | jelena.henkel@sowi.uni-giessen.de

The years of plenty have passed! – at least this is the impression given by the rising demand of sustainable products. Entrepreneurs increasingly develop and market sustainable products accepted by consumers. It seems that the “throwaway society” is on the retreat and a sustainable awareness is establishing. This suspicion is supported by the high rating of environmental protection expressing in surveys. Moreover, the LOHAS-group is growing continuously. But taking a closer look at these processes, it can be seen that despite the high
survey results regarding environmental protection, the share of those who are actively engaging in environmental protection is low. Furthermore, personal consumption is often not associated with environmental issues covered by the media. In the wake of this there is no consumption reduction in society, but rather a different consumption can be discerned. It seems that consumption is still a central issue in society. Therefore consumption still plays a critical role for identity construction and social stratification too. Due to the fact that many sustainable products are more expensive than non-sustainable products, sustainable products are frequently reserved to higher-income classes. The question therefore arises whether sustainable consumption replaces mass consumption – according to T. Veblen, P. Bourdieu et al – in terms of social prestige and therefore also relating to identity construction, social localization and differentiating characteristic? Does the trend towards sustainable consumption mean nothing else than an opportunity to express identity, lifestyle and social status under the conditions of a (post-)modern consumer society creating differences and inequalities? What do these patterns tell us about contemporary and future society?

RN05S03 - Consumption Inequalities and Exclusions I

Exploring the phenomenon of Spanish Time Banks in times of crisis
Carmen VALOR (Universidad Pontificia Comillas, Spain) | cvalor@upcomillas.es
Eleni PAPAOIKONOMOU (Universidad Rovira i Virgili) | eleni.papaoikonomou@urv.cat

Lately, Spanish time banks (TB) have gained popularity in international media and among policy makers, presented as a tool for social inclusion that allows marginalised individuals to counteract the negative effects of the crisis. However, previous literature (e.g. Dittmer, 2014; North, 2011) questions their potential. This paper reviews existing literature on TB and presents the results of a mixed method study conducted in Spain (in-depth interviews with time brokers of 27 Spanish TB; an online survey of 247 TB users).

First, Spanish TB appear to be fragmented; although they share some commonalities, they pursue different goals and are organised very differently. TB emerge as “chameleonic” devices, instrumental for different purposes. We provide a taxonomy of Spanish TB using three criteria: (i) type of promoter, (ii) organisation and functioning, (iii) means of communication, because these emerge as the criteria that best capture differences among them. Also, we observe that Spanish TB have attracted mainstream users, instead of households stricken by poverty, unemployment and vulnerability, that see in TB a kaleidoscopic project, combining political, social, and, to an extent, economic dimensions.

Then, our findings evidence that the number of exchanges is very limited and most participants have never carried out a transaction. This is interpreted along the lines of a mismatch offer-demand, inherent inflexibilities and inefficiencies of the TB models, and users’ “psychological barriers”, e.g. the reluctance to ask for services.

This study contends that for various reasons users do not see TB as a source of use value, thus the social and political value of the project is jeopardised. So, a paradox emerges: users join because they are attracted by the social and political dimension of the project, but unless TB become a way of meeting users’ needs, they will not fulfill their potential.

Reducing inequalities: the role of Internet in the construction of a responsible lifestyle
Ariela MORTARA (IULM University, Italy) | ariela.mortara@iulm.it
Geraldina ROBERTI (Universita degli Studi dell'Aquila (Italy)) | geraldina.roberti@univaq.it

In recent years, the adoption of a responsible lifestyle has become an issue both in public and private discourses. Governments and citizens have become more and more involved in fostering responsible behaviour and engaging in responsible practices, driven by the necessity to save natural resources, preserve the integrity of natural cycles, prevent the spreading of toxic substances in the environment, but also to assure fair labour conditions all over the word and to reduce the social inequality. Indeed social inequality is now not any more typical of third world countries only, but, boosted by the last years of economic crisis, is also found in the streets of the Western metropolis.

Among the different mass media that are seen as an important factor in influencing opinions, habits, and actions of the recipients, in the last years, Internet, as a new media, has gained a very important role (Reisch, 2001).

The paper analyses the potential impact and the possible role of Internet in encouraging consumers towards more responsible practices, leading to a more efficient and sufficient lifestyle (Langley, van den Broek, 2010). An explorative qualitative study has been conducted in order to understand which are the online available resources and what kind of support they offer to Italian citizens and customers willing to engage in a more responsible lifestyle.

Consumption of the poor in Germany: projecting the development until 2030
Thomas DROSDOWSKI (GWS mbH, Germany) | drosdowski@gws-os.com
Tobias RITTER (ISF München, Germany) | tobias.ritter@isf-muenchen.de
Britta STÖVER (GWS mbH, Germany) | stoever@gws-os.com

Recent macroeconomic data for Germany reveal improvements in terms of employment and material situation of private households. These successes have apparently shifted public attention even further away from distributional issues. However, income inequality remains high and rising energy prices, inner-city apartment rents or purchasing other essential goods such as food pose a significant burden for the households in the bottom tail of the income distribution. The purpose of this paper is the analysis of the expenditure structures of the bottom-quintile households of five household groups differentiated by size (one to five and more), in money terms and in relation to income. Moreover, given projected income components and expenditures until 2030, future developments and disparities will be discussed as well.

The results are obtained by using the macroeconometric input-output model INFORGE with a household module DEMOS designed to project socio-economic developments and perform policy simulations. Its data basis includes input from the German Income and Expenditure Survey from 2008 and various official economic statistics. The modelling tools have been extensively used in a variety of socio-economic studies including the Socioeconomic Reporting for Germany (soeb) over the last 10 years.

The expected results of the study are quantitative insights into expenditures and burdens of low-income households, their development over time and divergence (or convergence?) in relation
to household average for a given household size. Additionally, the results are expected to offer further modelling possibilities related to simulation of social policies, macroeconomic shocks or alternative behavioral assumptions.

**Consumer Acculturation and Ethnic Group Inequality: A Relational Configuration Analysis**

Marius K. LUEDICKE (Cass Business School, City University London, United Kingdom) | m.luedicke@city.ac.uk

Inequality between consumer groups has existed since the emergence of consumption as a symbolic practice. However, the forces that produce inequalities are constantly shifting. One domain in which inequality is particularly apparent is the domain of relationships that form immigrant (minority) and indigenous (majority) consumer groups. The point of departure for this study is to explore how consumption affects the relationships of ethnic groups and, more specifically, how indigenes’ responses to immigrant consumption practices foster inequality. Among consumer acculturation researchers who publish in outlets such as the Journal of Consumer Research or Consumption, Markets & Culture, consumer acculturation is typically theorized as a project that immigrants pursue when adjusting their consumer identities and practices to unfamiliar sociocultural environments. The present article broadens this view by conceptualizing consumer acculturation as a relational, interactive adaptation process that involves not only immigrant consumption practices but also indigenes who interpret and adjust to these practices, thereby shaping the paths of possibility for mutual adaptation. Based on John Fiske’s relational models theory and a relational configuration analysis derived from his work, the author explains how indigenes in a rural European town interpret certain immigrant consumption practices as manifestations of a gradual sell-out of the indigenous community, a crumbling of their authority, a violation of equality rules, and of indigenes being torn between contradictory micro- and macro-social morals. The article thus contributes a broader conceptualization of consumer acculturation, highlights four sources of ethnic group conflict in a consumer acculturation context, and demonstrates the epistemic value of Fiskenian relational configuration analysis for sociological consumer research.

**Is the Working-class Body the ‘Identity Project’? Social Inequalities and the Significance of Physical Appearance**

Dorota OLKO (University of Warsaw, Poland) | dorota.olko@gmail.com

Individual choice is an ideal celebrated in nowadays culture (Mol 2013), incorporated in practices of everyday life. According to hegemonic cultural message people create themselves through countless choices and they have no other option than to nurture their individualism. One of the objects of reflexive techniques is the body, presented in popular culture as ‘identity project’. The relation between the body and the identity is defined by consumption of cosmetics, clothes, vast range of beauty services etc. However, some sociologists confront the utopian vision of lack of determination in shaping the body and point out that such practices are conditioned by social inequalities (Smith, Holm 2010) or class habitus (Bourdieu 1984). The hegemonic ideal of ‘plastic’ body – disciplined and shaped by individual, instrumental strategies – is rooted in the ethos of the middle class, for which body work is evidence of their struggle to improve the ‘self’ (Adkins 2010).

The paper focuses on the significance of physical appearance and practices aimed at its improvement in the working-class men and women’s everyday life. Using the empirical data from individual interviews and case studies I explore the meanings and dispositions behind respondents’ consumption strategies in the field of fashion, cosmetics and body care, as well as...
their opinions on the hegemonic images of beauty and ways of caring for body. The analysis is aimed to answer the question, whether the individualistic ethos diffuse (being a tool of domination) into working class bodily practices or if they result from other values, rooted in working class’ habitus.

RN05S04 - Sustainable Practices and Change

Eating less meat? Changing consumer practices as a sustainability issue
Pasi POHJOLAINEN (University of Turku, Finland) | pasi.j.pohjolainen@utu.fi
Pekka JOKINEN (University of Tampere, Finland) | pekka.t.jokinen@uta.fi

The growing global consumption of animal based foods is one of the biggest sustainability challenges within the food sector. Thus, reducing high meat consumption in the Western world is an essential pathway to sustainability. To achieve this target the different processes embedded in the food system should be understood more profoundly. There is evidence of wide consumer interest in reducing meat consumption but simultaneously a lot of uncertainty surrounding the establishment and consequences of new practices.

This paper deals with the factors that drive and hinder meat reduction aspirations as seen from consumer’s lifeworld. These include individual, social and political considerations that are typically interlinked, context specific and prone to constant transformation, yet simultaneously resisting change. We focus on the practices involved in meat consumption in everyday life surroundings and on the ways these practices can change and evolve in time. We also explore how consumers position their role and operating space within the food system and whether they see meat consumption as a politicised sustainability question.

On the basis of focus group interviews and both quantitative and qualitative content analyses, we concentrate on the high meat consumers who either are considering reducing their meat consumption or have already made such consumption changes. In this way the attention is on the nexus where new practices are essentially established.

How to measure sustainable consumption?
Torvald TANGELAND (National Institute for Consumer Research (SIFO), Norway) | torvald.tangeland@sifo.no
Gunnar VITTERSØ (National Institute for Consumer Research (SIFO), Norway) | gunnar.vitterso@sifo.no
Nina HEIDENSTRØM (National Institute for Consumer Research (SIFO), Norway) | nina.heidenstrom@sifo.no

Consumption of raw materials and energy is increasing as a consequence of more resource intensive lifestyles and population growth. In post-industrialised societies, the consumption level is non-sustainable and above the carrying capacity of the Earth. However, it is in many ways impossible, and to some degree uninteresting, to estimate whether consumption is at a sustainable level. What is of more relevance for policy-making, and possible to identify, is in which direction consumption is going regarding sustainability, and what measures have been effective.

In this paper we ask how the private consumption in Norway has developed regarding sustainability in the periods 2002-2007 and 2008-2014. The paper has two aims: (1) To develop a methodology for evaluating the impact of changes in consumption on the societal sustainability level with an emphasis on environment and climate. The impact of changes in consumption is a function of the type of change (product replacement, reorganization of consumption and changing in consumption level) and the consequences that these changes
have on the environment and climate (from local to global. (2) To apply this method in analysing statistics from Statistics Norway that describes the development in private consumption in Norway concentrating on three important consumption areas: energy, transportation and food. The results from this paper may be utilized to evaluate and develop more efficient and action oriented sustainability policies in order to change consumption in a more sustainable direction in both a short and long-term perspective.

**Household Sharing and Consumption: Solo Living, Sustainability and Domestic Economies of Scale**

*Luke YATES (University of Manchester, United Kingdom) | luke.s.yates@manchester.ac.uk*

Recently, sociologists, economists and environmental scientists have focused on households, suggesting that their reducing size in average number of inhabitants has implications for environmental sustainability due to losses in economies of scale. Findings suggest that resources are shared more or more efficiently in large households, without specifying how. This paper analyses and theorises ‘shared’ domestic consumption, drawing on literature about consumption practices and sustainability, one-person households, and sharing. Recent survey data relating to meals and domestic laundry, two sociologically significant and resource-intensive spheres of domestic activity, are explored, with particular attention to sharing and the differences between one-person and multiple-person households. Drawing on these examples, three ‘economies of resource sharing’ significant for household resource consumption are identified. In concluding, it is argued that household size, allied to dynamics of state, market and community provisioning of goods and services, affects the resource intensity of production and consumption through modes of resource sharing attainable in both the domestic and public sphere.

**The split between ecological movements of “green growth” and “degrowth” and its impact on sustainable change: Press’s coverage of electric vehicles (EVs) and care sharing as case**

*Anita BORCH (National Institute for Consumer Research, Norway) | anita.borch@sifo.no*

Most research on ecological movements address the movements’ causes rather than their effects on sustainable change. To contribute to fill this gap of knowledge, this paper deals with two ecological, partially overlapping and competing movements: the “green growth” movement, which main aim is to reduce the CO2 emission through technological innovations, and the “degrowth” movement, which primarily goal is to reduce the CO2 emission through reorganization or reduction of current consumption patterns. The study is based on an analysis of the Norwegian press’s coverage of EVs and car sharing. A basic assumption is that spokespersons of EVs tend to be adherents of the green growth movements, whereas spokesperson promoting car sharing tend to be part of the degrowth movement. The analysis indicates that the number of press articles dealing with EVs is much higher than the number of articles dealing with car sharing, which may reflect that the green growth movement in the Norwegian society is stronger than the degrowth movement. However, the analysis also indicates that spokespersons of EVs increasingly meet opposition from spokespersons of the degrowth movement, which imply that the dominance of the green growth movement in these days is declining, at least in the Norwegian transport sector. The impact of this tendency on the reduction of CO2 in the Norwegian transport sector is discussed.

**Friend or foe? Sustainable consumption and political activism.**
Frederic VANDERMOERE (University of Antwerp, Belgium) | Frederic.Vandermoere@Uantwerpen.be

In this presentation the results will be reported of a statistical study on the relationship between conscious consumption and political activism. The main focus will relate to the question: Can sustainable consumption practices lead to political engagement? Building on previous research findings (cf. e.g. Stolle, Hooghe, & Micheletti, 2005; Willis & Schor, 2012; Lorenzen, 2012) specific attention will be given to the crowding out and crowding in hypotheses. The first hypothesis is driven by a conflict view as it assumes that conscious consumerism displaces the willingness to act collectively. In contrast, the latter hypothesis – crowding in - frames conscious consumption as a potential political act whereby sustainable consumption practices at the individual scale may trigger political acts such as signing a petition, taking part in a demonstration, and voting. To address this issue data will be analyzed that stem from an online survey that was recently organized in Germany between June and July 2014 (N=936). Preliminary findings suggest that the strength of the relationship between sustainable consumption and political activism is depending on the type of consumption practice on the one hand, and different measures of socioeconomic status on the other.

Media-ating practices: tracing the development of (un)sustainable consumption through media
Tullia JACK (Lund University, Sweden) | tullia.jack@soc.lu.se

It is increasingly recognised that habitual, inconspicuous consumption is ingrained in daily practices (Warde, 2011); as such creating pro-environmental default practices requires an understanding of people, everyday life and conventions. Household rituals, amongst them cleaning bodies and homes, consume significant volumes of energy, water and chemicals. Yet inconspicuous practices, such as these, are often overlooked in approaches to sustainability, compared to conspicuous actions like recycling or acquisition of goods (Shove and Warde, 2002).

The cultural context that underpins current cleaning routines of homes and bodies is represented in popular media through the advertising and marketing industries. On television and in lifestyle magazines there is a high proportion of sanitation advertising that overtly aims to increase consumption of cleanliness paraphernalia, however it is unclear how these interact with cleanliness conventions. As the world strains to accommodate up to 9 billion people in the coming years, we will face increasing resource shortages, droughts, energy supply, and food security. One way of saving water, energy and chemicals is through reconsidering our cleanliness expectations to bring them into line with locally available resources. Compounding the increasing population is the ratcheting upwards of cleanliness expectations (Shove, 2003),
however cleanliness narratives are simultaneous and interactive and there are many variations in the way that cleanliness is performed. Understanding how conventions change is key. Changing cleanliness conventions are interrogated in this paper using television and magazine advertisements from Australia, India and Sweden over the past 20 years. The advertising context is used to gain insights into how discourses have changed geographically and temporally. Alternative discourses exist around household cleanliness practices, both relating to, and competing with each other, in both a domestic, and also the broader sustainability and health discourses. These alternatives arise in different iterations in media and in everyday life, both drawing from and adding to collective conventions. The use of advertising as a departure point for an analysis of cleanliness narratives, proves fertile ground for ascertaining ways that advertising interacts with changing conventions, and implicated consumption practices.

Methodology

Social practice theory is a useful tool in exploring sustainability transitions. However, there is a case to be made that it is built asymmetrically on what people ‘do’, rather than on the meanings that propel daily life (Southerton et al., 2012: 240). Problems also arise from the SPTs differentiation between practice as performance (individual) and practice as entity (social). While Nicolini (2012) has made some headway with a zooming-in, zooming-out framework, investigating the individual moments still form the bulk of suggested tools. While this fits with the proposition that a practice is a ‘pattern which can be filled out by a multitude of single and often unique actions’ (Reckwitz, 2002: 250), there is also a need to think about, and experiment with, methods to collect qualitative data on the entity level, developing some framework to gather data on macro social phenomena.

Gathering data at the macro level is important if research is to understand the systems that structure performances. While there is no end in sight to the theoretical question of whether or not agency is an illusion, empirically at least, sovereignty changes over the distance between researcher and unit of study: ‘agency’ increases with in-depth, small samples, studies at close quarters when the observer is explicitly entangled in the co-creation of data, whereas ‘structure’ increases when the sample size grows, distances become longer, and the observer uses ‘mechanical and deterministic explanatory frames.’ (Fuchs, 2001: 40). The fullness of conventions that underpin social practices may be more easily observed from a distance, but this could come at the cost of qualitative understanding, and may miss propulsive meanings of aggregated social practices. In everyday life there is an observable coherence in ways of doing laundry between Australia (where I grew up), India (where I have travelled) and Sweden (where I now live), so I assume there is some structure at play in the reproduction of laundry conventions. The challenge, then, is to gather data on the structuring entities: ‘[a]rguing that such a structure is there is one thing, representing it as part of empirical research is another' (Nicolini, 2012: 181). To borrow an analogy from physics; the convention is the wave that changes over time and space and the individual is the particle being able to relatively account for their practices. If we look at the person we see the performance, but know less about the ways that the performances converge and change. Even if we do ask someone to account for their practices they may not have the language to tell us as ‘[w]e will not ordinarily ask another person why he or she engages in an activity which is conventional for the group or culture of which that individual is a member.’ (Giddens, 1984: 6). Yes, people can talk about their practices in surprisingly reflexive ways (Hitchings, 2012), but these accounts are so deeply embedded in their conventions that a researcher cannot help but to over-attribute agential decision making power to individuals. Data at the entity-level representations of everyday life are also needed to triangulate performance data and get closer to understanding social wholes.

With this in mind, I use television and magazine advertisements as a data source as it has both agential and structural properties: an aggregated macro-representation of an idealised individual practice. Situated inside the social world, advert makers are so entangled within culture that even as they try and ‘steer’ consumer behavior, they cannot help but reflect modes of
appropriate conduct back into culture; leaving residues of how ‘ideal’ practices exist. Advertising contains further promise as performers absorb cultural conventions as the basis for individual reproduction in everyday life; part of the absorption must occur through exposure accepted ways-of-doing, thus this empirical material promise a still-frame of the entanglement of entity and performance. A glimpse of description creating. A creation describing.

In this paper television and magazine advertisements, are used as the entry point into the entanglement of entity, performance and media. These were viewed using a mediated discourse analysis (Nicolini, 2012: Ch 8; Cameron, 2001). Data is collected from Australia, India and Sweden in 2015 from both magazines and television. Random samples of representative media are coded for themes and used to make descriptions of cleanliness conventions in the three countries. A temporal element is also explored using archival magazines, and analysing different cleanliness advertisements over the past 20 years. This provides insight into ways that cleanliness discourse changes across time and space, providing a departure point for considering ways that advertising interacts with cleanliness conventions, a question important in exploring sustainable consumption.

Will the Prosumer Survive in Digital Society, or it is/was just an utopia
Piergiorgio DEGLI ESPOSTI (university of bologna, Italy) | pg.degliesposti@unibo.it

Undeniably the increasing digitization of products and services, as well as many aspects of contemporary life changes the relationship between consumption and production, to the point that the role of the prosumer and the concept of prosumerism arise as interpretive paradigms of a reality in transition. The phenomenon of prosumerism in the digital society becomes ever more widespread and pervasive; despite not being a historically new phenomenon it has specific features in the global society, on the net and in the sphere of consumption.

The objective of this contribution is to describe and analyze the role of the prosumer in contemporary society, through analysis of the literature and the main theoretical sociological approaches. To this end, and as a starting point of our analysis, we believe it appropriate to reference the global society as the framework within which this and other complex social phenomena are the lifeblood and environment in which they spread. The heart of our subject, analysis of the role of the prosumer, hovering between being a producer and consumer, a representation of the contradiction of being a qualified subversive subject in respect of capitalist logic whilst at the same time being increasingly commercialized even more than in traditional discussions on brand.

Central to the debate in question we feel it is important to consider how the agency, consistent or deviant compared to predefined templates of production and consumption, leads us to propose those which are our ideals of contemporary prosumer: Maker, Fixer, Tester and Sharer. Based on what is seen as the principle action contribution of the subject we can categorize them according to the types proposed.

Our theoretical conception is that the role of the prosumer is the expression of a contradiction, a qualified, but at the same time, exploited person, voluntarily and forcibly, free and yet imprisoned. Prosumer as a result of a multiple utopian vision derived from the brandtopia, the cyberutopia, the Californian ideology and from the ecologist utopia. A subject who molds his awareness of freedom in the marketplace through the market, only partially aware of being qualified in some contexts and exploited in others even more than in traditional capitalist logic. Thus the proposed models cannot be defined as pure but as hybrids, since prosumeristic action does not necessarily exclude one from the other.

The conclusion of the study places its emphasis on the relationship between man and machine through the theoretical proposal of Ritzer who speculates upon the death of the human prosumer and the advent of prosuming machines, as opposed to our more utopian and romantic
vision in which the prosumer can still find space and margins of resistance through its soft power.

Performing realities - experts taking on domestic household practices
Eivind JACOBSEN (National institute for consumer research, Norway) | eivind.jacobsen@sifo.no

For more than a century home economics has had an explicit performative aim. Accordingly, science is not primarily about describing and explaining realities, but about changing them. Domestic household practices are mapped, measured and analyzed in order to improve upon habits, understandings and materials. This paper explores how this is done in regard to domestic food safety issues, where the instruments and methodologies of science leave marks in everyday kitchen practices as well as in its material premises. Drawing on practice theory as well as STS, Jacobsen discusses tensions that emerge when these science based realities meet up with the realities done in domestic everyday practices. The paper concludes reflecting on how to surpass sciences' paternalistic legacy without throwing away its potential to improve upon peoples lives.

Portugal Village. Material culture, migration and difference.
Marta VILAR ROSLAES (University of Lisbon, ICS, Portugal) | marta.rosales@ics.ul.pt

The “Portuguese Community” of Toronto integrates three generations of migrants who, during the second half of the twentieth century, abandoned Portugal and the Azores. Although the community presents the classic features of most large migrant contingents (spatial concentration, associations, cultural agenda of its own, alternative media productions), it shows the emergence of new distinctive signs. Less based on ethnicity than on class, gender, age, time of migration, local context of origin and social affiliation they are affecting, not only the relationship of the Portuguese with the city and its population, but also the ways the group sees itself as such, since it promotes original forms of identification beyond the ones based on ethnicity.

Grounded on three years of ethnographic fieldwork, this paper aims contributing to the investigation of these new processes of differentiation and inequality their impacts in terms of identification and interaction and how they coexist and negotiate with more “classic” configurations of difference and affiliation. Through a focus on everyday domestic consumption practices and mundane material culture, the paper unfolds and discusses the existing heterogeneity of the “Portuguese Community” in Toronto, its foundations and materializations. More specifically, it will explore:

a) The importance of class, gender, age and time of migration in the migrants’ positioning strategies and its impacts in terms of integration, belonging and appropriation of Toronto;
b) the work of everyday key consumption practices (food, clothes, housing, transportation) in the production and management of identification and difference.

Shopping, storage and gift-giving: An Ethnography of Oniomania
Liviu CHELCEA (University of Bucharest, Romania) | liviu.chelcea@sas.unibuc.ro

The existing studies of oniomania (shopoholism) have produced valuable understandings of the psychological, cultural, financial, legal causes and consequences of this process. Nonetheless, partially because they accentuate the potentially destructive and dysfunctional dimension of this way of life, such studies tend to overlook the way these people actually use these objects. One such overlooked social practice is the way oniomanics store, handle and get rid of the objects that they buy. Disposal of acquired objects so as to create room for new ones is a crucial
institution that makes possible this way of life. I will discuss how the disposal of these objects turns into a range of strategies ranging from gift-giving behavior to re-commodification. The study is based on interviews and observation of the behavior of people who engage in excess buying in Bucharest, Romania. This cycle of shopping and gift-giving is an excellent window to revisit the gift-giving – commodity discussion in anthropology. Existing studies of the relation between gift and commodities exchange emphasize speciation (Karl Polanyi), replacement (Karl Marx, articulation theories), coexistence (Jean Baudrillard, Joh Davis), hybridization (Gretchen Herrman on garage sales) or survival of pockets of gift-exchange in market economies (James Carrier). The process of excessive buying, thorough the imagined and real gift-giving acts involved in the acquisition of commodities, situates gift exchange at the core of market exchange.

RN05S06 - Sociology of Taste I

Dennis SMITH (Loughborough University, United Kingdom) | d.smith@lboro.ac.uk

Jean Améry is a brilliant sociologist of consumer culture, ripe for rediscovery. This paper analyzes his best book on this topic, entitled Preface to the Future, published in 1964. It focuses on Britain, France, Germany, Italy and the United States. This work presents a conspectus of the highly commercialized cultural landscape of the mid-1960s. It is a marker against which to compare the current situation, half a century later, and trace the further unfolding since 1964 of the ‘leveling, elevating and equalizing’ tendencies identified by Améry in the 1950s and early 1960s. Améry is alert to tensions between Americanization and Europeanization, the mingling of ‘high’ and ‘mass’ culture, the shaping role of capitalism, the monopolizing tendencies exploited by ‘captains of culture’ (such as Karajan), and the continuing openness of a European cultural field subject to potential influences from eastern Europe, Africa, Asia and America. Améry is best known for another enterprise in 1964: his talks on German radio in that year later published as Mind At Its Limits. These talks report his resentment for the suffering he endured as a concentration camp inmate. Améry wanted to become a famous existentialist author of fiction like Sartre. That is why he changed his Austrian Jewish name, Hans Mayer, to the French-sounding Jean Améry after the Second World War. He failed to make it and instead became a successful journalist investigating popular culture. The resulting empirical and theoretical insights in Preface to the Future are invaluable for today’s historical sociologist.

Dispositional flexibility across aesthetic domains
Stijn DAENEKINDT (Ghent University, Belgium) | stijn.daenekindt@ugent.be

A dominant assumption in sociology of consumption is that an individual’s taste is unified across aesthetic domains. For example, if a person prefers legitimate music, s/he will also prefer legitimate movies. This assumption stems from the strong legacy of Bourdieu. Bourdieu (1984) argued that the social environment generates generic dispositions, which can be transposed to other cultural media and to other cultural fields. However, is this a tenable claim? Possibly, individuals develop domain-specific dispositions, which are not transposable to other domains. This would imply, for example, that the dispositional tools an individual deploys to appropriate visual arts differ from the ones s/he deploys when being confronted with music. This dominant assumption in sociology of consumption needs to be addressed empirically, and a rejection of it would result in the need to fundamentally change underlying assumptions in the sociological
model of cultural taste. I use data from an audience survey in two art museums in Flanders (n = 1,448) and contrast aesthetic dispositions towards music with aesthetic dispositions towards visual arts. These aesthetic dispositions are measured by means of items assessing abstract evaluation criteria that make art objects deserve appreciation. Implications for the sociological account on cultural taste are discussed.

What is tasting? On subjective knowing, stilling hunger and praising God
Anna MANN (University of Amsterdam, Netherlands, The) | a.m.mann@icloud.com

The historian of science and technology Steven Shapin has recently stressed (2012) the importance of investigating subjective ways of knowing, such as ‘tasting’. Following this call, the paper provides a study of ‘tasting’ as it is configured in three sets of ethnographically observed practices. That tasting is a practice in which a subject gets to know an object is not a general truth, the paper argues, but a specific achievement realized in wine tasting. In mundane eating, it has to do with stilling one’s hunger and in devoted living in a Benedictine convent it becomes yet another way to relate to God. What we can learn from ‘tasting’, the paper concludes, is that people may take on different subject positions or renounce on being a subject altogether; and that knowing is just one among many ways of being and engaging in the world.

By bringing together detailed ethnography of everyday life practices with social science theory, the paper sheds light on sensual engagements with food and drinks.

Wine Consumption and Dimensions of Cultural Openness
Simone PAPE (University of Zurich, Switzerland) | post@simonepape.ch
Jörg RÖSSEL (University of Zurich, Switzerland) | roessel@soziologie.uzh.ch
Sebastian WEINGARTNER (University of Zurich, Switzerland) | weingartner@soziologie.uzh.ch
Patrick SCHENK (U)

Since the first publications by Kern and Peterson about omnivorous musical tastes, research on cultural consumption has explored cultural openness in its different forms and dimensions. Even though there has been a strong emphasis on music, more recent research also embraces other cultural fields, including omnivorousness with regard to food consumption. Additionally, omnivorousness is approached in a more differentiated manner. Besides the traditional focus on the breadth of taste, there is also research referring to the range of actual consumption (eclecticism) and the frequency or intensity of consuming different cultural offerings (voraciousness). Furthermore, there is a growing discussion on cultural cosmopolitanism, which is linked to the discourse about openness and omnivorousness. Finally, there is still the open question of how the traditional highbrow dimension is related to the different aspects of cultural openness in consumption.

In our paper we focus on wine consumption patterns in Germany. Wine consumption is a culturally meaningful activity, which makes it very well suited for a contribution to the research on cultural openness. Since our data include information on different aspects of wine consumption, we are able to analyze the interrelation between the breadth of taste patterns (omnivorousness), the range and intensity of wine consumption (eclecticism/voraciousness), the cosmopolitanness of consumption, and other highbrow activities. Thus, we are able to present a comprehensive picture of the different dimensions of openness with regard to wine consumption.

The material markers of ‘white trash’: Consumption and taste in Finland
Marjo KOLEHMAINEN (University of Tampere, Finland) | marjo.kolehmainen@uta.fi
This presentation examines the ways in which ‘white trash’ is defined and contested in Finnish online discussions. It is based on an empirical study whose data is gathered through combining online observations and extracting discussion threads on white trash. Both race and class are often seen as sensitive issues in Finland. Consequently, when white trash is debated online it is not done in relation to either class or race as explicit categories but mainly in relation to consumer choices. Whereas conceptions of white trash have been linked with tastelessness, poorness or immorality in several other countries, white trash can signal several contradictory features in the data. In addition to conventional low class features such as the lack of social, cultural or economic capital, distinctions are made on almost anything. Consumerism is central for those discussions, where even expensive travels or designer brands may be interpreted as white trash. Interestingly, popularity and ordinariness are interpreted as white trash rather than poorness or tastelessness. Hence white trash is used in contradictory but also in extremely flexible ways in Finland. It seems that this results from the shifting position of the Finnish middle-classes and from the ways how making distinctions within the middle-classes requires more and more cultural capital.

RN05S07 - Markets of Consumption

Time-banking on line: between sharing economy and personal branding strategies
Davide ARCIDIACONO (University of Catania, Italy) | davide.arcidiacono@gmail.com

More than sixty years ago Polanyi observed how reciprocity is one of the main form of economic exchange at the basis of social coexistence. Today, Web 2.0 becomes an amplifier of reciprocity in the so-called sharing economy. The paper is focused on a Time-Banking On line platform, called Time-Republic (TRK). The hypothesis is how such practices, although due to the logic of giving, are not alien even to personal and practical advantages for the givers. The study tries to deepen the following dimensions about these practices:
a) the "narratives" perspective of the users, their aims and motivations;
b) the size and structure of social relationships on line based on goods and services free exchanging.
The research follows a net-nographic approach but also a survey was submitted to deepen the aims and the interactions with other traditional forms of exchange.
In TRK many users mutually exchange services not only for ethical purposes but also as an opportunity to demonstrate their skills and finding a job. For this reason, on the platform who offer expertise is more widespread than those who require it. Moreover, frequently aid operations in TRK concern in most cases “online” operations but involving people of the same territorial contexts despite the global nature of the platform. The use of the platform melts to occasional needs, hardly recurring daily and intensely. A community sense of belonging is still limited, so the issue of trust on line and the possible integration between spaces on line and off line become crucial.

Liquid and linked. The concept of brand community.
Konstanty STRZYCZKOWSKI (University of Warsaw, Poland) | kstrzycz@is.uw.edu.pl

The start of the consumer society was a defining feature of the last century. Mass production enabled creation of consumer goods at the level unknown before. With or without prior intention of producers, the social and cultural value of many products surpassed their use value. They
were turned to a raw material employed in the practices of identity construction, aesthetization of everyday life and distinction. However, one of the results of this consumptive work has basically gone under the sociological radar. The phenomenon surrounding consumer identity, a new forms of neotribal sociality centered on brands – brand communities – groups of consumers demonstrating an affiliation to a certain products and their manufacturers and turning them to the basis of social interactions oddly didn’t earned much attention. Since the seminal paper of marketing theorists Albert Muniz and Thomas O’Guinn (2001) we can observe an outbreak of similar studies revealing communities surrounding brand based consumption of motorcycles, cars, computer games, toys, movies, fantasy literature, football clubs, shoes, photo cameras etc. etc. They all agree that brand communities turn to be realms of shared experiences and meanings, constituting their own culture with multiple rituals, traditions, and behavioral rules. As such they resemble other symbolic (imagined) constructions formed around shared symbols, producing particular sense of we-ness, a consciousness of a kind as well as group boundaries and exclusions of the others. In the same time brand communities are based on interactions, communication, cooperation and various forms of prosumption. As such they offer ground for a coordination of actions which require shared definitions of reality and collective forms of knowledge. The aim of the presentation is to answer the questions about communal character of the brand community, key features of brand communities that make them distinct types of social formations (especially in comparison to other concepts used to describe consumption based groupings), and the relationship between producers and consumers influencing a different shapes that brand community can adopt.

Sharing economy: between social inclusion and market exclusion. Insights from the case of leboncoin.fr
Renaud GARCIA-BARDIDIA (University of Lorraine, France) | renaud.garcia-bardidia@univ-lorraine.fr

Sharing economy online platforms have provided new opportunities for wiser consumption (Belk, 2014). Such practices help consumers cope with harder economic conditions. They may even foster new forms of solidarity (Caillé, 2013), but the prosumption it requires may also reinforce inequality and domination issues (Cova and Dalli, 2009; Ritzer and Jurgenson, 2010). This study addresses this ambivalence by analysing the uses on leboncoin.fr. As the main French website for second-hand goods, it has been described as an effective way for consumers to relief the pain of the crisis. Its success relies on its free access and user-friendly interface. Using it therefore requires taking charge of transaction issues without usual evaluation tools or online payment features.

We conducted 26 interviews with non-professional buyers and sellers in order to enlighten how users conduct transactions. Specifically, users need to develop skills in fields as various as computer, information, communication, self-presentation, or business. All of these skills help making business with other users through dedicated operations: the valuation of goods, the negotiation of exchange conditions or the demonstration of one’s honesty.

The transaction often ends with a pleasant meeting that enacts inclusion between trustful people. But one of the counterparts may decide to stop before that grateful experience. This decision often relies on the cultural capital (Bourdieu, 1979) of the other user. Notably, spelling skills are assimilated to honesty and care. To that extent, users may reinforce social inequalities by disqualifying the “marketplace and digital illiterate” from the economic benefits of this emerging economy.

Spreading of shopping practices (in theory and practice)
Dirk DALICHAU (Goethe-University Frankfurt, Germany) | dalichau@soz.uni-frankfurt.de
The shopping of daily goods seems to be repetitive when people are doing the same practices during their everyday shopping: Entering stores, looking for items, paying and leaving the stores. But these practices differ regarding the degree of conversation or the degree of interaction. Nonetheless they seem quite similar observing the shoppers in one and the same store for weeks. But what happens if the setting changes? Let us imagine a small square in a city center with small stores on its surroundings. Usually there are some people doing their shopping, nothing special is going on. During two days per week, a small open air mart is taking place on that square. While the shopping practices repeat day in, day out they are different during the market days. On these days, the shopping practices being typical for the market and including a lot of conversation and interaction are being transferred into the surrounding stores. How can that transfer or spread of practices be explained by practice theory? What results out of that for the composition of different stores in our cities, if shopping practices of one store might also influence the practices in surrounding stores and maybe compensate unequal practices?

The presentation is about an ethnographic case study, in which the consumption practices in 80 different stores in Frankfurt (Germany) have been analyzed. The major aspects, being important for the phenomenon described above, will be presented and connected with an explanation delivered by practice theory.

The inverse ticket office: analysis of a “pay what you want” experience
Jordi TENA-SÁNCHEZ (Universitat Autònoma de Barcelona) | jordi.tena@uab.cat
Francisco José LEÓN (Universitat de Girona) | francisco.leon@udg.cat
José A. NOGUERA (Universitat Autònoma de Barcelona) | jose.noguera@uab.cat

In times of crisis, the exploration of new avenues of commercialization has entailed the emergence of successful innovative strategies like reverse auction, paywall and many others; some of which challenge certain canonical principles of standard economics. Along these lines, the PWYW strategy has become increasingly popular in recent years. In these experiences, customers decide how much to pay for a good or service (usually including the possibility of paying nothing).

From the scientific point of view, the study of PWYW experiences is placed in the framework of the study of the role of trust, reciprocity and pro-social motivations in economic decisions. The analysis of variability in the outcomes of these experiences permits us to gain a better understanding of the factors that promote or discourage behaviors which move away from self-interest; a principle usually unquestioned in standard rational choice economic theory. Traditionally, evidence of these behaviors has come from laboratory experiments, but the external validity of these results has not been sufficiently tested in natural settings.

In this paper we present the analysis of one of these experiences. In 2013, three plays were performed with this system (there called inverse ticket office) in a theatre in Barcelona. The experience constitutes one of the most successful ones known until the present. The main purpose of this paper is identifying the mechanisms that explain attendees’ payment decisions. At this respect, the existence of an internal prize of reference could act as a cue which importantly determined these decisions.

RN05S08 - Cultural Stratification I

Cultural consumption and social stratification in Athens: results of empirical quantitative research
Dimitris EMMANOUEL (National Center for Social Research, Greece) | demmanuel@ekke.gr
Roxani KAFTANTZOGLOU (National Center for Social Research, Greece) | rcaftan@ekke.gr
Nikolaos SOULIOTIS (National Center for Social Research, Greece) | nicolassouliotis@

The paper presents the results of a recent empirical quantitative research project (SECSTACON, 2013) on the relation of cultural consumption and social stratification in Athens. SECSTACON follows the approach advanced in the collective research programme "Social status, lifestyle and cultural consumption: a comparative study" led by J. Goldthorpe and T.W. Chan (2010). The main leading hypothesis is that socio-economic class (in the Neo-Weberian model of occupational classes introduced by Erikson & Goldthorpe) does not suffice for understanding differences in cultural consumption and must be supplemented by the Weberian concept of social status. Furthermore, we investigate whether cultural consumption in Athens is closer to a one-to-one correspondence between class/status groups and forms of cultural consumption (as suggested by Bourdieu) or to a distinction between omnivores/univores (as suggested by Peterson). SECSTACON is based on a sample survey of households (2518 interviews) and examines the choice of establishments and genres in outings for music and the performing arts (theatre and dance) and the cinema. We make use of latent class analysis to distinguish patterns of cultural consumption which are then related to status, social class and other socio-demographic variables (using multinomial logistic regression). We arrived at a typology of cultural consumers which combine elements of the omnivore thesis and the distinction thesis, distinguishing between four types of consumers: omnivores, high consumers, "pop" consumers and inactive. A point of particular interest is the cross-class character of the group of "pop" consumers. The paper argues that, at least in the case of Athens, cultural consumption is only in part status-related and embedded in relations of social competition and distinction. Alongside this, cultural consumption is also linked to the creation of shared culture and mechanisms of social inclusion. The paper concludes by summarizing the characteristics of this cross-class "popular" cultural consumption.

Establishment of hierarchies in culture and arts: A temporal analysis of Turkish fields
Irmak KARADEMIR HAZIR (Middle East Technical University, Turkey) | irmakka@metu.edu.tr

Analysing the coverage of culture and arts in issues of a widely consumed Turkish newspaper between 1960 and 2010, this paper explores how the social valuation of culture has changed over time. Drawing on data gathered within the framework of a comparative project titled 'Cultural Distinctions, Generations and Change: A comparative study of five European countries', this paper questions the state of hierarchies (distinguished, legitimate- illegitimate, low) associated with certain forms of culture. The research adopts a Bourdieusian perspective, which suggests that the cultural classifications are established relationally and constantly legitimated by several institutions such as the public media. The cultural sections of all the newspapers sampled for the project are analysed by means of quantitative content analysis. Zooming in on the Turkish case, this paper investigates three main questions. Firstly, it explores what is defined as legitimate culture throughout Turkey's rapid modernisation period. Secondly, it illustrates the ways in which the distinctions between western/modern and local culture are formed. Thirdly, it highlights the changes in the attention paid to various genres of culture in order to understand the temporal development that took place in the national repertoire on culture. By emphasizing the 'production' side of cultural hierarchies - rather than the tastes of consumers per se - this research contributes to research on cultural stratification. Moreover a case on cultural hierarchies and boundaries outside the European core, but nonetheless operating at the crossroads of globalisation, will help to refine the knowledge accumulated so far within the cultural stratification literature.
I Watch It Just for Mocking: Cultural Stratification through Documentary Consumption
Gulay TALTEKIN (Bilkent University, Turkey) | gulay.taltekin@bilkent.edu.tr

This study aims to understand why and how people with different levels of cultural capital enjoy the same cultural product. I explore the different manners of watching a television program and the ends it serves for different social classes and how this media consumption interacts with class identities and boundaries. The program in focus is Ayna, the highest rated documentary in Turkey. Unlike other documentaries, which appeal to middle classes, Ayna has a very heterogeneous audience ranging from low to high cultural capital viewers. The study employed observations and interviews. I watched one (45 min. long) episode of Ayna together with each of the informants and took field notes. Later, I conducted in-depth interviews with the same informants. 12 informants from different social classes who were regular Ayna viewers and 2 informants who watched Ayna for the first time participated in the study. The results indicate that people from low classes are proud of watching Ayna and appreciate the sincere and modest image of Saim Orhan, the producer and presenter of Ayna. On the other hand, people from middle and upper classes, even though enjoy watching Ayna, tend to criticize Saim Orhan for his clothing style, physical appearance and parlance. The most interesting group of Ayna viewers is middle-upper class students and young professionals with high cultural capital. They watch Ayna for mocking Saim Orhan and the content of the program. Holt’s study on cultural capital (1998) suggests that people with high cultural capital tend to criticize media texts while people who have low cultural capital identify the content of these texts with their own lives. The contribution of this study is to propose mocking as an alternative strategy to criticizing media texts for young people who have high cultural capital.

Leisure, taste and cultural stratification of youth in Prague
Ondřej ŠPAČEK (Charles University in Prague, Faculty of Humanities, Czech Republic) | ondrej.spacek@fhs.cuni.cz

The nature of cultural capital is constant subject of discussion especially with respect to its difference in local, national and social contexts (e.g. Atkinson 2011, Hanquinet et al. 2014, Meuleman and Savage 2013, Roose 2014). The paper uses recent data from survey of 18- to 20- year-old students attending high schools in Prague. It examines local specifics of cultural stratification as well as broader questions of cultural reproduction. Several questions will be addressed in presented analysis. First, the existence and nature of legitimate culture among Czech youth will be empirically assessed. Most quantitative empirical accounts are limited by variables focused on traditional ‘high’ culture practices; therefore usage of wide range of indicators from different fields (e. g. movie, series, food, ICT practices) could substantially enrich these results. Second, taste and consumption practices will be related to family social position as the mechanism of reproduction through acquired habitus go beyond simple parent-child imitation. Third, following the origin of cultural capital concept in the study of reproduction of social inequalities, the differentiation in taste and consumption will be related to further career and educational plan of Czech youth at the end of secondary education.
Reading between the lines. Understanding youth’s reading behaviour and the ethnical differences in this cultural practice

Sofie BEUNEN (Ghent University, Belgium) | sofie.beunen@ugent.be
Jessy SIONGERS (Ghent University, Belgium) | jessy.siongers@ugent.be
John LIEVENS (Ghent University, Belgium) | john.lievens@ugent.be

Though cultural participation has lots of advantages (for instance for educational performances), it is one of the most unequally spread behaviours in modern society. Ethnicity is one of the key stratifying characteristics. Research on differences in cultural behaviour between ethnic groups, however, is scarce. This paper reveals insight in cultural preferences of an understudied population in European countries.

More specifically, we deal with youngsters’ (non-compulsory) reading behaviour. We expect less tresholds related to language, theme and timing for reading behaviour than for other (mostly investigated) Western cultural activities (one can chose the subject, when to read as well as in which language). This way we can make a more fair comparison between ethnic groups.

We use data from a large scale survey held in 2013 in 84 secondary schools in Flanders (Belgium) (n=5122), including 30,4% of respondents with a non-Belgian background. First, we examine differences in reading behaviour (both in intensity as in types of works read). Furthermore, we test whether observed differences can be explained by factors such as the respondent’s educational level, the parents’ economic capital and the three forms of cultural capital Bourdieu distinguishes. The institutional form comprises the parents’ educational level, the objectified capital is operationalised as the availability of books at home. Embodied cultural capital encompasses the parents’ reading behaviour and whether libraries were visited and books read to the children earlier. We will use multilevel analyses to control for school clustering and to assess possible effects of in-school art-education programs and reading stimulation.

Is Opera Attendance Fashionable?

Iuliai Olegavna PAPUSHINA (National Research University-Higher School of Economics, Russian Federation) | yupapushina@hse.ru

The research addresses to fashion as a significant dimension of performing arts consumption. The appliance of marketing technics for performing arts promotion creates supportive environment for fashion in high culture consumption. Simultaneously, marketing is also strongly associated with inequality (Huntington, 2007). The analysis of high culture consumption in terms of fashion allows catching details of inequality in high culture consumption. Although the phenomenon of fashion expands much wider than the sphere of clothes and accessories (Aspers, Godrat, 2013), it is still disregarded for high culture consumption. The research contributes in the field of high culture consumption by introducing a value framework for analysis of the fashion dimension of opera attendance. By contrast to other frameworks (Abrahanson, 1996; Hirsch, 1972) the value framework relies on the definition of fashion as a mechanism of social regulation found on fashion values (Gofman, 1994/2004). The framework is applied for the analysis of Perm Opera and Ballet Theatre case. Perm Theatre is one of the leading Russian theatres in terms of quality of ballet and opera performances. The case is relevant to the research goals because in last few years the theatre’s managerial team has achieved impressive results in promotion of the theatre based on sophisticated promotional tools and the personal brand of the theatre’s artistic director. The data comes from in-depth interviews with different types of operagoers and discourse analysis of Internet discussions. As a result, the set of indicators for evaluation of the fashion dimension of operagoers’ behavior is designed.

Jessy SIONGERS (Ghent University, Belgium) | jessy.siongers@ugent.be
John LIEVENS (Ghent University, Belgium) | john.lievens@ugent.be
Sofie BEUNEN (Ghent University, Belgium) | sofie.beunen@ugent.be

Several studies indicate that cultural experiences at school are conducive to general cultural participation and to a lasting cultural interest. In addition, these cultural experiences also have a clear impact on the pupils’ school well-being and school careers. Yet, the study of cultural education is still in its infancy and the existing studies focus almost exclusively on the formal aspects of arts education or on some of the most visible and easy countable indicators such as the existence of a specific arts subject or the time devoted to arts education. However, cultural interests and cultural tastes are more influenced by the so-called “hidden curriculum”. In this hidden curriculum teachers play a vital role. At the end of the seventies Bourdieu already described teachers as eminently rich in cultural capital but relatively poor in economic capital.

In our paper we want to delve deeper into the cultural profiles of teachers nowadays based on data that were collected during spring 2013 in 84 secondary schools in Belgium. In all of these schools teachers (n=1098) as well as pupils (n=5086) and school heads filled out a questionnaire about cultural activities and cultural education inside and outside school. Besides a description of the cultural interests and practices of teachers, we want to search for cultural profiles of teachers by using latent class analysis. In a final step we will relate the found cultural profiles to the teachers’ idea on cultural education in schools. Here we will make use of multilevel analysis.

Differences and Inequalities in arts participation: Case of Latvian Song and Dance festival

Jānis DAUGAVIETIS (Latvian Academy of Culture, Latvia) | janis.daugavietis@gmail.com
Līga GRĪNBERGA (Latvian Academy of Culture, Latvia) | liga.grinberga.lg@gmail.com

The Latvian Song and Dance Festival is traditional national event (and process) in Latvian culture and society, which began in 1873. The Festival takes place every five years in summer and joins together more than 35 000 performers from amateur choral, dance, orchestra, art and folk craft groups. It is recognized as a nationwide ritual and represents self-awareness of Latvian identity, which is closely linked with nation’s creativity. The participation in amateur arts is one of the most popular leisure time activities of the Latvian society, however the digital era and new technologies are changing conditions for the people taking part in the Song and Dance Festival. We are looking for the conditions which make society to keep this tradition in the new and innovative environment. In the process of the Festival it is important to include all social groups, since it is regarded as a nationwide celebration and must meet goals of modern social policy. Previous research on this shows (Tisenkopfs et al 2002, 2008) that there are some social groups (ethnic minorities, people with low income, etc.), which have been excluded from taking part in the Festival. The aim of our research is to continue to explore those social groups and detect possible changes in conditions which make people to participate in The Latvian Song and Dance Festival. We are comparing the survey of participants of latest Festival (2014) with data from similar surveys in 2002 and 2007.
Clothes we choose to wear: distinction, entitlement and conspicuous consumption in Romania
Iulia GHEORGHIU (The University of Hong Kong, Hong Kong S.A.R. (China)) | iuliag@connect.hku.hk

Theories of conspicuous consumption emphasize symbolic communication in affirming social status with focus on elites and the way they display wealth in material possessions. Everyday notions of conspicuous consumption operate across social strata as devices of exclusion centered around legitimate claims of entitlement in social interaction. Based on 80 in-depth interviews with Romanian consumers of brand and counterfeit clothes, I argue that dress indexes socially sanctioned notions of morality, serving as a tool to inscribe the person and her choices within social order. Dress makes people intelligible to others by communicating their tastes and preferences, position in social space, as well as claims they are socially entitled to make and boundaries whose crossing will cost them censorship and exclusion. Accounting for consumption of brands entails opting for good quality, pleasing designs, natural fabrics and predictability. Distinction amounts to downplaying the pecuniary prerequisites of brand and its misrecognition as the appeal of functionality, vocabularies of the select consumer who does not care for logo, but is concerned with comfort. The fake is met with twofold rejection: first, it fails to meet quality standards; secondly, it merely mimics the symbolic function of brand. My analysis stresses the relegation of conspicuous consumption to the category of consumers lacking the cultural and economic resources to appreciate brands in their functionality. Conspicuous consumption is related to posing claims of presentability that cannot hold the test of social interaction and therefore consigned to the category of individuals most likely to be confronted with losing face when claiming undue entitlement in social situations.

Tastes Erasing All Differences: Production and Consumption of Food in Antioch, Turkey
Zerrin ARSLAN (Mustafa Kemal University, Faculty of Arts and Sciences, Sociology, Hatay, Turkey) | azerrin@gmail.com

Antioch (Hatay) is a border town located on the Turkey-Syria border, recently a scene of turbulence. The population encompasses different religions (including Islam, Christianity, Jewish) and various ethnicities (Arab, Turkish, Kurdish, Turkmen, the Roma), making it an exemplary of peaceful togetherness of religious and ethnic diversity, as well as a condensed representation of perhaps all cultural cleavages in Turkey. The city is also famous for its tastes and cuisines. The very name of the city reminds throughout the country a cuisine of extraordinary diversity and richness.

Within the city, the diversity of tastes makes food especially significant, something more than just nutrition. Tastes in this city construct a unique culture that is an intersection of religions, ethnicities, and cultures, a culture that erases religious, ethnic, social and cultural differences; also, a medium of communication among both natives and strangers.

This study is a qualitative investigation of the role and significance of tastes and food in the daily of life of different social groups in Antioch, with the aim to discover their role in both representing and erasing cultural differences on a wider scale. The study is based on the data provided by interviews conducted with individuals from different religious and ethnic groups, as well as entrepreneurs working at different steps and fields of the production of those tastes.

Rationalization of pleasure. The analysis of the blogs of Polish minimalists
In this paper, we focus on consumption practices reflected on blogs of Polish minimalists. The objective of the minimalists is to consume less and live simple life without the excess of material objects. We studied the instructions of everyday conduct which the minimalists give on their blogs, as well as the meanings they give to their practices: their personal stories of becoming a minimalist and statements of their values. We analysed all 16 blogs of the minimalists present in the Polish blogosphere. The authors belong to one generation – their childhood took place in the times of the shortage economy in the 1980s.

The trajectory of becoming a minimalist occurs to have four stages: 1) excess of material objects in life, connected with having first earned money and buying lots of things in the 1990s and 2000s, when Polish economy opened to free market, to satisfy needs and desires suppressed earlier. 2) Critical point of feeling overwhelmed by things; 3) decision on making life simple; 4) becoming a minimalist.

The instructions how to become a minimalist, are constructed around metaphors of healing a house, which is sick of the excess of things, or fighting with the enemy of excess of things. The aim of the minimalists is simple, happy life. They methodically get rid of things which do not match their criteria (useful, beautiful). Happiness is being reached and maintained by rationalization of everyday conduct and control over emotions involved in consumption.

Cultural differences and the perception of happiness: a multidimensional perspective on leisure consumption and time allocation

Nela Filimon (Universitat de Girona, Spain) | nela.filimon@udg.edu

This research analyses the impact of cultural differences and socialization patterns on individuals’ perception of happiness. (In)equality and diversity are treated from a multidimensional perspective (gender, age, nationality, cultural, economic and social status) with a focus on: socialization patterns (alone, with friends, couple, relatives) emerging from leisure consumption; frequency of meetings with relatives/friends, parents, brothers, children, neighbors, compatriots; issues and values important for a happy life (having good friends; being well valued by the others; having a couple relationship; having children; good health; good family relationship; being physically active; having clear values in life; guaranteed freedoms; having religious beliefs; studying/intellectually active; advancing in the professional career); and the self-rated level of (un)happiness. The empirical analysis uses a representative data set of 2,465 Spanish and foreigners of both genders and age 18 years and older, all resident in Spain in 2014, provided by the Centre for Sociological Research (CIS). Overall, preliminary findings reveal that, on average, good health and a good relationship with the family go first for a happy life although national and socioeconomic differences apply. Socialization patterns show that some leisure activities are performed alone (reading, music and radio listening) while others are shared with friends/couple (bar and disco, cinema and theatre, excursions, concerts, watching TV, shopping); activities with children or meetings with parents and brothers are the most frequent ones. Findings could contribute to a better understanding of socialization and integration patterns among nationals and foreigners in a given country or region.
Types of gambling and their riskiness
Michael Dieter EGERER (University of Helsinki, Finland) | michael.egerer@helsinki.fi

The current scientific discourse understands the riskiness of the different gambling activities as a result of the structural characteristics inherent in the game. Electronic gambling machines (EGMs) are widely identified as the most risky form of gambling, whereas lotteries are considered the least dangerous. Poker stands out as a separate case due to the possibility of actively influencing the outcome. Highlighting structural characteristics of games, however, disregards the variability of the environmental characteristics of gambling.

Starting with the common typology of games (EGMs, (sport) betting, table games, lottery, and poker) this work revisits the inherent characteristics of games in the context of gambling environments. The work is based on a thorough literature review and aims at guiding ensuing empirical research on types of gambling and their riskiness.

In the reviewed literature, the environment and the situational characteristics of gambling are mainly discussed as a factor contributing to getting involved with gambling, or in an epidemiological framework. Only a few studies evaluate gambling environments in a comparative perspective, finding differing interpretations of game characteristics dependent on the cultural background. Furthermore, routines, rituals, and informal rules have been identified as a means to keep gambling consumption within controlled limits.

This study suggests widening the framework for research on gambling risks by taking the example of drug studies on set and setting. The identification of high and low risk gambling settings is crucial in establishing tailored legislations in order to prevent problem gambling.

Fulfilling Your Destiny? Towards a Relational Approach of Online Video Gaming
Tom BROCK (Manchester Metropolitan University, United Kingdom) | tom.brock@me.com

Destiny is the name of a massively multiplayer online (MMO) video game that to date has 16 million registered players. Some of these players play in excess of 12-16 hours a day; completing quests, levelling their characters, and co-operating to overcome some of the game’s most difficult challenges. What makes this game so gratifying? How does it ‘fit’ into broader discussions of the contemporary consumer culture? Drawing on a six-month virtual ethnography, this paper begins to address these questions by drawing out an analysis of Destiny that is sensitive to the ways in which its interface (or design) mediates the broader social and cultural contexts of its players. In particular, it looks to the practices of game playing, and how Destiny blurs the relationship between ‘work’ and ‘play’ to offer players a masculine, embodied and affectual gameplay experience. The paper contextualises the appeal of this experience in terms of some of the uncertainties that adult men face in late modern life. In particular, it focuses on a case study of two men from Manchester for whom playing Destiny unfolds over the spatial and temporal fabric of their everyday lives, presenting a variety of relational ‘goods’ and ‘evils’ along the way.

Consumerism and deviance: Adolescent prisoners in cognitive treatment settings and the wish to consume
Ronald KRAMER (University of Auckland, New Zealand) | r.kramer@auckland.ac.nz

Based on fieldwork involving unobtrusive observations and interview data collected from young male prisoners participating in a cognitive-therapy program, this paper explores how consumerism profoundly shapes the cultural views and desires of racially marginalized
adolescents. While recent literature intimates that such men will possess idiosyncratic cultural “repertoires” or “worldviews,” we find that many young prisoners are strongly invested in consumerism. This is evident in the central role that money, commodities, and lifestyles play in their lives. We also find that correctional officers are just as wedded to consumerism, yet castigate the young men for how they make sense of what it means to live in a consumerist world. In our view, this embodies a peculiar form of social injustice that we call “consumerist entrapment”: Young men are strongly encouraged to adopt cultural orientations and consumerist behaviors for which they are subsequently penalized.

Excessive consumption in gambling: society-provided financial assistance for problem gamblers in Finland

Maria Kristiina HEISKANEN (University of Helsinki, Finland) | maria.heiskanen@helsinki.fi

Problem gambling occurs when money or time is consumed in gambling more than one could afford, followed with social and financial difficulties. For many problem gamblers, the primary motives for treatment-seeking are the financial setbacks. Nonetheless, society-provided financial assistance for problem gamblers is understudied. Finnish welfare state offers protection against different life risks, and social assistance is a last-reform form of means-tested financial support, which purpose is to secure the livelihood for those who have no other way to manage financially. Is there financial support available for people who consume their money in gambling, especially in the current economic situation with welfare state retrenchments?

This paper examines the practices through which problem gamblers have applied or used social assistance, as well as perceptions of social service directors about allowing social assistance for problem gamblers. What kinds of mechanisms connect problem gamblers and social assistance? The data consist of 17 interviews of problem gamblers and 10 e-mail or phone interviews of social service directors.

The results reveal four scenarios: problem gamblers (PG) not applying for social assistance (SA), PG’s denied from SA, PG’s receiving SA before problem gambling and PG’s receiving SA after (because of) problem gambling. Social service directors connect the roots of problem gambling to growing inequality. Social assistance is available for PG’s, but social service directors emphasize that if gambling is active, SA may not be the best measure. In that case, control over the customers finances or help for indebtedness could be more efficient in enhancing the situation.

Alcohol consumption practices among Russian university students

Kiril MAKAROV (Higher School of Economics, Russian Federation) | makarov.vk@gmail.com

Problematic drinking among young adults and especially among college students is a topic of substantial significance. Being regarded as a form of deviant behavior, it may lead to a variety of negative consequences, concerning both young people and society as a whole. However there are evidences showing that Russian students tend to drink lesser than their contemporaries not enrolled in the university. Thus the question of the research is: whether we can explain or not the specificity of Russian students’ alcohol consumption practices by applying widespread terms (e.g. binge drinking, alcohol-related problems, maturing-out etc.) used in American and European surveys?

Three tasks need to be done in the research. First of all it is necessary to compare drinking patterns among those young adults (aged 18-25) who attend university and those who do not. Secondly, we should observe the development of alcohol consumption practices in time, attempting to answer a question of whether the fact of graduation from university alters drinking patterns of young people. And lastly we seek to scrutinize the very essence of college alcohol
consumption practices by examining motives, problems and factors concerning alcohol consumption.
Two datasets will be used in this project. One is data gathered within the Russian Longitudinal Monitoring Survey and second is the data of Higher School of Economics (HSE) Centre for Institutional Research annual survey of students’ life 2014.

RN05S12 - Theories of Consumption

Re-evaluating critiques of consumer society
Alan WARDE (university of manchester, United Kingdom) | alan.warde@manchester.ac.uk

This paper reviews critiques of consumption and the consumer society in light of the contemporary social and economic change. The problems generally held to characterise consumer society during the 20th century were neatly summed up by Schudson as being detrimental effects on character, waste, privatism, disregard for the people whose labour is embodied in commodities, and the deficient quality of mass produced items. Generalised critique has become less common in the last 25 years, but new and important themes have emerged. I will comment on this evolution and try to establish the grounds on which a plausible critique might now be mounted. I consider both epistemological and practical-political difficulties.

With reference to the sustainability of contemporary patterns of consumption, I seek to isolate appropriate objects of critique, which is primarily a theoretical matter, and what courses of practical action might be effective in establishing and diffusing such a critique. The paper will be illustrated with examples concerning ordinary consumption in the realm of food.

Are some practices denser than others? Analytic implications for practice change interventions.
Margit KELLER (University of Tartu, Estonia; Institute of Social Studies) | margit.keller@ut.ee
Triin VIHALEMM (University of Tartu, Estonia; Institute of Social Studies) | triin.vihalemm@ut.ee

The present paper's main inspiration comes from the authors' recent research on behaviour change interventions employing social practice theory (Vihalemm et al, 2015, in press). We zoom in on Schatzki’s (2002, 2013, 2014) and Warde’s (2013) concepts of integrative practices (more cohesive and crystallized nexuses of doings and sayings) and compound practices (looser sets of activities, either failed integrative practices or activities on their way towards greater integration). We introduce the notion of density for analysing social practices prior to planned interventions. We argue that compound practices could be understood as lower-density (mainly practices within leisure and private domains) and integrative practices (such as professional and institutional practices) as of higher-density. Following Warde (2013) we look at how higher-density practices are such mainly by virtue of their tighter coordination by various coordinating agents (both human and non-human). We analyse what are practice density's implications for various policies and governance responses such as behaviour change (or alternatively practice change) interventions within the domain of contested consumption (related to health, sustainability, financial literacy etc). We discuss in which case could practices be more amenable to creation, modification, substitution or complete interruption (see Spurling et al, 2013). We juxtapose practices with varying degrees of density and coordination with the concept of distributed governance (or distributed intervener) proposed by Schatzki (2014) as well as Moloney & Strengers (2014) and discuss, how different types of coalitions of such
Food Sociology and the Classics of Social Thought: Reductivism, Systemism and Microsociology

Filippo ONCINI (University of Trento, School of Social Sciences - Sociology and Social Research, Italy) | filippo.oncini@unitn.it

Introduction
Over the last twenty years, food sociology has received great attention from scholars all around the world (Beardsworth, 2013). Some authors pointed out how nutrition had actually been investigated also by the classics of social thought, whose reflections on food and society are usually residual parts of their works (Mennel et al, 1992). This contribution tries to further elucidate the positions of the classics regarding meals and humans using three diverse macro-theoretical frameworks: reductivism, systemism and microsociology. I will eventually show how these three frameworks are still able to capture the most relevant contemporary sociological contributions in the sociology of the meal.

Reductivism
In the first section I take into account those authors that treated nutrition in a reductivist manner, namely as a simple means to surviving. Many authors in the past happened upon nutrition, but their focus is limited and serves other macroscopic purposes. Engels (1845), in “The Condition of the Working Class in England”, highlights how the eating practices of the working class are forced by their material conditions, imposing them a poor and lower quality diet: workers buy food at the market once they get out from the fabric, thus choosing among left-over. Moreover, given their lack of education, they do not possess the upper class refined taste that would allow them to discover the trickeries of the “petit bourgeoisie”: butchers selling rotten meat or bakers selling stale bread. Similarly, the first empirical studies on material deprivation by Charles Boot (1903), Seebohm Rowntree (1908) and Maud Pember Reeves (1914) often mention food consumption. However, differently from Engels, their real objective is to find a realistic and generalized measure of malnutrition that could help them in constructing a deprivation threshold and thus to intervene through political programs. Finally, the contributions of Kropotkin (1892) and Sorokin (1921) are examples of a different kind of reductivism: the former proposes a strategy to manage the foodstuff in the post-revolutionary society; the latter, from a radically different perspective, depicts starvation as the “invisible director” which determines revolutions, wars and eventually authoritarianism.

Systemism
The conceptual framework that can be defined as "systemic", help me to combine those authors that treated human subjectivity and food consumption as subordinate to and subsumed by the social system. Spencer's analysis of several tribes' food habits, Durkheim's focus on religious sacrifice and donation, Halbwachs' analytical study on the "classe ouvriere" eating routines and Lévi-Strauss and Mary Douglas structuralism are all part of this inquiry. There are of course strong differences in the way those authors envisioned nutrition in their works: Spencer's organicism aims to show similar behavioral configurations in all social groups, running parallels between the Fijians and the Middle Age men (1899); Durkheim identifies the religious commensalism and the sacrifice as the moment of creation of the sacred intangible sphere (1912); Halbwachs (1912), backing on Durkheim's methodological framework, studies the expenditure for food of the working class, showing how nutritional choices are mainly driven by social needs, and not by physiological ones. Class consciousness emerges indeed as a result of the lifestyle adopted outside the workplace, though strictly tied to workers' timing and resources. Finally, Lévi-Strauss (1964) and Mary Douglas (1972), through their structuralist
lenses, aim to identify the unconscious structure of the human nature: whilst the French anthropologist concentrate on myths regarding “the row and the cooked” and (supposedly) discover bridges that make sense of the nature-culture leap, Mary Douglas tries to “decipher” the sintagmatic relations of her family meals and indeed engage a vivid intellectual battle over the origins and the reasons of prohibited food in the Hebraic tradition.

Microsociology
In this section I consider Simmel and Elias for their similar conceptions of the dichotomy "individual-society" wherein their sociologies originate: the dualism between collective and individual identity is in fact resolved for both authors in the complex intertwining of social relationships (Wechselwirkung). Simmel encounters food in his essay "Sociology of the meal" (1910). The ingestion of food or drinks perfectly resemble the dual character of society: it is the “most common thing that people have in common”, but, at the same time and “in a remarkable way, is the most egotistical thing, indeed the one most absolutely and immediately confined to the individual”. Hence, the sociological structure of the meal emerges in the intersection between the self-centeredness of the act, and the spontaneous gathering of individuals to share a superior social end. Norbert Elias, on the other hand, deals extensively with food and table manners in his famous "The Civilizing Process" (1939). The historical analysis focused on the raise of western individualization, leads the German sociologist to study the evolution of table manners. Since civilization firstly appears among the upper classes, bon-ton and its punctilios can perfectly illustrate the “general behavior prescribed by the society”. The slow but pervading diffusion of forks and knives are hence to be understood as post-hoc adaptations to the inexorable individualization. Similarly, the evolution of meat cuts well depicts the phenomenon: the etripage of the beast, once ineludible part of the banquette, it is gradually moved behind the curtain and assigned to professionals. In like manner, the animal's morphology disappears from the dishes in order to hide the killing of the animal itself, thus shaping a new ethic of refinement and demeanor.

Conclusion
There is a risk of being too severe in proposing such a distinction. Surely, there are strong differences among authors within the same framework: Spencer and Durkheim philosophical stances, for instance, were quite contrasting. Nonetheless, it is a useful conceptual tool for understanding contemporary trends in the sociology of the meal.

Current studies on food deprivation or obesity rates, do not recall the methodology used in the first studies on poverty? And what about the totalizing idea of McDonaldization proposed by Ritzer (2011)? The reductivist view offers a panoramic glance over nutrition, in the attempt to reduce the complex symbolism beneath food consumption in a linear and generalized picture. The systemic framework, probably because its looseness, gathers together the vast majority of sociological research on food. Fischler (1988), for instance, is strongly influenced by Durkheim’s thought in proposing the notion of gastro-anomy; similarly, Bourdieu’s Distinction makes explicit reference to Halbwachs when approaching eating practices (1979).

Simmel and Elias represent a third way in the structure-agency debate: whilst the former inspired ethnomethodology and symbolic interactionism (it is worth reminding Blumer (1986) words on the arise of appetite), the latter paved the way for a historical and sociological understanding of the evolution of culinary practices. Mennel’s work (1996) on the evolution of English and French cuisine is surely the most appropriate example.

Imagining the Sustainable Consumer: Cultural Intermediation and Sustainability Communications

Daniel James WELCH (University of Manchester, United Kingdom) | daniel.welch@manchester.ac.uk

This paper examines a novel form of cultural intermediary (Bourdieu, 1984)—the sustainability communications practitioner—and the performative role these practitioners play in instantiating ‘the sustainable consumer’. The paper draws upon research into the commercial field of sustainability communications in the UK, conducted through participant observation, key-informant interviews and secondary data analysis. Rather than making a strong case for the instantiation of this figure of ‘the sustainable consumer’ in the social world, the paper explores attempts to enact it on the part of practitioners. The paper addresses three areas. Firstly, the paper introduces the commercial field of sustainability communications in the UK, its discursive and normative dynamics, and the multiple “orders of worth” (Stark, 2009; Boltanski and Thevenot, 2006) it embodies. Secondly, I identify four ideal type modes of instantiation of ‘the sustainable consumer’ enacted within the commercial field. Thirdly, I address the issue of cultural intermediation. In current consumption scholarship there is a pervasive acceptance of the power of cultural intermediaries, but relatively limited attention paid to the empirical processes whereby that alleged power is enacted, or to the conceptualisation of that power. The paper offers an account of the cultural intermediation of sustainable consumption through the lens of contemporary practice theory (Warde, 2014; Schatzki, 2002).
Healthy living, consumer culture and governmentality: Cultural themes from Czech republic and Denmark
Zuzana CHYTKOVA (University of Economics, Prague, Czech Republic) | zchytkova@gmail.com
Dorthe BROGÅRD KRISTENSEN (University of Southern Denmark, Odense, Denmark) | dbk@sam.sdu.dk
In late modern consumer culture people have an unprecedented degree of control over their bodies, but they also live in an age that has thrown into radical doubt what bodies are and how they should be controlled (Shilling 2003, 3). Consumer culture then offers templates for the construction of bodily subjectivity, as well as options for its creation. These templates and options, however, are not uniform. While there are certain similarities of late modern experience of own body due to the common heritage of Western thought, the particular discourses concerning bodies differ within particular cultures, not least because of a diverging historical development. Similarly, states create bodies according to their particular goals. These issues shape dramatically consumers’ experiences, yet the effect of consumer culture on consumers’ bodies is often treated as a uniform force.
In this paper we set out to explore the interrelationship between the national cultural context and consumers’ experiences of their bodies. We do so by examining two data sets that build on qualitative studies of consumers’ perceptions and practices in the area of health and food in Denmark and the Czech Republic. Particularly, we explore how consumers deal with body and food consumption through different forms of governmentality mediated by consumer culture. We draw on a notion of trust and mistrust that consumers use as a tool to navigate safely the risky arena of health and that leads towards different modalities of self-government. We thus illustrate how the specificities of a particular cultural and historical setting reflect in the microphysics of consumers’ bodily experiences and health choices.

The gender gap in teenagers’ incomes. A 30-year trend in Finland 1983-2013
Terhi-Anna WILSKA (University of Jyväskylä, Finland) | terhi-anna.wilska@jyu.fi
Tomi LINTONEN (The Finnish Foundation for Alcohol Studies, Finland) | tomi.lintonen@alkoholitutkimussaatio.fi
In this paper, we examine the gender differences in teenagers’ disposable incomes during the 30-year period 1983-2013, using large nationally representative survey data. Since the gender pay gap in working life has been rather persistent in Finland and the EU, it was necessary to see whether the gap persists in teenagers’ incomes as well. Although teenagers don’t receive much income from work, they adapt to the structures of society during their teenage years and learn gender roles in consumption, education and working life. Several factors affect young people’s incomes and consumption. Macro-level factors include changes in the national economy and cultural traditions. Micro-level factors include age, gender, type of household, place of residence, income and the socio-economic status of the family. Also parents’ educational principles, teenagers’ material socialization, teenagers’ and their parents’ attitudes towards money and consumption and the availability of part-time work are likely to affect the disposable income of teenagers. Our results reveal that, unlike in many other countries, the gender pay gap has been rather persistent in Finland, particularly among 14- and 16-year-old teenagers. It is only among 18-year-olds that the gender difference in income has narrowed. There were interactions between gender and socio-economic variables such as the father’s education among the 18-year-olds. For younger teenagers, the area of residence and family type had an effect on the income of young people. Since young people’s full-time work is nowadays very rare, the gender pay gap cannot be explained solely by segregated working life.
and wage differences in any age group. This means that the parents’ role in the allocation of money is more important now than in the past decades.

The role of market in shaping women’s identity as mothers: practices, objects and social representations

Carlo Bagnoli (Ca’ Foscari, University of Venice, Italy) | bagnoli@unive.it
Francesca Setiffi (University of Padova, Italy) | francesca.setiffi@unipd.it
Gianluca Biotto (Ca’ Foscari, University of Venice, Italy) | gianluca.biotto@gmail.com
Gian Paolo Lazzar (University of Verona, Italy) | gianpaolo.lazzer@gmail.com

The aim of the article is to analyze the role of material culture in shaping women’s identity as mothers. The first pregnancy is a transition phase and it represents a turning point in the life of future parents. The motherhood transition offers an opportunity to study how material culture and consumer practices are linked to: feelings and self-representations of the pregnant women; social expectations on how a first-time mother should act in everyday activities; anticipation and socialization to a new social role. Many objects such as prams, strollers, clothing, toys, food and medicines can be considered as means by which the identity of a pregnant woman is constructed. Among all, prams and strollers play a central role in shaping the identity of future parents and they anticipate how the child will be part of the future everyday life of parents. Compared to the other objects, they have a high symbolic value. Ethnographic research was conducted in 7 shops and 50 semi-structured interviews were collected from pregnancy women in Italy. On one hand, results confirm the symbolic and relational complexity of the consumer choice. On the other, it can be stated that consumer practices embed the social representation of motherhood and the lived pregnancy experience. In conclusion, consumer practices related to prams and strollers materialize the symbolic transition to motherhood and fatherhood before the children birth. They are material supports for the transition to a new identity.

Same-Sex Marriage and its Discontents: Gay Consumers’ Response to Positive Subcultural Identity Threat

Christian A. Eichert (City University London, United Kingdom) | christian.eichert@cass.city.ac.uk

Since the inception of the modern gay civil rights movement, perceived minority status, heteronormative hegemony, and denial of privileges have been constitutive features of gay subcultural identity. Increasing legal and social recognition of same-sex couples in western democracies, however, can challenge established dominant/dominated logics of subcultural identity construction.

Grounded in the context of same-sex marriage legislation in Germany, this study explores the role of consumption when members of a non-mainstream subculture deal with positive subcultural identity threat from normalisation and assimilation into dominant mainstream culture. Through same-sex marriage, gay consumers gain access to institutional language, practices, and artefacts, which are historically marked as heterosexual privilege, and hence, as outside of gay subculture. This change in subcultural capital challenges the status of gay consumers as members of a marginalized group of society, and raises question of how gay identity is (re)negotiated in times of increasing plurality in concepts of marriage, family, and intimate relationships (Baumann, 2000, 2003, 2007; Giddens, 1991, 1992; Illouz, 2007, 2012).

Based on a thematic analysis of qualitative data from semi-structured interviews and focus group sessions with 25 self-identifying young gay men, the study reveals that consumption contributes to a (re)negotiation of subcultural boundaries and gay identity between heteronormative assimilation, gay subcultural exclusion, and appreciative inclusion of

RN05S14 - Consumption and Different Generations

Intoxicating Entertainment? Alcohol Industry's Sponsored 'Star Music Trek' and Alcohol Misuse among Young People

Emeka DUMBILI (Brunel University, United Kingdom) | emeka.dumbili@brunel.ac.uk

Sophisticated marketing strategies are increasingly used by transnational alcohol industries in contemporary Nigeria. Whilst this facilitates alcohol availability, use and misuse among young people, there are no policies to regulate alcohol production or marketing. The study draws on in-depth interviews with 31 Nigerian university students (aged 19-23 years) to explore the extent to which ‘Star Music Trek’ (SMT- a brewer-sponsored musical concert) facilitates alcohol use among Nigerian students. Data were analysed to generate themes with the aid of Nvivo 10 software. Findings revealed that although the rationale for attending SMT is to be entertained by famous artistes due to reduced entrance fees, SMT influences students’ drinking behaviours in diverse ways. Among non-drinkers, results show that SMT encourages alcohol initiation because purchasing ‘Star beer’ that sponsors SMT does not only serve as a ticket or Gate Pass to the event, it is also the only beverage sold in the event. Among those who use alcohol, data revealed that SMT encourages excessive consumption because of easy availability of Star beer and promotional activities in the form of price reduction, raffle draws and free drinks. Participants also discussed the way in which the sponsor uses its marketing representatives to promote brand allegiance by encourage SMT attendees to patronise Star beer after each concert. Overall, it was found that SMT is a sophisticated disguised marketing strategy to promote the Star brand. The study discusses the implications of the findings, concluding that alcohol control policies should be formulated and implemented in Nigeria.

‘Baby boomers’ expectations’ for leisure travel consumption: the influence of cohort inequalities

Susan VENN (University College London, United Kingdom) | s.venn@ucl.ac.uk
Russell Stephen HITCHINGS (University College London, United Kingdom) | r.hitchings@ucl.ac.uk
Rosie DAY (University of Birmingham, United Kingdom) | r.j.day@bham.ac.uk
Julia HIBBERT (University of Birmingham, United Kingdom) | j.f.hibbert@bham.ac.uk

The prospect of an ageing population or ‘agequake’ is often presented as a business opportunity for those working in travel, tourism and leisure. In particular, one cohort of older people, the so-called ‘baby-boomer’ generation that is currently entering retirement, is seen as offering significant potential because of their distinct ‘consumerist habitus’ and their determined rejection of the constraining associations of ‘old age’. Yet these economic hopes fail, for the most part, to fully acknowledge the heterogeneity of later life and how social inequalities within generations will likely impact upon travel consumption. Since the ‘boomers’ are still approaching, or in the early years of, retirement, we should be unsurprised to find limited empirical evidence of how, if at all, these wider representations have reached the variety of people subsumed within this generational classification. With this in mind,
our paper presents early findings from a UK study of travel consumption and the transition into retirement. As part of the wider work of a research centre focussed on how areas of predicted energy demand are practically assembled, we conducted serial interviews with three age cohorts from different socio-economic backgrounds. The first were aged 50-55 and still working, the second were recent retirees aged 60-69, and the third were at least 75. Drawing on the data from the first two cohorts (n=40), we discuss their later life travel expectations, where these expectations may have come from, and how this varied with level of affluence.

The right age to get good service - The stigma of youth and old age in consumer narratives
Eliisa KYLKILAHTI (University of Helsinki, Finland) | eliisa.kylkilahti@helsinki.fi

This paper studies cultural meanings of age in the context of service consumption. Service encounters appear as charged by age-related meanings, as the consumer culture idealization of youth, and the stigmatization of “too young” and “too old”, collide. Thus, Goffman's principle of equality guiding service interaction appears to be contested. Here, the research focus is on how age is discursively done in narratives of service consumers and what kind of representations of age they (re-)produce.

We analyse written stories, because in them fragments of events are organized with linguistic tools. The data were collected through an open writing competition in Finland. From the data set of 356 stories describing both ‘pleasant’ and ‘unpleasant’ service experiences we have chosen under analysis 37 consumer stories in which age-related notions, such as youth, middle-age, or old age are part of the narration. The analysis utilizes thematic and structural narrative analysis and applies positioning theory (Davies & Harre 1990).

The findings suggest that the stigmatized positions of being ignored and mistrusted are negotiated through both, young and old age. If young or old people are noticed and appreciated, it is perceived as an exceptionally good service. Thus, the stories construct the idealization of adulthood. Furthermore, the stories introduce a set of coping mechanisms to resist the stigmatization, some of them strengthening the ‘middle-aged’ norm even further, such as using a helper of the ‘correct’ age or modifying own performance towards adulthood, but also ironizing and thus resisting the prevailing discourse itself.

The Unseen Fashion Scene: Young Clothing Designers as Entrepreneurs in Kallio, Helsinki
Olga GUROVA (University of Helsinki, Finland) | olga.gurova@helsinki.fi

This research project is devoted to the study of careers of young clothing designers who have launched their business and have their studios or working space in the district of Kallio in Helsinki, Finland. Through personal interviews focused on designers’ careers, we intend to see how designers as young entrepreneurs establish and distinguish themselves on the market and how location adds to this process affecting their identity and the identity of their brands. We also plan to make a methodological contribution by using videography as a method of research and to produce a research-based film, adding voice of the designers to academic and public discourses. In general, the project is aimed at combining social science and visual art in order to explore the careers of young fashion designers in the district of Kallio.

Czech consumer through generations - example of vacation decision making
Anica DJOKIC (Collegue of Polytechnics Jihlava, Czech Republic) | djokic@vspj.cz
This paper examines changes impacting the Czech consumer through different generations. Czech republic has gone through significant political, economic and socio-cultural changes that had particularly influenced the choice of how to spend vacation. From the strictly controlled environment through the free and open market place, Czech consumer had to change. Yet, some impacts are weaker than other. On the example of vacation choice, this paper will present how different generations today make a choice and elaborate on socio-cultural, emotional and nostalgic factors impacting this decision. Through systematic literature review of pre and post socialist view of tourism and vacation in the Czech republic and applying the theory of distinction by Bourdieux, this context will be confronted with the results of qualitative primary research of qualified participants from the Czech republic.

RN05S15 - Structural and Institutional Conditions of Consumption

The Conflicting Middle Classes in Turkey: The Lifestyle Differences and Spatial Segregation

Öndercan MUTI (Mimar Sinan Fine Arts University, İstanbul, Turkey) | ondercanmuti@gmail.com
Derya FIRAT SANNAN (Mimar Sinan Fine Arts University, İstanbul, Turkey) | deryafirat@hotmail.com

The relative economic growth during 2000s in Turkey led to radical changes within the composition of middle classes in Turkish society. Especially, a certain vertical social mobility occurred in favor of conservative and religiously high-motivated middle classes, who are represented by the Ak Party, and with an absolute power for over a decade these middle classes have been enjoying the opportunity to emphasize their values and forms of religion in public space. The famous Gezi Park protests of 2013, taking up against the demolition of a city-park, evolved into protests against latest policies of the government which represents largely religious values and expressions of religion among the same conservative and socially climbing middle classes. During our field research on the middle classes and their lifestyles in a highly disintegrated Turkish society, we have encountered different middle class fragments which are extremely polarised and have willingly limited interactions. Moreover, the lifestyle and cultural differences between the established and traditional middle class members and the socially climbing and conservative middle classes are leading to mutual exclusion dynamics, such as negative classifications, all but importantly to spatial segregation. For this purpose, we aim to present primary results of our research, basically the lifestyle and cultural differences of both groups and discuss the social effects of this ‘lifestyle conflict’.

Turkey – Middle Class – Lifestyle – Conflict – Spatial Segregation

National Identity in the Context of post-Soviet Consumption

Oleksandra SELIVERSTOVA (Tallinn University, Estonia; Vrije Universiteit Brussel, Belgium 1) | alekseli@tlu.ee

Using ethnographic material collected in 2013-2014 in Estonia and Ukraine, this paper explores the role of consumer culture in the formation of Soviet and later of national identities in post-Soviet countries. It engages with the way in which consumer culture was developed during different periods of Soviet history, its role and evolution from the fall of Iron curtain. This paper will discuss different consumer culture models as promoted by the authorities, concentrating, in particular, on one of them - the support of the homo sovieticus project. We will suggest that imposing common consumer practices, and in their efforts to create a single consumerism path throughout the whole USSR, could be seen as a way to emphasize
similarities and, in turn, build a common identity around such commonalities in people's everyday lives.

The second part of this paper deals with consumerism and identity after the Soviet Union's dissolution, when models of consumption supporting Soviet identity did not have ground to be further promoted. However in a mix of inertia and desire to promote a national culture, post-Soviet states, facing challenges of state-building incorporated some narratives of consumer culture into their nation-building projects. This paper will investigate this attempt by comparing what kind of elements were kept from the Soviet period and which ones were introduced ex novo, exploring whether political preference to one ethnic group automatically implied the inclusion of consumer culture narratives only of that single group.

Who earns money and who works in family. Income, housework and consumption in Slovak families.
Ivan CHORVÁT (Matej Bel University, Slovak Republic) | ivan.chorvat@umb.sk

Consumption is based on income. Family members (couples) usually decide how the family income is spent. They also make decision about the division of housework. Are decisions about organizing consumption and housework in the family influenced by the fact who is the main breadwinner? Are the resource approaches focusing mostly on aspects of bargaining in couples valid in this respect?
The paper deals primarily with the division of household labour in the family from the gender perspective taking into account economic aspects of family life (income), some consumption patterns (with focus on leisure activities), and the role of family values. We are using data from the Slovak survey of the International Social Survey Programme (ISSP), the module Family and Changing Gender Roles (organized in 2012) in order to test whether the relative resource hypothesis (taking into account the control of resources) or the hypothesis stressing the role of values (having the family, marriage as the best alternative, etc.) can better explain some aspects of family life such as the division of housework or consumption decisions on leisure.

Consumer Practices as Struggles for Recognition: An Argument from the South
Samuel Dominic SADIAN (University of Barcelona, Spain. Department of Sociological Theory, Philosophy of Law and Methodology of the Social Sciences) | samuel.sadian@gmail.com

The recent study of consumption has begun to shake up received truths about social change and stratification but remains in need of both conceptual renovation and empirical extension. Conceptually, the study of modern consumer practices needs to move beyond ideology and perfectionist critiques and further develop a socially productive understanding of consumer behavior of the sort implicit in Pierre Bourdieu's landmark works. However, very little research has been done to systematically align the study of consumption with agential and hermeneutically oriented social theory. One important recent extension of this latter theoretical trend is recognition theory, especially as developed in Axel Honneth's critical theory. When reframed in accordance with concepts derived from economic anthropology, Honneth's work can be used as the basis for developing a historical-sociological account of economic behavior potentially applicable across a very broad spectrum of human societies. In so doing I historicize the problematic utilitarian assumptions found in Bourdieu and his followers. I then demonstrate the empirical openings of this conceptual reorientation by examining the experience of a highly stratified society in the global south. Reconstructing, with comparative historical-sociological intent, a range of consumer practices in South Africa from 1948 onward, I demonstrate the intrication of consumer practices and social stratification while arguing that (a) consumer practices do not merely reproduce class stratification but increasingly are constitutive of it, (b)
globalization affects some consumer practices profoundly while leaving others relatively untouched, and (c) the determinants of consumer behavior are socio-political and epistemological as much as they are economic.

**Housing consumption practices as a lens on the social trajectories of Chilean Teachers: exploring the entangled nature of everyday understandings of social mobility, biographical change and social change.**

Andrea LIZAMA (The University of Manchester, United Kingdom) | adlizama@gmail.com

Traditionally, the study of social mobility has attempted to distinguish changes in the structure of inequality from movements within the structure of inequality. Analyses show differences between people’s subjective understanding and ‘objective’ concept of social mobility discussed by class analysts. Individuals do not distinguish between questions of social change, biographical change and social mobility when they talk about their own social trajectories. Some analysts (Rose, 2006; Saunders, 2005) have suggested that class subjectivities are strongly affected by the experience of social change, arguing that there significant consequences for how people frame issues of class inequality if they feel they have been ‘mobile’ in these broader sense.

In this context, housing consumption practices allow us to explore complex and intertwined processes social change, biographical change and social mobility. Housing has a pivotal role in the subjective experience of social mobility because people define their social trajectory and aspirations of change in terms of their attitudes to their household location and lifestyle. However, housing consumption practices are also affected by historical and biographical changes in resources, taste and lifestyle, independent of social mobility or class position.

This presentation will show the findings of an ongoing qualitative research whose purpose is to explore everyday understandings of the social trajectories of Chilean Teachers through their housing consumption practices; analysing whether these teachers distinguish between questions of social change, biographical change and social mobility when they talk about their own social trajectories and identifying if (objectively) socially mobile Chilean teachers talk in different ways about these issues from socially immobile teachers. This research contributes to enlarge the knowledge of social mobility and class analysis from a subjective perspective and also to understand how people experience inequalities as part of their everyday lives.

**RN05S16 - Cultural Stratification II**

**Cellular Branding - The Search For Love Via The Emotions Industry**

Mira MOSHE (Ariel University, Israel) | miram@ariel.ac.il

Culture and art form part of the brand designer’s toolbox. Referring to artistic creations and/or developing unique artistic genres form part of marketing strategies whose aim is to create a brand or transform a brand into a cultural and artistic agent. As part of the branding process, “brand narratives” are embedded in the marketing mechanism, expressing, among other things, a connection with a particular time and “truth” imparting a sense of narrative authenticity. This being the case, the Cellcom Company, one of the largest cell phone concerns in Israel, has branded itself by means of emotional references to love, i.e., by means of using emotional imagery, Cellcom is attempting to transform itself into an emotional cultural agent distributing intimacy and love by becoming a beloved brand in its own right. Thus the purpose of this chapter is to examine the characteristics of emotional branding as exercised in the emotions industry. In order to analyze this topic, a qualitative research technique - narrative analysis -
was employed in order to examine the branding strategies implemented by Cellcom, an Israeli cell phone company. The research field examined included the content project, “First love,” promoted by Cellcom in 2010-2012 in which young men and women told about their first love and an advertising campaign launched by Cellcom from 2004 to 2014 that focused on the contribution of the cell phone to emotional empowerment. The results indicate that Cellcom’s brand narratives dealing with love blurred the perception of a specific locality, encouraging a feeling of no sense of place, while creating a large community of young people whose emotional common denominator was stronger than their socio-economic identity. Furthermore, the brand narratives dealing with intimacy and belonging called for the adoption of “new” technologies, while also emphasizing the importance of “traditional” emotions related to home, family, friends and community.

Cultural Tendencies of Social Stratas in Turkey: Patterns of Consumption and Life Style
Yunus KAYA (University of North Carolina Wilmington, USA) | yunuskaya@gmail.com
Lütfi SUNAR (Istanbul Universitesi, Turkey) | lsunar@istanbul.edu.tr
Seran DEMIRAL (Istanbul Universitesi, Turkey) | serandemiral@gmail.com

In recent years, the relationship between consumption patterns and socio-economic status (SES) has become a widely-debated subject in Sociology worldwide. Concurrently, the relationship between SES and consumption has been a matter of significant debate in Turkey. In recent years some heated debates on the issue of social class and life style in Turkey has increased both in academia and the public sphere. However, the fact that a SES index has not been developed in Turkey yet, empirical research on this topic has been limited. In order to fill this gap, we have conducted a survey in 2014 with a nationally representative sample, in order to develop a SES Index for Turkey. With this survey, we aimed to identify the factors that underline SES in Turkey. At the same time, in order to be able assess the role SES in daily life, we included questions on consumption and life style. In this study, using data from this survey we will explore the relationship between cultural consumption and SES in Turkey. Using linear and logarithmic regression methods, we will model the relationship between SES score and SES variables, and the cultural consumption variables. In this context, we will explore cultural activities such as eating out with family, the use of internet, reading magazines, going to movies, concerts and theaters, using a status scale that will be formulated at the end of the research. Thus, we will identify the areas where different social classes differ from each other in daily life.

Class position and musical tastes: A sing-off between the cultural omnivorism and Bourdieusian homology frameworks
Gerry VEENSTRA (University of British Columbia, Canada) | gerry.veenstra@ubc.ca

The longstanding debate between the homology and omnivorism approaches to the class bases of cultural tastes and practices rages on in cultural sociology. The homology thesis claims that class positions throughout the class hierarchy are accompanied by specified cultural tastes and specialized modes of appreciating them while the cultural omnivorism thesis contends that elites are (increasingly) characterized by a breadth of cultural tastes of any and all kinds. This study tests the applicability of these theses to musical tastes in Canada through the application of multiple correspondence analysis, latent class analysis and logistic regression modelling to original telephone survey data (n = 1,595) from Toronto and Vancouver. I find that musical omnivorism, an appreciation for diverse musical styles, is not dispersed along class lines. Instead I find a homology between class position and musical tastes that designates blues,
choral, classical, jazz, musical theatre, opera, pop, reggae, rock and world/international as relatively highbrow and country, disco, easy listening, golden oldies, heavy metal and rap as relatively lowbrow. Of the highbrow tastes, all but jazz are disliked by lower-class people, and of the lowbrow tastes, country, easy listening and golden oldies are concurrently disliked by higher-class people. Consistent with the homology thesis, it appears that class position is aligned with specific musical likes and dislikes.

The ‘Hipster’ as a Social Type: ‘Emerging’ Cultural Capital, Symbolic Boundaries and Socio-Spatial Divisions
Elias LE GRAND (Stockholm University, Sweden) | elias.legrand@sociology.su.se

This paper has two interrelated aims: (1) to examine the usefulness of the concept of social type for the study of social identity formation in contemporary consumer culture; (2) to explore how the ‘hipster’ is constructed as a social type in public discourse. The paper critiques earlier uses of the social type concept for their tendencies to functionalism and structural reductionism. An updated, cultural sociological version of the concept is proposed where social types are constructed through typification processes which are bound up with the appropriation and circulation of different capital forms. The paper then explores representations of hipsters in recent British media discourse. The primary source of data is articles published in the elite newspapers the Guardian and the Times during 2012-2014. It is demonstrated that the hipster is frequently typified as a young person appropriating an aestheticized taste of traditionally low- or middle-brow forms of cultural consumption. Moreover, the hipster is portrayed as an early adopter of consumer objects who draws strong symbolic boundaries against ‘mainstream’ consumers. Such representations are often classed and spatialized: hipsters are frequently associated with artistic or ‘creative’ occupations and to the gentrification of urban working-class areas. Thus, the hipster has become a contested middle-class social type that often takes on negative stereotypical characteristics. In conclusion, the formation of this social type is linked to developments within the cultural field and particularly recent discussions of the increasing legitimacy of ‘emerging’ cultural capital vis-à-vis cultural capital linked to high-brow forms of cultural consumption.

Cultural reproduction and mobility in the Netherlands – a life course perspective
Ineke NAGEL (VU University Amsterdam, Netherlands, The) | f.a.nagel@vu.nl
Harry B.G. GANZEBOOM (VU University Amsterdam, Netherlands, The) | harry.ganzeboom@gmail.com

Among several forms of consumption, participation in highbrow culture most strongly marks cleavages between social status groups (Bourdieu). As such, cultural participation is thought to be important in the status attainment process and therefore has received attention in numerous empirical studies. The literature can be roughly divided into two branches: cultural participation is studied as an outcome or as a cause of social inequality. In both lines of literature an important question is to what extent the status attainment process can be described as either cultural reproduction (parents are decisive) or cultural mobility (schools have additional effects) (DiMaggio).

In this paper we seek methodological improvements on the following points. First, we study the status attainment process longitudinally, among a sample of adolescents (age 14-17), followed until the age of 20-23. Second, we combine both lines of literature and study processes of cultural reproduction versus cultural mobility simultaneously. Third, we use information from three sources: students, their parents, and the secondary schools.
The longitudinal data set, Youth and Culture (Ganzeboom and Nagel, 1998-2002; Ganzeboom et al., 2004), comes from a sample of 1521 secondary school students (from 69 school classes, 23 schools) throughout the Netherlands, who took part in a classroom survey in 1998 and then were re-interviewed three times. For analysis we use linear multi-wave cross-lagged panel models (Green) in which measurement attenuation is corrected by using panel constraints.

RN05S17 - Food and Cultures of Consumption

National Food and Russianness in Immigration
Anna PECHURINA (Leeds Beckett University, United Kingdom) | a.pechurina@leedsbeckett.ac.uk

In this presentation I discuss different aspects of food consumption practices among Russian migrants in the UK. In particular, I will look at how typical food items and the rituals associated with them change their meanings in a new cultural context. By examining how migrants articulate their feelings towards foods they miss or like, their experiences of new and old tastes, and their everyday practices of buying, cooking and sharing traditional meals, I will show the connection between the symbolism of food and the sense of national belonging. Thus, food (following Caldwell 2009; Petridou 2001; Rabikowska and Burrell 2009) is understood here as cultural practice, or foodways, which includes a whole range of closely interlinked activities associated with food in daily life. As a result, my focus is not on the presenting a list of actual physical food items which would characterise Russian migrant community, but rather on the relationships and attitudes that Russian people develop towards those items which manifest their cultural identity and sense of belonging to a chosen culture or community (see Skey 2011). In this sense, a food product can be considered to be a visible representation or a tangible reference to the images and ideas people have about their everyday lives, relationships, culture and identity. Drawing on my research of Russian migrants in the UK I will discuss several related case studies to illustrate these issues.

Hunger amidst plenty. The institutionalisation of food consumption in Bihar, India
Unni KJÆRNES (National Institute for Consumer Research, Norway) | unni.kjarnes@sifo.no
Arne DULSRUD (National Institute for Consumer Research, Norway) | arne.dulsrud@sifo.no

This paper addresses the problem of food insecurity from a sociology of consumption perspective. We are doing this by using the concept of ‘the institutionalisation of food consumption’, which develops on the basis of how several social institutions come together in influencing food consumption patterns for individuals and households. This includes not only culinary cultures, but even food provisioning systems, food policies, and class structures. Each of these provide certain ‘entitlements’ to food: “The law stands between food and the eater” (A.Sen). This paper analyses how such dynamics play out among vulnerable households in Bihar – an Indian state with fertile lands and extensive poverty. It is based on a survey among households in rural villages and urban slums, key informant interviews with public authorities and NGOs, available statistics and local field observations. On the basis of this empirical input, the paper will discuss how the various social institutions together form specific preconditions for food consumption patterns for these households. Early observations suggest that economic inequalities are of major importance, but that the handling of an uncertain social and climatic environment is also influenced by failing market structures and inefficient policies.
The Relation Between Cuisine and Cultural Identity
Ayşen UTANIR KARADUMAN (University of Gaziantep, Turkey) | aysenutanir@gmail.com

My presentation aims to examine the relation between cuisine and cultural identity. The style of preparation, serving and consumption of food can be understood by associating it with the identity. For this purpose, in this study, Turkish Cuisine, specifically Gaziantep Cuisine, will be examined to understand the relationship between Gaziantep cuisine and being a Gaziantepian. It will as well be investigated and studied how the Gaziantep Cuisine evolved, affected by and how the local food culture changed over time in history. It will also be studied how the food practices are changed and evolved for the people living in Gaziantep and identifying themselves as Gaziantepian. The question of local definition of knowing and mastering this cuisine will also is going to be investigated for this region in this presentation. Another question whose answer is looked for in this presentation is the reason of the popularity of Gaziantep Cuisine in Turkey. How did Gaziantep Cuisine achieved to outscore (be by far the best) in comparison to other regions? With the aim of finding answers to all questions mentioned, in this study, oral history and interviewed method with Antepian are be used. Result of analyses after those interviews will be presented in this presentation.

“Food for masses” and the taste of luxury: rhetoric of luxury food in the Polish media discourse
Urszula JARECKA (Institute of Philosophy and Sociology Polish Academy of Sciences, Poland) | ujarecka@ifispan.waw.pl

Rhetoric of luxury which is also the rhetoric of success in life, dominates the stories on food, advertising slogans, recipes presented in different Polish media. In this paper the ideology of new eating practices, and new understanding of luxury in the food sector will be analyzed on the background of transformation of tastes in Poland. Interpretation of the results of research will be presented here; the research, which had been conducted since 2010 (on “Luxury and poverty”), gathered methods such as social survey and media discourse analyses (including data taken from popular press and the internet sites).

During the transformation from the old system to the new, semi-capitalist reality (still there are some relicts of the previous epoch in our social life and in the common consciousness), a lot of households in Poland had changed consumer practices and life priorities; some of them were forced to practice a deficit cuisine. The gap between some social strata became dramatically deep. At the same time, propaganda of capitalism and success for the chosen groups started to influence the social imagination. Chosen restaurants and types of food became the signs of prestige, desirable for social and customary reasons. The food discourse became the ideological battleground for the different social groups. Parallel to rhetoric of success, rhetoric of rationalization and resourcefulness had been developed, and in the social imagination the new strategies support dignity of the poorest in society had been introduced.

European Food Security and Food Labels: Who Cares and Who Does Not?
Carol Diana MILLER (University of Wisconsin-La Crosse, United States of America) | cmiller@uwlax.edu
The Great Recession exacerbated differences between members of the European Union (EU). While some countries moved toward recovery, others have continued to endure high unemployment, poverty and food insecurity. By conducting descriptive and inferential statistical analyses of data from the Eurobarometer 77.2 survey from 2012, this research attempts to identify and explain regional and national differences between Europeans on attitudes about food security and food product labeling. The Eurobarometer 77.2 provides data on attitudes about EU policies, and analyses were conducted on probability samples of respondents from 27 countries within the EU. Analyses tested the hypothesis that EU citizens in countries still reeling from the effects of the Great Recession express more concern about local food insecurity and more support for food policies that promote local and regional food production.

**Policies and practices of food waste reduction. Challenging the crisis through sustainable lifestyles**

Paola PARMIGGIANI (University of Bologna, Italy) | paola.parmiggiani@unibo.it  
Roberta PALTRINIERI (University of Bologna, Italy) | roberta.paltrinieri@unibo.it  
Piergiorgio DEGLI ESPOSTI (University of Bologna, Italy) | pg.degliesposti@unibo.it  
Pierluigi MUSARO (University of Bologna, Italy) | pierluigi.musaro@unibo.it

Our objective is to explore how food waste and reduction practices can be considered a way of sustainable and responsible development. In order to achieve such commitment we are presenting the results of an Italian Inter-University research still in progress. Horizon 2020 Program aims 50% reduction of food waste by year 2030, both as a sustainable response to the current economic crisis and as an opportunity to reflect upon our developmental model and the social limits of growth above everything. In this framework food waste reduction can be considered as a path to bridge the gap between economic and social behavior. Policies and practices of food consumption and waste reduction are not just ways to challenge the crisis through sustainable lifestyles, but also important means to generate local social effects in terms of social capital, networks of mutual assistance, participation ... (R.D. Putnam 2004).

The result of these practices can be seen as a lifestyle improvement through the creation of common shared goods. From our starting reference the European Charter on Shared Social Responsibilities (SSR) for a renewed social cohesion (EU 2011) we explore the practices and the policies of waste reduction as empirical improvement opportunities for local sustainable development models, as well as experiencing virtuous circles of shared social responsibilities among private sector, NGOs, local authorities and civil society. SSR is the key element in the process of creating a positive vision and a faith for the future. The empirical research is based on a mixed method both quantitative and qualitative. Desk analysis has been made trough a semantic web data mining, in order to define the low waste Italian universe. Then trough the definition of empirical categories we have set up a map of the main Italian food waste reduction communities, studied throughout best practices and case histories.

**Changing Consumption, Changing Preferences? A Practice Oriented Perspective for Understanding Food (In)Security**

Jessica Rhiannon Paddock (University of Manchester, United Kingdom) | jessica.paddock@manchester.ac.uk

Mirroring wider trends across Caribbean islands, the Turks and Caicos is seeing an increase in the consumption of foods associated with diet-related disease and ill-health (Schwiebbe et al., 2011). These shifts are broadly attributed to changing food tastes and preferences of
consumers, as islanders are thought to aspire to a modern and ‘Americanised’ diet. Meals of dried conch and pear-bush hominy are replaced by imported, processed foods and canned goods (FAO, 2013).

Drawing on accounts derived from oral-history interviews with Turks and Caicos islanders, we unpack the notion that changing diets result from shifting preferences. Rather, narratives suggest a number of interlocking changes that compound the effects of losing access to a valued local source of healthy protein: fish. By exploring the trajectories through which their diets have changed in interaction with wider institutional, ecological and cultural dynamics, we separate this account of social change from those that explain action as the preserve of individual choice (Tull et al., 2013), bringing to the fore a critical sociological account of changing consumption patterns. That is, through a practice-theoretical lens (Bourdieu, 1990; Schatzki, 2001; Warde, 2005).

A practice-theoretical lens offers a means of exploring the nexus of interactions between macro, meso and micro spheres of activity shaping food consumption, production and supply across this small island archipelago and across differentiated social groups. Doing so speaks to wider policy imperatives to boost food security (access, affordability and appropriateness of diets) by offering an alternative problematisation of the challenges faced in meeting this imperative.

Food waste: from household coordination to cooking competencies
Sophie DUBUISSON-QUELLIER (Sciences Po, Paris, France) | s.dubuisson@cso.cnrs.fr
Séverine GOJARD (INRA, Aliss, France) | severine.gojard@ivry.inra.fr

In the five last years, food waste issues have become central on public policy agendas in most developed countries. Consumers’ responsibilities have been raised as one of the major way of dealing with this public issues. However, ethnographic studies remain limited. Some recent studies have highlighted the role of normative injunctions and coordination constraints that individuals face explaining they waste food (Evans, 2014). Our contribution draws from both a quantitative survey by questionnaire and a qualitative and ethnographic study and proposes to explore the conditions for the production and dealing of food surpluses by households. First, we recall the importance of an economic moral that leads individuals to limit food waste. Second, our data shows that coordination constraints may actually explain a specific part of the food wasted: like small leftovers or food that nobody in the household no longer wants to consume. However, the food items more frequently thrown away consist in out-dated products or products approaching their expiration date, in damaged or rotten fruit and vegetables. Such a result suggested us to explore the cooking skills and the hygiene or preservation knowledge in their relation with food waste practices. Investments in such skills are unequally socially distributed and valued. Moreover, the type of food purchased may differ significantly regarding social classes, age and type of households, from processed food to fresh fruit and vegetable.

RN05S19 - Food: Meanings and Practices

Trust, pleasure and skepticism. Three attributes of the Romanian farmers’ markets
Laura NISTOR (Sapientia Hungarian University of Transylvania, Romania) | la.nistor@gmail.com
Local food products have a number of benefits which are usually centered around the issue of trust: knowledge of the origins of food, fresher and authentic products, re-personalization of commercial relations, etc. In this latter sense, local food related initiatives include many attempts whose aim is to connect producers to consumers and farmers’ markets and ‘taste education’ shows are just a few examples which aim to reduce the gap between these two agents of consumption and to create deeper and trustworthy, personalized commercial relations.

The presentation is focused on several Romanian case studies which were realized through qualitative methods like interviews, focus-groups and informal discussions with farmers’ market visitors in Cluj-Napoca, Brasov, Sfantu Gheorghe and Miercurea Ciuc during 2013 and 2014. The aim of the research was to collect information about the major motivations, experiences and discourses in connection with shopping behaviors at farmers’ markets. The vast qualitative data indicate that shopping experience offered by local food markets in the form of the farmers’ markets brings in the forefront the case of trust and such networks can be conceptualized as trust networks between producers and consumers. Once skepticism enters the ground, consumers usually avoid this arena of shopping. Besides trust and mistrust, pleasure in the form of the exploration activities involved in the search of fresher, tastier, more local, etc. goods is also important. In this form, local food consumption frequently includes a strong social element, meaning that such type of shopping and consumption experiences usually are shared experiences within families, friends and communities.

**Responsibility in Everyday Practices of Sustainable Food Choices between Self-Referentiality and Regional Identification**

Rachel RECKINGER (University of Luxembourg, Luxembourg) | rachel.reckinger@uni.lu

The aim of this paper is to analyse everyday appropriations of ‘responsible’ eating habits – seen as a set of plural ways of how people put into practice plural ideas of sustainability. The qualitative (N = 47) and quantitative survey (N = 3 300) were carried out in the transnational context of Luxembourg and the surrounding Greater Region, allowing for comparative results of consumption dynamics between regions in four countries (Luxembourg, Germany, France and Belgium).

To find out by which motivations the motor for ‘responsible’ consumption is driven, the notion of sustainability is not addressed directly, but is characterised by quantitative indicators of possible sustainability in the food domain, relating to consumed foods or to individual criteria of food selection. Subsequently, qualitative interviews provide insights into the meanings of, and values behind, those indicators, uncovering everyday priorities, appropriations and strategies of consumption, as well as its justifications in a perspective of regional/spatial identification.

By contrasting arguments about food consumption ideals and practices, the results show a marked dialectic between egocenteredness and a general interest in food’s provenance, understood as regionally produced. This shows which aspects of the polysemic idea of sustainability are relevant to people’s preoccupations, and to what extent consumers are reflexive in their ‘responsible’ food choices.

**Communicating conveniencisation of cooking: Comparative analysis of how meal box-schemes are framed in four European countries**

Bente HALKIER (Roskilde University, Denmark) | bha@ruc.dk

Convenience food is a food category that is not easily defined (Jackson, 2013). It refers to a multitude of different food items and meal types. In everyday cooking and eating, convenience
food is difficult to separate out, since it most often is combined with other food stuff (Short, 2006) to such a degree that convenience food and homemade food rather belong to a continuum than two different food categories (Marshall & Bell, 2003). It may even be possible to talk about different degrees and types of convenienicisation, when including not just processed single food items, ready-meals and take-away, but also e.g. assemblage food bags in supermarkets and meal box-schemes. At the same time, convenience food is a normatively ambivalent category of consumption (Szabo, 2011), sliding between being associated with problematic industrial products as well as ease of cooking and eating. The slipperiness of the category makes it interesting to analyse how conveniencised food consumption is constructed in the media-texts communicating directly with consumers.

In this paper, I am presenting a qualitative comparative analysis of website communication about meal box-schemes in four countries from an EU-funded research project, FOCAS. The data-material consists in website texts and pictures from two meal-box companies from each country. The analysis is based on qualitative coding (Silverman, 2006) and framing analysis (Borah, 2011).

Theoretically, the research behind the analysis takes its starting point in a practice theoretical perspective on food consumption, which sees media-texts as resources for everyday practicing (Keller & Halkier, 2014).

**Rethinking 'convenience' food**

Peter JACKSON (University of Sheffield, United Kingdom) | p.a.jackson@sheffield.ac.uk
Valerie VIEHOFF (Bonn University, Germany) | v.viehoff@gmail.com

Drawing on current research in the UK and Germany as part of an ERA-Net project on sustainable food, this paper challenges conventional definitions of ‘convenience’ food arguing that it is a chaotic concept which divides what are indivisible categories of food as used in everyday life and combines what are analytically separate kinds of food (such as supermarket ready-meals, take-away food and other types of processed food). The paper summarises the findings of a systematic literature review undertaken for the UK’s Department of Environment, Food and Rural Affairs and presents some preliminary conclusions from our current ethnographic research with households in the UK and Germany. We adopt a ‘theories of practice’ approach, examining the meanings that consumers attach to convenience food; the practices with which convenience food is associated; the embeddedness of convenience foods in the routines and rhythms of everyday life; and the ‘do-ability’ of different practices, in terms of their practicality and perceived social and cultural appropriateness. The paper contributes to the conference theme of re-imagining inequality by demonstrating that the conventional distinction between ‘convenience’ food and other kinds of food is ideological in nature, implying that convenience foods are inherently less healthy and less environmentally sustainable than ‘home-made’ food, using fresh ingredients, cooked from scratch. Our evidence suggests that such distinctions invoke ill-founded moral judgements and serve to reproduce class and gender divisions. The implications of the research for current ‘behaviour change’ initiatives are considered including their characteristic adoption of highly-individualised notions of ‘consumer choice’.

“**Appetite for a change: consumer agency in contemporary food networks**”

Wojciech GOSZCZYNSKI (NICOLAUS COPERNICUS UNIVERSITY, Poland) | goszczynski@umk.pl
Anna WÓJTEWICZ (NICOLAUS COPERNICUS UNIVERSITY, Poland) | anna.wojtewicz@poczta.onet.pl
The basic scientific aim of the paper is to analyse the scope and nature of the quality turn of consumers engaged in alternative networks of food production, distribution and consumption. Food and whole cultural activity related to this is one of the most important areas of the construction of identity and lifestyle of the contemporary consumers. Meanwhile economic systems are characterised by growing complexity. Elements are being locked in the so-called "blackbox" which is not available for consumers. The focus on technological innovations in agriculture has resulted in a considerable complication of food production and distribution systems. The researchers indicate that the process of industrialisation led to one of the most serious crises (van der Ploeg 2006), mass production and distribution of food generates both economic and social inequalities. This poses question of the role and meaning of new consumer attitudes in these attempts of making the global economy more transparent. The analysis of consumer behaviors that the notion of the quality turn has arisen and divides the contemporary research into consumer impact on selected production systems (e.g. Goodman 2003: In this process, the ideas of nature protection, social equality and moral economics play a symbolic role. They have caused the emergence of a group of citizens, consumers and producers dissatisfied with the type of the global agri-food system (Goodman 2004: 4). Active consumers seek to reconstruct selected social-economic systems. Entering into direct relations with the producers, shortening the distribution network, highlighting the cultural and ethical significance of fair trade, searching for organic, local, or traditional goods, they seem to be forming space for new, alternative social-economic micro-universes (Belasco 2007: 87). The attempts at reconstructing, making food transparent again are undertaken by consumers and producers via activity within the social networks linking the production and consumption processes (Fonte 2006: 231). In this way, the idea of alternative agro-food networks (Renting 2003: 393) has been conceived.

RN05S20 - Consumption Inequalities and Exclusions II

A balanced exchanged of sacrifices: the mechanisms of online barter.
Giulia Federica AIRAGHI (Università Cattolica of Milan, Italy) | giulia.airaghi@gmail.com

The emergence of the barter practice testifies a reaction to a crisis that is not only financial in nature, but which shows a profound cultural dimension. An analysis of the practice shows how consumers involved are searching for alternative patterns of exchange, not mediated by money, and seeking to transform possessed goods in a form of capital, with the twofold objective of establishing non-anonymous relations and to cope with the shortage of cash. This economic pattern apparently seems to equally redistribute power among the users of the barter websites analysed by the author. Indeed, the paper argues that in theory the barter mechanism could guarantee an high level of equality as it is performed only when the amount of sacrifices is
balanced between the two participants of the exchange. At the same time, within the contemporary online practice we can find the same hegemonic mechanisms, typical of the monetary exchange, replicated through an unequal distribution of different types of capital: the social and the cultural one. Consequently, barter can be described using the de Certeau’s category of tactics: an act of resistance breaking the norms of powerful forces of production, still not powerful enough to determine the rules of the field. The paper is the result of a five-month digital ethnography and 22 in-depth interviews with members of virtual communities.

Coping strategies and attitudes to food in budget constrained households: what is the relationship to obesity?

Thomas Bøker LUND (University of Copenhagen, Denmark) | tblu@ifro.ku.dk
Annemette NIELSEN (University of Copenhagen, Denmark) | anmn@ifro.ku.dk
Lotte HOLM (University of Copenhagen, Denmark) | loho@ifro.ku.dk

Recent literature primarily from English speaking countries has made it very clear that there is a higher risk of obesity among individuals who live under economic constraints, especially if they live in so-called food insecure households. The reason for this association, however, is not well understood.

It is an obvious assumption that the association is related to food intake. But might alterations in people’s food values also play a role? And do different kinds of coping strategies that people embark on when they are economically pressured have an influence?

To examine these questions we use longitudinal data collected in 2008 and 2012 from a Danish household panel.

Using data from the 2012 data only (N=1650), we show initially that obesity, also in Denmark, is clearly related to level of constraint (and especially food insecurity). We examine whether specific coping strategies employed because of food budget constraints (this includes: abstaining from luxury, prioritizing cheaper food, household efficiency) is associated with a reduced risk of obesity.

Using a combined dataset with respondents that completed both the 2008 and 2012 questionnaire (approximately N=1080) we then examine whether people who (in 2012) report that they are budget restrained have changed food values from 2008 to 2012 (we look at health considerations and importance attached to food quality) Following that, it is analyzed to what extent changes in food attitudes explain the higher obesity levels in the group of respondents that are budget constrained.

Dealing with food budget constraint in Denmark – vagabondic and touristic experiences

Annemette Ljungdalh NIELSEN (University of Copenhagen, Denmark) | anmn@ifro.ku.dk
Thomas Bøker LUND (University of Copenhagen, Denmark) | tblu@ifro.ku.dk
Lotte HOLM (University of Copenhagen, Denmark) | loho@ifro.ku.dk

How does an economic crisis influence food related practices? This study explored how shopping, storing, cooking and eating practices changed in Danish households as a consequence of experienced restraints on food budgets. The study applied a mixed method design. The qualitative data source consisted of interviews with 30 individuals from Danish households with different socio-economic characteristics, who experienced food budget constraint. The quantitative data consists of a survey among 1650 members of a household consumer panel. The quantitative results revealed how differences in terms of application of various types of strategies are related to different levels of food budget restrictions. Strategies applied to storing and cooking food in more efficient manners were widely practiced across all
groups. Strategies which affected eating experiences, first seemed to appear when food budget restriction increased. The qualitative study revealed important factors that link strategies to either positive or negative experiences. Interviewees who made a positive experiences out of coping with food budget restraint reported extra resources in the shape of e.g. more secure life circumstances, higher cooking skills, and a supporting social network compared to interviewees who had more negative coping experiences. We propose that Zygmunt Bauman's metaphors of the tourist and the vagabond can inspire us towards an improved understanding of different experiences of and reactions to restrained food budgets.

What if 'the poor' aren't who we think they are?: How urban gleaners redefine the idea of poverty
Dominique ROUX (Université Paris Sud, France) | dominique.roux1@u-psud.fr
Valérie GUILLARD (Université Paris Dauphine, France) | valerie.guillard@dauphine.fr

Despite various motives that drive people to retrieve discarded objects, the practice of urban inorganic collecting is traditionally associated with conditions of exclusion and genuine economic poverty in various countries. A qualitative study carried out with thirteen gleaners (nine women and three men, aged between 22 and 61) from various socio-economic strata – three young people whose financial state places them below the poverty line and eight belonging to the middle class situated between the poorest 30% and the highest paid 20% – examines chosen and proclaimed forms of gleaning. Our findings show that “gleaning by preference” is motivated by various refusals – the refusal to throw out things that can be of use or still have value, the refusal to waste resources, the refusal to suddenly turn “poor things” into “poor people’s things” in the name of the latest fashion. They also point to shifts in what it means to be poor. Poverty is no longer viewed as not having the resources to buy products, but as a distinction phenomenon that is testified by the lack in creative abilities, skills in terms of taste or finding makeshift solutions, and the capacity to think about consumer society, the future of the planet and the depletion of resources. Our respondents “are poor” because they exclude themselves from consumption as a legitimate reference system. According to our informants, “the poor” are not the people who retrieve things, but those who fall into the traps of consumption.

RN05S21 - Consumption and Parenting

Convenient food for baby. An ethnographic study of processed baby food and the practice of weaning
Helene BREMBECK (University of Gothenburg, Sweden, Center for Consumer Science) | helene.brembeck@cfk.gu.se
Maria FUENTES (University of Gothenburg, Sweden, Center for Consumer Science) | maria.fuentes@cfk.gu.se

Today, processed baby foods are marketed as a convenient and flexible solution for time-pressed modern parents, meeting their needs while conforming to official health advice. Manufacturers have responded by developing products that meet the guidelines of national food authorities, while claiming to solve the difficulties facing contemporary parents. Actual weaning practices are however left to parents, and a great concern. This presentation presents first results from a study of weaning practices from a perspective informed by practice theory. The overall aim is to examine how parents integrate ‘convenience’ baby food into their everyday
feeding practices and how consumer information and advice is incorporated. The focus is on the meanings of weaning, the perception of and performance of the steps of weaning, and the special competencies and tools that are used. Results show that what is considered as convenient is dependent on views on children as basically part of the family or separate individuals with their own needs. There are fundamentalist parents sticking to processed foods – preferably organic - as the only guarantee of healthy and additive free food for baby, and others who cannot see the meaning of buying expensive jars and packages of something you can just as well make yourself. The study is based on ethnographic field work at a meeting spot for mothers and babies, and interviews and e-mail “weaning stories” with 19 mothers in the small city of Falköping in western Sweden. It is part of the SUSFOOD ERA-Net project Food, Convenience and Sustainability (FOCAS).

When the happy parents are ‘parent-consumers’: the creation of new consumers in transnational surrogacy
Ingvill STUVØY (NTNU, Norway) | ingvill.stuvoy@svt.ntnu.no

Transnational surrogacy and the expansion of a surrogacy market offer involuntary childless people new opportunities for having children. They are positioned as a type of ‘parent-consumer’, where parenthood is claimed through buying power rather than fertility and reproductive capacity. This challenges everyday conceptions of what it takes to become a parent, as well as conceptions of what one can legitimately buy in a market. In this paper, I argue that by looking at transnational surrogacy as a (contested) consumer practice, we can tease out new meanings of what makes a good and bad consumer in a time when we are positioned as consumers in more and more aspects of our lives. Analyzing qualitative interviews with Norwegians who are paying for surrogacy outside of Norway, I show how the baby, as the ultimate good(s), is invoked to make their road to parenthood through purchase appear legitimate and intelligible. In their narratives, the meaning of a potentially problematic form of consumption is transformed into acts of love and biological desires, and as steps to fulfill a norm of having children and living life as a family. This distinguishes their consumption from other problematic forms of consumption, such as the buying of sex, which has otherwise been used as an analogy in the Norwegian debate on surrogacy. Thus, the market frontiers’ move into our intimate lives is legitimized by reference to conceptions of what a happy and respectable life consists of; conceptions intimately linked to class and the class position of the consumer.

Parents, Kin, and Consumer Pressure
Suzanna Johanna OPREE (University of Amsterdam, Netherlands, The) | s.j.opree@uva.nl

Many parents and caretakers feel powerless to the excessive amount of commercial pressure placed on their children, worrying advertising advocates “the good life being attained through the goods life”. Yet, children’s selection of and responsiveness to media is largely determined by their social environment. Hypothetically, if their social environment puts great emphasis on the importance of possessions, children might be more interested in advertising and more vulnerable to its effects. To test this assumption, longitudinal data were collected among 2,995 children aged 8 to 12 (53.2% boys) and their parents (67.8% women). The children completed items on their advertising exposure, materialism, and life satisfaction, whereas parents answered questions related to their own level of materialism, their social-economic status (i.e., educational level, household type, household income, number of luxury items present in the home), and the number and nature of parent-child conversations on advertising and consumption. At the ESA conference, we would like to share our project's preliminary findings: Do parents' own level of materialism, social-economic status, and the number and nature of
consumer related conversations predict children’s advertising exposure? And do they moderate the effect of advertising on children’s materialism and/or happiness? If so, who are at risk of becoming materialistic brats? Those who grow up in affluent families or, as others would argue, those who grow up in poverty – for whom consumerism might symbolize a climb on the social ladder?

Candies only on Saturdays: A qualitative investigation of how Somali–Norwegian mothers regulate their children’s sweets consumption
Laura Maria Elena TERRAGNI (Oslo and Akershus University College, Norway) | laura.terragni@hioa.no
Marlen AMUNDSEN (Oslo and Akershus University College, Norway) | marlen_amundsen@hotmail.com
Julianne LYNGSTAD (Oslo and Akershus University College, Norway) | juliannely@hotmail.com
Camilla HGUYEN (University of Oslo) | cam.ng@hotmail.com
Margareta WANDEL (University of Oslo) | margareta.wandel@medisin.uio.no
Marina Manuela DE PAOLI (Fafo) | marina.de.paoli@fafo.no

The aim of this study was to explore Somali–Norwegian mothers’ attitudes and practices related to sweets consumption by their children. This paper is part of a larger study of infant feeding practices among Somali and Iraqi mothers residing in Norway (InnBaKost). In-depth interviews with mothers were conducted when their children were 6 and 12 months old. Focus groups were held when the children were 2 years old. The mothers were selected using a multi-recruitment strategy. In total, 38 Somali mothers participated in the study. The data presented here are based on in-depth interviews with mothers whose infants were 12 months old and on focus groups. Results showed that mothers regarded themselves as the main person responsible for their children’s healthy diets. Sweets consumption was one of their concerns, and they lamented conflicting views on this issue among other family members. Fathers and grandparents together with older siblings were blamed for introducing sweets to the youngest child. In order to regulate sweets consumption, some mothers adapted the Norwegian rule of allowing candies only once a week, on Saturdays. As mothers otherwise tended to prefer their own child-feeding traditions, this is an interesting case illustrating how Somali mothers strategically adopt practices of the host country. Exploring how mothers choose between different cultural traditions in performing their role as food providers may add further insight into the dynamics of dietary acculturation among immigrant families.

RN05S22 - Arts Participation II

Catching the Cultural Omnivore: Omnivore Musical Preferences Within and Across Musical Fields
Mart WILLEKENS (Ghent University, Belgium) | mart.willekens@ugent.be

This research project focuses on omnivorous cultural preferences of the audience of concerts in Flanders. Using a field analytical approach, we give a very detailed account of how musical consumption, preferences and knowledge can be used to generate distinctive profiles of cultural omnivores. Cultural omnivorism is usually defined as an open attitude or a preference for both highbrow and lowbrow cultural genres. However, changes in the musical field might make it difficult to map broad cultural genres onto the highbrow-lowbrow dimension. Furthermore, an exclusive focus on broad genres might conceal new and subtle symbolic struggles within genres. This research project studies cultural preferences across and within musical genres. We use data from a large audience survey for musical concerts in Flanders (N=1720) that was...
conducted at 70 concerts from a wide range of highbrow and lowbrow genres at 16 concert venues. It contains detailed information on consumption, knowledge and preferences for different musical subgenres and artists within genres. This allows us to analyze to what extent frequently used accounts of cultural omnivorism (measured as preferences for broad highbrow and lowbrow cultural genres) map onto preferences for different subgenres and artists within these genres. This way, we provide a more detailed account of the cultural omnivore phenomena and we uncover new symbolic boundaries in contemporary musical fields.

The Grand Opening? A Comparative Study of Changes in the Conception and Content of Culture and the Arts in Five European Newspapers, 1960-2010
Semi PURHONEN (University of Tampere, Finland) | semi.purhonen@uta.fi
Riie HEIKKILÄ (University of Helsinki, Finland) | riele.heikkila@helsinki.fi
Tina Marjukka LAURONEN (University of Helsinki, Finland) | tina.lauronen@helsinki.fi
Jukka Olavi GRONOW (University of Helsinki, Finland) | jukka.gronow@helsinki.fi

Many studies, mostly concentrated on the consumption rather than the production side of culture, suggest that during recent decades, legitimate culture in Western countries has become less hierarchical and more open. Changes in the social value and composition of the legitimate taste as expressed in people’s preferences reflect transformations in cultural institutions which consecrate legitimate art. One such institution, which is instrumental in representing and disseminating -- as well as providing an arena for debates about -- cultural classifications and aesthetic standards, is the media. This paper presents an analysis of the changes in the cultural coverage of nationally leading newspapers from five European countries -- ABC/El Pais (Spain), Dagens Nyheter (Sweden), Helsingin Sanomat (Finland), Le Monde (France) and The Guardian (UK) -- from 1960 to 2010. Through content analysis of samples of the newspapers (the unit of analysis being an article, altogether over 7,000 cases), the paper examines how the structure and cultural areas covered in the cultural pages have changed. Thus, the paper asks whether the scope of culture has opened and become more heterogeneous and inclusive, and whether the five newspapers differ in these respects. The focus is especially on music and how the coverage given to classical and popular music has evolved. The results are largely in line with the supposed opening of culture, but not as straightforwardly as one might expect. The paper builds on an earlier version presented at the last RN5 midterm conference, but uses more comprehensive data and offers more elaborate analysis.

The Emergence of a Politicized Market: Kurdish Music in Turkey
Alev Pınar KURUOĞLU (Bilkent University, Turkey) | alev.kuruoglu@gmail.com

In this paper, I detail the emergence and evolution of the market for Kurdish music in Turkey; situated within a context characterized by the socio-political dynamics of domination and stigmatization by the state, and accompanied by the emergence and rise of a Kurdish political movement. Illegal until 1991, Kurdish music was widely circulated by informal practices and through underground networks. Circulation was influential in generating the imagining of a unified, resistive community. With legalization in 1991, music production and circulation was centralized and formalized, but remained subject to legal and normative restrictions, and preserved its oppositional character. Constrained by unequal access and representation in the mainstream market, producers and consumers of music responded by collaboratively generating an “alternative” market culture. I trace the ways in which actors framed their experiences in producing, consuming, and circulating music; and also in the frames that they adapted from the Kurdish political movement. I find that these normative and political frames shaped the business and artistic decisions that were made in the market, charged the music as
politically significant, and also concomitantly shaped (the imagining of) a politicized and resistive Kurdish public. I argue that the consumption, production, and exchange of Kurdish music in the 1990s served not only to unify an ethnic community around shared normative and emotional orientations, but concomitantly positioned this community as oppositional and resistive towards the mainstream culture. Inequality, stigma, and domination thus shaped an emergent market as well as an accompanying social imaginary.

RN05S23 - Sustainability and Energy Consumption

Galpshare: When a Petrol Company Promote Sustainable Consumption Practices Using Social Networks
Isabel Maria SILVA CRUZ (Institute of Sociology, University of Porto, Portugal, Portugal) | imsilvacruz@gmail.com

The impact of CO2 emissions, mainly from the road transport sector in the European Union, was about 900 Mt CO2 in 2012. In Portugal the amount recorded was 17 Mt CO2, representing the transport sector about 25% of the total of national emissions that year. In this context, to encourage the sharing of private car – car-sharing, is a strategy that promotes both sustainable consumption practices and the decrease in spending on transport. It should be noted that the cost of transport corresponds to the 2nd largest expenditure (14.5%) in the Portuguese household budget, in 2011.

In Portugal the first car-sharing platform was promoted by a company that sells fuel – GALP Energia. So, the purpose of this paper is to clarify the reasons and strategies that takes a petrol company to promote a car-sharing platform using social networks.

The methodological approach focuses on documentary analysis, on interviews with members of the petrol company and on data published on the Galpsharing website.

Preliminary results suggest that the main reason for GALP Energia Company to promote Galpsharing is associated with the oil crisis. This crisis had a strong impact on the company sales and the strategy used to get more clients was based on the promotion of sustainable consumption practices. Thus, saving and preserving the environment were presented as the main reasons to promote this platform for sharing the car. This fact reinforces the idea that economic issues can have a central role in what concerns environmental dimensions.

A sociological approach for investigating the effect of energy prices on energy consumption
Anders Rhiger HANSEN (Aalborg University, Denmark) | arh@sbi.aau.dk

Economic modelling dominates research on the effect of energy prices on energy consumption. However, by only approaching the relation between prices and consumption from an economic perspective, important insights on how people consume energy is never elucidated. A more sociological approach would to a greater extent emphasise the social and cultural context of energy consumption. In addition, such and approach would take into account that energy consumption is a result of everyday activities such as turning the radiator valves, opening windows and showering, and consequently, relate to past experiences which has embodied as routines and habits rather than individual choice-making.

This paper is an effort to show how a sociological approach can contribute to analysing and interpreting the effect of energy prices on energy consumption differently than the dominating economic approach, and thereby bring new understandings on how energy prices affects
households’ energy consumption and how the effect of prices differ across types of households, e.g. low-income and high-income households.

Based on data from more than 600,000 households in Denmark, this paper focuses on district heating used for space-heating and hot water. Using multilevel modelling, where the dependent variable is at household level and the explanatory variable is on heating-supplier level, the objective is to isolate the effect of variation in standardized prices between district heating suppliers in Denmark on the amount of heating consumed by single-family households.

(In)appropriately laundered clothing: a latent class analysis on use of washing machines?
Mette Hove JACOBSEN (Aalborg University, Copenhagen, Denmark) | mej@sbi.aau.dk

Despite decades of critique, energy research and policy agendas still tend to focus on efficiency gains and initiatives designed to increase awareness on energy use and to help consumers make informed choices. This perspective is based on an underlying conceptualisation of the consumer as autonomous and rational. However, many processes of actions are unobservable and patterns of resource consumption appear economically and environmentally irrational. In order to get a deeper understanding of the underlying mechanisms by which households are directed towards procedures appropriate to a given practice, this paper analyses the social structuring of laundering. The analysis is based on a Danish cross-sectional survey from 2014 consisting of 2,000 households answering questions about possession and use of electrical appliances. By controlling for social position and a wide range of household characteristics, I ask the question; to which extent does information about energy efficiency through energy labelling affect possession and use of washing machines and tumble dryers.

Following theories of practices, I suggest that social practices like laundering are not generated through series of reflexive and independently decisions. Instead the conduct related to laundering is systematically influenced by a set of embodied dispositions to act in particular ways. It is collectively and socially affected, which leaves little significance to the reflexive, rational consumer. I therefore end up questioning energy policy focusing primarily on promoting energy efficient appliances and initiatives aiming to influence individual choice. Rather, changed behaviour and household energy conservation involves changes in what households take to be appropriate conduct.

Are smart electricity display-monitors smart enough to disrupt the everyday?
Máté János LŐRINCZ (Keele University, United Kingdom) | m.j.lorincz@keele.ac.uk
Sharon GEORGE (Keele University, United Kingdom) | s.m.george@keele.ac.uk
Zoe ROBINSON (Keele University, United Kingdom) | z.p.robinson@keele.ac.uk
Lydia D MARTENS (Keele University, United Kingdom) | l.d.martens@keele.ac.uk

Disruptive life course events often prompt us to re-consider the ‘everyday’ and it can provide a ‘window of opportunity’ for innovations and behavioural change. From a practice theoretical perspective, disruptions - temporary breakdowns in the flow of events - are central to understanding the norms, practices and technologies that construct the socially accepted definition of normality: disruptions allow us to investigate what is actually perceived as normal (Warde 2005, Shove et al. 2012). More importantly, a practice based approach to periods of disruption allows us to investigate the ‘situated process of gathering the knowledge’ required to accomplish practices and achieve change (Nicolini 2011, Roberts 2006). In this perspective, a practice-based approach would reveal how ‘know-how’ (or embodied habits, Gram-Hanssen 2011) is learned, travel between moments of performance and how they change and ‘fossilise’ (Shove et al. 2012). This presentation is informed by research with newly established student
households and their evolving electricity consumption practices. Following Strengers et al. (2014) argument that electricity consumption is a social process within a home, I will explore whether and how electricity-display monitors shifts the distribution of ‘know-how’ within students' homes, including its distribution between human and non-human entities (Watson et al. 2008). In conclusion, I will ask whether this process helps in understanding the ‘everyday’ where the home and its residents transform one another (Pink et al. 2012).

RN05S24 - Understanding 'The Sustainable Consumer'

Understanding the identity and motivations of sustainable consumers: Towards a conceptual model
Irene GARNELO GOMEZ (Henley Business School, University of Reading, United Kingdom) | i.garnelogomez@pgr.reading.ac.uk

Despite an increasing trend towards the consumption of sustainable products and services globally, little is known regarding socio-psychological influences on these practices (eg. Evans and Jackson, 2008; Jackson, 2005). What are the drives which motivate people to consume in a sustainable way? Are the consumers’ identities salient in this consumption process? Is there an authentic ethical awareness or do people consume sustainable products because of their habits, or in order to identify with a particular social group? I believe not all sustainable consumers are the same, and therefore cannot be treated the same way. Each consumer will be different, will have different motivations, beliefs and values which drive her/him to consume sustainably. Market research companies have conducted research related to this matter, for instance, MORI helped The Co-operative Bank to identify five key consumer clusters taking ethical issues into account (2000), and divided British consumers into: ‘global watchdogs’, who are socio-political activists; ‘conscientious consumers’, who place importance on ethical issues when purchasing; ‘brand generation’, who often discuss ethical issues with friends and family; ‘do what I can’ consumers who sometimes recycle but do not significantly engage in ethical behaviour; and ‘look after my own’ consumers who are inactive in every social sense –political activism, ecological causes, etc. Yet the question remains, what are the innate motivations behind these different behaviours? How are the four innate drives of human behaviour affecting these different kinds of consumers? Are ‘global watchdogs’ driven in a greater way by the drive
to defend, while the ‘brand generation’ cares little about the environment and it is more concerned to bond with other? And what about the group ‘look after my own’? Are these non-sustainable consumers driven by these same motivations yet resulting in different outcomes? This paper explores how the different identities of consumers moderate the impact of human drives on sustainable consumption. The Four Drive Theory of human behaviour (Lawrence and Nohria, 2002) is used as the foundation of a conceptual model that is developed and presented as a key output of this study. More specifically, the paper argues that sustainable consumption can be seen as a function of the drive to acquire, bond, comprehend and defend, which in balance might affect in a different way different types of consumers. Importantly this paper also explores how the balance between these drives during consumption may vary depending on the different identities of consumers. Therefore, psychological and social aspects that influence the identity of sustainable consumers are also examined (including social group, lifestyle and ethical beliefs, between others) and presented as a moderator of consumption (Tajfel, 1982; Noonan, 1989; West, 2012).

The conceptual model is then explored with reference to a pilot study that has drawn on semi-structured interviews with 10 consumers living in the UK regarding sustainable consumption habits. The participants of the study have been students and researchers who are members of organisations that could be considered sustainable because of the causes they support (such as the ‘Fairtrade Society’ and the ‘Technologies for Sustainable Built Environments’ Centre at the University of Reading). The research has taken place in Reading, in the South East of England, because it is an area in which sustainable consumption is particularly prevalent in –for instance, heavy buyers of organic products are concentrated in this part of the UK (TNS, 2004). The participants of this study have been women and men living in the UK -aged between 18 and 45 years old- coming from different socio-economic backgrounds. It has been demonstrated that gender, age and social class (Lury, 1996; Atkins and Bowler, 2001) influence consumption, and that is why these specific demographics have been chosen for this study. Participants were recruited through direct contact between the researcher and the members of the groups that were considered interesting for the study (the researcher attended meetings of the organisations and explained the topic of the research), and also appeals for participation in social media platforms (such as students’ groups on Facebook). Semi-structured interviews have been chosen due to the character of the study –analysis of identity and human behaviour and motivation-, as qualitative methods provide a better understanding of the experiences lived by individuals, their beliefs and values (Hennink, Hutter, & Bailey, 2011).

The preliminary results of this piece of research firstly agree with recent studies which have demonstrated that identity has interaction effects on sustainable consumption (Costa Pinto et al., 2014). For instance, the results of this pilot study suggest that people are differently motivated to consume sustainably depending on the way they develop their sustainable selves. Furthermore, it seems that the motivational drives which lead people to start consuming sustainably vary between individuals, and the age at which they start this journey is highly influential to this process. It seems also important to highlight that even though there are not relevant differences between the responses given by women and those given by men, it was harder to recruit male participants for the study, which may mean either that there are more sustainable consumers who are women or more women than men who consider themselves sustainable –and therefore it could be said that gender influences this kind of consumption. Implications for consumers, business, societies and policy makers are then explored. Directions for future research are also examined –including the possibility to also take into account non-consumers of sustainable products and services (with the purpose of knowing not only what leads to this kind of consumption, but what does not) and the importance of including consumers from other socio-economic and cultural backgrounds in future studies. The key contribution of this paper is the presentation of a conceptual model and qualitative pilot study.
that contributes to a deeper understanding of the existing attitude-behaviour gap (Prothero, 2011) in the field of sustainable consumption.

**Lifecourse transitions and sustainable consumption**

Kate BURNINGHAM (University of Surrey, United Kingdom) | k.burningham@surrey.ac.uk
Susan VENN (University College London) | s.venn@ucl.ac.uk

Lifecourse transitions - such as to motherhood or retirement - are often characterised by changes in household economy, leisure practices and social networks and as times of reflection on identity and lifestyle. For policy makers interested in encouraging healthy or sustainable consumption such moments of disruption to everyday routines, might be thought to provide ‘windows of opportunity’ in which to deliver interventions (Darnton et al 2011). There is increasing evidence in the field of health prevention, for example, that smoking interventions are more likely to succeed if targeted at key life events (McBride et al 2003). The idea that a similar case might be made for interventions to promote more sustainable consumption is tantalising.

There is little sustained work, however, which explores how, when and why mundane aspects of everyday life change as people move through such transitions, and uncertainty about how long any changes will be maintained. Existing studies of the adoption of sustainable consumption practices do not typically track individuals over time and longitudinal studies of life transitions rarely consider sustainability implications.

This paper reports on mixed method longitudinal research with a sample of 40 new mothers and 40 retirees in the UK which explored how various aspects of everyday life, which have implications for sustainable consumption, changed or remained stable over a period of two years. Drawing on interview data we illustrate some significant aspects of the experience of these ‘transitions’ which challenge a simple reading of them as potential moments of change for sustainable consumption.

**Limits to Necessity**

Riikka Susanna ARO (University of Jyväskylä, Department of Social Sciences and Philosophy, Finland) | riikka.aro@jyu.fi

Despite the multifaceted progressions of consumer societies, a general development has been that households own a vast and a further growing number of appliances, vehicles, clothes, tools for specialized purposes in both leisure and work. Generally, consumption level has been shown to rise along with rising income individual solutions also being more popular among the well-off than others. Along with having more, the perceived necessity (aspiration level) of those items is claimed to be higher among people with higher income. In order to be satisfied with our consumption we are also more likely to keep up with consuming more rather than to lower our expectations (Karlsson et al., 2004). Goods become incorporated into the standard of living considered ‘normal’ and decent and thus the standard constantly moves upward. This is understood as one of the dynamic reasons behind escalating volumes of consumption.

Although necessity is commonly studied from the viewpoint of subsistence minimum (e.g. Halleröd et al. 2006) and viewed as an entity of material form, it is here considered as an intersection of elements, embedded into wider material and socio-cultural arrangements.

Focusing on sustainability this paper investigates the ‘normal standard of daily material life’ (Shove & Warde, 2002) by utilizing in-depth interviews of the well-off, people with higher income and higher education from the perspectives of delimiting and doing of daily necessity concerning home appliances, and in looking at use of water and electricity in daily proceedings.
10-year change toward (non-)sustainable consumption: practices, values and role of close personal relationships
Amélie ANCIAUX (Université catholique de Louvain) | amelie.anciaux@student.uclouvain.be
Françoise BARTIAUX (Université catholique de Louvain; FNRS-Belgium) | francoise.bartiaux@uclouvain.be

What are practitioners’ socio-economic profiles when it comes to practices that impact the environment and relate to food consumption, daily mobility and energy consumption at home? Which inequalities are observable? Furthermore, how did these practices change, or not, during the last ten years? Who did change in a more sustainable direction, who did so in a less sustainable direction and who did not change at all? For which practice(s)? What are the values and motivations given to explain such changes, or the absence thereof? Did close personal relationships play a role in bringing about these changes? Is it possible to quantify this role? These questions will be answered thanks to a very recent quantitative survey with 1785 respondents who were contacted mainly via municipality-based Facebook groups. The survey was realised with an Internet-based questionnaire in French-speaking Belgium in November-December 2014. The sample characteristics will be compared to relevant census data (2011) in order to evaluate the sample’s representativeness.

Social practice theories (Schatzki, 1998; Reckwitz, 2002; Warde, 2005) are the main component of the conceptual framework, which also includes concepts from relational sociology. By studying the practices’ careers and carriers, trajectories towards more sustainable practices in daily life are outlined.

JS_RN05+RN09 - Coping with the Crisis: Economic Shocks and Changing Patterns of Consumption

Lack of money or lack of time or both? Estonian consumers during and after economic crisis
Triin VIHALEM (University of Tartu, Estonia) | triin.vihalem@ut.ee
Margit KELLER (University of Tartu, Estonia) | margit.keller@ut.ee

Changes in consumption during the economic crisis that started in 2008 have deserved some scholarly attention (e.g. Marcu & Meghisan 2012, Catana 2012, Alimen & Bayraktaroglu 2011), but relatively little is known how crisis affects people’s relation with time. Time poverty – deficit of time for leisure, but also for leading a more environmentally sustainable, healthy or thrifty life – is a common feeling among people trying to make ends meet or hold on to their (well-paid) jobs. Consumption habits of time poor people can be extensive – they may buy “green” products, but holistic rearrangement of lifestyle is beyond their capability.

Downshifting – an idea of living simpler lives and using less (industrially produced) goods and services – may be attractive at good times, but how accessible an alternative is it during hardship? The few relevant studies reveal that decrease of income does not lead to willingness to invest more time in housekeeping and homemaking (Ironmonger 2012). Urbonavicius & Pikturniene (2010) have found that especially the younger generation, who lacks experience with scarcity of money and restraint, is unable to change consumption habits.

Our study aims to explore the complex interrelationships between money and time sufficiency and deficiency and changes in consumption during and after economic crisis. The analysis develops the segmentation of consumers along the time richness and money richness scale.
(Lindskog & Brege 2001) and discusses voluntary and forced changes in consumption patterns by different consumers, both at the time of crisis and after. The empirical analysis uses nationally representative surveys in Estonia in 2008, 2011 and 2014 and media text analysis.

**Crisis, social inequality and consumption – a Dutch perspective**

Stefan WAHLEN (Wageningen University, The Netherlands) | stefan.wahlen@wur.nl
Jornt MANDEMAKERS (Wageningen University, The Netherlands) | jornt.mandemakers@wur.nl

Inequalities have been exacerbating in the Netherlands since the economic crisis hit ground in 2008, with poverty increasing substantially. The amount of the Dutch population living under the poverty line increased from 7.4% in 2010 to 10.3% in 2013. Different types of household are affected: single parent and one-person households, as well as those with migration background. Moreover, life course influences are inherent in the rising amount of children and of elderly in poverty. The aim of this paper is to investigate how new inequalities impact the consumption of food, housing and mobility across the life course. Inequalities in food consumption are manifested in the growing amount of food packages handed out by foodbanks increased by 30% (2012-2013). Housing cost makes up a substantial share of the total expenditure for consumers with lower income and social inequalities become visible in the increasing late payments on mortgages as well as on energy and water consumption. Mobility is of interest, because low-income households appear to cut expenditure on mobility, considering the proportion low-income households spent on mobility is lower as households above the poverty line (7 and 11% respectively). This paper sheds empirical light on consumption inequalities by providing quantitative empirical evidence. A combination of statistical data is analysed, such as budget surveys and the consumer confidence survey of Statistics Netherlands. Life-course influences thereby indicate different peculiarities of consumption inequalities in the types of households affected by poverty.

**Sources of “interpretive cacophony” in public discourse on consumer behaviour: a case study of foreign exchange intervention of Czech National Bank**

Václav ČEPELÁK (Faculty of Social Sciences, Charles University, Czech Republic) | V.Cepelak@seznam.cz
Martin HÁJEK (Faculty of Social Sciences, Charles University, Czech Republic) | hajek@fsv.cuni.cz

In response to enduring economic uncertainty in Europe public debates on appropriate economic policy and behaviour have proliferated. This trend is not surprising – during the times of crisis and uncertainty the necessity for some kind of salutary intervention/change stimulates discourse on the topic. The presented paper analyses a controversial public debate in Czech printed and online media that has emerged after the Czech National Bank launching the quantitative easing of national currency in November 2013 followed by Czech crown depreciation. As analytical framework we applied the theory of orders of worth by Boltanski and Thévenot (1991), focusing on processual and situational aspects of controversies in everyday life. A computer assisted text analysis was carried out on a corpus of newspaper and online articles and blogs. Our results show that the controversy of the intervention was based on differing perceptions and evaluations of inflation and deflation produced by economic, political and popular media discourse. We determined three main controversies (money vs. savings controversy, inflation vs. price hike controversy, and consumer vs. person controversy) which represent different perspectives of policy makers and policy objects in the debate. Discovered barriers of mutual understanding between proponents and opponents of the intervention as well as strong dynamics with which the debate has emerged in the public discourse contribute to the
‘interpretive cacophony’ (Lodge, Wegrich 2011), which itself contributes to the sentiment of uncertainty in kind of behaviour appropriate in times of a supposedly never-ending crisis.

**Money, territory and relationships: three case studies from Italy**  
Valentina MOISO (University of Turin, Italy) | valentina.moiso@unito.it

In some contexts the exchanges of money among people are facilitated, not hindered, by different elements that have to do with relationships, representations and other non-rationalized factors. The paper presents three case studies, in which the communitarian element seems to get gradually stronger: a credit cooperative bank, a local bank with a strong link with territorial identity; an experience of Popular shareholding in agriculture, one of the most innovative solutions in environmental preservation, that asks citizens to invest their savings for an “alternative remuneration”; a Self- Financed Community (Comunità autofinanziate - CAF), little group of people - often rejected from traditional financial system - that trust each other and share savings and debts.

In all cases the link with the local community has two components, the territory and the personal knowledge: the analysis highlights how this components support the economic change, in particular savings and debts, activating interpersonal or collective trust.

The perspective adopts the family level point of view: this paper investigates motivations, representations and mechanisms at the basis of families' involvement in these experiences, that has increased after recent financial crisis. This is a real innovative point because those cases are especially studied by the organisations side, without a real focus on the motivations of people involved.

**JS_RN05+RN16a - Cross-national Perspective on the Normative Discourses of 'Food Health'**

**Toward a proper diet and a healthy body in France and in the United States : a comparison of normative discourses**  
Faustine RÉGNIER (INRA, France) | Faustine.Regnier@ivry.inra.fr

This contribution will analyse a wide corpus of normative discourse regarding a healthy diet and the measure of the ideal corpulence, coming from French and American women’s magazines, between 1930 and 2010. A “proper” diet has to be defined, in its relation to the measure of the feminine healthy ideal body. I will determine national models of recommandations related to healthy diet and ideal body and I will underline the main evolutions through time. Can the French tendencies be considered as the reflect of European ones, opposed to the American norms ?

I will first examine the definition of a “healthy diet” and the measaures of the “ideal body” : what are the main differences between the 2 countries ? What are the evolutions in terms of weight control ? I will then discuss the specificites of two different national models : a French model, where culinary art, health and beauty are intimately connected ; an American one, where nutrition, self-control and moral are the dominant factors. Finally, I will underline a transnational convergence : the discourse seem less and less normative, but their claim of hedonism and liberty is never expressed without a reminder of the new duties (in terms of health, nutrition or body weight control), in a context where explicit contraints have been transformed into internalized self-restraint and are thus, maybe, all the more powerfull.
Nutrition recommendations, health citizenship and lazy gluttons
Piia Tuuli JALLINOJA (University of Helsinki, Finland) | piia.jallinoja@helsinki.fi
Salla SAVOLAINEN (University of Helsinki, Finland) | salla.m.savolainen@helsinki.fi

In October 2013, the 5th edition of the Nordic Nutrition Recommendations was published, followed by the national version in Finland in January 2014. Both were widely reported and debated in the Finnish media. The data of the study consist of this debate in printed media, social media, online forums and blogs, one month after Nordic and one month after the national recommendations (n=430). We analysed who takes part in the debate, what are the arguments for and against recommendations and how consumers were positioned as regards expert advice, responsibility for one’s health and proper food consumption. Critical stances included claims that the recommendation do not take into account individual dietary needs and that they aim to control people’s lives. A common argument defending the recommendations stressed their scientific basis. Consumers were positioned e.g. by estimating their ability to control themselves: “The new nutrition recommendations are not for gluttons but for those who are able to control themselves in dinner table” (online discussion forum). Another type of argument referred to the lack of understanding, e.g. by leading nutrition scientists in a newspaper “Based on the lively discussions [since the publication of the recommendations], it seems that many parts of the recommendations have been misunderstood”. The study applies theories on new public health and health citizenship, Beverley Skeggs’ analysis of moderation as a consumption ideal among middle class and “letting-go” and gluttony as its opposite, and studies suggesting that “tamed hedonism” or “negotiated pleasures” are currently desired patterns for food consumption.

Do consumers reduce meat consumption? Background factors and opinions related to healthy and sustainable eating in four Nordic countries
Gun Mikaela ROOS (National Institute for Consumer Research - SIFO, Norway) | gun.roos@sifo.no
Mari NIVA (University of Helsinki, Finland) | mari.niva@helsinki.fi
Nina KAHMA (University of Helsinki, Finland) | nina.kahma@gmail.com
Unni KJÆRNES (National Institute for Consumer Research - SIFO, Norway) | unni.kjarnes@sifo.no
Thomas Bøker LUND (University of Copenhagen, Denmark) | tblu@ifro.ku.dk
Johanna M MÄKELÄ (University of Helsinki, Finland) | johanna.m.makela@helsinki.fi

Meat is a significant and valued food all over the world, but in addition meat is also today associated with problems related to health, environment and animal welfare. Citizens in the Western world are increasingly reflecting on the health and sustainability of meat, but there are few signs of policies actually aiming at reducing meat production and consumption. This paper examines consumer agency regarding meat eating in the Nordic countries. The analysis is based on data collected by a web-based survey in 2012 as part of the ‘Food in Nordic Everyday Life’ study carried out in Denmark, Finland, Norway and Sweden (N = 8 248). By using multivariate methods we investigate how reducing meat eating is related to socioeconomic and life phase variables, and to opinions, practices and policies of healthy and sustainable eating. The paper discusses whether citizens in the Nordic countries can be expected to take a leading role in reducing the environmental impacts of meat eating, whether they have the agency and power to do so, and how they see the role of political interventions in advancing sustainable food production and consumption. Theoretically, the article will contribute to the discussion on ‘new modes of green governance’ (Klintman 2009), especially by debating the key role attributed to people as buyers and eaters. We examine how assumptions of consumer agency and political consumerism encounter the practicalities of people’s everyday life and values related to societal responsibility of various actors.
You Are What You Eat - On Perception Of Linkages Between Food Consumption And Health In Poland
Agnieszka MAJ (Warsaw University of Life Sciences, Poland) | agnieszka_maj@sggw.pl

The paper will present results of a quantitative research based on an opinion poll of a group of research participants from Poland. The research will investigate the participants’ opinions concerning chosen aspects of relations between food consumption and maintaining health and a good look, especially their beliefs about the kinds of food considered as “healthy” or “unhealthy” and the possible reasons standing behind such a classification of certain food products. The study will also investigate the importance of a “healthy diet” in the lifestyles of the research participants: whether they consider it important at all, do they feel determined to follow any patterns of dieting or not, are they open to exploring any new trends in nutrition, for example following new dieting fashions. The proposed research study will also attempt to investigate the role of the slim body ideal in shaping participants’ attitudes towards healthy eating: whether they find it important to maintain a slim body silhouette or not and whether it influences their everyday choices of food products in any way, for example by the fact of avoidance of any specific kinds of food. Where possible, the findings of the research study will be presented in a broader context of lifestyle choices made by specific social groups.

JS_RN05+RN16b - Feeding Peoples’ Health: Dietary Health and the Medicalization of Eating

Feeding health. The role of functional foods.
Paulo Jorge MONTEIRO (ISCTE-IUL ( University Institute of Lisbon), Portugal) | pjemonteiro@gmail.com

The relationship of man with food testifies, at any time, the crossover between culture, technology and marketing. Regardless the apparent paradox between a sophisticated food science and the expansion of diseases related with food ingestion, in modern societies, food has, progressively, played a dual role: instrumental as a supplier of nutrients as well as therapeutic resource managed both in isolated and combined way. Functional foods, developed in Japan in mid- 1980s, are a product of food science and the marketing of the agro-food sector, that are supposed to improve health and well-being and prevent future disease, fuelling a consumerist ethos leveraged by a growing reflexivity, knowledge and activism by the healthcare consumers.

In Portugal, fortified yogurts with bifidus bacteria, the most representative segment of functional foods, are ranked in the 24th position among the top 50 most purchased products in hyper and supermarkets in 2014, and my current research as a PhD student will cross the results of the first national food and nutrition survey, with 1200 respondents, performed since mid-1980s, with the analysis of half a million transactions, integrating any sort of functional food from a hypermarket chain’s loyalty cardholder database, to produce the portrait of profiles and consumer habits of functional foods by the Portuguese population. Further qualitative research through Focus Groups (n= 32 ) will try to uncover the logics of consumer’s adhesion to such “natural” tools and explore the hypothesis that special food’s therapeutically usage is a contemporary expression of medicalization.
Scottish policy initiatives to improve dietary health in secondary schools: food and drink purchasing practices of young people

Giada DANESI (University of Hertfordshire, United Kingdom) | danesi.giada@gmail.com
Wendy WILLS (University of Hertfordshire, United Kingdom) | w.j.wills@herts.ac.uk
Ariadne KAPETANAKI (University of Hertfordshire, United Kingdom) | a.b.kapetanaki@herts.ac.uk

Public authorities in Scotland have implemented several initiatives regarding food and drink sold in schools in order to improve the diet and health of children and young people. Some foods and drinks are not available in schools and the sale of others is restricted. Kitchen supervisors have to develop menus respecting the Statutory Nutrient Standards for Schools. Nonetheless, regulation does not prevent food retailers around schools selling whatever they wish, and public authorities are now concerned with this issue.

Through a mixed-methods approach and a case study methodology, this study explored food and drink purchasing practices of pupils aged 13-15 years across Scotland. Seven schools took part with 535 pupils completing an online purchasing recall questionnaire and 651 pupils involved in one or more qualitative methods of the study (individual and collective interviews, writing exercises, go along tours, focus groups and participant observation). Moreover, 13 head teachers and kitchen supervisors as well as 25 food retailers took part in informal or semi-structured interviews. The schools were varied in terms of social deprivation and food environment.

This paper reveals the impacts of public policies regulating food and drink on offer in school and the reasons why many pupils venture beyond the school gate at lunchtime. Furthermore, perceptions of pupils on food and drink sold in school and strategies they adopt to avoid school rules are discussed in order to highlight views of young people on public policies concerned with their health.

Incorporating considerations on equity-oriented implementation and ethics in WHO normative work on nutrition actions

Gerardo ZAMORA (World Health Organization) | zamorag@who.int
Juan Pablo PEÑA-ROSAS (World Health Organization) | penarosasj@who.int
María Nieves GARCÍA-CASAL (World Health Organization) | garciacasalm@who.int

Setting norms and standards is one of the core functions of the World Health Organization (WHO). WHO follows an evidence-informed, policy-oriented process for its normative work on nutrition and provides programme guidance to its Member States and partners in emergency and stable settings. Guidelines are developed for nutrition-specific and nutrition-sensitive interventions and include, for instance, food fortification, supplementation with vitamins and minerals, protection, promotion and support to breastfeeding, complementary feeding, prevention of childhood obesity, or clinical practices for improved nutrition (e.g. delayed umbilical cord clamping or care of patients with Tuberculosis). Starting in 2014, the Evidence and Programme Guidance Unit, in the Department of Nutrition for Health and Development of WHO, started a progressive and systematic approach to incorporate policy-relevant considerations on health equity and ethics into its normative work. By approaching eating as a social act and adopting a social determinants of health perspective, guideline development has been enhanced and recommendations are furnished with guidance on equity-oriented implementation. This paper examines the conceptual and methodological steps followed in this progression and suggests considering equity in access as an implementation outcome grounded on ethical principles. It takes the examples of four WHO guidelines related to micronutrient deficiencies and one theoretical work on exclusive breastfeeding to illustrate how social determinants, equity in access and ethics are considered in guideline development and
programme guidance. It highlights the limits of such work and the challenges to programme implementation and finalises with a brief discussion on the applicability of sociological inquiry to nutrition sciences.

JS_RN05+RN30a - Youth and Risky Consumption

Drugs as an element of life style
Martin STANOEV (Silesian University in Opava, Faculty of Public Policies in Opava, Czech Republic) | martin.stanoev@fvp.slu.cz

The paper presents the main findings of the research focused on the social aspects of drug careers in Czech Republic. The aim of the research was to capture the changes in the social environment and its normative aspects of individual drug careers of those individuals whose process of addiction begins in adolescence and do not come from socially marginalized environment. Design of concerned research is case study, and draws mainly on in-depth interviews with informants who became drug addicts. The sample includes eighteen informants. The findings are conceptually based mainly on Irwin’s concept scene and Erickson’s conceptualization of adolescence. It emphasized the role of environment labelled as pro-drug scene as a bridge between conventional peer-group environment and socio-excluded group of drug addicts (drug subculture) within the three-stage sequential model of inclusion into the drug subculture. Then it shows the identification with anti-hero of drug addict in early adolescence as one of possible motives of drug experimentation. In conclusion, the author tries to relate research findings in a broader socio-cultural context. Context of society, which lacks widely shared perspective which could facilitate identity achievement in adolescence.

Risk, addictions and rituals. A sociological interpretation of the Opal Coast students’ anomy
Philippe MASSON (University of Lille 2, France) | philippe.masson@univ-lille2.fr
Alessandro PORROVECCHIO (University of the Littoral Opal Coast, France) | alessandro.porrovecchio@gmail.com
Isabelle CABY (University of Artois, France) | i.caby@wanadoo.fr

The aim of this paper is to describe the social health condition of the university students of the French Opal Coast littoral. In particular, we will focus on risky and addictive behaviours (alcohol, drugs, sex, internet and sports).

This work moves from a research called “Universanté”, started in 2008. This research includes an observatory to monitor students’ health and aims to promote healthy behaviours in the territory. Our analysis has been carried out on a sample of approximately 4,000 students, both at regional (Nord-Pas de Calais: University of the Littoral Opal Coast and Artois University, University of Lille 2), inter-regional (University of Rouen) and international level (University of Chicoutimi, Canada and University of Balamand, Lebanon). The aim of this study is to define a “global health” profile, through the analysis of some usual determinants (biomedical, social, psychological, etc.). As concerns this paper, we mixed the epidemiological approach of Universanté with some in-depth interviews and some focus groups.

One of the most important evidences emerging from our data is a widespread condition not so far from Emile Durkheim’s idea of “anomy”. This sociopathic condition includes some alarming situations of isolation and brings a new conception of risk, that takes the shape and the meaning of a sort of (collective or individual) ritual and in some cases can transform itself in a set of
addictive behaviours (alcohol, drugs, sex, etc.). This brings also a new conception of risk: it seems clear that young people are switching from safety objectives to more flexible conditions.

"Psychonauts", “healthneers” and those between; Preferences and consumption of illicit drugs among youth in northern rural Sweden.
Mats JAKOBSSON (Lulea University of Technology, Sweden, Sweden) | mats.jakobsson@ltu.se

The paper presents and discusses results from two survey studies, 2012 (N=5608) and 2014 (N=6211) among youth, 16-19 years of age in the county of Norrbotten in northern Sweden. The studies reveal changes in preferences concerning consumption of cannabis towards normalization in terms of less restrictive attitudes in favor of liberal or neutral attitudes towards cannabis. Risk factors for using drugs (tobacco, alcohol, cannabis, spice and other narcotics) is related to different social backgrounds and the sociocultural context. Applied logistic regressions shows that gender, class and social control have significant effects; age, males, attending school in another town away from family, growing up in economic poor and/or vulnerable conditions, youth from working class homes, liberal or neutral attitudes towards cannabis, regular use of tobacco and alcohol and having friends that use drugs occasionally increase the risk. MDS-analysis revealed four specific clusters of positions regarding drugs; psychonauts who regularly use alcohol, cannabis and experiment with other drugs and have pro-drug attitudes and socialize with drug liberal friends. The opposite position is the healthneers who have not tried or used any drug and have strong antidrug preferences and only socialize with like-minded. The first group represents 8 % , the second group represent 28 % of the population in the study in 2014. Between these two clusters there are different combinations of attitudes and use of drugs that correspond to findings in an earlier study where these clusters are described as ambivalent position and transitional position.

Alcohol Use in Young and Middle Adolescence: Influences of Family Structure and Parenting Behavior
Eva-Verena WENDT (German Youth Institute (DJI), Germany) | wendt@dji.de
Christine ENTLEITNER (German Youth Institute (DJI), Germany) | entleitner@dji.de
Sabine WALPER (German Youth Institute (DJI), Germany) | walper@dji.de

Early alcohol use of adolescents is an increasing problem in Europe. Data from Germany indicated that, at age 14, around 70% of the adolescents have experiences with alcohol and nearly 15% consume alcohol regularly or frequently (Bergmann et al., 2011). Empirical findings proposed family factors, such as parental separation and supervision, as important socializing parameters for alcohol consume in adolescence (e.g. Kask et al., 2013). This paper aims to examine how factors such as family structure, parenting behavior, parent-child relationship, as well as economical and educational deprivation, influence adolescents’ alcohol use in two representative studies from Germany.
Data 1 comes from the child interview of the fifths wave of the “German Family Panel” pairfam (2012/2013). The sample comprises answers from 454 young adolescents, aged 12-15 years, on with their prior experiences with alcohol and frequency of alcohol consumption. Data 2 comes from the study “Growing up in Germany” (AID:A, 2014/2015), which include responses from 1200 adolescents, aged 16-17 years.
Results from the pairfam sample revealed that, for young adolescents, perceived parental emotional warmth and monitoring are associated with lower, and negative communication with higher likelihood of early experiences with alcohol. However, these factors are not related to the frequency of alcohol consumption. Besides family factors, further analysis will include influences of economical/educational deprivation, age and gender, and the results will be compared with...
patterns in the AID:A-sample. These findings will be discussed in the context of the development of early drinking and practical implications for effective prevention work.

**JS_RN05+RN30b - Building Young People’s Identities in Media**

**Online Exposure to Pro-Eating Disorder Content among Young People in the UK, Germany and Finland**

Atte OKSANEN (University of Tampere, Finland) | atte.oksanen@uta.fi
Markus KAAKINEN (University of Tampere, Finland) | markus.kaakinen@uta.fi
Matti NÄSI (University of Tampere, Finland) | matti.nasi@utu.fi
Pekka RÄSÄNEN (University of Tampere, Finland) | pekka.rasanen@utu.fi

The Internet is the most widely-used form of media among teenagers and young adults and as such can encourage participation in unhealthy behaviors. The online setting provides a platform for pro-anorexia (pro-ana) and pro-bulimia (pro-mia) sites along with associated online communities, allowing users seeking such material to access a variety of resources and user-generated content. Our paper examines how exposure to pro-eating disorder material varies among British, German and Finnish Internet users aged 15 to 30 (n = 2,532). We expect offline social support and involvement with traditional offline groups to act as buffers against searching for pro-eating disorder material online. In this paper, our analysis focuses on social belonging to both offline and online social groups. The results indicate that 22% of Finnish, 21% of British and 7% of German respondents had been exposed to pro-eating disorder content online during the past 12 months. Those encountering such material were likely to have a strong sense of online social belonging and low offline social belonging. Furthermore, female gender, younger age, active usage of online services, not living with parents and living in an urban area were all associated with exposure to pro-eating disorder content. Country differences were found to in terms of the strengths of detected associations. Our results indicate that pro-eating disorder material is widely accessed by the young European users and that exposure to it is especially high among young females who report a strong sense of belongingness to online communities.

**Consuming food media, building dreams among Young Portuguese Chefs**

Mónica TRUNINGER (University of Lisbon, Portugal) | monica.truninger@ics.ulisboa.pt
Vitor Sérgio FERREIRA (University of Lisbon, Portugal) | vitor.ferreira@ics.ulisboa.pt

The entertainment industry around cooking television programmes has boomed in recent years (Rousseau, 2012). Programmes such as Master Chef among others contributed to building the profession of chef as iconic, helping to reconfigure its symbolic and social status, and inspiring hedonistic and consumerist lifestyles. The celebrity chef culture has fueled career plans and consumption dreams of many young people. But does the image of chefs and their practices mediated on TV programmes and consumed by young audiences match the enacted lives of real chefs in a professional career? Informed by a practice approach in sociology of consumption (Warde, 2014), this paper contributes to addressing this issue drawing on a qualitative analysis of in-depth interviews with professional young chefs in Portugal. The analysis shows a mismatch between the ‘dream’ (carefully built by generalist producers of TV food programmes) and the everyday life practices of professional chefs in restaurants or hotels kitchens. However, the real lives of young professionals would not be enacted without the power of food media, which helped to reconfigure the professional practices of young chefs. Medialized dreams and enacted lives feed off each other, and the relation of professional young chefs with the media (e.g. TV, Press, blogosphere) is paramount to the survival of their careers of practice. This paper is supported by the FCT project Making dream jobs come true:

Habitus on social media: College students’ different approaches to identity construction on Facebook
Liang-Wen LIN (University of California, Los Angeles, United States of America) | liangwen0626@gmail.com

Youth identity that explores the relationship between self and society is a central concern of youth studies. The very question whether there is still as much influence of social background on identity construction or identity is more individually achieved has aroused debates in youth studies. Nowadays young people live in a world of social media where they utilize multimedia resources to express themselves in different ways. Facebook has become the most popular social network site among college students and has begun to play a substantial role in their college life.

The purpose of my research is to reveal how college students in Taiwan construct their identities regarding impression management and cultural consumption on Facebook. Based in Taipei, Taiwan, this research applied methods including in-person interviews, online observation and a visual approach of photographic analysis inspired by P. Bourdieu and R. Chalfen. I refer to the conceptions of distinction and habitus proposed by Bourdieu and arguments provided by visual studies as the primary theoretical frameworks in this research.

I suggest that individuals demonstrate unifying and consistent practices of identity work between online and offline activity through different cognitive structures of identity work, which are socially produced, exercised by habitus, and different from socio-economic status. Two different principles of perception and construction of identity are unveiled. My argument contributes to the debates on identity in youth studies for it provides the real-world evidence and connects the logic of identity work practices online to the ones offline.

‘Charlie is so cool like’: Authenticity, popularity and inclusive masculinity on YouTube
Max MORRIS (Durham University, United Kingdom) | max.morris@durham.ac.uk

On the world’s most utilised video-sharing social networking site, YouTube, Charlie McDonnell (Charlieissocoollike), Dan Howell (Danisnotonfire) and Jack and Finn Harries (JacksGap) are Britain’s most successful video-bloggers (vloggers). With more than two million regular subscribers to each of their channels, along with millions of casual viewers, they represent a new form of authentic online celebrity. These young men, whose YouTube careers began as teenagers, do not espouse a traditional form of masculinity; they are not sporty, macho or even expressly concerned with being perceived as heterosexual. Instead, they present a softer masculinity that embraces emotional openness, homosocial tactility, male femininity and homosexuality; eschewing the homophobia, misogyny and aggression attributed to boys of previous generations. These behaviours are theorised using Anderson’s inclusive masculinity theory. Drawing on analysis of 115 video-blogs (vlogs), along with an in-depth interview with Charlie McDonnell, this paper examines how these young men developed and exhibit their inclusive masculinities and attitudes, which I postulate are a reflection of dominant youth culture.
JS_RN05+RN30c - Youth and Consumption Styles

Credit and debt as the ‘new normal’. Conceptualizing the risk of ‘overindebtedness’ as part of emerging financial practices in contemporary consumer society.

Pernille HOHNEN (Aalborg University, Denmark) | hohnen@cgs.aau.dk
Malene GRAM (Aalborg University, Denmark) | Gram@cgs.aau.dk
Turf BÖCKER JAKOBSEN (The Danish Consumer Council) | tbj@fbr.dk

Along with the global deregulation of financial markets and the introduction of new forms of money and credit, most European countries have witnessed an overall change in financial practices in recent years. Among young people in particular, credit based consumption has become a common way of consuming related to increasing digitalization of money and easy access to credit (McNeill 2014, Poppe and Böcker Jakobsen 2009). In addition to this, ‘overindebtedness’ has become an increasing problem among young adult consumers both in Denmark and in other European countries (Christensen 2014). The present paper aims at discussing ‘overindebtedness’ as closely related to changes in ‘mainstream’ practices and imageries of financing and consumption in contemporary ‘access economy’. In doing so the paper disembarks from prevailing literature focusing on debts problems as an outcome of individual irrational behaviour. More specifically, we relate the increasing risk of ‘overindebtedness’ to three central patterns in contemporary markets: easy access to credit; changing practices of savings; and an increasing consumption of ‘social necessities’ (Hjort 2004). Empirically, the paper draws on individual interviews with young adults (18-25 years) who have experienced problems with indebtedness as well as focus groups with young adults who do not have financial problems. Embarking on these empirical insights the paper proceeds to conceptualize the forms of credit and debt that seems to be developing in contemporary globalized European markets.

“I love these Shoes” – Shopping as a Practice of Legitimization and Presentation

Steffen EISENTRAUT (University of Wuppertal, Germany) | eisentraut@uni-wuppertal.de
Alexandra KÖNIG (University of Wuppertal, Germany) | akoenig@uni-wuppertal.de

If young people are asked about the criteria for buying clothes, they mostly refer to their “individual taste”. Clothing is understood as a material presentation of self. In this sense, fashion artifacts are symbolic representations of identity that display belongings to specific groups, or distinguish from others. Searching for an outfit is not just a matter of finding something “nice” but to perform a successful and consistent self-presentation. Being both young individuals’ own claim and social expectation, choosing the “right” clothes is a meaningful and challenging practice.

Based on an empirical study, the paper investigates processes of selection, presentation and legitimation in the context of young people’s consumption of fashion. With the help of different data types – observations in clothing stores, interviews as well as fashion blogs and YouTube channels (“shopping hauls”) – we ask for the implicit rules that structure practices of buying clothes. How are certain choices justified in front of familiar peers or even in front of an anonym audience? Which ascriptions, classifications and demarcations can be found within the presentation of purchased goods and what are relevant categories for constructing individuality besides “classical” sociological dimensions like age, class or gender?
The paper contributes to the research of youth consumer culture and sheds light on concrete practices. In order to understand how young people select and present “fitting” fashion items and legitimize purchase decisions, they are not only studied as customers but as creative entrepreneurs producing self images for and in interaction with an audience.

**The effects of socializing agents on youth consumption styles**

Leena HAANPÄÄ (University of Turku, Finland) | lehaan@utu.fi  
Terhi-Anna WILSKA (University of Jyväskylä, Finland) | terhi-anna.wilska@jyu.fi

Youth consumerism is a theme under a constant interest since, indisputably, the consumer role of children and adolescents has become more active in the last few decades (e.g. Ironico 2012). One of the main interests regards the way youth are socialized in consumerism, i.e. how they learn to be consumers. According to theories of consumer socialization (e.g. Moschis 1987), young people develop their consumer related skills, knowledge and attitudes through interacting with socializing agents: family, friends, media, celebrities, school etc.

This paper focuses on Finnish youth consumption styles and the socializing agents affecting it. The data are drawn from a survey called Youth in Focus which targets adolescents at school grades 5, 7, and 9 (N = 1803) mainly in Southern Finland. The data are collected in November 2014 during school lessons using an online questionnaire. The findings regarding youth consumption styles are part of a wider survey that aims at gaining understanding of the living conditions of youth (http://www.utu.fi/cyri).

The results of a statistical analysis made by explorative factor analysis (EFA) proposed five consumption styles labelled as ‘brand-conscious consumption’, ‘price-conscious consumption’, ‘recreational consumption’, ‘anti-consumption’, and ‘status consumption’. The following linear regression analysis conducted for each consumer style revealed diverse effects between different socializing agents and youth consumption styles. On one hand, media had effect in all but anti-consumption. Interestingly, TV commercials had no effect on any consumer style. Peers had a significant effect on the other consumption styles except anti-consumption, respectively. Parents’ role was significant especially to price-conscious and anti-consumerist youth.

**Social inequalities and symbolic boundaries in a local club and discotheque market**

Gunnar OTTE (Johannes Gutenberg-University Mainz, Germany) | gunnar.otte@uni-mainz.de

In many contemporary portraits of young people’s leisure time practices and consumption patterns the impression prevails that adolescents are free to choose from a “supermarket of styles”. Youth is often seen as a moratorium in the life-cycle that dispenses with the status hierarchies typical for adult life in class-based stratification systems. This paper uses the under-investigated case of the urban nightlife economy in order to study processes of symbolic boundary-construction and structures of social inequality in young people’s music scenes. Two components of a comprehensive mixed-methods design are systematically combined in the investigation of a local market of clubs and discotheques in the city of Leipzig, Germany. On the one hand, quantitative audience surveys are used to compare the social audience composition of twelve clubs and discotheques varying in size, organizational form and musical genre. On the other hand, the drawing of symbolic boundaries is studied using ethnographic methods and group discussions with cliques of typical visitors. The paper shows how traditional bases of social inequality (especially class, gender, and age) and scene-specific forms of capital (especially music and bodily capital) interact and, together, produce a market of urban nightlife that is hierarchized along multiple lines.
RN06P01 - Poster Session

The Critique of Social Network Service Appropriation: Analysis of Platform Rent and Profit

Wook Inn PAIK (Seoul National University of Science and Technology, Korea, Republic of (South Korea)) | klangwelt@snut.ac.kr

This study tries to explore the contradiction between the social production and private appropriation of the digital artifacts of user activities. The users of huge platform service companies like Google, Facebook are cooperatively participating in the Big Data formation by their platform. The service platforms of the companies combine the rent and profit in their cybernetic apparatus. The products of the users’ activities in those platforms are appropriated as raw material when the companies make the service products for the users without paying wages and rewarding them. This survey discloses that kind of appropriation is the new type of rent in the age of cognitive capitalism. After appropriating the users’ activities in the form of rent they try to subsume them into the circuit of the profit making platform apparatus. Those profit generating machines are equivalent to those of factory in the age of industrial capitalism. So the service platform could combine the rent and profit in its cybernetic apparatus. They accumulate the data of users’ activities in the form of platform rent and directly turn them into the raw material for their informational goods. In their platform apparatus they mix the platform rent and varolisation process to realize the profit for them. This study urges that the understanding of the new type of rent form and profit based on platform would play key role to explain the accumulation mechanism of current SNS companies in cognitive capitalism.

RN06S01 - Debt, Finance and Resistance

The constellation of the ‘non-market’: conceptual considerations, methodological consequences, political implications

Ian BRUFF (University of Manchester, United Kingdom) | ianbruff@gmail.com

This paper builds on the arguments of Martijn Konings and others, who claim that there is an enduring tendency to pay lip service to neoliberalism’s rhetorical and ideological valorisation of the ‘free market’. As a result, the significance of ‘non-market’ parts of the political economy for neoliberalisation processes is often downplayed. Accordingly, the paper focuses on what I term the constellation of the non-market: this is grounded in the state and the household, whose relationship with each other is mediated by the labour market, public services, and political representation. In the current period these three mediating sites are less able to absorb the pressure placed on them by capitalist crisis, meaning that greater burdens are placed on the state and the household, bringing them into a more direct relationship with each other. A key consequence is the rise of authoritarian forms of neoliberalism – an example being the widespread constitutionalisation of austerity – which leaves the state as a more direct target for popular struggles, demands and discontent that seek new forms of organisation and participation. Hence the political implications of this paper’s conceptual and methodological discussion are highly significant, for they entail the need to re-imagine not just the
neoliberalisation processes that we all claim to know but also the responses and strategies that could be pursued.

**How have state institutions reinforced the bottom-up mechanisms of consent in financialised capitalism?**

James David Gordon WOOD (King’s College London, United Kingdom) | james.wood@kcl.ac.uk

Financialisation describes the increasing influence of the financial sector in modern capitalism, which has been attributed to the increasing incorporation of financial products into the everyday life of workers, primarily through investment in owner-occupied housing. Access to mortgage credit has been identified as a “mode of regulation” that establishes a structural path dependency for borrowers on employment, which also generates large revenues for the financial sector. Neo-Weberian scholars suggest that individuals enter into these structural path dependencies to augment their income from employment; however, the financial gains of homeownership are non-ubiquitous, and the Neo-Weberian emphasis on material gain ignores the role of loss aversion, which suggests that individuals are more concerned with mitigating the fear of potential losses rather than achieving potential gains. Therefore, as opposed to demanding gains from investment, workers may actively demand access to mortgage credit, and adhere to the explicit and implicit demands of the lender, to offset the threat of physical insecurity established by the declining wage share of GDP in Britain. Successive British governments since 1979 have promoted owner-occupied housing as a means to access wealth and have reinforced the structural path dependencies by facilitating access to mortgage finance, which has also generated large revenue for the financial sector.

**Disciplining Debt. Meeting Across Crisis Realities**

Angela WIGGER (Radboud University Nijmegen, Netherlands, The) | a.wigger@fm.ru.nl
Monica CLUA-LOSADA (Pompeu Fabra Barcelona, Spain) | monica.clua@upf.edu

A range of critical political economy accounts have pointed towards the authoritarian guise of the crisis responses of the European Union (EU) and its member states, thereby drawing on Poulantzas’ (1978, 1979) authoritarian statism (see Oberndorfer 2012; Sandbeck and Schneider 2013), as well as in combination with Hall’s (1979, 1985) authoritarian populism (Bruff 2014). As a focal point, the analyses disclose the vast incorporation of a range of “authoritarian” elements in the institutional outlook of EU and member state governing agencies, through a strengthening of the executive, judicial and bureaucratic discretionary powers in regulatory steering processes, in combination with an increased suspension of the rule of law and hence possibilities for political and judicial contestation. This paper aims to link more closely conceptions of authoritarian crisis responses with an analysis of resistance to the crisis, by drawing on literature on multi-scalar solidarity and political protest from critical geography (Featherstone 2012). As such, the dialectical relationship between growing authoritarianism and protest within different multi-spatial sites of resistance is explored in the light of subaltern protest movements at local, (trans)national and EU level.

**Theorizing the commons: bringing the philosophy of money in**

Marinus OSSEWAARDE (University of Twente, Netherlands, The) | m.r.r.ossewaarde@utwente.nl
Wessel REIJERS (University of Twente, Netherlands, The) | wesselreijers@gmail.com

Although academic literature on the topic of the commons has become abundant, it remains an elusive term subject to an array of definitions. Most of its definite descriptions are based on a binary opposition, framing the commons as the opposite of private property, of the “anti-
commons” or as implying an organizational structure that stands in opposition to regulated markets. Moreover, the academic debate seems to revolve around either a support or an opposition towards Hardin’s “tragedy of the commons”; revolving around pre-suppositions of human rational self-interest.

In this paper, we aim at overcoming the conceptual dichotomy that plagues the definitions of the commons by reflecting on the relation between the commons and money. The concepts of “price” and “costs” are generally either explicit or implicit part of the definition of the commons; and these concepts are generally understood in the context of a money economy. Moreover, new forms of money like crypto-currencies incite discussions about the status of money, of whether for example the peer-to-peer technology of Bitcoin should be regarded as commons or as a contradiction of the commons as Marxist literature suggests.

We will use Simmel’s philosophy of money as a starting point, while he rejects the scarcity/abundance dichotomy as an origin of exchange and grounds the origins of money in the subject rather than in the objects of the economy. By contrasting the commons with the emancipatory and anonymizing effects of the use of money, we expect to discover new conceptual grounds.

Through basic income to economic democracy – the importance of the relative wage
Maciej SZLINDER (Adam Mickiewicz University, Poland) | mszlinder@gmail.com

In this paper I argue that the crucial measure of the current state of class struggle is the relation between aggregated wages/salaries and aggregated profits. Basing on the tradition of critical political economy of Karl Marx (rate of exploitation), Rosa Luxemburg (relative wage) and Michał Kalecki (wage share in GDP), as well as the diagnosis of the crisis of neoliberal capitalism made by contemporary heterodox economists (Flassbeck, Husson, Laski, Palley et al.) I claim that only these propositions and reforms that significantly change this relation for the benefit of the workers (and not those connected with nominal/real wage) can lead to activate transformative dynamics indispensable for re-appropriating the commons, including the common, collective control over the totality of economic life (production, distribution and consumption). The latter means a system of economic democracy situating itself in opposition both to corporate, monopoly-finance capitalism and centrally planned economy of state capitalism.

In the second part I analyse the potential outcomes for the relative wage of unconditional basic income (UBI) which has become an increasingly popular demand in last years and explain this popularity in the contemporary, anti-oligarchic and “precariat-based” social movements fighting for democratisation of politics and economy, as well as economic security without being forced to accept precarious, unsatisfying jobs proposed by workfare systems. As an example of this kind of movements I analyse the place and importance of UBI proposition in the program of Spanish 15M movement and in the process of its institutionalisation into the political party of Podemos.

RN06S02 - Advances in Critical Political Economy

Everyday troubles, indeterminacy and changing the world: making sense of inequality
Wendy BOTTERO (University of Manchester, United Kingdom) | wendy.bottero@manchester.ac.uk

This paper is concerned with how troubling social situations come to be seen as unjust, unfair, or a source of grievance. All versions of class analysis have struggled with the question of how
everyday understandings of class inequality are related to the experience of that inequality. The consensus is that, whatever the relationship, it is not straightforward. Class theories have been more successful in explaining why people fail to acknowledge or recognise inequality than in accounting for when they do. Yet people do protest, mobilise and organise, and rather more often than such accounts suggest - how can we explain this? This paper looks at different approaches to the subjectivities of inequality, and argues that it is important to understand what shapes everyday ‘views’ or framings of inequalities in terms of their practical and strategic significance. It argues that we need to examine everyday forms of protest, dissent and misbehaviour from the point of view of a pragmatist analysis, seeing the subjectivities of inequality within a broader framework of everyday sense-making, part of people’s attempts to grapple with their practical problems and so engage in ongoing reconstructions of their social experience.

Women’s Empowerment and the Economics of Inclusion
Carlos Julian HERNANDEZ (Independent Scholar, United States of America) | chernandezhrd@gmail.com

The global women's empowerment movement and feminist economic theory (Beneria, 2003; Kuiper and Sap, 1995; Riley, 2008) represent the most effective platform from which to advocate for inclusive economic policies that address the regressive effect of austerity and economic restructuring on the commons, and thus class dynamics. These perspectives also redefine class along lines that favor the traditionally privileged (Agarwal, 1988) while exacerbating the ability of vulnerable groups, such as women and those living in absolute poverty, to participate meaningfully in society and take charge of their own lives.

The commons are meant to alleviate these discrepancies in power relationships between different participants in the economy, as public services that are aimed towards the least privileged affording them the opportunities that the most privileged possess because of their disproportionate influence on society. Absent access to the commons, it is exceedingly difficult for marginalized social groups to become independent self-sustaining participants in the economy. These groups tend to be delineated along lines of gender, ethnicity, and pre-existing social class distinctions based on economic means.

I will argue that the current economic paradigm, policies of austerity and state divestment from the economy exacerbate class power relationships, and that the women's empowerment movement, over traditional leftist movements, represents the most effective platform for advocacy that is global in scope and addresses divergent economic forces “potentially incompatible with the meritocratic values and principles of social justice fundamental to modern democratic societies” (Piketty, 2014).

Bilderberg Group and the Transnational Capitalist Class: Recent developments in tabooed elite club and their relevance for neo-Marxist sociology
Lukas KANTOR (Charles University, Faculty of Social Sciences, Institute of Political Studies, Czech Republic) | lukaskantor@centrum.cz

As a contribution to class analysis and elite theory, this paper focuses on significant, but under-researched Bilderberg Group as prominent private network, which serves for annual meeting, socializing and coordinating of the Euro-Atlantic elites. The proposed presentation extends the current knowledge by investigating the five last Bilderberg conferences from 2010 to 2014. Largely based on data from official Bilderberg website, our study provides both qualitative and quantitative insights into the occupational, national and gender composition of recent Bilderberg attendees as well as into the topics discussed. These empirical findings are explained as
validation of neo-Marxist theory of the transnational capitalist class (TCC) as advanced by leading critical sociologist Leslie Sklair. Specifically, we argue that the case of Bilderberg corroborates all key Sklair's propositions: the existence of four different fractions within TCC, the dominance of corporate fraction, the inter-permeability of all fractions and the collective effort of TCC to promote capitalism and manage globalization processes. Moreover, as the emergence and power of TCC is still sometimes disputed, Sklair's argument will be supported by the evidence of how TCC has been becoming more globalized as Bilderberg repeatedly welcomed new attendees from post-communist Central and East European countries. Finally, personal biographies and public engagements of Czech Bilderbergers (and hopefully also interviews with some of them) are examined in order to demonstrate common backgrounds, interests and identities of these TCC “novices”.

RN06S03a - Critical Class Analysis in Eastern Europe 1

Three Worlds of Capitalism and Three Faces of Economic Protest in the Post-communist Czech Republic
Jiri NAVRATIL (Masaryk University and Charles University in Prague) | jiri.navratil@econ.muni.cz
Ondrej CISAR (Charles University in Prague, Institute of Sociology - Czech Academy of Sciences) | ondrej.cisar@soc.cas.cz

Drawing on a Polanyian logic, the present paper focuses on the gradual institutionalization of a neoliberal state in the Czech Republic and protests accompanying this process. Employing the Polanyian perspective in the context of a contemporary post-communist society gives us an opportunity to analyze an accelerated “great transformation” having gone through various stages of capitalism, and related forms of popular protest at the same time resisting and fast-forwarding this process. While Polanyi analyzed the changing nature of capitalism in the 19th century, we have been witnessing a much faster and shorter process of capitalist formation in the post-1989 politico-economic transformation of former socialist states. In the Czech Republic, the originally nationally managed wave of marketization (privatization, deregulation and liberalization) was soon followed by the qualitatively different processes of economic globalization, and subsequently by neoliberal political measures embodied in the national austerity policies. While Polanyi’s notion of protective counter-movements of regulation, de-commodification, and re-embedding has already been applied in the context of post-communist transformation and economic globalization, we aim at including also recent anti-austerity protests in the present paper. Since we draw on longitudinal protest event data from the Czech Republic, we are given a unique opportunity to see whether and how different this last protest wave was compared to previous ones, related to the inception of capitalism in the 1990s, and the global anti-capitalist resistance at the very end of millennium.

The Political Economy of De-Democratization in Hungary
Gabor SCHEIRING (University of Cambridge) | gs385@cam.ac.uk

Post-socialist democratization in Hungary had been a fragile process from its onset, however with the election of the right-wing government after 2010 it took a sharp U-turn towards de-democratization. My hypothesis is that the consolidation of democracy after ‘89 was not sustainable due to increasing economic insecurity of the working and middle classes. The variety of post-socialist dependent capitalism both curtailed the growth of real incomes and facilitated the emergence of new social risks, like low levels of economic activity, short term employment and high levels of indebtedness. With their social expectations left unfulfilled an
increasing number of citizens lost faith in democracy and became increasingly susceptible to demagoguery and political authoritarianism. Driven by a linear imaginary of development the political and intellectual elites have failed to foresee the conflictual relationship of democracy and capitalism. The lack of critical analyses, a neglect of the concept of social class and the weakness of a progressive vision centred on the idea of social citizenship has contributed to this lack of understanding. My paper reviews the theoretical and empirical literature necessary to evaluate my hypothesis, including the effect of inequalities, social risks and the experience of injustice on democratic stability and provide a synthesis of the political economy of democratization focusing on Hungary. By offering a better understanding of post-socialist democratic citizenship and social class the paper not only contributes to the development of the critical political economy literature on Eastern Europe but to the rethinking of left wing political strategies as well.

The death and reemergence of class analysis in eastern Europe
David OST (Hobart and William Smith Colleges, United States of America) | ost@hws.edu

This paper looks at the reasons for the decline of class thinking in postcommunist eastern Europe, and at the different ways it reemerges today. It argues that there are two reasons for its reemergence: the familiarity of a younger generation with capitalism, rather than state socialism, and a fear of the rise of the right. Whereas those who shunned class analysis after 1989 argued that this was necessary to avoid a populist rebellion against modernization, scholars today argue that the avoidance of class discourse only led to the strengthening of right-wing populist discourse against capitalism. The renewed interest in class in seen as more substantial than the similar development occurring also in western Europe, due to the relative absence of a significant immigrant-based cross-cutting cleavage. On the other hand, this absence may make any revived class analysis of limited use in an increasingly globalized world.

Class in Eastern Europe - Elements for a Reconsideration
Agnes GAGYI (Eszterházy Károly College, Hungary) | agnesgagy@gmail.com
Tamas GERÖCS (Corvinus University Budapest, Hungary) | tamas.gerocs@gmail.com
Márton SZARVAS (Central European University, Hungary) | marton.szarvas@gmail.com

Conceptualizations of class structure in Eastern Europe have been marked by political-ideological turns as well as by a general problem of situating Eastern European societies within global history. The idea of Eastern European “backwardness”, a definitive element of debates over socialist or capitalist transition, has been deeply connected to debates over local class structures, often conceptualized as “distorted”, “double”, “without substance” etc. The paper will draw out some elements for reconsidering the twin questions of class and backwardness in Eastern Europe, through re-embedding local social formation into an interconnected global history. Relying on the tradition of world systems analysis, we will propose to understand local social forms as integrated elements in the historical development the capitalist world economy. In that view, class positions are identified as positions within the global distribution of labor. Class dynamics within states take shape not only relative to each other, but relative to transnational alignments of coalitions within the space of the world system. As the whole system develops in a hierarchically structured way, it engenders different social forms and state-society relations at its various points. As the literature of unequal development has pointed out, characteristics that are associated with “backwardness” when compared to social forms in the center - e.g. endurance of non-free labor forms, increased economic role of the state - originate in the hierarchical distribution of functions within the whole system.
Looking at the history of Eastern European integration into the development of the modern capitalist world system, we will propose to reconceptualize some much-debated elements of local class structure and state-society relations, such as second serfdom, socialist proletarianization, the dominant role of the state within the economy, enduring structures of state-bound oligarchic groups, subsistence economies and violent primitive accumulation.

**Class analysis in Croatia: silences and futures**  
Danijela DOLENEC (University of Zagreb, Croatia) | ddolenec@fpzg.hr  
Karin DOOLAN (University of Zadar, Croatia) | kdoolan@unizd.hr  
Mislav ŽITKO (University of Zagreb, Croatia) | mislav.zitko@gmail.com

Assuming that knowledge production is deeply entwined with politics (Weiler 2009, Fourcade 2009), we theorise changes in the academic field that ensued from the political upheaval of the early 1990s as forms of conversion (Eyal, Szelenyi and Townsley 2000). While overall this was a historical moment of great uncertainty (Ekiert 1996), the necessity of rejecting Marxism was clear. Stripped off its role of theory, Marxism was reinterpreted as ideology, removed from curricula, teaching and research programmes (Dolenec, Doolan, Žitko 2015, Kasapović, Dolenec and Nikić Čakar 2014).

In examining why social sciences took an “anti-class turn” in the 1990s, we propose a Bourdieuan (1988) account of how, given the de-legitimation of Marxism, the rules of the game were reshaped and the discursive boundaries of legitimate knowledge redrawn. We focus on the turbulent relationship between sociology and class analysis. Banned as “bourgeois ideology” in Yugoslavia until the 1960s (Dolenec 2015), rehabilitated initially as “philosophy’s younger sister” (Šporer 2006), sociology developed into a fully-fledged empirical discipline that investigated social stratification as late as the 1980s (e.g. Lazić 1987, Sekulić 1991) – only for class analysis to disappear from the discipline in the following two decades (Popović 2009).

Building on our previous work (Dolenec, Doolan and Žitko 2015), in this paper we analyse the academic conversions in the field of sociology between 1991 and today, as it witnessed both the disappearance of class analysis and its recent revival. Relying on interviews with social scientists that were academically active since the late 1980s as well as primary and secondary sources on the history of the discipline, we charter the trajectory of sociological class analysis in Croatia until its recent reinvention. In doing this, we firstly aim to identify the crucial political consequences of two decades of academic blindness to class. Secondly, we investigate the relationship between the neo-Marxian revival of class-analysis and the renewal of the political left in Croatia.

**RN06S03b - Critical Class Analysis in Eastern Europe 2**

**Working-class power and left opposition in Russia: new union activism under authoritarianism**  
Jeremy MORRIS (University of Birmingham, United Kingdom) | j.b.morris@bham.ac.uk

This paper presents ethnographic and interview material focussing on the actions of alternative trade unions in the automotive industry in Russia. Because of the association of traditional unions with state control, new alternative unions in Russia are particularly associated with political opposition and radicalism. The paper analyses recent (2008-present) activities of these unions in their attempts to mobilise automotive workers in multinational and domestic owned...
plants. Due to draconian labour laws often activists resort to work-to-rule and indirect methods of resistance. At the same time their activities resemble both political entryism and political agitation in the face of an extremely hostile and authoritarian state. How can these nascent leftist movements be understood as a barometer of wider working-class power and opposition in post-socialism? What are the prospects for their semi-formal, semi-informal insurgency against neocapitalism?

Informality and agency in Georgia: in search of a way to maximise and legitimise policy making
Lela REKHVIASHVILI (Central European University) | lel.rekhviashvili@gmail.com
Abel POLESE (Tallinn University, Estonia; Tallinn University of Technology) | ap@tlu.ee

Traditional views on informal labour, informal economies and in general informality tend to locate these practices somewhere on a spectrum between the legal and illegal. Recent critiques from new institutionalism have added concepts such as extra legality, or contextual and shifting moralities to try to better find a place for informality in a society. They have been echoed by a number of works dealing with the relationship between state and non-state actors with the goal of finding a place for informality that has often looked at it as a marginal, temporary, or merely economic phenomenon.

This paper is an attempt to challenge these views to propose informality as something persistent and not likely to disappear but to simply change face and modes of expression. Using a narrative on competition for public spaces between informal traders, the state and private actors in Tbilisi informed by in-depth ethnography of the street vending and bazaar trade throughout June 2012 to May 2014, totalling eight months of fieldwork in Tbilisi, this presentation looks at the relationship between private, public and informal sectors to rechart their relationship. We claim that informality is not (only) a transitional phase between two statuses but a social glue between situations.

We partially endorse the structural-functional idea that (some) informality is functional to the structure of a country and the way it expresses itself depends on current structures. However, we argue that there is always space for informality since policy making is made of a series of measures that rarely address what is needed “now and here” or, in other words, urgent. Especially in the contexts where states facilitate marketisation processes but are unwilling or unable to guarantee smooth social adjustment. Rather, policy making deals with projections, forecasts and anachronistic attempts to address present problems that will become past by the time a law is adopted. Informality as phenomenon, we suggest, is not transitional. The modes and ways informality presents itself may be. That means that spaces of informality, or places where informality is stronger, change and informality may move from a sector to another, from an aspect of life to the other but the need of informality will most likely stay.

Remembering the new Working Class: Memorial and Material Transformations in the making of the Post-Soviet World
Gregory SCHWARTZ (University of Bristol, United Kingdom) | gregory.schwartz@bristol.ac.uk

This paper is concerned with the role of memory in the reconstitution on the working class in the post-soviet space. Using evidence from a Russia-based longitudinal ethnographic study of workplace relations and conflicts during the last decade, the paper shows how class should be thought of as a bundle of social, cultural, legal, political, and economic ‘nodes’ coalescing through symbolic construction, including, in a specific manner, collective remembering. Rather than deny the political economy of class, the paper, repudiates the ‘economic’ primacy of class. Following Thompson, the argument shifts from Marx’s high level of abstraction—typified by the
implied existence of class with reference to capital as a social relation premised on the expanded reproduction of abstract labour and surplus value—to a level that helps in the understanding of how class exists in the social organisation of production relations. As class lives through language and the imaginary, as much as through their material conditions, and the paper captures a class in re-formation in a transforming society. Rather than Thompson’s peasants in patrician 17th century England, the aim here is to understand the post-Soviet transformation of the workers into a specific kind of class by relating the re-forging of property relations in Russia’s ‘peripheral capitalism’ to the workers’ use of the memory of the Soviet in their reconstitution vis-à-vis property relations changes. The paper makes two key contributions. First, that class is not measurable in income, educational attainment, or social status, but must be linked to the transformation of property relations and how people understand the nature of that transformation. Second, the goal is to examine the memory of the Soviet as a specific ideological cornerstone around which the contemporary working class is constituted, and how the collective struggle over its meaning (either its contestation, acceptance, or critical engagement) is central to that.

Working Class in Precarious Times (the Czech Republic case)
Katerina NEDBALKOVA (Faculty of Social Studies, Czech Republic) | nedbalko@fss.muni.cz

Working Class in Precarious Times (the Czech Republic case)
In this paper I firstly focus on the conceptualization of class and working class in the post-communist countries. I critically revise the debates on non/existence of class and position my perspective within the existing sociological knowledge. I argue for 1) the ethnographic approach focused on everyday observations and interactions rather than “objective” descriptive measurements of the differences sought solely in the labor market; 2) the importance of researching not only elites and middle classes but especially those who did not benefit all that much from the process of economic and political transformation. In the second part of the paper, based on observations and interviews with two generations of workers in the Czech Republic, I explore the changing and diverse character of the working class that does not form a homogeneous and unified category. Precarious working conditions have been described, but little stays known about how do these working conditions influence the private sphere of individuals and their partnerships and families. What creates the working class today? How do workers cope with employment insecurities? How are their cohabiting and parenting strategies gendered and how do they change over generations? Also central to the paper are the question of value, respect and dignity of working class in regard with the processes of recognition and misrecognition by various organizations, institutions and media representations.

Taming the Labor: Class Genesis of Lukashenka Regime
Volodymyr ARTIUKH (Central European University) | artiukh_volodymyr@ceu-budapest.edu

Discourses on Belarus in social sciences characterize Belarusian society as a survival of state socialism in a dammatory (‘Last Dictatorship’) or celebratory (‘Last Soviet State’) manner. Moreover, with rare exemptions, they ignore the dimension of class struggle and postulate a political pact of ruling elites with wide masses of population. In this paper, I regard Belarusian capitalist society as an outcome of a particular trajectory of class struggle leading to the balance of forces among working class, capitalist class and bureaucracy upon which the rule of elites reposes. Using archival sources on workers’ protests and interviews with union activists and workers, I show that a specific trajectory of labor movement was significantly influenced by state-imposed changes in labor regulation. I trace the balance of power among social classes
throughout three phases: from open confrontation with spontaneous mass protests and incipient labor organization (1990-1995) through 'war of position' by organized trade union and party opposition (1995-1999) to attempts of neoliberalization from above with a protracted period of passivity and disorganization of working class (1999-2014). I focus on the latter phase and demonstrate that working class was attacked from above with a series of laws harshly restricting independent trade unions and other labor organizations and from below, drastically changing the balance of forces on the shop floor. I show that major changes concerned a new structure of employment relations and labor process control, which I call the double trend of state-imposed work precarization and labor fixation.

RN06S04 - Spaces of Resistance

Constructing and Contesting the Multilevel State: Social Movements and the Territorial Redistribution of Authority
Olatz RIBERA-ALMANDOZ (Universitat Pompeu Fabra, Spain) | olatz.ribera@upf.edu

In the context of the ongoing crisis, the governmental imposition of severe austerity programmes and spending cuts in most European countries, together with the deeper deregulation and flexibility of labour markets and the reduction of social rights, has triggered a wave of dissatisfaction and disaffection with the current political and economic regime throughout the Eurozone. This discontent explains the proliferation of new social and political movements and innovative forms or resistance, protest and disobedience from citizens concerned with the promotion of social justice, the supply of public and social policies, and greater democracy.

Furthermore, in the last decades, many national-states have faced two parallel processes: the decentralisation of previously centralised government structures and the supra-national integration through the emergence of transnational political institutions. As a consequence of these recent transformations, multiple layers of decision-making co-exist in a single state, creating what has been called multilevel –or scalar– states. Hence, decentralisation and integration have contributed to the creation of ‘new state spaces’ (Brenner 2004), that is to say, of new political arenas in which public policy is debated, contested, developed and implemented. However, the co-existence of multiple and overlapping territorial spheres of political authority have witnessed the emergence of overt and covert conflicts –both vertically and horizontally– between different state apparatuses, frequently over the allocation of competencies and the distribution of resources.

The confluence of the emerging social and political movements and multilevel political systems, as well as the increasing ‘impenetrability’ and reluctance of many national governments to negotiate or even debate with these movements, has prompted the adoption by the latter of secondary struggles over the territorial distribution of authority and the multilevel composition of the state. Thus, the absolute lack of access to the political institutions at the state level encourages these actors to find alternative access points at the supra-national and/or sub-national levels of government, and to intensify the existing contradictions and tensions between different layers of governmental bodies—that is to say, local, regional, national and supra-national institutions—, in order to fulfil their primary demands for social justice and ‘real democracy’.

In the academic literature, the phenomena of multilevel governance and multilevel state have mainly been analysed from de point of view of their consequences the reconfiguration of authority, including the analysis of the interaction and confrontation between different decision-making levels, the allocation of resources and competencies, and the effects on party
competition. These previous accounts frequently address the relationship between institutional structures and socio-political struggles as a unidirectional process in which the former are treated as set by other agents, and the latter have to develop strategies to adapt to the given context.

Reassessing the contributions of both social movements theory and critical theories of the state, this article invites to reconsider the complex interplay of structure and agency in the context of the multilevel state. On the one hand, social movement theory consider multilevel states beneficial for the development of citizen struggles since lower decision-making layers—such as local and regional governments—are deemed more permeable and open to their demands. This context favours the development of social and political movements by creating political opportunity structures that facilitate the access to decision-making processes, and ultimately to social change. On the other hand, drawing on Poulantzas’ conceptualisation of the state as a condensation of social relations, and on Jessop's strategic-relational approach, critical theories of the state treat the multilevel configuration of state as built upon the permanent interaction of multiple social agents. State structures—including multi-scalar or multilevel political arrangements—are seen as socially produced, and therefore as fluid and in constant process of change.

With the theoretical integration of the aforementioned approaches, this paper invites to rethink the interplay between structures and social agents as a multi-directional process in which both institutions and agents constantly interact and exert mutual influence on each other. The territorial distribution of authority in the multilevel state is here conceived as the result of the process of negotiation and confrontation of social forces for the strategic selection the institutional arrangements that better suit their interests, beliefs and values. The contribution of the article is threefold. First, it elaborates a critical review of the main theoretical approaches on the interaction between social movements and the institutional structure of the state. Second, it provides new theoretical and conceptual tools for the study of the political agency of social and political movements in the (re-) or (de-) construction of the multilevel state. Third, it aims to introduce general guidelines for the application of these tools to the empirical analysis of specific case studies. Moreover, the study of the capacity of social movements to modify power relations between different territorial layers of political authority provides a new insight into the understanding of the actual construction—and contestation—of the multilevel state.

The political economies of modernity and tradition in the social movements of Brazil ‘new frontier’.
Robert Paul STEWART (University of Strathclyde, United Kingdom) | paul.stewart.100@ac.uk
Brian GARVEY (University of Strathclyde, United Kingdom) | brian.garvey@strath.ac.uk
William FERREIRA (Federal University of Goias, Brazil) | williamjatai@gmail.com

In the European Union’s turn to the southern hemisphere to source the biomass required to meet Kyoto renewable fuel targets, hi-tech innovation is aligned with new alliances between energy and food corporations and state and intra-state institutions, policies and investment strategies. These are marketed both as a responsible commitment to a lower-carbon EU and global economy and to rural economic development in key agrofuel producing countries in the global south, such as Brazil. A more systemic and power relation attentive approach taken here, and informed by Brazilian rural workers in the supply chain, illustrates how incumbent energy infrastructures (and south-to-north primary commodity flows) are kept intact by the new alliances that have deepened conditions for power asymmetries between labour and employers, and between small landholders and multinational corporations. ‘More’ technology and market-orientated, voluntary certification, however, has proved inadequate in addressing the distinct, social challenges emerging from this transition and this
paper suggests that this is indicative of how an emerging techno-institutional ‘fix’ for agrofuel struggles to contain inherent contradictions the increasingly capital-intensive model of large plantation-scale monoculture in which global energy majors simultaneously replace, while producing simulacra, of the notorious absentee landowners of the 18th century. The fact that this model is contested most vociferously by the dispossessed and poorly paid rural workers, the very labourers that agrofuel innovation was proclaimed to benefit, leads to a new theoretical and empirical agenda in the interpretation of the so-called energy transition through dynamic and co-produced power relations. This invites, in turn, greater empirical attention to socially committed alternatives that are made possible and actively invited by the collective action and existing practices of these workers and their new social movements.

Croatian Urban Social Movements for Commons: From Contesting Privatisation to Appropriating the Public
Tomislav TOMASEVIC (Institute for Political Ecology, Croatia) | totomase@gmail.com
Vedran HORVAT (Institute for Political Ecology, Croatia) | vedardan@gmail.com

Social movements defending urban public goods in Croatia started in 2006 when initiative the Right to the City started in Zagreb. For 6 years it was mobilising thousands of citizens against construction of private shopping mall in downtown Zagreb and its massive car garage with entrance in pedestrian public street paid with public money. Case study of the Right to the City is important for understanding development of social movements for commons which followed in other Croatian cities like Dubrovnik and Pula, but also for its theoretical implications. Following Harvey (2012) who rejects notions of traditional Left that urban social movements are reformist attempts to deal with specific rather than revolutionary that focus on systemic issues, it is important to revisit the class and the battlefield of class struggle. Zagreb movement was driven by cultural, environmental and youth activists, NGOs workers, students, unemployed which supports the need to redefine the battlefield from workplace to cities and revolutionary class from 'factory proletariat' to 'urban precariat' opposing urban accumulation by dispossession (Harvey, 2004).

Other values of this case study are innovative tactics of contestation in physical space which in May 2010 included occupation of the pedestrian street for one month during which it was transformed into the commons. Urban social movements in Croatia are currently advancing from anti-austerity struggles against privatisation of urban resources to appropriating public open spaces, buildings, institutions and utility companies experimenting with democratisation practices and claiming collective right to the city as overall commons (Hardt and Negri, 2009).

RN06S05 - Rethinking Class Struggles

The resurgence of class and the neocorporatist (national) bind
Jonathan PREMINGER (Ben-Gurion University of the Negev, Israel) | yonatanpreminger@yahoo.co.uk

Renewed interest in class is inseparable from the renewed desire for political influence as a way of rethinking the public good. Scholars sympathetic to class-based worldviews have looked to vestigial neocorporatist institutions as channels for democratic participation and opposition to neoliberalism, which has raised the question of a neocorporatist revival. This paper contributes to the debate by investigating Israel’s political economy of democracy, and asserts that two fundamental premises of the neocorporatist socioeconomic order have broken down. Firstly, being a worker is now incongruent with being a citizen: the borders of the
national economy have been blurred by outsourcing and by the influx of migrant labour, and labour market borders are no longer coterminous with those of the political community. Secondly, the labour-capital conflict is no longer the salient social division. Non-union organisations have emerged to provide some protection for non-citizen workers, yet these organisations represent workers as supplicants, not as participants, and they subscribe to a rights discourse that rejects "capital" and "labour" as empirically relevant concepts; instead, they emphasize identity such as ethnicity, thus shifting the focus away from structural exploitation and towards discrimination.

The paper therefore questions whether “leftover” institutions are dependable channels of resistance or “democratic” influence, thus casting a shadow over hopes of re-establishing labour as a force for social change within neocorporatist frameworks. Moreover, it suggests that if “class” is to be useful as a mobilising ideal or as an ideational basis for institutional structures, it must escape the conceptual borders of the nation-state.

Contesting Capitalism and Imagining Democracy in China: A Typology of Left-wing Visions
Andreas MULVAD (University of Copenhagen, Denmark) | acmm@ifs.ku.dk

Based on original interview data and a mix of primary and secondary sources, this article examines three intellectual expressions of the Polanyian social counter-movement triggered by China’s turn to neo-liberalism since the early 1990s: First, the social democrat labourist vision of trade union organizer and 1989 veteran Han Dongfang, which can be seen as an attempt to reorganize Chinese labour and strengthen the bargaining power of workers vis-à-vis capital, both foreign and domestic. Second, the ‘world-systems’-inspired socialism of agricultural economist Wen Tiejun, a proponent of 'New Rural Reconstruction', a movement to resist marketization and enhance the power of the Chinese peasantry through self-organization from below. Third, the vision of intellectual historian Wang Hui, who systematically mines China’s ideational legacy for conceptual resources which can help to rekindle the Chinese dream of an alternative modernity beyond Western capitalism – an ambition which makes him a figurehead of those fractions of China’s educated urban middle-classes that lean ‘left’ politically. The purpose of this comparison is to discuss, in the final section, the potentials for constructing a counter-hegemonic project with a popular appeal strong enough to force the Party-state elite to change its course in the direction of a more egalitarian and bottom-up democratic state. I argue that the tensions between the visions of these three ‘organic intellectuals’ (of reorganizing labour, land, and knowledge respectively) will need to be overcome if such a ‘demotic’ project is to succeed.

Class Redefined as Action Orientation towards Labour Market Participation: Tested on the German Case for Descriptive Validity
Douglas Richard VOIGT (King’s College London, United Kingdom) | douglas.voigt@kcl.ac.uk

Since the 1970s, class-based politics, emerging from the structure of the capitalist system, have conflicted with identity-based politics, leading to divergent justice claims and ultimately the fragmentation of the Left. Likewise, empirical scholarship on the subject has demonstrated a tendency towards structural reductionism and cultural essentialism in ontological definitions of class and identity, respectively. Moreover, considering the empirical tendency towards precarization and career instability, often attributed to globalization or post-industrialization, maintaining a definition of class based on the wage labour nexus of the already employed is increasingly distant from the lived experience of individuals. This is also true in traditionally industrial political economies such as Germany, where the hegemonic influence of neo-liberal
ideology has been entrenched for at least 15 years. The consequent redefinition of social policy in Germany, championing flexibilization and activation, has resulted in the empirical tendency towards labour market dualization, further complicating the binary class distinction of traditional Marxian approaches. Nevertheless, with accelerating dualization, inequality, and political polarization, the need to define and empirically substantiate an approach to the social stratification of capitalist societies is more pressing than ever. This paper argues that examining the form of active participation in the labour market is a fruitful solution. This theory is empirically tested for descriptive validity on the German labour market.

Grounded in a critical epistemological framework drawn from Jürgen Habermas’ system and lifeworld distinction, form of participation is defined along two dimensions. First, the normative purpose of system participation for individuals is dependent on their communicative understanding of the lifeworld and denoted in this paper as an action orientation. An action orientation is thus an agent’s moral orientation towards participation in the social system of instrumental action. For capitalist society specifically, the operationalized definition of action orientation is drawn from the empirical work of Klaus Dörre, but broadened to include unpaid labour in the domestic, political, and cultural spheres. This broadening represents an attempt to incorporate identity-based distinctions. Therefore, Nancy Fraser’s reinterpretation of Karl Polanyi’s double movement, in which emancipation from structural and cultural oppression formed a triple movement in the mid-20th century, is operationalized as three distinct action orientations towards social labour in capitalist society. An agent thus participates in the system of social labour to accumulate capital, ensure continuity in social reproduction, or emancipation from oppressive market structures or ascribed social statuses. Secondly, the incentive structure for participating in the capitalist labour market itself is drawn from the work of Claus Offe. Understanding the labour market as a system of labour allocation for capitalist production, a given agent’s incentive to enter the wage labour relationship is defined by their position in the structure. Those lacking any non-wage forms of subsistence are structurally coerced into participation. Those positioned to benefit from their particular educational and familial background are offered financial incentives for participation. On the other hand, an agent can be morally compelled to participate either as a form of positive realization, or a form of negative pressure. In short, individual agents existing in a given lifeworld hold an action orientation towards social labour, and social labour in a capitalist system is organized according to a matrix of incentives drawing both from system and lifeworld.

Seeking to test such a conception for descriptive validity, the empirical portion of the study conducts semi-structured interviews in Germany with work placement officers (Arbeitsvermittler – AV) at Job Centers and local branches of the Federal Employment Agency (Bundesagentur für Arbeit – BA). These interviews are scheduled to occur throughout February, 2015, ending March 3rd, 2015 in the culturally and politically contrasting BA directorates of Greifswald (Gr), Ingolstadt (I), Freiburg (F), and Gelsenkirchen (Ge). These regions were also selected based on their unemployment levels which are, as of January, 2015: Gr: 15.4%; Ge: 12.5%; F: 4.5%; I: 2.6%. The interview is built around Vignettes, which are fictitious life histories reflecting the stated action orientations yet made realistic through drawing on previous research conducted with labour market participants at the Institut für Arbeits- und Berufsforschung (IAB). The interview procedure asks each AV how he or she would respond to each Vignette, particularly concerning the application of incentives to activate the given fictitious job seeker. The responses are understood as empirically consequential speech-acts which are re-interpreted in light of the over-arching epistemological framework. The subsequent analysis hypothesizes that a pattern of incentives are applied to specific action orientations in a hierarchical manner, thus potentially validating a redefinition of class which is able to incorporate identity-based conceptions without any ontological assumptions. This paper is designed from the theory and data emerging from a larger PhD-research project focusing on social justice in comparative political economy.
Reflections on contemporary class formation in Mozambique
Kajsa Johanna JOHANSSON (Linnaeus University, Sweden) | kajsa.johansson@lnu.se

At the time of Mozambique’s independence, Frelimo, the former liberation movement that was turned into a political party, aimed to address the country’s “underdevelopment” through socialist policies and rapid modernisation. The peasantry was to be transformed into agriculture workers to form a working class with the industrial proletariat working in the state run industries. The socialist dream was interrupted by a destabilisation war raging until 1992. By the time of the peace accords the country was a market economy and has since become an economic growth success story. However, poverty levels have stagnated with over half of the population living in absolute poverty.

This presentation explores how political consciousness is created and expressed in contemporary Mozambique, departing from two cases: First, the rise in large-scale agriculture investments currently taking place, generating struggles over land. Peasants increasingly organise to protest against not only the investors but also, more overall, the current development model. The second case is the expressions of urban discontent through food riots in Maputo 2008 and 2010. The riots were sparked by rise in the price of basic goods such as bread and water, but the rioters, alike the peasants, expressed a more profound critique against current neoliberal developments. Both the peasants’ movement and the food rioters refer to the fact that the still ruling Frelimo has turned against the values for which they all fought. The presentation will discuss how these two processes could be understood jointly in terms of possible conditions for formation of one class in and for itself.

The latest digital technologies and the changing forms of contemporary capital-labour conflict: Towards technophobia and 21st century Luddism?
Sérgio Henrique ROCHA FRANCO (University of Barcelona, Spain) | francoshr@yahoo.com.br

There is so much excitement about technology, about applications, about screens, about sensors, big data and artificial intelligence nowadays. We are surrounded with devices that have the ability to capture, record, and process information about us, about who we are, about what we do, and where we go. Moreover, "smart objects" are about to be united through internet, which would allow immediate and custom-made feedback that comes in real time. Alongside the latest technological burst, new applications promising cooperation between users and optimization of resources, like Uber and Airbnb, have been created. In this paper, I discuss some of the consequences of these kinds of apps and other emerging digital technologies for contemporary capital-labour conflict. My first point is that the latest digital technologies largely work through a market logic that increases inequality and would be associated with the neoliberal project. Secondly, by focusing on contemporary social struggles, such as those fought by taxi drivers in several cities around the world, I argue that the latest digital technologies very often destroy occupation and rely on cheap and precarious forms of human labour, which in extreme situations can reach the form of the self-provisioned service. Finally, I state that emerging digital technologies and artificial intelligence are at the core of contemporary capital-labour conflict, as they have opened up the possibility of either lowering labour costs or replacing human labour on an unprecedented scale.

RN06S06 - Totalled (Colin Cremin 2014) - Book Launch and Discussion
Salvaging the Future from the Wreckage of Capitalism
Colin CREMIN (University of Auckland, New Zealand) | c.cremin@auckland.ac.nz

The 2008 crisis was its own kind of hurricane, ripping through communities, destroying livelihoods, ushering a depression that Europe has still not recovered from while also mobilising widespread opposition to the political establishment. Crises are both real and imagined. They are part of a lexicon pronouncing a more uncertain age. In the midst of this are headline events, Fukushima, the Arab Spring, terrorist attacks and warnings from ecological scientists about rising carbon emissions rendered apocalyptic spectacle by Hollywood cinema. Franco Beradi said ours is the century of no future. The future is nonetheless a void yet to be determined, a territory yet to be inhabited and an energy yet to be marshalled. Today’s struggle for hegemony is for determination of the future, both to negate the idea that there is no alternative to the market and also, more positively, to demonstrate the collective capacity to end hunger and suffering. Drawing on my work on capitalism, crisis and the apocalyptic imaginary, the paper situates this struggle within a broader one to shift the balance of forces inexorably in favour of a class that neoliberalism had once pronounced dead and now appears to have awoken.

RN06S07 - Transforming Capitalism - Institutional and Cultural Dimensions

Adaptive Capitalism and US Political Economy
Rodney LOEPPKY (York University, Canada) | rloeppky@yorku.ca

According to popular understandings of political economy, American society should be characterized by the most open forms of free market production and distribution. Indeed, even the school of political marxism has long since maintained that the US state retains governance apparatuses that are, by far, the most subservient to capitalist civil society (Wood, 1992). But it is also true that the US state gets characterized in peculiarly non-capitalist ways, through descriptive categories such as ‘lender of last resort’ and ‘military-industrial complex’. While these often amount to vague references rather than sustained empirical analysis, there is a contemporary need for politico-economic analysis that repositions the state as more than just a facilitator of capital dynamics. As such, this paper proposes an analysis of ‘adaptive capitalism’ in the United States, wherein capital actively allies with state mechanisms to seek new profit streams by transforming or rerouting public revenues. While ‘bailouts’ and public interventions remain central to a cyclical capitalist economy, the robust entry and/or expansion of capital in areas such as health, education and incarceration are also highly notable. These arenas exhibit more than what David Harvey (2002) has characterized as ‘accumulation by dispossession’ — instead, they accumulate private revenue channels under an umbrella of public service delivery. By pointing to these domains, the paper will shed light on the manner in which capital attempts to maintain both the credibility and regularity of publicly inspired (and often financed) revenue streams while, ultimately, transforming their utilization and purpose.
States Unmasked? Revisiting Abrams in the Context of Crisis
Katharina BODIRSKY (Middle East Technical University, Turkey) | bodirsky@metu.edu.tr

In his article on the “Difficulty of Studying the State,” Philip Abrams argued that both political sociology and Marxism had fallen prey to a reified “idea of the state”. He implied moreover that such “state ideas” played a role in legitimating political power exercised through the state system. Abrams concluded that “the state is not the reality which stands behind the mask of political practice. It is itself the mask which prevents our seeing political practice as it is.” (1988: 87)

In the contemporary context of crisis, however, states stand unmasked. It has become particularly apparent how state power serves partial interests and how different social forces contend for the exercise of power in and through the state system. The widespread dissatisfaction with institutions of representative democracy is one indicator of the unmasked state.

If the “state idea” indeed played a crucial role in “politically organized subjection” (Abrams), how do we explain the latter’s continuity despite waning state legitimacy and increasing opposition? This paper discusses three potential factors with an empirical focus on contemporary EU-Europe plus Turkey: First, the importance of the “repressive state apparatuses” and the ways in which ideology is used not to mask, but to constitute hegemony. Second, the ways in which “state rescaling” has been used as a political strategy to insulate the state system from opposition. And third, the culturalization of (what might have been) class politics.

New Forms of Inequality in Networks and Flows of Glam-Capitalism
Dmitry IVANOV (St.Petersburg state university, Russian Federation) | dvi1967@gmail.com

Globalization has resulted not in the ‘world society’ or ‘worldwide sociality’ but rather in transnational network of globality. In such networked enclaves like super-urbanized areas Los Angeles, New York, Tokyo, Hong Kong, Moscow, London, Paris, Berlin, Buenos Aires etc., people experience globality as borderless, mobile, and multicultural life. Compared to their countries, metropolitan areas outperform in economic growth and they are the most unequal in terms of Gini index. Capitalism there has been transformed into glam-capitalism being in sharp contrast with social life outside that localized globality.

Preconditions for new form of capitalism have been generated by virtualization of social structures. By the 2000s intensive commodification of images had leaded to overbranding and triviality of the virtualization strategy that has provoked shift of competitive advantages to hyper-virtuality of glamour. Being since the 1930s specific life style or aesthetic form, glamour has become now rationality of newest version of capitalism. Glam-capitalism raises when producers at the hyper-competitive market-place must glamour consumers and when goods / services must be aggressively beautiful to be intensively attractive for targeted groups. Value creation process now is related more to trends, than to brands, not only in traditional fashion industry and show business but also in high-tech and financial industries. While the core process of industrial economy is capitalization on things (value of products) and the core process of virtualized economy is capitalization on images (value of brands), the glamour economy is capitalizing on flows (value of trends).

At the century edge the ‘onion-like’ stratification with dominant middle strata is replaced by the ‘pear-like’ bimodal stratification. Owners of trends and its creators compose new status groups – glam-capitalists and glam-professionals, which are core of new middle strata above shrinking traditional middle class. Despite of apology of glam-capitalists and glam-professionals as ‘creative class’ (R. Florida) capitalization of trends is based rather on copyright as regime of
monopoly. Monopolizing mass production of practically costless copies priced like an original, owners of trends exploit more consumers than workers. New shape of stratification is resulted from the rise of glam-capitalism flow-structures. Structures of glam-capitalism are flow-structures because they coordinate participants (actors and actants, humans and things) through direction and intensity of moves penetrating barriers and boundaries established by traditional institutional structures and by network structures of recent decades. Flows of people, money, goods, information are structuring social life under the glam-capitalism as they define intentions and outcomes of social activities. Involvement in flows is becoming a factor of social differentiation. The impact of the glam-capitalism on social inequality is its temporality. Rising significance of temporal organization of access to trendy goods creates new configuration of inequality as traditional quantitative gap between ‘having more’ and ‘having less’ is combined with the temporal lag between ‘having now’ and ‘having later’.

Emerging flow-structures reshape configuration of social inequality traditionally based on institutional regulation of access to material / symbolic resources according to social status. Three types of inequality are represented in current practices of discrimination, social conflicts, and social policies: 1) institutional inequality based on social status, 2) networked inequality based on personal identity, 3) flow-inequality based on personal mobility / creativity.

Transforming the Political-Politicising Transformation: Beyond Developmentalism
Bhavya CHITRANSHI (Ambedkar University Delhi, India) | bhaav1488@gmail.com

This paper builds on an ‘action research’ project that took transformation as an object of inquiry within the context of collective mobilization and formation of a Single Womens’ Collective in a tribal village called Emaliguda in Rayagada, Odisha. The process of public articulation of the everyday experience and condition of singleness in rural women, gave way to the formation of a collective where women who have been ‘abandoned’ by their families have come together with an objective of spelling out its own well-being, carving out its own language of empowerment and taking charge of a future; beyond mere development. This is an emergent ‘being-in-common’ that premises itself on the ethico-politics of relationality, multiplicity, love and friendship.

As this initiative progressed towards (a) collective (in) action, while engaging with the State, the society at large and one’s own self as ‘ethico-political subject’, the attempt has been to revisit the question of transformation in its three inter-related sites: ‘political’, ‘social’, ‘Self’. This research is thus a kind of reflexive writing on the process of right-ing wrongs; reflecting how an in-depth transformative process requires these three sites of transformation to be engaged with continuously and simultaneously in a triadogue. This paper attempts to offer a possible philosophy of transformative praxis that engenders change and collective formation among the gendered subaltern through participatory processes of self-reflection and reflection on the process of collectivization; through an engagement with Marxist, Gandhian, and Tagorite takes on transformation, as also contemporary (trans)formations around New Social Movements post Laclau and Mouffe (1985).

RN06S08 - European Political Economy in Crisis

Stealing water. The Italian political economy of water after the referendum of June 2011: a case of neoliberal authoritarianism?
Adriano COZZOLINO (University of Naples "L'Orientale", Italy) | acozzolino@unior.it
The proposal of paper, rooted in a critical politico-economic perspective, firstly deals with the analysis of the Italian current neoliberal restructuring, in particular from 2008 crisis to date. The analysis takes into account the role of Italian capitalist elites in fostering the neoliberal agenda, determining a remarkable increasing of social inequalities (unemployment, over-recourse to temporary jobs, privatizations etc.) and class polarisation. At the same time, this trend is marked by what Bruff has called the “authoritarian turn of neoliberalism”, a way to insulate the institutional set-up from “popular demands, discontents, struggles” and make them “less responsive to popular-democratic forces and processes” (Gill, 2001).

In this respect, a remarkable case study is the Italian referendum on public water: 26million people, after a massive campaign organized by the Italian Forum of the Movements for Water (horizontal network of local groups), voted in June 2011 to keep water a Common and to avoid its privatization. But, after three years, the results of the referendum have been disobeyed by every single national and the most part of local governments (except for few but interesting cases as Naples): privatizations, in other words, have been reintroduced surreptitiously in the interest of the four big companies in this sector.

In this frame, the main research questions are: how the political economy of water in Italy can shine a light on authoritarian governance and lobbies agency? What is, three years after a huge mobilization, the legacy of the referendum in terms of imaginary, continuity of resistance and organization?

Unfree labour in mature capitalism?Some reflections from the analysis of the agricultural production in Lazio region, Italy
Lucilla SALVIA (La Sapienza University of Rome, Italy) | lucilla.salvia@gmail.com

Over the last few years, practices variously referred to as "unfree", "forced" or "slave-like" labour have received increasing attention from international organisations, NGOs and scholars from a range of schools of thought. The bulk of the debate, although recognising the dramatic increase of the phenomenon in recent years, considers it as an anomaly or deviation from the standard functioning of labour relations. Unfree labour is often associated with human rights abuses and immorality, and portrayed as an individual relationship of coercion or at best as a residual relationship from the past, something that has more to do with developing economies where persist feudal-like relations.

This paper argues against this view, considering unfree labour as a common tool used by contemporary capital to extract surplus value, even in mature capitalism. Indeed, with the shift towards neo-liberal globalisation there has been an increasing premium put on competitiveness that calls for increasing liberalisation, deregulation of markets and above all flexibilisation of the labour force. This shift has created areas of inclusiveness of new forms of exploitation, including the harshest, such as forced labour.

This paper presents some reflections and preliminary findings from an ongoing field research in the rural area of 'agro-pontino', in the south of Lazio region, Italy, where firms make regular use of forced labour mediated by labour contractors, together with more standard labour relations, such as conventional wage-labour.

Towards a conjunctural analysis of the European crisis
Johannes JÄGER (University of Applied Sciences BFI Vienna) | Johannes.Jaeger@fh-vie.ac.at
Laura HORN (Roskilde University) | lhorn@ruc.dk

Towards a conjunctural analysis of the European crisis
Drawing on critical political economy perspectives, in this paper we develop a framework for, as well as a first, tentative exploration of a conjunctural analysis of the European crisis.
Conjunctural analysis demonstrates the comprehensive and holistic outlook of CIPE methodologies. Focusing on the complex interplay between social forces, cultural and technological change and ideological currents against the background of historically specific economic structures at a particular given moment, i.e. a conjuncture, conjunctural analysis facilitates studying this moment as articulation, crystallisation and sedimentation of specific social power relations (see e.g. Jessop 2008: 44, 126f). The ideological currents and alliances between social forces carrying specific conjunctures are not considered stable or monolithic, however, rather they are seen as open-ended developments that can fracture and become instable. Hence, in the concrete social struggles currently taking place against EU-mandated austerity in Europe, the role of conjunctural analysis for a comprehensive formulation and articulation of sustainable and feasible alternative strategies, and the question in how far social science can contribute to this, should be emphasized.

Re-imagining Spain in Europe: embracing austerity, the raise of Podemos, and the possible end of the Spanish liberal national project.
Nagore CALVO (KCL, United Kingdom) | nagore.calvo@kcl.ac.uk

Recent polls in Spain suggest that the left political movement Podemos, only established a year ago, might win the next general elections. This prediction has become even more likely as a result of the electoral win of the anti-austerity political party Syriza in Greece. Podemos has presented itself as an anti-austerity and anti-establishment democratic alternative which promises a shift in economic strategy and changes to the political system. At the same time Podemos has declared support for a process of further decentralisation and willingness to respect the political and democratic aspirations of regional and nationalist groups. This is in contrast to the current crisis management status quo where the decentralised structure of Spain and the high level of regional autonomy have been described as part of the problem before and during the financial crisis. This in turn has led to calls for recentralisation and the dismantlement of the federal structure of Spain. Thus, the challenges mounted by the Podemos programme to the neo-liberal austerity programme is likely to have multi-faceted implications for the future of Spain. This include the size of the state and the structure and organisation of the Spanish welfare state, but also has significant implications for the future sustainability of the Spanish liberal national project. This paper will draw on cultural political economy and will seek to explore the contrasting metaphors, imaginings and social formations implicated in describing the Spanish crisis, in justifying the adoption of different crisis management techniques, and linking them to different coalitions and possible alliances within the dominant neo-liberal programme underpinning the political and economic strategy of Spain’s liberal national state.
RN07 - Sociology of Culture

RN07S01 - Collective Memory as a Cultural System

An “unaccomplished memory”: the period of the ‘strategy of tension’ in Italy (1969-1993) and the Piazza Fontana bombing in Milan
Anna Lisa TOTA (University Rome III, Italy) | annalisa.tota@uniroma3.it
Lia LUCHETTI (University Rome III, Italy) | lia.luchetti@uniroma3.it

In Italy the ‘strategy of tension’ period represents a still very obscure time in country’s recent history. The terrorist attacks that took place from 1969 to 1993 have never been included in the Italian public discourse. Can one imagine that this is due to various forms of instigated amnesia? It seems to be an ‘unaccomplished memory’ that could never be inscribed in the international public discourse. When ‘State Terror’ occurred in Italy, access to legal and political arenas was systematically denied and cultural trauma process could be performed only in aesthetic arenas. After addressing the hypothesis of the role played by international intelligence services (especially CIA) in the Italian ‘strategy of tension’, the chapter focuses on a case study of the first Italian terrorist attack happened in Piazza Fontana (Milan, 12 December 1969) and analyses the social trajectories of this public memory.

Re-writing memory: mediation and mediatization of remembrance about communism through cinema
Alexandru I. CÂRLAN (National University of Political Studies and Public Administration, Romania) | alex.carlan@comunicare.ro
Malina I. CIOCEA (National University of Political Studies and Public Administration, Romania) | malina.ciocea@comunicare.ro

The aim of this paper is to investigate the processes of memory mediation through cinematic technologies and practices, in the context of a dialectical relationship between mediation and mediatization. We analyse recent Romanian cinematic productions belonging to various genres (the documentary about Communism as a historical period, the fictional films, the art films) as types of mediation in the engagement with the past, in order to understand how these mediation dispositifs work and how mediation incorporates reflexively the processes of history mediatization. Our analysis will focus on how such technologies and practices allow for types of engagement with the Communist period through strategic negotiation of distance towards the past, discussing both their repressive and emancipatory potential. Thus we investigate the contribution of cinema to the reconfiguration of cultural memory about the Communist period in Romania and the dynamics of memory policies in the Romanian public sphere, highlighting the relationship between identity building through remembrance and the processes of public legitimation of memory building. The empirical area of our investigation consists mainly productions that thematize the historical period of Communism in Romania, negotiating versions and meanings of the Communist experience in terms of historical relevance, moral responsibility and identitarian significance. We can take these discourses as competing/convergent inputs in building a collective memory about Romanian Communism. In order to reach these objectives, we build an analytic of techniques and practices of mediation of the past through cinema, adapting insights from Critical Discourse Analysis in the field of memory studies.
Wall is Over! Imagining John Lennon in Prague
Trever Thomas HAGEN (University of Exeter, United Kingdom) | t.hagen@exeter.ac.uk

'Lennonová Zed' (The Lennon Wall) is situated in the center of Prague, tucked away on a quiet street of the Malá Strana quarter. Its beginning can be traced back to chalk writings on the Wall in the late 1970s. After John Lennon’s murder in 1980, a spontaneous commemoration took place for him at the Wall, establishing an annual gathering. The Wall soon became a place where people could scrawl their thoughts on peace, music and champion the former Beatle: “You were not a god nor a king—you were one of us”. An outline of a tombstone adorned the Wall with the simple epitaph “For John Winston Lennon”, with candles, graffiti and flowers in constant rotation.

This presentation addresses the transformation of cultural practices at the Lennon Wall over the past thirty years. I examine three moments: the collective effervescence of an unplanned and unprecedented public demonstration at the Wall in 1985; the Wall’s post-89 existence as a transnational site shaped by the tourist gaze; and more recently, on 17 November 2014, the Wall was painted over in white with a single piece of black-lettered graffiti reading ‘Wall is Over’, bringing forth a number of public reactions to the Wall’s shared meaning. The presentation considers Lennon as a mutually negotiated symbol that, when assembled with the materiality of the Wall and its temporary objects (e.g., candles, flowers, graffiti), has created a particular space that affords a divergent range of meanings maintained by convergent patterns and practices.

A Tale of Two Crises: the Changing Cultures of Financial Regulation and Accountability
Mark D. JACOBS (George Mason University, United States of America) | mjacobs@gmu.edu

I propose to contrast the legislative responses in the U.S. to the Great Depression of 1929 and the Great Recession of 2008, as a comparative case study in what I call “the no-fault society”—reflecting conditions of constrictive individualism, the blurring of public and private, and the erosion of the rule of law—amidst the transformations of modern societies. By contrast with the Pecora Hearings of 1932-33, which presented a clear explanation for financial collapse, specified an underlying “web of corruption,” and helped shape landmark legislation (the Glass-Steagall and Security and Exchange Acts) establishing relatively effective financial regulation, the Financial Crisis Investigation Committee of 2009 failed to achieve consensus about causation or accountability, resulting in legislation (the Dodd-Frank Bill) that is still unfinished and whose regulatory provisions have been compromised by financial lobbying.

Recreating traditions and making atmosphere! The case study of the assembly dancing at the Amis Harvest Festival
Ming LIN (Department of Sociology, Lancaster University, United Kingdom) | wagilin@gmail.com

The aim of this paper is to explore the role of traditions in the regeneration of social practices and building an atmosphere for local tourism promotion. I chose the “assembly dancing” of the Amis Harvest Festival in Hualien, Taiwan, as a case study, which has become more famous for its lively, delightful atmosphere although its appearance is different from “the tradition”. Through the connection with tourism, the involvement of the government, this “indigenous” festival has been recreated. It thus becomes a good case study which can show the dynamic relationships
between tourism, indigenous culture, and political affairs. The assembly dancing is a form of recreation using Amis/ Pangcah traditional materials and organised by the Hualien government. In this paper I begin the discussion by exploring the roles that Amis/Pangcah traditions and assembly dancing play in the growth of tourism in Hualien. By doing so, I respond to the theories about reasons for forming traditions. Next, considering the ongoing debate about culture preservation or innovation among the stakeholders of Hualien County, the possible cultural changes that assembly dancing might bring are discussed. I not only examine the possibility of actors doing assembly dancing as a hybrid Amis/ Pangcah tradition by recreating a relatively old tradition of Amis/ Pangcah, but also the connection between atmosphere and tradition. How an atmosphere can be constructed by recreating traditions will be explored at the end of this paper.

The idea of invented traditions, as proposed by Hobsbawn, has gradually been applied by ethnographers, historians and sociologists. By comparing historical and empirical observations of the past and today, Hobsbawn sees the appearance and establishing of invented traditions (Hobsbawn 1983, p. 4). He defines the invention of tradition and notes a phenomenon: when ‘old’ traditions are going to disappear, ‘invented’ traditions frequently arise. Furthermore, he argues that when there are rapid and large changes in demand on the supply side, new traditions may be invented and constructed. For instance, when carriers and promulgators can no longer maintain traditions, or when traditions cannot keep pace with rapid social transitions, there will be changes on the supply side. And when a tradition is no longer needed as it was originally designed, it is a change on the demand side. In this argument, the demand for an old tradition and for a new one always move in opposite directions. And this is also the same as his assumption about the supply side. However, in the case of assembly dancing and traditional Amis singing and dancing, the demands on both traditions are increasing. Although Hobsbawn (1983) does not ignore the possibility of the co-presence of old and new traditions, his argument again sets out a dichotomy between them. He argues that ancient materials can sometimes be used to construct invented traditions for different purposes, and sometimes new traditions can be grafted onto old ones (Hobsbawn 1983, p. 6).

The interesting thing is that, in the case of assembly dancing, both situations can be found. The modern tradition uses old materials to create a new activity, and the ancient traditions are in turn shaped by the new one. In this section, by examining the roots of and benefits to Amis/ Pangcah of both the assembly dancing at the United Harvest Festival and the traditional Amis dancing ceremonies at the Harvest Festival respectively, the existence of invented traditions is discussed. I indicated that assembly dancing has become an emerging tradition in Amis/ Pangcah tribes. The personal benefits that the assembly dancing brings have also been examined. And the opinions against the dancing have also been pointed out. The ancient and the new emerging tradition can co-exist in the same society. Referring to the ongoing debates over cultural preservation and innovation in Amis/ Pangcah societies, is there a need to take sides? The process of brewing wheat to make beer is a complex and delicate series of chemical reactions. At the end, the wheat will be removed and beer will be enjoyed. However, the relationship between Malalikit/ Malikuda and assembly dancing is not the same as wheat and beer. It does not have to be that one revives and one disappears.

At the beginning of this paper, I address the question of how assembly dancing, which is a recreation of the Amis/ Pangcah tradition, affects forming the atmosphere of the Hualien United Harvest Festival. Although the Hualien government consciously chooses Amis/ Pangcah culture as a template and recreates it as a new version of Malalikit/ Malikuda, the atmosphere is not solely produced by the organizing team of the Hualien government. In fact, the atmosphere is co-created by the images transmitted by the media, the stereotypes fostered among the public, the historical and cultural meanings of the Amis/ Pangcah tradition and the participation of tourists. Again, through the networking of all these actors, the atmosphere of the Hualien United Harvest Festival is formed. However, as Malalikit/ Malikuda is treated as representative of
indigenous culture (Hatfield 2014, p.3), it has been used as a tool on the occasions when someone wants to claim indigeneity (Hatfield 2014, p.6). Thus, there is a need to discuss possibly influences that assembly dancing brings to local tribes, and to examine whether the intrinsic essence of indigenous culture can remain after being used by policymakers, governments or the tourism industry. The case of assembly dancing is unique although it seems to have been a top-down product at very beginning; it eventually became a co-making practice of numerous actors. For this reason, the spirits of the Amis/ Pangcah are retained. Referring to the debate between the preservation or innovation of cultures, the most important thing is not to pick one of them, but to keep the Amis/ Pangcah spirits. In the case of assembly dancing, tourists are brought in somehow and become part of the spectacle of assembly dancing. They feel the joyful atmosphere, and have lived experiences of togetherness. It is a great example of the involvement of tourists being greater than before.

**Songs of the Factory: Multi-tonous musicking in the routinized workplace and beyond**

Marek KORCZYNISKI (University of Nottingham, United Kingdom) | Marek.Korczyynski@Nottingham.ac.uk

The paper reports on an ethnography which focusses on the role of pop music in workers’ culture in a window-blinds factory. The paper uses participant observation to outline how workers in this factory clung desperately to music on the radio. It analyses how this music had a dialectical quality of allowing workers both to fulfill their social roles in a regimented industrial environment and to express a sense of resistance to this social order. It puts forward a theorization of this form of ‘musicking’ (Small, 1998) as a ‘multi-tonous’ cultural practice. The multi-tonous is rooted in the context of the monotonous social structure. It is a form of musicking that allows the enactment of the social order within the monotonous, while also allowing the expression of a spirit of resistance to that social order; that does not involve deep immersion of the senses within music, but rather tends to use music as a way of preventing the senses being dominated by the monotonous; that accents non-repetitive cultural practices as a critical response to structural repetition within the monotonous; that opens up space for agentic rather than structured movements; and that involves the re-appropriation of meaning of lyrics in pop songs (often in choruses) to express critical understandings of the monotonous social setting. The paper considers the extent to which multi-tonous musicking may occur in social contexts outside of the routinized workplace.

**Emergent Meaning Structures: Sociosemantic Network Analysis of Creative Communities**

Nikita BASOV (Center for German and European Studies, St. Petersburg State University – Bielefeld University) | n.basov@spbu.ru

Wouter DE NOOY (University of Amsterdam) | W.deNooy@uva.nl

Artem ANTONYUK (St. Petersburg State University) | artem.a000@gmail.com

Aleksandra NENKO (Center for German and European Studies, St. Petersburg State University – Bielefeld University) | al.nenko@gmail.com

Irina KRETSER (St. Petersburg State University) | kretser@list.ru

The paper approaches construction of differences in cultural patterns as based on social structure and practice following the duality tradition (Friedland & Alford 1991). We address this by applying structural approach to interpretation of collective meanings and combining formal analysis for reducing complexity of meanings with qualitative analysis of meaning structures (Mohr 1994, 1998, 2000). The study is based on textual and sociometric data on artistic
communities – groups of artists involved in intense interaction with each other. Such communities develop in constant (re-)interpretation of the essence of art, discussions on the themes and formats for artworks, continuous interaction during collective creative activities and representation of artworks. In these processes subgroups normally emerge in social networks within communities and explicit subgroup-specific structures of meaning are developed. Basing on 2-mode approach (Breiger 1976) we introduce sociosemantic network analysis techniques to locate those subgroups as well as to detect and to visualize how their meaning structures intersect and vary. Further, qualitative analysis links these contrasts and intersects to specific traits and similarities of the subgroups attempting to reveal how the peculiarities of social structure and practice condition emergence of a variety of meaning structures.

Making cultural capital work: How does the culture matter?

Barbara Anna MARKOWSKA (Collegium Civitas, Poland) | bmarkowska@civitas.edu.pl
Xymena BUKOWSKA (Collegium Civitas, Poland) | xymbuk@wp.pl

In the last decade we have observed the revival of Bourdieu’s legacy, particularly, increasing interest in his concept of cultural capital and class distinction. As Bennett and Silva (2011) pointed out we should reconsider cultural capital analysis in historical and national context. In our last study we develop the heuristic potential of this category analyzing the dynamics of the social field in Bialowieza (Bukowska, Jewdokimow, Markowska, Winiarski 2013). Inspired by Geertz (1973), we define culture as a set of meanings created by social practices. Re-conceptualization of Bourdieu’s approach allows us to map some located configurations of cultural capital in a specific, complex and dynamic local field. It refers also to current sociological discussions on the role of culture in structuration processes (Alexander, Smith 2003).

The local cultural field of Bialowieza is divided into different sub-fields, which are social spaces, where local games of domination and recognition take place. Each sub-field relates to a specific cultural capital representing a local relevant resource (i.e. local identity, social engagement, attitudes toward nature), which provides advantages within the sub-field. Moreover, those different cultural capitals compete with each other for local dominance, structuring the whole community. In other words, culture creates local distinctions, but at the same time it produces the means of communication for representatives of diverse discursive social worlds. The presentation will show how the game between specific cultural capitals for the symbolic domination keeps the whole social field of Bialowieza in flux.

RN07S02b - Art as a Cultural System 2

The artist’s profession: description and self-perception of an atypical job
Mariselda TESSAROLO (University of Padova, Italy Department DPSS) | mariselda.tessarolo@unipd.it

Mariselda Tessarolo, Eleonora Bordon

Premise and goal- In every society professionals have the task of linking together the processes of definition and production of the reality. The legitimation of a profession allows to strengthen all that has been traditionally institutionalized so that, from a sociological point of view, one can speak of profession only when this latter is considered as an autonomous activity with its own modality of recruitment. The professionalization of the artistic experience leads to internal conflicts among intermediary professionals, such as reviewers, patrons, and among artists or
rival groups of experts, so that it becomes “irrelevant the pretence of the experts of knowing the ultimate meaning of professionals' activity better than those professionals themselves”.

**Method** - The goal of the research is finding out, by means of semi-structuralized interviews, how artists perceive their own profession and how they consequently build their Self and their social role. The dataset, obtained from the texts of the semi-structuralized interviews made to 150 artists of various arts, underwent text analysis with the SPAD-T software which proves being well suited to perform a qualitative/quantitative inquiry. The analyses that emerge allow to interpret the implied discursive processes.

**Conclusions** - The description of the creative process appears secondary compared to the telling of the technique and to the sensitiveness, with some differences within various typologies of artists and within the same art, like for example between modern and classical dance: the former heads principally towards the creative process, while the latter towards the technique. It is interesting to notice that the term “teacher” is characterizing the creative process that is to say it is typical of the profession.

**Intimate sociality: the example of dancing**
Tora HOLMBERG (Uppsala University, Sweden) | tora.holmberg@soc.uu.se
Maria TÖRNQVIST (Uppsala University, Sweden) | maria.tornqvist@edu.uu.se

The paper concerns the phenomenon of couple dancing. This study engages with research on the expanding area of intimate relations in late modern societies, and takes off from a somewhat blind spot within the research terrain: a recognition of intimate relations as neither commercialized in a market of goods, the nuclear family, nor the romantic couple. Departing from ongoing ethnographic fieldwork performed at a country side dance festival and at regular dance floors, it explores a) intimate practices, i.e. the acts and rituals through which people shape, make sense and negotiate their intimate lives, b) intimate subjectivities, i.e. relational identities and reflexive selves in regard to the relations at stake, c) intimate arenas and temporalities, i.e. the impact of the spatial and temporal contexts of the relations.

**Heritage: the interested and the lay-practicioners among the Dutch population**
Andries VAN DEN BROEK (Netherlands Institute for Social Research SCP, Netherlands, The) | a.van.den.broek@scp.nl
Pepijn VAN HOUWELINGEN (Netherlands Institute for Social Research SCP, Netherlands, The) | p.v.houwelingen@scp.nl

In conceptualizing and in researching arts participation, it is common to distinguish between those who attend (i.e. those who visit performances and exhibitions) and those who practice (i.e. those who play music, act, paint, etc.). Hitherto, in The Netherlands at least, heritage participation by and large focussed on those who attend only. This paper, based on research commissioned by the Dutch Ministry of Culture, explores and examines lay-involvement in practicing heritage, both material and immaterial. Based on national register-data, on survey-data and on mapping the social fabric around heritage in a Dutch 'Middletown', it provides a bottom-up description of this somewhat neglected domain. The paper comes to a close by comparing 'amateur heritage' to 'amateur arts', fields that show some striking dissimilarities.

**Visual culture differences: a case study**
Mathias BLANC (CNRS, France) | mathias.blanc@univ-lille3.fr
Our case study focuses on the way different social groups associate filmic scenes and communicate on a non-verbal level about the selection they make between these scenes. In this research, twenty groups of three people dealt with the same sequences of films, which evoke what the German art historian Aby Warburg called the “roman formula of triumphant pathos”. In other words, these films give a presentation of charismatic authority through triumphal narratives. Our observation focuses on the way the spectators interacted within their groups to index visually the films. Our study puts into relief three forms of groups (totalitarian, comprehensive, conflictual) and two modalities of social action dealing with pictures. It appears that this visual activity, depending on the modality of action organizing the group, can whether reinforce prevalent structures or promote agency. These elements make us possible to elaborate hypothesis which meet visual culture issues, such as: does visual culture only qualify a subculture in a specific historical context? or does it promote a particular relationship between the physicality of the sight and its social meaning? In this perspective, are we talking about transitivity, symmetry or dialectic between the two? Our paper will discuss these issues through the results of our case study.

**RN07S02c - Art as a Cultural System 3**

**Dialogue and the “third voice”**
Dagmara BEITNERE-LE GALLA (University of Latvia, Latvia) | dbeitnere@gmail.com

The current economic climate and globalisation have brought the issues of values and identity to the fore. According to Deidra MacCloskey’s approach, culture consists of the telling of stories. Stories remind a society of its understanding of itself; but stories may also be a means of suppression and a way to show changes in society.
What does a life story offer? Is a life story only a humanities resource that a society collects to serve as an archive about itself? In what aspects is a life story important to society?
The rise of the authority of the documentary genre indicates that society wishes to delve into the experience of as many different groups and strata of society in order to search for that which textual society has not yet discovered about itself.
Communication is a dialogue between the interviewer and the author of the life story. When telling his/her life story, the author does not represent only him/herself. In an indirect way, the life story is also the author’s dialogue with his/her own society and the time in which he/she is living. The humanities and social sciences sum up this many-voiced dialogue and interpret the representations. How best to obtain this shared voice, which Barbara Myerhoff has called the “third voice”, or, the voice of society? By studying the society and culture to which we the researchers belong, we will obtain the point of view (that Luhmann describes as “second level observer”), to found power of understanding and reconciliation.
Paper present two life stories – Latvian and Russian people, participants of the WW2.

**Measuring Social and Economic Impact of Large Scale Cultural Events: Social Network Analysis**
Anda LAĶE (Latvian Academy of Culture, Latvia) | lake.anda@gmail.com
Baiba TJARVE (Latvian Academy of Culture, Latvia) | baibatj@gmail.com
Līga GRĪNBERGA (Latvian Academy of Culture, Latvia) | liga.grinberga.lg@gmail.com
In 2014, Riga has been chosen to be one of the European Capitals of Culture (ECoC). It has created discussions in society about impact of the Riga 2014 programme because of the investment of public money.

The large scale cultural events require integrated evaluation approach developing arguments for a broader community (Labadi, 2009, Reeves, 2002; Pratt, 1997). The ECoC is a challenge for researchers despite the existing methodological efforts (Palmer-Rae Associates, 2004). The research objective is to adapt an integrated impact evaluation methodology allowing to measure diverse effects of the Riga 2014 programme.

Social network analysis (SNA) is considered to be one of the latest evaluation methodologies. In the field of culture it has been applied often indirectly (Saccone, 2014). The research is based on the assumption that SNA has a potential in evaluation of cultural impact, as culture incorporates the very idea of a network through which new ideas and creativity are channeled.

The following tasks have been set for the research: to examine applicability of SNA in impact evaluation of cultural events and to identify cultural impact of Riga 2014 programme applying SNA.

Findings show that analysis presents an integrated insight into the social and economic impact of Riga 2014: network displays visually how cultural event is structured and allows to demonstrate all stakeholders, their size and interconnections helping to develop arguments concerning economic impact; network shows the distribution of creativity, ideas, initiatives which are not quantitatively measurable displaying social impact.

Guidelines for researching socio-cultural competencies. The case of visual competence in Poland.
Łukasz ROGOWSKI (Adam Mickiewicz University in Poznan, Poland) | lukasz.rogowski@amu.edu.pl

Research of new dimensions of socio-cultural competencies (such as digital, information, visual or spatial competence) are very often based on false theoretical and methodological assumptions. Some possible problems are: the identification of competencies as knowledge or as the efficient pursuit of some goals, the assumption of a common pattern allowing to compare and evaluate activities.

Different assumptions founded the project “Seeing Better” – a nationwide research of visual competence funded by the Polish Ministry of Culture. The project used both qualitative (photo-elicitation interviews) and quantitative (representative surveys) research techniques. In my speech, I would like to present four aspects of this project. First, I will describe the theoretical assumptions which may be used in research of other types of competence (eg. creating profiles of competence instead of measuring its level; researching the competence in the context of everyday life; researching social practices in selected areas of life, not knowledge about them). Secondly, I will recount how the very notion of “being competent” was understood by our respondents (eg. flexibility, independence, awareness, passion, habituality...). Thirdly, I will present some of the key results of the project (eg. the ways of evaluating visual tastes, the ways of defining visual professionalism, the two main profiles of visual competence: the pro-active and the withdrawn). All these aspects will be compared with socio-demographical variables. Fourth, I will discuss the model of visual competencies, consisting of 9 elements (reflexivity, communication, control, determinism, barriers, ties, diversity, professionalism, manipulation), which is based on the results of the project.

The link between Art Education and School Performance in primary schools
Dries VANHERWEGEN (Ghent University, Belgium) | dries.vanherwegen@ugent.be
John LIEVENS (Ghent University, Belgium) | john.lievens@ugent.be
Starting with a discussion of the theoretical models of social reproduction and cultural mobility, in this study, we focus on the relationship between social background, enrollment in extracurricular arts education programs and academic performance. We use data collected from 2845 students of the fifth and sixth grades of primary education in 68 Flemish schools. As a potential form of cultural capital, we not only investigate the social inequalities related to participation in art education programs, we also take a close look at the link between enrollment in art education programs and school performance. Based on multilevel regression analysis, the results show that enrollment in art education programs is positively related to the SES background of the student as well as the SES composition of the school. Furthermore, results suggest that higher SES composition of the school can work to reinforce social inequalities related to participation in art education. Subsequently, our results indicate that the effects of art education on indicators of school performance are strongly dependent on the SES background of the student, but not on the SES composition of the school. The results provide support for the social reproduction theory. Suggestions are provided how further inquiry on the ways that art education programs can influence patterns of reproduction and cultural mobility.

**RN07S03 - Evaluating Art**

**Artists’ discourses in the legitimation of visual art: an analysis of discursive and aesthetic regimes in Flanders between 1965 and 2015.**

Willem ROOSE (Universiteit Gent, Belgium) | willem.roose@ugent.be
Henk ROOSE (Universiteit Gent, Belgium) | henk.roose@ugent.be

Using the state subsidy-archive for visual arts, this study focuses on how visual artists in Flanders between 1965 and 2015 have legitimated their artistic work in their applications for subsidies. I am concerned with constructing a typology of these legitimations (which I call "discursive regimes"), and see how they are associated with the aesthetic characteristics of the artists’ work ("aesthetic regimes"). The main objective of this research is to provide a historical sociological analysis of how (the associations between) these discursive and aesthetics regimes evolved over the last 50 years. The timeframe of this study is very interesting for sociologists. Between 1965 and 2015, society witnessed macro-social transformations that significantly affected culture and the arts. Most notably, I hypothesize that the democratization of education, the expansion of a professionalized cultural sector with a growing number of 'cultural intermediaries’ such as critics and curators, and the advent of neoliberal politics transformed how artists legitimate (their) art. I expect that the social condition of 'post-modernity’, in which the boundaries between social subsystems (e.g. art, politics, economy) are becoming more fluid, resulted in fundamental shifts in the ways in which art is being legitimated (i.e. references to the role of art in society rather than aesthetic references such as beauty and technique). New quantitative research methods will be used to answer these questions.

**Beyond distinction: theorising cultural evaluation as a social encounter**

Simone VARRIALE (Department of Sociology, University of Warwick, United Kingdom) | simone.varriale@gmail.com

This article expands recent attempts to theorise the role of culture’s materiality in Pierre Bourdieu’s relational epistemology. Drawing on empirical research about the reception of Anglo-American rock and jazz in Italy, and focusing on Italian critics’ evaluative practices, the article theorises cultural evaluation as a ‘social encounter’ between the dispositions of social actors...
and the aural, visual and narrative properties of cultural artifacts. The article argues that such encounters produce relational aesthetic experiences, which are neither a property of social actors (e.g. their class) nor of cultural artifacts, but emerge from the interaction between the habitus’ socio-historical specificity and different cultural materials. This approach provides several advantages to both Bourdieusian and post-Bourdieusian cultural sociologists. First, it can account for the formative power of aesthetic experiences upon people’s dispositions, but without losing sight of the social biographies in which such experiences are embedded. Second, it can account for meanings and attachments which cannot be reduced to a focus on boundary-drawing, thus revealing dimensions of cultural value which have been underappreciated in Bourdieu-inspired sociology. The article, hence, proposes a theoretical synthesis between different traditions of cultural research, one that is particularly helpful for studying the transnational circulation of popular culture.

Performing creative places: clusters, reputation, identity and distinction
Yosha Gaeli Denise WIJNGAARDEN (Erasmus University Rotterdam, Netherlands, The) | wijngaarden@eshcc.eur.nl
Erik HITTERS (Erasmus University Rotterdam, Netherlands, The) | hitters@eshcc.eur.nl

There is a strong relationship between the Cultural and Creative industries (CCI) and the concept of place (Pratt, 2004). Places are continuously made and remade; imagined and negotiated through the practices of its inhabitants and visitors (Clare, 2013). In contrast to academic work exploring place in terms of ‘the place to be’ for creative entrepreneurs, this paper seeks to understand the performative nature of place by looking at the interrelationship between place, identity and processes of legitimation, representation and distinction (cf. Goffman, Bourdieu).

We interpret place as a container of symbols that influence the locational decision-making practices of entrepreneurs. These practices are, subsequently, transformed into locational narratives, in which creative entrepreneurs give meaning to their histories, current situation and (sometimes) future plans. Furthermore, these narratives are successively used by entrepreneurs in a process of representation of their selves, products and ideas. We hypothesize that in the CCI, product/service and the entrepreneur often overlap, and therefore such symbolic values of services/products will largely be homologous to representations of the self as well as the narratives of entrepreneurship.

Building upon 50 in-depth interviews with entrepreneurs located in nine Dutch creative clusters, as well as a discourse analysis of their online presence, locational narratives are explored and thematically analysed in Atlas.ti. By looking at these meanings given to places, how places are distinguished (Logan, 1978), and by the narratives and performances these entrepreneurs and artists employ when promoting their work, we explore the ways in which place enters the symbolic economy (Zukin, 1995).

Sociology, aesthetics and 'bad taste'
Simon STEWART (University of Portsmouth, United Kingdom) | simon.stewart@port.ac.uk

What is bad taste? Who is considered to have bad taste? Commonsense notions of taste maintain that some people have been born with a gift to understand beauty. Others lack this gift and are thought to have bad taste, and this bad taste is sometimes linked to a lack of morals just as good taste is associated with virtue. Sociologists have a quite different take on taste, arguing that it is rooted in our class backgrounds and is relational. Through our tastes, we align ourselves with certain people; we differentiate ourselves from others. In this paper, which will include reference to contemporary debates about sociology, aesthetics and taste, the following
questions will be considered: to what extent is ‘bad taste’ synonymous with the tastes of the least powerful? How can social justice be assisted by the identification of offensive forms of ‘bad taste’? How do people define and categorize ‘bad taste’? Judgements of bad taste have social consequences and this lecture will explore these in relation to wider debates about cultural value.

How Taste Does It
Predrag Mihajla CVETICANIN (Faculty of Sport and Tourism, TIMS, Serbia, Serbia) | pcveticanin@gmail.com
Mihaela POPESCU (California State University, San Bernandino, USA) | popescum@csusb.edu

By combining the insights of Bourdieu’s practice theory and that of the Cambridge Stratification Group, the role of taste in the creation of social collectivities is analyzed in this paper. In Bourdieu’s conception, social space is constituted by three continual axes (a total volume of capital, a composition of capital and their changes over time). The introduction of boundaries into a continual social space – which implies separating one group of participants from other such groups and forming social collectivities – is a function of social practices, especially lifestyle practices. According to Bourdieu, simultaneously with the process of constituting one’s own lifestyle, there is a process of differentiation in relation to other lifestyles – or even, their rejection. This process of classification of others and self-classification, and social inclusion and exclusion based on similarities and differences, represent the first step towards the formation of social collectivities through the establishment of symbolic boundaries between them.

However, as noticed by the authors of “Culture, Class, Distinction”, the spatial proximity in the field of lifestyles, constructed by using the Multiple Correspondence Analysis (MCA), does not signify by itself a necessary agreement when it comes to tastes, but rather “it may be that people who occupy closely related positions in the space of lifestyles have intense disagreements (as well as agreements) about precisely the cultural items and genres they share in common” (Bennett at al. 2009:34).

Since the question of whether people who have similar tastes indeed socialize among themselves and form social collectivities cannot be answered if one remains within the framework of Bourdieu’s conception (and use only MCA), we have searched for the answers to these questions by combining it with the approach which has been developed within the Cambridge Stratification Group, using the methods of social network analysis. In this conception, differential association is used to define distance within a social space, using close social networks and shared cultural tastes and lifestyles in order to identify social similarity [(Stewart et al. 1980); (Prandy, 1990); (Prandy and Bottero, 1998); (Prandy 1999); (Prandy and Jones 2001); (Prandy and Lambert, 2003); (Bottero and Prandy 2003).

The paper is based on the data which resulted from surveys “Resistance to Socio-Economic Changes in Western Balkan Societies” (2012-2013) and “Life-Strategies and Survival Strategies of Households and Individuals in South-East European Societies in the Times of Crisis“ (2014 – 2016), in which, besides a large number of indicators of cultural practices of respondents (cultural needs, cultural habits, tastes, cultural knowledge, possession of cultural objects) there are questions regarding gender, age, occupation, nationality, religious beliefs and favorite music tastes of their three closest friends.

RN07S04a - Political Culture 1

Sanna Marika VALKONEN (University of Lapland, Finland) | sanna.valkonen@ulapland.fi
This presentation deals with indigenous and ethnic differentiation in postcolonial Finnish Sámi region. Since the Sámi of Finland have gained constitutionally recognized position as an indigenous people and obtained cultural autonomy, their traditional practices of self-identification are challenged by diverse interpretations of indigenousness. This struggle for indigenous and ethnic recognition has caused an inflamed situation in which many academic, political and everyday encounters have become critical. The paper approaches this struggle of belonging and recognition from the perspective of intersectionality, stressing the different intersections as productive places and spaces creating novel forms of identification, subjectivity and agency. The paper strives to generate new theoretical insights into the relationship between fixed and fluid identities and questions of indigenousness and ethnicity. It aims also at rethinking the epistemological and theoretical hypotheses and practices of western science regarding ethnic minorities and indigenous peoples by considering people under scrutiny as developers of theoretical knowledge.

Rethinking Individualization: Three Varieties of Institutionalized Individualism
Liza CORTOIS (University of Leuven, Belgium) | liza.cortois@soc.kuleuven.be
Rudi LAERMANS (University of Leuven, Belgium) | rudi.laermans@soc.kuleuven.be

According to Ulrich Beck (1992) and Zygmunt Bauman (2001), the notion of individualization refers to the declined influence of religion, tradition or shared lifeforms and the corresponding growth in autonomy of individuals and personal decision-making. Although this view has become current knowledge within the social sciences, it also raises a crucial question: How can we theorize in a sociological manner about the individual when personal life seems no longer molded by strong cultural norms? This problematic is vital for the viability of sociology, not the least because in a growing number of disciplines a ‘turn to the subject’ is advocated on the base of for instance cognitivist or neurological premises.

In this paper we present a Durkheim-inspired, thoroughly ‘culturalist’ perspective on the increased emphasis on the individual within post- or hypermodern society. In line with John Meyer’s (2000) view, we argue for an all-embracing approach of institutions in terms of cultural scripts that construct agency and identity. More particularly, we discern three prevailing forms of institutionalized individualism. Whereas in utilitarian individualism the homo economicus is key, the kind of moral individualism already analyzed by Emile Durkheim (1898) advances the values of autonomy, equality and tolerance. Last but not least, the more recently institutionalized expressive individualism that Talcott Parsons (1985) already described in the aftermath of the counter-culture primarily embodies an all-pervasive ethos of self-expression or authenticity. In sum, against the prevailing notion of individualization we view individualism as a shared institutional structure that has meanwhile generated three more particular modes of legitimate individuality.

Summer camps in Russia – the analysis of a cultural form in an authoritarian political figuration
Anna SCHWENCK (Humboldt University Berlin, Germany) | anna.schwenck@hu-berlin.de

Many social scientific analyses of official youth policies in authoritarian political figurations ignore culture. The proposed paper analyses the flagship of official Russian youth policy since 2005 – so-called educational youth fora. The most famous one, "Seliger" takes place not far from Moscow, yet in recent years dozens of regional reenactments of the youth forum "Seliger" flourished in the Russian regions.
I argue that a summer camp is not only a tool for implementing a political strategy, but also a cultural form. Interestingly, the form of camp, connected to certain coordinative and communicative traditions like a strict daily routine, rules to refine behavior (kulturnost), visiting delegations, stable group structures and a clear hierarchy, is not specific to pro-governmental fora.

How do these widespread coordinative forms (categorizations, rules, standards) interplay with official political aims and how do political aims in turn stress certain traditions, whilst neglecting others?

To answer this question the paper draws empirically on my own participant observations at most different summer camps in four Russian regions (in 2013 and 2014) and the participant observations of a colleague from anthropology, studying ethnic summer camps in Russia. Narrative interviews with organizers, teachers and participants as well as legislative documents complement the empirical data.

East-West Cultural Diplomacy in the Cold War: The Instrumentalization of Cultural Capital in China and
Gordon SHOCKLEY (Arizona State U., United States of America) | shockley@asu.edu

My purpose in this essay is to develop a cultural-capital framework in order to examine the cultural diplomacy of China and the USA during the Cold War. The cultural-capital framework blends two conceptions of cultural capital — an economic one and a sociological one — that are connected by micro-macro linkages. The economic conception of cultural capital is developed by Throsby (1995, 1999, 2001). A repository of cultural and economic value, Throsbeian cultural capital is economic capital in the neoclassical sense of the means of production but with a penumbra of cultural value. I argue that Throsby operationalizes his economic conception of cultural capital at the macro level of cultural phenomena. Bourdieu’s sociological conception of cultural capital is then juxtaposed with Throsby’s economic conception. To Bourdieu in Distinction: A Social Critique of the Judgment of Taste (1984), where he might most fully develops the concept, cultural capital might be generally described as “forms of cultural knowledge, competences or dispositions” (Johnson, 1993, p. 7). I argue that Bourdieu operationalizes his conception of cultural capital at the micro level of the individual. Then I tie these two conceptions of cultural capital together with a micro-macro conceptualization (Alexander & Giesen, 1987). In short, this framework instrumentalizes cultural capital by supporting and servicing cultural diplomacy from both the macro- and micro-levels. I then apply this cultural-capital framework to China’s and America’s cultural diplomacy during the Cold War, specifically examining the examples of American Abstract Expressionism in the 1950s and the “rediscovery” of ancient Chinese culture in the 1970s.

RN07S04b - Political Culture 2

‘The Hidden Democracy’;
Lise KJØLSRØD (University of Oslo, Norway) | lise.kjolsrod@sosgeo.uio.no

The Hidden Democracy’; Play as Source of Cognitive Capacity, Social Resilience, and Public Commitment
In the wake of Sennett’s (1992) Fall of Public Man and Putnam’s (2000) Bowling Alone thesis, the democratic potential of all kinds of voluntary groups and organizations has been seen as sadly volatile; pessimism has been nourished by pervasive notions of growing individualization
to the point of narcissism. This paper gives a bottom-up contribution to contemporary political theory and cultural analyzes by presenting leisure activities as a democratic arena. Men and women who practice their freedoms as collectors, mountain climbers, live role-players, and in numerous other game-like activities are not seen as consumers, rather as producers of resources they can use in micro-processes that may contribute to the molding of relevant models of the real world, encourage social resilience, and/or inspire civic engagement. The idea is that inconspicuous yet democratically relevant resources emerge by virtue of actors being enmeshed in specialized activities apart from political organizations or social movements. The notion of ‘a hidden democracy’ is approached from three different angles: play is seen as basis of social connectivity across national and international boundaries, as material for metaphoric interpretations of individual and collective concerns, and as means of mediating activism when participants find themselves augmenting issues beyond their own self interests. Accepted as end-in-itself, the argument here is that play also has democratically relevant byproducts.

Riie HEIKKILÄ (University of Helsinki, Finland) | riie.heikkila@helsinki.fi
Carlos FERNÁNDEZ RODRÍGUEZ (Universidad Autónoma de Madrid, Spain) | carlos.fernandez@uam.es
Semi PURHONEN (University of Tampere, Finland) | semi.purhonen@staff.uta.fi

Changes in the macro-political level often translate into changes in cultural tastes. The shifts in social values and composition of legitimate taste, as expressed in the preferences of consumers of culture, reflect also important transformations in cultural institutions concerned to consecrate what is legitimate in the art world. These institutions include the media, particularly the written press. In this paper, we draw on data from a project studying the cultural coverage of nationally leading newspapers from five European countries between 1960 and 2010, focusing here on the culturally rather unique case of Spain. Because of the historical peculiarity of Spain, we have had to select two newspapers to cover this period: ABC in the Franco years (1960 and 1970) and El País during democracy (1980, 1990, 2000 and 2010). Combining a qualitative viewpoint and content analysis of cultural pages of these newspapers (the unit of analysis being one article, altogether more than 1000 cases), the article examines how the content of the cultural pages of the Spanish newspapers has changed in both structure and cultural products discussed. We ask whether the concept of culture has opened up and become more inclusive, paying particular attention to coverage given to music (both classical and popular) in order to examine how the supposed “omnivore thesis” shows in the case of Spanish newspaper data. We believe that the assumed shift towards a more omnivorous orientation to culture looks especially interesting in the context of a country with a strong transformation from dictatorship to democracy.

**Communities in conflict: Cultural Aspects in the Danish Reluctance towards European Integration**

Thiago BABO (University of São Paulo, Brazil) | babo.thiago@gmail.com

Denmark has one of the most exceptional policies towards Europe. From the beginning of European integration the country has demonstrated a strong skepticism and concern with the idea of a united Europe. Even after her incorporation into the EC in the 70s, Denmark has positioned herself as a member of another community, the Nordic one, and Danish role in the EC was to 'build bridges' between these two. The Danish exceptionalism remained even after the end of the Cold War, when the government stipulated the existence of four opt-outs in the
European policies. Several hypotheses have been raised in an attempt to understand this peculiarity, often based on theoretical insights common to scholars of IR’s, but few bother to make a parallel with certain historical events and their impacts in the construction of a Danish national and political culture. Thus, through the historical-sociology approach, this paper seeks to understand to what extent the development of the Danish policy in relation to the European integration process was highly influenced by historical events of great impact for the consolidation of Danish modern nation-state and national identity - which is tightly coupled to a Nordic identity. This paper will emphasize the role of the wars with ‘Germany’ and the construction of Nordic identity as the main events of this historical process with impact on current Danish policy.

RN07S04c - Political Culture 3

Crisis of cultural values as one of the manifestations of the crisis of culture
Tatiana KIRILINA (Financial and Technological Academy, Russian Federation, Russian State Social University) | kirilina_t@rambler.ru
Nadezda KIRILINA (National Research University Higher School of Economics) | kirilinan@gmail.com

On the question of understanding the culture, as well as its structure, there is no unity among researchers. Nevertheless, many specialists consider values as one of the key elements in the structure of culture. In this respect, the sociology of culture has much in common with the sociology of morality, which explores values with sociological methods. Cultural crisis manifests itself in a crisis of traditional values. In a period of stability of social consciousness generations of people have a well-established view of the world and are spared from having her critical thinking. During the crisis, people are demoralized, confused, they do not know what he can lean on in certain circumstances, as the old values are losing their relevance, but the new ones have not been formed yet. According to national surveys every third middle-aged respondent (31%) acknowledges that moral norms are aging and no longer meets modern standards and rhythm of life. More than half of young Russians (57%) have no idols, heroes, who they are ready to take as an example.

The dynamics of the youth value orientations has become a subject of the study conducted by us for the last 17 years among students. This study has revealed certain trends. In the minds of Russian young people it is seen “interlacing” of traditional values and innovative ones. Attention is paid to a sharp decline in the importance of socially significant values for the youth. With increasing a role of innovative values in the minds of young people socially important traditional values remain dominant.

Culture and the Differentiation of Politics: The Reflection on Political Clientelism in the Irish Political Debate
Isabel KUSCHE (Osnabrück University, Germany) | isabel.kusche@uni-osnabrueck.de

Most scholars agree that there is no political clientelism in Ireland today. Nevertheless, public debate constantly refers to it. Statements either criticize it as a major problem of Irish politics or defend it as a corollary of true representative democracy. Both sides use clientelism predominantly as a label for the brokerage activities of parliamentarians, who typically help individual constituents in their various dealings with the public administration. At first sight, the fact that role expectations of parliamentarians stress such brokerage activities could simply be interpreted as a feature of Irish political culture. Against the essentialist implications of such a
view, I argue that the way brokerage is reflected on in public debate is a topic of inquiry in its own right, best understood with a notion of culture as process. Inspired by Luhmann’s work on self-descriptions of social systems, I analyzed parliamentary debates and newspaper articles. Using a combination of content analysis and sequential analysis, I show how the notion of political clientelism in public debate helps to deal with consequences of the generalized expectation that brokerage for constituents and electoral success of representatives are linked. Since politicians cannot be observed publicly when they engage with constituents in this manner, Irish politics is riddled with fundamental uncertainty as to which matters are truly political and which are either banal or improper. The function of references to clientelism in public debate is to punctuate the ongoing process of political actions by marking boundaries between politics and other societal spheres.

Passing or Failing the Stalin Test? Analyzing Contemporary Perceptions of Stalin in Georgia
Ana KIRVALIDZE (Ilia State University, Georgia) | ana.kirvalidze@iliauni.edu.ge

After the recent (democratic) regime change in Georgia, questions immediately arose as to what political path the new administration would take: pro-Western, pro-Russian, or some amalgam in between. At the same time, debates about Stalin’s role in Georgian history and Stalin’s current place in Georgian society intensified. Stalin monuments were installed in several villages in the Kakheti region, and more vocal calls were made for the return of the Stalin monument in Gori. In a 2012 survey of 4 post-Soviet countries, the highest positive evaluations of Stalin were found in Georgia. For some commentators, this became proof that the people surveyed had failed the “Stalin Test”, or else that these results indicated that there is a “Stalin puzzle” that needed solving. Despite this recent attention, few scholarly attempts have been made to better explain this phenomenon.

This paper will examine contemporary Georgian understandings of Stalin and the Soviet era. Narratives about the past and opinions about historical figures can reflect the tenor of political stances in the present. The main question is how correlates the positive attitudes of citizens toward Stalin to the issue of national Identity formation process.

The main objectives are to (1) identify Stalin’s place in Georgians collective memory; (2) analyze how the Soviet period in general, and the Stalinism in particular, is understood and what role it plays in Georgian national identity and nationalism; (3) investigate the various demographic, socioeconomic, and geographic factors that have correlative and causal links to opinion about Stalin and the Soviet past.

Changing Cultures in Turkish Prisons: From the Ward System to the F-type Prisons
Elif Yagmur KARAGÖL (Middle East Technical University, Turkey) | yagmurkaragol@gmail.com
Çağatay TOPAL (Middle East Technical University, Turkey) | catopal@metu.edu.tr

This study analyzes the ‘prison culture’ in the prisons in Turkey in terms of architectural design and political and economic context in Turkey. The case of prisons is examined with respect to the transition period from the ward system to the high-security cell-type prisons as a state policy. The concept of prison culture comes from the arguments of Gresham Sykes. He conceptualized this concept as determined by the internal deficiency of imprisonment and also as specific to penal institution. This conceptualization of Sykes is significant; however, it is accepted as inadequate by other sociologists. They show that prison culture is not only related with inherent deprivations of prison environment and there are also some other factors which have an impact on prison culture. Therefore, it is significant to make an analysis in terms of both
an architectural design; that is, internal deprivations and also political and economic context in Turkey; that is, external factors. During the study, the snowball sampling is used and a qualitative research; that is, a semi-structured interview is realized with twenty people who experienced the ward system, the transition period from the ward to the cell, and the cell system. The experience of these three conditions is significant; because, each of them correspond different practices, so different cultures, in prisons due to change in the design of the prisons.

A Sociological Approach to the EU Accession Process of Turkey: Different Cultures & Different Identities
Fatih YAMAN (Celal Bayar University, Turkey) | fatih.yaman@cbu.edu.tr
Deniz İSPIRLI (Celal Bayar University, Turkey) | deniz.ispirli@boun.edu.tr
Zeynep Selin ACAR (Ege University, Turkey) | zeynepselinacar@hotmail.com

Turkey’s process of membership to the European Union, which started with the partnership agreement signed with the European Economic Community in 1963, has been continuing despite disruptions and interruptions faced from time to time. Nevertheless, this process has generally been a policy conducted under the leadership of political powers, rather than a communal expectation. The issue of membership to the EU, a current extension of the Westernisation movement that has been on the agenda for a couple of centuries, has been imposed to the public with “sudden and unexpected” policies, so to say. On the other hand, sociological aspect of this membership process has largely been ignored, and current problems are only approached from political aspect.

In this context, the purpose of this study is to take Turkey’s EU membership process into consideration within the framework of concepts of identity and culture, and to subject the problems faced in this process to a sociological analysis. Today, the EU is not only an economic association but also quite a comprehensive project having social-cultural-political aspects, and one that provides many innovations in many aspects for member countries and citizens of those countries. Therefore, analysis of Turkish identity and Turkish culture, which are quite different than those of the EU countries, and assessment of roles played by these factors in membership process constitute an extremely important issue for truly understanding the process and for making consistent determinations regarding the process.

RN07S05a - Imagining the Other 1

Religious Accommodation in the Australian legal system
Ashleigh BARBE-WINTER (University of Western Sydney, Australia) | 17163141@student.uws.edu.au

Modern states hold varying stances on the legal accommodation of minority cultural groups. In Australia, there is a constant narrative about the strength of Australia as a multicultural society. However, there is also bipartisan political rejection of the incorporation of any form of Islamic law into state-sanctioned legal institutions. This rejection is expressed vehemently with regards to criminal law, but its impact also quietly extends to personal and financial law. In the Muslim Australian community, this political rejection has become synonymous with a community view that the official legal system is not accommodating of personal laws that have a grounding in religious beliefs. In order to meet the need to live according to religious law, various Muslim Australian communities have begun to build unofficial legal structures. Australian research has focused on how these unofficial legal structures are being implemented and used.
Absent from this conversation is a close historical analysis of instances where Muslim Australians have been involved with the official legal system in matters of personal law. This presentation is based on an ongoing analysis of legal decisions that incorporate evidence of Islamic family law. It will review the Australian social security concepts of “marriage” and “marriage-like relationships” as they have been exercised in historical tribunal decisions. For Muslim Australians whose marital traditions differ from the majoritarian cultural norms upon which Australian laws are based, does the exercise of these concepts impact on this particular minority group in a way that is measurably disadvantageous? This presentation will be theoretically grounded in an analysis of Ayelet Shachar’s ‘transformative accommodation’ approach within her model of ‘joint governance’, as a response to the ‘multiculturalism paradox’ that sees multicultural accommodation impinge on individual rights. The ‘transformative accommodation’ approach addresses the space between the state and a minority culture as an opportunity for the state to develop its accommodation of all cultural groups within its boundaries, while recognizing the multiple identities contiguously maintained within a single individual. Looking to the Australian context, this presentation will focus on the extent to which existing legal structures such as ‘cultural assessment’ and ‘special consideration’ can be accommodating of group identity rights without impinging on rights of the individual.

**Imagining difference and inequality: cultural constructions of unauthorized immigrants**

B. Nadya JAWORSKY (Masaryk University, Czech Republic) | jaworsky@fss.muni.cz

Imigration is a hotly contested issue in receiving countries, especially with regard to unauthorized populations. Some see the unauthorized as “illegal” interlopers, while others advocate for their rights. Each of these social movements devotes a great deal of energy to articulating its demands and grievances, increasingly utilizing the Internet as a site of meaning creation. Culture acts as both an instrumental and expressive vehicle through which activists imagine and respond to discourses of difference and inequality. Are unauthorized immigrants just like “us,” as immigrant rights groups assert? Do they deserve equal treatment under the law and in the court of public opinion? Or are they intractably different because they have broken the “rules” and reside in the country illegally? Utilizing internet data collected from 29 national-level organizations in the United States, I conduct a cultural sociological analysis of the ways in which both immigrant rights and immigration control activists construct the unauthorized population. To unearth the structures of meaning in the organizations’ website and social media activity, I examine the ways in which they create legal and moral boundaries around different categories of immigrants, often (and sometimes unwittingly) portraying some as more equal than others. Looking at the cultural construction of unauthorized immigrants through the theoretical lens of boundary work helps us understand the conditions of belonging to a collectivity such as the nation state and potentially work at moving from exclusivity and inequality to inclusivity and fairness for all within its borders.

**(De)constructing a White Space: Boundary Work, Whiteness and the Reception of Rock Music in Rotterdam**

Julian SCHAAP (Erasmus University Rotterdam, Netherlands, The) | j.schaap@eshcc.eur.nl

This paper addresses the complex relationship between popular music and ethno-racial inequality, that is, the linkage of aesthetic with social categories that causes differences and inequalities in everyday life (Roy & Dowd, 2010). As music genres do not simply reflect ethno-racial groups but are often actively structured along racial divisions, taste preferences can lead
to social exclusion. Popular music can function as a bridge between mainstream society and ethnic (immigrant) communities – by cultivating understanding and repairing stereotypes – as well as a boundary – a marker of one’s own ethnic or mainstream identity, particularly since race/ethnicity is literally visible in (the performance of) pop music. Zooming-in on the lively rock scene in Rotterdam, the Netherlands, as a case-study, this paper investigates how ethno-racial boundaries are (re)produced and/or contested in the reception of rock music by demonstrating how white and non-white audience members of rock music use ideological discourse and discursive strategies to construct (or deconstruct) whiteness. This is done by conducting qualitative in-depth life-story interviews and drawing from sociological theory on (1) boundary work, (2) whiteness and color-blindness, and (3) the reception of culture.

Ever since the 1950s and 60s rock music has been steadily appropriated by whites (Taylor, 1997). As such, the rock music genre is shaped by ethno-racial “symbolic boundaries:” conceptual distinctions that social actors attach to other people, objects and – in this case – music, to bring order to social reality (Lamont & Molnár, 2002). These symbolic conceptualizations can result in objectified social boundaries, which are formative for every-day inequality and segregation along ethno-racial lines (Omi & Winant, 1986). Rock music is symbolically linked with “white” cultural traits: “whiteness,” and local rock scenes can function as “white spaces” that are difficult for non-whites to navigate (Anderson, 2015). Hence, although ample evidence reveals that rock music is produced and enjoyed by many non-whites in Europe and beyond, the institutionalization of rock music as white has caused that in general “black rock won’t sell to whites because it is black, and it won’t sell to blacks because it is rock” (Mahon, 2004: 68).

“White privilege,” the location of structural advantage that whites enjoy in Western post-colonial societies due to a history of both numerical and symbolical domination (and ignoring the relevance of this), is believed to have disappeared together with most blatant forms of racism and ideas of white supremacy (Hughey, 2012). Thus, fundamental for the idea of “post-racial” society – drawn from ideas on a supposed post-racial America – is the assumption that European societies are beyond racial markers: “color-blind.” This indicates that people of any racial and/or ethnic background are responsible for their individual success in society (Bonilla-Silva, 2003; Tatum, 1999). Color-blind ideology suggests that despite different histories of inequality (e.g. slavery, racism) and lopsided social opportunities, there exists an essential sameness between ethno-racial groups. Paradoxically, rather than actually turning blind towards ethno-racial categorization, color-blind ideology causes ignoring talking about race, rather than ignoring race itself. This henceforth also ignores the institutional benefits that white have over non-white people (Hughey, 2012). Color-blind ideology thus establishes a status-quo in which social inequality along ethno-racial lines persists, and where talking about it is frowned-upon. Dominant members of society – whites – enjoy status by default and hence are left “unmarked” as opposed to non-whites (Brekhus, 1998). This effectively makes whiteness a symbolically dominant but “hidden” ethnicity, as members are often unaware of the implications of not being marked (Doane, 1997). Whiteness can therefore be conceived of as a set of (classed and gendered) cultural practices that – as a result of being socially dominant – are less visible in everyday interaction than those of ethno-racial others (Frankenberg, 1993), making it “the unspoken elephant in the room of a racialized society” (Brekhus et al, 2010, p. 71). Whites hence often believe that a racial or ethnic identity is “something that other people have, [which is] not salient for them” (Tatum, 1999, p. 94). Only on direct encounters with a non-white other – in music for instance – “a process of racial identity development for whites begins to unfold” (ibid). Although it is evident that whiteness is (re)produced within rock music production and consumption (e.g., Bannister, 2006; Mahon, 2004), it remains unclear how these symbolic boundaries are created and sustained in the reception of rock music. The invisibility of whiteness, color-blind ideology and a denial of institutional racism are particularly prevalent in the Netherlands due to a history of policies promoting tolerance and
pluralism (Essed, 1984). Recent public debates that have increased in intensity annually on the racial stereotyping of “Black Pete” however, reveal that Dutch society is far from equal regarding ethno-racial difference. Rotterdam, where over 173 different nationalities reside, functions as the multi-cultural capital of the Netherlands and hence serves the prime location to study the everyday (de)construction of whiteness and the white spaces where rock music is enjoyed.

Rock fans differ from critics or regular consumers of music in the degree to which they have invested in subcultural capital – embodied knowledge of rock music, while showing a less aesthetically distanced approach toward rock music in comparison to critics. Their fandom being a central part of their cultural identity, they are relatively self-reflexive and self-aware. A life story approach (Atkinson, 1998) is therefore the most appropriate method to examine if and how rock fans do ethno-racial boundary work, focusing on the ideological discourse respondents use when discussing race/ethnicity and authentication practices. Semi-structured interviews (N = 15) take rock fans through their life stories, focusing on (1) their musical self-history and current involvement (e.g., what was the ethno-racial make-up of the neighborhood they grew up in, how did they come into contact with rock music, how did their co-ethnics react, who are their musical heroes and why, etc.) and (2) their (racialized) historical narrative of rock music as a genre (e.g., where did rock originate, who are the authentic originators, etc.).

Societal Decline and Xenophobia
Mark ELCHARDUS (Vrije Universiteit Brussel, Belgium) | Mark.Elchardus@vub.ac.be
Petrus TE BRAAK (Vrije Universiteit Brussel, Belgium) | ptebraak@vub.ac.be

Xenophobia is often explained in terms of either deprivation or relative deprivation. While deprivation can have many causes – a currently popular explanation of deprivation is the theory of the losers of modernization and globalization – its effect on xenophobia is generally explained as a consequence of insecurity and vulnerability induced by a weak socio-economic position. Relative deprivation, while sometimes treated as a superior operationalization of deprivation, is in fact a quite different phenomenon since it presupposes a comparison of one self or one’s in-group with other people and other groups (and hence an in- vs. out-group perspective). It is the perception that one is unfairly treated, and the expectation that one will be unfairly treated compared to others. Both variables – deprivation and relative deprivation – explain xenophobia in terms of personal and expected future experience. High levels of xenophobia are expected in people who are insecure, feel vulnerable and feel unjustly treated compared to relevant others. In that way the indirect causes of xenophobia are situated in inequality, processes of exclusion, discrimination, and status loss. This paper wants to confront those explanation with one based, not on personal experience, but on the perception of societal evolution: the extent of declinism or the belief that society is in decline. The different explanation will be tested on the basis of a random probability sample of 2000 inhabitants of Belgium, aged 25 tot 35. We find that socioeconomic insecurity and vulnerability has no direct or indirect effect on xenophobia, while declinism has a very strong and relative deprivation a medium sized effect.

The contentious body: On representation of women’s body in the Iranian public sphere
Elaheh MOHAMMADI (Masaryk University, Czech Republic) | elahe.m@gmail.com

Since the Islamic revolution in 1979, the concession of the political Shia Islam as the sovereign power has transformed the duality of the modernist and counter modernist Islamic norms into a rather complex horizon in Iran. In such multiple discursive fields the duality of traditional women vs. modern woman revised and varied into a multiplex pattern. This multiplicity to a large extent stems from paradoxical influences of the Islamic Republic’s policies on the presence of women.
in the public sphere in Iran. The Islamic Republic which revealed as the ‘revolution of masses’, strengthened its authority by the means of its reference to Islam as the religion of majority and tradition, in its early years. Unlike the pro-western cultural and gender policies of the former monarchy in Iran, which promoted the western cultural values which gave rise to the presence of a group of secular women in public sphere, the Islamic Republic’s gender and cultural politics, such as gender segregation in public places and compulsory hijab as well as the revolutionary public education system facilitated the presence of traditional and religious women in the public sphere in Iran. On the one hand the emergence of new groups of religious elites in Iran gave rise to new gender discourses such as Islamic feminism in Iran which break from the old binary concept of traditional vs. modern Iranian woman and gave birth to new conceptualization of identity politics. On the other hand the severe body politics and control of sexuality in the form of intervention of the government in private sphere has brought the issues of right over body, individualism and privacy to the forefront of political struggles in Iran. In this study, I address this complexity by analyzing how different discourses address the subject of woman and how they articulate the relationship between women’s body and the concepts of emancipation in the contemporary Iranian society.

RN07S05b - Imagining the Other 2

Nudity in the study of interaction order
Pavel POSPEČH (Masaryk University, Czech Republic) | pavel.pospech@gmail.com

This paper suggests a systematic study of nudity and the presence of naked body in public space as a means of analysing the interaction order. It builds on Goffman's analysis of the interaction order as set of cultural norms, meanings and codes which tacitly govern the interaction in public space. Due to its everyday, tacit nature, the interaction order is experienced as phenomenologically "normal" and, therefore, largely invisible. Following Goffman's own dictum that the most fruitful way of analysing this "invisible" order is the study of situations when actors come under pressure to comply with its rules, the paper suggests the study of nudity as an analytical tool for understanding the interaction order. Building on empirical studies of nudity by scholars such as S.Cahill, J-C.Kaufmann, S.Scott and E.Grosz, the paper shows how naked bodies are sexualized and de-sexualized through the everyday interaction ritual. In the processes of sexualisation and desexualisation, a central part is played by the gaze of the actors and by the social framing of the situation. The paper argues that the context provided by cultural frames produced in the interaction is a key factor in the defining of nudity as potentially harmful for the interaction order. In conclusion, the paper shows how this approach can be employed to study the contested borders of the public and the private and how it can advance the interactionist model by overcoming the critiques portraying Goffman's approach as ahistorical and insensitive to gender issues.

The Disciplinary Power of Grammar: How Language Structures Govern Mentality
Matthias MEYER-SCHWARZENBERGER (University of St.Gallen, Switzerland) | matthias.meyer-schwarzenberger@unisg.ch

The grammatical structure of the languages of north western Europe, combined with certain language games typically used by caregivers and teachers speaking these languages, make a vital contribution to the unquestioned authority of inter-subjective reason in Western cultures; hence the voluntary subjection of the ‘free’ Western individual to rational democratic rule (Meyer-Schwarzenberger, forthcoming). The present paper aims to link this finding, which has
emerged from my theoretical and empirical research on cultural/social capital, with the conceptual frameworks of Michel Foucault, Pierre Bourdieu and other historical sociologists concerned with social discipline. Bourdieu, for instance, suggested that modern government relies on the received legitimacy of an ‘Official’ public discourse; as I shall argue, this Official discourse builds on a more general cultural inclination towards abstract rationality, which is inherently associated with modern grammar. Beginning in the Middle Ages, the grammaticalization of anaphoric relationships in north western European languages gave rise to obligatory subject pronouns which invoke the presuppositions of every statement in an explicit way; the resulting integration of discourse creates a flavour of necessity and unison which is absent in other languages, and which helps teachers and caregivers to vest particular authority in the ‘Great Other’ by means of appropriate language games. Thus, grammar serves as an important psychological resource underpinning discourses of positive law, rational rule, and democratic governance in Western societies. At a meta-theoretical level, this hypothesis implies that Bourdieu’s and other theories of social discipline are applicable to these societies only.

Representation of Class Culture: A Case on Private Schools in Turkey
Emine Ecem ECE (Middle East Technical University, Turkey) | ece.ecem@metu.edu.tr

This paper examines in what ways educational choices reflect class culture and so how they are related with reproduction of social inequalities. Firstly, it gives information about Turkish education system in which private and public schools are rigorously split in terms of their target group of parents and variety of courses/activities. Afterwards, considering the lack of empirical data on this issue in Turkey, my own case study of two private primary schools is introduced. It is based on in-depth interviews with parents who chose either of those schools. The interviews aim to gather information about educational and occupational background of parents, the meaning of ‘good’ education for them, their expectations from a ‘good’ school and their aspirations behind choosing that school specifically. On the basis of the data, the paper concludes by an analysis of the ways in which parents’ primary school choices are influenced by class values. While doing so, Bourdieu’s concepts of field, habitus, distinction, and cultural capital, and examples from the studies of Lareau, Weininger, DiMaggio and Mohr are utilized. Consequently, although cultural distinction has been an important focus in sociology of culture, research on its representation in education has so far been mostly dominated by educational approaches. In that sense, the significance of this paper rests in its sociological approach to this relationality between cultural distinctions and education strategies. Moreover, it reveals the peculiarity of Turkey among its European counterparts because of increasing social inequalities formed by education in the process of fast modernization.

Crisis at the age of crisis
Emanuela FERRERI (Sapienza University of Rome, Italy) | nariff@alice.it

The general aim of the paper is to relate ‘society’ and ‘crisis’, in terms of representation from one to the other, illustrating a socio-anthropological perspective for the study. Nowadays ‘crisis’ means a relationship between the condition of social inequality with that of cultural difference. The specific aim of the paper is to relate the condition of social inequality with that of cultural difference. Gender (sex), generation (age group) and cultural identity (ethnicity and minority) are examined within the context of the current global crisis, and one particular risk factor within the crisis process is examined: a widespread feeling which assigns responsibility to cultural subjectivities while exonerating society’s institutionalised systems. The paper takes as its principal references the works of:
F. Héritier, L. Dumont and G. Balandier, and the most recent perspective of a non-hegemonic anthropology, Saillant, M., Kilani, F., Graezer Bideau F., (Manifeste de Lausanne. Pour une anthropologie non hégémonique, 2011). In order to illustrate a socio-anthropological perspective for the study of the relationship between cultural frames and structural conditions of our common society, the paper is oriented towards an interdisciplinary discussion of research methods and theories. One particular thesis is examined: the crisis as a peculiar shape of the relationship between cultural frames and structural condition of the current society.

Key words: global society, social inequality, cultural differences and political subjectivities, cultural frames and structural conditions.

‘Elite’ in the Finnish academic and public discourses: interconnections and a conceptual jumble

Nina KAHMA (University of Helsinki, Finland) | nina.kahma@gmail.com
Sonja KOSUNEN (University of Helsinki, Finland) | sonja.kosunen@helsinki.fi

The ‘elite’ is often discussed in social scientific research as well as in public debate, but the content and the actual meaning of the concept seems to vary and remain unclear. Often it is approached through conceptualisations of wealth and lifestyle or the combination of the two. As a social group the elite is defined as the culturally and economically well-off. The Finnish social scientific research has not thus far examined the conceptualisation around the elite into wider extent and especially in relation to the ongoing public debate. Often the counterpart for working class is rather the middle class, which this presentation aims to problematize by investigating the role of the elite in the academic as well as the public discussion.

The data of this study consists of the editorials of two major Finnish daily newspapers (Helsingin sanomat and Maaseudun tulevaisuus, n=198) in 2000-2014 and of peer reviewed articles derived from two leading social scientific journals (Sosiologia and Yhteiskuntapolitiikka) from the same time range. We aim to explore the interconnectedness of the societal discussion and academic debate by methodologically applying discourse analytical practices, and tackle the concept of elite: on what sort of societal phenomena the concept is related to, and what kind of an elite is under consideration in the discourse (cultural, economic, political, or something else)? The discovered connections will be compared in terms of the publication times, authors and the content of prolonged discussions.

RN07S06 - Cultures of Inequality

From pre-modern fashion systems to value illusion today – on fashion and global inequality

Anna-Mari ALMILA (University of the Arts London, United Kingdom) | a.almila@fashion.arts.ac.uk

A widely shared belief among sociologists of fashion is that fashion is, if not strictly ‘Western’, then at least ‘modern’. Yet many fashion historians place the ‘beginning’ of fashion in Europe in the mid-14th century, and some suggest that there were far earlier fashion systems in other urban locations. The idea of fashion as essentially modern, and the failure to recognise pre-modern fashion phenomena, leads to various serious problems. Sociology generally fails to recognise that what we consider modern European fashion has its roots in periods when Europe was not a hegemonic power in the global exchange of goods, ideas and styles, but rather a peripheral location compared to China and the Arab world. Fashion as a set of phenomena is not exclusively modern, and fashion systems are historically and geographically located.
Today’s fashion systems are global in scope, particularly in terms of production and marketing. While the symbolic ‘value’ of fashion is mostly produced in the ‘West’, garments are produced everywhere. This geographical inequality encourages scholars to think of fashion as primarily ‘Western’. A more inclusive and satisfactory understanding of fashion is necessary, and can be achieved by recognising two issues. First, there is nothing about fashion that makes it particularly typical of any one historical period or geographic location, including Western modernity. Second, the role of all kinds of labour involved in producing fashion must be recognised. Acceptance of these ideas will lead to better, more comprehensive, less Eurocentric and presentist analyses of the social roles of fashion.

Negative Classifications: The Symbolic Order of Social Inequality
Sighard NECKEL (Goethe University Frankfurt, Germany) | neckel@soz.uni-frankfurt.de

The paper explains a cultural sociological approach to the research on social inequality. "Cultural sociological" means that social inequality is not regarded as resulting only from a distributive order of goods, income and positions, but also from a evaluative order created and reproduced by the actions of social groups. Thus, social vulnerability of weak actors and groups does not only derive from a lack of material resources, education and power, but also from derogatory evaluations which can have a variety of social consequences. In the first part of the paper the significance of symbolic classifications for the study of social inequality is explained. Secondly, two different types of negative evaluations will be distinguished: “gradual” and “categorical” classifications. In the last part of the presentation, I will discuss the ways such evaluation patterns are relevant to current changes in social inequality.

“Zet die ploat af!”. Rap music, Flemish nationalism and structures of inequality in Belgium.
Alessandro MAZZOLA (University of Liége - Belgium, Belgium) | a.mazzola@doct.ulg.ac.be

In the last two decades, the consensus towards Flemish ethnonationalist/secessionist parties has grown into Belgium’s political landscape. The Vlaams Blok/Belang (VB) and the Nieuw-Vlaamse Alliantie (N-VA) see Flanders, the Dutch-speaking Community of Belgium, as an independent social, cultural and geographical space occupied by a homogeneous people. This ideology is reflected into a series of discourses that serve to legitimate such an extremely ethnocentric way of understanding the society. Narratives of cultural, ethnic and moral order that focus on the maintenance and stability of group-based social hierarchies. They create and reinforce the structures of inequality through which people are identified and classified as “being worthy” to be part of the Flemish people or not. Rap music is largely symbolic into these discourses. In Belgium, as well as in many other countries, rap is dominated by artists with multi-ethnic and working-class background. Not only this genre clashes with the conservative cultural aesthetic of right-wing nationalists, but it is also instrumentalized as material and symbolic source to address three of the major issues of the parties’ agenda: a) the criminalisation of immigrants, b) the conflict with the French-speaking Community, c) the broader question of social security. Analysing nationalist political elite’s discourse against hip-hop in the public sphere, and the reaction of rappers through their music and "organic" activity, this paper moves to deconstruct the identification of rap as the music of deviant multiethnic youth in Belgium.

RN07S07 - Culture and Commerce
The Controversy of Values in Cultural Industries: The Distinction of Use Value and Exchange Value
Ta-ho LIU (National Chiao Tung University, Taiwan, Taiwan, Republic of China) | liutaho@gmail.com

Since the Council for Cultural Affair in Taiwan started promoting Cultural Industries Development in 2002, the concept “cultural industries” has raised controversies over whether “culture” (cultural arts) could be industrialized. The paper suggests the current debate is rooted in the misunderstanding of the concepts between “cultural enterprise” and “cultural industry”. In order to seek an interpretative understanding and put an end to the current debate, the article starts from Weber's methodology of ideal types and uses two concepts--“use value” and “exchange value”-- to compare and contrast the “cultural enterprise” and “cultural industry”. The article argues that the main distinction between them rests on the goals-oriented of policies. Pragmatically, the two concepts share resembling art creation process and forms of representations. Therefore, they cannot be simplified as mutual exclusive.

When Culture and Commerce clash: cases of mutual innovation between autonomous spheres of valuation
Michael HUTTER (WZB Berlin Social Science Center, Germany) | mhutter@wzb.eu

How does culture help ground economic compulsion, and how does economic compulsion in turn help ground culture? To ask the same question in particular conceptual terms: How do cultural games make an impact on commercial games, and how do they in turn contribute to the development of culture? Games, in this model, are similar to autonomous action fields, or to operationally closed communication systems.
In the two cases studies that I want to present, the cultural game is constituted by the Visual Arts, and the commercial games include a variety of markets on which a particular type of products is sold and bought: these products generate emotional experiences as their users live through them or remember them. They are called “joyful products”. The first case focuses on the Flowers game: Between 1964 and 1970, Andy Warhol generated around 900 objects based on an altered photograph. The impact on commercial games is documented. The second case focuses on a painting created by the Flemish painter Pieter Aertsen and his workshop in 1551. It was one of the showpieces in Emperor Rudolph II's collection in Prague, before it vanished from public sight and was rediscovered in 1911. Here, the commercial influences that led to its particular innovative quality can be traced to a documented case of real estate speculation. Both cases are taken from my book “The rise of the joyful economy. Artistic invention and economic growth from Brunelleschi to Murakami”, to be published by Routledge in April 2015.

The candidacy for the European Capital of Culture title: an opportunity for destination branding or for social engagement?
Florin NECHITA (University Transilvania of Brasov, Romania) | florin.nechita@unitbv.ro
Adina Nicoleta CANDREA (University Transilvania of Brasov, Romania) | adina.candrea@unitbv.ro
Victor BRICIU (University Transilvania of Brasov, Romania) | victor.briciu@unitbv.ro
Codrina SANDRU (University Transilvania of Brasov, Romania) | csandru@unitbv.ro

Right at the start of the official bidding for the prestigious title “European Capital of Culture” (ECOC) in 2021, the Romanian cities that entered in the effervescence of the competition...
should ask themselves “why” and “where” to direct their efforts. There are both general or specific objectives for every bidding city and each of them carries its own practical and emotional package: existent or planned infrastructure, heritage, people and organizations involved in cultural sector, expertise of local administration, goals, ambitions, weaknesses to address in short time or strengths counted as strong assets in the future bid-book. Considering this context, the aim of this study is to investigate whether the ECOC candidacy will mainly reinforce destination branding or increasing the engagement of local community members will be the most important benefit. A literature review reveals how previous candidate cities benefited from the bidding stage to post-event stage. An analysis on local authority’s public discourse evaluates the outward orientation (directed to tourists or direct economic and image benefits that came from outside of community) versus inward orientation of the Romanian candidate cities. A research conducted among Brasov volunteer community members reveals ECOC candidacy as a tool for increased self-esteem, sense of belonging and pride of its citizens engaged in the bidding process. The results of the present study can be useful to Brasov local authorities in order to increase volunteering and local community’s engagement and to consolidate the destination’s brand.

The ideological crossroads of the creative act: how a shopping mall became a music hub, and how it might perversely return to consumption mode.
Anselmo CANHA (University of Porto, Portugal) | anselmocanha@gmail.com
Heitor ALVELOS (University of Porto, Portugal) | halvelos@fe.up.pt

This paper presents the case study of CCStop, a Portuguese bankrupt shopping mall turned music ecosystem, from its slow decay in the 1990s to its gradual occupation by musicians to this day. Both authors of the present paper engage in militant observation in this context since 2007. Prior academic work includes various MA dissertations, conference papers, and action research within international R&D networks. Current findings are reverting to a PhD thesis. CCStop has recently closed a cycle of creation and collapse at the point when mainstream exposure betrays its social, semantic and pedagogical originality: its mythology returns to a realm of anonymous passive consumption.

The threat of closure by the City Hall in 2010 drove a tactical bridging with local cultural mainstays; in 2014, Stopestra – a pool of about 100 CCStop-related musicians – performed a concert broadcast on national television. The show constructs a narrative of institutional, aesthetic and media submission: hardly recognizable from the original, confrontative alchemical congregation.

As the threat of territorial closure was overcome through association with mainstream agents, has Stopestra compromised CCStop’s integrity beyond decree, its endlessly self-renewable semantics?
This paradox may have had its roots in this precise interface: when a fairly indeterminate and media-averse set of musicians simultaneously translates itself into (and differentiates itself from) “Stopestra”, a readable format, by force of circumstance. And when, itself faced with the allure of a brand, a conductor and a system, Possibility and Promise are soon reduced to the blind alley of exotic sameness.

Planned obsolescence as a controversial issue. Analysing conversations generated by two different Apple iPhone launches
Lorenzo GIANNINI (University of Urbino, Italy) | lorenzo.giannini@uniurb.it

The issue of planned obsolescence has accompanied the evolution of mass production and mass consumption since the period of the Great Depression, during which it was formalized as a
 tool to stimulate demand in a period of economic stagnation (London 1932). The legitimacy and harmfulness of the phenomenon has been regularly called into question, in particular from a consumer point of view (Packard 1960; Galbraith 1958; Slade 2006), and its effectiveness has been periodically discussed (Bulow 1986; Waldman 1993; Fishman et al. 1993; King 2005 only to name a few). Recently, the issue has again become central in the public discussion particularly in relation to the production of ICT.

The research addresses the issue of planned obsolescence as a controversial issue, an issue that can stimulate a plurality of narratives, narratives that may arise in opposition and contradiction. News and conversations covering the release of Apple iPhone 5 and iPhone 6, respectively, will be taken into consideration, as a case study.

The collection and analysis of data will be made through a new set of tools recently developed by the Berkman Center for Internet and Society at Harvard University. These tools allow qualitative and quantitative analysis of a large number of sources, mapping the evolution of controversy through time (Benkler et al., 2013; Graeff, 2014).

RN07S08 - Class and Culture

Vakif system (foundation) in Ottaman Empire as an effective model against social inequalities
Zeynep SANCAKTUTAN (Gazi University, Turkey) | zeynepsancaktutan@hotmail.com

Vakif System (foundation) in Ottoman Empire as an effective model against social inequalities
Department of Sociology
Gazi University
06500 Teknikokullar Ankara, Turkey
E-mail: zeynepsancaktutan@hotmail.com

Abstract
One of the requirements of maintaining social order and security is preventing the increasing social inequalities in the society. Preventing social class conflicts arising from unequal life standards and maintaining social order is possible with re-distribution of societal resources. This necessity was met with Vakif (foundation) system in Ottoman society. The most efficient way to get social classes closer to each other is reciprocal aid. In this sense, Vakifs are the most ideal form of assistance provision. This system which deeply effected the city and society life of Ottoman state has been the main focus theme for several studies. And also many works done by churches, city halls and governments in Western states were done by Vakifs that had personal funding in Ottoman State. The purpose of this study is to elaborate the functioning of the Ottoman Vakif system in terms of preserving social order by using Ottaman documents. And also in this study, my aim is to explain why the Vakifs are unique institutions which have administrative, financial and military autonomy. As a result, Vakifs were primarily established to prevent the social inequalities in Ottoman Empire and different than the other foundations which we see in other communities.

Political Economy of Culture and Cultural Politics
Seehwa CHO (University of St. Thomas, United States of America) | scho@stthomas.edu

During the last three decades, “culture” has become dominant in academia, and cultural politics has become a dominant political position in the New Social Movements. It is, Michael Denning (2004) says, as if we have newly discovered culture, realizing suddenly that it is culture that really matters. Moreover, cultural studies and cultural politics have become a global
phenomenon. Why has culture become so important? Why has culture come to the forefront of academic studies and the Left politics? What are the political and economic contexts that have catalyzed this sudden move towards culture? What problems do the cultural theories address that were not addressed before? These are the questions this paper aims to address.

As I endeavor to outline the historical contexts of changes in capitalism through which culture studies and cultural politics have evolved, I define the turn to culture more broadly, which is a move away from the material base to the superstructure in social theories. Thus, my examination of the move toward culture proceeds from the early 20th century. My focus is to demonstrate how the fundamental changes in political economy have changed the significance and meaning of culture, and how the changes in the mode of capitalism have pushed culture to the center stage both in critical theories and Leftist politics. My study is a material analysis of cultural studies and cultural politics, and my central argument is that culture has become important in the course of the 20th century, because of changes in capitalism itself.

Class reproduction and “middle-class” subcultural participation: Dropping-out or a temporary reprieve from middle-class responsibilities?

Tyler Martin DUPONT (SUNY at Buffalo, United States of America) | Tyler.Dupont@gmail.com

The paper investigates how participation within a middle-class counter-culture affects a participant’s ability to reproduce his or her class status as an adult. Specifically researching the subculture of skateboarding within America and Canada, I examine how the local and professional skaters’ involvement with the subculture affects their ability to retain their middle-class status after they exit the culture. Skateboarding has positioned itself as a resistive counter-culture and skaters overtly reject many middle-class values and performances. The subculture’s ideology often rejects the dominant understanding of success in capitalist society and core skaters often openly resist traditional paths to middle-class success. This resistance influences the skaters to delay or reject seizing many of the opportunities that often assist in (re)producing a middle-class socioeconomic status. Intuitively it would seem that by not seizing these opportunities at age appropriate times, the skaters might reduce their ability to retain their class status. However, my findings show that the skaters’ initial status within the socio-economic hierarchy and their initial childhood socialization into the dominant culture may assuage or alleviate the negative effects related to heavy participation in the deviant subculture of skateboarding. In this paper, I provide a detailed examination of the culture surrounding skateboarding and investigate how a strong commitment to skateboarding and the internalization of skateboarding’s core values, attitudes, and performances as they intersect with class, race, and gender affect the skater’s ability to reproduce a “middle-class” status as an adult.

Class and Memory: Formation of the Local Bourgeoisie in Bursa, Turkey

Esra DABAGCI (Ankara University, Turkey) | esradabagci@gmail.com

This study is an attempt to understand the formation of the local bourgeoisie in Bursa, Turkey through their collective memory. Following the substantivist approach seeing economy is also "embedded" in other social structures like family, kinship, ethnicity and religion, this paper examines culture of a local bourgeoisie from an anthropological perspective. Bursa, which is the fourth most populous city with 2.7 million people, is one of the most industrialized metropolitan center in Turkey. The city is still a center for people with various background who were migrated from Caucasus, Balkans and many other regions of Turkey during 18th, 19th and 20th century. The city did not only take new groups of migrants but many people of especially Jewish, Greek and Armenian population had also emigrated at the turn of
the 20th century. The movement of people changed the social and economic configuration of the city. Being the oldest industrial branch in Bursa, textile industry in which many people from various origins had engaged from late Ottoman till now constitutes a microcosm for this study. Based on an oral-history research conducted with three family engaged in textile business, this paper mainly inquires how the local bourgeoisie describes continuities and ruptures with regard to their biographies and the political trajectory of Turkey; if there is an intergenerational (re)production of cultural/social capital, if so, how it is remembered and phrased; how the movement of cultural/social/economic capital (if any) among the local bourgeoisie of different cultural backgrounds is remembered.

**RN07S09 - Religion as a Cultural System**

**Institutional clarification to the religious economic theory: Historical roots of secularization in the Netherlands**

Tymofii BRIK (Universidad Carlos III, Madrid, Spain) | tbrik@clio.uc3m.es

Religious economic theory was introduced as an ambitious project to explain religious behaviour within and across societies. Being extensively used in many different contexts this theory has recently witnessed a rise in criticism. One of the first critical responses to religious economic theory was given by Lechner (1996) who recognized that social institutions are important in framing actions of both sides: suppliers and consumers of religious services. Although the need to study social institutions and historical context was voiced frequently, not many empirical studies confronted religious economic theory with institutional context. In the present paper I demonstrate an example of how this can be done. I investigate to what extent a likelihood of religious affiliation in the Netherlands can be predicted by historical developments of religious institutions. Empirical evidence comes from the census data for 1909 that are merged with European Social Survey data for 2002-2008. Moving from descriptive statistics and correlations to statistical inferences by means of multilevel binominal regressions I demonstrate that historically religious competition is indeed important in framing religiosity in the present days. A person who lives in a region that historically had higher rates of church monopolization and was mostly Protestant is more likely to have a religious affiliation. This is because religious competition is itself an important institution that gave a possibility for the Roman Catholic Church to be established in a region outplaying with time once dominated competitors that vanished in the course of secularization.

**The Bearable Lightness of Being, or: "Shit Happens". How Dutch religious nones deal with life, death, and suffering**

Julia PETERS (Erasmus University Rotterdam, Netherlands, The) | julia.peters@gmail.com
Stef AUPERS (Katholieke Universiteit Leuven, Belgium) | Stef.aupers@soc.kuleuven.be
Julian SCHAAP (Erasmus University Rotterdam, Netherlands, The) | J.schaap@eshcc.eur

How do religious nones deal with life, death, and suffering? When it comes to this kind of meaning-making, cultural sociology has fixated on either the waning significance of Christianity or the waxing significance of other forms of meaning making in the West, especially spirituality, leaving a blind spot for a systematic inquiry into the ways those who do not believe in a God or immanent essence find solace. This conceptual gap seems to follow from the assumption that the only worldview that can give anyone a sense of purpose in life is religion and that, consequently, religion will never vanish; it will only change. When one departs from such hard-line claims about religious meaning making, the religiously unaffiliated should be thoroughly
pessimistic. After all, being faced with a cosmos that operates arbitrarily, they should experience no sense of purpose or moral guidance. We held ten (and counting) in-depth interviews with Dutch respondents who claim that they do not believe, or highly doubt, that there is something like a God or immanent spirit. Paradoxically, the by our respondents assumed purposelessness and finiteness of life and insignificance of the individual, are precisely where they found the tools for endowing their lives with meaning. These paradoxes of meaning are often consolidated by them with irony; a wink and nod attitude that helps to make the lightness of being bearable through detachment and playfulness. This article opens up a sociological blind spot for a-religious meaning making, a significant theme considering the steady growth of the religiously unaffiliated.

Measuring Institutional Logics at the Level of the Subject: Investigating Pathways toward Identity Formation in two Buddhist Communities

Jose Antonio RODRIGUEZ DIAZ (University of Barcelona, Spain) | hardiaz@yahoo.com
John W. MOHR (University of California - Santa Barbara, USA) | mohr@soc.ucsb.edu

The study of institutional logics concerns the ways in which fundamental systems of understanding and repertoires of practice combine into shared understandings and orders of meaning within specific social domains (or fields). Institutional logics obtain where subjects, practices and objects cohere as cultural grammars (Friedland, 2009, 2013; Friedland, Mohr, Roose and Gardinali, 2014; Mohr and White, 2008). Just as individuals’ critical abilities to judge the justness of a being relative to a common good is essential to the operation of conventions of worth (Boltanski and Thévenot, 2006), so too is the institutional formation of subjects invested in and by a particular value an essential element in the operation of any institutional logic. The use of formal methods to analyze institutional logics has until recently focused on studies of organizations or broader organizational fields. In this paper our goal is to instead look to understand the way that institutional logics are constructed out of (and through) the lived experiences of the individuals who participate in these logics by studying the way that key practices, beliefs and identity constructions are linked together into constellations of experience that together make-up alternative pathways into institutional engagement. In this paper we examine this process with data taken from an extensive ethnography and survey of two Buddhist communities in contemporary Spain. Being Buddhist, of one type or another, is seen through this lens to be a dynamic process of balancing a complex duality of practices, cosmological beliefs and identity experiences.

How Does a Personal Value System Influence Subjective Well-Being?
Wonkwang JO (Seoul National University, Korea, Republic of (South Korea)) | thinkera@naver.com

A value system is a very important factor which influences Subjective Well-Being (SWB). However, the majority of the previous research on SWB has overlooked the effect of a value system, because it has focused on revealing external conditions which influence SWB, like income and education. Even though the external conditions affect SWB much, it has to be noted that a personal value system could alter the external conditions’ effect size and direction. In a nutshell, a personal value system works as a frame which interprets the external conditions and produces meanings in people’s mind. The aim of this paper is to explain a value system’s frame effects. In order to do this, I set up regression models on SWB, using the sixth round of World Value Survey. I analyzed the frame effects of several value systems, which are materialism; subjective freedom; and opportunism judgment, in four countries (Korea, Japan, China, and the USA). Adding the interaction terms between value system’s variables and the external conditions (income, education, and religiousness) in the model, I could find the personal value system’s frame effects. The coefficients of the interaction terms indicates that the post-materialism decreases income’s effect and increase education’s effect on SWB in the USA; the subjective freedom decreases income’s effect in Korea and Japan; and the opportunism judgment increases the effect of education and religion in the USA. These results shows that the value systems have various frame effects definitely.

RN07S10a - Narratives 1

Where does the “God” within the “God particle” come from? Cultural sociological analysis of the Higgs boson research
Jan VÁŇA (Masaryk University, Faculty of Social Studies, Czech Republic) | 173329@mail.muni.cz

In my paper I examine activities and speeches included within the meaning-making process of the quantum physics research at CERN, Geneva. A particular focus will be put on the research of the Higgs boson, the so called “hunt for the God particle”. The “God particle” is a symbolic entity connected to an extensive spectrum of meanings and audiences. The notion of “God” does not stick here with the usual conception of religious beliefs, however, it somehow connotes beliefs and religion. Rather than to a particular institution of a church, it refers to the idea of religion as something more general. Something that is above us, that transcends our directly experienced reality, something that is even enigmatic and mysterious. Here, the notion of “God” is grounded in the way in which certain actors relate to the “God particle”, respectively the Higgs boson, in which they make it meaningful for themselves.

In order to investigate various aspects of this relation, I employ the method of structural hermeneutics as proposed in the Strong Program of Cultural Sociology. To provide a convincing interpretation, I have been working with various types of resources, including public media outputs, official scientific statements, historical resources, scientific presentations, public courses, TV shows, and also popular culture artifacts. The paper is a contribution to the discussion on so-called “modern disenchantment” proposed by Max Weber. The case of the “God particle” is a persuasive example that regardless its “rational” and “mechanical” character, modern science is enchanted in its very core.

Narratives of a case of (quasi) euthanasia: contested meaning and polarized ambiguity
Simone RAMBOTTI (University of Arizona, United States of America) | rambotti@email.arizona.edu

Accounts of violence are part of everyday life of media consumers in every region of the world. In the endless dispute between content and structure, cultural theory proposed by Cerulo (1998) connects meaning with sequencing: in deciphering violence, order matters. Resting on the idea that meanings are constantly negotiated, I integrated this perspective with a field approach in order to analyze an ambiguous case of quasi-euthanasia that occurred in Italy few years ago. I believe that ambiguous cases are a privileged arena for witnessing the battle to affirm one’s vision of the world, and indeed Italian society vigorously contested the story of life, death, and suffering of Eluana Englaro, a young woman who – following a car accident occurred when she was 21 – spent 17 years in a persistent vegetative state, and died after the request of her father of interrupting life support (artificial feeding and hydration) was received. I collected 260 newspaper reports published in 7 different newspapers between July 2008 – when the Milan Court of Appeal suspended feeding and hydration and the case became more publicly debated – to the aftermath of her death in February 2009. I coded the reports through traditional content analysis. I took into account structural dimensions like political affiliation and proximity to Catholic Church of the newspapers, and rhetorical dimensions like the multilateral vs. unilateral use of reported speech. The outcome is the interpretation of the event given by the news reports as deviant, ambiguous, or normal, which was guided by the identification of key words and metaphors. Reports invoked metaphors such as silence and respect (Secolo d’Italia), the freedom of choice and a lesson of dignity (l’Unità), a death caused by hunger and thirst (il Giornale), a “horror that will devour us” (il Giornale), a “sweet and painless death” (Repubblica), the “last caress of Beppino to his daughter” (Repubblica), a “death compatible with the medical protocol” (Corriere della Sera), a “decision that allows her body, 16 years after her brain, to die” (again Corriere della Sera), and so forth. After inputting the data in a matrix, I formally analyzed them using multiple correspondence analysis and Galois lattice analysis. Results show that: (1) political and religious dimensions are strongly intertwined but leave space for different outcomes: in particular, being only mildly close to the Catholic Church links the meaning to ambiguity; (2) there is no connection between sequencing and meaning; (3) there is a link between ambiguous interpretation of the event and multilateral use of sources; (4) the study of narratives sheds light on the political relationship between two Italian political leaders, who will break their alliance few months after assuming a sharply different rhetoric style over the case of Eluana. Finally, on a theoretical level, the case suggests an elaboration of the concept of ambiguity, which can be consensual (characterized by weak opinions and unclear positions) or polarized (strong opinions, irreconcilable positions). Future research should address the question: Do the two different kinds of ambiguity affect cultural change (thus social change) in different ways?

Intellectual Civil War: Struggle for a Master Narrative in "Chomsky Affair"
Petr KUBALA (Masaryk University, Faculty of Social Studies, Czech Republic) | 333132@mail.muni.cz

The purpose of my study is to describe and analyse a recent event; public scandal that emerged in Czech public space and was named as Intellectual civil war or Chomsky Affair. An important discussion, or rather clash, between ideologies, narratives or memories which was triggered by a visit of Noam Chomsky and his statements on East-European dissidents is analyzed in this paper. Contribution is methodologically based on a discourse analysis of newspaper articles from given period (june - august 2014) and type of media (mainstream journals, commentaries,
etc.). The focus is on two main groups involved in this event - “Guardians” and “Riders” of the master narrative. I will describe the discourse field which is outlined by the conflict of those two groups, their discursive positions, and rhetorical figures. In the case of “Guardians” (side of the first strong critics of Chomsky’s statements) I will focus on the strong reactions they made. Those reactions are interpreted as defensive responses that are determined by the Czech post-revolutionary master narrative and its recent weakening. In the case of “Riders of the master narrative” (group of people strongly criticizing critics of Chomsky) I will focus on an attempt to redefine a post-revolutionary narrative which the group made in order to narrate the master narrative differently. In the end, I will provide a cultural-sociological analysis of cultural conditions of struggles or scandals of this kind which occasionally emerge in Czech public discourse.

Narrating Indigenous Cultures: Global Formal Structures and Local Struggles Over Definitional Power
Frank SOWA (Institute for Employment Research (IAB), Germany) | frank.sowa@iab.de

In a globalized world the category of culture enables groups to place themselves within a global political frame and relate to global issues. Global formal structures of a world polity offer the narration of indigenous cultures. With the founding of the United Nations the power divide between Euro-American and postcolonial societies has continued to persist but has adopted a different language and other means. Communities that were once defined as “primitive peoples” have been relabeled as “indigenous peoples” and assigned a new official position that is constructed based on an underlying division between traditional verses modern. Indigenous peoples as the Greenlandic Inuit are thought to live in harmony with nature and use the natural resources in a sustainable way. In this way, the representation of the old Eskimo culture forms the basis for later re-interpretations within the ecological discourse: the social construction of ‘ecologically noble savages’ by conservationists and environmental groups on the one hand and the social construction of ‘traditional ecological knowledge’ by anthropologists and other scientific experts on the other. In order to gain rights that are attributed to indigenous peoples in international fora and bodies the Greenlanders adopt and reproduce this Western representation through identity politics. Being recognized as an indigenous people with traditional ecological knowledge means that the Greenlandic Inuit are, for instance, given the right to whale and use their natural resources. However, according to young Greenlanders there are more conflicting narratives of culture in Greenland today which lead to local struggles over definitional power.

The presentation of belonging and the construction of differences in post-traditional communities
Paul EISEWICHT (Technical University Dortmund, Germany) | paul.eisewicht@tu-dortmund.de

Due to the process of individualization via pluralization in modern societies people are more and more disembedded from traditional affiliations (e.g. family, birthplace, class). Post-traditional communities are an answer to that disembedding, grounded in a shared interest rather than structural similarities like age, class and gender. People from different social backgrounds get together and form a community (not just of practice but more important) of a shared view of the world. Typically this shared understanding respectively this imagined community finds its expression in material presentations of belonging (it is rather enacted than imagined). This presentation is therefore guided by two observations - that post-traditional communities are based on a shared understanding (that they are imagined) and that they are presented in shared practices and presentations of their members (that they are material). Normally this
presentation is constructed via consumer goods. The subsequent questions that are to be discussed in the presentation are how people present themselves as belonging to a post-traditional community and how they display differences in status in these communities (so to say how they achieve distinction with the use of the goods of mass-consumption). Understanding these groups not just as (sub-)cultures in their own right but as the individual management of belonging (not just as the freedom to but also a necessity) could deepen the understanding of the re-embedding of modern individuals from a subjective perspective and the interplay of materiality and culture.

RN07S10b - Narratives 2

Film as a Medium of Social Imagination: Zero Dark Thirty and the Imagination of History
Jörn AHRENS (University of Giessen, Germany, Germany) | joern.ahrens@sowi.uni-giessen.de

Social experiences of crisis are deeply inflicting the quotidian reality and routines of social order. Regarding such events, fictional narratives of key meaning when serving the rationalization of such experiences. When approaching events not sufficiently aware to the social public, fictionalization is historicizing social events by producing a narrative master version. Such performativity is decisive, because society stems from experiences and knowledge of the past—not only chronologically, but also symbolically and epistemologically, the past continuously determines what is experienced as specifically interpreted present age. The paper focuses a mimetic dealing with social experiences of crisis by referring to a significant example for the cultural and social power of fictitious narrative. Such competence, within the framing of media based fictionalization, is of essential meaning for the (re-)construction of social normality and its order after social crisis. That way it is visualized how a specific incident could have been like. Simultaneously, its media communication produces a standardization of the imaginative experience of the crisis in question. Thus, it helps making possible the ex post realization of a generally shared experience of social crisis as iconology of society. As such, the fictitious narrative translates into a secondary experience of social reality as commonly shared experience. The paper examines such context by the example of K. Bigelow’s film Zero Dark Thirty (USA 2012)—the film’s narrative about the liquidation of Osama bin Laden, fills an important gap concerning the common experience of one of the most prominent traumatizations of the contemporary.

Zeus pregnancies? Fictional filmic images and imaginaries of human cloning and
male parthenogenesis
Roberta BARTOLETTI (University of Urbino Carlo Bo, Italy) | roberta.bartoletti@uniurb.it

Procreation offers a privileged perspective on the relationship between genders and particularly on the different values of the two sexes (Hértilier). The paper focuses on a recurring theme in (not just) western imaginary: male appropriation of female maternal power, exemplified by the mythological extraordinary birth of Athena from Zeus’s head (Kerényi, Vernant). We argue that the scientific myth of human cloning allows representing male desires of self-procreation bypassing women’s bodies. We analysed a significant panel of fictional films on human cloning from the period 1997-2013. In these fictional stories human cloning is represented mostly as masculine techno-scientific parthenogenesis, but the relation of the new Zeus with female figures is underrepresented. We notice that, more radically, the relationship between sexes is repressed in the imagery of human cloning, even if it constitutes a central and challenging point.
In the paper we refer to the perspectives of cultural studies and feminist studies on science and technology (Duden, Franklin, McNeil, Haraway, Braidotti).

**Democracy in Ruins. Civilizing and De-Civilizing Practices in Cold-War Greece**

Despina LALAKI (CUNY, The Graduate Center, United States of America) | lalad335@newschool.edu

Archaeology is inextricably intertwined with questions of identity, historical memory, nostalgia and myth; its object is produced and re-produced on the excavation site, in academia, in museums, the school textbook, the mass media, in daily conversation. Greek classical archaeology, more specifically, despite its epistemological credentials and its ‘boundary work’ could probably never rid of aestheticism or its propensity for ideology and politics. I suggest therefore that it offers great opportunities for in depth ‘textual readings’ not only of the field itself but also of those societies’ cultural structures which are embedded in the tradition of Hellenism – this convoluted idea of Western heterotopia of civilization and culture built with the ruins of antiquity.

In this paper I take an interpretative approach trying to trace some of the transformations that the idea of Hellas underwent during the 20th century from being employed as a critique toward the effects of modern civilization – primarily informed by German visions of cultural reform – to an expression of instrumental rationality, cultural commodification and liberal democracy. Arguing that each institution constitutes a particular symbolic network, and while drawing from various normative conceptions of the symbolic order and cultural theories of power I explore the ways in which representative democracy as an endorsement of a capitalist economy was offered as a public narrative through various collaborative archaeological projects between American and Greek institutions: the excavation of the ancient Agora of Athens, the reconstruction of the Attalos Stoa as the museum of the site, a program for the repair and rebuilding of archaeological museums under the auspices of the Marshall Plan, are a couple of the cases I will cursorily present. The systematization of the relations between the two countries, especially after the end of the Second World War when the American intervention put an end to the civil war between the communists and the old regime – the first American Cold War victory – led to some significant transformations of the imaginary components of western democracy and culture and to the reformulation of social and political identities. Classical archaeology provided the vehicle for symbolically articulating and expressing some of these transformations normalizing the new political and economic status quo and giving shape to new ontological and epistemological distinctions between the Democratic West and the Communist East.

If classical antiquity provided the foundations for the civilization of modernity, as scholars of the macro-sociological field of ‘civilizational analysis’ have explained, a closer study of the subsequent development, integration, appropriation and interpretation of the classical inheritance by various cultural programs may help us to provide an explanation for the endurance of that civilization. Furthermore, the examination of any new cultural facts born in the intersection of these cultural programs and their effects in our social, political and moral life may lead not only to better understandings of our distant or recent past but possibly to more informed choices for our future.

**RN07S11 - Topics in the Sociology of Culture**

**Coding the Past: Tracing the Meaning of Historical Events From Presidential Speeches to Media**
In our already published work, we attempted to grasp the main cultural codes related to the First World War in presidential speeches in the Czech Republic for the past twenty years. This historical event is particularly important within the Czech national metanarrative as it constitutes an impulse from which the independent Czechoslovak nation was formed. To continue in our work, we now turn our attention to media to explore how these codes operate in a wider public space. To construct our sample, we monitored the press coverage of the speeches that proved to be significant in our previous analysis. From this material, we will show how the codes relate to the reception of speeches by different (domestic and foreign) audiences. We will also point out the internal logic of the codes which structures the options for position taking. We will achieve that by following selected cases which from our understanding of a broader sample of material represent the aforementioned processes well. In doing so, we will attempt to explain at least some of the processes involved in production and diffusion of meaning assigned to crucial past events. Such meaning forms a reservoir that is commonly used by actors to legitimize political positions and actions related to them.

Frontier Societies in Modern World: Settlement and Values
Anna NEMIROVSKAYA (National Research University Higher School of Economics, Russian Federation) | annanemirov@hse.ru
Roberto FOA (Harvard University, USA) | foa@fas.harvard.edu

The paper is analyzing formation and core socio-cultural attributes of relatively recently formed migrant societies of settlers in the frontier regions within the borders of contemporary states: Russia, the United States, Canada and Brazil, all of which have extended rule over new territories adjacent to their core regions in recent centuries. However, despite the resilience of the ‘frontier thesis’ by F. Turner within sociology, social history and political science, it has not been subject to a rigorous empirical examination. This paper tests whether the ‘frontier thesis’ is a description only of the social norms and institutions of the western United States, or is a more generalizable phenomenon, found in other times and places. The study examines data on the nature of social relations in frontier zones in four countries: Russia, the United States, Canada and Brazil, in order to reveal the role of settlement patterns in different frontier states in formation of values, social norms and social institutions. Taking a wide range of the World Value Survey’s items, it is found that higher levels of voluntary activity, social trust, tolerance of outgroups, egalitarianism, economic libertarianism and civic protest are distinctive features of frontier life in general, and not simply a feature of the American historical experience. Hence we suggest that the experience of settlement is conducive to the formation of norms of community solidarity and cooperation.

Tourism and virtual social capital: case study in Iranian tourism social networks
Gholamreza GHAFFARY (University of Tehran, Islamic Republic of Iran) | ghaffary@ut.ac.ir
Malihe SHIANI (University of Tehran, Islamic Republic of Iran) | mshiani@ut.ac.ir
Maryam TAGHIZADEGAN (University of Tehran, Islamic Republic of Iran) | taghizadegan

The reality of current world is captured by virtual world. Today reference groups have been transferred from the real world to the virtual world and comments or recommendations are often shared in online networking and prior sources of knowledge such as official institutions have become less important.
Individuals With their membership and activities in virtual social networks, considering the norms, values and linked networks among themselves and other users, they get the necessary social capital and sometimes, they transfer it to the real world.

The used method in this study is Survey method about the social capital users in tourism virtual networks. The result of study showed that virtual social capitals of users are in upward average level in Iranian Tourism networks. each day Linked networks, individual's supports of each other and users' trust are increasing in such networks. Based on Cohen's tourism typology, four types of tourism can be distinguished as: Organized mass tourist, Individual mass tourist, Explorer and Drifter. By Result of study it was concluded that tourism in virtual networks is often the type of exploratory tourism. This type is attended less by tourism official institution and travel agencies.

In Iran and many countries the role of virtual networks and its impact on tourism has not been considered seriously. Travel information databases are weak in Iran and responsible official institutions also have not organized the appropriate program in tourism. This is the point that should be reviewed for developing of Iranians tourism industry.

Transforming Russia in search of a new esthetic
Mikhail DYAKONOV (Russian state social university, Russian Federation) 
 dyakonov.m@gmail.com

This presentation focused on the main problem, which particularly concern the author - the interaction of ethic and esthetic in cataclysms of the XX century and global changes in the XXI century, in particular - on the way representing the socio-political and economic systems themselves in the visual reach.

It's significant that the October Revolution of 1917 and the transformations that followed after, coincided with the rise of Russian avant-garde - a phenomenon, that is one of the most striking and distinctive Russia's contributions to the world culture.

Throughout the history of Soviet Russia -from the mobilization of "military communism" to "Perestroika", which was conciliatory in relationship with whole surrounding world - it's possible to select a whole range of specific historical moments, which provoked shift of ethical principles and perspectives. The most important of them have also became significant milestones in the esthetics of Soviet civilization. We shouldn't forget about the 90's epoch, which included as the collapse of the USSR, and the transition to capitalism, and which is generally negatively perceived by modern Russian society. This epoch is important, but a purely negative precedent in the contemporary Russian information space.

The historical aspect becomes important for us, because nowadays we are watching another socio-political fracture in Russia, that seems to have reached its climax. Today the esthetics or the process of searching it might explain a lot itself.

The author offers the results of his research, which in it's empirical part is based on the analysis of modern Russian media (including the Internet) and other channels of textual and visual information.
Exploring Disaster Myths by Contrasting Expectations of Different Stakeholders

Daniel F. LORENZ (Disaster Research Unit (DRU), Freie Universität Berlin, Germany) | daniel.lorenz@fu-berlin.de
Katja SCHULZE (Disaster Research Unit (DRU), Freie Universität Berlin, Germany) | katja.schulze@fu-berlin.de
Martin VOSS (Disaster Research Unit (DRU), Freie Universität Berlin, Germany) | martin.voss@fu-berlin.de

The common notions about people’s behavior in disaster situations are often not based on empirical data, but rather on myths which overemphasize extreme behaviors: such as antisocial behavior, panic, disaster shock or helplessness and passivity and so on (Quarantelli 2008, Wester 2011, auf der Heide 2004). Due to the fact that these expectations are shaped within specific social environments, different stakeholders such as a heterogeneous population, professionals or the media exhibit different expectations towards disaster behavior (Drabek 1986, Wenger et al. 1975). These different expectations may not only be misplaced, they additionally guide the actions taken by the different stakeholders before and in disaster situations.

This presentation displays empirical results from the research project ENSURE (Enablement of Urban Citizen Support for Crisis Response) which analyzed the expectation of different stakeholders towards disaster behavior. Three different surveys were conducted: 1) a comprehensive document analysis on disaster behavior; 2) qualitative interviews with firefighters, paramedics and disaster relief workers as well as 3) a quantitative representative poll of 1,006 citizens in Berlin, Germany. By contrasting the status of research with professional narrations as well as with the people’s expectations concerning their own and other’s disaster behavior, we try to explore the different expectations and their variations in detail. We are furthermore able to show how different person-related variables, such as gender, age, education etc., may inform the specific expectations of citizens.

Natural disasters in two emerging countries: remembering socio-historical episodes of collective vulnerability

Eduardo GUICHARD (Center for the Interdisciplinary Study of Gerontology and Vulnerability, University of Geneva) | eduardo.guichard@unige.ch
Aude MARTENOT (Center for the Interdisciplinary Study of Gerontology and Vulnerability, University of Geneva; Global Studies Institute, University of Geneva; Institute of Socioeconomics, Faculty of Social Sciences, University of Geneva) | aude.martenot@unige.ch

As in biographies, there are moments of imbalance in the history of countries, events with unpredictable consequences that can mean the passage to a period of vulnerability for those who lived it. What is the place for memories about events such as natural disasters in the collective narratives? Moreover, when that memory comes from individuals that build their remembering in a subjective way?

This communication focuses on the shape of the socio-historical memory of the subjective experience of natural disasters. For this aim we analyze the mentioning about the two main natural disasters remembered within two samples of two countries from different cultural roots; Chile and India. On one side, the strongest earthquake registered in the modern history, which
happened in 1960 at the city of Valdivia, Chile. On the other side, the floods produced by the strongest rainfall registered in the last century, happened in 2005 in the state of Maharashtra in India.
The data was compiled under the CEVI international research project. Samples of around 600 individuals were collected in Concepción in 2009 and Mumbai in 2014. It considers five age groups covering the whole adult life (from 20 to 86 years old), and separated by ten years between them. We focus on the place of these disasters in the whole historical memory reported within samples and between the cohorts, as well as the anchorage of these experiences in the life course of individuals of both samples. Finally, we analyze in depth the reasons that lead individuals to consider this experience important within their lives.

Analyzing disaster communication processes - complementarities and tensions in the theoretical field
Nina Blom ANDERSEN (Roskilde University, Denmark) | ninablom@ruc.dk

In this presentation it will be explored how communication processes in relation to disastrous events are understood, analyzed and theorized upon and it will be argued that the theoretical field is characterized more as being dispersed than coherent. There is a lack of common vocabulary for understanding the different communicative processes, there is no theoretical canon and no common goals related to the practices of analyzing disaster cycle, as will be shown. The tendency to operate in separate domains and the lack of consensus is a challenge to a research field (Craig 1999).
The discipline of disaster communication is not a clearly demarcated research field. It is an interdisciplinary field that refers to many of the distinct features of communication research in general as described and analyzed by Craig (1999). There is no consensus of what defines the communication research field in general or the disaster communication research field in particular. The lack of building bridges between theoretical discussions involving empirical findings characterizes the disaster communication field as well.
The consequences of the apparent lack of attempts to build bridges between the five traditions that I sketch will be discussed and it will be argued that a more dialogical-dialectical approach in the research field in general can create a common awareness of the challenges in the field, more discussion and dynamic across the traditions and an articulations of the complementarities and the tensions.

Exploring differences between the secular and religious in the international humanitarian response to Typhoon Haiyan in the Philippines: the perspectives of national and local staff members
Olivia Justine WILKINSON (Trinity College Dublin, Ireland) | wilkino@tcd.ie

The international humanitarian community, although it includes organisations with a faith-based background, operates in a mainly secularised manner. Organisations originating from largely secularised countries work in more religiously centred cultures worldwide. The post-disaster environment can be a meeting point of secular and religious perspectives unlike any other. It provides a place for the religious and the secular to collaborate, which can lead to opportunities as well as challenges for those providing and receiving assistance. Typhoon Haiyan made landfall in the Philippines on 8th November 2013 and followed a course over the Visayan region of the country. Over 6000 were killed, 4 million displaced, and 14 million affected. The international community responded quickly with organisations arriving in the most affected areas in the following days and weeks. This paper examines the ways in which divides between the
international and the local were affected by secular and religious viewpoints in this context. The population of the Visayan region regularly identifies as over 95% Roman Catholic or belonging to other Christian denominations. The opinions of national and local staff members employed by international humanitarian organisations show they are often the people relied upon to bridge any divides that may arise. Based on interviews with staff working for a range of organisations, the paper demonstrates the ways in which the space between different secular and religious viewpoints is negotiated and the effects this has on local and national staff.

Inter-professional encounters in crisis situations
Erna V. DANIELSSON (Mid Sweden University, Sweden) | ernadanielsson@miun.se
Roine JOHANSSON (Mid Sweden University, Sweden) | roine.johansson@miun.se

All accidents and crises do not happen in public places. Sometimes they occur in ‘private’ places, such as schools. In such cases, emergency response organizations work at incident sites located at other people’s workplaces. The aim of this study is to investigate the relationship between professionals of two workplaces, when one workplace (the incident site) is temporarily organized at another, permanent workplace (a school or a special home for the elderly). This means that new activities are temporarily organized, by newcomers, on somebody else’s home ground. Our focus is on the relation between ‘the established’ and ‘the newcomers’. The data consist of interviews on handling crisis situations, made with rescue workers and personnel at schools and elderly care centers. In the present study, mutual adaptation between the two groups occurred, resulting primarily in parallelism; both groups worked independently of each other, and both groups tried to manage the crisis situation, but in different ways. Emergency response personnel trying to eliminate the immediate cause of the crisis, and school and elderly care personnel trying to maintain their normal functions in an unknown situation by adapting their task performance. Even though parallelism between the two groups was the dominant pattern, it was also the case that the direct crisis management of the emergency personnel took precedence over the indirect crisis management of school and elderly care personnel, e.g., when the school and elderly care personnel left their workplace in the hands of the rescue workers.

Effects of Disaster Types and Lifestyle on Expected Information Seeking Behavior in Disasters
Katja SCHULZE (Freie Universität Berlin, Germany) | katja.schulze@fu-berlin.de
Daniel F. LORENZ (Freie Universität Berlin, Germany) | daniel.lorenz@fu-berlin.de
Martin VOSS (Freie Universität Berlin, Germany) | martin.voss@fu-berlin.de

Through which channel people receive and search for information during disasters is crucial for understanding how they process information and take means of action. People seek information so as to reach a better understanding of the situation including the danger they are in and to make an informed decision. Previous studies have concentrated on the channels used for information seeking and in doing so, identified variables such as gender, age or ethnicity through investigating only one disaster at a time. This focus on one disaster at a time in turn has had the consequence of an underappreciating of the effect which different disaster types have on information seeking. An analysis which combines the results of different disaster events and questions how lifestyle influences the information seeking process remains to be undertaken. This presentation seeks to answer these questions, and as such, focuses on the expected active information seeking process in disasters. As part of the project ENSURE – Enablement of
Urban Citizen Support for Crisis Response – 1,006 people in a representative sampling were interviewed regarding their expected behavior in two disasters. Using a Latent Class Analysis we were able to identify different types of information seekers depending on the expected channels used in the scenarios. We moreover explore the impact of lifestyle and other person related variables on channel selection and their implications. Additionally, we demonstrate that the need for information seeking and the channels used are related to other expected behaviors during disasters.

Requirements for severe weather warnings for civil protection and emergency management authorities
Thomas KOX (Freie Universität Berlin, Germany) | thomas.kox@fu-berlin.de

Classical meteorological severe weather warnings in Germany (and in most parts of Europe) are not tailored to the needs of specific users. But end-users of severe weather warnings, neither the general public nor such a sophisticated group as civil protection and emergency management, are not a homogeneous group (Doswell 2003). Users vary considerably in their individual perceptions and capabilities, their institutional requirements and legal frameworks (Kox et al. 2014).

In order to communicate weather warnings more effectively it is necessary to determine such influences. Thus, a framework was developed to reconstruct the requirements members of civil protection and emergency management have for weather warnings.

The research was based on data obtained from observations of fire department control centers, and from semi-structured interviews with representatives from different civil protection and emergency management authorities (fire fighters, police, and state and local authorities). The data revealed the importance of dealing with uncertainty in warnings, the role of lead times and thresholds for decision making as well as non evident and implicit principles of action.

Landscape up in smoke
Andrew BUTLER (Swedish University of Agricultural Sciences, Sweden) | andrew.butler@slu.se
Ingrid SARLOV HERLIN (Swedish University of Agricultural Sciences, Sweden) | ingrid.sarlov-herlin@slu.se
Igor KNEZ (Högskolan i Gävle) | igor.knez@hig.se
Elin ÅNGMAN (Swedish University of Agricultural Sciences, Sweden) | elin.angman@slu.se
Åsa SANG (Swedish University of Agricultural Sciences, Sweden) | asa.sang@slu.se
Ann ÅKERSKOG (Swedish University of Agricultural Sciences, Sweden) | ann.akerskog@slu.se

The focus of this paper is the research project “Landscape up in smoke”. This project examines the forest fire which occurred in the county of Västmanland in central Sweden in 2014 which constituted the largest forest fire in Sweden in modern times, 14,000ha. The aim of this project is to reveal how people’s relationship to their landscape, changes when their environment is ravaged by a catastrophic event; how landscape related identity, recognised as a psychosociological perception of a place defined in spatial-cultural space, is affected by drastic change. These changes result is not only a loss of identity, but also the development of new identities. These new identities are bound up in both the fire as a catastrophic event and the new geography which the event created. This new geography is created through new boundaries (the fire area) and the destruction of old boundaries (forest compartments etc.), landmarks, routes and the alteration of perceived distance. This change creates the space for new identities, albeit identities where conflicts need to be renegotiated and losses reconciled. This paper sets out our theoretical standpoint, revolving around ideas of landscape, and place identity; and also outlining the methodological approach where both qualitative and quantitative
methods are incorporated in order to develop an understanding of how individuals and communities relations to the landscape have altered.

How do religion and socio-spatial conditions affect adaption process to climate change? Empirical evidence from southwest coastal Bangladesh

Zakia SULTANA (Khulna University, Bangladesh) | torri_ku@yahoo.com
Bishawjit MALLICK (Vanderbilt University, TN, USA) | bishawjit.mallick@vanderbilt.edu

Emergency managers as well as disaster planners have to consider the ‘local knowledge’ for implementing programs. Therefore, it is necessary to know: which role do socio-spatial, religious and cultural differences play in handling with climate change consequences? To answer this question, the shared knowledge of different NGOs and experts of spatial planning was analyzed. An in-depth interview method was employed to assess existing hazards and disasters as well as adequate measures to cope with them. This research investigate how the socio-spatial perceptions are interconnected with religious variable and how it affects the adaption process. 380 households from 12 villages in Satkhira district of Bangladesh were randomly selected amongst the cyclone Aila (2007) victims and they interviewed on their adaption strategies to cope with cyclone. The core arguments are based on cultural anthropology and results are presented with focus on disaster management strategies by different socio-spatial and religious group. Different adaptation strategies are mentionable: (1) protection of land and homestead from saline intrusion (by raising homestead-ground or by construction of embankment and other technical measures); (2) taking refuge (Muslims women were not comfortable to take refuge at a public place, like cyclone shelter); (3) planned rehabilitation (i.e. construction of roof by CI sheet was not preferable); etc. Since different options exist, stakeholder assessments of adequate strategies might also differ. Therefore, a Qualitative Comparative Analysis (QCA) was applied to explore how different aspects of socio-spatially and religiously were interconnected with strategies of adaption.

Is post intervention process in Kosovo a success story?

Zeynep Selin ACAR (Ege University, Turkey) | zeynep.selin.acar@ege.edu.tr
Altug GÜNAL (Ege University, Turkey) | altug.gunal@ege.edu.tr

The way to reach international peace &order in interest-run states system is to find a possible roof for acceptable rule of law in order to stop the civil wars and conflicts. As many times the only way to cease the conflicts between especially ethnic groups in one state had been the humanitarian intervention, a more important question came to the surface: what happens to the ex-inequalities in the post-intervention period. Together with no-rules-system, humanitarian intervention has been creating different effects on the people in conflictual regions. In this context, finding a way to build a more secure world with limited conflicts becomes dependent to what appears to be successful in the minds of people.

In this regard, as one of the most problematic interventions was carried out by NATO in Kosovo in 1999, the post-intervention period there is a great example to lead the way on what might be called “successful” post-conflict era. As the conflict and intervention came afterwards-it eventually happened to end with independence of Kosovo from Serbia, it should be examined from the eyes of its people who is most affected by both conflict and intervention, ethnic Albanians and ethnic Serbs.

The purpose of this paper is to analyze the sociological outcomes of conflict followed by intervention by examining the two sides of the conflict – ethnic Albanians and ethnic Serbs – and their state of mind considering whether the independence is rightful or not and whether it brings the justice to the people of Kosovo.
RN08S01c - General Session - C

“‘Disaster’ in political discourse: New ways in the exercise of power in Greece under crisis”.
Joanna TSIGANOU (EKKE, Athens, Greece) | jtsiganou@ekke.gr
Maria THANOPOLOU (EKKE, Athens, Greece) | mthano@ekke.gr

As C. W. Mills has argued “it is now the social scientist’s foremost political and intellectual task… to make clear the elements of contemporary uneasiness”. In the contemporary Greek society under crisis, there is evidenced a mounting sense of uneasiness. At the same time public rhetoric and discourse especially in pre-election periods are escalating this sense of uneasiness by invoking threats of social and economic ‘disasters’.

The aim of the proposed paper is to show the multiple ways the notion of ‘disaster’ is used in the public discourse and debate as well as wonder on the relationship existing between such a political discourse and the exercise of power. To this end our paper considers values, symbols and myths related to the ‘collective unconscious’ some of which bring into surface the relationship between religion and power. Our case is built upon qualitative data coming from the Greek experience of the last two national elections (in 2012 and 2015). By analyzing newspaper clippings referring to speeches of the main political actors during the electoral campaigns we are attempting to show how appeals to ‘disasters’ are in fact ‘catastrophic’ in various senses.

We are also interested in examining whether the electoral campaigns in the middle of crisis are led by rational argumentation or they are driven by the management of public fears and social panics.

Media Construction of Crisis: A Conceptual Framework
Johana KOTIŠOVÁ (Masaryk University, Czech Republic) | J.Kotisova@gmail.com

Although Ulrich Beck emphasized the socially constructed and media-defined character of new risks and the disasters that arise from them, i.e. social crises, natural disasters and technological breakdowns, the subtheme of media remained under-theorized. Consequently, sociological research has paid surprisingly little attention to the role of media within the process of defining and constructing new risks and crises. A similar gap exists in the field of media studies: although media researchers have been traditionally interested in mediatisation of war or natural disasters, the research of interrelations of media, risks and crises still remains insufficiently systematic and comprehensive, lacking a conceptual and theoretical framework.

Thus, the theoretical/conceptual paper approaches media as one of disaster infrastructures and deals with mediatisation of crisis. Firstly, I suggest why we need to pay more theoretical attention to media organizations and institutions and to conduct media-oriented sociological research of disasters (perhaps resulting in a special theory of media action within crisis situations). Secondly, the paper discusses conceptual tools capturing different aspects of the interrelation of media and disasters. Building on the concepts of mediatisation, new risks, crisis and its typologies, I address the following questions: how are media organizations plugged into other larger disaster structures? Regarding (media) research, is it fruitful to conceive social crises, technological breakdowns and natural catastrophes as modifications of a general “type”, a crisis situation? What are the specifics of different kinds of crises? Finally, I put forward the conceptualization’s methodological consequences for media-focused research.
Differences in Conflict Perception Among Certain Sociodemographic Groups in Hungary
Péter TÓTH (Széchenyi István University, Hungary) | ptoth@sze.hu

Social differences especially income inequality and the research of its perception became a hot topic recently as a consequence of the strengthening debate generated by the global social movements after the global economic crisis. The worldview presented and drawn by the well-known Kuznets-curve had fallen apart and replaced by a permanent increase in wealth differences model both on global and national level. Hungary and Eastern-Europe are not an exception although the Piketty model deals only with Western European and American data. Hungary and the post-socialist states are in a special position due to the fact that the socialist economic policy and the state organization itself prevented these countries from too wide wealth disparities. Yet the last 25 years of post-socialist era generated similar differences in this field and Hungary caught up with Western-European societies. One the question of our national research that dealt with conflicts and the factors of well-being in Hungarian society was are these processes are perceived at all and are there any differences between the perception of different social groups. Do they feel that the existence of wealth disparities can cause conflicts between Hungarian social groups. Beside the conflicts fueled by wealth disparities we also listed other potential conflict sources related to social disparities, such as, gender, age, education, place of living, ethnic background. Using the reference group theory we could prove that the visibility and the coexistence of other groups reduce the level of how serious certain conflict are seen and interpreted by these groups.

Sociology & The Spirit of Crisis
Francis Le Maitre (University of Constance, Germany) | Francis.le-maitre@uni-konstanz.de

Ever since Comte, sociological scholarship is predicated on the legitimizing image of being the science of crises and conflict. The dealing with crises has attended to the question of how they arise, how they may be prevented through sociological insight, and what role they play for the functioning of our socio-cultural reality. According to A. Weber sociology is a “daughter of crisis“ entering the academic world in the so called saint-simonian time of modernity; a period of change, tremors, uncertainty and unsettledness be it with regard to the political, the economic or the societal order. Even nowadays, we can witness the topos of crisis and conflict as being the ever renewed funding myth of our discipline.

Within my contribution I will show that whilst early sociologist have both attempted to understand the outbreaks of crises in order to cope with these anomic jolts and believed in the eschatology of a cathartic grande crise finale, recent sociological theory mainly regards crisis as a part of a social drama and all the uncertainties accompanied as constitutive for the structuring and the stabilization of the routine of social reality. Herein crises are no more labeled as punctual outbursts but seem to offer an omnipresent model of contemporary social reality. Positing that the routinization of crisis is at the stake of present sociological narrations, I will finally question how this ever-present dystopian corrective of tremors can function as a ‘challenge of reality’ (Baudrillard).
RN08S02a - Post-disaster Recovery: Understanding Social Relationships in the ‘New Normal’ - A

Rebuilding lives post-disaster: An international partnership
Julie DROLET (University of Calgary, Canada) | jdrolet@ucalgary.ca

Disasters such as floods, wildfires, earthquakes, and hurricanes result in devastating human, economic, and environmental impacts. Previous research on disaster social work has focused on the need to prepare social workers in disaster recovery efforts with far less attention paid to the long-term consequences. Social work is increasingly involved in long-term disaster recovery by providing social services, community redevelopment, trauma counseling, psychosocial support, and advice on policy and practice. The "Rebuilding Lives Post-Disaster: Innovative Community Practices for Sustainable Development" is a research partnership that brings together an international research team to investigate long-term disaster recovery in six countries. This presentation will share the research findings that aim to advance knowledge in long-term community-based disaster recovery. Qualitative research methods (e.g., interviews, focus groups, and document analysis) were used to better understand disaster recovery from the perspectives of disaster responders, community leaders, and officials, and individuals and community members directly affected in local communities in Canada, Australia, USA, India, Pakistan and Taiwan. A community-based and international comparative research approach was used to collect in-depth information from individuals, groups, and organizations in communities affected by different types of disasters. The international research partnership aims to create meaningful knowledge of relevance and value to other researchers and academics, policy-makers, and practitioners in order to support disaster risk reduction and resilience in Canada and the global context. The results of the study are of interest to practitioners, educators, researchers, policy-makers, community members, and government officials.

Understanding social relationships in the ‘new normal’: an introduction to unanswered questions
John David TWIGG (University College London, United Kingdom) | j.twigg@ucl.ac.uk

Disaster recovery is relatively under-researched and there are many gaps in the literature. The old notions of disasters as an interruption in development, and recovery as a return to pre-disaster normality, are no longer viable. New insights into recovery processes are emerging, but the empirical evidence is patchy, and as a result we are still some way from establishing broad, coherent theories of recovery. By reviewing the recent literature, this paper seeks to identify the main developments in recovery thinking and some of the key questions that are still awaiting answers. It frames the other, more specific, discussions and presentations in this session.

The discursive politics of recovery
Filipa Joao da Cruz BRANDAO (University of Bristol, United Kingdom) | fb12857@bristol.ac.uk

Recovery is a widely complex process. Using a multidisciplinary approach that ranges from political science, political philosophy, and human geography, this paper aims to shed light upon the way in which myriad perceptions of risk, and the eventual emphasis over disaster and a specific catastrophe, have effectively produced meaning around the practice and management of recovery processes, and what it means to recover. To do so I will consider the discourses surrounding risk, catastrophe, and the way recovery has been managed and conducted.
Sites of catastrophe have become creative spaces where discourses present an intricate concoction of concepts of recovery, memorialization and economical fragility, as well as social exclusion. Therefore these sites offer a fertile terrain to impose new technologies of governmentality, and create new forms of subjectification. Nonetheless they have also become a place for post-political discourses to arise in response to what is said to be a world of uncertainty, insecure by design, which privileges nihilistic prophesies, the impacts of such in the conduction of recovery processes should be addressed. It is by exploring the significance of public discourses, that connect perceptions of catastrophe and recovery, that it is aimed to understand a multitude of changes in the conduction of this process, while also understanding how this has an impact on the lives of those that see in this process a way to regain their ‘normal life’s’.

**RN08S02b - Post-disaster Recovery: Understanding Social Relationships in the ‘New Normal’ - B**

**The dialectics of Resilience: Examining the Trajectories of Recovery through the Spatial Experiences of the 2010 Chilean Earthquake and Tsunami**

Alla VOLKOVA (Central European University, Hungary) | vs.alla@gmail.com

My paper introduces three ethnographies from the Bio Bio region of Chile: the coastal town of Dichato, the port area of Talcahuano and the residential neighbourhood Barrio Cruz of Concepcion and explores the uneven trajectories of recovery in the aftermath of the Chilean’s 2010 earthquake and tsunami.

I suggest shifting the focus from the hegemonic framework of resilience and advocating for a site-specific approach. Another important foundation of my project is the principle that space is not a void waiting to be filled, but an explicit political project. The analytical framework of the research translates ordinary recovery stories and spatial experiences into analytical constructs – affirmative (progress-oriented) and alternative (agency-centered) narratives of recovery and illuminates the processes of social production within the post-disastrous urban fabric. The coincidence of these narratives leads to the important conclusion about the dialectical nature of resilience and demonstrates the existence of multiple resiliences that correspond to different actors, strategies and tactics. This perspective enables to examine patterns that accelerate or constrain the processes of spatial transformation and implies two important considerations. First consideration illuminates the dynamic interaction between recovery and resilience, where the changing power balance between the actors determines the set of scenarios that outline the potential directions of post-disaster recovery efforts.

Second consideration embeds the idea of dialectical resilience into a broader debate on the interrelatedness of the concepts of “emergency”, “disaster” and “catastrophe”, and suggests that each recovery case is a continuous and open-ended dialectical process, inseparable from the everyday human actions.

**Social reconstruction of post conflict region: on the example of Kosovo and Chechen Republic**

Musa Movlievich YUSUPOV (Chechen State University, Russian Federation) | musa_y17@hotmail.com
In interstate and inner state relations the aggravation of social and political contradictions develops into the conflict. Such conflicts have heavy social and humanitarian consequences. On the territory of Kosovo and Chechen Republic there were the confrontations which have entailed destructions of material objects, losses of people. Comparative study of experience of restoration of post-war territory has theoretical and applied value.

Object of research: social reconstruction of post conflict region

Methods: conflict and action approaches, methods of the statistical and sociological analysis were used.

Kosovo and the Chechen Republic have different cultural, social and political history. However on boundary of XXI century something general is seen in them - aspiration to the state independence. The military conflict in Kosovo has come to the end as a result of compulsion by external forces of Kosovo and Yugoslavia to the world. In the Chechen Republic - as a result of suppression by the Federal centre of military resistance. Conflicts were accompanied by occurrence of refugees, infringement of a social order and the humanitarian rights of citizens. Of sociological interest are the peculiarities and way of revival of post-war regions.

Conclusion. In a post conflict region at an initial stage important is the restoration of objects of a municipal and economic infrastructure, material and moral indemnification, medical rehabilitation of the population. On the second - planning of revival and region development. In a context of these processes the sociological judgment of formation of new social communications, structures, inequalities is necessary, for a social distance, minimization of poverty for instability and crisis prevention.

Institutional changes during the reconstruction of Bam after the earthquake of 2003
Ahoura MESKINAZARIAN (PhD King's College London, United Kingdom) | ahoura.azarian@gmail.com

Post-disaster recovery is seen as an opportunity to apply development factors in the affected community, in which the development is defined as a process that improves the level of adaptation of a population to its environment and lowers its level of vulnerability to disruption. Disasters can also institute a new form of governance through informal responses that operate outside of established institutional frameworks which can address pre-disaster vulnerabilities.

This article studies the root causes of the social vulnerability of Bam and examines the role played by the evolution of institutions in the post-earthquake reconstruction period in shaping resilience after the devastating earthquake of 2003. This paper is based on both qualitative and quantitative research undertaken between 2008 and 2011 in Bam. The reconstruction of Bam was planned by state decision makers to be highly centralized and housing focused. The study shows that despite the designed centralized plan, the new habitat was shaped mostly by the new residents based on their needs. They had the power to legitimise, accept or deny the services provided for them. The social and urban structure of Bam changed in order to increase social resilience and reduce the vulnerabilities that were formally and informally embedded in the society: gender biased laws were changed in favor of women, new form of household was defined, and women became socially and financially more active.

RN08S03 - Sociological Imagination, Inequalities and Disaster Resilience: Which Future Connection for a Resilient Society?
Janja MIKULAN (School of Advanced Social Studies, Slovenia) | janja.mikulan@fuds.si
Jasna DJORDJEVIĆ (Independent Consultant in the field of Humanitarian Assistance, Slovenia) | jasna.djordjevic@amis.net

The paper addresses the issue of measuring social vulnerability to natural disasters in Slovenia, since ability to measure it, is increasingly being seen as a key step towards effective disaster resilience (Kasperson et al., 2005). There is a widespread agreement that disasters are not only the result of physical events but the complex interaction between this events and the vulnerability of society, its infrastructure, economy and environment (Birkmann 2006; Cannon et al. 2003). There are different vulnerabilities, however the identification and assessment of social vulnerability are at the forefront of this paper. There is a significant number of concepts and definitions of “social vulnerability”. However the idea that when addressing the “social” the focus is not just the characteristics of individuals but also their relations within wider society. Therefore the paper will apply a broad framework for approaching social vulnerability (Parker et al., 2009). In order to identify critical indicators and their causal combinations of social vulnerability in Slovenia, comparative assessment of social vulnerability to natural disasters between selected Slovenian regions will be made by using a fuzzy-set methodology. Methodology will enable significant communication between theoretical aspects and empirical data and enable not only to know all the different causal combinations linked to an outcome (social vulnerability/resilience) but also to assess their relative empirical weight, something that most studies on vulnerability do not apply. In the second part, the paper will test the validity of indicators on the case study of 2014 floods.

Subjective Vulnerability and the discursive production of (un-)safety in Urban Spaces
Martin VOSS (Free University Berlin, Germany) | martin.voss@fu-berlin.de
Kristina SEIDELSOHN (Free University Berlin, Germany) | kristina.seidelsohn@fu-berlin.de
Daniela KRÜGER (Free University Berlin, Germany) | daniela.krueger@fu-berlin.de

European cities are characterized by a growing social polarization and socio-cultural differentiation and consequently, the capability of urban residents to protect themselves or to resume normality after a large-scale disaster is unequally distributed. Since the current state of research on (social) vulnerability merely analyses the spatial expositions to risks in relation to the social distribution of resources as capability for disaster protection and response, we advocate for the inclusion of the subjective dimension of vulnerability. In other words, previous concepts focus on “objective” or “technical” criteria for vulnerability to identify the susceptibility of individuals or communities (Bankoff et al 2004; Voss 2008). Instead, we will argue that the subjective dimension of vulnerability should be conceptualised as a relevant dimension in the distribution of inhabitants in urban spaces and for the reproduction of social inequalities: feelings of (un-)safety and vulnerability influence processes of residential segregation and determine the development of situational and culturally shaped coping capacities – and vice versa. A milieu-oriented research approach allows for the linking of the subjective dimension of vulnerability and (un-)safety with the social/spatial distribution of resources and capitals (Bourdieu 1987). Furthermore, the approach provides an empirical basis to account for the needs and necessities of the most vulnerable in safety-related discourses, to enhance their “participatory capacity” (Voss 2008), as well as to reduce pre-existing discursively produced inequalities. On the basis of two ongoing case-studies of German Mid-sized cities, we will present empirical findings and conclude on the (re-)production of social inequality in urban spaces.
Imagining and negotiating disaster risks and resilience
Christiane GRINDA (University of Bonn & Cologne University of Applied Sciences, Germany) | christiane.grinda@fh-koeln.de

Finding adequate response to disaster risks or occurring disasters is seen as a challenge in many societies around the globe. Disaster risks are part of public discourse in various spheres of economic, political and social life and the term is used increasingly in order to influence decision making processes. Being understood by the author as social constructs, risks are not only formed in line with people’s different vulnerabilities and capacities, they are moreover constructed intentionally.

Some scientists observed the rise of the fashionable term resilience with caution and highlighted that the concept of vulnerability more adequately took into account the root causes of disasters, including inequality and political notions (Cannon & Mueller-Mahn 2010). Discourses about disaster risks and about resilience reflect ongoing negotiation processes taking place within societies. Negotiations about the right to define these terms comprise struggles concerning the distribution of power.

Presenting empirical research findings from a case study in a flood prone area in the Mexican state of Chiapas, it is the goal of this paper to show how new inequalities are produced using the concepts of disaster risk and resilience for framing and thereby legitimizing a range of interventions from government agencies and private enterprises into rural communities. At the same time, the paper wants to highlight that the concept of resilience, enriched conceptually by approaches of sociological imagination, could be a useful one for defining in a participatory way disaster risks and measures. By discussing theoretical concepts of sociological imagination (Mills 1959) and practice theory (Schatzki 2002) together with findings from qualitative empirical research, this paper wants to show options for developing resilience as a concept and as a practical process. Linking social theory with approaches from human geography and social anthropology, especially visual methods, this paper wants to make a contribution to interdisciplinary research.

Vulnerability and Gender Before and After the disasters: Comparing Experiences From Two Turkish Earthquakes
Sibel KALAYCIO ĞLU (Middle East Technical University, Turkey) | ksibel@metu.edu.tr

Gender equality during disasters is a new topic on which there are not many studies. Most common approaches to disasters involve technical efforts, and search and rescue issues. However social issues and specifically gender perspective is rather rare. We can say that mostly disaster studies and research are gender blind. Vulnerability to natural disasters touches the poor, disadvantaged, dependent groups, who might be more seriously falling at risk. However, women suffer disproportionately during a disaster, whether it is war, famine or a natural disaster like earthquakes and floods. Women’s status before disasters is important. They are generally poorer than men, have little political voice, and are often less mobile for cultural reasons, they do not own land, and are less likely than men to have an education or
access to employment, income and health care. Women are not just victims, they are also survivors who can help countries recover more quickly from natural disasters and conflict. On the other hand, social, economic and political vulnerabilities of women in Turkey during and after disasters depend on the status of women before the disasters. The presentation is based on research about women’s experiences in two past earthquakes in Turkey. The role of non-governmental organizations in the recovery period after the disasters is also discussed. The discussion will be on social support and especially gender based vulnerability is yet a new issue to be understood. However, NGO activities and support have crucial significance for women to be empowered after the disasters. Otherwise vulnerabilities especially for women increase. Widows, elderly, youth and children who lost their relatives, have different needs which require different strategies of support. Hence, there is a big need for developing most sensitive social policies which can support women in the recovery period.

How to build the prevention for the elderly and disabled before of natural disasters. The added social value of voluntary organizations in Europe

Andrea VOLTERRANI (University of Rome Tor Vergata, Italy) | andrea.volterrani@uniroma2.it
Paul WARDENGA (Samaritan International, Deutschland) | p.wardenga@samaritan-international.eu
Markus LEIMEGGER (White Cross, Bozen, Italy) | markus.leimegger@wk-cb.bz.it
Aurelio DUGONI (Anpas, Italy) | aurdugon@gmail.com

In disaster situations, such as floods or earthquakes, the elderly or people with disabilities are particularly vulnerable and require additional attention. However, they are often neglected in existing municipal disaster emergency plans, particularly when such people live alone instead of in a care institution, as their location is often undetermined in disaster situations or the information exists (e.g. if the people receive social services or if neighbours are aware of people in need in their vicinity) but is not structured in a way that is usable for civil protection emergencies. Up-to-date information for helpers and a community that is aware of this particular challenge to disaster relief can alleviate this problem.

The paper presents the first results of the research action carried out by a joint partnership (Universities / voluntary organizations Italian, German and Danish) highlighting:

a) which aspects are relevant to identify the condition of vulnerability of the elderly and disabled
b) how to develop a system to vulnerable people in integrated risk management mechanisms through local networks and volunteers
c) what is the added social value of volunteering in the prevention and support for the elderly and disabled and contribution to strengthening the resilience of local communities

RN08S04 - Infrastructures of Preparedness: Conceptual Issues, Empirical Openings

Social Services in times of disasters– The case of Iceland
Nordic countries are known for their extensive welfare systems and social services but few (Nordic) studies have addressed their roles in times of disasters. The paper asks if and how the the local social services, are prepared for disasters. The welfare state plays an extensive role in mitigating and recovering from disasters but while the emergency response plans and the organization of civil defense do include the health system in their planning, the role of other welfare agencies including the social services is rather unclear. The literature has placed increased emphasis the role of social services that are considered to play a key role in working with vulnerable groups in order to reduce their vulnerability and enhance their resilience. In the study mixed methods are applied: 1) policy analysis, where laws, reports and public records are analysed 2) systematic review of the relevant literature.

How could the implementation of Surveillance Oriented Security Technologies increase personal and national security while preserving and fostering individual liberty? Insights from SurPrise Project

Elvira SANTIAGO (Consejo Superior de Investigaciones Científicas, Spain) | santiagogomezelvira@gmail.com
Vincenzo PAVONE (Consejo Superior de Investigaciones Científicas, Spain) | vincenzo.pavone@csic.es
Sara DEGLI ESPOSTI (ISMS Forum) | sara.degliesposti@gmail.com

The concept of security has undergone multiple reformulations over the past twenty years. The latter approach places a new emphasis on pre-emptive action, anticipation of threats and risk management, and fosters a massive implementation of surveillance-oriented security technologies (SOSTs). These technologies generate a new security infrastructure responsible for ensuring the safety of citizens and the considered “risk infrastructures” such as hospitals, ports, research centres, military bases, etc. Given their value to our societies, these infrastructures must be protected and at the same time are the focus of threat. The problem arises in the paradox that these surveillance oriented security technologies are focused on the improvement of security but at the same time, become in a new source of weakness and vulnerability. Surprise project evaluates the effectiveness and acceptance of security technologies in two ways: first, Surprise (FP7) highlights the fragility of these technologies and therefore the fragility of the infrastructures that trying to protect, and, second, Surprise tries to prevent these technologies damage the rights of citizens. Involving more than 1100 European citizens across 9 countries, the results of the Surprise project presented in this paper contain the keys to ensure that these technologies are designed and implemented in a manner that protects risk infrastructures while being respectful of social values and requirement. These outcomes not only question current policy measures inspired by the trade-off, they also suggest new, socially responsible ways to increase security while preserving and fostering individual liberty.

Politics of Difference. Sociopolitical Issues Disguised as Natural Disasters in a Middle Size City in Mexico

Frida GÜIZA (Universidad Nacional Autonoma de Mexico, Mexico) | frida.ciga@gmail.com

This paper offers an in depth view of an urban microuniverse revealed when hazards threaten and disasters strikes in a periurban site, within a midsize city in Mexico. We demonstrate the production of vulnerability in the urbanscape as the result of long socio political and
environmental transformations. Some scholars in the field claim that urban environmental degradation is an extension of political power, and different social inequities emerge soon after a disastrous episode occurs. Our aim is to illustrate the relationship of vulnerability, and the current urban trend in Mexico impelling people to inhabit interstitial hazardous places. This case illustrates the extreme negative effects of a dislocated and fragmented model of urban growth prompted by the neoliberal trend. This flood prone place, exhibits intricate social, political and environmental conditions that render people vulnerable to hazards and disasters. This study is oriented to uncover understandings and rationales of two different communities within one geographical space. We highlight the unforeseen material and immaterial factors, institutional arrangements, as well as vulnerable dwellers’ adaptive strategies making them to endure in the site. We make use of ideas from political ecology on natural disasters, and sociopolitical explanations of urban expansion. We found that the essential driver for the people to live in the flood-prone slum is to achieve plot security rights; even if only suffering from disasters brings the possibility of achieving their owner property aims. Slum dwellers, try to find different strategies: property legalization based on political mobilization and financial support from the government, resettlement with no certainties, or at least remaining in the slum until better conditions can emerge.

**RN08S05 - Energy Resilience Politics**

**A network approach to households’ role in electricity and ICT breakdowns**

Nina HEIDENSTRØM (National Institute for Consumer Research, Norway) | ninah@sifo.no
Ardis STORM-MATHISEN (National Institute for Consumer Research, Norway) | ardis.storm-mathisen@sifo.no

Electricity and digital infrastructures are crucial in modern living, even short outages may have major consequences affecting basic needs such as heating, water supply, food storage, cooking and internet- and telecommunication. In this paper, we examine the role of households in two recent disasters in Norway, a storm and a fire, which caused long-term electricity outages. Drawing on tools from practice and actor-network theory we see the household as a specific sociality with certain practical and moral qualities and resources. To investigate how household qualities and resources played a role in risk management practices weee investigate what social and material networks households were part of during the occurred events, and how these were utilized to deal with the lack of electricity and communication. The data was gathered through post event fieldwork consisting of on-site reconstructive and reflecting video-tour interviews with affected households and relevant actors, photo assisted observation of the affected areas, supplemented with document analysis of media coverage and evaluation reports of the event. Findings suggest that household qualities and resources do affect risk management practices in various ways and that a better understanding of the mechanisms at play are vital to grasp in order to understand risk management practices and what can be done to improve them.

**Security and Risk in a Liberalized Electricity Infrastructure: Does Competition Compromise Resilience?**

Antti SILVAST (Princeton University, United States of America) | antti.silvast@iki.fi

During the past decades, large societal infrastructures such as electricity networks, gas, water supply, and telecommunications have been increasingly opened up to competition on international markets. This has been driven by several related aims: streamlining activities, improving efficiency, and increasing transparency among industries that operated as natural
monopolies before. However, a number of criticisms, many of them by social scientists, have stated the harmful effects of market competition. Specifically, increasing competition between different providers can compromise infrastructural resilience: If market liberalization increases complexity and interconnections in infrastructure systems, then their high-consequence, low-probability failures become almost inevitable according to the sociological Normal Accidents argument. However, even if these systems were more prone to accidents than before, their reliable management can still mitigate risks according to another popular counter-argument (called High Reliability Theory). My paper interrogates these theories and explanations empirically by drawing from fault statistics of the Finnish electricity supply system between 1958 and 2013, published by the policy association Finnish Energy Industries (formerly Finnish Electricity Association), and running through the Finnish electricity market liberalization in 1995. Measuring energy system resilience through how long it takes for the customer electricity supply to be restored after disturbances, I present a longitudinal exploration of how different risks emerged in the increasingly internationally-connected and market-based electricity supply infrastructures. Specific emphasis is laid on the difference between city and country-side infrastructures, cross-border energy trading, weather events, and diffusion of renewable energy generation, all factors in electricity supply reliability according to recent academic and political discussions.

Existing studies underscore several types of potential problems in a liberalized electricity infrastructure. The most general argument states it is systems as such that provoke critical breakdowns: Being a very tightly coupled and complex system, failures are inherent to any large-scale power grid. This sociological Normal Accidents perspective is however utilized in more depth by acknowledging contemporary changes in energy systems. It is now widely agreed by organizational scholars, but also by the energy industries at least in Europe that the deregulation of energy systems can have problematic effects. Specifically, in some exceptional cases, it can lead to volatile market transactions that the electricity transmission infrastructure was not originally designed for. On average, international collaboration raises efficiency and reliability among local energy companies; yet, according to its critics, it creates the risk of wide-ranging and uncertain failures that can cascade from one national system to another.

An initial look into the Finnish electricity reliability statistics seems to support the above critical discussions rather directly. After World War II, the system was operated mainly by municipalities and the state and was centrally planned from 1980 through 1995. The statistics suggest a constant improvement in reliability until the Finnish electricity market liberalization in 1995. During the liberalization though beginning already in the 1980s, the volume of cross-border energy trading with Sweden, Russia, later Estonia, and to a lesser extent Norway has raised significantly. The amount of energy generated from renewable sources has also grown since the early 2000s, though with the exception of biofuels and hydro power the Finnish renewable generation remains modest compared to most other industrialized European countries. After 1995 in the statistics, the duration of electricity supply failures begins to grow noticeably especially in what is understood as the Finnish country-side. This includes a number of difficult years such as 2001, 2013, and especially 2011, when country-side electricity reliability worsened to levels previously experienced in the late 1950s.

The first part of my paper subjects the historical reliability data to a more systematic statistical analysis. It asks whether the faults occurred in different years could be considered random events or whether there is measured correspondence between liberalization and energy quality. Yearly measured data of electricity interruption durations from 1958 to 2013 is used to address this question on the general level. Then, the number of electricity interruptions per each day of the year from 2004 to 2013 (where data exists) is analyzed in depth in order to find more nuanced trends over these ten years.

Biomass crop production in Greece: Constraints and future recommendations
Eugenia PETROPOULOU (University of Crete, Department of Sociology, Greece) | petrope@uoc.gr  
Vasiliki PETOUSI (University of Crete, Department of Sociology, Greece) | petousiv@uoc.gr  
Costas ILIOPOULOS (Agricultural Economics Research Institute, Greece) |

Bioenergy is attracting a great deal of attention from science and society. The ‘discourse on potential opportunities and risks has increasingly propelled bioenergy high onto the legislative and policy making agendas of governments around the world’ (Morgera et al., 2009, 12). The adoption of bioenergy resources include not only the prospects of contributing to mitigating climate change but also fostering rural development and enhancing the security of the energy supply through reducing dependency on fossil fuel resources (Pons, 2008). Studies of the public understanding of environmental issues have demonstrated that there is often a gap between peoples’ opinions and actions (Grob, 1995). The reasons for this vary, possibly because many environmental problems are characterized by complexity, risk and uncertainty, often being global in character and with effects that are distant in time and space (Nicholson-Cole, 2005). This paper aims to address the social, economic and political context/framework; that is the motivational factors or barriers that lead to the acceptance or rejection of the production and use of bio-energy crops by producers and various other stakeholders. The underlying hypothesis is that acceptance or rejection of the production and use of bio-energy crops is associated with economic and financial considerations, socio-ethical and environmental factors and the overall value system of producers and other stakeholders, etc. The current research is a combination of desktop and field research. It includes primary data collection from focus group research conducted in an agricultural region in Central Greece with a long agricultural tradition.

RN08S06 - Too Little or Too Much as a Leading Cause of 'Natural' Disasters

Exploring too much water related to community resilience: two Italian case studies. Sardinia flooding in November 2013 and Genoa flooding in October 2014
Barbara LUCINI (Catholic University of Sacred Heart, Italy) | barbara.lucini@unicatt.it

Italy has always been stricken by different natural phenomena such as earthquakes, storms and also floods. These last events are relevant causes of losses, damages and injuries provoking social, institutional, political and economic collapses where they have occurred. Specifically, two dramatic Italian floods took place around the Sardinia town of Olbia on 17-19 November 2013 and in Genoa on 9-10 October 2014. These are two interesting case studies on floods due to their specific social impact, crisis communication, disaster management and disaster resilience practices, taking into account their different geographical areas, communities and institutional systems. A secondary data analysis of these two critical events has been conducted considering the theoretical principles of visual sociology, while a methodological framework has been adopted according to the principles of the secondary data analysis itself. The data collected originated from the consideration and analysis of assorted sources such as pictures, videos taken from various websites and the national newspaper coverage. What has emerged from this analysis is a unique picture for each of the events, that are able to tell us, on a multidimensional level, the disaster phases, the resilient response of the affected communities which had to face the risks and vulnerabilities during the events and the representations that the online sources gave to the general public.
These empirical findings are very significant within the disaster resilience process, making a new reflection possible on future resilient practices in terms of risk communication and its resilience and their roles during the preventive phase.

The „Himalayan Tsunami“: Disasters and Catastrophes as a result of conflicts
Cordula DITTMER (Freie Universität Berlin, Germany) | cordula.dittmer@fu-berlin.de
Lena BLEDAU (Freie Universität Berlin, Germany) | lenabledau@gmx.de
Martin VOSS (Freie Universität Berlin, Germany) | martin.voss@fu-berlin.de

In June 2013 60 hours of extreme rainfall triggered devastating landslides and massive flooding in the state of Uttarakhand, India. Around 5,700 people lost their lives. For some actors the flood was simply a natural disaster, but the tremendous damages to infrastructure and the huge amount of lives lost raised questions to the guilt and responsibility of man: The huge construction projects of energy companies building dams in the vulnerable Himalayan environment, uncontrolled interventions on riverbeds for the construction of hotels and resorts for the massive increase of pilgrim tourism of the growing Indian middle class, as well as missing evacuation plans and early-warning-systems were considered to be important “manmade” causes. Within this paper we will discuss this disaster as an ideal type of disasters in the 21st century that are neither purely “social” nor “natural,” but rather are the consequence of conflicts between social actors entangled in changing biophysical and social environments who mobilizing environmental, economic, material, social, cultural, and particularly also religious resources to push their socially construed interests. As an unwanted but systemic side effect, these conflicts have devastating consequences for the most vulnerable: the “subaltern.” This paper bases its work on the theoretical and empirical considerations of cultures of catastrophes as developed in two Indian-German-research-projects at the Disaster Research Unit (DRU), Berlin.

From reactive spatial planning to... what? Comparative analysis between Belgium, France, Netherlands and Poland
Jakub LEWANDOWSKI (Institute for Agricultural and Forest Environment, Poland) | jakub.lewandowski22@gmail.com
Marleen VAN RIJSWICK (Utrecht University School of Law, Netherlands) | h.vanrijswick@uu.nl
Lisa LEVY (University Francois Rebelais of Tours, France) | lisa.levy@univ-tours.fr
Herman Kasper GLISSEN (Utrecht University School of Law, Netherlands) | H.K.Gilissen@uu.nl
Jean-Christophe BEyers (Katholieke Universiteit Leuven, Belgium) | jeanchristophe.beyers@law.kuleuven.be
Piotr MATCZAK (Institute for Agricultural and Forest Environment, Poland; Adam Mickiewicz University, Poland) | matczak@amu.edu.pl
Adam CHORYŃSKI (Institute for Agricultural and Forest Environment, Poland) | adam@swarzedz.net.pl

Transition from infrastructure-oriented flood risk management towards non-technical one is presented as a promising paradigm shift (Hartmann, Driessen 2013). Spatial planning measures are perceived as effective for reducing flood vulnerability and contributing to flood risk mitigation (Fleischhauer 2008). There are two problems that need to be taken into account: dichotomy in adaptation-mitigation research approaches that analyse the role of spatial planning (Biesbroek 2009), and different scales and times as an endogenous features of the local context shape spatial planning (Albrechts 2003; Lloyd 2010).
Several attempts have been made to use concept of ‘proactive spatial planning’ but they vary from the perspective used and scope of the analysis (Bulkeley 2006, Carter 2007). We then propose three social learning cycles to analyse changes in spatial planning. By combining four
dimensions of Policy Arrangement Approach (actors, rules, resources, discourses) (Liefferink 2006) and social learning framework (Pahl-Wostl et. al 2009), main aim of this paper is to find whether shifts in reactive (from incremental, through reframing, to transformative) spatial planning are observed (and what factors contribute or constrain these shifts).

Basing on more than 130 interviews with various stakeholders, policy analysis and legal expertise conducted for STAR-FLOOD project, our research aim is twofold. Firstly, we examine whether combining PAA dimensions and social learning framework is useful for comparison purposes. Secondly, through the lenses of this combination, whether similarities and differences in spatial planning’ changes between different countries can be observed. Comparative analysis will be based on experiences from 4 European countries (Belgium France, Netherlands and Poland).

Institutional fragmentation and continuity in the context of periodic urban disasters
Katarina SOLTESOVA (University College London, United Kingdom) | katarina.soltesova@gmail.com

Disaster research in developing countries cities addresses predominantly large one-off events. This paper enquires about periodic disasters taking place in the urban context. I investigate the linkages between institutions related to urban planning and those which have been created to respond to long-term disaster risk. I elaborate on the dynamics between institutional scales at which fragmentation and continuity appear as complementary.

The paper is based on an empirical case of periodic flooding and permanent water-logging in the informal suburbs of Dakar, Senegal. I examine the nexus between two institutions the mandates of which widely differ. For the past 25 years, neighbourhood upgrading and land titling programmes have been, with little effect, governed by one set of actors. A different network of actors has developed over the past decade through sustained response to periodic flooding which has been occurring in many of the informal neighbourhoods. A study focus on community-based disaster risk reduction brings to the fore important linkages between these sets of actors.

RN08S07a - Social Inequalities, Demographic Diversity and the Well-being of Families in Europe in the Context of the Economic Crisis: Patterns and Common Challenges - A

Social inequalities in Greece under the impact of the economic crisis. Challenges for the adoption a new European Social Model
Nikos SARRIS (National Centre for Social Research, Greece) | nsarris@ath.forthnet.gr

Since 2008 Greece has been severely hit by the current crisis. The need for fiscal consolidation has had significant impacts both on the economy and the social situation. Austerity measures implemented by the Greek government, rising unemployment rates, cuts in salaries, pensions and social spending resulted in a growing number of people living under the poverty line. The historical high level of unemployment, long-term unemployment and youth unemployment constitute key factors for severe poverty and social exclusion.

With an indicative reference to unemployment and poverty rates, the aim of the paper is to present how the economic recession has contributed to an increase in the existing social
inequalities giving a focus to discrimination issues, especially in the Greek labour market through the Greek Ombudsman’s annual reports. It also explores the question whether the economic crisis has affected the dynamics of family formation through the number of marriages and divorces and the issue of migration.

The necessary intervention of the European Union in social and employment policies for the reinforcement of social cohesion are examined especially after the announcement of the new European Commission's initiative under the Agenda for Jobs, Growth, Fairness and Democratic Change to tackle as priority issues the unemployment and migration. Does this constitute an effort for the adoption of a new European Social Model?

In-group affiliation as a strategy to cope with employment opportunities: Self-employed Roma and Muslim immigrants in Greece
Katerina ILIOU (National Centre for Social Research, Greece) | kiliou@ekke.gr

The proposed paper focuses on the impact of economic crisis and the deterioration of social inequalities in employment opportunities for two vulnerable groups, Roma and Muslim immigrants in Greece. These groups appear to lose the level of social inclusion that have achieved through entrepreneurship and self-employment (a rather thriving sector in this country before the advent of the current crisis). We present the results of a field research conducted in 2014 in Greece under the title “Combating discrimination in the field of entrepreneurship: Women and young Roma and Muslim immigrants” (funded by the European Commission). We test the relationship between “vocational activation” and: 1) “job satisfaction” and 2) “discrimination perception” (perceived discrimination against in-group and personal discrimination). These two factors are tested as mediators for predicting “in-group affiliation” (solidarity with family members and/or in-group). We investigate how “job satisfaction” and “perceived inequalities” may motivate members of vulnerable social groups to engage in introvert strategies such as in-group favoritism in order to cope with economic recession and professional survival. Aspects of Social Identity Theory provide a theoretical background for answering research questions.

During the years of high unemployment rates strategies that persons develop in order to cope with inequalities and discrimination are of high interest. Social indicators in Greece depict the increased risk for social destabilization. Present paper attempts to highlight how vulnerable groups achieve to survive in a mutable socio-economic environment and which strategies may ensure social stability and cohesion.

Demography and poverty: How Europe’s changing population will impact on poverty
Dionyssis BALOURDOS (National Centre for Social Research, Greece) | dbalourdos@ekke.gr

This paper focuses on the interrelationships between population, family structure and poverty among European countries and on how social policy can best address poverty in the family institution. Sections of the population most at risk of poverty include the children, one earner households, elderly and migrants, as well as elderly women and single heads of households. Key issues include the fact that in many countries parenthood is starting at a later average age, also that marriages are less stable and divorces more frequent, that highest shares of young adults live with their parents and finally that cohabitation without marriage and single-parent households are increasingly common.

Household demographics, also including the average number of earners per household age, sex and education of householders are all very highly correlated with household income and the risk of poverty.
The main research question is which families or households structures are most vulnerable to fall into poverty in Europe. Can family networks in the countries affected by the crisis efficiently complement the basic form of protection against poverty?

The presentation, using data from the EU-SILC survey, is based mainly on descriptive and comparative analysis, on appropriate indices, trends and policy prospects. The data shows that in several countries children and active-age people are more at risk of poverty or are materially deprived than elderly people, while the household structure is a major driver of income inequality and poverty.

Demographic characteristics of poverty in Athens Municipality
Maria PETRAKI (University of Athens, Greece) | mariapet21@yahoo.gr

This paper examines the social and economic factors affecting the risk of poverty in the Municipality of Athens. We used data from the sample survey conducted from the University of Athens at the second half of 2012 to a random sample of 800 households. The sampling design was based on the partition of Athens into seven (7) standard administrative sub-regions or geographical zones corresponding to certain groups of building blocks or squares (nh). In a first stage, from any ultimate geographical stratum, say stratum h, nh primary units were drawn (where the number nh of draws was approximately proportional to the population size Xh of the stratum (number of households according to the last population census of the year 2001).

In a second stage from each primary sampling unit (selected area) the sample of ultimate units (households) is randomly selected. Actually, in the second stage we draw a sample of dwellings.

The sample survey is based on face to face interviews.

One difficulty is specific for some section of the population. This is for example the case for young people aged from 16 to 24 years. Transfers within families are very difficult to measure, meaning financial help given by parents to their children for completing their studies or finding their first employment. We also do take students into account: students are taken into account with however no possibility of determining the family-internal transfers.

Briefly, the paper is divided into two parts. The first part is concerned with the description of selected methodological aspect of the data used and the at-risk-of-poverty rate; the second part presents the poverty risk groups mostly affected by the financial crisis and the main conclusions. It also underlines the significant importance of material deprivation and the so-called secondary poverty indicators (poverty at different threshold levels).

Besides qualitative research were being conducted with key informants and stakeholders in the municipality of Athens. Thus composite methodological framework is part of a more comprehensive framework which is going to be applied both for data collection and analysis as well as for policy design and evaluation.

Regarding the theoretical framework, the analysis is based on the examination of the types of causes of poverty at local level.

A. Individual
Poverty is explained by individual circumstances and/or characteristics of poor people. Some examples are:
• amount of education, skill, experience, intelligence.
• health, sex, age.
• work orientation, culture of poverty.
• discrimination, etc.

B. Aggregate
There are two types of aggregate poverty theory: case and generic. There is no agreement on what is the correct explanation of most poverty.

1. Case. Add up all poverty explained by individual theories, and that is equal to total or aggregate poverty. In other words, according to case theories of poverty, individual and aggregate explanations are really the same. According to these theories, aggregate poverty is just the sum of individual poverty.

2. Generic. Poverty is explained by general, economy-wide problems, such as
   • inadequate non-poverty employment opportunities
   • inadequate overall demand (macro problems, macro policy)
   • low national income (Less Developed Country)

If generic theories are correct, poverty is caused by one set of forces (general, economy-wide problems) but distributed according to individual theories.

This perspective poverty is being based on a recession cycle and is being examined under circumstances of high unemployment rates, decreasing national and lowering social expenditures.

The research questions are as follows: What is the extent and depth of poverty in Athens municipality? Which are the risk groups with respect to age, sex, marital status and household size and composition? Among them who are the most affected by the crisis? Are there any differences between poverty rate in Athens municipality and the total population in Greece?

The data analysis is based on simple distributions as well as relative quantitative indicators and qualitative analyses. In particular, it reveals that the risk of poverty in Athens is high, but lower than that of the whole country (2013: 23.1%) while children, the elderly, older women and single-person households are the most vulnerable.

Overall, the poverty profile presented in this paper reveals that poverty in Athens Municipality has important demographic and socio-economic dimensions that are in line with the findings of other poverty studies in Greece. On the one hand, poverty rates are quite low among the well educated and among those who participate in the labour market. On the other hand, poverty increases with age and with household size.

More precisely, the main conclusion of the previous analysis is that both poverty and deprivation constitute a serious problem for the population living in Athens. The at risk-of-poverty population comprises:
   • The unemployed persons
   • People with primary education
   • Persons aged 65+ years
   • People living in rented household
   • Households with large size four or more than five members
   • The retired (27.4%) and other inactive persons
   • Households without working members and large size
   • Children aged 0-17 years

Note that the data concerning household living conditions in Greece is limited. They are provided by the Greek Statistical Authority at national level or at broader regional categories. Thus the added value of the survey is the estimation of poverty indices and the analysis of poverty at local level.

Finally, as social expenditure are limited because of the crisis, the survey demonstrates that targeted policies at the local level are necessary to relief groups below the poverty line and those affected by the economic downturn.

Keywords: poverty, high risk groups, demography, household composition.
RN08S07b - Social Inequalities, Demographic Diversity and the Well-being of Families in Europe in the Context of the Economic Crisis: Patterns and Common Challenges - B

Assessing social vulnerabilities under the current socioeconomic conjecture: quantitative and qualitative findings in health and labour market status across the EU and within Greece

Olympia KAMINIOTI (National Institute of Labour and Human Resources, Greece) | o.kaminioti@eiead.gr
Dimitra KONDYLI (National Centre for Social Research, Greece) | dkondyli@ekke.gr

One of the main issues investigated in the paper is whether the current socioeconomic conjecture stabilized or altered existing inequalities in European societies. We focus on labour market and health status; these two aspects are first examined separately from each other and then the interplay between the two is investigated. An integrated methodological approach is chosen, combining quantitative and qualitative methods. More specifically, quantitative methods are used to assess inequalities across Europe and within Greece, analysing Eurostat data and Labour Force Survey data for Greece. Supplementary, qualitative data from a small number of in-depth interviews elucidate the meanings, causes and effects of inequalities in health and labour market status (employment, unemployment, inactivity) within Greece. Results show how vulnerabilities in the labour market status reinforce vulnerabilities in health status nourishing a cycle of negative results both at the personal and social level, arising great policy challenges for overturning existing trends. Moreover, inequalities in these two aspects seem to exacerbate inequalities in other aspects of social life such as education, family planning, etc. A main question is the identification of resilient factors in terms of social and economic resources. Concluding remarks concentrate on disaster-resilient policy suggestions in the two areas of interest.

Perceived impact of economic crisis in Hungary: social and economic differences and inequalities

Gábor JELENFI (MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary) | jelenfi@gmail.com
Gábor HAJDU (Institute for Sociology, Hungarian Academy of Sciences, Hungary; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary) | hajdu.gabor@tk.mta.hu

The aim of our research is to examine the impact of economic crises started in 2008 on Hungarian families. Using a large scale Hungarian, nationally representative survey conducted in 2014 (n=3000), we have data on perceived impact of the crisis on Hungarian families: from increasing cost of living to losing job or forcing to work abroad. We also have data on the potential coping options that individuals think they can use to rise above the difficulties caused by the economic crisis.

With this two sets of questions we are able to get a picture about the impact and depth of impact of economic crises perceived by Hungarians. Second, we will also show how the perceived impact of the crisis and the range of coping options are varying by social status, demographic characteristics and economic differences. Third, we will explore the association between these variables and subjective evaluation of future (e.g. economic situation of the household, subjective well-being).
Our results shed light on how social and economic differences and inequalities moderate the impact of economic crises, thus they might provide important implications for social policy.

The Subjective Experiences of Three Generations during the Greek Economic Crisis
Athanasia CHALARI (University of Worcester, United Kingdom) | a.chalari@worc.ac.uk

The aim of this study is to investigate how Greeks as individuals experience the ways society is changing and to understand the lived experiences of the Greek economic crisis, as an example of the global economic crisis. This study focuses on the ways three different generations experience the Greek crisis: the younger (20-30), the middle (30-40) and the older (40-55) by examining the different ways that lived experiences are revealed. It has been confirmed that the impact of the dramatic economic, political, historical and social transformations in Greece is twofold: there has been an undeniably negative and harmful effect on Greeks’ everyday lives as well as a re-prioritisation of ways of thinking, acting and behaving. The Greek case serves as an example of a society that is currently undergoing significant social, political and economic alterations reflected in the dramatic change in everyday living, thinking and acting. This study may provide an initial overview of the possible effect of social changes that individuals have to confront in their everyday lives due to the consequences of the economic depression.

RN09S01 - Theoretical Perspectives in Economic Sociology I

The Social mechanisms of market coordination
Jukka Olavi GRONOW (University of Helsinki, Finland) | Jukka.Gronow@Helsinki.fi

In Valuing the Unique (2010) Lucien Karpik suggested that the markets of singularities always rely on the judgment of taste. In his analyses of the regimes of coordination which constitute these markets he distinguished four different cases based on their respective (unpersonal) market devices: 1) the authenticity regime, 2) the mega regime, 3) the expert regime and 4) the popular opinion regime. Karpik's detailed description of the functioning of these markets with the help of their specific devices is very illuminating and interesting. He does not however go deeper into analyzing the social processes of taste formation which lay behind each of these market devices. They can however be supplemented with other existing theories. In the case of the popular opinion and mega regimes the theory of fashion, in the case of the authenticity and expert regimes the understanding of the functioning of social worlds is useful. Furthermore, Schulze’s (Erlebnisgesellschaft, 1993) distinction between the suppliers’ market strategies and consumers’ strategies is important in understanding the demand for the variety and novelty on the other hand, and the principles of schematization and correspondence on the other hand, in the markets selling authentic experiences.

Can economic sociology contribute to socio-economics?
Andrea MAURER (University of Trier, Germany) | andrea.maurer@uni-trier.de

On the one hand, new economic sociology established pretty well by analyzing social mechanisms which improve economic transactions. On the other hand, new economic sociologists still claim to improve explanations by using more realistic assumptions both on the micro and the macro level and therefore overcome restrictions of sociological as well as economic explanations.

I’ll ask what makes social economics special when it comes to a more realistic view on the economy? Furthermore I’ll consider what new economic sociology can contribute by doing so to the project of social-economics. Therefore I’ll outline social-economics as a research program emphasizing the enhancement of society and economy with special regard to Max Weber. That helps to define social-economics as an interdisciplinary approach that combines social, economic, cultural and other factors to explain the economy.

I will highlight the claim of new economic sociology bringing social factors back into explanations of the economy. Therefore I’ll argue that new economic sociology can contribute to social-economics by their analyses of social relations and institutions as well as by providing models of “social actors”.

Understanding the ‘Economic’ in New Economic Sociology
Jan SPARSAM (Friedrich-Schiller-Universität Jena, Germany) | jan.sparsam@uni-jena.de

Despite the vast success of new economic sociology regarding empirical research there are few inquiries about the deeper theoretical content of the field’s central approaches. This is puzzling because theoretical clarification is explicitly demanded and the few existing attempts to do so are rigorously critical. Contributing to this process of clarification, the planned presentation aims...
at revealing the understanding of ‘economic’ in new economic sociology. Designed as a meta-theoretical investigation, my presentation provides a reconstruction of the theoretical content of the four most prominent approaches in market sociology: the ones offered by Mark Granovetter, Harrison White, Neil Fligstein, and Jens Beckert. The presentation will give insight into the realization of the main objective of new economic sociology: to conceive economic facts as social facts. The reconstruction will identify those phenomena that are posing explanatory problems to the present frameworks: the emergence, the order, and the functioning of specific economic facts in modern societies, encompassing valorization and profit orientation, money and monetization, the systematicity of modern economy, and the impact of the economy on non-economic social spheres. Complementing those critiques which are addressing the absence of specific socio-cultural factors that are pivotal for economic action in all its variations, the presentation aims at revealing the unitary elements of modern economies – or the economic commonalities of markets as social spheres – as unmarked categories in each of the four theoretical frameworks.

What Is New in the ‘New Economy’? Care as Critical Nexus Challenging Rigid Conceptualizations
Seppo POUTANEN (University of Turku, Finland) | seppou@utu.fi

During the last two decades the ‘new economy’ has come to epitomize many things in society, widening its territorial and intellectual coverage from the dot-coms, powered by the rise of websites, internet firms and the tech industry, more generally to all types of immaterial and innovation-driven work and changing living conditions, both nationally and beyond borders. In relation to work, the ‘new economy’ often refers to changes in the ways the work is conducted, due to advances in information technology, globalization, and the commodification of knowledge.

On the other hand, the intersections between new types of transnational work, migrating workers, gender and new types of global dependencies and interdependencies have been analysed and discussed widely in relation to changing care work and global care chains but also in relation to global companies, commodity production and to global commodity chains. The questions of how care is understood in the global context and how is it shaped by the social and political institutions and contexts that operate from the top down, show how care is changing and being changed by politics. Despite these changes care work remains work with gendered subtexts that are in the analyses shown to be tied to a culturally feminine quality of caring, and thus subjected to the pressures of the new capitalism and new economy. We argue that this assumption is built on the assumed connection of care work belonging to the ‘old economy’ and being in stark contrast of the ‘new economy’.

RN09S02 - Theoretical Perspectives in Economic Sociology II

In a state of flux? Communication - a newfound key element of economic theories.
Dorothee WILM (Bielefeld University, Germany) | dorothee.wilm@uni-bielefeld.de

In times of ever-present possibilities of economic crisis, it is common to assume a societal necessity for alternatives to the standard economic theory which is suspected to be a main culprit for the misery. And indeed, the field of economic research is changing. New economic theories are generated in economics as well as in sociology. These theories collectively make
the critique of the neoclassical theory their reference point. Critique which remains without considerable consequences so far, because it refers to textbook economics only and dismisses the actual status quo of the research field.

Instead of following this beaten path, my presentation points out that lately communication gained remarkable importance in economic theories. Not only as the subject of research, but also on the epistemological level as a theoretical category or method.

The prominence of communication in these younger theories is surprising because it is completely excluded from the neoclassical concept. It is obvious to assume that the new theories refer to communication to avoid the weaknesses of the standard theory and to somehow bring the social back to economic theory. Is that possible? And what would it change - with regard to the structure and self-conception of this field of research and the potency of a new economic theory?

The presentation addresses these questions comparing a selection of economic theories to unveil commonalities and differences in the conceptualizations of “communication” and discusses the findings with regard to the consequences of this theoretical shift for the field of economic research.

**Changing markets as change of expected expectations**

Sebastian GIACOVELLI (Justus-Liebig University Giessen, Germany) | soziologie@giacovelli.net

Modern sociological concepts of markets emphasize embeddedness of markets, commodification of goods, selection and imprinting mechanisms of information, role of networks, norms, conventions, and much more, to analyse constitution, continuation and change of markets.

The objective of my paper is to highlight the terms 'expectation' and 'expected expectations' and discuss an analytical concept that focuses on change of markets. First actors anticipate expectations and act according to them (cf. Beckert 2014, Galtung 1966). As expectations pre-structure social action, this challenges action-theoretical concepts. Secondly, expectations solely influence the macro-level if they assume the form of (formal or informal) expected expectations ('Erwartungserwartungen', Luhmann 1984, 1996). Only if expectations are oriented towards expected expectations markets gain stability. And thirdly, the term 'expectation' brings temporal elements into play: expectations are imaginations of future developments. Change of market structures can be interpreted as change of expectations (more precisely: as a change of expected expectations).

As Neil Fligstein (2002) points out the idea of dominating concepts of control and interprets change of markets in terms of establishing more dominant concepts of control, change of markets could alternatively be described as an establishment of dominant expected expectations also considering aspects of power. Establishing dominating expected expectations is a communicative process triggered by powerful actors, which leads to new options for orientation on action, reduction of uncertainty, and puts obsolete expectations to the test.

**Between Anomie and Fatalism. Reconstruction and empirical test of Durkheim’s social regulation theory.**

Jacek BIELIŃSKI (Collegium Civitas, Poland) | jacek.bielinski@collegium.edu.pl

The goal of this paper is to reconstruct and empirically test Emile Durkheim’s social regulation theory and confront it with modern Institutional Anomie Theory.

I conclude that Durkheim only casually treated that part of his theory which refers to oppressive regulation. This contributed to confusion and ambiguity in the concept of anomie. Reconstruction of Durkheim’s theory involves such modalities of social regulation as under-
regulation (chronic and acute progressive anomie) and over-regulation (severe fatalism and alienation, chronic fatalism).

Empirical analyses are based on data from a survey conducted by TNS in 2011 on a representative sample of Polish population over 15 years of age. The sample size was 1005 respondents.

Using structural equation models, I demonstrate that Durkheim’s theory is better reflected in empirical data than Institutional Anomie Theory. Despite the fact that both models adequately fit to the data, only in the estimated model of Durkheim’s theory the observable variables correspond with theoretical constructs accordingly to theoretical predictions.

The second-order factors - anomie and fatalism - served as dependent variables in the formulated regression models. The investigation has shown a correlation between individual-level social regulation disturbances and respondents position in the social structure (age, rural-urban place of residence, social-occupational position, legitimacy of the political system, assessment of one’s own material situation, etc.).

**Forever in debt time: Morality, temporality, and subjectivity in neoliberal economies.**

**Tom CAMPBELL** (Bauman Institute, School of Sociology and Social Policy, University of Leeds) | t.w.campbell@leeds.ac.uk

**Mark DAVIS** (Bauman Institute, School of Sociology and Social Policy, University of Leeds) | m.e.davis@leeds.ac.uk

In taking on a debt, one becomes obligated to another in such a way that financial relations are rewritten as moral duties. The idea of debt is thus predicated upon the creation of a subject who can offer both a moral promise to the lender. Drawing upon our existing work on the accelerated motion of modernity, we seek to contribute to the development of new theoretical approaches to economic sociology by expounding upon the temporal nature of the debt promise.

Debt is fundamentally linked to time, wresting the unknowable future of human activity into a present set of financial and moral constraints upon human action in order to render it knowable, calculable and so governable.

Utilising the vitalist tradition of Simmel and Deleuze & Guattari, as well as the landmark contribution by Lazzarato, we explore the relationship between markets, morality and subjectivation in order to assess the implications of the moral and temporal dimensions of indebtedness as a mechanism by which to foreclose the possibility of alternative social, political, and economic realities.

**RN09S03a - Economic Sociology and Social Inequality I**

**Income Inequality in Slovenia 1993-2012 and the Economic Crisis: Was Piketty Right?**

**Andrej SRAKAR** (Institute for Economic Research, Ljubljana and Faculty of Economics, University of Ljubljana) | andrej.srakar@ier.si

**Miroslav VERBIČ** (Faculty of Economics, University of Ljubljana and Institute for Economic Research, Ljubljana) | miroslav.verbic@ef.uni-lj.si

In this paper we show the trends in income inequality in Slovenia in the years 1993-2012. We show that income inequality in Slovenia which is already among the lowest in the world, further declined in the economic crisis. By observing the movement of the Gini coefficient, its decomposition and related measures of inequality we try to offer some basic explanations of the
observed trend. Furthermore, we use cointegration analysis, adjusted for small samples, to econometrically examine the main reasons for the observed trend. Finally, we point to discrepancy between the findings of the article and the findings of the theory of economic inequality, as developed by Thomas Piketty in his recent work Capital in the 21st Century.

Social consequences of poverty in Russia: measurement and technologies of reduction
Marina RODIONOVA (Financial University under the Government of the Russian Federation, Russian Federation) | m.rodionova@mail.ru

Research subject - methodology of measurement of poverty and social technologies of its reduction.
Object of research - poverty and its social consequences.
Research objective
The comparative analysis, assessment and justification of social indicators of measurement of levels, types and consequences of poverty in Russia on the basis of the international approaches to methodology of calculation of poverty and recommendations of the Declaration of the UN of "The purpose of development of the Millennium" (TsRT), and also an assessment of efficiency of the social technologies influencing reduction of poverty among certain segments of the population.
Development of recommendations about extrapolation on the regional level of the most productive social technologies of reduction of poverty for neutralization of its negative consequences.
Tasks
1. Development of methodology and a technique of implementation of the sociological project, justification of monitoring indicators of social measurement, calculation and measurement of consequences of prevalence of poverty at the regional level with application of the comparative secondary analysis of sociological indicators.
2. Development of theoretical interpretation of the main categories of research, systematization and specification of the content of the concepts "level", "threshold", "types of poverty"; drawing up the glossary of the main terms characterizing developments, researches, measurement and social and technological minimization of poverty.
3. The comparative analysis of the theory and methodology of calculation of poverty in three world country enclaves (the European Union countries, Scandinavia and the USA) taking into account recommendations of the Declaration of the UN of "The purpose of development of the Millennium" (TsRT) about fight against poverty: an assessment of distinctions of domestic calculations of scales of poverty and its consequences in Russia from the international criteria.
4. Development of tools for carrying out on the basis of the Russian regions of the concrete sociological research allowing to carry out sociological diagnostics of prevalence and definition of "threshold" of poverty and its consequences in the Russian society. under influence depending on influence of objective and subjective factors, and also regional features.
5. The analysis of typology and criteria of the analysis of social consequences, their types and forms of manifestations at poverty distribution; essence, functions and types of social technologies by criterion of their influence on neutralization of negative social consequences and minimization of poverty among needy segments of the population.
Main hypothesis. Approaches to measurement of poverty in Russia and in the European Union countries strongly differ on the methodology and indicators of measurement that leads to overestimated or opposite - to the underestimated estimates of real scales of poverty, underestimation of really current situation in the countries and to the unreasonable, quite often
politicized conclusions about prevalence of poverty especially at intercountry comparisons and adoption of social programs.

At current methodological and methodical approaches to calculation of poverty in Russia and in the western developed countries it is almost impossible to obtain comparable settlement data. Transition of the Russian government bodies to the West European or American indicators of measurement of poverty in the conditions of weakened economy and social resource base is premature and increases value of sociological monitoring of level of poverty at the regional levels that didn't gain due distribution yet. The absolute majority of regions such monitoring isn't carried out.

Indirect hypotheses of research.
1) The prevailing part of urban population critically treat the taken measures in the field of reduction of poverty and considers that poverty level for the last five years in Russia grew.
2) Social technologies of reduction of poverty and the help poor and needy on an area of the action have to cover not less than a third of Russians.
3) The structure of the poor population over the last ten years changed; certain social groups or left structure poor or reduced the specific weight, the pool of the poor population is replenished mainly at the expense of pensioners and disabled people
4) The essential gap between the necessary and real level of the income incapable remains to bring poor the population out of a condition of steady poverty.
5) The criteria of calculation of poverty applied in Russia strongly disperse from foreign practice of the developed countries, the basic criterion - a living minimum - can't open the real depth of poverty in the Russian society.
6) For social practice the broad pluralism of the applied social technologies of assistance to the needing segments of the population is characteristic, but isn't developed a target set of the social technologies directed on poverty reduction; (as the social contract) the population is actually not informed on new technologies.

Empirical base of research. For studying of a subject and object of research the complex method of collecting primary sociological information was used:
1) Traditional method of the analysis of documents. Generalization legislative and normative legal acts of the Russian Federation (Laws, Decrees and the Resolutions Russian Federation), the European Union, the USA, the Scandinavian countries and others, entering object of research work. Analysis of declarative documents of the UN, EU and World bank. Analysis of scientific sources.
2) The secondary analysis of the empirical these earlier conducted sociological researches ("Levada Center", Institute of sociology of the Russian Academy of Sciences).
3) Concrete sociological research on a subject ". Social consequences of poverty in Russia: measurement and technologies of reduction" agrees raschetnoy1 selections. Tools of research – the questionnaire "Poverty in Russia: social consequences and technologies of reduction". Research is conducted by methods of distributing and electronic polls among needy segments of the population of five regions (subsidized and not subsidized), i.e. differing level of a social status of the population and poverty.

Object of research – needy segments of the population and expert group of the cities of five Russian regions.

Characteristic of a sample
For research 5 territorial subjects of the Russian Federation presented by urban population of three groups of regions are selected: subsidized, characterized by the high level of poverty; so-so safe, safe.: A selective quota - 100 units on the region, from which – on 30 units of experts: 70 – representatives of the needy population (group of risk).
Structure of expert group in regions - representatives:
1. Social security authorities - City administrative bodies - Legislative authorities - Services zanyatosti-Rukovoditeli the enterprises - Pension bodies - scientists.
2. NPO - Non-profit organizations (veterans, pensioners, female, children's, disabled people, the military personnel, youth).
3. Representatives of parties - bodies of health care - educational institutions - cultural.

Relevance of scientific research consists in scale of distribution of poverty as the social phenomenon possessing serious and long-term social consequences for development of society, the state and the personality. In September, 2013 in 27 European Union countries below the poverty line lived 84 million people. In other words, every sixth. In a quantitative ratio it exceeds the population of the biggest European country — Germany.

For Russia the poverty problem sharply became aggravated in connection with transition to market economy. Multidimensional character and multidimensionality of negative consequences of poverty possess, from one party - the certain universality which is shown in development of any society and state, and with another, have the features, characteristic for each country, and specifics connected with social stratification of society, its gender structure, life expectancy of the population, sociocultural norms and development of social policy.

Poverty defines limitation of access of the population to considerable part to development resources: to highly paid work, high-quality services of education and health care, possibility of successful socialization of children and youth. Low level of the income of considerable part of families in combination with excessive polarization of the income cause a social break of society, cause social tension, interferes with successful development of the country, sharply becoming aggravated in connection with financial and economic crises.

According to Rosstat the number of those who lives below the poverty line increased in the first quarter 2014: on 2,3 million people also reached 22,9 million in comparison with the first quarter 2010. These are more than 16% of the population of Russia.

At the same time it should be noted the positive dynamics of distribution of poverty reducing its scales and depth of distribution. So, for October 1, 2014, according to Rosstat, the number of the needy decreased to 17,2 million people (12,1% of the population of the country). At the same time relevance of a subject is caused not only the fact of scale of poverty, but most of all its social consequences and administrative need of justification of methodology of calculation, measurement of social results of poverty, its influence on development of society and state, its prospect and quality of life.

In all cases, irrespective of country features, poverty – the conventional brake of development of public system which became in the conditions of globalization to one of the most important factors of improvement of quality of the human capital defining success of social and economic transformations. In this regard the task overcoming of poverty is not a "private", internal problem of the certain states, and the purpose of development of the world community.

Such social and political importance of a problem of fight against poverty is fixed in the most important document of the world value accepted by special session of the United Nations General Assembly in September, 2000 at the Summit of the Millennium - Concepts of TsRT: "Purposes of development of the millennium". The document opens modern situation, policy of the state and a possible role of the UN in the solution of priority problems of the third millennium. On the basis of this document all states of the world community accepted the TsRT + Programs adapted for national conditions.

The similar TsRT + program is accepted also by the Russian Federation. The Concept purpose – definition of ways and ways of ensuring steady increase of welfare of the Russian citizens, strengthenings of national security and dynamic development of economy in the long term (2008-2020), strengthenings of positions of Russia in the world community. A strategic objective of the Concept is achievement of level of the economic and social development corresponding to the status of Russia as the leading world power of the XXI century, with an attractive way of
life which is taking the advanced positions in the global economic competition and reliably ensuring national security and realization of constitutional rights of citizens”.

**RN09S03a - Economic Sociology and Social Inequality I**

**Consumer Expectations of Russian Population (1996–2009): How are Cohort, Generation and Age Related?**

Dilyara IBRAGIMOVA (National Research University Higher School of Economics, Russian Federation) | dibragimova@hse.ru

The main aims of this study were 1) to identify the age profile of consumer expectations by comparing them across different cohort profiles and 2) to demonstrate the cohort effect on consumer sentiment.

The research deals with the analysis of consumer expectations of Russian population, which are mediated by many socio-demographic characteristics: income, age, education, place of residence, sex, etc. The paper points up the influence on variable “age” because it is rather complex itself. First, actual age represents biological characteristics. Second, “age” represents a unique birth cohort in terms of socialization and formation of life experience. Finally, all ages feature influence by a time period effect that reflects the socio-political, economic, and informational phenomena of the macro environment. Solving the problem of “identification” (i.e. the separation of these three effects), which inevitably arises in case of cohort analysis, is based on theoretical views concerning the character of consumer expectations and the results of empirical testing. Its point is that the aggregated Consumer Sentiment Index (CSI) reflects the general socio-economic situation in a country at a certain time and allows us to use the CSI as a distillation of a specific time moment. The information base of research is the data of consumer survey although not the panel, but conducted over a 15-year period on the same methodology and sample. All 79 waves of cross-section data (from May 1996 to September 2009) were converted into a “quasi-longitudinal design”, the total sample of dataset was 182,507 respondents. The regression analysis demonstrates that belonging to a cohort actually determines significantly consumer sentiments. However, the nonlinear correlation describing such dependence showed that an increase of optimism/pessimism in respect for the economic and social development of the country happens non-uniformly from one cohort to another. In addition, the article attempts to implement approach to differentiation of generations, is not based on age differences, and the relationship with historical events. The research shows that an indicator such as the CSI could be one instrument for defining the time boundaries of the generations.

**Regional disparities in price levels across the European Union**

Dominika KOLCUNOVA (Institute of Economic Studies, Faculty of Social Sciences, Charles University in Prague) | dominika.kolcunova@gmail.com

Petr JANŠKY (Institute of Economic Studies, Faculty of Social Sciences, Charles University in Prague) | jansky.peta@gmail.com

It is not questionable that different price levels may implicate welfare distortions. Currently, when analysing socio-economic indicators, purchasing power parities (or, for the case of the European Union, purchasing power standards) are used. Nevertheless, this measures account only for one national parity in each country and do not reflect actual inter-regional price levels. Consequently, this approach distorts the contribution value of the indicators (GDP per capita, disposable income per capita, et cetera) since the majority of countries are definitely not
completely homogenous from the perspective of prices. Therefore, the aim of this paper is to estimate regional price levels across the EU regions using an econometric model, which is based on available data on regional price levels for six countries in Europe. As for the explanatory variables, regional data on income, GDP, unemployment, dummy variables for capital cities or rural areas and other potentially relevant variables are used. After estimating a regression equation and checking for out-of-sample predictive power, regional price levels for the rest of EU regions at NUTS 2 level are computed and subsequently used for recalculation of socio-economic indicators. The results imply that there exist significant differences between analyses with one national parity and actual regional parities. This raises several issues for policy implications (for instance potential sub-optimality of the European Cohesion policy) and shows further necessity and importance of precise estimation of regional price disparities and their taking into account.

**RN09S03b - Economic Sociology and Social Inequality II**

**The impacts of crisis on quality of life: Switzerland from the 1990s to nowadays**

Jehane SIMONA (University of Neuchâtel, Institute of Sociology, Switzerland) | jehane.simona@unine.ch
Laura RAVAZZINI (University of Neuchâtel, Institute of Sociology, Switzerland) | laura.ravazzini@unine.ch
Christian SUTER (University of Neuchâtel, Institute of Sociology, Switzerland) | christian.suter@unine.ch

Switzerland experienced less strongly the effects of the last financial crisis compare to its others European neighbours. Still, during the past twenty years Switzerland experienced three major recessions and periods of economic slowdown: the prolonged and deep economic stagnation of 1992-95 and the comparatively mild two recessions of 2002-03 and the global financial economic crisis of 2008-09. During these periods of economic crisis, unemployment and poverty increased, particularly during the crisis of the 1990s, when unemployment soared from its previously extremely low level. The proposed paper aims to explore the impacts of recessions and economic downturns on various dimensions of quality of life by comparing the three historical periods of economic stagnations.

In order to analyse how quality of life has evolved since the early 1990s, we use two longitudinal databases, notably the Swiss Labour Force Survey (SLFS, available from 1991 onwards), and the Swiss Statistics on Income and Living Conditions (CH-SILC, available from 2007 onwards). Various indicators of quality of life, mainly poverty, as well as of subjective well-being will be calculated in order to measure and compare quality of life during different recession periods. Our empirical analysis will explore the impact of economic crises for different vulnerable groups as well as for various quality of life domains (objective and subjective indicators). First results suggest negative crisis impacts on quality of life and subjective well-being particularly for specific vulnerable population groups.

**European Top Management Careers: a Field-Analytical Approach**

Felix BÜHLMANN (University of Lausanne, Switzerland) | felix.buhlmann@unil.ch

The globalization and Europeanisation of economic markets has brought about an intensification of the international circulation of goods, services, money and people. In this contribution we seek to understand the consequences of the economic globalisation on top management careers in Europe. For a long time, research on European business elites has
been dominated by a “national career model” approach, arguing that each country has a specific top management career pattern. In recent years, this line of argument has been challenged due to the increasing international circulation of top managers. In particular it has been ascertained that this increased circulation has led to a transnational career model and an increasing convergence of top management careers in most European countries. To examine this hypothesis we will draw on an extensive database of 916 top managers in Germany, Switzerland, France and Britain - four countries which vary both in terms of size and internationalisation. Applying a field-analytical perspective and a multiple correspondence analysis to this comparative sample, we reveal that the most important career distinction – between internal and external careers – is valid beyond national models. In addition, international managers do not constitute a separate homogenous group: in some countries they imitate national career patterns; in others they pursue complementary strategies.

Non-financial wealth of Russian households: structural assessment
Tatyana Yurievna BOGOMOLOVA (Institute of Economics and Industrial Engineering SB RAS, Novosibirsk State University, Russian Federation) | bogtan@rambler.ru
Tatyana Yurievna CHERKASHINA (Institute of Economics and Industrial Engineering SB RAS, Novosibirsk State University, Russian Federation) | touch241@rambler.ru

Property-ownership is a relatively recent phenomenon in Russia. Special surveys are needed for constructing the justified estimates of household wealth, but there were no sufficient research until very recently. In 2011, Russian Federal State Statistics Service (Rosstat) conducted the Complex survey of living conditions of Russian population. The data does not include monetary estimates of non-financial wealth of households, but it does allow measuring its material composition. Considering the limitations of the data, we formulated the following research questions: How the material assets are distributed among the Russian households? What property-based strata can we distinguish? What are the factors defining the chances of getting into different strata? The aim of the research is to define the characteristics of stratification of the Russian households based on non-financial wealth as one of the aspects of socio-economic inequality. We define non-financial wealth as consisting of the following assets: primary and secondary housing owned; cars; other vehicles; garage; land ownership; owning a business. The core component of the property owned by Russian households is housing (86.4% of households own the housing they live in). Land (48.7%) and transport (36.7%) follow housing in the list of commonly owned assets. The property-based stratification of households was constructed as follows. Each element of non-financial wealth was weighted, and made its contribution to the estimate of the generalized household property. The distribution of the generalized property scale was transformed into the ordinal scale reflecting property-based stratification consisting of six strata. We used logistic regression for finding significant determinants of household wealth.

“Outward Migration from Greece to the West during the Crisis: The educated middle class on the move”
Sokratis KONIORDOS (University of Crete, Greece) | sokratiskonio@gmail.com

Since the emergence of the ongoing economic crisis in Greece, there has been a new out-migration from the country to cities of advanced counties of Europe and overseas. This out-migration concerns degree-holders, and those that have acquired specializations in the higher professions, for instance medical doctors. Such ‘elite’ emigrants possess advanced language skills, are in their 20’s and 30’s, or/and early in their careers. It emerges that while this migratory movement is individualized, it unwittingly acts to maintaining the social position of the emigrants'
and their families in their place of origin. In fact, it is argued that it operates as a middle-class social adaptation mechanism to the crisis; one that has social reproduction effects. My aim then is to obtain a clearer overall insight of the specific migratory wave. For this purpose I present and discuss the first outcomes of interviewing undertaken with agents of this elite emigration to the European centers of London and Paris. An outline of the features and patterns of this emigration is presented, and there is an attempt to tease out its raison d’être, and social consequences too.

RN09S04 - Money, Finance and Society

The social structure of Government Debt Market: a status hierarchy based model of economic actors

Matilde MASSÓ (Universidade da Coruña, Spain) | m.masso@udc.es
Obdulia TABOADELA (Universidade da Coruña, Spain) | obdulia.taboadela@udc.es
Ana MARTÍNEZ-BARREIRO (Universidade da Coruña, Spain) | anamb@udc.es

This paper analyses the social structure of the government debt market in Spain using a multi-method approach based on a qualitative methodology, documentary and statistical analysis. Status can be defined as a position within a social structure that confers prestige and privileges upon an actor according to ascribed and achieved criteria. An actor’s rank in this hierarchy affects others’ perceptions and actions towards her/him and thereby the opportunities and constraints s/he faces in the market (Jensen 2008; Jensen and Roy 2008; Podolny 1994). Status influences a very wide range of market outcomes such as segmentation (Phillips and Zuckerman 2001; Podolny 2001), price formation, or the formation and dissolution of exchange ties (Podolny, 1994).

The status of an actor is defined using a relational criteria based on market participants relationships with each other (Podony, 2001). More specifically we have considered four types of norms that constitute the social structure of a particular market and that make possible the institutionalization of an exchange model:

Property rights: They are referred to the characteristics of corporate and organizational structure of market participants.

Governance structure: They are referred to the regulation of cooperation and competition in the market.

Rules of exchange: They define the characteristics of authorised actors to participate in the market and the conditions of the economic exchanges.

Control conditions: They are specific agreements among actors, strategies of competition or cooperation and the local knowledge actors have about the functioning of the market.

Through the description of how each one of these four criteria work in the Spanish case, we have bought a model that describes how a status position is generated and reproduced among government debt market participants. Semi-structured interviews and time series of available statistics have provided empirical support for this status based model.

Predicting and performing financial futures through geographical classifications:
How the narrative of Westernization of Central and Eastern Europe (CEE) contributed to the mortgage market boom in Hungary

Léna PELLANDINI-SIMÁNYI (ELTE, Budapest, Hungary) | simanyi@emc.elte.hu
Zsuzsanna VARGHA (University of Leicester, Leicester, UK) | zv8@leicester.ac.uk
Ferenc HAMMER (ELTE, Budapest, Hungary) | ferenc.hammer@gmail.com
Between 2000 and 2010 the virtually non-existent Hungarian mortgage market developed into a 4.4 billion Forints ($19.46 billion) business (Schepp and Pitz, 2012). How could the market grow so substantially in such a short amount of time? Using discourse analysis of policy documents and interviews with regulators, policy-makers, bankers and borrowers this paper highlights the role of a symbolic geographical classificatory system in creating the boom. This classification placed countries on an East-West continuum, and saw the Westernization of the CEE countries (in the middle of the continuum) both as an unavoidable development and as a normative-symbolic aim. The Hungarian mortgage market, classified as belonging to the CEE region, was believed to ‘catch up’ with the Western markets. This narrative translated into prediction models, benchmarks and performance indicators used by banks, regulators and policy-makers which, in the short run, made it performative (Callon, 1998, MacKenzie, 2007), by contributing to the growth predicted by the narrative. The paper analyses these events, first, by using Beckert’s (2013, 2014) arguments on the creation and politics of ‘fictional expectations’. It shows that in this particular case, predictions of the future resulted from a set of relatively shared Westernization narratives, which emerged at the intersection of economic models and symbolic identity politics around Hungary’s place in the world. Second, it expands the scholarship on how geographical categories in financial markets have performative effects (Wansleben, 2013) by tracing the concrete socio-technical devices through which the narrative futures associated with the category of CEE shaped market outcomes.

Lost and Found in the Social Maze of Central Bank Statements
Jocelyn Florence PIXLEY (Macquarie University, Australia) | jocelynpixley@gmail.com

The balance sheets of economic units are social-historical documents. One sociologically telling aspect is that only pure financial entities have assets and liabilities that sum to zero, since IOUs are both. Household and firm balances show positive or negative discrepancies: gains or losses, but not banks. This paper applies Joseph Schumpeter’s conception of state budgets to central bank statements. Just before World War I ended, he wrote an essay that boldly declared that the best way of looking at fiscal history was by starting with ‘hard naked facts which have yet to remain drawn into the realm of sociology’. He approvingly quotes a then current idea that “the budget is the skeleton of the state stripped of all misleading ideologies”. My aim is not fiscal but central bank sociology.

Central banks, most now publicly owned, provide statements that show how, like banks, they create money as routinely as loan repayments or taxes reduce it. This social fact that money expands and contracts rarely sees public light. Central banks are (fairly small) credit engines of states and banks, and today’s statements show they mostly monetize bank debt: historically the exception not norm. Statements show monetizing the much lesser state debt continues (despite state rules). Even so, some entries under the conventions of double-entry bookkeeping seem to get lost. Why? A recent example of the social maze of balance sheets is discussed, of a right-wing government’s equity gift to its central bank.

When Finance became Politics – The Relations of Politics and Financial Markets following the Financial Crisis
Carola WESTERMEIER (Justus-Liebig-University Giessen, Germany; Collaborative Research Centre “SFB/TRR 138: Dynamics of Security”) | carola.westermeier@sowi.uni-giessen.de

When in 2008-2009 the financial crisis started at Wall Street and soon swept over to the European financial markets, it caused weeks and months of insecurities, leading to severe economic shocks which still affect large parts of (especially Southern) Europe today. During the
It became increasingly clear that the relation of politics and financial markets has changed. The state intervened and prevented the collapse of the financial system by the bailout of banks. Political leaders acted in order to calm the markets and restore financial stability.

During the last years, the crisis has been interpreted in many ways: it has been described as a starting point for the state to regain power and put limits to processes which were a driving force of financialization since the 1980s: financial deregulation and an out-of-control financial industry. At the same time, developments of financial regulation have been criticised as insufficient and controlled by financial lobbyists which even lead to an increasing power of financial elites.

The question which I want to answer with my paper is, how the relations between actors of the financial markets and politics changed which then lead to macro-level changes. It is based on my PhD project, for which I conduct interviews with financial markets experts and policy makers all over Europe. Applying the hegemony-theories of Laclau and Mouffe I will show how the two perspectives articulated a new understanding of financial market’s regulation and financial policy.

Investment habitus and stock market capitalization: How structural differences of private and institutional investors influence national share prices

Raphael H. HEIBERGER (University Bremen, Germany) | raphael.heiberger@uni-bremen.de

This paper provides empirical evidence that different socioeconomic structures have a significant impact on the capitalization of national stock markets. Using a fixed effects regression model on 26 OECD countries two major influence channels are investigated: private and institutional investment decisions. Both show tendencies that are congruent with the liberal and coordinated ideal types of capitalist regimes. Theoretically, these structural conditions of financial actions are manifestations of a national “investment habitus” and thereby a result of complex interacting processes of socialization, personal experiences and dispositions. Seen as a continuum of incorporated liberal/coordinated characteristics, each specification of the habitus brings about corresponding empirical results: The more of their income private households invest in financial assets, the higher is the relative valuation of national share prices. The same holds true for a higher amount of professional administered capital in a political economy. Moreover, a hitherto widely unrecognized negative significant impact of state expenditures on market capitalization is revealed, which underlines the positive (negative) causal effect of a more liberal (coordinated) market structure on stock price formations. Hence, different historical traditions and conditions frame the supposedly rational financial decisions of households and professionals alike. The subsequent “investment habitus” leads, by trend, to the implementation of “right” forms of investment choices in a society, which then have significant effects on the macro level of national price formation processes.

RN09S05 - Markets and Morality I

Fairness Norms, Sanctioning Power and Social Control at Bonus Payments in Companies. A Multi-Level Factorial Survey Experiment

Knut PETZOLD (CU Eichstätt-Ingolstadt, Germany) | knut.petzold@ku.de
Martin WIENHOLD (Leibniz University of Hannover, Germany) | m.wienhold@ish.uni-hannover.de

Experimental results show that exchange and giving behavior in market situations is driven by both egoistic as well as social motivations, such as morality and fairness norms. With a factorial
survey design we investigate how employers in small and medium-sized companies in Germany decide how they would allocate 10,000 Euro between themselves and fictitious employees that vary regarding relevant characteristics. We focus on the relative strength of fairness norms and the employees' sanctioning power on the bonus payment and how both is being influenced by different previous informational conditions as well. To do so, subjects are randomized into one of three decision environments differing in their degree of informational transparency. Knowing that there is an occasion for a bonus and knowing how it is allocated among the employees activates further motives for a bonus payment and, at the same time, strengthens or weakens both sanctioning considerations and the pursuit of fairness norms differently. Although the fairness norm of proportionality dominates in each of the environments, its degree strongly varies between non-transparency and transparency, indicating the divergence between subjective fairness ideals and the perceived desirability of the employees. Altogether, we show that social control does not only influences the amount of bonus paid, but also the normative criteria (equity vs. equality) which allocation is conducted.

Banking and Morality: The Problem of Disembeddedness
Claudia CZINGON (Goethe-University Frankfurt, Germany) | czingon@soz.uni-frankfurt.de
Sighard NECKEL (Goethe-University Frankfurt, Germany) | neckel@soz.uni-frankfurt.de
Sarah Lenz (Goethe-University Frankfurt, Germany) | S.Lenz@em.uni-frankfurt.de

In our paper we raise the question of the relationship between finance and society which, in economic sociology, is known as the problem of embeddedness. In contrast to the two main approaches in the special field of financial markets research (the social studies of finance on the one hand, the politico-economic approach on the other) we propose a praxeological notion of embeddedness which considers the normative capacities of financial actors. More precisely we examine how financial actors themselves refer to the question of societal responsibility of the financial industry. Our findings thus contribute to the controversial debate about finance’s potential for normative self-regulation.

The analysis of more than 20 semi-structured interviews in the field of banking and finance reveals a dilemma: Even though financial actors do raise moral claims, these claims don’t affect the societal sphere in which normative concerns would be particularly necessary. The empirical findings rather show that the professional ethics in banking and finance feature an internal morality which is primarily addressed to clients, colleagues or employees. By contrasting “ethical” bankers “morality” we will show, that the absence of societal concerns in the professional self-conceptions of financial actors relates to a twofold process of structural dissociation. Regarding the dissociation of finance industry’s interest in profit making from real economic concerns on the one hand, we particularly want to draw attention to what we call a socio-structural process of dissociation: The widespread homogeneity of the social milieu of financial elites is deeply intertwined with an internally directed professional ethics that largely disregards the societal consequences of economic action. The problem of the disembeddedness of financial industry thus also reflects the problem of social inequality.

How would you like your egg? A sociology of moral struggles and the process of market moralization.
Philip BALSIGER (Université de Neuchâtel, Switzerland) | philip.balsiger@gmail.com

How do markets get moralized? Recently, a number of “moral markets” have developed, such as fair trade or organic markets. Social movements are often driving forces behind processes of market moralization. They advocate new rules and develop new frames of market behavior, acting as moral entrepreneurs. Their opponents – industry associations, corporations – resist
challenges and defend existing market conventions. Thus, struggles emerge around ethical values in markets, which can lead to the development of new, “moral” market conventions. To reveal and theoretically understand the processes of market moralization, this paper proposes a case study of the market for eggs in Switzerland, ca. 1970-90. During this period, a ban on cage husbandry systems was widely debated, opposing animal rights activists to the egg industry. Using a broad range of archival data from producers and moral entrepreneurs alike, the paper retraces the struggles around the cage ban in the public arena and in markets. Through a qualitative analysis, the study shows how movement actors promote new forms of moral valuation and how dominant market actors contest them in turn, developing “alternative moralities”. In particular, studying this moral struggle reveals how moral categories clash with the supposed “laws of the market”. Producers use this market logic to fight against demands while movement actors attempt to change the behavior of consumers and producers. The study contributes to understanding of market moralization by bringing together perspectives from economic sociology on the moral underpinnings of markets, theories of market conventions (économie des conventions), and theories of moral entrepreneurship.

The moral dimension in Scandinavian systems of collective skill formation
Ole Johnny OLSEN (University of Bergen, Norway) | ole.olsen@sos.uib.no

The fields of political economy and economic sociology have witnessed a growing interest in the evolution and transformation of national skill formation systems (see e.g. Colin Crouch, Kathleen Thelen, Wolfgang Streeck, Marius Busemayer and others). In terms of the general study of vocational education training (VET), the perspectives and empirical studies that have emerged in this field have been very stimulating, and have yielded substantial gains in terms of the understanding of various institutional systems – especially in terms of research on the relations between states, markets, and different types of corporate governance within national VET systems. This paper takes its point of departure in this body of literature, and proceeds to develop a critical discussion of the normative regulation of national VET systems. Whereas many of the contributions from the field of political economy concentrate on the strategic interests of political actors in the study of institutional order and change, this paper will emphasize the role played by a broader register of normative orientations that exist among different actors in VET systems. Drawing on E. P. Thompson’s concept of “moral economy”, the paper will focus on the moral dimension of firms within systems of collective skill formation based on apprenticeships and statist-corporative regulations. The paper will discuss the character and strength of this kind of moral order in Norwegian VET, and will also provide a tentative comparison of the moral aspects of other Scandinavian VET systems

RN09S06 - Markets and Morality II

A Market of Distrust: Unofficial Payments for Hospital Care in China
Cheris Shun-ching CHAN (University of Hong Kong, Hong Kong S.A.R. (China)) | cherisch@hku.hk

This study examines the mechanism through which distrust constitutes and organizes an illegal market of gift and favor exchanges in the hospitals in urban China. Based on ethnographic studies in public hospitals in four Chinese cities in 2011-2013, this paper presents how the corporatization of hospital care in post-Mao China resulted in generalized distrust in hospitals and physicians. This distrust induced patients to revive a tradition of delivering hongbao (red packets containing money) to physicians, but imbued it with new meanings and new practices. It argues that patients or their family members offer hongbao not only to gain preferential
treatment, but also to buy an obligation from the physicians of whom they generally distrust and to abate the insurmountable fear and anxieties. However, physicians also displayed generalized distrust in patients, and consequently they refrain from accepting hongbao offered by those without guanxi (interpersonal connections). Hongbao exchanges, thus, are highly associated with the use of guanxi, and their category has shifted from “bribery-oriented” to “gift-giving-oriented.” This case sheds light on how and under what conditions distrust could generate an illegal market and shape its pattern of operation.

Economies of Death
Tiina Katarina ARPPE (University of Helsinki, Finland) | tiina.arppe@helsinki.fi

The paper targets the relationship between two concepts that a priori would seem to have little in common: Death and Economy. Economy as the institutionalized domain of production, exchange and consumption is based on positivity, repetition and circularity with a temporal perspective opening to infinity (continuous growth). Death, on the other hand, is a rupture affecting any positivity, the negation of what has been produced, something that cannot be appropriated, exchanged, measured or even experienced as such. Yet, when looking at the social and cultural theory of the 20th century one observes that death has been associated with almost every domain of the economic: appropriation, exchange, circulation, expenditure, debt, even the business cycle. The paper focuses on this connection in the texts of two of these theorists, the French Georges Bataille and Jean Baudrillard. It sketches out the anthropological roots of both authors in Marcel Mauss's essay on the gift and their divergent emphasis on exchange vs. expenditure. It shows the crucial role of death in this constellation by taking up Bataille’s theory of general economy and Baudrillard's discussion of terrorism as paradigmatic examples articulating their differing views of the relationship between death and the economic; this discussion is directly connected to the problem of the inappropriable and the way the two theorists understand the nature of the rest (that which cannot be appropriated). Lastly, it discusses the theoretical framework in which the authors articulate the problem, and its implications on social order as well as social theory.

Business Long Distance Adoption through Micro Finance. Reflections on the Application of the Ethic of Responsibility to Economic Decisions
Caterina GALLUCCIO (Universita' Degli Studi “G. d'Annunzio” Chieti-Pescara, Italy) | CGALLUCCIO@UNICH.IT

The paper combines together two instances of the contemporary Italian society: on the one hand the increasing poverty and the scarcity of public funds, and, on the other hand, the need for savers and investors to acquire an awareness about the ethic of responsibility (Weber) included in their daily economic decisions. After analyzing that 1) ethical supply is driven by ethical demand; 2) in the future the economic sustainability of micro finance programs will lie in their capacity to attract individual savings; 3) little interest appears to be paid to the non-economic consequences of economic actions; 4) empirical evidence shows a general lack of trust in others and in political and economic institutions; the problem that sparked off this research is how to combine demand and supply, in other words, how to involve small and medium savers in order to create a point of encounter between individual savings and micro finance programs aimed at fighting the increasing daily resource deprivation a large number of Italian people are experiencing. The hypothesis that has been put forward as a keystone of the above topics is to borrow the well-known formula of long distance adoption, looking to it for that “emotional” key that can open
the door to socially managed savings, encouraging savers to consider the consequences of their economic action and to abandon the mechanism of delegation in their economic decision making.

The paper reviews the literature on the topic, examines the above issues and, based on some empirical results, proposes some perspectives for the future.

RN09S07a - Sustainability and Corporate Social Responsibility I

Sustainability of Social Institutes and Corporate Social Responsibility
Irina Vladimirovna DOLGORUKOVA (Russian State Social University, Russian Federation) | div0607@gmail.com

Social responsibility of corporations gradually takes more important place in different spheres of social life in the world. However, with a growing share of corporate social responsibility in the social sphere in many countries, its chaotic and individual character reveals. For example, systemless social policy is typical for Russian companies. Individual entrepreneurs take measures in social security as they think fit and desirable.

Creating a sustainable strategy for corporate social responsibility in the company is quite difficult, when the conditions for this concept are not created in the society in general, i.e. with involvement of key public institutions. These can include the state, civil society, public opinion and others.

The concepts of "social responsibility" and "sustainability" are closely connected. Social responsibility aims to organize and manage a sustainable development and responsibility for society and environment. On the other hand, the stability of the key public institutions stimulates the social responsibility of business.

The state is the main social institution that organizes and manages social processes. Governmental support encourages social responsibility of business. Also many countries support a system of sanctions which regulate the process of implementation of corporate social responsibility. General norms and principles of morality in the economic sphere are supported by professional associations and councils, as well as by business associations. So the civil society regulates standards of social responsibility.

Therefore, the classical model of corporate social responsibility should be based on the principles of sustainable strategies and the inclusion of all stakeholders into management process.

Corporate philanthropy of large firms in Russia: sociological analysis
Marina CHERNYSHEVA (National Research University – Higher School of Economics, Russian Federation) | maringord@gmail.com
Olga KUZINA (National Research University – Higher School of Economics, Russian Federation) | kuzina@hse.ru

Both economics and sociology have advanced research on corporate philanthropy. However, these academic disciplines provide different explanations of how corporate philanthropy works. If economists base their research on the assumption of rational behavior, sociologists take into account cultural and political issues, such as norms and values or ideology. In our research we compare and contrast existing sociological theories and empirical research on corporate philanthropy and apply Weber's concept of patrimonial authority to the analysis of this phenomenon in Russia.
In the Western sociological literature there are at least three main approaches, explaining how corporate philanthropy functions. In structural functionalist approach society is seen as a self-maintaining system made up of «parts» which contribute essential functions to the survival of the whole. In this case corporate philanthropy is an institute which mitigates income inequality and therefore contributes to a stability of the social system. In the critical theory corporate philanthropy provides an institutional basis for the hegemonic function of the dominant class. Institutional approach conceptualizes the relationships between business and its environment in terms of existing norms and formal institutions. Firms support philanthropic programs on the basis of what is acceptable and legitimate within a particular environment.

In our research we apply Marx Weber's theory of patrimonial authority. On the basis of this theory we assume that the state protects the privileges of the firms in exchange for their loyalty to the state. In response firms carry out philanthropy initiatives favored by the state.

Rami KAPLAN (The Free University of Berlin, Germany) | ramikaplan@gmail.com
Daniel KINDERMAN (The Free University of Berlin, Germany) | dpk24@cornell.edu

The paper unearths the earlier globalization of ‘corporate social responsibility’ (CSR). In the postwar era, CSR immigrated from the U.S. to other parts of the world through four process: American MNC operation in the global South (1950-1972) and adoptions by indigenous corporate elites in Venezuela (1964), The Philippines (1970), and the UK (1980). The article analyzes an understudied form of corporate exercise of social power, including national business community-level mobilization for collective action, institution building, and global circulation of strategies. While sociologists have for long studied corporate political action in influencing legislation and public policy, we shift the focus to a distinct socio-political strategy that (1) targets populations and only indirectly governments; (2) is realized through a business self-initiated expansionary redefinition of its role in society and a corresponding redeployment of corporate policies (i.e., a particular model of management is collectively adopted); (3) is aimed to improve individual and collective corporate public image (i.e., it functions as a public relations strategy); and (4) when collectively adopted by a national corporate elite, is aimed to modify the national layout of socio-economic governance (i.e., a particular [more privatized] societal mode of governance is promoted). While the above are traced to be universal features, the comparative design allows for a nuanced analysis of the nature of challenges/opportunities that triggered the adoption of CSR strategies in either the global South or North, the various goals pursued, the constitutive processes of mobilization, the adjustment of the strategy to particular contextual factors, and the kind of American influence in play.

Co-operative values to promote corporate social responsibility

Ana BURGUÉS (Universitat de Barcelona, Spain) | ana.burgues@ub.edu
Maria Angeles SERRANO (Universitat de Barcelona, Spain) | mangelesserrano@ub.edu

A body of research shows that during economic crisis, cooperatives are more resistant if compared with the conventional capitalist enterprises. Furthermore, it is already proved that cooperatives have lower dismissal rates during recession periods. These factors are related to strategic decisions made by the associated work cooperatives, as they include the participation of workers in the decisions with regards to capital, results and management. In a sense, they generate a stronger sustainability at the business and social levels, achieving social impact in the territory.
The corporate social responsibility of cooperative enterprises is based on institutionalized actions and values. The International Co-operative Alliance defines as co-operative values aspects such as self-help, self-responsibility, democracy, equality, equity, solidarity, honesty, openness, social responsibility and caring for others. Therefore, in order to replicate such type of organization committed with the territory, it is necessary to put into practice business actions but also to include people towards the co-operative values.

The present paper analyses the strategies that contribute to achieve a successful transferability of the cooperative experience. The evidences presented are based on the results of the research project “Competitive cooperativism: Contributions to employment sustainability and quality in the present economic framework” funded by the R+D National Plan of the Spanish government. The results emphasize the importance of the strategies that the cooperatives have developed with regards to values in order to strength social responsibility.

RN09S07b - Sustainability and Corporate Social Responsibility II

You Are Hereby Warned: You Can Borrow Money!
Christian POPPE (The National Institute for Consumer Research (SIFO), Norway) | christian.poppe@sifo.no
Unni KJÆRNES (The National Institute for Consumer Research (SIFO), Norway) | unni.kjarnes@sifo.no
Jo HELLE-VALLE (The National Institute for Consumer Research (SIFO), Norway) | jo.helle-valle@sifo.no

In 1999, a duty for Norwegian banks to dissuade certain categories of customers from borrowing was introduced. The intention was to establish a choice architecture designed to nudge borrowers to voluntarily abstain from taking on too much debt. As such, it is a case of applied behavioural economics in regulation. This article investi-gates empirically the political and legal processes behind the regulation, and identifies immediate and long-term consequences. It is questionable whether the duty to dis-suade works as politically intended. Rather, the analysis suggests that the conse-quences of market nudges are influenced by existing regulations and power structures. The imbalanced relationship between financial institutions and households enables the former to define the frames, and thereby the effects, of dissuasion. This point to the need of placing studies of behavioural economics approaches within the particular institutional frames in which they are employed, with special regard to power and interest constellations.

Experimentalism Meets Economy – a Fusion Supporting a Transnational Democracy? Lessons From the Case of Electronic Waste
Stefan LASER (University of Kassel, Germany) | stefan.laser@uni-kassel.de

Today, we live in highly interdependent, transnational societies. Global value chains (Gereffi et al. 2005) intermingle distant countries, which (mostly) also embrace democratic values. The backdrop of our consumption is considered to be highly political, collectively relevant, yet governance is sought to be handled best autonomously by private actors. – Is it possible to balance transnational values chains with democratic interventions more intensively? An experimentalist model of a “consumer democracy” – developed cooperatively with my colleague Jörn Lamla (Lamla 2013) – is introduced considering the example of electronic waste to answer this question positively.
Embracing pragmatist framings (Dewey 1927; Latour 1999) democracy is defined as a process of problem solving that evaluates gradually which actors and interests ought to be a part of a collective. This may be applied to (problematic) global values chains. These evoke arenas where propositions about the programming of a value chain are intensely negotiated – unlike the infamous “invisible hand” suggests collective programming is not transcendent but immanent. Economic sociology could accompany an arena and its specific laboratories ethnographically, to carve out emerging market-orders, outstanding experiments, and the “economies of worth” (Boltanski/Thévenot 2006) mobilized.

The example of the value chain of e-waste – linking Europe with India – helps accentuate possibilities and challenges of an experimentalist framework. Here, one especially finds supporters of machine-efficiency (recycling) combating visions of repairing and sharing (refurbishment). A new Indian law, which evolved inside the arena, will be interpreted. There, one finds a problematic, unilateral focus on recycling – being imported from influential yet questionable European laboratories.

Solidarity-based strategies in times of crisis, responses from the worker cooperatives
Gisela REDONDO (University of Cambridge, UK) | gr368@cam.ac.uk
Alfonso RODRIGUEZ (University of Barcelona, Spain) | alfonso_rod@hotmail.com

This paper explores some of the solidarity-based strategies that the worker cooperatives have developed to face financial crisis in the Spanish context. The body of research focused in the analysis of these strategies as an effective way to achieve sustainability of the cooperatives during time, is at the core of this work. In particular, the conceptualization of the Successful Cooperativist Actions (Flecha & Santa Cruz, 2011) is underpinning the findings presented. Using the communicative methodology, this paper draws on the results of a project developed in the framework of the International Network of Research on Cooperativism, coordinated by Ramon Flecha and Erik Olin Wright with scholars involved around the world. A total of 11 case studies were conducted between 2011-2014 by using diverse data techniques, and going in depth into the actions that allow cooperatives to be competitive in a global world on the basis of democratic principles. Some of the solidarity-based strategies, such as income adjustments or relocation of workers, are presented and discussed in this paper. The findings suggest that the solidarity-based strategies of the cooperatives contribute to the sustainability of employment rates and the improvement of the working conditions.

Consuming the Home - Crisis, what Crisis?
Elling Martin BORGERAAS (National Institute for Consumer Research, Norway) | elling.borgeraas@sifo.no
Christian POPPE (National Institute for Consumer Research, Norway) | christian.poppe@sifo.no

The financialisation of the world economy has enabled households to build welfare and accumulate assets with borrowed money. But it has also led to a more unstable economy and recurrent financial crises. Norway is one of the few European countries that has only been lightly affected by the current one. Instead, the country is marked by more than two decades of economic upturn. However, during times when “everybody” is getting rich, people are also moving into risk positions that may prove difficult to tackle over time. Based on recent survey data, this paper explores how severe potentials for crisis are building up among Norwegian households through equity extensive ‘equity borrowing’ whereby homeowners spend their housing wealth by rolling back the costs of consumption into an existing mortgage. The practise means that households, encouraged by a favourable system with low interest rates and sales-
oriented lenders, speculate with their future incomes against expectations for rising property prices. As a result, both mortgage volumes and home prices have risen to unprecedented levels. Economists generally expect the “market” to “fix” any imbalances through so-called “corrections” where “unnatural” housing prices are brought down to reasonable proportions. This may be unproblematic as long as such corrections are done at a point in time when the system is still “sound”. The paper argues that this is no longer the case for Norway as the level of borrowing is too high among substantial proportions of households.

RN09S08a - Markets, Innovation and Technological Change I

Innovation at the information and communication technology sector: identifying firms’ profiles under the crisis in Portugal
Ana FERREIRA (Centro Interdisciplinar de Ciências Sociais, CICS.Nova - Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, Portugal) | aferreira@fcsnh.unl.pt
Ana Lúcia TEIXEIRA (Centro Interdisciplinar de Ciências Sociais, CICS.Nova - Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, Portugal) | analuciateixeira@fcsnh.unl.pt

Portugal had steady increases of innovation performance and innovation activities in companies up to 2010, the year when the sovereign debt crisis burst in Europe and one year before Portugal's bailout by the Troika. Since then, there is an inversion of this increasing trend that is concomitant to negative economic performance by firms. Understanding innovation as a future-oriented social change process that, building upon scientific and technological (S&T) knowledge, is framed by organizational, social, economic and political contexts, we questioned how innovation development was dependent on these contexts during the crisis in Portugal. For this purpose, we quantitatively characterized innovation activities and its contexts in 309 firms of the Information and Communication Technologies sector between 2010 and 2012. Following, we performed a cluster analysis and identified two innovation profiles. These present intra- and extra-organizational dimensions with indicators on financial resources and number of clients contributing the most to discriminate firms’ profiles and not indicators assessing scientific or technological activities. Additionally, our data shows that in favourable contexts, historically- and contextually-embedded confidence emerges and surpasses future-associated uncertainty, thus enabling innovation development. In more unfavourable scenarios, the absence of confidence inhibits innovation contributing to trap firms in deleterious vicious cycles.

This study shows that the additive impacts of the intra- and extra-organizational contexts have to be jointly tackled to foster innovation development. In addition, perceptions on confidence in the companies’ future are dependent on companies’ innovation profiles and thus can give us, in a snapshot, an indication of companies’ physiognomies.

What explains the differences in the level of financial capability of consumers? Evidence from Russia.
Olga KUZINA (National Research University - Higher School of Economics, Russian Federation) | kuzina@hse.ru

The main purpose of the study is to assess the level of financial capability of Russians using the methodological approach developed by Russian Financial Literacy and Education Trust Fund. Data - all-Russian survey conducted in September 2014 (N = 1,600 people).
To ensure internationally comparable results the methodological approach developed by Russian Financial Literacy and Education Trust Fund was used to estimate indexes of financial capability. The difference between financial literacy and financial capability lies in the fact that the concept of financial literacy focuses on knowledge of the financial market, while financial capability - on the application of knowledge in practice. This approach was developed in the UK and was first applied in the study, commissioned by the Financial Services Authority (FSA), and then formed the basis of the methodology of Russian Trust Fund. Financial capability consists of several components (skills, understanding, knowledge, and motivation) that have to be measured empirically. Unlike other approaches to the measurement of financial literacy the Russian Trust Fund methodology is based not only on the value judgments of experts about the components of the concept of financial literacy of individuals, but also includes the notions of consumers themselves about the kind of behavior which they consider to be financially literate. Empirical validation of the methodology was carried out through focus group discussions in low and middle income countries.

On the basis of Russian sample collected in 2014, using PCA analysis, the components of financial capability were revealed and scored. Due to the fact that the international methodology was used, the results are comparable with those obtained in other countries including Mexico, Uruguay, Colombia, Armenia, Turkey, Lebanon and Nigeria.

To identify socio-demographic factors affecting the financial capability scores of each of the components the regression analysis is used. Cluster analysis groups people with similar financial capability profiles. The results are discussed in comparison with the empirical findings in the countries of Russian Trust Fund research sample.

By describing the average socio-demographic characteristics of people in a group useful information is provided to policy makers who will target an intervention at those groups.

Management Fashion Market in Brazil
Monise Fernandes PICANÇO (University of Sao Paulo, Brazil) | monise.picanco@gmail.com

This paper is interested in the emergence of management fashions in Brazil. It is argued that management fashions can be studied as a market, where management gurus are products and producers of new conducts to run, create strategies, lead and think organizations. Through an empiric case study I intend to show (1) the importance of status signals in a market where management gurus and management fashions are traded (PODOLNY, 1993; ASPERS, 2005), as well as the value of social network analysis to comprehend production of management fashion in Brazil. The quality of management fashions and management gurus performances are seen as constructs. They are assigned accordingly to strategies of cooperation or competition between actors involved in production and diffusion of management fashion in this market as well as the links between these actors. Management gurus are described here as speakers who usually act as management consultants and as writers. Through their performance, rhetoric about ideas and their own personal experience, they sell and spread forms of thinking and conducting oneself in corporative world (HUCKZYNSKI, 1993; JACKSON, 2001). Management gurus are producers and products of singularities (KARPIK, 2010) and their transit in the market of management fashions is entangled with the performance of other actors interested in diffuse and produce management fashions. Business schools, management consulting firms, management media and editorial market constitute a multitude of firms that connected through competition and cooperation make viable the construction of this market. In Brazilian case, most of the key actors of this market are reunited once a year since the 2000 in a management fair called HSM Expomanagement. This fair—thought here as a photograph of Brazilian management fashion market—will be in focus of the empirical analysis, as well as its creator – HSM Executive Educator, one of the main actors in management fashion market in
Brazil involved in business training within firms, as well as with management media. Empiric data used to this article involves ethnography, qualitative interviews conducted with in the fair expositors, fair organization and consumers. Documental analysis will also be used in the analysis and reconstruction of the network of firms that constitute this fair and consequently this case study of management fashion market in Brazil.

Can there be any innovation in “closed” communication conditions?
Regina SALMU (University of Tartu, Estonia) | regina.salmu@ut.ee

In order to assess and improve the innovative potential of organisations, the analysis of communication procedures, tools, actors involved and the general structural preconditions shaping the communication process is crucial. However, research focusing on holistic interrelationships between an organisation’s communication policies and practices and its innovative potential is rather rare. One reason might lie in the deficit of the frames for analysis. This study shows how development models can be used for the analysis and evaluation of interrelationships between communication management policy and practice and the efficiency of the innovation process.

Empirically, the analysis is based on an ethnographic study carried out in the largest ICT Company of Estonia. The author explored the process of the implementation of SEPA (Single Euro Payments Area), a particular innovative service development process, during a one-year period. This was based on participant observation field notes from more than thirty meetings. I aimed to identify the connections between the practices of communication and moments of creativity, and map situations where creativity was impeded by such communication procedures as “information scattering points” and interaction barriers between participants. During the implementation period, two different development models were used: waterfall and agile. The development process started as a waterfall model and, with the addition of complexity to the process, the model was transformed into the agile. I discuss how the communication model can follow the development model’s changes via the smart combination of open and closed communication.

RN09S08b - Markets, Innovation and Technological Change II

South European Countries’ systems of innovation in hard times
Francesco RAMELLA (University of Turin, Italy) | francesco.ramella@unito.it
Davide DONATIELLO (University of Turin, Italy) | davide.donatiello@unito.it

Is there anything that South European Countries (SECs: Greece, Italy, Spain and Portugal) share in terms of innovative performances? What has been the impact of the international crisis and austerity policies on the behaviours of public governments and private companies? Have SECs adopted a pro-active behaviour -investing more resources in research and innovation and in the related policies- or have they taken a more defensive attitude? In other words, have SECs deployed a counter-cyclical strategy based on innovation and policies aimed to support long-term growth?

What have these countries in common?
The first element shared by SECs is the weakness of their National Systems of Innovation. In fact, according to the 2014 Innovation Union Scoreboard all of them belong to the group of the “Moderate Innovators”.
The second aspect is that firm investments and patenting intensity are below the European average.
The third aspect is that SECs are under-specialised in high tech industries. Looking at the Community Innovation Survey, however, the picture seems less gloomy and we have a sort of paradox: the firms of the Mediterranean countries seem able to innovate despite the limitations of their national systems and the deficit of resources invested in R&D. How can this SECs’ Paradox be explained? We will try to answer this question focusing on two dimensions: 1) the specific characteristics of their National Systems of Innovation, highlighting not only their similarities but also their differences, and 2) the behaviour of firms during the international crisis.

Cultures of Innovation: The Role of Long Term Orientation and Indulgence in National Innovation Success

Andrzej BUKOWSKI (Jagiellonian University, Poland) | contraab@wp.pl
Seweryn RUDNICKI (AGH University of Science and Technology, Poland) | sew.rudnicki@gmail.com

The aim of our presentation is to show that culture plays a crucial role in national innovation success. Hofstede’s values dimensions has been widely recognized as measures of important components of cultures. It was also shown that Hofstede’s dimensions of individualism and power distance were correlated with national innovation (Rinne, Steel, Fairweather 2012; Shane 1993). The former studies, however, did not included all of Hofstede’s dimensions and as such may be regarded as insufficient. Via multiple linear regression including all of Hofstede’s cultural variables we show that actual correlations significantly differ from those reported in the earlier research: not only individualism but also ‘long term orientation’ and ‘indulgence vs. restraint’ are highly related to national innovation level.

We also propose an interpretation of these new correlations as revealing some complementary cultural drivers of innovations. Long term orientations is related to thrift and perseverance which may be responsible for supply of innovations, whereas high levels of indulgence may stimulate demand for innovations in consumption societies. If so, it seems that the most innovative societies are those both oriented for hardworking and ready to make life easier and more pleasurable. This argument is in contrast to popular Schumpeterian model of innovativeness as it highlights not only the individual innovativeness of an entrepreneur or a company but rather complex cultural background as crucial factors of national innovation success.

RN09S08b - Markets, Innovation and Technological Change II

Entrepreneurial Universities: British, Finnish and Turkish Cases

Emek Banş KEPENEK (Baskent University, Turkey) | ekepenek@gmail.com

It is accepted that innovation which is based on knowledge creation isthe key driving force behind the socio-economic growth. There are three complimentary factors that must function harmoniously in order create a proper innovative base; entrepreneurship; public governance and universities. The paper interests in one of the leg of that triple-helix: universities which have run entrepreneurial activities.

It is known that universities play an important role as both knowledge-producing and a disseminating institution in both innovative and entrepreneurial activities. While many students dream of starting the next Facebook, universities have focused more on the increasing the entrepreneurship culture for their students. Universities are investing both in formal programs as well as in extra-curricular activities to channel the ideas of students towards entrepreneurship
and so to contribute to their societies. One of the outcome such activities is the concept of pre-incubation center which is the central focus of this paper.

Incubation is a business support process that accelerates the successful development of start-ups and companies by providing targeted resources and services. Although incubation idea will focus on already established firms, either start-ups or seniors, the pre-incubation centers will focus on the new ideas of students. It is well known that pre-incubation activities will bring the society, notably the youngsters, into a better and sustainable future.

There are a few universities in the EU region which are perfect examples in terms of their accumulated experience about university –based entrepreneurial activities. Historically the Great Britain is the first well advanced country in terms of entrepreneurship while Finland is the primal example for the innovative entrepreneurship.

The research will focus on the impact of the services offered, namely infrastructure, coaching and networks, on the graduation rates of the respective incubators' tenants. The aim is to compare and contrast the British, Finnish and Turkish cases. Such comparison will definitely provide necessary ideas to improve the quality of those initiatives, especially for Turkey.

**Temporary debate on universities functions: is the knowledge transfer manifestation a neo-liberal paradigm?**

Maria NAWOJCZYK (AGH University of Science and Technology, Poland) | maria@list.pl

The dominant paradigm for a number of decades of neo-liberal economy has not significantly weakened even times of economic crises referred to as the largest since the Great Depression. Moreover, for a long time we were witnessing the moving logic of economic activities to other spheres of social life. The process of marketization of the public sphere is constantly progressing. It should, therefore, take the debate over its reach and impact on the functioning of the universities too. Teaching and research were two traditional activities of universities to which now the third equally important one is added – the knowledge transfer. It is understood as the link between research and commercial outcomes (i.e. spin out and ‘spin-in’ companies, entrepreneurial incubators, start-up businesses, commercial patenting and licensing, marketization of research innovations). Moreover, it also includes other activities aimed at the strengthening of the academia business ties such as consultancy and contract research, student projects in industry, capacity building and continuing professional education. The question arises who could be the agents of these changes toward innovative economy. Within the present concept of knowledge based economy, knowledge became acknowledged as perhaps the most decisive economic resource for the 21st century’s economic activity. This has given rise to a whole new set of practices aimed at the improvement of the ways that knowledge is created, applied and transferred within and between organizations. The primary organizations where knowledge is created are universities. In the most developed countries, we can find many successful examples of cooperation between universities and their business environment in creating innovative hubs. From economic point of view these are very effective mechanisms of innovative development. The question arises how these practices influence universities as knowledge created organizations.

**RN09S09 - Modes of Economic Coordination and Governance**

**Legitimacy in Multi-level Governance: A Deliberative Discoursive Approach to Union Competition Law**

Firat CENGIZ (University of Liverpool, United Kingdom) | firat.cengiz@liverpool.ac.uk
The question that this paper aims to answer is: Union competition law protects ‘consumer welfare’ but what role do consumers play in competition policymaking? In the search for an answer, the paper investigates the moral (output) and procedural (input) legitimacy of the recent competition law reforms. Following a discursive approach, the paper looks into the roles played by institutions deliberating for citizens (consumer organisations, European Parliament and the Union Courts) in the reform process. This inquiry results in the questioning of the reforms’ legitimacy, and it also leads to broader conclusions regarding the legitimacy of multi-level governance: expert discourses overshadow potential deliberative qualities of networks, which exacerbates networks’ legitimacy problems. Also, the input/output legitimacy dichotomy appears problematic, as expert policymaking in the absence of citizen participation does not guarantee policies resonating with public interest.

Pan-European Fiscal Governance and Public Sector Sustainability – A Finnish Case of ‘Sustainability Gap’
Olli Petteri HERRANEN (University of Tampere, Finland) | herranen.oll.p@student.uta.fi

During the 21st century, several socio-political reforms in Finland have been justified with the so called ‘sustainability gap’ (kestävyysvaje). According to this concept, the public sector sustainability is under a threat due to an aging population and increasing social costs. The method of assessment applied comes from the European Council and is a part of the pan-European financial governance where the EU-countries have to use the same indicator to estimate the public sector sustainability. However, a closer investigation reveals that the indicator and the calculations concerning the sustainability gap are based on a lot of questionable economic presumptions. According to one, public spending always crowds out private economic activity and therefore harms the economic growth. It follows that seeing public spending as a substitute for private spending also crowds out the possibility to see public action as a productive investment. This study uses the Finnish case as an example of how the claim of aging societies in EU changes the organization of a welfare state while the calculations concerning the relationship between economic and demographic development are highly questionable.

Andre ORTIZ (University of Oldenburg, Germany) | andre.ortiz@uni-oldenburg.de
Henrik SCHALKOWSKI (Private) | hsch09@gmx.de
Manfred KLÖPPER (University of Oldenburg, Germany) | manfred.kloepper@uni-oldenburg.de

In rather economically underdeveloped regions and in low- and medium-technology sectors, like the Renewable Energy Industry, small and medium size enterprises (SMEs) require specific financing solutions because of their unique sectoral business models (Mautz et al. 2008; Böttcher 2010; Böttcher/Lange 2010). Referring to these characteristics economic geography and regional innovation literature postulate the important relationship between financial intermediaries like banks in a region and companies’ and industries’ competitiveness (Boschma 2004; Nauwelaers 2011). However, the process in which regional banks contribute to firm success and the attended regional factors remain occasionally unexplained. While prior studies (Crouch/Trigilia 2001; LeGalès/Voelzkow 2001; Voelzkow 2007) emphasize the perspective of companies who act as stakeholders in economic regions and profit from local collective competition goods (demand side), our explorative empirical-based paper presents for the first
Materialities of economic growth in southwestern rural Poland. Special Economic Zone as a manifestation of neoliberal imaginary
Marta SONGIN-MOKRZAN (AGH University of Science and Technology, Poland) | martasongin@gmail.com

In the course of systemic transformation Poland has adopted growth-oriented approach toward development and a line of politics that supports it. One of the key assumptions underlying this approach is the idea that the influx of international capital is an indispensable condition for stimulating economy at macro and micro levels. For this reason, the consecutive governments have been introducing legal mechanisms which offer investment incentives to foreign entrepreneurs. As a result of these efforts, in 1995 the first Special Economic Zone (SEZ) was established. Since then, Poland has created another 13 zones, mainly in rural areas. These neoliberal procedures of restructuring ruralities have contributed to the sociospatial reorganization of the local landscapes.

In my presentation I would like to explore the socio-cultural consequences of the economic transformation processes through the prism of the manifestations of economic growth in rural Poland. I will particularly focus on the changes that have occurred in a commune which is well-known for its active policy on attracting foreign investors. My point of departure is the territory, occupied by the SEZ, which I conceive as a certain time-space material palimpsest representative of the scenario of economic transition: from the utopia of state-owned collective farms to the neoliberal dystopian industrialization with its complex infrastructure. Questions of my interest are as follows: what are the material indicators of growth in rural areas?; what meanings are attached to them?; and in what ways do they redefine the imaginative landscapes of the local communities?

Institution Arrangement and Economic Development: A Case from Taiwanese Software Industrial Development
Ssu-Chin PENG (National Cheng-Chi University, Taiwan, Taiwan, Republic of China) | aegis146@gmail.com

Differing from Neoclassical economics, some scholars from social science argue that state interventions have positive influence in economic development. For example, Gerschenkron (1992) discuss the economic development process of the European countries in 19 centuries, arguing that why those European countries can develop, it is not because of the cheaper labor wages, it is because those countries use the financial (German) and state (Russia) system to support their economic development. Same thing echoing in the East Asia, when scholars discuss the economic and industrial development of East Asia countries, they argue that due to the cooperation of state and private sector, make East Asia countries can fast catch up with the
developed countries in the western. The pioneer is Johnson’s (1979) study of Japanese Ministry of Economy, Trade and Industry (short as MITI). Johnson’s study not only explained the economic development of Japan during 1925-1975, but also opens a study approach called “developmental state”. Since the Johnson (1979) began to use the theoretical frame of developmental state to discuss the economic development in Japan, many scholars followed this academia tradition, hoping to give the proper explanation of economic development in developing countries, especially in East Asia. Amsden (1989), Evans (1995) and Woo-comings' (1999) studies basically followed Johnson’s theoretical frame, trying to interpret how state influences its economic and industrial development.

As to Taiwan, the efforts of Taiwanese government in economic and industrial developments not only become the example that scholars used to against the dependency theory, but also as the proof of developmental state. Amsden (1979) and Barrett & Whyte (1982) both pointed out that Taiwanese government trying to control the foreign capital and they worked with domestic private sector, together they create the so called “Taiwan economic miracle”. Wade (1990) found that Taiwanese government used the method called “governing the market”, argued that government using the policy tool to govern the market, pushing the local firms do things that government want them to do. According to Wade (1990), doing so, Taiwanese government can upgrade its domestic industries and create economic growth one time and another. Besides Wade, many Taiwanese scholars discovered the same thing (Chu & Amsden 2003, Chen 2008), and arguing that Taiwanese government have positive influence on economic and industrial development. Today, such theoretical framework has become the popular theoretical tool, when scholars discuss the East Asian countries’ economic and industrial development, they always use the “developmental state” as the causal mechanism.

Till today, this “developmental state” conceptual framework has become a popular causal mechanism of economic development in East Asia, but it still has its theoretical weakness. This article list three major problems that researcher will encounter, when they try to use such concept in analyzing. First, in theoretic level, the concept of developmental state has its adequate limitation (Cheng 1999; Wang 2003). Second, researcher of developmental state have bias in research target, they often chose the succeeded one instead of failure ones (Cheng and Wang 2010). Finally, and most importantly, this article argues that researcher of the developmental state, ignoring the important role of state agency in industrial development. What is state agency? This article defines state agency as the institute that state set up for industrial development. For example, in Evans’ (1995) study, he discussed the different role that state played in high-tech industry. The problem of his study is that, if we look carefully at his example, we will find out that those state Evans discussed, they all use state agency to push industrial development. So there is a misunderstanding between state and state agency in industrial development. Hence, if researcher wants to evaluate the state’s performance in industrial develop, it is necessary to distinguish the role of state and state agency. And the biggest weakness of developmental statists is that those researchers garbled the role between state and state agency in discussing industrial development. When they analysis the developing countries’ industrial development, they often contributed the efforts of state agency to state, so their researches have bias.

Hence, to avoid such bias, this article uses the Taiwanese software industrial development as the example. To take a detour of Taiwanese government (state) and Institute of Information Industry (state agency), try to discuss the institutional arrangement of state agency’s influence of economic performance. Here, there are two questions need to be answer. First, why choose Taiwanese software industry? In the Taiwanese government’s plan, Industrial Technology Research Institute (short as ITRI) is responsible for Hardware industry development in Taiwanese high-tech industry development (including semi-conductor industry), and in Taiwanese software industry development, Taiwanese government set up the Institute of Information industry (short as III), ask it to help domestic software industry to development.
Unlike its counterpart ITRI, some scholars argue that III not only block Taiwanese software industry development, but also gain self-profit from its special apparatus (Breznitz 2007). Taiwanese newspapers also reported same point of view, especially when they interviewed some of the local software companies, same as Breznitz (2007), they both point out that III fight interest with the local software companies. Hence, Breznitz (2007) said that the Taiwanese software industry development’s failure is the III’s responsible.

Second, this article argues that the failure of III, is not because III use its special apparatus to block Taiwanese software industry to develop and gain its own profit, while it is because the flaw of the institutional arrangement when setting up the III. Institutionalist thought that institution will affect the individual and organizational behavior, even constraining their choice. Institutionalist use the term “path dependency” to portray the influence of institution. Scholar discussed the concept of path dependency, besides considering the pattern of institutional change, some scholar argue that the moment of institutional “lock-in”, when setting up the institution. Some said that it is important to discuss the time when institution is being set up, because how the institution be designed, can affect the later-on institutional maintenance and change. In this article, to discuss the time when institution is being designed has another insight, which is can tell the difference of state’s capability to control the state agency, make them to fulfill their goal in promoting industrial development.

This article uses the technological project as the example. Technological project are the financial founding that comes from Taiwanese government as the financial support of ITRI and III’s expending of R&D. This article founds that due to the institutional arrangement difference, Taiwanese government has more control power on ITRI than III. This difference causes that III ignoring its original goal of industrial development, focusing on its own organizational survival. But why III has to do so? According to the Data from official document, this article found out that although III have much more degree of freedom, III can not get enough financial support from Taiwanese government. In technological project, it is clear that ITRI got twice founding more than III. In this vein, it is clear that why III have to block all of governmental bids, because there is not enough founding from government. III has to depend on itself to make organization survival.

To conclude, this article through organize the empirical data, argues that government intervene into industrial development is not guarantee the industrial development. This article founds that the institutional arrangement is the key of industrial development. Comparing III and ITRI’s institutional arrangement, we found that ITRI’s institutional arrangement makes Taiwanese government has ability to constrain ITRI’s behavior, also can finance ITRI as much as ITRI needs. So ITRI can focus on promoting Taiwanese hardware industry and developing technological skills. While, due to the III’s mixed position, Taiwanese government can provide mush resources to III, hence have to use another method to finance III. This article argues that because of the institutional constrain, makes III ignore its goal of industrial development, focusing on its technological increase and its organization survival.

RN09S10a - Work Transformations I

With a little help from my friends – relational work in horse-based enterprising
Erika Andersson CEDERHOLM (Lund University, Sweden) | erika.andersson_cederholm@ism.lu.se
Malin ÅKERSTRÖM (Lund University, Sweden) | malin.akerstrom@soc.lu.se

Abstract
The integration and fuzzy borders between formal and informal economic exchanges are highlighted in important contemporary sociological work. A study of Swedish lifestyle entrepreneurs who are running small-scale horse-related enterprises, is used as an illustration of such blurred boundaries: Between family life and work, individual leisure interest and business, money and gifts. The specific characteristics of this form of enterprising, where the owners/operators of the horse-farm, customers, employees and voluntary workers share a leisure interest in horses and take part of everyday work at the farm, provides the foundation for a work environment where personal favour exchanges and a gift economy are intertwined with a monetary economy. Drawing on Viviana Zelizer’s notion of “relational work”, the analysis focuses on how various friendship-like relationships are established in tandem with specific forms of economic exchange. It is suggested that relationships, transactions, and forms of repayments, are constantly negotiated along a continuum between work-oriented friendship and friendly work-relations. Formal work-relationships and monetary exchange seem to exist both in parallel and intertwined with informal work-relations and gift-exchanges.

Nationalists at Work: Nationalism, Protestant Work Ethic, and Modernization in Cross-Cultural Comparative Perspective
Marharyta FABRYKANT (National Research University Higher School of Economics, Russia) |
marharyta.fabrykant@gmail.com

The relation between nationalism and work ethic has hardly ever been explicitly posed as a research subject, let alone empirically tested. Greenfeld (2001) and Mosk (2013) argued that in Europe nationalism was among the driving forces of the European modernization, via inspiring the features of Weber’s protestant ethic – propensity to accumulate the necessary resources for investment and readiness to delay rewards. The goal of the proposed research is to discover how nationalism is related to the protestant work ethic in the contemporary world, and if the theory of the role of nationalism in the early modern Europe can be extrapolated to the contemporary modernization dynamics in non-European countries. We estimated 9 series of multilevel logistic regressions using three indicators for nationalism (national identity, national pride, and willingness to fight for one’s country) and three indicators of work ethic (importance of hard work, hard work as an important child quality, and the belief that hard work brings success) from the two most recent waves of the World Values Syrvey (2005-2007 and 2011-2014) to test the following hypotheses: (1) that nationalism and work ethic are positively interrelated; (2) that a country’s level on nationalism for an earlier period is a stronger predictor of that country’s work ethic at a later period than vice versa; (3) that the relation between work ethic and nationalism must be moderated by modernization level: both nationalism and work ethic are higher in countries with lower scores on objective indicators of modernization level and have weaker impact on each other when controlled for a country’s current modernization level. The obtained results confirm the first and third hypotheses and reject the second hypothesis. 6 out of 8 interrelations between indicators of nationalism and work ethics are statistically significant, all of them positive. Most of these relations become weaker when controlled for countries’ modernization level, measured by the GDP pc. For most indicators, however the impact of work ethic on nationalism appeared stronger than vice versa: Thus, the relation of nationalism to work ethic at the contemporary modernizing countries is reverse to that attributed to the European early modernity. Work ethic, probably via real or perceived successes, inspires nationalism, which may bring forwards the destructive side of nationalism if a country’s performance falls short of the popular expectations.

The transformed career logic of Swiss banking elites: a field analytical approach
Pedro ARAUJO (Institute of Social Sciences, University of Lausanne, Switzerland) | pedro.araujo@unil.ch

During the last four decades the Swiss banking system has undergone a concentration process, has shifted its activities from retail to investment banking and has been thoroughly internationalized. Inspired by a bourdieusian framework, we will examine in this contribution the impact of these changes on the structure and composition of the field of Swiss banking elites. For this purpose we will conceptualize elite’s careers as dynamics of acquisition, accumulation and conversion of different types of capital. Using a database of 487 Executive and Non Executive Directors from 37 Swiss banks we perform a multiple correspondence analysis which allows us to identify combinations of educational, social and cosmopolitan capital that lead to top positions in the different fractions of the field of Swiss banking elites. Our findings show a duality between an increasingly importance of transnational careers and the persistence of national anchorage. On the one hand, the restructuration of the Swiss banking system has led to the emergence of a new financial elite, characterized by its internationality and mobility, working mainly in investment banking. On the other hand, while national mechanisms of elite recruitment are still predominant in the majority of Swiss banks, cosmopolitan capital seems to become a powerful legitimization resource for banking elites.

RN09S10b - Work Transformations II

The Strength of Ties on the Polish Labor Market: How the Conditions of Local Economy Impacts on Getting a Job
Mikołaj PAWLAK (University of Warsaw) | mikolajpawlak@uw.edu.pl
Michał KOTNAROWSKI (Polish Academy of Sciences) | kotnar@isppan.waw.pl

The seminal work of Mark Granovetter (1973) proved that weak ties play a crucial role in the flow of information on the labor market. Yet, from the social networks literature, we know that ties of different strength are used in the acquisition of goods of a different value (Wellman, Gulia 1999). Assuming that the value of a job is affected by the economic situation in a given market, we intend to answer the question how does this situation influence the getting a job behaviors. Our general hypothesis states that the worse the economic conditions get, the more employees tend to rely on strong ties.

In order to check whether this is the case, we analyze the quantitative survey data on Polish employees who got a new job, in the July 2013-February 2015 period. In comparison to the majority of studies on the getting a job phenomenon, where the samples were limited to a local labor market or a single industry, our sample of 400 observations is nationwide. This very unique dataset allows us to analyze economic variables that we expect to exert various influences across the regions of Poland.

In the paper we present the results of a multiple regression analysis where the strength of the ties is the dependent variable, while the local economic conditions (rate of unemployment, local GDP, etc.) and the social status constitute the independent variable and control variable respectively.

Work transformation within post-soviet tranzit: sociological peculiarities of Ukraine case
Olga Vasylivna IVASHCHENKO (Institute of Sociology Nat’l Academy of Sciences of Ukraine, Ukraine) | olgvash@socinform.kiev.ua
Ukraine as a specific example of the post-soviet transitional country with nonstructured economy and partial changes on the background of prolonging usage of previous economic resources displayed strong interdependence of market, work, state and democratic processes. Simultaneous two historical projects of state and market building ongoing from early 1990-s revealed visible impact of soviet birthmarks, highly difficult for overcoming both for politicians and society. Ordinary working people faced to unknown experience of unemployment after broken ideological rule: one life-one work due to the soviet full-employment policy turned to search of work for surviving. Ukrainian policymakers were unable to offer any employment policy, therefore all postsoviet labour processes reflected initially spontaneous changes of employment practices, new tendencies of working aspirations and market with antisoviet private property consciousness development, highlighted by raised sociological rates of entrepreneurship support (62%) and own business start willingness (50%). Research question is addressing to understanding and explaining the routes and reasons of strong market trends within labour sphere and their crucial influence on Ukraine’s social transformation.

Conceptual framework build up on the methodology of path dependency; theory of market transition from socialism actualised by V.Nee as ‘capitalism from below’ (Nee 1989,1996, 2012); conceptualisation of second economy (Shreider, Gramatski 1986) and informal employment (de Soto 1986; Shneider 2006, Alexeev, Pyle 2001; Lehmann, Pignatti 2007; Maloney 2004); concept of self-employment in postsoviet case (Ivashchenko 1999-2014).

Labor integration processes and Job embeddedness of young people and the role of social factors in the current Greek economic crisis.

Sotirios CHTOURIS (University of the Aegean, Greece) | htouris@aegean.gr
George STALIDIS (Alexandrian Thessaloniki University) | stalidgi@mkt.teithe.gr
Malama RENTARI (University of the Aegean, Greece) | isse@aegean.gr
DeMond S. MILLER (Rowan University, USA) | millerd@rowan.edu

Labor integration processes and Job embeddedness, of young people and the role of social factors in the current Greek economic crisis.

In this paper, we attempted to reveal the trends and behavior profiles of young people, as regards the paths of their employment integration and Job embeddedness in today’s labor market in Greece. The study was based on a primary survey conducted in Greece in the period 2013-14 by the Lab of Social an Cultural Digital Documentation in the Framework of In4Youth Research programme with a sample of 2000 people aged from 15 to 34 years old. The statistical analysis included multidimensional factor analysis methods such as Multiple Correspondence Analysis, in order to uncover complex relations among Job embeddedness, job satisfaction and organizational commitment social capital, social support and traditional stances and values. Interesting patterns were found regarding the influence of Greek society on the paths of young people to employment. Unemployment and situations of unwillingness to pursue work consolidation are often related with strong dependencies from the family and high degree of support reception, while stable employment status is associated with strong social capital but moderate support from the family. The flexibility of contemporary labor activity as regards time, space and contractual forms is questioning work position security and predictability.
The challenges of labour market integration and its analysis using the social network approach
Kinga SZÉKELY (Corvinus University of Budapest, Hungary) | szkinga2003@gmail.com

This paper has in its focus a theoretical discussion about whether relatively good jobs can be accessed through using informal search methods; and under which conditions? The theoretical discussion is followed by a methodological comparative analysis of those results which cope with this question, presented in the light of the chosen methods.

Three major theories are presented. The first is the strength of weak ties hypothesis which argues that weak rather than strong ties are useful for job seekers to find a good job. The second is the social resources theory, which formulates that resources are unevenly distributed. Finally, the theory of employee referrals argues that an applicant with an inside contact has a higher probability of being hired than do other applicants in certain types of jobs.

The findings of this topic are ambiguous, some of the results suggest that applying on job contacts have positive relationship with wage, and employment probabilities, other results emphasize that the relationship is negative. What I argue here is that if we present these results from the aspect of the applied methods contradictions dissolve; and this suggests that results should be interpreted with more caution.

RN09S11 - Marketization and Financialization I

Debt collection through heterogeneous networks: Socio-technical arrangements and the enforcement of obligations to pay
Elias STORMS (University of Antwerp, Belgium) | elias.storms@uantwerpen.be

While indebtedness lies both at the heart of economic activity (as the necessary complement to credit) and at its fringes (as the inability to meet payments), the social practice of debt collection remains strongly understudied. When a debt cannot be met within predetermined terms, a complex struggle emerges over payment obligations, during which both creditor and debtor deploy various practices and strategies, from negotiations and payment plans to legal threats and juridical procedures.

Building on insights from the 'economization' framework outlined by Çalıkşan & Callon, this paper investigates the 'socio-technical agencements' at play in the debt collection processes. Using data obtained from a case study of debt collection practices in Belgium, I show how different devices (textual, material and technical), practices, expectations, and knowledges (both scholarly and lay) are deployed by both debtors and collectors. Special attention is paid to bureaucratic procedures and their textual & material aspects at 'street-level', to economic knowledge 'in the wild', and to narratives of legality. Examples of heterogeneous elements are legal consciousness, contractual stipulations, forms and procedures, financial strategies and budgeting practices.

In this paper, I argue that the economization framework is particularly well-suited to understand complex social and economic processes like debt collection, due to its emphasis on the active participation of heterogeneous elements in economic action, from materialities to specific economic knowledges. By drawing on these insights, this paper hopes to shed sociological light on indebtedness, while exploring and expanding the potential of the theoretical framework of economization.
Financialization, credit markets, and political consent in the “New Turkey”
Basak KUS (Wesleyan University, United States of America) | bkus@wesleyan.edu

One of the major dimensions of change in Turkey in the 2000s has been increasing financialization of the economy and the growth in household credit use. The total of consumer loans and credit card debt as a proportion of GDP increased about nine-fold between 2002 and 2012. In this paper I analyze the implications of increasing access to credit for the lives of middle and lower income citizens. Access to credit has granted these income groups more flexibility in terms of private consumption. In the context of a liberalized trade regime and expanding consumer and retail market, this has had a substantial impact on the everyday lives of middle and lower income citizens. As various studies have shown, attaining purchasing capacity by way of access to credit is a factor that might affect the way citizens perceive the prevailing level of welfare in society, and hence, has consequences for their contentment with and approval of the political regime. Therefore, this is a factor that needs to be considered as one of the underpinnings of public opinion and political consent in Turkey. At the same time, increased access to credit might lead to unsustainable levels of household indebtedness, which is a factor that might lead to instability for households as well as the larger economy.

In this paper I examine the degree of financialization in Turkish economy, and patterns of credit use across income groups, and discuss the implications of these transformations for the lives of middle and lower income classes.

Financialization in Turkey: Unending Conflicts among Actors
Nurdan Z. ATALAY GÜNEŞ (Mardin Artuklu University, Turkey) | znurdan.atalay@yahoo.com

Growing financialization has led to an increase in the number of credit card users and intensified the relationship among the banks and customers since 1990s in Turkey. The both sides of the relationship come counter especially issue on the credit card annual fees. The role of the state in this relationship is behind the shades for decades without regulating this dimension of it. Yet the state issued a law for encouraging banks to offer a credit card without an annual fee at the end of 2013. However; this has not solved the conflict because neither banks nor citizens were satisfied with this regulation. This paper, as a part of the ongoing project on the financial citizenship practices in Turkey, focuses on this unending conflict on the credit card annual fees among the state, the banks and the citizens or in other words ‘customers/consumers’ in Turkey from the historical perspectives.

Why is this conflict crucial to understand the financial citizenship? Because it gives us clues about the organization of economy under the growing financialization and the impact of the state on the regulation of this field and the positions of other actors from citizens to banks. Arguing this conflict or struggle of consumers NGOs against the credit card annual fee might be interpreted as a new form of active financial citizenship, this paper uses ethnographic methods to define the borders between legitimate and informal practices of the financialization of the economic field in the contemporary Turkey.

Counter-movements or weak veto players? Paths to industry regulation in the case of the financial transaction tax
Jan-Christoph JANSSEN (University of Cologne, Germany) | janssen@wiso.uni-koeln.de
Agnes ORBAN (University of Cologne, Germany) | aorban@uni-koeln.de

This paper examines varying national responses to the financial crisis in Europe in the case of the financial transaction tax. The literature on financial reform stresses the enduring power of the financial industry to veto regulation. This leverage is explained by the dominance of financial
markets in the operation of the domestic economy or by the lobbying capacity of the industry. In contrast, social movement scholars pinpoint to the costs of the crisis, the public outrage or consumer movements. We take a comparative perspective to examine the conditions for governments’ intervention in financial markets.

The European Financial Transaction Tax (FTT) has created a huge controversy in the aftermath of the financial crisis. Some applaud the tax as a contribution of the financial sector to the costs of the crisis; others warn that such a tax might reduce the competitiveness of the financial market. Given the nature of this regulatory measure, the controversy is not surprising: a tax directly affects actors’ opportunity to profit and the financial industry lobbied heavily to prevent its introduction. While ten European countries such as Germany, France, Spain, and Greece have agreed to introduce a financial transaction tax, many countries such as Denmark, the Netherlands, and Sweden remain reluctant or strongly oppose such a measure. As discussed above, political economists usually explain financial market regulation with reference to the structural and instrumental power of the financial industry. In contrast, using insights from economic sociology (Beckert 2012; Fourcade & Healy 2007; Suchman 1995; Trumbull 2010), we argue that counter-movements construct a legitimacy crisis by publicly questioning the appropriateness of market practices. We focus on moral legitimacy which is defined as the congruence of an organization and its activities with societal expectations about what is right and what is wrong (Suchman 1995). Hence, change originates from frictions between societal beliefs about the appropriateness of market practices and actual practices as perceived by relevant audiences. Such frictions can trigger a legitimacy crisis if social movements challenge the moral legitimacy of practices and institutions which support these practices (Avent-Holt 2012; Fligstein 2001; Schneiberg & Bartley 2001). Thus, broad counter-movements construct legitimacy crises which are visible to the so called “main street”. This in turn alters governments’ discretion of policy making through the public opinion. Thereby, the paper contributes to recent scholarship which stresses the importance of salience or public opinion in financial market regulation (Culpepper 2011; 2012; Woll 2013). However, we argue that public attention alone is not sufficient for changing politicians’ preferences, but needs to be catalyzed by broad social movements.

To capture the non-linear and conjunctual nature of this process, we examine governments’ preferences for a FTT in 27 European countries as the outcome of a “fuzzy set Qualitative Comparative Analysis” (fsQCA). In contrast to most quantitative approaches, fsQCA is well suited for the analysis of different paths to the same outcome (“equifinality”) (Schneider & Wagemann, 2012). Therefore, QCA offers leeway for national imprints and does not assume single conditions or variables affecting all countries in the same manner. The identification of necessary and/or sufficient conditions requires variation on the outcome as well as on all conditions deemed relevant. 27 EU-countries capture our whole population of interest (the European Union - without Croatia, EU-member since 2013). These cases vary on all conditions of interest. The time period of our analysis ranges from the outbreak of the crisis in 2008 to the decision of eleven countries for an FTT in 2013.

The preliminary findings of our analysis suggest that low financialization is a necessary condition for a strong preference for regulation. Governments in countries with a low level of financialization prefer regulation (1) when the costs of the crisis are high and when financial industry power is low, or (2) as a response to a broad counter-movement including both consumer and labor interests – regardless of the costs of the crisis. The results provide evidence for equifinal paths to regulation. Either governments take action if the pressure by their constituents is too strong to be ignored, or if the crisis hits hard and the financial industry is too weak to veto regulation. The former path is predominant in Western Europe, while the latter applies to Eastern Europe. We show that regulation is indeed the “first best” solution to a financial crisis when the crisis had severe impacts on society. On the other hand, broad social movements are able to impair national policies – independent of the cost of crisis.

RN09S12 - Marketization and Financialisation II

In Banks We Trust - Or Do We?
Christian POPPE (The National Institute for Consumer Research (SIFO), Norway) | christian.poppe@sifo.no
Elaine KEMPSON (The National Institute for Consumer Research (SIFO), Norway) | e.kempson@bristol.ac.uk

The financialisation of national and global economies has significantly increased lending in the private market; throughout the West, large proportions of households are typically engaged in life-long debt obligations. As thoroughly illustrated by the financial crisis, responsible lending and borrowing is crucial in cultures where social welfare and individual well-being is largely based on borrowed money. However, in terms of financial knowledge and competence the relationship between banks and households is skewed in favour of the professional actors. From a consumer point of view, the solution to this asymmetry is trust. Correspondingly, to attract customers lenders must appear as trustworthy in the long term. Based on a comprehensive literature review, three elements of trust are identified: affective trust and cognitive trust in financial advisers, and confidence in banks as financial institutions. The empirical analysis sets out to disaggregate these elements to understand how they in combination are distributed in the population. Furthermore, we look at how trust relates to the level of experience and sophistication of consumers in the financial services marketplace and how it influences behaviour when consumers buy financial products. The aim of the study is to
assess the vulnerability of consumers in financial markets. The analysis is based on survey data representative of the Norwegian population. The results are contrasted with data from Ireland.

Exploring long-term care as a morally contested commodity through the experiences of old-age users of cash-for-care benefits in England
Ricardo Jorge RODRIGUES (European Centre for Social Welfare Policy and Research, Austria; University of York, Department of Social Policy and Social Work) | rodrigues@euro.centre.org

The marketization of long-term care (LTC) in England has been underlined by a strong consumerism and empowerment rhetoric depicting old-age users as ‘consumers of care’ and care as a conventional commodity. In contrast, the notion of care as an experience good and a morally contested commodity, particularly as to its relational aspects, has been underplayed. This paper aims to expand the understanding of how care as a relationship may impact the transactions involving care and test the limits of the consumerism discourse.

We investigate how the characteristics of LTC as an experience good and the relational aspects of care impact the decisions and exchanges with paid carers of three groups of users of cash benefits: those that hired acquaintances as personal assistants (PAs); those that hired strangers as PAs; and those that purchased care from agencies. Qualitative data was gathered from 24 semi-structured interviews with old-age users living at home in three London boroughs.

Findings point to the importance of relational aspects of care, but also social norms in understanding choices of old-age users, for example, regarding the employment of acquaintances as paid carers. The analysis also uncovered the existence of reciprocity between users and paid carers, including strangers, built around gifts exchanges. What was particular to these gift exchanges was their non-monetised nature and their absence when paid carers were not directly employed by users. The implications of these findings are discussed as to their contribution to understand choices made in LTC and the impact of markets on transactions involving care.

Saving in uncertain times and the idea of a rational organization of retirement
Felix WILKE (University of Kassel, Germany) | wilke@uni-kassel.de

Retirement systems in Western societies have been strengthening private pensions and thereby promoted marketization and financialization of pension provision. The underlying process has been analyzed by sociologists thoroughly on an organizational level (e.g. Ebbinghaus 2011). However, the answer to the question how individuals organize a ‘financialized retirement’ has been left for economists, who regard retirement saving decisions mainly as a result of rational planning of life-cycle resources. From a sociological point of view, this explanation omits the most important aspect, that for such long-term decisions it is uncertain which strategy can be regarded as rational.

Economic sociology offers a new perspective on this matter. Under uncertainty, rationality is guided by certain ideas and cannot be regarded as an objectively defined strategy. From this point of view mainstream economists have only developed a very specific idea for rational retirement resting upon the assumption that individuals act as if there was a predefined and known future.

My presentation will reconstruct the idea of a rational organization of retirement in economic theory and demonstrate how individuals are related to this idea.

The empirical material is based on a case study of Germany, where a supplementary private pension has been installed in 2001. To reconstruct the individual perspective, I use a series of qualitative interviews (n=18) and underpin the main findings with multivariate analyses from a representative German study of saving behavior (SAVE).
The empirical evidence reveals that individuals depart from the dominant idea of a rational organization of retirement in economic theory. Instead of carefully planning their life course, they develop different strategies to cope with uncertainty.

**Dynamic Stagnation: Linking Marketization of Social Subsystems to Economic Stagnation**

Ferdinand WENZLAF (University of Hamburg, Germany) | ferdinand.wenzlaff@uni-hamburg.de

Sociologists investigate the expansion of market mechanisms into previously non-market coordinated social domains. This phenomenon is problematized as marketization by referring to hegemony of economic considerations. However, from the perspective of the classical theory of functional differentiation, social subsystems are autonomously coexisting without any relationships of dominance or hegemony. Some scholars try to save the hypothesis of the dominance of the economic over other subsystems by considering that subsystems may follow their own logic of coordination, but nevertheless need to be financed from the economic system. However, the sheer dependence on the taxation of the economic system alone still offers no satisfying explanation of marketization. I argue that marketization is not causally related to the economic system per se, but to the state of the economic system. My hypothesis is that a prosperous economy would not necessarily exert pressures of marketization, but a stagnating economy does. In order to prove that claim, I show why developed capitalist economies tend to stagnate and the reason this is a problem for which marketization is an emerging solution. I do so by referring to the Keynesian paradigm of the monetary economy allowing theorizing a growth imperative inherent in capitalist economies.

Capitalist economies tend to stagnate, but would require higher growth rates. The process of marketization can be theorized as a response to the absence of sufficient growth, or as a valve for the growth imperative. Informing the discourse of marketization from the perspective of societal differentiation, marketization receives a functional explanation.

**JS_RN05+RN09 - Coping with the Crisis: Economic Shocks and Changing Patterns of Consumption**

Lack of money or lack of time or both? Estonian consumers during and after economic crisis

Triin VIHALEM (University of Tartu, Estonia) | triin.vihalem@ut.ee
Margit KELLER (University of Tartu, Estonia) | margit.keller@ut.ee

Changes in consumption during the economic crisis that started in 2008 have deserved some scholarly attention (e.g. Marcu & Meghisan 2012, Catana 2012, Alimen & Bayraktaroglu 2011), but relatively little is known how crisis affects people's relation with time. Time poverty – deficit of time for leisure, but also for leading a more environmentally sustainable, healthy or thrifty life – is a common feeling among people trying to make ends meet or hold on to their (well-paid)
jobs. Consumption habits of time poor people can be extensive – they may buy “green” products, but holistic rearrangement of lifestyle is beyond their capability. Downshifting – an idea of living simpler lives and using less (industrially produced) goods and services – may be attractive at good times, but how accessible an alternative is it during hardship? The few relevant studies reveal that decrease of income does not lead to willingness to invest more time in housekeeping and homemaking (Ironmonger 2012). Urbonavicius & Pikturniene (2010) have found that especially the younger generation, who lacks experience with scarcity of money and restraint, is unable to change consumption habits.

Our study aims to explore the complex interrelationships between money and time sufficiency and deficiency and changes in consumption during and after economic crisis. The analysis develops the segmentation of consumers along the time richness and money richness scale (Lindskog & Brege 2001) and discusses voluntary and forced changes in consumption patterns by different consumers, both at the time of crisis and after. The empirical analysis uses nationally representative surveys in Estonia in 2008, 2011 and 2014 and media text analysis.

Crisis, social inequality and consumption – a Dutch perspective
Stefan WAHLEN (Wageningen University, The Netherlands) | stefan.wahlen@wur.nl
Jornt MANDEMAKERS (Wageningen University, The Netherlands) | jornt.mandemakers@wur.nl

Inequalities have been exacerbating in the Netherlands since the economic crisis hit ground in 2008, with poverty increasing substantially. The amount of the Dutch population living under the poverty line increased from 7.4 % in 2010 to 10.3 % in 2013. Different types of household are affected: single parent and one-person households, as well as those with migration background. Moreover, life course influences are inherent in the rising amount of children and of elderly in poverty. The aim of this paper is to investigate how new inequalities impact the consumption of food, housing and mobility across the life course. Inequalities in food consumption are manifested in the growing amount of food packages handed out by foodbanks increased by 30 % (2012-2013). Housing cost makes up a substantial share of the total expenditure for consumers with lower income and social inequalities become visible in the increasing late payments on mortgages as well as on energy and water consumption. Mobility is of interest, because low-income households appear to cut expenditure on mobility, considering the proportion low-income households spent on mobility is lower as households above the poverty line (7 and 11 % respectively). This paper sheds empirical light on consumption inequalities by providing quantitative empirical evidence. A combination of statistical data is analysed, such as budget surveys and the consumer confidence survey of Statistics Netherlands. Life-course influences thereby indicate different peculiarities of consumption inequalities in the types of households affected by poverty.

Sources of “interpretive cacophony” in public discourse on consumer behaviour: a case study of foreign exchange intervention of Czech National Bank
Václav ČEPELÁK (Faculty of Social Sciences, Charles University, Czech Republic) | V.Cepelak@seznam.cz
Martin HÁJEK (Faculty of Social Sciences, Charles University, Czech Republic) | hajek@fsv.cuni.cz

In response to enduring economic uncertainty in Europe public debates on appropriate economic policy and behaviour have proliferated. This trend is not surprising – during the times of crisis and uncertainty the necessity for some kind of salutary intervention/change stimulates discourse on the topic. The presented paper analyses a controversial public debate in Czech printed and online media that has emerged after the Czech National Bank launching the
quantitative easing of national currency in November 2013 followed by Czech crown depreciation. As analytical framework we applied the theory of orders of worth by Boltanski and Thévenot (1991), focusing on processual and situational aspects of controversies in everyday life. A computer assisted text analysis was carried out on a corpus of newspaper and online articles and blogs. Our results show that the controversy of the intervention was based on differing perceptions and evaluations of inflation and deflation produced by economic, political and popular media discourse. We determined three main controversies (money vs. savings controversy, inflation vs. price hike controversy, and consumer vs. person controversy) which represent different perspectives of policy makers and policy objects in the debate. Discovered barriers of mutual understanding between proponents and opponents of the intervention as well as strong dynamics with which the debate has emerged in the public discourse contribute to the ‘interpretive cacophony’ (Lodge, Wegrich 2011), which itself contributes to the sentiment of uncertainty in kind of behaviour appropriate in times of a supposedly never-ending crisis.

Money, territory and relationships: three case studies from Italy
Valentina MOISO (University of Turin, Italy) | valentina.moiso@unito.it

In some contexts the exchanges of money among people are facilitated, not hindered, by different elements that have to do with relationships, representations and other non-rationalized factors. The paper presents three case studies, in which the communitarian element seems to get gradually stronger: a credit cooperative bank, a local bank with a strong link with territorial identity; an experience of Popular shareholding in agriculture, one of the most innovative solutions in environmental preservation, that asks citizens to invest their savings for an “alternative remuneration”; a Self- Financed Community (Comunità autofinanziate - CAF), little group of people - often rejected from traditional financial system - that trust each other and share savings and debts.
In all cases the link with the local community has two components, the territory and the personal knowledge: the analysis highlights how these components support the economic change, in particular savings and debts, activating interpersonal or collective trust.
The perspective adopts the family level point of view: this paper investigates motivations, representations and mechanisms at the basis of families’ involvement in these experiences, that has increased after recent financial crisis. This is a real innovative point because those cases are especially studied by the organisations side, without a real focus on the motivations of people involved.

JS_RN09+RN15 - Europe and the Globalizing Economy

New patterns of consumption among Portuguese-speaking African countries
Raquel Barbosa RIBEIRO (School of Social and Political Sciences, Portugal) | rribeiro@iscsp.ulisboa.pt
Isabel SOARES (School of Social and Political Sciences, Portugal) | isoares@iscsp.ulisboa.pt

Because of globalization, many developing countries have adopted increasingly westernized consumption patterns. In this article, we address the cases of three African Portuguese-speaking countries: Cape Verde, Angola and Sao Tome & Principe. Although consumption patterns in these countries are largely inspired by the media-conveyed American consumption society model, specific cultural particularities can also be found. In fact, despite their differing rates of economic growth and their various social structures, these three countries share an important relationship with Portugal (at economic, commercial and social levels), which contributes to their connection to the consumer society. By the use of in-depth interviews with
consumers and observation of commercial spaces in major cities, this article seeks to explore how westernized consumption patterns are appropriated by the local cultures of these African countries.

**Diaspora, female immigration streams and self presentation: cariocas in São Paulo city, and brazilian women in Paris**

Laura Graziela GOMES (Universidade Federal Fluminense, Brazil) | lauragraziela@gmail.com
Solange MEZABARBA (École des Hautes Etudes en Sciences Sociales, Paris) | solange_riva@hotmail.com

This text presents an analysis of two different cases of female migration at the present time, investing in « self presentation » (Erving Goffman) as an issue of adaptation to specific situations where the professional objectives and, in one of the cases, also religious, are definitive for a successful project of life in the chosen city. In order to get this aim, we investigated the lives of a group of brazilian religious women in Paris, and in another scope, women from Rio de Janeiro that moved to São Paulo for increase their professional level. We worked using ethnography method. The main idea is to show how those women undertake their strategies of self presentation, pursuing through « tacit deals » observation of personal presentation in the public space (emphasising the world of work) of the « townies », the patterns that will help them to build a personal face that, to their expectations, will be the most convenient. So, in the end we discovered how those two groups of women interpret the « new place » and their rules of sociability. Cariocas that moved to São Paulo had to deal with the formal x informal uses of apparel; and brazilian women in Paris persued, in their terms, a « liberty » to move all around the city through the effort of keeping their appearance as much as possible close to what they think is a french women appearance.

**The significance of ethnic social capital in case of Polish migrant entrepreneurs in the UK and its enhancement by the incremental transnationalization of the European Union**

Sakura YAMAMURA (University of Hamburg/Maastricht University) | syamamura@hotmail.com
Paul LASSALLE (Sheffield Hallam University, Sheffield) | p.lassalle@shu.ac.uk

The EU aims to transnationalize its territory and allow free flows of capital, goods and people on a common market. However, the enlargement to the East has been approached only cautiously, especially regarding labor migrants. Polish migration to the UK experienced a strong increase through EU-accession. However, rather than enabling smooth economic integrations of migrants into the local market, the reserved stance and the incremental implementation of the- what was supposed to become- transnational migration contributed to the strong attachment of the Polish entrepreneurs to enter the EU-market by ethnic channels, mobilizing and using social capital of the Polish community. Ethnic niche market remains the most lucrative and accessible market for Polish entrepreneurs. Despite the formally free access to the EU-internal market, barriers to access appropriate employment in the labor market still exist for migrants. The society also remained reluctant towards opening doors to their new EU-co-citizens, thus, enhancing the re-/production of ethnic niche markets in a “host” country.

Based on empirical evidence on Polish entrepreneurs in Glasgow, this paper discusses their market integration after the EU-enlargement and questions the notion of an overenthusiastic transnationalization of the EU economic market. It gives a valuable insight into the circumstances and the significance of the ethnic social capital for the market entrance of Poles.
By analyzing the impact factors for entrepreneurs in a particular city and region within an EU country and its embeddedness in EU-wide policies, it contributes to a multi-leveled discussion of the 'transnationalizing' economy of Europe.

**In time of glocalisation: the end of "Made in", and the new scenery of "Made by".**

Riccardo GIUMELLI (University of Verona, Italy) | riccardo.giumelli@univr.it

We are experiencing a deeply change of age. As many important sociologists said we are facing a change of our identity and our social relations in everyday life. Time and space are changing, proximity is our local dimension, but we are immersed in the global flows. Deterritorialization is a widespread characteristic of this new postmodern era, deeply different from the modern one, where the territory was so linked to sovereignty and citizenship. Nowadays the crisis of the idea of modern state nation is reflected by the difficulty to keeping the same meanings to the same expressions.

We use to say "Made in" China, or Italy, or France to express the idea that some products are manufactured in a particular country. Is this a real and appropriated meaning respect to the global flows of goods, expertise, knowledge? Delocalization and new processes of "back-reshoring" (part of the production comes back in the original country) cut the relations between, for exemple, products and territory. The problem is understanding the belonging and, on the other face, the identity of goods, services, intellectual propriety, and so on.

For better understanding what I mean I will present different cases of analysis. Our reflection wants to move from these premises to identify a new paradigm where the preposition "in" could be sostituted with "by". The implicit idea is to move from a paradigm of the modern era with the state nations as protagonists to a new one more and more with cultural and glocal social actors.
RN10 - Sociology of Education

RN10P01 - Poster Session 1

**Market and education inequalities**
Robert PAWLAK (Academy for Special Education, Poland) | robertpawlak@aps.edu.pl

It has been 25 years of democratic transformations in Poland. Today Poland differs from the communist system absolutely. The democratic institutions have taken roots in the Polish society. The economic, social, and education reforms have been introduced. However, some problems have not been resolved and new ones appeared. Educational inequalities are still in existence.

Today local governments in Poland take responsibilities for the administration and management of preschool institutions as well as primary and lower-secondary education. They are responsible for local educational policies: school networks, financing and teachers employment.

My research was conducted in Cracow, the former capital of Poland. The strategy for education introduced by the local government is to promote parental choice and competition among schools as well as to reduce expenditures for education by implementing school voucher scheme, closing down small schools and pay off teachers working in those schools. The aim of the local government is not to eliminate the problem of selection in the public education system neither to improve the quality of schooling.

The data come from statistics on local school system, individual in-depth interviews with school masters from public and private lower-secondary schools as well as politicians representing the local government.

The special attention was paid to:
• school recruitment and selection policies
• unequal access to education for students from different backgrounds
• schools characteristics in different locations (e.g. quality of education and students background)
• schools competition
• local government strategy for education and its reception by local actors.

Schools participated in the project located in two different areas: the city center and post-industrial area. Schools situated in the city center have the best results in external exams in Cracow according to official statistics.

The study found that school recruitment practices and school competition lead to cream skimming. The best schools select the best candidates from affluent and well educated families. Usually they continue their education at the university level after graduating from secondary schools.

At the same time schools located in post-industrial area have poor reputation. They attract students from poor and working class families and have much problems with school violence and students motivation for learning.

**The "Misère de l’éducation" in the Age of Crisis**
Elena GREMIGNI (University of Pisa, Italy) | elena.grem@tin.it

Over twenty years after the publication of La misère du monde (Bourdieu,1993), Pierre Bourdieu’s work is still highly relevant. The social order that has led to a proliferation of the
“small miseries” of the world seems to have prevailed: Pierre Bourdieu’s micro-sociological essay highlighted the symptoms of a disease that has been getting worse in the past few years and prophetically predicted many of the current consequences. This paper aims to analyse the consequences on the educational field where, alongside the usual mechanisms of social reproduction, practices of «technocratic Taylorism» are emerging. They are allegedly inspired by meritocracy but actually aimed at the utilitarian exploitation of human resources. Student potential is thus trivialised, dumbed down to a few measurable variables on which teaching and selecting are based, according to a view of humans as merely means-to-an-end. Thus, by concealing the social fabric in which individuals are rooted, any failure can be blamed surreptitiously on the individual’s responsibility. Sociological research has the crucial task of revealing the peculiar logic of this kind of mechanisms, more and more common in several fields, and their ideological implications, typical of neoliberalism: because, as Bourdieu says, “ce que le monde social a fait, le monde social peut, armé de ce savoir, le défaire” (Bourdieu 1993, p. 1454).

National education systems in the global market: freedom of the choice or intellectual colonization
Svetlana Alexeevna SHARONOVA (St-Tikhon’s Orthodox Humanitarian University, Russian Federation) | s_sharonova@mail.ru

The processes of globalization based on the formation of a common economic space including in the field of education. Rating systems formed segments of the educational market. Leading countries: America, England, Australia, Germany, - whose universities occupy high rankings in the world system testing, and through which the main financial streams go. The market is focused on the rapidly growing middle class in China, Russia, India and Brazil and others countries.

How do national education systems respond to the processes? On the one hand, they must respect human rights in an open society: the choice of university to continue studies. On the other hand, national education systems are required to play the national cultural traditions. These national traditions include not only moral and ethical behavior, but also the specifics of historical and economic relations and especially the scientific worldview. If you rely on the first statement, it solves the problem of free choice of the individual, if we take into account national interests, there is a danger of intellectual colonization. Theoretical substantiation of occurrence of intellectual colonization, we find in the writings of K. Mannheim and P. Bourdieu:
- The law of objectification of knowledge in the form of ideology means in the context of the global community, the ideology of domination, which is reproduced in the universities of countries leading the world market. Broadcast their ideology forms the economic, political values, which do not take into account national interests, and furthermore may be in conflict with them;
- The law of reproduction of culture educational institution says that regardless of culture, which had an entrant in the learning process, he learns the ethical, moral and ideological norms, broadcast to the University.

The author makes an attempt to understand how neo-liberal principles of defending the geopolitical interests and ignore the national education.
Assessment of indicators of mass higher education based on the analysis of Webometrics ranking results

Margarita Davydovna BERSHADSKAYA (Research University-Higher School of Economics, Russian Federation) | beriandr@mail.ru
Yulia Alekseevna VOZNESENSKAYA (Modern University for the Humanities, Russian Federation) | youvoz@yandex.ru
Olga Mikhailovna KARPEN

The development of high-quality mass higher education in the regions and world countries is a necessary condition for increasing the accessibility of higher education, both globally and in each individual country.

The purpose of the study is the assessment of the results of Webometrics ranking of world universities – the only one of the global rankings of universities, stimulating the development of not only the elite but also of mass higher education.

Quantitative indicators characterizing the scale and quality of mass higher education:
• number of national universities in several thousands of best universities of the world (6 indicators);
• a conditional parameter of quality - the share of ranked universities in the country/region included in top 5000 (N5000) in the total number of ranked universities (N20000).

Comparative evaluation of the indicators is presented in diagrams, tables, graphs.

Main results:
1. In terms of the scale of development of mass higher education leaders are:
   - USA, Brazil, China, Japan, France (in the top ten countries by all indicators);
   - Germany, the United Kingdom (by five indicators);
   - Russia, South Korea (by four indicators).
2. By the conditional indicator of quality China is the absolute leader among the listed countries: over 60% of ranked universities of China entered 5000 best universities of the world. China is followed by the United Kingdom and Germany, then the United States, France, South Korea and Japan. Low indices are in Russia and especially in Brazil (significantly lower than the regional average).
3. The study examined the growth of web activity of Russian universities as an example of the impact of evidence-based information on the practical activities of universities in the period 2007-2015.

Is ICT Enough in Order to Provide Equal Opportunity in Education?: Fatih Project

Nehir YASAN (Middle East Technical University, Turkey; Gaziosmanpasa University) | nehir.yasan@gmail.com

Educational inequality in Turkey is observed in three aspects which are socio-economic status (SES), gender, and regional difference. Recently, Information Communication Technologies (ICT) is considered as an educational inequality relevant to SES. Some studies and international educational reports highlight the importance of ICT skills for information age. However, all schools and families cannot afford ICT tools because of high cost effect. Related to this, Ministry of National education of Turkey initiated an ICT project called FATIH (2010-2014) to prevent educational inequality. Tablets and LCD smart boards were provided for the primary and the secondary education within the scope of this project. This paper aims to discuss the impact of ICT on education in order to answer whether ICT enough to provide equal opportunity in education. Previous investments of MoNE and other studies from the world showed that the successful integration was not easy because of depending on many interlinking variables. The obstacles are generally aggregated under two titles: (1) sufficient infrastructure, (2) teacher and teaching methods. While some researchers argue about successful integration of ICT on
education, some researchers carry the argument to a different point, which is the impact of ICT on students’ social and psychological development. They claim that computers hinder children emotional contact and may cause some health problems. In conclusion, while the issue of ICT in education is so controversial, such a huge investment does not seem significant for preventing inequality.

Roxana Diana BALTARU (University of Essex, United Kingdom) | rdbalt@essex.ac.uk

The current research investigates the prioritising of financial autonomy by European higher education systems (HEs) and its implications on the organization of higher education (HE). In doing so, it employs a cross-sectional dataset containing quantitative information on 33 national HEs as primary units of analysis. The paper argues that the process of financial autonomisation involves several dimensions (cultural, administrative and institutional) functionally associated with particular organizational logics which converge in reflecting neo-liberal normative models of change. The analysis provides empirical support by confirming the hypothesized associations between the dimensions of financial autonomy and the organizational logics taking into account differences in student percentage, age demographics and public expenditure on tertiary education. Finally, it is argued that the success of the normative model guiding such change can be understood with regards to the degree to which it complies with global cultural trends.

**Comparative analysis of educational policy in the Soviet and contemporary Russia**  
Yulia EPIKHINA (Institute of Sociology RAN, Russian Federation) | epikhina@gmail.com

The educational policies in the Soviet Union and contemporary Russia are guided by a set of formal norms. However there is a great difference in the character of the norms and the way they are defined. In the Soviet Union the “norm” came to mean a certain educational level that most educational institutions and the population had to correspond to. The normative level changed over time: the obligatory primary education was replaced by the obligation for all to have a secondary education. The system was regarded as having inbuilt provisions for social justice: any form of inequality in education was viewed as social injustice and a violation of the existing order. Therefore the primary goal of Soviet education consisted in creating social conditions and social institutions that would make the common good (education) available to all. However the justice demand in education came to mean injustice for some: the quest for equality led to a system of preferences and constraints for some social groups.

In contemporary Russian the educational “norm” is tantamount to the number of social services that the state undertakes to provide free of charge. The “norm” implies a consumer who is entitled to a certain minimum, but beyond that norm he or she has to pay his or her way. The new definition of the “norm” frees the state from the obligation to sustain the educational infrastructure and allows for increased inequality related to a class position of an individual.

**Inequality in access and continuity in the education system of the sons and daughters of immigrants in an irregular situation in Spain**  
María JIMÉNEZ DELGADO (University of Alicante, Spain) | maria.jimenez@ua.es  
Diana JARENO RUIZ (University of Alicante, Spain) | diana.jareno@ua.es  
Yury LEAL DOS PRAZERES (University of Alicante, Spain) | yury_leal@yahoo.es
According to the Spanish Constitution in its article 27, all children without exception have the right to education. Also, the same right to education is collected in the Organic Law 4/2000, 11th January, about rights and freedoms of foreigners in Spain. However, subsequent developments of this law limit this right. This communication, framed within a broader research project (Gender, Education and Equality - GEI), intends to point out, from the revision of educational and immigration legislation, the vulnerability of the rights of the minors whose parents are in an irregular situation in Spain.
Additionally, through case studies, we show the difficulties that their sons and daughters find in the access as well as in the continuity in the education system, especially in non-mandatory stages, where there are new requirements for the minor, such as holding the identification number of foreigner, the health insurance card or the registration in the municipal register. All this evidences an increase of legal obstacles in the access to the educational system and the continuity in the same, when the right to public resources (scholarships, grants...) to compensate for inequalities in origin is denied. It is so truly difficult for the children and their families to leave the circle of exclusion in which they are intended.

Social inequality in higher education dropout: A theoretical and empirical explanation.
Sören ISLEIB (German Centre for Research on Higher Education and Science Studies (DZHW), Germany) | isleib@dzhw.eu

Individual performance in the education system is both outcome of and sustaining inequality. As higher education is perceived as a crucial condition for economic and social success of societies the problem of non-completion becomes societal relevant. Right now reducing dropout rates is a main goal for higher education institutions and education policy among European countries. But little is known about the relevance that (social) inequality has for higher education dropouts. Recent research developments indicate that an explanation of the problem has to be interdisciplinary.
Therefore the paper focuses on an interdisciplinary perspective on higher education dropout. The main questions are: How is (social) inequality related to higher education dropout? How do we explain this relationship in an interdisciplinary way?
The contribution starts by giving a short overview about the main interdisciplinary theoretical explanations for higher education dropout. An integrative theoretical model developed in a current project at the German higher education research institution DZHW will be presented. Second it will be asked how social inequality is linked to higher education dropout. Third empirical evidence for the German case is provided by data from a nationwide representative study (also DZHW) which is focusing on both dropouts and graduates (N=7000). As a conclusion it will be shown that higher education dropout results from social and psychological inequalities which exist before the entry in the higher education system. Success in the German (higher) education system keeps strongly related to the individual social background.

Teenagers’ representations of occupations: a catalyst of social reproduction?
Dinah GROSS (University of Lausanne, Switzerland) | Dinah.Gross@unil.ch

During the school to work transition process, teenagers are expected to shape educational and occupational aspirations that will guide them through future choices. Our central hypothesis is that representations that teenagers have of occupations play a central role in shaping occupational aspirations. These representations help them decide whether a given occupation is adequate for them. However, representations may be strongly stereotypical in terms of class and gender, leading teenagers who identify with a specific social background or gender to
embrace aspirations that they find adequate to this identity. We hypothesise that this may be a central force of social reproduction. Using data collected from a sample of 3200 teenagers in Switzerland, we will consider how a set of representations as to the interest, prestige, accessibility and gender of given occupations influence occupational aspirations and to what extent these representations can be considered as stereotypical and as favouring social reproduction.

A New Stage of Modernization of the Russian Education System: Growth of Opportunities or Strengthening of Contradictions?
Irina I. KHARCHENKO (Institute of Economics & Industrial Engineering, Siberian Branch of Russian Academy of Sciences, Russian Federation) | kharchen@ieie.nsc.ru

Paper discusses the existent changes in national educational system, first, as reforms within a state policy (with started at 01.09.2013 "The law on education in the Russian Federation", new Federal state educational standards, other standards and rules), secondly, as objective social process.
To keep track of processes in education our Institute conducts periodical sociological investigations, last of which was executed in 2014 in Novosibirsk region. Two tasks were set: 1) An assessment of changes in the regional educational system under new conditions of reforming; 2) Monitoring of senior school students' intentions towards further professional education. Methods of research include interviewing of experts, polling of school students and parents, collection of objective information. Methodological approaches of human capital, human development, social inclusion-exclusion, transitions from school to work theories are used.
Findings display that there are not simply changes in educational system, but there is a formation of educational “environment” with a new configuration. Although new conditions promote wider educational choice of pupils and families, and also create better opportunities for children socialization, but they don't face numerous already existing problems. Among which there is the decreased quality of students' theoretical knowledge. Development of their practical skills and abilities is interfered with actually legalized cancellation of labor education at school. It aggravates contradictions in professional self-determination of school-leavers even more. The carried-out reorganization of vocational education system allowed to start its modernization. However the appeared progress comes against the availability of vocational education for children from rural areas, and also from families of low social status.

The meaning of health and family resource for secondary-education drop-out
Annica BRÄNNLUND (Umeå University, Sweden) | annica.brannlund@umu.se
Karina NILSSON (Umeå University, Sweden) | karina.nilsson@umu.se
Mattias STRANDH (Umeå University, Sweden) | mattias.strandh@umu.se

Secondary-education is crucial as to labour-market competition, additionally, a request for higher education. In Sweden almost 99 percent of students who pass primary-school continue to secondary-school. At the same time, nearly one in three drop-out and leave school with incomplete education. From research we know that there is a strong link between health and school achievements, additional, that parents' social- and economic resources are central for children’s school results.
Research questions:
• How does poor childhood health influence secondary-education drop-out?
• In relation to this, can family resources mitigate any negative influences of poor health?
Drawing on the Capability Approach, we argue that it is not sufficient to focus exclusively on formal rights, since equality in access to education might not mean equality in what education can deliver. Individuals have different resources that may affect the conversion of education into valuable educational achievements.

We will utilize Swedish population-wide longitudinal register- and census data, designed to address questions related to childhood conditions and welfare. We follow the entire 1990-cohort from birth until they are 20 years. Data include information on education and health from national registers, parental characteristics (as SEI and educational level), along with demographic information.

We expect to find a relation between poor childhood health and higher risks of school drop-out, further, that family resources might mitigate any impact of poor health.

**Teachers Occupational Stress**

Ana Paula Ferreira de BRITO (CESPU - Cooperativa de Ensino Superior, Politécnico e Universitário, Portugal) | anapaulabrito08@gmail.com
Diogo FERREIRA (ISMAI - Instituto Superior da Maia) | diogo4business@gmail.com
Bruno FERNANDES (ISMAI - Instituto Superior da Maia) | brunofmfernandes@gmail.com
João OLIVEIRA (ISMAI - Instituto Superior da Maia) | joaoliveira220@hotmail.com

**Introduction:** Teachers face challenges of contemporary complexity, making urgent, in addition to a reasoned knowledge of curricular subject they teach, the development of the understanding and security necessary to work with the mediation of the teaching / learning process and other skills essential in professional activity. Teaching can be identified as one of the most stressful professions nowadays. Objectives: To analyze the relationship between the level of Occupational Stress (OS) and sociodemographic variables / socio-professional of the teachers; to determine the OS types. Methodology: This quantitative, exploratory and cross-sectional study was configured from an online survey MBI-GS, version translated / adapted from Pereira & Cunha (2009) and IPSSO (2000). The sample was not random. It consisted of 335 primary and secondary school teachers (53.1% female and 46.9% male). Results and Conclusions: The discrimination of the constituent factors of OS: stress in teaching, personal and professional fulfillment, weight of the pedagogical activity, administrative organization (OA) and interpersonal impact. Male teachers have a significantly more positive perception on the Inter-relational Impact and Educational Organization factors. The youngest have lower level of OS, but show a lower achievement in professional activity. The "Single ones" show a lower OS level. The number of children is responsible for the increased values obtained at OS level. In space, the Azores demonstrate higher OS signals. Teachers with successful careers also show greater OS signs. The SP is significantly lower in the Framework for School /Grouping. Teachers belonging to the Languages and Literatures Department have higher OS values.

**Visual literacy as a competence – A pedagogical study on visual grammar in multimodal communication**

Linnea Margareta STORSVED (Åbo Academy University, Finland) | linnea.storsved@abo.fi

The aim of this paper is to illuminate the importance of visual literacy and visual communication in a multimodal classroom. Multimodality and the use of technology are emphasized in the new Finnish national curriculum of 2016. Visual literacy is a field that concerns both multimodality and technology. Traditionally schools have been text orientated, however, as a result of the paradigm shift within the field of information and information sharing in a social context, visual communication has expanded, for example, as a result of mobile phone- cameras and social networks, like Instagram and Facebook.
The scientific field is based on a social and cultural traditions were culture and globalisation affects the way students read images. From a phenomenological perspective, visual competence is analysed and contrasted to the use of multimodal digital aids in the classroom. The empirical material is based on resent research within the field multimodality, visual literacy and pedagogy, and on an expert-interview with one of the leading IT-educators in Europe. The data was then compared to theory within the field of visual literacy and multimodality. The results indicate a need for a pedagogical approach on visual communication, as an educational instrument, and as a field of learning. It is in the interest of the educational system to educate young people in the field of visual literacy, i.e. developing a working relevant language and vocabulary, basic knowledge in visual grammar, ability to create and interpret images and an understanding of different context concerning visual communication, in which social media and social communication plays a major role.

Emojis/emoticons, (internet-) meme, selfies and documentary photographs are examples of visual communication in social media.

The study is a part of the Dididi-project at Åbo Academy University: http://dididi.fi/english/

Reproduction of social inequality through teacher-student interaction: A field study using participant observation in the school classroom.

Maya BECKER (Ludwigsburg University of Education, Germany) | maya.becker@ph-ludwigsburg.de

Social inequality is reproduced through the education system and in the school classroom in particular. The approach of analyzing the emergence of social inequality structures inside the classroom draws attention to the behavior of the teacher, the students and their interactions. This paper discusses the results of participant observation taken from 70 school lessons in elementary and secondary schools (pupils age: 6-14 years) using a structured two page recording sheet. Additionally, a one page questionnaire about the school was applied. Data was collected in southern Germany in 2014/2015 at different schools in urban and city regions, in various school subjects and at different times of the school day.

It appears that high teacher satisfaction occurs mostly in classes with comparatively high student interest and low student disturbance. Comparatively high student interest and low student disturbance is recorded in school lessons of elementary schools in rural areas. Schools in the city with a higher number of students coming from working class families and families with migration history seem to have school lessons with a higher amount of student restlessness and disturbance.

Social inequality is reproduced inside the classroom because the education system does not establish equal learning environments in schools. Students behavior in the classroom seem to be less effected by subject or the time of the school lesson, but more through the type of school they are put in.

Tolerance education in higher school

Zilya RAKHMATULLINA (Bashkir State University, Faculty of Philosophy and Sociology) | rakhmatullina_z@mail.ru

Complex social and political framework of contemporary Russia including its educational sphere, emphasized the problem of tolerance education. This problem calls for a practical solution and academic rationalization.

In documents of UN tolerance is described as recognition of, respect to, and maintenance of rights and freedoms of all people, regardless of social, class, religious, ethnic and other differences. Researchers also regard tolerance as value and as a social norm of civil society.
In presence of some discrepancies in approaches, it is possible to identify the main defining features of tolerance: value and attitude. Classifying tolerance as value is due to increasing awareness of interconnection of individuals and the diversity of humanity which imply not only differences, but also commonality. The basis of this commonality consists in belonging to human kind and builds on general human values, and this enables interaction and dialogue. Those are conditioned by tolerance which, by facilitating the attitude of “equality of diversity”, makes coexistence of different people and groups possible and, while preserving individuality, fosters mutual development and enrichment.

The system of higher education involves not only teaching professional skills, but also rearing capacity to apprehend heterogeneity of cultures, live in peace with other humans, find a peaceful solution of conflicts, and engage in multicultural communication, and thus can become auspicious environment for formation of tolerance. Tolerance education is a common objective of many public and private institutions. In particular, when youth is concerned, the main responsibility lies with educational system and educators.

**RN10P02 - Poster Session 2**

**Accessibility of informal education for children with disabilities: evidence from Russia.**

Olga Alekseevna GURKINA (Moscow State University for Psychology and Education, Russian Federation) | bazinao@gmail.com
Elena Vladimirovna ARZHANYH (Moscow State University for Psychology and Education, Russian Federation) | elenaarzhanykh@gmail.com

Despite active promotion of inclusive education and arrangements aimed on changing physical and social environment the segment of informal (supplementary) education still stays closed for the most of children with disabilities and special educational needs in Russia. The research of Moscow State University of Psychology and Education focused on obtaining detailed information about the availability of informal education for children different disorders in order to develop requirements for adaptation supplementary educational programs and the conditions of their implementation. Based on questionnaire survey of 1045 parents who had children aged from 7 to 18 years old (both with physical, and mental disabilities and SEN) in 10 regions of Russia we examined difficulties and barriers in process of informal learning of such children. Respondents were chosen according to quotas based on statistical distribution of certain disorders among children. Several outcomes of accessibility of informal education emerged: 1) Less than a haff of children (46%) was getting informal education; 2) children with autism and mental disorders were the most deprived group, 48 % of them had never attended supplementary classes. 3) one of the most widespread problem was a lack of information about special informal education for children with disabilities and SEN. Three groups of arrangements were suggested: 1) social advertising; 2) actions aimed at improving the physical accessibility (architectural, territorial and logistical); 3) arrangements aimed at improving supplementary educational programs (for children with disabilities and for teachers of supplementary education).

**Russia in the global rankings on the accessibility of higher education**

Olga Mikhailovna KARPENKO (Modern University for the Humanities, Russian Federation) | dn@muh.ru
Margarita Davydovna BERSHADSKAYA (Research University-Higher School of Economics, Russian Federation) | beriandr@mail.ru
In the studies of global issues of accessibility to higher education there is no enough aggregate statistics allowing to quantitatively compare the population's access to higher education in the world countries. In this context it is necessary to highlight the approaches and results of global rankings of national educational systems on access to higher education undertaken by Canadian researchers (A. Usher and co-workers) in 2005 and 2010. The purpose of our research is to evaluate the accessibility of higher education in Russia compared to other countries. Main objectives: 1) determination of Russia's place among other countries in the pre-crisis period; 2) calculation of changes in the values of ranking indicators during the crisis. Analysis of the results has confirmed the expediency of the two rankings that divide the social and economic aspects of inequality in higher education. To assess Russia's place among 14 countries surveyed, there were determined the approximate values of the indicators of both rankings characterizing the Russian system of higher education. When determining the strengths and weaknesses of the Russian higher education system the results of the rankings for each indicator were taken into account. Main results in the pre-crisis period:
- At an estimated assessment Russia refers to one of the least successful countries with the low ranking of the accessibility of higher education (social aspect) and with a relatively good indicator in the ranking of affordability of higher education (financial aspect);
- The weakest point of the Russian educational system is the low rate of social equality in higher education (students elitism).
Calculation of Russia's performance in 2012-2013 showed a decrease in affordability of higher education in Russia and forecast of further reduction as the crisis deepens.

New Educational Inequalities or Changing Preferences? Structural diversification of foreign language proficiency in Poland (1993-2013)

Olena OLEKSIYENKO (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland) | olena.oleksiyenko@gmail.com
Ilona WYSMULEK (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland) | ilona.wysmulek@ifispan.waw.pl

In the presentation we will discuss the structural diversification of foreign language proficiency in Poland. The question of the foreign language proficiency is rarely the subject of interest for sociologists (Butler 2014). However, there are empirical evidences that foreign language acquisition depends not only from individual motivation and abilities, but also from the number of ascriptive factors (Hattie 1993, Enever 2011). Socio-economic reforms, being the sign of transformation period in Poland, resulted in the devaluation of various skills and shifts in the value of some assets. For example, the value of manual skills and the knowledge of Russian language have considerably decreased as compared to computer skills and knowledge of English (Kanef, Pine 2011). Educational policies were meant to help students to equalize the chances of meeting the requirements of the new socio-economic reality, however, they might have had the opposite effect, and caused the formation and reproduction of the “new types” of educational inequalities (foreign language proficiency, computer literacy etc.). The presentation aims to analyze the diversification of foreign languages proficiency in Poland in the context of the changes of state educational policies. We will also address the issue of changing trends in the preferences for certain foreign languages, placing this problem in wider frame of school curricula reforms and educational recommendations of European Union. Our analyses are based on the Polish Panel Survey POLPAN, which gives the unique possibility to
trace the skills and attitudes of respondents thorough 20 years of the post-socialist transformation in Poland (1993-2013).

'Sense of place' and college choice
shlomo GETZ (The Academic College of Emek Jezreel, Israel) | shalomog@yvc.ac.il
Lilach LEV-ARI (Oranim, Academic College of Education, Israel; Bar-Ilan University, Israel) | llevari@oranim.ac.il

It is generally assumed that young people from lower socio-economic status (SES) faces restricted access to higher education institutions and particularly to those which are considered to be more prestigious. Differences of students' choices by place of residence are usually explained by their SES. We argue that place of residence is not only a geographical attribute but also a social place that influences self-identity and plays a significant role in students’ choice regardless their SES.

The present study was conducted in Israel, among first year undergraduate students and analyzed the effect of living in four residence types (cities, small towns, Jewish and Arab villages) on institutional choices. The study focused on students’ patterns of institutions choice (universities or colleges) controlling for individual SES and previous scores (matriculation and psychometric test).

Findings indicate that the place of residence has a net effect on students' choices, and it interacts with their SES and with previous academic achievements. Students with high previous achievements who live in cities, regardless of their SES, tend to enroll in elite universities. Students from Arab village, regardless of their SES, tend to enroll in less prestigious universities or those which enables them to achieve a profession at the end of their undergraduate studies. Students from towns and Jewish villages show a similar mixed pattern. Less "successful" students, regardless of their SES, are less influenced by their residential place in choosing higher education institutes.

To sum up, these differences in college choice is partially explained by the residential place which serves as a way of life that create a shared "sense of place" or 'habitus' based on locality and to a lesser extent by the SES of the students.

Intergenerational educational mobility and completed fertility: Evidence from 25 Polish cohorts
Zuzanna BRZOZOWSKA (Austrian Academy of Sciences, Austria; Warsaw School of Economics) | zuzanna.brzozowska@oeaw.ac.at

This paper investigates the role of intergenerational educational mobility in completed fertility of women born between 1948 and 1972. It examines the hypothesis of acculturation, which predicts that the mobiles will partially conform to the norms and values of their new strata. So, fertility of the newcomers is expected to be in between that seen in their parents' (origin) and their new (destination) stratum. The main questions I address concern (1) the extent of female intergenerational educational mobility, (2) the educational gradient in completed fertility and (3) the role of educational mobility, parents’ education and fertility in daughters’ achieved family size. The analysis compares birth cohorts whose reproductive careers took place before and after the collapse of communism.

I first conduct comprehensive descriptive analysis and then I employ diagonal mobility models as defined by Sobel (1981, 1985) on data from a large-scale survey conducted in Poland in 2013 on a representative sample of over 60,000 respondents aged 16 to 65. From this sample I select women aged 40 and more, i.e. those who have (almost) completed their reproductive careers.
The results suggest that educational mobility was stable over time, oscillating around 70%; nine out of ten mobiles moved up. Fertility exhibited a strictly negative educational gradient; fertility of the newcomers tended to be lower (downward movers) or higher (upward movers) than that of the non-movers. Except for daughters of at least one highly educated parent, the destination stratum played a much more important role in the achieved family size than the origin.

**Consumerism at school**

Marta ZAHORSKA (Warsaw University Institute of Sociology, Poland) | martazahorska@wp.pl

Consumerism at school

Modern times are often related to as a consumerism era. The place of an individual in the society is very often determined by goods he owns as well as his purchasing power. The aim of my research was to analyse how different signs of wealth such as trendy clothes or various gadgets can influence level of popularity at school environment. Whether while defining popular or rejected individuals there appear words related to their ownership conditions. Whether while indicating popular individuals at school there is emphasis on the way they dress or other features. Do teachers ever notice any material differences among their pupils and how do they react? The research was conducted using qualitative screening method thus it is impossible to determine the scale of the analysed phenomenon or its regularity. What could be noticed is the differences in the importance of the consumption level according to the background of pupils, schools or classes. The analysed phenomenon was very often ignored by teachers who refused to give it any relevance. The text is an attempt to show the importance of ownership standards among schoolchildren as well as a cogitation about creation and deepening of new divisions which determine pupils' social place in the class. Gaining popularity thanks to new clothes or gadgets can become for young people a very important lesson of what they might need to seek for and what is the importance of material value in comparing to non-material value.

**Parents’ Attitudes about School-based Sex Education in Croatia: Findings from a National-probability Study**

Igor KUŠTREBA (Independent Scholar, Karlovac, Croatia) | igor.kustreba@gmail.com
Ines ELEZOVIC (National Centre for External Evaluation of Education, Zagreb, Croatia) | ines.elezovic@ncvvo.hr
Aleksandar ŠTULHOFER (Faculty of Humanities and Social Sciences, University of Zagreb, Croatia) | astulhof@ffzg.hr

Health Education (HE) in Croatia comprises of four modules: Healthy living, Prevention of violent behavior, Addictions prevention and Sex/gender equality and responsible sexual behavior. Experimental phase of program implementation (2012-2014) introduced HE in Croatian education system through maximum of 12 school lessons per year, depending on grade, within the homeroom classes in all grades of elementary and secondary school. This process was characterized by a significant public interest and a clash of polarized views regarding the fourth module (sex education), which amounted to the national culture war. The aim of this study was to explore parents’ support toward comprehensive sex education (CSE) in schools. The main dependent variable in the study was parental support for the health education curriculum, which in most cases pertained to the support for its fourth module (CSE). Among the predictors and correlates of parental support, we focused on parents’ familiarity with the program. Two independent probability-based samples of parents were used in the analyses. The first included 2,287 parents who participated in a pilot study, while the second sample (N=957) represented parents who participated in a program evaluation study by completing questionnaires at two time points six months apart. Multivariate logistic regression analysis was
carried out to explore correlates and predictors of parental support, as well as to analyze factors related to familiarity with the program’s contents. The implications for educational policy planning and the implementation of CSE in a highly religious, post-transitional society are discussed.

Considerations for the realisation of children's right to participate within primary schools in Kenya based on a Participatory Action Research
Johanna MAHR-SLOTAWA (University of Bielefeld, Germany) | johannamahr@gmail.com

Primary school age going children make up a great number of human population, especially in the Global South. In Kenya, children’s participation in decision-making is, however, often seen as a threat to adult authority. The dominant perspective is that children are ‘to be seen, but not to be heard’. The realisation of children’s right to participate is a great challenge within this cultural context and even more within the social hierarchy of Kenyan primary schools. The Participatory Action Research with primary school children in Kenya sought to theorise children’s right to participate based on field practices. It contributes to the existing theoretical bases on children’s participation by drawing conclusions from Action Research practices (Percy-Smith 2014). In the research, children’s recommendations on how to realise their own right to participate were combined with reflections on the Action Research process. The research findings reveal that the realisation of children’s right to participate can occur through a collaborative process. Children’s participation was shown to be facilitated within an on-going dialogue of critical reflections, in which they are given a voice. The promotion of children’s participation should focus on actions, in which the children, especially, work together in groups and help others. It was noted that children’s participation includes the generation of knowledge and takes place in real life situations, during which, as the children suggested, they should strive to exhibit good behaviour. The realisation of children’s participatory rights should also be followed by the establishment of an institutional culture for participation.

Learning to Disengage: The Role of Peer Effects in Explaining Disengagement in Teaching
Olof REICHENBERG (University of Gothenburg, Sweden) | olof.reichenberg@socav.gu.se

Student disengagement is an educational problem in Swedish schools. The aim of the paper is to explain why student disengagement occurs and reoccurs in Swedish classrooms. Theoretically, the paper discusses different mechanisms explaining student disengagement, which are tested quantitatively and illustrated qualitatively with primary data consisting of 74 video-recorded lessons from three comprehensive schools in Sweden. The statistical analyses (Cox regressions) suggest that peer encouragement is a central mechanism for explaining student disengagement. Furthermore, time and school subject were influential covariates. The qualitative analysis illustrates in detail how the peer effects work.

Laura LÓPEZ CALVO (University of Barcelona, Spain) | lauralopez@ub.edu
Ana VIDU (University of Barcelona, Spain) | ana.vidu@ub.edu

Lifelong learning is broadly investigated as being favourable to promote individual and social benefits in many aspects of adults’ lives. The European project BeLL (Benefits of Lifelong Learning) (2011-2013) has explored the benefits perceived by adult learners who participated in liberal adult education courses. BeLL’s results show that people with lower educational background perceive more positive changes, as a consequence of the participation in adult education classes. For them, education means improvement of their everyday lives, in terms of employment, health care, housing, among others. However, scientific literature has proved that people with risk of social exclusion continue to be excluded from the benefits provided by online training and Lifelong Learning (Eynon and Helsper, 2010; eUser Project, 2004-2007). This paper presents the concept of Dialogical Blended Learning (DBL) as a model that allows the inclusion and effective participation of Collectives Normally Virtually Excluded (CNVE) at the distance education, enhanced by technology. The DBL, based on the Dialogic Learning’s contributions (Flecha, 1997), offers new patterns of learners’ participation in the educational process and the development of technology. This study submerges from the analysis of two research projects, ABE CAMPUS (European Commission, 2003-2005) and RTD APADIS (2006-2007) whose outcome was a virtual learning environment for formal education and leisure for CNVE. Using the Communicative Methodology of research (Gómez, 2011), which has proven its transformative results with vulnerable groups, the egalitarian participation of those who participate in the lifelong learning and belong to vulnerable communities, is possible.

Social Capital, Gender and Institutional Inequalities in the Mexican Higher Education: ¿Persistent or non-persistent?
Lorenza VILLA LEVER (Universidad Nacional Autónoma de México, Mexico) | lorenza@sociales.unam.mx

I would like to present a higher education students populations comparison that have different social positions, defined by the type of capital of which they are possessors and by the social spaces they occupy in the university they study. The argument is that the set of capitals that the agency own are related with their conditions and their relations, and that the social spaces –defined as universities with different levels of academic development-, allow to argue that universities are constituted in “asymmetric social spaces”, as strategically space in order to have a control, to distinguish an to classify the individuals, because the control to accede to those spaces create frontiers in order to standardize in their interior and classify in relation with their exterior, in agreement with the social group that inhabits them and with their historical and geographical context. (Bourdieu, 1989; Levy y Lussault, 2003).
In that sense, the combination of factors as different types of capital, the type of university and the gender, becomes in a mechanism that it favors a disadvantageous inclusion for some and advantageous inclusion for others, and that may be traduced in inequality and exclusion (Sen, 2010), where the effort and personal talent seem to have a very limited functions. The results aim at being able to affirm that the universities of low level of academic development are oriented to more disadvantageous population preferably women, meanwhile those with high academic development lodge more men with advantageous positions, which supposes the persistence of inequalities.

What is Education for in neoliberal times? Looking inside the educational policy in Turkey via vocational and technical education.
Ezgi PINAR (Istanbul University, Turkey) | ezgipinar@yahoo.com
This paper seeks to understand the deepening and intermingling relation between the education policies and labour market policies and suggests that education policy largely becomes an aspect of labour market policy. That is to say the aims of education and the aims of labour market overlap. The content of education is much more associated with work and designed with quality and skills discourse. The increasing tendency of capital groups in the education sector is not surprising for neoliberal times then. When we make a technical, simple content analysis of the educational documents of the governments since the 1980s in Turkey and of the capital groups; it is outstanding that in the name of education policy vocational and technical education has been the main concern. All the governments underline the weakness of the relation between education and employment and put an aim of strengthening this relation. Sociology of education had already been pointing out that the school has a dual role of meeting the demands of labour market and conserving or reproducing the existing power relations and privileges. Education process, which means a selection process, has internally related ideological and economic functions that work for the reproduction of our hierarchical society. Within this critical perspective, restructuring of education will be analysed in this paper with a particular focus on the vocational and technical high schools as a part of inequality management of neoliberal education policy.

Increasing inequalities: Recent Trends in School Failure in Spain
José Saturnino MARTÍNEZ GARCÍA (La Laguna University, Spain) | pepemart@gmail.com
María FERNÁNDEZ MELLIZO-SOTO (Complutense University, Spain) | mfmellizosoto@edu.ucm.es

School failure is substantive in Spain. The percentage of students that do not get the compulsory education diploma is around 20%. Students that “fail” cannot continue to post-compulsory education and, sooner or later, are out of formal education. School failure is, as it is usually the case, higher for students from lower socio-economic backgrounds. Our article explores the evolution of Inequality of Educational Opportunities (IEO) in compulsory education from the seventies in Spain. Using logit models of estimation to control for socio-demographic factors that may interfere with IEO dynamic, it shows that IEO at this level of education went parallel to school failure: decreased until late nineties and increased afterwards. In order to explain this (unexpected) increase, we have tested the impact of a Law, called LOGSE, implemented in Spain at the end of the nineties. We show evidence that this Law, although egalitarian in spirit, in practice could go against the continuation of students from lower socio-economic backgrounds in education, therefore increasing IEO at this transition point.

The impact of economic, social and cultural capital on academic achievement
Susanne GERLEIGNER (German Youth Institute e.V., Germany) | gerleigner@dji.de

It is well documented, that children’s social background does have an important effect on their educational participation and attainment. In Germany, especially the academic performance at the end of primary school does have important impact on the transition to secondary school which mostly determines the educational participation at all. Therefore this contribution is about to figure out the role of economic, social and cultural capital for academic achievement at the end of primary school.

What kind of impact do these capitals have on academic performance at the end of primary school? Do they mediate between children’s social backgrounds respectively parents’ level of education and academic performance? And what do they influence more – objective test results or grades, given by the teacher?
Based on the institutional and individual mediation model from Baumert, Watermann and Schümer (2003) as well as on the mediation-moderation-model from Marjoribanks (2002) a new model was developed and empirically tested with data from the longitudinal German study Kompetenzaufbau und Laufbahnen im Schulsystem (Koala-S) [competence development and trajectories in the school system].

The analyses indicate, that especially cultural capital (but also social capital) does have important impact on academic achievement, but nevertheless, the parents’ level of education still has effects on the grades, given by the teacher.

Reform of higher education as a factor of stratified reproduction: example of Serbia
Gordana D. VUKSANOVIC (Novi Sad Business School, Serbia) | gordanavuk@uns.ac.rs

Reform of higher education is happening simultaneously with two significant processes: a) ownership transformation and b) adaptation of universities to market economy. The first process, ownership transformation, has conditioned a continuous increase in the number of the unemployed. The second process, the adaptation of universities to market economy, has ended the practice of the so-called free education. Therefore, the expenses of studying are increasingly more borne by students and their families. In the conditions of a high unemployment rate, low income or the total lack of income, higher education is becoming the privilege of the wealthy.

The relationship between the membership in certain layers of the society and educational aspirations is investigated on the basis of an empirical research conducted at the Faculty of Philosophy in Novi Sad in the period 2006-2010 and at the Higher School of Business in Novi Sad in the period 2008-2014. The data was collected via a questionnaire of the semi-structured type. The open- and closed-type questions have allowed for greater precision in the process of deduction and have allowed insight into the subjective experience of informants. Special attention was dedicated to the investigation of the relationship between the social origin and the motive for choosing a certain study group. Besides the said research, the paper also relies on relevant statistical data, as well as scientific and professional literature.

The ‘elite’ status of liberal education in Poland. Myth or reality?
Daniel KONTOWSKI (Institute of Sociology, University of Warsaw, Poland) | d.kontowski@is.uw.edu.pl

Theme: Colleges of inter-departmental individual studies in the humanities and social sciences (MISH), established at 9 major polish public universities, are early 1990s response to departmentalization of university study. Targeted at candidates with a promising academic record, they remained a niche (c.a. 1500 students in Poland, less than 0.045%) serving a fraction of students.

These institutions are relatively uninterested in promotion outside of their home city, best high schools and knowledge contests. However, they should attract also young people from underprivileged environments, to better develop the civic dimension of liberal education and meritocratic ethos of academic tradition to which they make appeal.

The question of their elite status and social origin of candidates is important and open, as no research have been published on this topic.

Questions: Where do the candidates to MISH come from? What are the differences between Warsaw and smaller academic centers? Do the patterns change over time, and if so, what are the possible reasons? How did the demographic downturn and opening access to higher education institutions in the European Union affect the social background of MISH candidates?
Theoretical Issues
By making claims to liberal education, MISH faces the perennial question of equity in education in general, and equality of educational opportunity in particular. Over two decades, MISH students pool has grown, which should lead to a more egalitarian dispersion of main demographical profiles. But at the same time, relative popularity of this mode of study among candidates have declined. Second-cycle studies are far less popular than fist-cycle among the candidates. Comparing that with academic profile of studies, as well as an opportunity to earn double degree void of fees makes the assumption of a middle class, big city origin of candidates feasible, which should hold especially true for Warsaw. MISH at regional universities, smaller (around 60% of MISH student pool combined) and less popular, may share this characteristics – or not, being a milieu promoting upwards social mobility.
Methods: As higher education institutions in Poland do not normally collect data on family income of candidates, it is extremely hard to make an analysis without launching a separate quantitative research. However, the government require all higher education institutions to report on the class of the place of residence (declarations). The data will be collected from all MISH colleges, serving approximately 1500 students, for the period of last three academic years (after which old data are destroyed). These data will be supplemented, where possible, by the admission reports from the previous years, generated by the institutions for internal analyses.

Preliminary Results
The results from MISH at the University of Warsaw, only for first cycle studies, based on admission survey (response rate 80-88%) show ca. 66% admitted candidates come from 500k+ cities, and around 60% from the Warsaw county, without significant changes over time. Second cycle studies as well as profiles of candidate pool are required to fully evaluate this program. The data should be compared with other 8 MISH colleges in the country to make a definitive conclusion.

Towards a Gender sensitive Teacher Education. A research in Basic Education.
Telma Maria Gonçalves QUEIRÓS (Polytechnic Institute of Bragança, Portugal) | telma@ipb.pt
Maria do Céu RIBEIRO (Polytechnic Institute of Bragança, Portugal) | ceu@ipb.pt

In the context of current social and educational policies, guided by values of citizenship and equal opportunities, it is crucial that teacher education develops social and ethics dimensions in the future professionals. However, inequalities persist in society, like those related to gender. Education and teacher education are promising fields for changing. The Bologna process has put new challenges and created new opportunities to higher education in order to rethink Initial Teacher Education (ITE). Simultaneously, demands for improvement issues about equity and gender in curriculum of teacher's education have strengthened. This research represents an additional step in the interpretation of gender and its relation to ITE, once gender in teacher education is a relatively under research area. The lack of knowledge regarding an analysis of gender issues in ITE is, therefore, one of the starting points for this research. Elementary school teachers need to understand gender policies and how they impact on their teaching before they can begin to challenge these. Within this context, the main purposes of this study are: (i) to analyze whether gender issues are addressed in the study plans and modules of the Master Degree Programs (MDP) on 1st Cycle of Basic Education (CBE) in all public polytechnic institutes of Portugal; to know the student teachers perceptions about gender about gender sensitive teaching practices. To meet the main goals of this investigation, a qualitative methodological approach will be used, applying in-depth interviews and document analysis. The sample will consist of: i) the
plans and modules of MDP of 1st CBE in all public portuguese polytechnic institutes; ii) the student teachers of one public polytechnic institute selected. Data will be analyzed independently by two researchers and their findings will be compared at a later stage. The procedures for analysis and discussion of the results will be followed by other researchers in order to promote a comparison with our beliefs, values and biases. It is our understanding that the results of this investigation will be important to make aware of the ways gender issues interfere in teacher education, revealing the absence of this issues in basic education programs. On the other hand enables the awareness and reflection about a set of meanings and practices in student teaching in elementary school regarding gender issues. Moreover, it also expected that the results will provide some insights that suggest crucial recommendations to the administrators of the courses of MDP regarding the importance of include gender issues in initial teacher training programs for an improved educational environment in elementary school classes.

**RN10S01 - Early School Leaving and Drop-out**

**Drop out or walk out? Analysis of the dropout phenomenon from the rational choice theory perspective – example of University of Warsaw.**  
Agata KOMENDANT-BRODOWSKA (University of Warsaw, Poland) | komendanta@is.uw.edu.pl  
Tomasz Zbigniew ZAJĄC (University of Warsaw, Poland) | zajact@is.uw.edu.pl

Higher education dropout is one of the major issues studied by researchers from different domains and discussed by higher education experts and policy makers. It is analysed in many contexts, e.g. of higher education efficiency or educational inequalities. University dropout is not always related to poor academic record, but it's rather a more complex phenomenon. It can also be a conscious decision not to continue education due to different reasons. The aim of the presentation is to analyse this complex phenomenon from the rational choice theory perspective. Our analysis of key drivers leading to a decision of leaving education is based on the case study of University of Warsaw, one the leading and the biggest higher education institution in Poland and of the major universities in Central and Eastern Europe, with over 10 thousand students enrolled each year. We analyse administrative data on the whole population of students and their educational paths which enable us to measure the scale of the phenomenon in question and also to identify different types of dropout at the University of Warsaw. We also conduct qualitative research on recent dropouts, which is complementary to the register-based analysis. Individual in-depth interviews conducted with students who have recently left university allow us to identify motivations and factors leading to different types of dropout decisions (eg. permanent vs. non-permanent dropout). Results of our research show the complexity of the decision-making process of people leaving higher education and enable us to identify diverse factors that lead to dropping out.

**How Does Policy Against School Dropout Contribute to Hinder Social Inequality? The Strange Case of Italy**

Maddalena COLOMBO (Università Cattolica del Sacro Cuore, Italy) | maddalena.colombo@unicatt.it

The paper is focused on school dropout in Italy, an endemic and serious issue of social inequality. Based on social-economic, territorial and individual divides early school leaving persists over the last years notwithstanding several attempts to reduce it. Mostly in the South of Italy many initiatives have been carried out with the support of Eu development programs (PON
Some recent dispositions taken by Ministry also increased the public attention and the worry about the poor learning skills of students as a risk factor. In the past sociologists have focused on the determinants of school leaving and agreed on three types of explication factor: direct factors, as school distress or teachers’ inadequacy; indirect factors, as poor family background or unrealistic aspirations; remote factors, as the divergence between academic and vocational culture and the opposition “doing”- “studying” (Colombo, 2010) that under-evaluates knowledge in itself. Recently more critical elements have been pointed out: 1) although the average improvement of ESL rates, since the economic crisis began all these factors affected even more the school population with low social status, coming back to inequality as the system were elitist in itself; 2) the lack of public investment on education (as financial cuts and “motionless” reforms) leads to convince people (whatever is the status) that education is useless for social achievement and this betrays the aim of equality and universal access; 3) incapacity of teachers to deal with special needs pupils reinforces inequalities, 4) subject-targeted or school-related measures do not hinder the risk of school abandon because they address to a conventional drop-out (disable, poor or disadvantaged) and it lacks considering school leaving as a personal choice (Colombo, 2013).

Starting from the ESL situation in Italy (ISTAT-Eurostat data) looking backwards since 2000, the contribution moves through the analysis of learning outcomes (PISA - INVALSI data) related to the social background of students (territory, gender, migrant background) to show how the national policy against ESL still lacks of a “prevention view” that only could have hindered social inequality in the completion of educational tracks.

**Determinants of Dropout from Higher Education. The significance of Social and Academic Integration**

Daniel KLEIN (University of Kassel, Germany) | daniel.klein@uni-kassel.de
Volker STOCKÉ (University of Kassel, Germany) | volker.stocke@uni-kassel.de

Tinto’s (1975) “student integration model” has been dominating sociological research on dropout from higher education. This theoretical framework assumes that academic integration positively affects students’ persistence through grade performance and intellectual development, both capturing the congruence between the norms and standards in institutions of higher education and those held by the students. Social integration is achieved through peer group associations and interaction with faculty staff, facilitating identification with the university and successful completion. The interplay of these two dimensions is left open for empirical research. Despite an extensive body of international literature, supporting the theoretical model, it has largely been ignored in higher education research in Germany.

Drawing on survey data from a country wide sample of universities and multiple measures for social and academic integration, we investigate the extent to which international results are applicable to the German context. Based on explanatory factor analysis, we find evidence for the two assumed dimensions of integration, which however proved to consist out of separate subdimensions. In regression models we show that each of the subdimensions independently exerts an negative effect on the students’ dropout intention. Testing for statistical interactions between the latent dimensions, we also find evidence for substitution effects between academic and social integration: One of the two dimensions being more available, decreases the relevance of the respective other. Furthermore, we test for whether subgroups of students, e.g. B.A.- vs. Master-students or students with higher vs. lower social origin, profit differently strong from being more integrated in their university.

**Early school leaving, vocational schools and social structure in Poland**

Anna Marzena WRONA (University of Warsaw, Poland) | am.wrona@uw.edu.pl
Early school leaving is claimed to be one of the major challenges to the European Union in the field of education. The scale of the phenomenon, however, is different in particular European countries, and so are its reasons and determinants. The studies on ESL conducted in Western Europe draw attention primarily to the difficulties with the integration of immigrants and ethnic bias, as the factors increasing the risk of abandoning education early. This is not the case in Poland, where the number of immigrants remains insignificant and the society is considered ethnically uniform. Therefore, the research aiming to explain the main reasons and protective factors for ESL have to focus on the role of social structure.

The paper investigates to what extent socioeconomic status correlate with the willingness of Polish students to leave education early, and furthermore – how the type of secondary school they are attending to interfere in the relation between SES and the risk of ESL. The particular focus is on the pupils enrolled to one type of secondary school (basic vocational school), who – due to the mode of selection and the curricula – are at a relatively high risk of early school leaving. The paper is based on the data from the quantitative survey conducted in 2014 on the sample of over 3000 students of upper secondary schools in the three Polish cities within the large international project “Reducing Early School Leaving in Europe”.

Exploring how educational practices, expectations and decisions are classed and gendered. A qualitative analysis of students at risk of dropping out school in Catalonia

Miss MARTA CURRAN (Universitat Autònoma de Barcelona, Spain) | marta.curran@uab.cat

Although much research has been done about the factors that explain Early School Leaving, there is still little research that explores how the interaction between gender and social class has an effect on the attitudes and sense of belonging of students with their schooling from a subjective perspective. The aim of this paper is to analyze how educational processes are gendered and classed and how this has an effect on the attitudes and the configuration of educational expectations and decisions of students at risk of dropping out school before the end of secondary compulsory schooling. In this sense, we explore the role of teachers in the configuration of students' gender and class identities and how different institutional settings (specially, guidance and counseling and mechanisms to manage pupils' heterogeneity) and educational indicators (grade retention, students in the low track, absenteeism among others) are indeed classed and gendered and how this influences overall in educational decisions.

The analysis is based on a qualitative methodology developed through case studies in four secondary schools in Barcelona (Spain). The schools were selected according to their diversity in terms of social composition and their logics of manage pupils' heterogeneity. In order to develop the analysis, we conducted interviews with principals, teachers, counsellors and students coursing the last two years of secondary compulsory education (14-16 year old). We also conducted focus groups with teacher and students, class observations and attended teachers' regular meetings. The initial conclusions of the analysis point out that the role of secondary school is key to understand how gender and class identities' are formed and its influence on educational trajectories.

RN10S02 - Higher Education and Inequalities I
Vulnerable groups and inequalities in higher education
Judith PÉREZ-CASTRO (National Autonomous University of Mexico, Mexico) | pkjudith33@yahoo.com.mx

Education has been considered an important variable to achieve social mobility. Particularly, higher education generates the highest rates of return for individuals. However, this still remains a scarce commodity for large sectors of the population. In this research, we are interested in the relationship between educational inclusion and exclusion of vulnerable groups. Specifically, we want to study what the challenges and opportunities of these people are regarding their chances of enrolling, continuing and completing higher education. In this case, we present the results obtained with disabled. The research is being developed with a sample of higher education institutions from Mexico. Our theoretical perspectives are sociology of education and the social vulnerability approach. As a methodological strategy, we are using a mixed-model design. The results showed us that only 5.2% of the total population with disabilities, in Mexico, has access to higher education. The principal factors that restrict entrance to higher education are: the limited access to previous educational levels, the lack of educational programs for the different types of disabilities, family resources, discrimination and social prejudices. Regarding permanence the main variables are: the lack of institutional policies to foster inclusion of disabled students, the lack of resources to develop institutional strategies and programs for this population, pedagogical models with too many courses and activities designed for people without disabilities, untrained academic staff to support disabled students, and physical barriers. Finally, regarding exit, the principal obstacles are: graduation requirements and the lack of institutional units or departments to help disabled.

Values and Motivation for Entering Higher Education in the Hungary-Romania Cross-Border Area
Krisztina BERNATH (Partium Christian University, Romania) | natikrisz@gmail.com

In the frame of this paper we aim to explore the characteristics, value system and motivations of learning, towards the university and the profession that students have in entering higher education by exploring quantitative data collected in the frame of the "Higher Education for Social Cohesion – Cooperative Research and Development in Cross-Border Area" project, funded by the Hungary-Romania Cross-border Cooperation Programme (HERD - HURO/0901/253/2.2.2).

The individual's position in the social structure is strongly tinged to housing-related micro-social effects, such as the development level and quality of the home area, accessibility of the education institution and the socio-economic environment, which are factors that strongly influence a region's society's fate, and decisively determine the individual schooling conditions. The review of the literature enlightens upon the problem raised here, in its various aspects. Both international and national literature proves that social reproduction within the family acts upon the educational/career choice of university students. Educational theory and research from countries other than Romania remain focused on social class disparities, incorporating factors from the human capital investment framework, while Romanian research on the theme is also interested in more psycho-sociological approaches of the motivations for entering higher education.

Social inequality in higher education: the role of decoupling
Jelle MAMPAEY (Ghent University, Belgium) | jelle.mampaey@ugent.be
Inequality in higher education continues to be a widespread phenomenon that manifests itself at different levels. In this paper, we focus on social inequality in higher education defined as the lower accessibility for disadvantaged students from lower social classes. Social inequality is strongly condemned by governments worldwide and social justice and related concepts such as inclusion and equality are important features of macro-level policies. However, studies demonstrate that social justice often remains rhetoric and is not reflected in the substantive actions (or the pedagogies and didactics) of universities. In organizational institutionalism, this phenomenon is referred to as ‘decoupling’, which means that organizations often build gaps between their rhetoric and their substantive actions. When social justice is not reflected in substantive actions, universities remain highly inaccessible for disadvantaged students, although many universities may argue that they are socially just. We explore the antecedents of decoupling in a comparative case study of two Flemish universities that differ with regards to the accessibility for disadvantaged students. University A is becoming increasingly accessible while University B is becoming increasingly inaccessible. We will try to explain how and why University B decouples rhetoric and substantive action (in contrast to university A) and how this is related to the (in)accessibility for disadvantaged students. Our analysis indicates that decoupling occurs when staff members oppose social justice. In this case, the available resources are mainly used to counter opposition instead of implementing social justice substantively.

Higher degrees, higher inequalities? Access to postgraduate education and its implications for social mobility
Paul WAKELING (University of York, United Kingdom) | paul.wakeling@york.ac.uk

Sociologists have led the investigation of inequalities in access to higher education and their implications for social mobility and social closure. Research has, however, concentrated on initial entry to higher education. This is despite continued and rapid growth of enrolments on postgraduate qualifications such as masters degrees and doctorates in recent years. Such qualifications have long been prerequisites for certain careers – including university teaching – but increasingly control entry to a broader range of professions. Gains made in widening the social basis of university recruitment risk being undermined if credential inflation leads to the ‘passing up’ of class (and other) inequalities from first degrees to postgraduate level. Focussing on the British case I will draw on a range of datasets about students and graduates to investigate the role of postgraduate qualifications in social mobility. I will examine whether there are class and other inequalities in transitions into postgraduate study; and also scrutinise the labour market outcomes for postgraduate qualification holders in comparison to those with first degrees. Results suggest that there are social class inequalities in access to postgraduate education, but these are partly mediated through differences between types of university and subject disciplines. Similarly, postgraduate qualifications confer advantages in terms of income and class position, but there is also a suggestion that postgraduate degrees can be used as a strategy to compensate for underemployment. I will conclude by considering the prospects of recent government initiatives in postgraduate funding and policy in England for ameliorating inequalities at postgraduate level.

Same, same but different. How graduates that studied the same major at different universities end up on different positions on the job market?
Mikołaj Karol JASINSKI (University of Warsaw, Poland) | mikolaj.jasinski@uw.edu.pl
Marek BOYYKOWSKI (University of Warsaw, Poland) | m.bozykowski@is.uw.edu.pl
Tomasz ZAJAC (University of Warsaw, Poland) | zajact@is.uw.edu.pl

European educational policies aim to unify the educational standards in order to ensure comparability of learning outcomes and therefore to increase educational mobility in Europe. But even the process of recruitment indicates that people don’t see universities as providers of similar educational service. Indices showing perception of graduates on the job market brings even more light to the picture.

The paper compares careers of graduates who chose the same major at different universities. It shows how job market percepts seemingly identical diplomas with the same formal learning outcomes. Register-based analysis including data from the Social Insurance Institution and the central universities graduates register (POL-on) can show how universities’ brands are evaluated by external experts – employers.

The phenomenon will be presented on the examples of the most popular majors. The analysis of careers covers earnings as well as employment rates. The regional level of these indices will be regarded to avoid bias resulting from differences in local economics.

Changes in access to higher education in the Nordic countries 1985-2010 – a comparative perspective

Jens Peter THOMSEN (University of Copenhagen, Denmark) | jp@jpt.dk
Emil BERTILSSON (University of Copenhagen, Denmark) | Emil.bertilsson@edu.uu.se
Tobias DALBERG (University of Copenhagen, Denmark) | tobias.dalberg@edu.uu.se
Juha HEDMAN (University of Copenhagen, Denmark) | juhedman@utu.fi
Håvard HELLAND (University of Copenhagen, Denmark) | havard.helland@hioa.no

In the international literature on access to higher education, the Nordic countries often stand out as being the ones where social background matters the least, and the Nordic countries/Scandinavia is often being characterized by more or less the same educational patterns of access to education (Blanden, 2013; Breen & Jonsson, 2005; Erikson & Jonsson, 1996; Shavit & Blossfeld, 1993). Additionally, the international mobility literature have traditionally been referred to Sweden as a proxy for the Nordic countries in comparative studies (Erikson, Goldthorpe, & Portocarero, 1982; Erikson & Jonsson, 1996). So, while the Nordic countries have served as an important comparator in international studies of inequality of educational opportunity, there has been a lack of literature comparing the Nordic countries with each other.

This paper adds to these studies by comparing access to higher education by social background in the Denmark, Finland, Norway and Sweden 1985-2010. This is the first comparative paper on access to higher education in all four major Nordic countries, where we make use of unique administrative data in all four countries. Such a comparison is important for a number of reasons; most importantly, qualitative differences in the Nordic welfare state models may affect the structure and organization of higher education systems leading to possible differences in educational attainment for different social groups.

In our comparison, we want to focus specifically on a) whether privileged groups have been able to maintain an advantage in access to higher education, and b) on gendered access patterns, i.e. whether women are more mobile than men.

These two questions are at the core of most research in inequality of educational opportunity. First, a large body of the mobility and immobility literature have focused specifically on the ability of privileged groups to keep an edge in the race for educational qualifications, and how this had led to de facto monopolizations of not only upper levels of the educational system, but also, as the education system has expanded, of particular tracks or sections within educational levels.
We want to examine to what extent this is the case in the Nordic countries, and if the countries differ from each other in important ways, e.g. if access in some Nordic countries is more open than others, and if this can be viewed in relation to the state and the education system. Second, we want to focus specifically on gender differences in access to higher education. The Nordic countries have traditionally had wide ranging gender equity policies, and a very high frequency of women in the workforce. These women have also gained qualifications and skills on par with men, even surpassing them at the higher education level. As an example, in the parent generation, mothers were just as often the higher educated parent as men in 2010 in Denmark.

RN10S03 - Gender in Education

The gender gap in grade retention: the role of sex, gender typicality and school belonging.
Dimitri VAN MAELE (Ghent University, Belgium) | dimitri.vanmaele@ugent.be
Ellen HUYGE (Ghent University, Belgium) | ellen.huyge@ugent.be
Wendelien VANTIEGHEM (Ghent University, Belgium) | wendelien.vantieghem@ugent.be

This paper contributes to research on educational inequality by exploring the gender gap in grade retention after the first year of secondary education. First, masculinity theory is used to explain how dominant cultural views on masculinity may influence boys to develop antischoolish attitudes and behaviors in their strive for popularity, hypothetically resulting in a higher level of grade retention for boys than girls. Second, we transcend a gender-dichotomous approach to the educational gender gap by introducing the concept of gender typicality. This is a dimension of one’s gender identity and refers to the extent one feels typical for his/her biological sex in a given society. We hypothesize that students who identify themselves as atypical for their own sex might feel less connected to peers and teachers as compared to more gender typical ones, possibly resulting in less school belonging and therefore higher levels of grade retention. Multinomial logistic multilevel modeling on data of 5830 first year students across 55 secondary schools in Flanders (Belgium) demonstrate that, compared to girls, boys have double the chance to get retained under control of students’ ethnicity, SES, track and school delay. Moreover, boys and girls who feel gender atypical have a higher chance to get retained than those who identify as gender typical. This association was explained by lower levels of school belonging among gender atypical students. Our findings warrant attention to the extent boys and girls feel to belong at school, certainly for those who do not feel to fit dominant gender stereotypes.

Struggling against the Myth of Equality in Research and Academia: The case of women in academia in Turkey
Fatma Umut BEŞPINAR (Middle East Technical University, Turkey) | bespinar@metu.edu.tr
Ayse Idil AYBARS (Middle East Technical University, Turkey) | aybars@metu.edu.tr

This paper examines the myth of gender equality in research and academia by focusing on women academics in Turkey. Most studies argue that woman academics in Turkey are in a favourable position in quantitative terms. The relatively large numbers of women in academia leads to the perception that women academics and researchers in Turkey are in a better position, even when compared to their Western counterparts. Indeed, while Turkey has one of the lowest female labour force participation rates amongst countries with similar levels of economic development, and the lowest among EU and OECD countries, with 33% according to
2014 data, the rate of women in academia is 43%. On the other hand, this relatively high rate conceals important inequalities that women face in academia, including the heavy concentration of women in lower ladders of academic hierarchy, the gender-stereotypical distribution of women academics in the disciplines that are traditionally associated with women, and the specific disadvantages women face in recruitment, promotion and research processes. The objective of this paper is to reveal what is hidden under the myth of gender equality in Turkish academia and to understand the specific obstacles women face in academic career development through qualitative methods aiming to reflect women academics’ own experiences and perceptions.

The long mission towards gender equality in education – with reflections from a project on gender awareness in teacher education in Finland

Elina LAHELMA (University of Helsinki, Finland) | elina.lahelma@helsinki.fi
Sirpa LAPPALAINEN (University of Helsinki, Finland) | elina.lahelma@helsinki.fi

The need to promote gender equality within and through education has been a worldwide mission since the 1970s, with recurrent international and national resolutions. Also Finland has evidenced a history of hundreds of projects and reports that have repeated the same aims, ideas and practical innovations for promoting equality, many of them with teacher education as one of the foci. However, the actual pace of change has been very slow. In this paper we focus in the impact of a national project on gender awareness in teacher education (2008-2011), four years after. We will analyse changes in cultures and curricula in relation of gender awareness in teacher education, with reflections to the aims and activities of the former project.

Theoretically, the paper draws from feminist intersectional understandings of gender and gender equality in education. The data includes documents of the project, curricula of teacher education and interviews of activists of the project. Auto-ethnographic methodology will also be used, based on experiences of the two of us who represent different generations of scholars who have worked as researchers, teachers and activists in gender equality issues. We will suggest that conceptual problems in issues around gender and involvement in personal lives makes addressing gender awkward in schools and teacher education. We also suggest that the mission of gender awareness is difficult, but not a mission impossible.

Gender Inequality in Higher Education in Turkey: A comparative Analyses of Education and Engineering Faculties

Aylin ÇAKIRO ĞLU ÇEVİK (Dr. Middle East Technical University, Department of Sociology, Ankara, Turkey) | aylincakiroglu@gmail.com
Ayşe GÜNĐÖZ HOŞ GÖR (Prof. Dr., Middle East Technical University, Department of Sociology, Ankara, Turkey) | hosgor@metu.edu.tr

Education as an institution of a modern society has several functions such as training of individuals for skills, values and qualifies which need for occupation as well as labour market. In addition, education has plays notable role for nations, specifically in nation-state building process, via transmitting values required for constructing national identity and labour. However, attainment of education has occurred as an issue in the contemporary societies. The reason of the importance of the issue is that education provides opportunity for upward mobility, social status and occupation via higher education particularly. For the educational attainment and then upward mobility, therefore, equality of educational opportunity as concept gains its importance in the society. However, many studies and reports on the equality of educational opportunity have displayed that there has been inequality of educational opportunity in the world. In other words, the equality of educational opportunity has not been achieved yet in terms of gender,
regions and socioeconomic status of family because there has been a strong relationship between social background or ascribed characteristics and education attainment process. Therefore, as conflict theory claims, education (re)produces inequalities and hinders the intergenerational socioeconomic mobility. On the other hand, in spite of strong relationship between ascribed characteristics and education attainment, education has already gives opportunity for upward mobility for one with higher education than his/her parents’ education level. Therefore, the question rises about the social background and attainment process. Considering gender inequality in education, the attainment process varies by gender. According to the empirical and theoretical literature, gender educational inequality is partly related with macro structural factors (i.e. state’s historical education policies, international division of labour, international organizations and agreements, industrialization and urbanization history) and partly with family factors (i.e. socioeconomic status of parents, family structure and parents’ decision making process).

In case of Turkey, gender equality in educational opportunity has not been achieved all education levels. However, higher education has the highest gender inequality in terms of parity between genders and gendered division of labour. Regarding historical background of higher education in Turkey that goes back to Ottoman Empire, education and engineering schools/departments, their roles and functions are different each other in Turkey. Since 19th century engineering has been considered as male-dominated field while education has been found suitable for females because of gendered division of labour: teachership is something like the continuation of their mother roles, whereas engineering is related with physical power. In other words, genders have been more strongly related with and represented in these fields. In addition, in Ottoman Empire, engineering schools were found to raise the necessary specialist staff for the army and navy and thus they could save the army, lost territory and then the Empire. It can be argued that another clue for considering engineering as male field is that Ottoman women, that fought for the right of higher education such as medicine training, natural sciences, did not struggle to attain engineering schools. The reasons prevented the willingness of women to engineering can be associated with the traditional education system in the Empire and internalized gendered division of labour in the society. Indeed, the first woman in engineering school/faculty is welcomed in the early period of Turkish Republic (in 1927) thanks to state feminism. On the other hand, teacher-training schools for females which were the results of the non-coeducational system in Ottoman (i.e. female schools required female teachers because of Islam) gave the opportunity of women to be in public, enabled women’s upward mobility and participate in workforce. In the early republic, teachers considered as the agent of new nation-state ideology (Kemalist ideology) played a crucial role in nation-state building process. When we look at the socioeconomic background of the students in tertiary education in these periods, it is seen that they were children of middle and higher socioeconomic background families (i.e. educated, have occupation in state like soldier, administrator and lately supporter of the Kemalist ideology). Therefore, this study takes a position that (i) higher education reproduces gendered division of labour and (ii) the interaction between gender and socioeconomic status of family has been represented in higher education system.

In contemporary Turkey, it is evident that while education faculty is still female-dominated field, engineering faculty is male-dominated field. Moreover, teaching which is lower paid and less prestige occupation than engineering is preferred mostly by females. By the way, this paper explores who accesses to the education faculty as female-dominated field and engineering faculty as male-dominated field in Turkey? What are the differences/similarities among students in terms of their socio-demographic, family and educational background? Which variables affect attainment of these faculties regarding gender? In other words, do the effects on the attainment of these faculties vary by gender? If so why? Drawing on the Eurostudent Survey IV (2011) (http://www.eurostudent.eu/) which is nationwide representative and internationally comparable
data, we explore the differences between two faculties. Sample size for the education faculty is 3,172 whereas for engineering faculty is 3,669 out of population 16,817. Besides the descriptive statistics, logistic regression model is applied. Findings are explained within the discussions on modernization history of Turkey. Findings indicate that specifically, females are relatively coming from higher socioeconomic background family, urban areas and better education background, compared to males. Considering faculty, these characteristics are also valid for engineering faculty. Students in engineering faculty are from higher socioeconomic background family, urban areas and better education background, compared to education faculty. In this sense, education faculty consists of relatively disadvantage groups. In sum, it can be argued that, education faculty provides upward mobility for students, while engineering faculty protects status quo.

Gender Inequalities in the Process of Participation in the Classroom. A Sociological Perspective
Paulo Coelho DIAS (Centre for Research and Studies in Sociology (CIES), Portugal) | pgdias@sapo.pt

We compared in this article the verbal participation levels of male and female students in the context of the classroom. We also tried to foresee the influence of the teacher in this participatory process. We worked with a sample of twenty-four teachers and 651 of their students, from the municipality of Faro in Portugal. The results indicate that male students participate in the classroom much more than their colleagues. The nature of this participatory process is also different in ways that we problematize in sociological terms. The teacher’s role, overall, seems to reinforce the trend towards greater participation of male students, since, despite their greater involvement, teachers as a whole, still tend to ask more boys than girls to participate.

RN10S04 - School Performance

Measuring different dimensions of truant behavior: a typological approach
Gil KEPPENS (Vrije Universiteit Brussel, Belgium) | gkeppens@vub.ac.be

Truancy is often cited as a complex and multifactorial phenomenon. However, studies researching truancy are often limited to conceptualize truancy based on the frequency of the absence, which results in comparing characteristics of regular absentees with characteristics of non-truants. The purpose of the present study is to provide important insights into the conceptual understanding of truant behavior by exploring different types of truants. To examine different types of truants we used latent profile analysis, based on a representative sample of 4189 youngsters in secondary education in Flanders (the Dutch-speaking part of Belgium). 6 key indicators were employed to identify latent classes: the period of the absence, the parental awareness of the child’s absence, the location of the absence, individual versus group absence, pre planned versus on the moment absence, and the intention of the absence. Three classes of truant youth were identified: ‘homestayers’, ‘traditional truants’, and ‘condoned social truants’. In addition, multinomial regression analysis revealed social differences between the three types of truant youth. Our findings suggest that truant youth are a heterogeneous group, which can be categorized in different types that have specific social characteristics. In the discussion we
demonstrate how studying different types of truants can be important for understanding how truant behavior can be identified and prevented.

Students’ Aspirations, Expectations and School Achievement: What really matters?
Nabil KHATTAB (University of Bristol, United Kingdom) | nabil.khattab@bristol.ac.uk

Using the Longitudinal Study of Young People in England (LSYPE), this study examines how different combinations of aspirations, expectations and school achievement can influence students’ future educational behaviour (applying to university at the age of 17-18). The study shows that students with either high aspirations or high expectations have higher school achievement than those with both low aspirations and low expectations. Furthermore, complete alignment between high aspirations, high expectations and high achievement is the most important predictor of future educational behaviour amongst students. However, it is also found that low expectations do not negatively impact students’ future behaviour when they have high aspirations accompanied with high school achievement. Additionally, the study finds significant ethnic differences in favour of white students at GCSE level, but that these differences are reversed in relation to applying to university at the age of 17-18.

A MIMIC Model of Skills Among Young Adults
Rosario SCANDURRA (Universitat de Barcelona, Spain) | rosario.scandurra@gmail.com

The paper analyses through statistical modeling how the distribution of post-compulsory education between individuals and social groups affects inequality of skills among young adults (aged 25-34) in different countries. The paper is based on data collected by the Survey of Adult Skills 2012, a product of the OECD Programme for the International Assessment of Adult Competencies (PIAAC) that measures proficiency in literacy and numeracy internationally. In order to gain understanding of the relationship between different potentially explanatory factors of numeracy and literacy scores in PIAAC, separate sequential models were constructed for socioeconomic background, education and training, employment, and skills practices factors. The results show that even after accounting for all factors education remains the most important predictor of literacy and numeracy proficiency among young adults. In all countries, however, the total effect of education on skills is partially explained by the unequal distribution of education among individuals from different socioeconomic backgrounds. The paper explores how different institutional arrangements, such as the differentiation of post-compulsory education and the expansion of the access to tertiary education, moderate the effect of individual socioeconomic background on the educational attainment and the skills of young adults.

Schools matter? Mathematics performance in Portuguese public basic schools
Teresa SEABRA (ISCTE-IUL, Portugal) | teresa.seabra@iscte.pt
Helena CARVALHO (ISCTE-IUL, Portugal) | helena.carvalho@iscte.pt
Patrícia ÁVILA (ISCTE-IUL, Portugal) | patricia.avila@iscte.pt

The main objective of this paper is to analyze School Effect on the pupils’ achievement in Mathematics, in Portuguese basic schools. As Demack, Drew and Grimsley (2000) remind us, the study of Jencks et al (1972) show that the relative effect of the school on pupils’ achievements is small in comparison with the effect of the social and ethno-racial condition, but this does not mean that there is no effect. While studies on the “school effect” have had some tradition in Anglo Saxon countries (ie Rutter,
Having pupils nested within schools a hierarchical linear modeling (multilevel models) was used and separately data analysis were carried for native students and immigrants in order to explain Mathematics achievement, measured by the results obtained in national exams on fourth and sixth-grade. We explore the relationship between the ethnic and socio-economic composition of schools and pupils’ achievement at Mathematics and if the effect of school differs between fourth grade and sixth grade in Mathematics results in national exams. We have some evidences that this happens (Seabra et al., 2014) but now we can measure these differences and deepen our understanding about the factors that can explain it.

The Craft of Academic Performance: A Study of Adolescents
Thorolfur THORLINDSSON (University of Iceland, Iceland) | thorotho@hi.is
Vidar HALLDORSSON (University of Iceland, Iceland) | vidar@melarsport.is

Qualitative sociological analysis from sociologists such as Howard Becker, Gary A. Fine, C. Wright Mills and Richard Sennett have documented a craft-oriented approach, which is based on play-like practice, intrinsic motivation, experimentation, flow and holistic understanding - in various areas of social life. They have contrasted this approach with a more formal authoritarian and bureaucratic approach to learning and solving problems, which they suggest creates meaninglessness and alienation, besides being less effective. Several overlapping theories of learning that emphasized active task- or craft-oriented learning have at one time or another found their way into the formal educational system. Modern education is, however, also characterized by fixed curriculum and standardized procedures and outcomes (exams and credentials). In this study we test the influence of craft-oriented approach on academic performance among national sample of Icelandic adolescents, quantitatively. We developed a scale measuring craft-orientation. We also measure meaninglessness, alienation as well as several other factors that prior research has shown influence academic performance. The findings lend a considerable support to the theories of Becker, Mills, Fine and Sennett. The findings suggest that this line of research may hold an important promise pertaining to academic achievement and other performance-oriented tasks.

RN10S05 - School Selection and Student 'Choice'

Selection of the best – selection procedures and patterns of legitimisation at exclusive secondary schools in Germany
Mareke NIEMANN (Martin-Luther-University Halle Wittenberg, Germany) | mareke.niemann@zsb.uni-halle.de
Katrin KOTZYBA (Martin-Luther-University Halle Wittenberg, Germany) | katrin.kotzyba@zsb.uni-halle.de

Important changes took place in the field of education. In Germany, to begin with, almost half of all pupils attend secondary schools preparing them for advanced academic studies at university. Secondly, there are new developments concerning the governance of the school system, the strengthening of school autonomy in relation to the formation of ‘educational quasi-markets’. This development led to a renewed discussion on social exclusion and inequality in Germany. Thus, a dilemma was raised – one of socio-economic barriers and the pursuit of genuine academic meritocracy.
Our research project focuses on exclusive schools in relation to the public discourses on elite, excellence and social inequality. The analysis refers to the institutional side, especially to mechanisms of selection, coherence and institutional distinction. Qualitative data from exclusive and non-exclusive secondary schools constitutes the base of our research. Exclusive schools in Germany have the permission to choose matching pupils according to their profile. In our presentation, we focus on the analysis of pupil selection processes and show that selection needs a special legitimisation. Using contrasting schools as examples, we will show the different selection processes, their formal organisation, the head teachers’ justification of choosing the best and which selection pattern are made use of. Selection procedures range from a quantifying, standardised organisation to a procedure lacking any intersubjective measurability. However, the additional selection processes as such create a legitimisation problem. This is faced nearly without exception by the meritocratic principle. The interview practices reveal the existence of habitual challenges in different testing scenarios.

Ethnic school composition and educational choice at the transition from primary to secondary education.

Sarah THYS (Ghent University, Belgium) | Sarah.thys@ugent.be
Mieke VAN HOUTTE (Ghent University, Belgium) | Mieke.vanhoutte@ugent.be

Research on the inequality of educational opportunity has neglected the influence of contextual variables (Boone & Van Houtte, 2012). As such, studies on the transition to secondary education pay little attention to features of the primary school. School level variables can, however, contribute significantly to our understanding of the mechanisms that underlie educational choices. For example, research suggests that students of all racial backgrounds have higher educational expectations in schools with a high percentage of minority students (Frost, 2007). A possible explanation for this, is the finding that minority students have more optimistic beliefs about their educational opportunities (Goldsmith, 2004). This study aims to examine the association between the ethnic composition of primary schools and the educational choice in the transition to secondary education. Hierarchical logistic models were tested on data gathered in 2014 in 36 Flemish primary schools. Preliminary results show that the probability of choosing a technical track over an academic track is lower among pupils who attend a school with a high ethnic diversity. An interaction-effect shows that this relationship between ethnic diversity and educational choice is different for immigrant and native students. In trying to explain these effects we found that high feelings of futility, or low optimism about educational opportunities, increase the probability of choosing a technical over an academic track. Yet, the effect of ethnic diversity on educational choice cannot be explained by the culture of futility at school. Other explanations will be tested to fully understand this effect of ethnic diversity.

Primary goals and descendants in Norway- a study of choices of educational fields.

Tanja ASKVIK (Centre for the Study of Professions, Oslo and Akershus University College of Applied Sciences, Norway) | tanja.askvik@gmail.com

According to Goldthorpe and Boudon, rational agents primary goal in terms of choices of higher education, is to avoid downward mobility. They aim for an education giving them a future class position at least as good as their parents. This theory indicates reproduction of social class through education, but former research suggests that class background do not affect the choices of education in the minority groups to the same extent as the majority. Due to massive expansion in higher education in Norway, choice of field has become a more significant
determinant of future social class. The question is not so much if one has chosen higher education or not, but which field one chooses.
The descendants from the biggest ‘visible’ minority groups in Norway are examined within this framework, and the research question is: Which educational fields do different groups of descendants choose and do these choices indicate that these groups have upward mobility as a primary goal in greater extent than the majority?
The preliminary findings, based on various regressions analyses of register data, shows that descendants in fact have upward mobility as a goal in a far greater extent than majority students. When comparing students with lower class background, majority choose less prestigious fields than the descendant. If we examine country of origin, we also find that it is difficult to use ‘descendants’ as an analytical category. The differences within the group are fundamental, and there are no patterns to suggest grouping together any of the six countries.

Assimilated enough? Stories about educational choices among children of immigrants in Norway
Marianne Takvam KINDT (University of Oslo, Norway) | mariannetakvam@gmail.com

The educational choices of children of immigrants are often seen as a yardstick of successful assimilation. In Norway, there is a clustering of children of immigrants into elite tracks such as medicine, engineering and law. To date, research has sought to explain these choices by focusing on cultural aspects within the immigrant population, such as ethnic capital, Confucianism and obligations towards parents. In this article I pursue the role of norms and expectations, and I ask; what reasons do children of immigrants give for pursuing elite higher educations? I use a narrative approach to analyze 29 in-depth interviews with children of immigrants admitted to a prestigious educational track. I find that to be enrolled in one of the most prestigious educational tracks in Norway is not enough to feel accepted. When accounting for their educational choices, these students adhere to a freedom discourse, arguing that they are interest-based and that their families have never pushed them. They refuse control and obligations as legitimate reasons, and see freedom and self-fulfillment as necessary means to happiness and success. With this background, I propose that norms and expectations prominent in the Norwegian society more broadly shape thoughts about what members of the second generation want to do with their lives. These findings suggest that in order to be “assimilated enough”, pursuing an elite education is not sufficient, you need to pursue it for the right reasons.

Unmet goals of tracking: within-track heterogeneity of students’ expectations for the future
Laura VAN DEN BROECK (Ghent University, Belgium) | laura.vandenbroeck@ugent.be

Educational systems are often characterized by some form(s) of ability grouping, like tracking. Although substantial variation in the implementation of these practices exists, it is always the aim to improve teaching efficiency by creating homogeneous groups of students in terms of capabilities and performances as well as expected pathways. If students’ expected pathways (university, graduate school, or working) are in line with the goals of tracking, one might presume that these expectations are rather homogeneous within tracks and heterogeneous between tracks. In Flanders (the northern region of Belgium), the educational system consists of four tracks. Many students start out in the most prestigious, academic track. If they fail to gain the necessary credentials, they move to the less esteemed technical and vocational tracks. Therefore, the educational system has been called a 'cascade system'. We presume that this cascade system creates homogeneous expectations in the academic track, though
heterogeneous expectations in the technical and vocational tracks. We use data from the International Study of City Youth (ISCY), gathered during the 2013-2014 school year from 2354 pupils of the tenth grade across 30 secondary schools in the city of Ghent, Flanders. Preliminary results suggest that the technical and vocational tracks show more heterogeneity in student’s expectations than the academic track. If tracking does not fulfill the desired goals in some tracks, tracking practices should be questioned as tracking occurs along social and ethnic lines, causing social inequality.

RN10S06 - Trajectories and Transitions in Education

The Second Transition Phase in the Expansion of Higher Education
Ildiko HRUBOS (Corvinus University of Budapest, Hungary) | ildiko.hrubos@uni-corvinus.hu

By the second decade of the 21st century, in the majority of developed countries the expansion of higher education has reached the phase that Martin Trow refers to as the transition between the phase of massification and the phase of universal participation (enrolment rate of over 50%). This transition entails a similarly fundamental transformation related to the structure, content, financing, operation and the mission of higher education as the change during the massification previously involved (after the enrolment rate in higher education exceeded 15%, the upper limit of the elite phase). The new transition should also be interpreted in the way that the previously developed sectors have remained – the outstanding institutions (research, world standard universities) representing the elite phase, and the mass education sector that evolved in the process of expansion –, but at the same time a new type of institution emerges, which explicitly serves the purposes of universal, or more precisely universal access higher education. (Of course, there will always be overlaps between the institutions of the current three sectors.) A swiftly spreading practice already exists for the implementation of universal access higher education, Massive Open Online Courses, which blasted on the scene in the United States in 2012, and have subsequently taken root in Europe as well. In the world of globalization, phenomena related to higher education also occur in a way spanning countries and regions. Emerging countries and a portion of developing countries have been rapidly improving their higher education, which currently has barely exited the elite phase (or hasn’t at all). It’s possible that in these regions the mass university sector, well known in the developed world, will not be constructed at all, rather this function will be fulfilled by the MOOC sector (while they will still aspire for the development of a few top universities). As a result of this, the MOOC sector will be one of the significant scenes of global higher education, in which courses formulated in developed countries and created on a local level will compete for students, resources and prestige.

Transition to upper-secondary education in Switzerland: Effects of tracking, SES and informal competences
Basler ARIANE (University of Zurich) | basler@jacobscenter.uzh.ch
Buchmann MARLIS (University of Zurich) | buchmann@jacobscenter.uzh.ch
Irene Susanna KRIESI (Swiss Federal Institute for Vocational Education and Training (SFIVET)) | irene.kriesi@sfivet-sw

Swiss secondary education is highly differentiated and stratified. Lower-secondary education is subdivided in several, academically selective tracks. In upper-secondary education, young
people are allocated either to one of the many vocational education and training programmes (VET) of different intellectual requirements, to a specialized school or a baccalaureate school. Previous studies have shown that young people’s socio-economic background plays an important direct and indirect role in explaining track allocation to upper-secondary education (e.g., Becker 2010; Combet 2013). Our contribution extends previous research in two ways: First, we take into consideration that VET programmes greatly vary in intellectual requirements and distinguish two levels. Second, we include informal competences (e.g., achievement motivation, academic self-efficacy) and tracking in lower-secondary education, thus focusing on the interplay of SES, tracking and informal competences in explaining access to two VET levels, to specialized schools or to baccalaureate schools.  

Our analyses are based on the middle cohort of the Swiss longitudinal study COCON. The data was collected in 2006, 2007, 2009 and 2012 when the respondents were 15, 16, 18 and 21 years old. We ran multinomial regression models and make use of the khb-method (see Karlsen and Anders 2011; Kohler, Karlson and Holm 2011) in order to decompose the effects of interest. Preliminary findings show that the track of lower-secondary schooling greatly determines whether young people enter VET with low or high requirements, a specialised school or a baccalaureate school. The relevance of SES and informal competences varies considerably between the different tracks of upper-secondary schooling.

The kick-off for educational trajectories of immigrant youth in Finland
Mira KALALAHTI (University of Helsinki, Finland) | mira.kalalahti@helsinki.fi  
Janne VARJO (University of Helsinki, Finland) | janne.varjo@helsinki.fi

Integration of immigrant young people is a growing issue in European societies. In advanced societies like Finland educational trajectories are crucial determinants of integration – and maybe even relatively more important than countries with lower educational levels. Despite the general equality of Finnish comprehensive school, non-native children have difficulties on following educationally the mainstream paths and face higher risk of dropping out than average. (Kilpi-Jakonen2011; Järvinen & Jahnukainen 2008.) This presentation focuses on the group of Finnish youth moving from comprehensive to the secondary education – the key ramification of Finnish education system. Overall aim is to understand and interpret the educational trajectories and transitions of immigrant youth compared to the majority population. We follow a group of 9th graders from different cultural backgrounds for three years. As a vital part of youth transitions, secondary education school choice entail possibilities and risks that are “--contingent and linked to complex interactions between individual decisions, opportunity structures, and social pathways” (Heinz 2009). The basis of the analysis presented is the kick-off for the educational trajectories; constructed from the first survey-data (n~300) and thematic interviews (n~50) conducted at the beginning of the follow-up. A special emphasis is on the themes of the "risk-awareness" and “belief in education” - that is on the future orientations and overall believe in education which are stronger and more positive among the immigrant youth, who also report more learning and schooling difficulties.

Perceptions of Insecurity and Social Inequality in Academic Trajectories

Hannah BURGER (Augsburg University, Germany) | hannah.burger@phil.uni-augsburg.de
Julia ELVEN (Augsburg University, Germany) | julia.elven@phil.uni-augsburg.de

PhD-studies can be characterized as a period of education in a broader sense, but at the same time they are a period of preparation for an occupation in the academic field. With regard to the latter, already Max Weber stated a century ago that academic trajectories are highly hazardous. Today as well PhD-students find themselves frequently in “a generalized and permanent state of insecurity” (Bourdieu 1998: 85). However, the particular meaning of institutionalized modes of the production of insecurity and the way they structure academic trajectories can only be understood by taking into account the actor’s perspectives: What do they perceive as (in)secure? Which strategies do they develop to handle or avoid insecurity? These (in)security-related patterns of perception, thinking and acting can be analyzed as habitualized social structures and it can be assumed that they vary according to the actors’ social background (El-Mafaalani 2012).

Our contribution is based on an empirical study of trajectories of emerging researchers focusing the time of their doctoral studies. Drawing on Bourdieu’s theoretical framework, these trajectories are examined as a product of the interplay of institutional constellations and the young researchers' 'habitus'. We firstly outline a practice-theoretical perspective on (in)security in academic trajectories. Based on interview material, we secondly reconstruct different (in)security-related patterns of perception, thinking and acting, and discuss the relevance these patterns may have for unequal positioning processes in the context of academic trajectories. El-Mafaalani, A. (2012): BildungsaufsteigerInnen aus benachteiligten Milieus. Wiesbaden.

Puncturing inequalities: A configurational analysis of educational upward mobility

Nicolas Martin LEGEWIE (DIW Berlin, Germany) | nlegewie@diw.de

Inequalities in education and their reproduction have long been a core interest in social science research. Less knowledge exists on educational upward mobility: How do some students manage to attain high degrees despite their parents’ low educational level? Especially in-depth analyses are missing that analyze how different combinations of factors foster educational upward mobility.

My study addresses this gap by investigating what combinations of factors produce educational upward mobility. I integrated a life course with a personal network perspective to study the phenomenon. I conducted 36 in-depth biographical interviews with respondents from low socio-economic backgrounds, comparing 25 upwardly mobile respondents and to 11 respondents who replicated their parents' low educational degrees. As comparative dimensions I included in equal parts respondents with Turkish and German-born parents, as well as female and male respondents. I employed in-depth case analysis and qualitative comparative analysis (QCA) to identify combinations of conditions that were sufficient for educational upward mobility in my data set.

Results suggest five conditions based in respondents’ personal networks foster educational upward mobility. Some, like specific Promotive Narratives, establish or reinforce clear educational goals and a sense of self-efficacy. Others, like Support with Academic Efforts, provide concrete support in how to achieve these goals. The five conditions combine in three
alternative combinations that produced educational upward mobility in my data set. With these findings, the study contributes to efforts in understanding stratification processes in education.

**RN10S07 - Higher Education and Inequalities (II)**

**Unequal future(s) of higher education in a Central and Eastern European context.**

Gábor KIRÁLY (Budapest Business School, Hungary; Corvinus University of Budapest, Hungary) | kiraly.gabor@pszfb.bgf.hu
Zsuzsanna GÉRING (Budapest Business School, Hungary) | gering.zsuzsannamargit@gkz.bgf.hu
Sára CSILLAG (Budapest Business School, Hungary; Corvinus University of Budapest, Hungary) | csillag.sara@pszfb.bgf.hu
Tamás GÁSPÁR (Budapest Business School, Hungary) | gaspar.tamas@kkk.bgf.hu
Alexandra KÖVES (Corvinus University of Budapest, Hungary) | koves.alexandra@gmail.com

In recent years there is a growing interest about the future of higher education. Both in the academic and the public discourse it is an often-cited statement that the higher education sector is (or should be) undergoing a fundamental transformation in terms of its role in society, its mode of operation, and its economic structure and value.

Our paper aims to contribute to this discussion by summarising the results of a participatory backcasting workshop involving teachers, researchers and educational management staff about the future of higher education held in Budapest in January 2015. Backcasting is a special methodological approach in future studies which starts with a normative vision of the future and elaborates a strategy to reach this normative vision. By analysing this vision and comparing it to future scenarios discussed in academic and policy arenas, one can gain new insights both in relation to global trends and their possible manifestations in a CEE context.

In order to do so, our paper is divided into three parts. Firstly, the paper briefly delineates the key aspects of the future vision of higher education developed by workshop participants. Secondly, our analysis especially focuses on inequalities of higher education in the future identified by the participants. In the final part of the paper, we aim to show which social, economic and technological trends might contribute to these inequalities and what the possible ways might be to deal with them.

**Does disciplinary background matters in contextualizing Societal Problems? A Study of Liberal Arts and Engineering Students of four Educational Institutions of India**

Sarvendra YADAV (Dr. Harisingh Gour Central University Sagar, India) | sarvendra2u@gmail.com

In the era of neo-liberal educational policies, certain forms of knowledge are encouraged over others. Technical degrees are given preference over liberal arts degrees because of immense demand in labour market. It has led liberal arts disciplines in a state of isolation and marginalization. State is withdrawing financial support to liberal arts departments in different countries, and if not, asking them to prove their worthiness in today’s economy. In this background, it is important to understand how liberal arts disciplines are identifying, contextualizing and defending their position by full filling its different objectives especially providing concrete solutions to different contemporary societal problems. This paper tries to address this larger debate whether training in liberal arts disciplines really helps to sensitize students to visualize the societal problems in better way by using their ‘sociological/narrative imagination’ than engineering students? Do liberal arts students really acquire better critical outlook just because of their training in liberal arts? And also, how sociological interpretations are different from commonsensical interpretations? On the basis of 200 college students'
interviews of north India, this paper has analyzed how students interpret different societal problems by situating the debate within the context of disciplinary training. 100 students from engineering background and 100 from humanities and social sciences background from India’s top two elite institutions i.e. IIT Delhi and University of Delhi, and two middle-ranking educational institutions i.e. HBTI Kanpur and CSJM University Kanpur were interviewed by asking them open ended questions about three biggest social problems and its possible solutions. Individual interviews as well as focused group discussions were conducted among students who were in the third year of their college education. This paper proceeds first with discussing different general and sociological perspectives on social problems. Secondly, it explores the definitional aspects, calling upon the importance of subjective and objective elements in contextualizing a social problem. The different ways of analyzing social problems have been discussed through examples, followed by a discussion on the research procedure adopted. In the findings, student’ individual narratives of different societal problems and its interpretations have been discussed and analyzed in-length, and finally, the conclusion of the study.

Higher Education Intentions among Native and Foreign Youth in Italy and the Role of Primary and Secondary Effects
Marco ALBERTINI (University of Bologna, Italy) | marco.albertini2@unibo.it
Debora MANTOVANI (University of Bologna, Italy) | d.mantovani@unibo.it
Giancarlo GASPERONI (University of Bologna, Italy) | giancarlo.gasperoni@unibo.it

This paper addresses tertiary education intentions among a random sample of over 9,000 last-year upper secondary school students in four Italian provinces; approximately 600 have an immigrant background. Data collection was performed during the 2013/14 school year via a two-wave administration of structured questionnaires. More specifically, we investigate the gap between Italian and foreign students in their transition to the tertiary education (decision to pursue/not pursue a university-level degree) and, among probable would-be enrollees, choice of field of study, placing particular emphasis on so-called primary and secondary effects. Originally developed by Boudon (1974) in his study on social inequalities and educational transitions, here the concepts refer to students’ migratory status. Primary effects explain the differences between natives’ and foreigners’ choices stemming from their school performance; secondary effects are directly associated with migratory status, regardless of performance. The paper, inspired by a forthcoming study by Azzolini and Ress on native-immigrant differences in educational transitions from lower to upper secondary schools in Italy, will also apply a logistic regression coefficient decomposition method developed by Karlson and Holm (2011). Preliminary results suggest that differences in Italians and foreigners’ educational choices display a stronger link to scholastic performance.

Trends and contradictions in Glocalization of European higher Education
Marina BULANOVA (Russian State University for the humanities, Russian Federation) | marina_bulanova@inbox.ru

In the proposed paper, the author is going to focus on the effect of global trends in higher education and their implementation in the controversial education policies of European states. For instance, the main trend is democratization of education, however, in some European countries, social inequality of education is still exist. With development of the European Higher
Education Area the market of educational services grows also. Bologna process (bachelor degree-magistracy-doctor's degree) unifies steps of higher education. Glocalization of the European education is presented by Bologna process. Nowadays it is beyond the European Union, covering all European countries. During the realization it has acquired characters of international organization which activity is based on cooperation of the countries-participants and essential impact on educational policy of these countries. Growth of education as a formal value, compulsory part of career, and warranty of quality of life, from one hand, and inability of University degree to protect owner to be unemployed. University as a system, which works as an ontology factory and, from the other hand, being a part of a educational service market. Education as a system which includes formal institutions and strong rules and law and, from other hand, education as a wide set of opportunities for a person to be studied informally (e.g. Courcera etc).

The Social and Credential Structure of the Elite Segment of Swedish Higher Education
Mikael BÖRJESSON (Uppsala University, Sweden) | mikael.borjesson@edu.uu.se

The structure of acquired and inherited national and transnational assets among students in Swedish elite educations is the main issue in this paper. Based on a survey answered by nearly 1,200 students on 25 elite educational programmes in Swedish higher education, the distribution of such properties as language resources and experiences of travel, studies and work are set against more refined Swedish assets, like good grades from established schools and programmes. By using specific multiple correspondence analysis three distinct poles are identified: one pole where formal acquired educational assets and inherited national and international resources are weak, one pole with a strong international orientation and accumulation of inherited international resources, and one based on predominantly heavy investments in the Swedish educational system. These poles correspond to three different sorts of positions in the field of higher education: at the first pole, students in art and theatre are overrepresented, while the national pole is primarily defined by the medical programme and the international pole by the engineering programme in industrial economics and the programme in economics at Stockholm School of Economics. The poles also display three different modes of gaining access – by special tests at artistic pole, by grades from upper secondary school at the international pole, and by scores at the national aptitude test at the national pole – articulating different valuation of former educational investments, and, more broadly, of cultural capital possession.

RN10S08 - Educational and Institutional Policies

Changes in Educational Policy in Estonia: Self-Descriptions of Russian-Speaking Pupils
Anu MASSO (University of Tartu, Estonia) | anu.masso@ut.ee
Maie SOLL (University of Tartu, Estonia) | mainele@hotmail.com
Sander SALVET (University of Tartu, Estonia) | sander.salvet@gmail.com

This study concentrates on one of the most drastic changes in Estonian educational system after regaining independence – change in instruction language in Russian-medium schools. We depart from the communication theoretical approach (Luhmann 2002, 2004) and assume that
one of the factors behind the failure of Estonian minority policy (Aidarov, Drechsler 2013) may be the unsuccessful communication of changes in instruction language. We focus on pupils' ethno-cultural self-descriptions as one of the indicators for studying the communication of change in instruction language. We aim to answer to the next research questions: (1) How the changes in education policies are perceived among groups having various ethno-cultural identification strategies? (2) Through which mediums, inside or outside of educational system, the ethno-cultural self-descriptions are constructed? We use online interview method (Salmons 2010) as empirical basis; the sample consists of school-leavers of those schools/classes having various instruction languages (Estonian, Russian, language immersion) and situating in various Estonian regions (monolingual vs bilingual everyday setting; n=14). In the study, thematic analysis is combined with elements of grounded theory (Strauss, Corbin 1990), and software-aided techniques with manual ones. The analysis suggests that the role of the instruction language may be essential in mediating the educational changes, especially in the cases of ambivalent messages received from inside and outside of the formal educational system. The perception of instruction language is related to the unequal accesses to ethno-cultural identification. Unsuccessful communication of changes in educational policy may thereby (re)produce the cultural and social inequalities in the society.

A sociological study of the effects of educational policies on educational inequality in Europe
Kaspar BURGER (University of Geneva, Switzerland) | kaspar.burger@unige.ch

Inequality in educational outcomes can be related to characteristics of the individual, the family, and broader societal contexts. Educational inequalities potentially challenge the principle of equal opportunity and consequently deserve our attention. The present study aims to assess whether country-specific educational policies increase or diminish educational inequalities associated with social origins in European countries. Five policy dimensions are considered: 1) pre-primary enrollment ratio, 2) private school enrollment ratio, 3) educational tracking, or allocation of students to different types of schooling, 4) amount of time that children spend at school annually, and 5) school choice policy in the public education sector.

The study draws on data from the 2012 wave of the Program for International Student Assessment (PISA). In addition, it derives country-level data on educational policies from different data repositories. The sample consists of 203,240 15-year-old students who attended 8665 schools in 31 European countries. Multilevel modeling techniques are applied. Cross-level interactions are performed to determine whether educational policies moderate the associations between children’s social origins and their educational achievement. The findings show that the degree of social inequality in education changes as national educational policies change. For instance, both a longer annual amount of time spent at school and a larger private school sector mitigate the effect of social origins on children’s achievement. The study informs debates about the role that policies play for social stratification and mobility.

Compensatory Policies to Achieve Equity and Social Inclusion in Higher Education
Guadalupe PALMEROS Y ÁVILA (Juárez Autonomous University of Tabasco, Mexico) | gpalmeros@hotmail.com
Judith PÉREZ-CASTRO (National Autonomous University of Mexico, Mexico) | jcperez@unam.mx

Compensatory educational policies are implemented by governments as a way to reduce inequalities in different areas of social life (Pedroza & Villalobos, 2009). In Mexican universities, these policies seek to overcome disparities in access to educational services. Right now, it is
estimated that only 29.4% of young people between 18 and 24 years old attend higher education (SEP, 2013). The gap between the most favored economic group and the least favored is significant. So, while 47 of every 100 youths from the decil X are registered in tertiary education, only 7 of every 100 from the decil I have access to it (Villa, 2013). This situation becomes worse for individuals from vulnerable groups: poor people, indigenous, disabled, female heads of households, etc.

This paper is part of an exploratory-descriptive study whose objective is to study vulnerable groups and their possibilities to enter, remain and graduate from higher education. As a hypothesis we hold that the chances these people have to attend higher education depend on both, the tensions, risks and threats they face in everyday life as well as the quantity and quality of their resources (Chambers, 1989).

The results showed us that the main difficulties students face to enter, remain and finish the university are: the lack of material resources and equipment, such as internet and computer, the lack of economic resources, not knowing a second language, the absence of study techniques, and the attainment of the social service.

The Rationale and the Rationalisation of Greek Education during the Current Crisis (2009-2014)
Vasiliki KANTZARA (Panteion University of Social and Political Sciences, Greece) | v.kantzara@gmail.com

The effects of the ongoing crisis on Greek education have been complex and overwhelming. Next to extensive budgetary cuts, educational changes were also initiated on a number of issues. Most of the changes were related to ‘shrinking’ the education: less teachers, less school buildings, less student support, but other changes asked for more funds! This puzzled me. Especially in tertiary education, the establishing of a ‘Council of the Institution’ that runs since 2012 the university is comprised for the first time in education history partly by non-academics. This and other educational changes establish not only new institutions but they need extra funds, while it is not certain how these influence quality of education; extensive budgetary cuts on the other hand do affect quality of education.

The main questions then posed are, What is the reason that quality of education lacks from the dominant discourse of the educational policy during the crisis? Following from this, What do the changes signify for the role of education in Greece?

The empirical material in answering these questions comes from my study on the effects of the crisis on education. The theoretical framework draws on sociology of education approaches as I attempt to interpret the educational changes in a wider context, that is, taking into consideration the relation of education to society. To my view, some educational changes are mostly political as they may be related to the changing structure of dominant relations, from (partly) traditional to rational (conceived in Weberian terms) and this involves altering structures of management and control of education.

State Intervention and Social Origin of University Students in Republican China, 1912-1949
Yunzhu REN (The Hong Kong University of Science and Technology, Hong Kong S.A.R. (China)) | yunzhuren@gmail.com
Hongbo WANG (The Hong Kong University of Science and Technology, Hong Kong S.A.R. (China)) | hbwang.ucla@gmail.com
Chen LIANG (Nanjing University, China) | liangchen@nju.edu.cn
This paper examines changes in social origin of university students in the Republic of China (1912-1949) using archival data. In particular, we assess the impact of the implementation of student loan scheme by the central government in 1938 on social origin profiles of university students.

We draw on about 20000 student registration records of the National Sun Yat-sen University from 1919 to 1951, with information on year of admission, parental occupation, and sources of financial support. Student's social origin is indicated by father's occupation. We have made great efforts to code and harmonize hand-written occupation titles. To assess the impact of the 1938 student loan policy, we divide the students into three cohorts, namely pre-war cohorts (1919-1937), war cohorts (1938-1945), and post-war cohorts (1945-51). A key question is whether the implementation of 1938 student loan policy had increased the diversity of the student body with respect to social origin indicated by parental occupation.

Education has been dominated by people of privileged social origin in historical China. This continues to be the case for the Republican era. In 1938, the Chinese government abolished tuition fees for the students in normal schools, medical schools and engineering schools later as an effort to alleviate the burden for higher education due to the hardship caused by the Japanese invasion. The policy continued after the end of the Second World War. We thus expect the social origin of university students to be most diverse during the war because of a weaker effect of family background on college attendance due to both the war and the new student loan policy.

Our preliminary analysis indicates that the student loan policy, which provides public funds to college students during the war not only helped those from humble origins, but also benefited those from elite families. Virtually all people were affected by the Japanese invasion, especially those who retreated from the occupied areas. It seems that the 1938 student loan policy succeeded in increasing social mobility by allowing more students from disadvantaged families to go to national public universities during the war and afterwards.

**Comparative Study of Educational Development and Inequality in Non-European Countries**

Shinichi AIZAWA (Chukyo University, Japan) | s-aizawa@sass.chukyo-u.ac.jp
Hirofumi TAKI (Hosei University, Japan) | taki@hosei.ac.jp

We illustrate how differences in educational development and in the levels of inequality occurred in non-European countries. The similarities and differences in social development within non-European countries as well as between European and non-European countries are analyzed using comparative historical approaches and development research.

Exploring the official national statistics and analyzing PISA datasets, non-European countries can be divided into two types of educational development and inequality; those with higher (H) and lower (L) scores compared to European countries. Rapid industrialization is observed with educational expansion in both types. On the other hand, cultural and ethnic diversities connected with religion have differentiated in these groups. For example, type H countries have often been influenced by the traditional Chinese examination system. The public’s belief in its government and public sectors are also different. Type H countries have many highly prestigious "national" and "public" schools on the upper secondary education level even though some of these countries have lower educational expenditure compared to European countries. We will show a Truth Table in Boolean algebra approach, and our results will help further understand European social development.

**RN10S09 - Disability, Minorities and Schooling**
Education for children with special needs in the Flemish community of Belgium: Side effects of the current educational integration system
Leen SEBRECHTS (University of Antwerp, Belgium) | leen.sebrechts@uantwerpen.be

While the Flemish education sector has begun to evolve alongside international developments towards more inclusive types of education for children with special needs, the segregated special school remains the dominant model and a valued type of education in Flanders. An advantage of the Flemish system is that parents of children with special needs are currently able to choose the educational setting that is most suitable for their children: integrated education or special education. This choice is however complex and influenced by many characteristics. Results of quantitative analyses on two Flemish databases show that the patterns of choice are determined systematically by the social position of the family of the child; besides the influence of characteristics like type and severity of the disability and age of the child. The initiatives for integrated education implemented to date in the Flemish community of Belgium appear to rely heavily on the capacities of the families with the result that families in stronger socio-cultural and socioeconomic positions are best able to cope in integrated education. At the same time, there remains an overrepresentation of vulnerable families in segregated specialist education. We concluded that policies aimed at increasing equality serve to exacerbate the embedded structural social inequalities.

The Role of Madrasah in the Formation of Identity and Expectations Among Muslim Youth in Cotabato City, Mindanao, Philippines
Crisanto Jr. Quinos REGADIO (De La Salle University, Manila, Philippines) | crisanto.regadio@dlsu.edu.ph

The school which is part of the microsystem of the child (Bronfenbrenner, 1989) plays a significant role in shaping adolescent identity formation and expectations (McLeod & Yates 2006). Framed using this principle, this paper aims to show how Muslim education (known as Madrasah) in the southern region of the Philippines has influenced the identity construction of young Muslim with particular focus on ethno religious and ethno national identities. This is a worthy research enterprise as it examines the relationship between ethno-religious and national identity and how such connection could instigate conflict in the Mindanao which is the home of the largest Muslim population in the Philippines. Muslims from the region criticized secular education to promote an ethno-national character that separates them from their “real” ethno-religious identity and their collective goals and aspirations.

This subject matter needs further understanding given the ongoing tensions that surround Muslim communities in the Philippines. Some scholars argued that the formation of an ethno religious identity could spark separatist aspirations. This paper, which is based on literature review, intends to show how participation in Madrasah education along with sociodemographic variables may have a bearing on the behavioral and attitudinal expression of Muslim youth's ethnic, religious, national identity, and life aspirations.

'The Chef, The Sportsman and The Actor': The Role of Identity Formation in the Further Education of Disabled Students
Ceri MORRIS (Cardiff University, United Kingdom) | morrisce7@cardiff.ac.uk

For disabled students and pupils in mainstream education, the formation of identity as someone 'different' or 'other' in the classroom can create significant barriers to educational and social
development. Despite policy imperatives for an integrated education system in Wales, barriers to successful inclusion can include the mechanisms of support and the social exclusion of individual pupils in the communities of the school or college.

This paper draws on an ethnographic PhD study conducted in further education colleges across Wales. Studies of individual students were conducted using sensory ethnographic observation methods, interviews and documentary analysis.

Drawing on Thomas' (1999) Social Relational model of disability, the paper examines the intersection between psycho-emotional well-being, career and educational identities, and academic and social achievement. Findings suggested that for disabled students, the role of identity formation, and the re-imagining of their identity through education, was significant to their present and future learning and well-being.

“The School from the point of view of Portuguese Gypsies/Roma (Ciganos) families and students: The construction of a place of belonging”

Maria Manuela MENDES (CIES-IUL, Portugal) | mamendesster@gmail.com
Olga MAGANO (CEMRI-Uab) | Olga.Magano@uab.pt
Ana Rita COSTA (CIES-IUL, Portugal) | costaartl@gmail.com

Recent studies and reports point to the persistence of low levels of education between Portuguese Gypsies/Roma (Ciganos), particularly comparing to the overall Portuguese population. This situation is not unique to the Portuguese case. Disparities between Gypsies/Roma and non-Gypsies/Roma in key areas such as education, employment, healthcare and housing exist across the European countries. Even though results in terms of school success and the extension of schooling paths of Portuguese Gypsies/Roma students are still below expectations, we have been witnessing a gradual increase in the presence and continuity of Ciganos in schools. More than ever, in contrast with the situation lived by the past generations, the school is part of the life of Ciganos families and individuals, men and women, and is perceived as important, especially when it comes to the first level of education - 4 years of basic education (1st cycle). Families are also more attentive to the quality of the social environment and quality of education practiced in schools that their children attend and frequently express critical points of view about it. This presentation focuses on the perceptions of Ciganos families and students toward the schools which the/ or their descendants are attending (or attended) and is based in fieldwork conducted in neighbourhoods marked by a high presence of Ciganos, school ethnographies and semi-structured interviews with Gypsies persons, men and women, who live in the Metropolitan Area of Lisbon and Oporto. Some results show that gradually the school has become a place not of exclusion but the belonging and conviviality with the Others.

Is There a Catholic School Effect for Muslim Pupils?

Orhan AGIRDAG (University of Amsterdam, Netherlands) | orhan.agirdag@gmail.com
Geert DRIESSEN (Radboud University Nijmegen, Netherlands) | g.driessen@its.ru.nl
Micael MERRY (University of Amsterdam, Netherlands) | M.S.Merry@uva.nl

Since the early 1980s there has been a considerable amount of sociological research focusing on the consequences of Catholic schooling on pupils’ academic achievement. While many studies report that pupils in Catholic schools outperform pupils with a comparable background who attend public schools, others argue that this Catholic school advantage primarily reflects a selection effect. A second important finding in previous research is the claim that Catholic schools more closely resemble the ideal of ‘the common school’ than do public schools, as many empirical studies suggest that the achievement gap between disadvantaged minorities
and more privileged pupils is actually smaller in Catholic schools than in public schools. This study investigates the so-called Catholic school advantage and more specifically as it concerns Muslim pupils. The distinctive characteristics of Catholic schools in Belgium (Flanders) form an exceptionally suitable context in which to study this. Multigroup multilevel latent growth curve analyses are conducted with data from approximately 5,000 pupils across 500 primary schools. No support was found for the Catholic school advantage hypothesis as the overall achievement growth for math and reading was not significantly better in Catholic schools than in public schools. Likewise, no evidence was found for the so-called ‘common school effect’ hypothesis: the learning growth of Muslim pupils was not significantly better in Catholic schools. In fact, the minority achievement gap generally was found to be higher in Catholic schools than in public schools. Implications of these findings are discussed.

RN10S10 - Social Class, Mobility and Stratification

Intergenerational Social Mobility among Muslim Minority in Kerala State of India: Formal Vs Religious Education and Issues of Gender
Sreekala EDANNUR (Pondicherry University, India) | sreekala3048@yahoo.co.in
Afsal PK (Pondicherry University, India) | sreekala3048@yahoo.co.in

Education of Muslim minority in India has been a topic of research for academics and policy makers post-independence. According to the report on the Social, Economic and Educational Status of Muslim Community of India (GOI, 2006) one-fourth of Muslim children in the age group of 6-14 years have either never attended school or are drop-outs. This study attempts to understand the issues of inequalities in accessing education and occupation by the Muslim community of Kerala; their education- Formal and religious, and gender differentials. The extent of inter generational educational and occupational mobility among two generations of respondents is studied. The existence of gender differentials in accessing education and occupation and parents’ and children’s educational and occupational levels is tested. The existence of any association between religious education and formal education of the respondents is also tested.
Data was collected from 231 randomly selected Muslim respondents; 128 males and 103 females, aged 25-40. Outflow mobility table is used to find out the extent of inter generational mobility in education and occupation. The results show that there is a high inter generational educational mobility among Muslim community in Kerala (97.6%). Gender is found to be significantly influencing the chances of accessing higher education and occupation. There is a significant relationship between fathers’ education and male Respondents’ education; mother’s occupation and daughters’ occupation; Fathers’ occupation and respondent education. Family background is significantly influencing younger generations’ social mobility. Religious education and Formal education of respondents’ is also significantly related. This study has important implications for policy decisions, they are discussed and recommendations are spelt.

Getting on the Ball: Reconceptualizing Recent U.S. Literature on the Middle Class and School Choice
Anthony E. HEALY (University of North Georgia, United States of America) | anthony.healy@ung.edu

In the past three years, a flood of literature in the United States has turned attention to the role and actions of the middle class in school choice. Interestingly, Ball's seminal 2003 work on the
middle class and school choice globally is largely ignored in this literature, though Ball drew partly on U.S. scholarship (as well as elsewhere) in formulating his theoretical framework. Echoing Ulrich Beck, Ball and Nikita (2014) note that school choice literature often suffers from “methodological nationalism” in which the nation is assumed to be “the only appropriate frame of analysis.” That appears to be the case here. Interestingly, too, much of this recent literature reaches conclusions similar to Ball’s. In this paper, I review the recent U.S. literature and then re-conceptualize it in accordance to Ball’s framework. This is largely successful, providing support for Ball’s contentions on school choice and the effects of globalization. This paper is important in that it helps to consolidate our global knowledge of school choice and the middle class, in accordance with the recent call of Ball and Nikita (2014).

Structural factors behind differing chances of access to international student mobility
Katalin BANDER (Corvinus University of Budapest, Hungary) | katalin.bander@gmail.com

Research showed that participation in international student mobility creates clear advantages for formerly mobile students regarding foreign language proficiency, international and intercultural competences and related employment opportunities (Teichler 2009). Despite the aim of the Bologna Process to facilitate mobility and the EU’s commitment to increase financial resources for temporary student exchange, access to international student mobility remains socially selective in most European countries (Orr - Gwosć - Netz 2011). Studies observed different factors underlying the unequal chances of access to a study period abroad. The paper aims to identify structural features of the Hungarian higher education system which can have an effect on students’ chances of having an international study-related experience. We examine how much of the variation of mobility rates is explained by the impact of structural factors and how these factors influence other characteristics (the means of financing, the perception of obstacles) of the mobility experience.

We rely on the Hungarian database of the EUROSTUDENT V. survey and use cross-table analysis and logistic regression to answer the research questions. Our preliminary results show that different structural features – like the level and the field of study, the type of the higher education institution and the formal status of students – affect the chances of participation in student mobility. To avoid false causalities, our model considers the impact of the above factors in the light of students’ family background and actual socio-economic situation.

Educational stratification: upsides and downsides
Claudia TRAINI (University of Bamberg, Germany) | claudia.traini@gmail.com

The role of schooling has long been one of the core interests for social scientists. In a recent study, two researchers have summarized them as follows:
(1) offer equal educational opportunity,
(2) maximize the capabilities of children,
(3) allocate students into the labour market,
(4) prepare students for active citizenship (Bol and van de Werfhorst 2011).

Economists and sociologists have devoted intensive effort to understand whether and how the structure of education systems affects the way in which these goals have been accomplished. This issue is important if we consider its policy implication. Indeed, since these tasks cannot be satisfied all in once, in the design of educational structure, governments have to consider the several upsides and downsides involved with each choice.
Although institutional effects have been primarily analyzed through static designs, the information collected by previous scholars has made available several indicators that vary both cross-sectionally and longitudinally. Thus, a first point on which this paper makes a step further, is the application of a dynamic indicator that will make it possible to look at different cohorts of individuals who have been exposed at different educational settings within the same country. Besides, another innovation of this paper is that the proposed index will make up for an additional earlier studies’ shortcoming that is, the confusion regarding different aspects of educational structure. In fact, stratification, tracking, vocational orientation, and vocational specificity have been often used as interchangeable even though they do not mirror the same original concepts. Thus, by using these available indicators, I built an index of educational stratification based on the pioneering definition of Allmendinger (1989) that, in addition to tracking, takes into account also the selection procedures to access to the highest educational level. In details, the three indicators are:
· the proportion of tertiary educated people among the corresponding age population;
· the age of first selection into track;
· the length of the differentiated curriculum.
Furthermore, the main contribution of this paper is to investigate an additional function of education that will shed light on the existence of more pros and cons than those already discussed by the existing literature. Education should indeed alleviates social class differences by being a separate source of resources that may compensate for the disadvantages faced by individuals belonging to different families. In fact, if we consider that education represents a tool to channel individuals from origin to destination, educational stratification may explain to what extent social origin is converted into (dis)advantages. In other words I try to address the following question: does educational stratification alleviate social inequality?
What is at stake here is that instead of focusing on early educational outcomes, I will analyze later outcomes looking at the intergenerational transmission of occupational status and civic and political engagement. Starting from the first, although scholars have extensively measured inheritance of occupational positions, less attention has been focused on those features of education systems that shape the entire process. Indeed, when education and stratification researchers have paid attention to institutions, they have mostly done it breaking down the entire pattern into two parts: from social origins to education and from education to the labor market. So what we do not know yet is whether the indirect effect of social origin on occupational status (i.e., the effect of social origin on occupational status through education) changes according to the stratification of education systems. According to the literature and the previous findings, we expect a weak indirect effect of social origin in stratified systems only for men.
Recently it has been pointed out that schooling should contribute to create active citizens who actively participate in society. Thus, the next empirical part will examine the extent to which education systems prepare students for civic and political engagement as well as the extent to which educational stratification hampers or alleviates social inequality in civic and political engagement. Following the ongoing debate, we expect first a strong effect of education on respondent's civic and political engagement in stratified systems while considering the second the hypothesis states the higher educational stratification, the wider social inequalities in civic and political engagement transmitted by education.
When it comes to methods, to identify micro level outcomes due to institutional differences two methods have been applied by researchers: multilevel regressions with random country intercept and country fixed effect models (Bol, Witschge, van de Werfhorst, and Dronkers 2013). The former technique faces several problems mainly due to the low number of countries (not randomly selected) included in the analysis. In detail, multilevel estimates rely on the degrees of freedom at the country level and, when the number of countries included is low, the possibilities to include both additional country-level indicators and cross-level interactions are limited. In this
condition, multilevel estimates are likely to be biased because of unobserved heterogeneity at the country level. Accordingly, I employed country fixed effect models rather than multilevel models. Moreover, according to Brunello and Checchi (2007), to avoid the possibilities of unreliable results that may confound institutional effects with other within country time effects, country(*time) dummies have been included in the models.

Funding a unique dataset that includes retrospective information on individuals' social origins, education, occupation, civic and political engagement is challenging. The only dataset who allows me to empirically address the abovementioned issues is the European Social Survey.

**RN10S11 - Diversity and Diversification in Education**

**Religious Diversity in Primary Schools: Reflections from Ireland**

Daniel FAAS (Trinity College Dublin, Ireland) | daniel.faas@tcd.ie
Merike DARMODY (Economic and Social Research Institute, Ireland) | merike.darmody@esri.ie

Growing secularisation of the population and the arrival of new culturally and religiously diverse migrants are posing new challenges to schools in Ireland. These challenges are particularly acute in Irish primary schools, the majority of which are under Catholic patronage. Recent changes have necessitated an extensive consultation process about how to accommodate religious diversity and have resulted in some important policy changes. This paper seeks to contribute to an ongoing debate about the place of Religious Education in public schools. In so doing, we acknowledge the challenges posed by migration and diversity to educational systems within the European Union (EU). We investigate the extent to which existing educational policies and practices within the EU address diversification of religious beliefs and practices. While set in the Irish context, the paper is also relevant for educators and academics in other jurisdictions as it describes recent policy developments and steps taken in addressing cultural and religious diversity in schools. We discuss recent policy developments in Ireland in the context of a European Commission report on Pluralism and Religious Diversity, Social Cohesion and Integration in Europe (2011) which differentiates between the non-confessional approach (e.g. Denmark, UK, Estonia), the confessional approach (e.g. Bulgaria, Greece, Poland, Spain), the no religious education approach in public schools (e.g. Albania, France), and a multi-religious approach to education (e.g., UK, Netherlands). The 'integrative' approach in Ireland which we theorise and discuss in this paper indicates a need for a responsive, pluralistic approach both at the macro and micro levels.

**Bisexuality in Education: Erasure, Exclusion and the Absence of Intersectionality**

Maria PALLOTTA-CHIAROLLI (Deakin University, Australia) | mariapc@deakin.edu.au
Based on my research into bisexuality in Australian and US schools, this paper argues that even though many schools and educational systems, from elementary to tertiary, state that they endorse anti-homophobic policies, pedagogies, and programs, there appears to be an absence of education about, and affirmation of, bisexuality, and minimal specific attention to bi-phobia in curriculum, policy, and student welfare. Bisexuality continues to fall into the gap between the binary of heterosexuality and homosexuality across all educational sectors, even though there is increasing evidence of sexual identities and practices in youth subcultures that are adopting shifting discursive and societal constructs of sexuality, characterized by notions of fluidity, ambisexuality, and a reluctance to label their sexuality according to the heterosexual/homosexual binary. I discuss three impediments to education systems engaging with sexual diversity instead of sexual duality, namely: erasure, exclusion by inclusion into gay and lesbian categories, and the absence of intersectionality (wherein other facets of identity and experience that interweave with sexuality are not taken into account, such as class, gender, Indigeneity/Aboriginality, ethnicity, geographical location, and religion). These three absences and erasures leave bisexual students, family members, and educators feeling silenced and invisibilized within school communities. Indeed, these absences and erasures have been considered a major factor in bisexual young people, family members, and educators in school communities experiencing worse mental, emotional, sexual, and social health than their homosexual or heterosexual counterparts.

Diversification of educational paths and the social composition of schools in urban Finland

Sonja KOSUNEN (University of Helsinki, Finland) | sonja.kosunen@helsinki.fi
Piia SEPPÄNEN (University of Turku, Finland) | piia.seppanen@utu.fi
Venla BERNELIUS (University of Helsinki, Finland) | venla.bernelius@helsinki.fi

Finnish comprehensive school has a reputation of being relatively equal and providing uniform education for all 7 – 15 year-olds regardless of their social and ethnic background. Nevertheless, recent studies in Finland have shown that the educational paths of pupils in cities are getting diversified into soft streams. Ever since the reform in pupil allocation policy from a uniform comprehensive school towards wider parental choice policy in the 1990s, specialisation of schools and their classes have emerged. Simultaneously the growth of urban segregation has intensified the socio-economic differentiation of school catchment areas and schools. The parental choice and pupil selection conducted by some of the schools have led to new levels of pupil mobility to and away from schools across urban space. This presentation aims to shed light on the patterns how pupils’ choices of lower secondary schools take place across the city, and how do the school choices impact and diversify the social composition of schools and their classes. By analysing quantitative pupil age cohort register data in a metropolitan city of Finland, Espoo (n=2400, 12 year-old pupils), we show how pupils’ mobility across schools is connected to the social background of the families based on their location of residence. The key question to be answered in the presentation is, can we still talk of a uniform and equal comprehensive school system in the case of urban Finland. The findings aim to contribute to the discussion of equity in education and social distinctions via educational choice in Finnish society.

Education and Identity Norms Conflicts. The Mechanism of Social and Educational Adaptation of Roma Children

Costel GRIGORAS (Paris-Sorbonne University, France) | grigoras@europe.com
Nowadays, one of the most heated debates focuses on the Roma immigration in Europe and the removal policies of an unwanted population. Regardless of their country of immigration, removal policies generate the same consequences everywhere: forced geographical mobility, social instability, de-schooling. Despite the small number of Roma in France – estimated at 20000 in 2013 – the removal policies implemented by the government have constantly increased: from 8000 in 2008 to 19000 in 2013. The Roma children’s education in France is one of the most challenging issues especially due to their successive de-schoolings. As academic training is the main vector to assimilating the norms and values of society, the impact of forced geographical mobility on the transformation of the Roma children’s societal points of reference is to be questioned. This mixed methodological study is carried out in a longitudinal ethnographic approach on a sample of 80 schooled Roma children living in 6 slums located around Paris. The research is carried out at school but also at home, with their families. Preliminary results show the apparition of a mechanism that generates normative, cultural and relational conflicts for the Roma child. He is trapped in a conflictual environment and his contact with the academic system represents a break with his family setting. After a period of adaptation to the academic environment and by adopting the school’s norms and values, the Roma child enters a conflictual relationship with his family due to his behaviour, beliefs and know-how, which are non-compliant with the ethnic group.

Managing student diversity: teachers’ discourses and student grouping practices in Catalan secondary schools.

Alba CASTEJÓN (Universitat Autònoma de Barcelona, Spain) | alba.castejon@uab.cat
Jordi PÀMIES (Universitat Autònoma de Barcelona, Spain) | jordi.pamies@uab.cat

Previous research has pointed out that student grouping practices affect the quality of students’ instructional opportunities, perceptions of their abilities, and their achievement, which may lead to an increase in educational inequalities. It has also been shown that school and classroom composition are related to teachers’ expectations, and these expectations are communicated more explicitly in segregated schools or homogeneous classrooms (Dupriez, 2010; Van Houtte, 2011). In Catalonia, grouping practices are not clearly regulated by law: although the educational system is formally comprehensive, 1 in 3 schools group their students by ability. Thus, grouping practices should be understood as an organizational response to diversity, grounded in teachers’ conceptions and expectations about the role of compulsory education and students’ success and failure.

The authors focus on those school organizational practices which deal with student diversity, such as ability grouping or the use of support resources, in two secondary schools with a high percentage of ethnic minority and working class students. Schools were selected according to their diversity management practices. The analysis focuses on teachers’ discourses about educational success and failure, as well as their sense of responsibility for student learning (Halvorsen et al., 2009), and their teachability expectations (Agirdag, et al., 2013). In each school, teachers, principals and academic coordinators were interviewed, and classes and teachers’ meetings were observed. The results are oriented to identify similarities and differences between schools in respect of the rationale of those organizational practices designed to manage student heterogeneity, and teachers’ discourses about their students.

Do opposites detract inequality? The impact of assortative mating and of female labour supply on inequality in Switzerland
Ursina KUHN (FORS/University of Lausanne, Switzerland; University of Neuchatel, Switzerland) | ursina.kuhn@fors.unil.ch
Laura RAVAZZINI (University of Neuchatel, Switzerland) | laura.ravazzini@unine.ch
Christian SUTER (University of Neuchatel, Switzerland) | christian.suter@unine.ch

This paper tries to shed light on the relation between labour incomes of spouses in Switzerland. This country is an interesting case as previous research suggests that the correlation between spouses’ earnings is negative and particularly low from a comparative perspective. The empirical analysis of the paper is twofold. In the first part, we monitor the level of educational assortative mating and of couple sorting on earnings. In the second part, we construct Gini indices to monitor the evolution of the relation of couple’s earnings using 14 waves of the Swiss Household Panel (2000-2013). We separate the effects of couple sorting (assortative mating) from labour market decisions based on a categorical labour supply model. Results show that – although there is stable assortative mating on education – in Switzerland there is no assortative mating on earnings. The inequality of couple’s earnings, measured by the Gini coefficient, is at the same level as under the assumption of random mating patterns. This means that other factors, such as female labour supply, sex segregation and varied returns to education, are able to contrast the desequalising effects of couple sorting based on education. Preliminary results confirm that female labour supply contributes to a low correlation and thus to a low inequality level in Switzerland, as women are responsive to their partner’s wage level through a negative cross-wage elasticity.

Gender and Race Differences in High School Academic Achievement in the United States: Predictive Role of Individual and Parental Factors
Gokhan SAVAS (Social Sciences University of Ankara, Turkey) | gokhan.savas@asbu.edu.tr

Gender and racial/ethnic differences in high school academic achievement have long been discussed and are still an important social and educational policy issue especially because differences at the pre-college stage also predict differences observed many years later after high school graduation such as differences in college enrollment, retention and success (Mickelson 1989, Buchmann and DiPrete 2006, Cho 2007, Sax and Harper 2007). Research found that girls outperform boys in high school grades (Jacobs 2002, Downey and Yuan 2005). For race/ethnicity, black and Latino students traditionally lag behind their white peers in educational achievement by almost any measures (Jencks and Phillips 1998; Kao and Thompson 2003; Fryer Jr. and Lewitt 2004; Card and Rothstein 2007). We know little about the mechanism producing these inequalities between students. Why are girls than boys doing better in school when it comes to grades? What are the factors leading to the educational
disadvantage of black and Latino students? Can we attribute these gender and racial/ethnic differences in educational achievement to the individual factors such as students’ expectations, school behaviors and attitudes? What are the roles of their parental expectations, involvement, and socio-economic background in explaining achievement differences? We still do not fully understand or totally agree on the sources of differences in students’ academic performance. This research systematically investigates the relative importance of these individual and parental factors in understanding the achievement gap among students. It aims to contribute to the current scholarly discussion by revealing the key factors leading to gender and racial/ethnic differences in students’ academic achievement during high school in the United States. It also discusses relevant policy issues and implications pertaining to the research results.

Theoretical Framework: Gender Role Socialization and Oppositional Culture

Sociologists have long studied gender through the framework of social constructionism. As a social structure and identity, gender is commonly viewed as socially constructed (Lorber 1994). According to gender role socialization theory, males and females have different sets of values, attitudes and behaviors throughout their life-long socialization. Both females and males learn how to behave in society within the cultural norms of masculinity and femininity. In this sense, everyone is constantly “doing gender” in society (West and Zimmerman 1987). Those different values, attitudes and behaviors are also reflected in the educational system. Within this theoretical framework, we can argue that males act differently than females in educational settings. In other words, under the influence of male-dominant culture that is sometimes seen as “macho”, males tend to have more anti-school attitudes and disruptive behaviors, which would in turn hinder males’ educational achievement. Moreover, research finds that hardworking males at school are looked down upon and feel that they need to pretend not to care about school work (Francis 1999, 2000, Warrington et al. 2000, Van Houtte 2004). Overall, masculinity is constructed and reinforced during the early years of education and will continue throughout students’ respective educations. On the one hand, boys are more likely than girls to react to school in ways that are seen as oppositional (Francis 1999, 2000, Warrington et al. 2000, Van Houtte 2004) and this negatively affects their educational achievement (Jenkins 1995; Ewert 2009). On the other hand, females are being socialized to be obedient and less independent so they have closer relationships with both their parents and teachers. As a result, female students are expected to demonstrate a greater level of conformity to academic standards and to have good school behaviors, qualities that are highly prized and rewarded by school teachers (Mickelson 1989), but teachers may not hold similar positive thoughts about males and their school performance. Teachers tend to grade students based upon their in-class behavior, and females are deemed better classroom citizens because their behaviors are valued more highly by teachers (Farkas et al. 1990; Downey and Yuan 2005). In contrast, males are more likely to have disruptive behaviors in school, such as attending class unprepared, breaking school rules, and consequently, being punished by teachers (Jenkins 1995; Ewert 2009). This is seen as ‘normal’ behavior for boys, and therefore accepted. Teachers often reinforce unarticulated ideas about males that have a direct correlation to males’ poor performance in educational settings. Overall, socialization process expects females to behave well, to be obedient and to become better students; however, males are socialized to underachieve academically (Mickelson 1989). This gender role socialization does not occur only at home, but also in school as an important site where students learn how to practice those norms given the influences of masculinity and femininity (Martino 1999; Younger and Warrington 1996).

Boys are not the only ones who are expected to develop anti-school behaviors that are seen as oppositional. Racial/ethnic minorities and especially African American students are also believed to have similar attitudes and behaviors toward education. That is why it makes more sense to utilize oppositional culture theory along with gender role theory to investigate the effects of gender and race in educational outcomes. Cultural explanations mainly focus on family-related factors that deal with a racial/ethnic group’s cultural orientations and values,
including their life styles. A well-known sociological explanation dealing with the effect of culture on students’ educational achievement is “oppositional culture theory.” Anthropologist John Ogbu (1978) developed this theory to provide explanations for racial/ethnic differences in school performance.

The main argument of oppositional culture theory is that the historical relationship between a minority group and the dominant group shapes the perceptions and beliefs of group members about the role of schooling. More specifically, African Americans do poorly in school because they believe that the U.S. educational system does not provide benefits for them. They believe that there is a limited payoff to schooling for them and that the American educational system is centralized on white values and culture. African Americans have this perception given the fact that they have experienced slavery, racism, and discrimination throughout American history, and due to this past they have lost their confidence in the U.S. educational system. According to Fordham and Ogbu (1986) that is why striving for academic success within this system is regarded as “acting white”, and African Americans have created a survival strategy called “the oppositional culture” as a coping mechanism that resists substandard schooling. The oppositional culture has also been expanded to include other groups, such as the children of immigrants. Zhou and Bankston (1998) argue that “social isolation and deprivation have given rise to an ‘oppositional culture’ among young people who feel excluded from the mainstream American society” (p. 219).

A cultural-sociological experiment with teaching techniques: Do gendered film examples stimulate students’ sociological imagination?
Margot Elisah R BELET (KU Leuven (Catholic University of Leuven), Belgium) | margot.belet@soc.kuleuven.be

Although sociology long has recognized that education both reduces and reproduces social inequalities, the mediating role of teaching techniques remains unclear. Abstract humanities courses may alienate students, especially those from disadvantaged backgrounds. Hence, this paper tests the effects of stimulating the sociological imagination via everyday course examples. A between-subjects randomized experiment varies these examples’ verbal/visual (anecdotes/films) and ‘masculine’/’feminine’ (e.g. football/shopping) character. Belgian university students (N = 291) watched one of four versions of a social methods video lecture, evaluated via surveys and focus groups.

The (re)production of inequalities through education is theorized as a two-step process: 1) the impact of students’ structural position (administratively registered sex, ethnicity and class) and 2) the moderation of such social divisions by cultural (self-)ascriptions of ethnicity, class (Bourdieu) and gender (Butler). This paper’s experiment focuses on how teaching techniques’ effect on student learning is moderated by sex and gender (self-ascribed masculinity/femininity, gender attitudes, gendered film preferences and hobbies). E.g. do ‘feminine’ students perform better when ‘feminine’ examples are given?

Preliminary results show that using films improves student interest and perceived lecture atmosphere. However, male students rate the course content as significantly less ‘valuable’ when films, rather than verbal examples, are used. Students’ sex and self-ascribed masculinity moderate the teaching techniques’ effect on perceived lecture atmosphere, likely because of masculine students’ discomfort when male lecturers discuss cliché female examples. The insignificance of other gender moderations is explained by the focus groups’ finding that most students appreciate both ‘masculine’ and ‘feminine’ examples, and virtually all blockbusters.

New and old normativities in gender and sexual identity education?
Tatiana ZIMENKOVA (TU Dortmund University, Germany) | tatiana.zimenkova@tu-dortmund.de
Caterina ROHDE (Centre for German and European Studies, Faculty of Sociology, Bielefeld University) | caterina.rohde@uni-bielefeld.de

The grand narratives of educational policies in Europe and beyond seek to embrace diversity and establish equality both in educational policies and practice with respect to gender and sexual identities. Besides the “traditional” educational concepts, which are often predicated on heteronormativity and gender binarity, new educational concepts have been developed that articulate different forms of gender and sexual identity and enforce alternative normativities for example by promoting a gender neutral language or sexual diversity in teaching materials. Simultaneously, contradicting national educational policies and explosive public debates on the topics of gender and sexual identities in education emerge in European countries. Opposing the openness to gender and sexual diversity in education new coalitions of parents from different cultural, religious and political background in collaboration with other actors form social movements which publicly demand to prohibit the articulation of sexual diversity in education. What is the relation between the policy-based openness towards diversity education on the one side and emerging consolidations of anti-diversity coalitions? And what do these controversies mean for the learners?

The contribution is based on sequential analysis of the controversial discourse and protest actions in the context of new educational curriculum in German Federal State Baden Württemberg, articulating non-heterosexual lifestyles. The contribution demonstrates the structure of actors, involved in protest activities and the structure of their argumentation, analyzing different rationalities beyond behind the protest discourse while putting it into the theoretical context of sexual citizenship, theories of participation and approaches towards doing gender. Furthermore the contribution reconstructs new and old normativities within this specific discourse.

Ellen HUYGE (Ghent University, Belgium) | Ellen.Huyge@UGent.be
Dimitri VAN MAELE (Ghent University, Belgium) | Dimitri.VanMaele@UGent.be

Boys and girls rejecting school as a matter of gendered popular identities, are dominating the qualitative sociological literature on secondary education. Although many of these studies depict a colourful image of such “laddish” or “antischoolish” student profiles, the thematic literature lacks large-scale evidence and a focus on profiles other than antischoolish ones. Using quantitative methodological techniques, this article attempts to meet both gaps. Hierarchical cluster analysis revealed four student profiles for each sex among 6234 students (ages 13–14) from 58 secondary schools in Flanders (Belgium). These different student masculinities and femininities varied along five gender-related and popularity dimensions such as gender role ideology, homonegativity and social integration at school. The cluster solution introducing “golden boys and girls, macho boys and babes” among others, was externally validated by relating these profiles to school deviancy as an indicator of “antischoolishness”. This additional analysis showed that the gender profiles which are theoretically assumed to be more antischoolish, reported significantly more events of school deviancy than those which are assumed to have more positive school orientations. Whereas the literature on antischoolish students claims the connection between gender and school orientation, these orientations are not solely the result of gendered (popularity seeking) identities. Ethnicity, sexual orientation and social class are also important classificatory principles operating in making different student profiles, as an intersectional exploration of the availability of gendered student profiles according to these background features shows. This article argues the need to abandon gender-dichotomies and adopt a focus on intrasexual differences.
RN10S13 - Teachers: Issues and Prospects

Opening up towards children's languages: enhancing tolerant practices towards multilingualism in teachers
Anouk VAN DER WILDT (Ghent University, Belgium) | anouk.vanderwildt@ugent.be
Piet VAN AVERMAET (Ghent University, Belgium) | piet.vanavermaet@ugent.be
Mieke VAN HOUTTE (Ghent University, Belgium) | mieke.vanhoutte@ugent.be

Migration has made classrooms super-diverse (Vertovec, 2007). Mainstream classroom teachers have difficulties managing children’s’ linguistic diversity (Agirdag, 2009; Coleman, 2010), often leading to restrictive language policies (e.g. Gogolin, 2002). Scientific research, however, recommends including pupils’ multilingualism in school life (Cummins, 2001; García, 1996; García, 2013). Various small-scale qualitative studies have evaluated implementations targeting teachers’ tolerance towards multilingualism (e.g. Blondin & Mattar, 2004; Ramaut, Sierens & Bultynck, 2013; Verhelst, 2003) and indicate the possibility of improving teachers’ attitudes towards multilingualism.

Our research question is whether and how tolerance towards multilingualism in primary school teachers (measured as tolerance towards pupils using other languages than the dominant language) is affected by an experimental implementation that consisted of three tools aiming at increasing tolerance towards multilingualism among all teachers and thus affecting the school as a whole. This process was facilitated by an external school coach.

Data originate from 62 Flemish primary schools (of which half were experimental schools) that participated in two waves of surveys (first wave: 1166 teachers, 34 % attrition in second wave). We used multilevel regression, since teachers were clustered in schools.

We conclude that teachers working in experimental schools were more tolerant towards multilingualism than teachers in control schools. Furthermore, we discovered differences in this outcome depending on aspects of the implementation process (intensity of working with tools, intensity of cooperation with external school coaches) and other school characteristics (linguistic diversity of pupil population). We controlled for various teacher characteristics (gender, grade, age, tolerance rate at beginning of project).

Belgian teachers’ ethnic prejudice: the role of ethnic school composition and teachability
Roselien VERVAET (University of Ghent, Belgium) | roselien.vervaet@UGent.be
Peter STEVENS (University of Ghent, Belgium) | Peter.Stevens@UGent.be

From the Second World War onwards, Belgium became a migration society and, over the past few decades, Flanders (the northern, Dutch-speaking part of Belgium) has rapidly developed into a multi-ethnic society, whereby Flemish schools are now much more ethnically diverse. The presence of different nationalities and cultures within a school context influences the inter-ethnic perceptions and relationships of pupils and teachers. Most of the research carried out in explaining variability in ethnic prejudice focuses on individual level characteristics. Although research has focused on the relationship between ethnic school composition and ethnic prejudice, studies in this area tend to look on the victims, the pupils of non-West European descent. This study will contribute to the existing research by examining the association between ethnic school composition and teachers’ ethnic prejudice, controlling for individual characteristics of the teachers and taking into account teachers’ perceptions of pupils’
teachability. Multilevel analyses on data from the survey RaDiSS (Racism and Discrimination in Secondary Schools), collected during the school year 2011-2012, including 499 teachers in 44 Flemish secondary schools, show that the effect of ethnic school composition is suppressed by the fact that in schools with a higher proportion of ethnic minority pupils, teachers evaluate their pupils as less teachable. A higher proportion of ethnic minority pupils in school reduces Belgian teachers’ ethnic prejudice, only when teachers evaluate their pupils as teachable. The implications of these findings are discussed.

From academic to social success? The case of teachers’ children in France
Géraldine FARGES (University of Bourgogne, France) | geraldine.farges@u-bourgogne.fr

Our presentation takes an interest into the explanation of inequalities in education and more particularly tackles the resources provided by privileged familial backgrounds in order to facilitate educational and social achievement of their children. Our presentation will focus on teachers as parents.

For the primary and secondary school level, educational success of teachers’ children has been recently demonstrated for the case of France. However the conversion of this academic success into professional or social achievement has not been particularly investigated. Do teachers, as parents, provide their children with all conditions for social achievement? If they supply their children with academic resources, they may not provide them with other resources that make a difference for entry the job market (such as economic, social or material resources).

Using recent French data on employment (Labour Force Survey, INSEE), we examine the pathways of teachers’ children in higher education and their entry into the labor force. Preliminary results demonstrate that there are significant differences between trajectories of the children of secondary or tertiary education teachers versus the children of primary education teachers. The former have the most successful educational and social trajectories along with the children of professionals, even though we need to distinguish between a “mother effect” and a “father effect”. Our research therefore emphasizes the importance of both high cultural and high economic capital in educational and professional achievement in contemporary France.

Increasing teacher attrition? A study of changes in attrition from teaching in Norway 1992-2010
Mari Lande WITH (Oslo and Akershus University College of Applied Sciences, Norway) | mari-lande.with@hioa.no

Issues of recruitment and retention of teachers has been a recurring matter during the past decades, and particular concern has been directed towards attracting and retaining talented teachers. A common claim is that teaching has lost societal esteem and that problems of recruitment and retention are increasing. This paper examines changes in attrition from teaching over the past twenty years, with particular focus on characteristics of teachers who are leaving the profession. Previous research has established that teachers with high-academic performance and higher-level degrees are more likely to leave teaching. Still, little is known about how this has changed over time. In accordance with the status-drop assumption, one would assume that retention of high-quality teachers is increasingly difficult. Conversely, as larger proportions of the labour force hold higher education degrees, teaching credentials may have become less transferable to work in other sectors, leading to the opposite assumption. This is investigated by use of high-quality register data on the Norwegian teacher population. Results challenge the common perception that teacher attrition is increasing, and show how different types of teacher training as well as characteristics of recruits are related to attrition, findings which may prove important for the development of future recruitment policies.
School differentiation and the sorting of teachers. The relationship between teacher and student characteristics in Sweden
Emil BERTILSSON (Uppsala University, Sweden) | emil.bertilsson@edu.uu.se

The Swedish school system has undergone rapid transformations the past two decades. These changes can be described in terms of decentralization and marketization. More precisely Sweden has since the early 1990s witnessed a growing number of independent schools and increasing freedom of choice of schools for children and their parents. This system has created more competition between upper secondary schools (Lundahl et al. 2013). Studies on the effects of these transformations in Sweden have shown increasing social segregation and performance differences between different schools (Andersson et al. 2010; Östh et al. 2013). The same attention has not been paid to the sorting of teachers.

This study analyzes the distribution of teachers on different school taking into account research on school segregation and teacher sorting by combining these within the framework of Bourdieu's theory of capital and field. The results are based on national census data on all upper-secondary teachers and students in Sweden complemented with regional based analysis in the town of Uppsala. Multiple correspondence analysis (MCA) (Le Roux & Rouanet 2010) is deployed as the main research tool.

The correspondence analyses indicate a clear cleavage within the teaching profession based on the teachers’ qualification and merits as well as a homology between the teachers and students inherited and acquired resources. Teachers richer in educational capital tend to occupy more stable professional positions and are also overrepresented at schools where the students feature significant educational and social assets, which in turn further contributes to the uneven distribution of educational capital between schools.

RN10S14 - Citizenship and Tolerance in Schools

Citizenship, nationality and minorities in Turkey’s textbooks: From politics of non-recognition to ‘difference multiculturalism’?
Kenan CAYIR (Istanbul Bilgi University, Turkey) | kenan.cayir@bilgi.edu.tr

There is currently a glaring gap between recent socio-political developments and the notion of citizenship promoted in textbooks in Turkey. Non-Turkish and non-Muslim minorities have attained a greater public visibility while claiming a right to equal citizenship for the last two decades. The governing Islamic-conservative Ak Party introduced several reforms for the inclusion of minorities such as the incorporation of minority languages as elective courses into the curricula in 2012. Nevertheless, minorities still receive no mention in Turkey’s textbooks. The national narrative is based on a single-language and single-religion policy. Textbooks relay a cultural capital (Turkish, Sunni-Islamic) which excludes specific groups while privileging the dominant groups, thus recreating inequality. Recent developments, however, show that it is no longer possible to maintain difference-blind, assimilationist education. Turkey needs to develop a new notion of citizenship and national imaginary that would allow for peaceful coexistence of diverse groups. Based on a discursive analysis of textbooks, this paper explores tensions and dilemmas in Turkey’s search for developing an inclusive citizenship and a new collective identity. It draws on data collected in “Human Rights in Textbooks III Project” which involved the analysis of 245 textbooks in different subjects. The paper argues that building a democratic
citizenship seems to be impossible if difference-blind Turkish national ethos remains at the center of the curriculum in Turkey. It then evaluates the AK Party’s and conservative intellectuals’ multiculturalist propositions and tolerance discourse which might lead to inclusion on the basis of unequal social position for minorities.

**Tackling inequalities in political socialisation**

Bryony HOSKINS (Roehampton University, United Kingdom) | Bryony.Hoskins@roehampton.ac.uk  
J Germ JANMAAT (IoE/UCL, United Kingdom) | G.Janmaat@ioe.ac.uk

Disadvantaged youth in the UK are the most politically disaffected and also the ones who have lost the most from austerity measures implemented by the 2010-2015 coalition government (Browne and Elmig 2015: Cribb and Joyce 2015). In this context, this paper will explore how inequalities in intended voting occur and the factors that enhance and mitigate this disposition using data of the Citizenship Education Longitudinal Study (CELS). There is a considerable body of knowledge that exists on how citizenship is learnt at schools including through an open classroom climate (Torney-Purta 2002; Hahn 1998; and Campbell 2008), citizenship education (Whiteley 2012) and participatory activities (Hoskins, Janmaat and Villalba 2011). There are also activities outside schools that can enhance citizenship learning including media and out of school activities (Hoskins, Janmaat and Villalba 2011). However, there is limited research that examines whether these methods are equally effective in fostering political engagement for different social groups.

We start by exploring the issue of access to these methods to identify possible social differences in opportunities for becoming engaged citizens. In a second step we will perform OLS regression analysis using interaction effects to establish whether some method mitigates or enhances social disparities in political engagement. The initial results suggest that citizenship education at the age group 15-16 is having a compensatory effect. However, this effect is not found in the earlier age groups (between 11-14) suggesting that citizenship education is a crucial measure in tackling social inequalities in political engagement but only from mid-adolescence onwards.

**The Citizen and the ‘Lesser Citizen’: Constructions of Unequal Citizenship in Classrooms in a State-run School in India**

Rupamanjari HEGDE (Jawaharlal Nehru University, New Delhi, India, India) | rupamanjarihegde@gmail.com

This paper seeks to explore how the children in the middle school construct their notions of citizenship with regard to certain marginalized communities in the Indian society. Based on an year-long ethnographic study consisting of classroom observations and interactions with a few students and teachers, conducted in a State-run co-ed school in Delhi, the paper examines whether the introduction of an innovative and inclusive civics curriculum has succeeded in challenging certain social inequalities deeply entrenched in the Indian social imagination. The study would argue that shifting the focus of discussion from an ideal society and polity to a more realistic one without hiding all the cleavages arising out of institutional and systemic malfunctioning and social inequalities based on class, caste, gender, ethnicity and religion has substantially altered the classroom discourse. However influenced by an assessment system that still encourages rote-learning and one ‘right’ answer the pedagogic practices within the school have largely remained teacher-centric regulated by rigid ‘framing’ (Bernstein), leaving little space for the children to meaningfully engage with the issues.

This along with the hidden curriculum of the school, as the paper seeks to tentatively conclude, that clearly favours the dominant majoritarian ethos and the children’s own socio-cultural
context, has resulted in multiple reading (Apple) of the textbook and the construction of the traditionally marginalized groups like the Muslims, Dalits and Adivasis as the 'lesser citizen' thereby reproducing the very inequalities which the textbook has attempted to challenge.

Keywords: Marginalization, Dalits, Adivasis, Muslims

**Education and Citizenship: Phase Two of the study**
Bernadette BRERETON (DkIT, Ireland) | bernadette.brereton@dkit.ie

Humans are social beings, creating networks of interaction that influence our social engagement, integration and emotional well-being. The degree of ‘Social support correlates to stress, emotional and psychological well-being, physical well-being, health and the longevity of individuals.’ (Agneessens et al 2006). Following John Stuart Mill (1864) who stated that: ‘the State should require and compel the education…of every human being who is born its citizen’; we hypothesise that an effective citizenship education is a key student support in higher level education in the multicultural, global context. In this, we build on previous work by Brereton, Hurley (2012) which examined the diversity of qualitatively different support networks within the higher level student body and showed that understanding these networks is key to understanding the student learning experience.

We surveyed the complete student body (5,000+) of Dundalk Institute of Technology (DkIT), Ireland to assess some key understandings and perceptions and highlighted some key philosophical difficulties which arise in the provision of education for citizenship. This paper incorporates the results of both Phase One and Phase Two of the study allowing a much higher proportion of student data to be considered and analysed. We expand our initial interpretation (based on Phase One results) that differing interpretations of the concept and content of citizenship education exist. We highlight specific means of harnessing the potential for the development of future global citizens through a more comprehensive understanding of citizenship.

**RN10S15 - Schooling and Success**

**Tracks and subjective feelings of success in secondary education: A qualitative study in Flanders**

Lore VAN PRAAG (Research group CuDOS; Ghent University, Belgium) | Lore.VanPraag@UGent.be

Jannick DEMANET (Research group CuDOS; Ghent University, Belgium) | Jannick.Demanet@UGent.be

In Flanders, a strict tracking system exists. Tracks are hierarchically ordered, with the vocational track being least valued. Hence, the tracking system might impact on the subjective feelings of being successful in school. These feelings matter as they relate to students’ future educational and professional aspirations and decision making processes during their school career. In this study, based on ethnographic observations and semi-structured interviews, we examine how students evaluate their educational success in secondary education in Flanders and how this appraisal is affected by the track they are enrolled in. Our data indicates that the hierarchy between tracks is reflected in the comparison groups students use to evaluate their school success. In academic tracks, most students considered their educational career automatically as successful precisely because they were enrolled in the academic track, regardless of their actual grades. These feelings of relative gratification, therefore, are based on a between-track comparison. Conversely, students in vocational tracks developed more complex and
contradictory feelings with respect to their personal success in school and felt the need to distinguish themselves from their classmates – e.g. by stressing their grades or professional future goals. Their feelings of relative gratification, therefore, are more likely the result of within-track comparison. Thus, all students searched for ways to positively evaluate their success by adapting their comparison groups.

Self-Processes and Academic Success – When the “Child as Actor” Enters the Research Agenda
Doris BÜHLER-NIEDERBERGER (University of Wuppertal, Germany) | buehler@uni-wuppertal.de
Aytüre TÜRKYILMAZ (University of Wuppertal, Germany) | tuerkyil@uni-wuppertal.de

The study aims at identifying new patterns of inequalities in education. For this purpose we analyze in how far academic performance is produced in interaction processes with the child as a participating actor. Quantitative data of primary school children in a German follow up study reveals that children transform aspects of their social background into an educational advantage via aspirations and self-positioning in the social structure, self-assessment and self-presentation. At school, children can use these self-processes in order to navigate through the interactions and evaluations of teachers.

In other words, students who have higher confidence in themselves and in their abilities achieve better grades, whereas parental socialization practices affect grades only partially. Nonetheless, researching structural effects of educational inequalities should not be neglected; in fact, social class has a significant effect on academic success as well. Thus, it is essential to illuminate the relations between social positions of the children and their self-processes.

The quantitative part of our study was supplemented by a qualitative study. Based on the data from both study parts, we developed a model of family-teacher-student-interactions in order to explain inequalities in academic success. In these interactions the child has a central role as a self-reflecting and (re-)acting instance. In this paper multiple regression analysis and equations modelling as well as case studies will provide ample evidence for the arguments made. Practical applications of the results will be discussed.

The school effect in student ICT confidence: the case of Spain in comparative perspective
Maria FERNÁNDEZ MELLIZO-SOTO (Complutense University of Madrid, Spain) | mfellizosoto@edu.ucm.es
Dulce MANZANO ESPINOSA (Complutense University of Madrid, Spain) | dnmanzano@edu.ucm.es

In last decade, Information & Communication Technologies (ICT) have been generalized in Spanish schools. This investment has been made with the aim of increasing digital skills of students, at least the competence of those students with low access to ICT outside schools. Despite this generalization of ICT in schools, differences in digital skills among Spanish students persist. The aim of our paper is the analysis of differences in digital confidence of Spanish students.

The literature reviewed stresses the impact of individual and family variables, considering the school effect as a residual. Our paper, on the contrary, presumes that school-level variables are relevant for advancing students’ digital skills. The generalization of ICT infrastructure in schools has reduced its explanatory power, but it is a necessary condition (not a sufficient one, though) in order to attain these skills. We argue that certain “intermediary” agents between new technologies and students play a much more relevant role nowadays: peer group and teachers may help students to develop digital skills.
We test our hypotheses using the Spanish sample of the “European Survey of Schools: ICT in Education” (ESSIE). By employing multilevel regression techniques (two level, random effects) and indicators on digital confidence (as a proxy for digital competence), we offer empirical evidence consistent with our predictions. The effect of school-related variables seems to be greater than individual and family variables, specially the impact of peer-group ICT use outside school. We also find that teachers’ digital confidence has an impact in digital confidence of students.

**Narrative Mediation Path – an innovative tool to promote nontraditional/disadvantaged learners participation in higher education**

Dan Florin STĂNESCU (National University of Political Studies and Public Administration, Romania) | dan.stanescu@comunicare.ro
Elena Madalina IORGĂ (National University of Political Studies and Public Administration, Romania) | elena.iorga@comunicare.ro

The importance of widening participation in higher education has been associated with social and economic benefits for individuals, communities and nations. In this context, the growing phenomenon of nontraditional students increases the risk of educational underachievement and drop-out in European universities. Within the European funded project INSTALL (Innovative Solutions to Acquire Learning to Learn) researchers developed a qualitative methodology - Narrative Mediation Path (NMP) consisting in a group training process targeted to nontraditional students. NMP, based on the psychological concept of mentalization, combines into one methodology four discursive modules (metaphoric, iconographic, written and bodily) in order to increase an understanding of the meaning of the university experience and foster the different levels of the reflective process. The use of a “multidimensional” narrative promotes a progressive cognitive and emotional involvement of the student; a gradual evolution from a reconstructive function of the formative experience to a planning function that allows students to act in an effective way in academic settings. The results suggest that the use of different discursive modules supports the students in developing their reflexive competence during a formative experience which enables them to better adjust to the university context and to minimize drop-out rates and increase completion.

**RN10S16 - Ethnicity and Migration: Inequalities in Education**

**Fitting in or standing out? The implications of ethnic congruence for school misconduct**

Jannick DEMANET (Research group CuDOS, Ghent University, Belgium) | jannick.demanet@ugent.be
Lore VAN PRAAG (Research group CuDOS, Ghent University, Belgium) | lore.vanpraag@ugent.be

Ethnic segregation is generally believed to limit equal opportunities. Therefore, most policy makers strive towards a dispersal of ethnic groups across schools. The presence of co-ethnic students for ethnic minority students is mostly seen as a hindrance to their integration in the host society.

Recent studies starting from a person-environment-fit framework showed, however, that students’ sense of belonging increases when there is higher ethnic congruence – i.e. more co-ethnics are present in school. Other outcomes of congruence, nevertheless, are yet to be studied. The first objective is to investigate whether ethnic congruence relates to school misconduct. After all, social control theory holds that conventional bonds to the school and its
actors diminish deviant behavior. As higher congruence increases belonging, we expect it to associate with lower misconduct.

The second objective is to examine whether the association between ethnic congruence and misconduct is mediated by sense of belonging. We approach belonging as a multidimensional concept, distinguishing between attachment to friends on the one hand, and attachment to teachers and the school on the other.

Multilevel analyses on data (2004-2005) from 11,759 students in 83 Flemish secondary schools show that higher ethnic congruence associates with lower misconduct, but only for ethnic minority students. This association was not due to friendship attachment, but was mediated by attachment to the teachers and the school context. We conclude that, when more co-ethnics are enrolled, students are less likely to break the rules because they feel more attached to teachers and their school context.

**Ethnicity, Migration, and Educational Achievement in Italy: a Comparison across Educational Levels.**  
Eleonora VLACH (University of Trento, Italy) | eleonora.vlach@unitn.it

In this paper I look at the stratification of educational competencies in a new immigration country. Previous literature on the topic founded that immigrant students, particularly first generation immigrants, underperform natives at school. However, some scholars have questioned that ethnicity constitutes a new line of educational inequality, independent to the traditional one of social origins. Still others have criticized the vision that attributes immigrants’ underachievement only to individual and family characteristics, advancing hypotheses about the influence of the classroom climate and teachers effect. In this paper I build on what has been done so far with respect to both aspects.

Firstly, I analyze whether the detected immigrant-native gap is constant between educational levels and whether its determinants retain the same influence throughout the school career. Until now, scholars have mainly adopted a synchronic approach, comparing same-age students (e.g. using Pisa data). In doing so, they have implicitly assumed the immigrant-native gap and its generative factors as constant during the individual educational career. In this paper I put this assumption into question. According to the school’s equalizer effect theory, which claims that school attendance gradually make students more similar, I argue that:

- **H1a:** Other things being equal, the achievement gap between immigrants and natives will decline as the educational level increase.
- **H1b:** The higher the school grade considered, the lower the effect of individual and family characteristics, and the higher the influence of contextual variables.

In addition, in this paper I propose a more detailed consideration of the individual “immigration status”. Because of limited data availability, the existing quantitative research on the Italian ethnic stratification in education has almost exclusively relied on the distinction between natives, first generation immigrants (immigrants strictu sensu) and second generation immigrants (children born in Italy from immigrant parents). I argue that this definition does not allow us to fully understand the multidimensionality of the concept of immigration background, and thus the mechanisms by which it can affect school achievement. To solve this, I propose to decompose the individual's immigration status in three different dimensions, considering each one as able to influence educational achievement independently of the others, and independently of social origins. The first is the individual's own migration experience, that is: being born in a country other than the one where he/she lives. The second is the socialization to host country’s norms and values, approximated by the number of years spent in Italy. The third one is ethnicity itself, an aspect that reflects the cultural lineage of the individual, detected through the information on the country of birth of his parents. With reference to this, I test the following hypotheses:
H2.a: Since migration might be a traumatic experience, leading to a loss of social capital and
the need to learn a new language and new norms, it negatively affect educational competences,
regardless of the individual’s specific country of origin.
H2.b: As the number of years spent in the host country increases, immigrants’ school
performances will be less and less different from those of their native peers.
H2.c: The higher the cultural distance of the parents’ country of birth to Italy, the greater the
extent to which individual’s ethnicity will negatively affect educational achievements.
I rely on 2013 data from the National Institute for the Evaluation of the Educational System,
which every year administers tests of linguistic and logic/mathematical proficiency to all Italian
students attending the II” and V” year of primary school, and the I” year of lower secondary
school. In addition to competencies, data provide useful information about the individual social
background and learning environment. Moreover, I merged these data with official statistics at
the provincial level. For the analyses I use four-level hierarchical linear models in which I
consider students as first level units, classrooms as second, schools as third, and provinces as
fourth.
The analyses show that the variance explained by individual characteristics is always greater
than the one due to any other contextual factor at each school year considered. Individual’s
features do never account for less than 78% of the total heterogeneity in test scores, both of
linguistics and logic proficiency. Thus, although the overall differences in achievements diminish
with the increase of the school year, the importance of individual’s features as the leading cause
of those differences remains substantially stable. However, if among the three considered
higher levels, the specific classroom climate was the most influential factor at the second year of
primary school, four years later it is less affecting one. On the contrary, the higher the school
grade considered, the higher the relative weight of the local context in explaining the differences
in students’ test scores.
According to the previous literature on the Italian case, even after controlling for parental
education and socio-economic status, immigrant students show lower educational
competencies than natives. Using the traditional measure of immigration status, the immigrants’
students mean level of competences falls circa 16 points below the average (set at 200), in
each of the considered school grade. If we decompose immigration status in its three
dimensions of migration, ethnicity and socialization, however, we can obtain more clarifying
evidences. In line with the research hypotheses, each dimension affect educational
achievement independently one another. In partial disagreement with the hypothesis H2.a,
having directly experienced a migration has no negative effect on educational achievement at
the beginning of the schooling career. Nonetheless, at a later stage, it shows a negative and
significant effect, which grows with the increasing distance between the country of origin and
Italy. Similarly, the effect of socialization, which is not statistically significant at the II” grade,
becomes relevant as they schooling career progresses. Finally, according to H2.c, evidences
show a negative and statistically significant effect of ethnicity on educational achievement,
which is much lower if both parents are born in the European Union and much higher if they
migrated from any another continent. The fact that the father’s place of birth affects educational
achievements more than the mother’s country of origin, certainly deserves more attention and
future analyses.

Legal Status of Migrants and Inequality: The Vocational Training of Young
Tolerated Refugees in Germany
Franziska SCHREYER (Institute for Employment Research, Germany) | franziska.schreyer@iab.de
Angela BAUER (Institute for Employment Research, Germany) | angela.bauer@iab.de
Migrants unsuccessfully claiming refugee status may be ‘tolerated’ in Germany. This legal status positions them in the host society nearly at the end of a vertical model of civic stratification, implying restrictions in accessing central institutions such as the education system or the labour market. Furthermore, they are constantly facing a high risk of being deported to the country of origin. However, the impending shortage of the skilled workforce in Germany enforced a new political debate. As a consequence young tolerated refugees have been re-defined as educational subjects and labour market resource. Despite the still persisting inequalities in the access to vocational training of tolerated youths as compared to young citizens or migrants being granted a residence permit, legal changes have been introduced since 2009. They are to reduce vocational training boundaries for tolerated youths. But empirical evidence from our research project reveals a heterogeneous application of the new regulations. This results in regionally diverse vocational training chances for tolerated youths. Does this cause new inequalities within this group of migrants? How far can tolerated youths leave their precarious position within the vertical model of civic stratification? These are the questions we would like to focus on in our presentation. To answer them we present findings of our comparative regional case studies that are based on document analyses, semi-structured interviews and group discussions with experts. Our findings argue for an enhanced consideration of institutionalised inequalities that are bound to a person's legal status in the sociology of education.

Education, Ethnic Differentiation and Social Inequality. Insight from South Tyrol
Romana LINDEMANN (apollis - Institute of Social Research and Opinion Polling, Italy; Michael-Gaisal-Bozen) | romana.lindemann@apollis.it
Eike Lars POKRIEFKE (apollis - Institute of Social Research and Opinion Polling, Italy; Michael-Gaisal-Bozen) | eike.pokriefke@apollis.it

The South Tyrolean society is constituted by three ethnolinguistic groups: The German speaking population being a “fragile majority” (McAndrew 2013), the Italian and Ladin speaking populations being minorities in South Tyrol (autonomous province of Italy). Later than in its neighbouring regions in the north, South Tyrol is recently seeing growth of the migrant population, currently contributing nine percent to total population. The aim of this study is to analyse social inequalities arising from ethnic differentiation and social stratification in this unique constellation of new and old minorities.

Ethnic differences in education result in different social structure. E.g. the traditional higher appraisal of craftsmanship in the German and Ladins speaking population contradicts the often dismissive opinion about apprenticeship as an educational aim for children in the Italian speaking population. Further differences result less from ethnic differences, but the allocation of ethnic groups between urban and rural environment. The survey at hand investigates social inequalities between ethnic groups, resulting from educational differences interdependent with structural differences.

The data base results from a quantitative telephone survey (CATI) with a representative sample of 1500 respondents. Classical approaches to social structure (Blau 1987, Haller 2008) based on social characteristics (age, sex, religion, ethnicity, ISCED, income), the European Socio-economic Classification (EseC) and a recent lifestyle approach (Gunnar Otte 2008) are combined.

RN10S17 - School Achievement - Social and Human Capital
"Challenges for Families Facing Differences, Inequality and Sociological Imagination" How Can Families Still Function as Educators in Unequal Societies?

Esther SEROK (The Hebrew University of Jerusalem, Israel) | esther.serok@mail.huji.ac.il

The paper presents a research study on the educational impact of social inequality on the role of families as educators. Specifically, it presents the field work and findings of qualitative research, involving educational settings in which innovative methods have been developed to include families from unequal diverse cultures as educators in their children's educational process.

The study's outcomes include theoretical and empirical methods of facilitating an authentic dialogue between families and educators, a creative model for the incorporation of family's culture as enrichment resources for the school curriculum, developing curricula and educators training. The study's findings demonstrate that an effective partnership between the family and the educational framework relating to the child's cultural background improves the learning process, enhances the children's scholastic achievements, building families' resilience thereby promoting equality among families, helping the family to regain its leadership role and culturally assigning responsibility for strengthening their cultural identity. The study's conclusions show the contribution of families' leadership to the child's development and to the school's success in achieving its educational agenda. Such school-family collaboration has the potential to minimize the risk of crises in the family's structure which include social changes such as the loss of parental authority, children acting as the parents' translators, adaptation to democratic society's values.

It encourages acquiring formal education as a vehicle for minimizing inequality and enabling social mobility. The paper will present studies conducted in a widely diverse type of families and schools along with innovative educational programs developed, tested and implemented.

Educating Children in Times of Globalisation: Class-specific Child-rearing Practices and the Acquisition of Transnational Human Capital

Soeren O. CARLSON (Freie Universitaet Berlin, Germany) | s.carlson@fu-berlin.de
Juergen GERHARDS (Freie Universitaet Berlin, Germany) | j.gerhards@fu-berlin.de
Silke HANS (Universitaet Goettingen, Germany) | silke.hans@sowi.uni-goettingen.de

People can only profit from globalisation if they speak several languages and are familiar with foreign cultures and institutions. We call these skills transnational human capital. This sort of capital can effectively be acquired by spending a school year abroad, an educational practice that is highly dependent on the familial class background. Drawing on Pierre Bourdieu and based on semi-structured interviews with parents of adolescents, some of whom spent a school year abroad, we reconstruct class-specific differences in the acquisition of transnational human capital. We show how, for upper middle class families, its acquisition is embedded in specific child-rearing practices and facilitated by their endowment with different forms of capital. For the same reasons, lower middle class families find the acquisition of transnational human capital much more difficult. However, we can also point out in which ways these families can enable their children to embark on a school year abroad.

Social Capital and Educational Inequalities – Different Theories, Different Empirical Applications

Piotr MIKIEWICZ (University of Lower Silesia, Poland) | piotr.mikiewicz@yahoo.pl
Social capital is one of the most popular categories in contemporary social sciences. In the field of educational studies it seems to be an important element of analyses enhancing introduction the wider social environment into analytical models applied to understand relation between schools and social structure. However, disseminated across the social sciences social capital category becomes unclear and has been applied in very different ways in analytical models. The main issue is therefore to clear out, what do we mean by social capital.

The answer to this question is neither simple nor unequivocal. The concept of the designation “social capital” changes depending on which theoretical optic is adopted. Understanding these differences requires presenting the entire theoretical background of the category. The work presented here is an attempt to show these theoretical sources and the analytical consequences that stem from them, including in educational research.

An analysis of the literature permits identifying four basic, but different, theoretical sources of the use of the social capital category. These are James Coleman’s rational choice theory, Robert D. Putnam’s concept of a democratic society, Pierre Bourdieu’s structural constructivist theory, and Nan Lin’s network theory. Since different social capital concepts were applied, the research focuses on a different issue. This stems from adopting another perspectives of reality which imposes the theoretical background of the social capital category, which, each time, illuminates a different area of the individual’s actions. This is one of the reasons for the semantic confusion. By adopting a designated understanding of social capital — consciously or not — we choose the theoretical background that suggests to us the questions that are worth posing about the relation between education and the social structure. In effect, the analysis of results shows us different things about the relation between school and the community.

**What is the role of teachers’ expectations in explaining students’ engagement? A qualitative analysis in Catalan secondary schools**

Aina TARABINI (Autonomous University of Barcelona, Spain) | aina.tarabini@uab.cat
Marta CURRAN (Autonomous University of Barcelona, Spain) | marta.curran@uab.cat

Teachers’ expectations have an important impact on students’ attitudes and educational results (Van Houtte, 2011). These expectations, far from being analyzed from an individual perspective, have to be observed from a collective dimension that takes into account specific organizational contexts (Diamond, et al 2004). In that sense, the school culture -understood as the taken for granted assumptions and believes shared by the members of the organization (Van Houtte, et al. 20011)- is the necessary unit of analysis in order to explore these expectations. The object of the paper is to analyze some specific dimensions of this culture (specifically, the factors attributed to the students’ failure and success and the teachers’ sense of responsibility for the students’ learning) and its impacts on the students’ engagement with their schooling. In order to conduct the analysis, we developed a qualitative research in four public secondary schools in Barcelona (Catalonia-Spain), selected according to their diversity in terms of their social composition and their logics of managing pupils’ heterogeneity. In each school we developed interviews with teachers, principals, academic coordinators, counsellors and with students in their two last years of compulsory secondary schooling. We also conducted focus group with teachers and students, class observations and participation in teachers’ meetings. The results are oriented to identify the main conditions (both at structural and organisational level) explaining the formation of different school cultures and teachers’ expectations. Our thesis is that the context generates different opportunity framework that consequently causes unequal chances to success at school.

Determining the factors that are responsible for the growth of the school parental involvement in children education

Agnieszka OTRĘBA-SZKŁARCZYK (Jagiellonian University, Poland) | a.otreba@gmail.com

Parental involvement is parents participation in the process of children education (Jeynes 2005) and is mostly defined by the six types of behaviours: a) parenting, b) communicating, c) volunteering, d) teaching at home, e) decision making, f) collaborating with the community (Epstein et al., 1991). The main purpose of this presentation is to present the results of qualitative research in order to verification and modification the model elements of parent involvement developed by Hoover – Dempsey and Sandler (1997, 2001, 2005) in relation to the context of Polish.

Model of motivations and engagement consists of three elements 1) parental role construction for involvement in childrens’s education, 2) parents perceptions of invitations for involvement from others, 3) parents’ perceived life context (Hoover – Dempsey & Sandler 1997). During the qualitative research were tested additional factors, not included in the model, which may affect the level of commitment. Additionally, in order to better understand the social context of the functioning of the parents the parental role which parents should act in the education of children, according to teachers and school administration, was verified.

This presentation may play an important role in the scientific discourse as they are still few studies was conducted in order to verify the model (Jeynes 2005), especially the technique of qualitative research. Moreover, the majority of studies failed to mention an important aspect of the social environment, and as shown by the results of the research, the school environment affects the educational achievements of students (Carbonaro 2005; Stewart 2008).

RN10S18 - Education, Market and the Crisis

Social Inequality of Educational Attainment in Market Transition of China

Yuling WU (Nanyang Technological University, Singapore) | wuyu0018@e.ntu.edu.sg

This article aims to explore in the context of market transition of China, how the interplay of market and state reshapes the educational stratification mechanism and alters different social groups’ positions on social ladder, with particular attention to the effect on children’s schooling of father’s work units (danwei) and the three household categories of urban household, rural household and rural-urban migrant household, as the former is the specific institution through which the market exerts its influence on social inequality in China and the latter is the outcome of the state intervention of Household Registration (hukou) system on social stratification.
Multiple regression models by using OLS method are adopted to analyze data from a national representative survey in 2011. The analyses based on the descriptive statistics and regression results clearly delineate the educational gap of children from different household categories and reveal that urban households always hold the most prominent advantages on children’s education, and migrant households only in eastern regions where market economy is well developed present a little more positive effect than rural households, whereas in western and central regions where market economy is underdeveloped, the background of migrant household makes children’ educational achievement to lag far behind those from urban and even rural households. Besides, father’s work units also present distinctive discrepancy in their impacts on children’s schooling by showing that children gain the most in education from father being working in his own enterprises or employed in private/hybrid enterprises rather than working in state sector such as government agencies and state institutions, after controlling for other variables constant. The main findings suggest that whereas hukou system still poses negative impact on children's education from rural and migrant households which would cast the two groups into disadvantageous position on class structure in the long run, the developed market economy and the emerging market sector are currently exerting a spark of positive effect for children particular those from migrant households, on their academic journey, though the effect is weak and is not always guaranteed in western and central regions.

Education, marketization and students coping with accountability
Majsa ALLELIN (University of Gothenburg, Sweden) | majsa.allelin@socwork.gu.se

Being one of the world leading countries when it comes to educational equality, Sweden is now a leading nation when it comes to marketization of education and practically the only country which allows publicly financed schools to make private profit. In order to keep up with and meet the needs of the globalized market, there is a consensus within the Swedish politics that the educational system must offer a more flexible and entrepreneurial service. Though, at the same time the neoliberal turn has in less than twenty years caused both an educational as well as a socio-economic gap which now stands as one of the fastest growing, according to OECD. By doing an ethnographic comparative field study, the aim of my study is to understand how and why students are held accountable for their education, both when it comes to making a choice of school and during the time of their education. My observations show that students are well aware of and adapt the instrumentalization of education. This adaption affects their goals in life, both the ones concerning preset time as well as their future goals. It is also clear to them that they are expected to be entrepreneurial subjects in order to achieve good grades, and in the long run, get a “good job”.

Can education be a response to the economic crisis? Unintended consequences from the introduction of innovative programs in higher education in Greece
Marios VRYONIDES (European University Cyprus, Cyprus) | m.vryonides@euc.ac.cy
Dionysios GOUVIAS (University of the Aegean, Greece) | dgouviias@rhodes.aegean.gr
Chryssi VITSILAKIS (University of the Aegean, Greece) | vitsilaki@Rhodes.Aegean.gr

At times when societies go through crises (economic, social and cultural) education is often seen as an agency that may offer a sustainable answer for the medium and long term future. This assertion may be examined in at least two levels: a) At the level of the individual (micro-level) where the focus is on training and retraining individuals in order to equip them with those skills and competences that will make them more employable and adaptable to the changing needs of the economy and b) at the macro-level by investing in innovative programs in an effort
to advance society's human capital as the most endurable source of investment for sustainable and long term development and growth. 

In this primarily theoretical and policy driven paper we will focus in the case of Greece through examining the policy that was behind the introduction of a distance, e-learning education program at a Greek University. This introduction was initiated a few years ago by legislation and related to a political discourse regarding the need for the public higher education system to offer flexible educational provisions and opportunities to groups of students who would otherwise be excluded from “formal” education. At the same time this was an investment that constituted a response to the changing landscape of higher education and the economy. We will examine the theoretical underpinnings that supported this introduction amidst an environment of protracted economic crisis that has serious effects on the social, economic and educational foundations of the country. We will then present data from the abovementioned e-learning program in order to draw preliminary conclusions regarding the implications and possible unintended consequences of running such a program, both for the participating individuals (micro-level) and for the development of human capital (macro-level).

Crisis and equity in Southern Europe’s Educational Systems: tendencies and evolution

João SEBASTIÃO (Centro de Investigação e Estudos de Sociologia, Portugal) | joao.sebastiao@iscte.pt

Alexandre CALADO (Centro de Investigação e Estudos de Sociologia, Portugal) | alexandredanielcalado@gmail.com

The aim of the present communication is to discuss the impacts of the ongoing crisis in Southern Europe educational systems (Portugal, Spain, Greece and Italy), at both political and performance levels.

During the last 20 years, significant improvements were observed in all four countries in key indicators such as early school leaving, pre-school enrolment or higher education enlargement, although with specific national dynamics. These results are related to internal political efforts to achieve convergence with the European qualification levels, and the impact of the educational implications of European policies, in particular the Lisbon Strategy.

The comparative analysis of what happened between 2000-2013 in Southern Europe educational systems reveals, as a preliminary conclusion, that the differences in the political cycles identified for each country can explain:
1 - The reasons why each country differ in their results and priorities in the educational policy-making, suggesting further that equity can assume diverse conceptions at the national level and in different periods;
2 – Why austerity measures negotiated with the troika differ in their implications in national educational policies;
3 - Why budget crisis cannot be considered as an exclusive factor to explain the retraction in certain educational areas, but involves also the consideration of ideological and political choices and the way educational equity is conceived’

To put it briefly there are contradictory signs, some revealing resilience of southern educational systems dealing with the pressures of greater selectivity and elitism, others showing a clear degradation of the quality and equity inside them. In the end, this tension will redesign the prospects of educational systems and their contribute for the balance of social inequalities.

RN10S19 - Interventions and Change in Schools

Living with Hope: The Meanings of Education among the Weavers of a South Indian Town
Sreeramulu GOSIKONDA (University of Hyderabad, India) | sreeramg123@gmail.com

There is a close relationship between caste and occupation in India. In the era of Globalization, the traditional occupations like agriculture and weaving have been declining not only due to technological revolution but also introduction of neo-liberal economic policies in the country. The Indian Textile Industry provides direct employment to over 35 million people, which is the second largest provider of employment after agriculture in India. Telangana is the new State and it came into existence as 29th State of Indian Union from 2nd June, 2014. Even though the weavers of Sircilla Town in Karimnagar District of the State have adopted technological changes by replacing their handlooms with power looms, they are getting meager wages. The semi industrialized power loom sector of the Town is unable to compete with either local textile mills or global textile industries. Due to severe crisis in the power loom sector more than 300 weavers were committed suicide from April 1997 to till date. The gloomy weavers have no hopes on their traditional occupation for livelihood. So, the weavers aspire to change their children’s occupation by accessing education.

At this juncture the present paper would like to focus on the importance of education as a powerful instrument not only in struggling against the economic and occupational crisis but also in getting achieved status through upward social mobility. The paper explores reasons for decline in traditional occupations and increasing demand for education. The objectives of the paper are to find out the educational levels and occupational profiles of the weavers’ family members for three generations and also to examine the strategies and problems of the weavers in educating their children. The study is based on both primary and secondary sources.

MOOCs as a way to achieve equality in higher education...is it possible?
Tatiana SEMENOVA (Higher School of Economics, Russian Federation) | tatiana@semenova.me

Many researchers (Kay et al, 2013; Chen et al, 2013; Liu et al, 2014) consider MOOCs as a means to achieve equality in gaining knowledge through making available equal access to online courses, taught by faculties of different universities around the world. This view is based on such MOOCs characteristic as its openness. Openness means the possibility to register for any online course, as you want, without entrance exams and tuition fees. Thus, anyone with access to the Internet can register for any course, presented on the online platform. It seems
that the problem of inequality in higher education is solved by MOOCs distribution. However, does equal access to knowledge through online course ensure equality in gaining knowledge? We will demonstrate the existence of two barriers in acquiring knowledge through MOOCs with the example of four online courses of Higher School of Economics on Coursera, held between February and July. In order to do that, we need to find out: 1) What kind of effect does the level of language proficiency, which is taught, have on progress in studying? 2) What kind of effect does cultural capital of MOOCs listener have on progress in studying? Preliminary analysis showed that although MOOCs offer open and unlimited access to online courses of various leading universities, the chances to gaining knowledge are not equal for all listeners, enrolled for the course.

Assessing quality of interventions for reducing differences in students’ academic achievement in Southern Italian Regions

Donatella POLIANDRI (INVALSI - National Institute for the Educational Evaluation of Instruction and Training, Italy) | donatella.poliandri@invalsi.it
Isabella QUADRELLI (INVALSI - National Institute for the Educational Evaluation of Instruction and Training, Italy)

Significant differences were found in students' academic achievement between EU countries and regions within countries. Despite policy interventions, regional disparities tend to persist. A combination of national, regional, and local circumstances affected material inequalities, forms of capital, and opportunities in learning. Research has shown that differences in students' academic achievement depend also by school characteristics, local contexts, and school processes.

EU policy has tackled inequality in education by implementing intervention programs for reducing differences in students’ academic achievement and, thus, improving the access to education. To reduce differences in students’ academic achievement between north and south regions, Italy used structural EU funds. Schools in south regions (i.e., Campania, Puglia, Calabria, and Sicily), which are considered to be more at risk of economic and social disadvantage, received extra founding to provide additional learning opportunities for students, training for teachers, and laboratory devices within school.

Our study is aimed to evaluate how schools used EU funding for improving students’ academic achievement. 109 secondary schools from south Italy were involved. Using a combination of qualitative and quantitative methods, we analyzed the quality and implementation of projects that each school presented to obtain funding. Results showed differences among schools. Schools that were less able to plan and implement improvement activities had students with lower scores at PISA tests than other schools. Therefore, more-at-risk schools were less effective in delivering improvement interventions. Our study underlined as school characteristics and processes (education planning, teacher cooperation, leadership) may play a role in explaining school effectiveness.

Transferring Successful Educational Actions to overcome educational inequalities in Europe and beyond.

Nataly BUSLÓN VALDEZ (University of Barcelona, Spain) | nataly.buslon@ub.edu
Tinka SCHUBERT (University of Barcelona, Spain) | tschubert@ub.edu

In this paper we present how sociological research contributes to improving education on a global level. Therefore, we analyse the possibilities of transforming educational inequalities by analysing the transferability of Successful Educational Actions (SEAs) from Europe to Latin
American countries and South Korea. This research departs from INCLUD-ED (FP6, European Commission) which has been the only SSH research project selected by the EC among the 10 success stories of the Framework Programme. This project identified SEAs, that is, actions in schools that demonstrated with evidence to improve children’s performance and outcomes in different contexts across Europe. SEAs reverse educational inequalities focusing on equal results rather than equal opportunities. In this paper we analyse the transferability of these actions, initially only implemented in Europe, to several countries in Latin America and recently to South Korea. The process of transferring SEAs to other contexts consist in the recreation of the SEAs with different educational actors in the different contexts, but the principles and the objective is always the same: improving pupil’s educational results and improving coexistence. In Latin America and South Korea, SEAs are promoted in collaboration with a wide variety of social and educational actors: local and regional administrations, public and private educational organizations, teachers, families, community members, and scholars from different universities who attempt to improve education. The co-authors of this paper are from Uruguay and Germany and the presentation will specifically address how different cultures, histories and educational systems have been taken into account to guarantee success.

RN10S20 - Reproduction of Inequalities in Education

Perpetuating inequality: How conceptions of who is the right fit for an institution shape widening participation practices.
Jon RAINFORD (Staffordshire University, United Kingdom) | r023799e@student.staffs.ac.uk

Current practices of widening participation (WP) in higher education in England are shaped by a single policy; the National Strategy for Access and Student Success (OFFA, 2014) but ways of enacting of this policy are diverse. As part of a broader project examining the enactment of WP across institutions, this paper examines a case study an one elite university. Utilizing a Bourdieusian framework and Reynolds and Saunders (1987) notion of a policy staircase, this paper argues that a socially just agenda designed to reduce inequality has been altered into one that actually reproduces inequalities. Through the individualised institutional processes of local policy making and implementation by teams of practitioners, there is a reframing of policy through a localized understanding of what WP means to these policy actors and their institutions.

This paper will argue that by creating limiting demographic and educational achievement criteria for selecting young people who have access to widening participation activities, inequalities are reinforced by privileging certain types of students. This demarcation of individuals from certain backgrounds as being deserving of intervention in order to meet their potential based on prior academic achievement ignores the wider structural issues that shape early achievement.

Whilst this initial paper focuses on a single case study, it will explore how a detailed examination of other institutions programmes is needed in order to identify practices in this area that are counterproductive to the overall social justice mission of widening participation work.

Inequalities in participation to lifelong training: A comparative analysis of ESS data from selected European countries
Marios VRYONIDES (European University Cyprus, Cyprus) | m.vryonides@euc.ac.cy
Dionysios GOUVIAS (University of the Aegean, Greece) | dgouvias@rhodes.aegean.gr
Education, lifelong training and updating of skills are major requirements for adapting to the requirements of post-modern societies. Indeed this has been at the core of EU policies for the past few years (EU, 2001) for a multiplicity of reasons; economic, political social, cultural, as a direct consequence of technological advances. However, in Europe there has been a discrepancy in education attainment (see, Vryonides & Lambrianou, 2012) and in adults’ participation in lifelong training, updating of skills etc. In some countries particularly in Northern Europe people manage to perform this much more successfully than in other countries (Eastern and Southern Europe) thus creating a “training gap”. This paper will investigate factors that affect participation to lifelong training and upgrading of work related skills at the background of the current economic crisis which is particularly acute in some Southern European countries where the economic recession has dramatically transformed the economic and social conditions. Amidst these conditions this paper examines factors affecting participation to education and lifelong training. At the same time by mapping these factors a better picture for policy makers is provided of the changes occurring, their social costs and their implications for individual’s attitudes to education, work – family balance etc. The data for the analysis will be obtained from the European Social Survey. The findings of this investigation will have policy implications especially for Southern European countries and relate to the lack of support mechanisms that allow for more young people and adults to gain educational credentials or have their skills upgraded in order to have more secure employment prospects and/or more potential in advancing their working careers.

Excellence. A Genealogy of a Rationality of Inequality
Tobias PETER (University of Freiburg, Germany) | tobias.peter@soziologie.uni-freiburg.de

In the last few years ‘excellence’ has grown into a universal, central concept for the education system. The deepening inequality within contemporary societies raises the question of whether excellence can be seen as a rationality of inequality. Which normative requirements build the foundation for the implementation of excellence? Which interrelationships emerge between the societal, particularly the economic, and the scientific discourses on excellence? What is the relationship to equality and inequality that is demonstrated here?

Following a Foucauldian genealogy, the current study turns to discourse analysis in order to reconstruct the career of this central term. This means considering the key texts from the German and international discourses since the 1950s, including scientific literature, strategic political texts, management literature and the self-descriptions of excellence institutions. By looking at the way the rationality of excellence spreads as well as at the values attached to it, this paper aims to explain how it gains effectiveness in the education system, how it delegitimizes existing egalitarian models of order and legitimizes inequalities.

The origins of excellence can be described in terms of a history of the present which aims for a permanent optimization of people, collectives and institutions. Strategies and programs of excellence in education politics and in educational institutions describe vertical differentiation in terms of both results and objectives. In this way what is being ignored by elite education’s meritocratic argument for permanent competition is the lack of equal points of departure for those within this competitive environment. Since everyone should be excellent but not everyone can be excellent, narratives on excellence do not dispense with the illusion of equal chances (Bourdieu) but rather renew them. By valorising top positions the focus on excellence simultaneously allows for an increase in societal inequality.

Inequalities in ECEC Use in Europe: Impact of Systemic Characteristics on the Use of Child Care by Disadvantaged Groups
Most European countries have started to prioritize and increase public spending on early childhood education and care (ECEC), in some cases targeted at low income, ethnic or sociolinguistic minority groups, to provide them a fair start in primary school. This paper investigates the effect of various equity measures European states have in place to compensate for disadvantages in the education system and ensure children's equitable access to ECEC services. The hypothesis we test is whether disadvantaged groups use institutional ECEC more in countries employing certain equity measures compared to countries that do not. We primarily focus on low-income families in the context of the ‘disadvantaged’; however we may expand our analysis also towards the migrant groups. The novelty of this research is in examining the impact of the wider welfare regime in which an ECEC system is embedded on accessibility and inclusiveness.

We opt for multilevel analysis method to analyse the two-levelled structure. The first is the family level including various demographic and socio-economic indicators as well as information on ECEC use. The second is the country level where systemic characteristics such as legal entitlement to ECEC, compulsory ECEC, childcare support, parental leave schemes, parental fees, financial state support for families, and public spending on childcare come into play. Demographic, socio-economic, and ECEC use-related variables are explored based on the latest individual-level data collected by the European Quality of Life Survey (EQLS) in 2011-2012. Macro-level indicators are taken mainly from the OECD Family Database and the latest Eurydice report on ECEC (2014).

Regional inequalities and educational opportunities in Russia: “offline” and “online” dimensions

Olga G. ECHEVSKAYA (Novosibirsk State University, Russian Federation; Institute of Economics and Industrial Engineering, SB RAS, Russian Federation) | echevskaya@gmail.com

Based on the materials of two research projects (conducted in 2011 and 2013) and using openly accessible data from the websites of Russian universities and platforms for online education as supporting materials, the paper discusses the dynamics of regional inequalities in educational opportunities in Russia over the last few years.

The analysis shows that, while the reform of higher education in Russia intends to balance regional inequalities (both via the network of Federal universities and through the smarter use of the technologies of distant and online education), so far we observe the growing gap between the “the best” and “the rest” (the “center” and the “regions”):
* cross-regional inequalities are not decreasing, and (for some regions) even growing;
* best (regional) school graduates move from their regions to capital cities right after high school;
* (non-leading) regional universities adjust to “weaker” student cohorts and enter the vicious circle of reducing requirements therefore losing positions therefore losing best graduates.

Overall, the logic of the academic mobility flows reproduces the “world-system” logic of inequalities, and results in the situation of “dual asymmetry” for regional universities.

Similar trends are registered in online education: on the one hand, it opens up unique opportunities for the students from remote regions to take the courses from best universities and to build individual educational trajectories (reducing the dependency on local resources and teachers); on the other hand, the uses of online education tend to reproduce rather than challenge the general logic of inequalities.
RN10S21 - Educational Attainment and Inequality

From attitudes to mathematical exclusion. Emergence of educational inequalities.
Anna BACZKO-DOMBI (Polish Academy of Sciencies, Poland; Institute of Sociology, University of Warsaw) | anna.baczko@gmail.com

Mathematics as no other school subject evokes conflicting emotions and contradictory attitudes – from “the Queen of the Sciences” to widespread acceptance for mathematical ignorance in the society. Relation to mathematics in society seems to be based on stereotypes, “mathematicians” are opposed to “humanists”. According to studies, attitudes of students, teachers and parents towards mathematics have an impact on students’ achievements (Aiken, 1970; Zan & Di Martino, 2007; Gunderson, 2012) and are inextricably linked, however that relation seems to be complex (Belbase, 2013). In case of mathematical education we can observe a process of abandoning mathematics by a part of students, what leads to serious decisions about profile of future education. This decision has numerous consequences, it may narrow down possible paths of future education and career, finally resulting in employment and income inequalities. This phenomenon can be named “mathematical exclusion”.

In the paper I intend to propose a description of the process of escaping from mathematics as a result of series of intertemporal decisions especially susceptible, according to the special status of mathematics, for submitting short-term temptations over a long-term goals. I will base on terminology developed in intertemporal choice perspective (e.g. Loewenstein at al., 2002; Read, 2004; Rachlin, 2011). I intend to show sources of abandonment of mathematics in specific attitudes and perception of usability of mathematical knowledge in short and long perspective. I will refer to selected results of two studies – exploratory qualitative study and quantitative study on a large sample of polish students, teachers and parents.

Educational attainment at 21: where are the differences coming from?
Lara Patrício TAVARES (Instituto Superior de Ciências Sociais e Políticas, Universidade de Lisboa, Portugal) | ltavares@iscsp.ulisboa.pt
Fernando Humberto SERRA (Instituto Superior de Ciências Sociais e Políticas, Universidade de Lisboa, Portugal) | fserra@iscsp.ulisboa.pt
Diana CARVALHO (Instituto Superior de Ciências Sociais e Políticas, Universidade de Lisboa, Portugal) | dianadiascarvalho@gmail.com

The way family background shapes children’s education and future qualifications and life chances has long been a central question for the social scientists concerned with the reproduction of social inequalities. In Portugal the educational system still reveals high levels of socially biased school failure and dropouts. Using data from the first three waves of the Epiteen cohort study (at 13, 17 and 21 years old) we analyze the educational achievement of Portuguese students (N=1205). This unique dataset on Portuguese youngsters from Oporto contains detailed information about the respondents’ life trajectories as well as information on their parents providing us an opportunity to study some of the factors that help explaining why some Portuguese succeed academically and others do not. We profile the individuals according to their educational attainment at 21, and whether they are still studying or not. We go beyond the traditional family background variables by also looking at parenting practices and youngsters’ own behaviours. Given that education is a cumulative process, we use measures for studying effort when youngsters were 13 and 17 years old and also information about school
success throughout the students' educational career. The preliminary results show important differences in socioeconomic background according to whether individuals pursued or not studies beyond secondary schooling. More interestingly, there are also significant differences among those who continued studying after compulsory schooling in terms of practicing sports, reading habits and obesity at 13 years old.

The significance of recognition practices on social inequalities in and through education
Eva-Maria KLINKISCH (University of Hohenheim, Germany) | eva-maria.klinkisch@uni-hohenheim.de

Regarding questions of equality and social inequality recognition theories highlight the meaning of formation and educational participation. Recognition theories, e.g., outlined by Axel Honneth, argue that one can only come to an unbroken self-relation if one receives the experience of being recognised threefold: in one’s individual need of personal integrity, in the need to be part of society as a legal entity and in the need to receive solidarity. Beyond that, recognition theories also delineate structural and functional pathologies and study society as a web of recognition structures. We suggest elaborating on social inequalities in and through education by analyzing social recognition related to education. Meanwhile, several studies stress recognition practices in education concerning individual development, identity and interpersonal interaction; others discuss normative ideals, e.g., democratic values and social justice in and through education. However, this contribution examines on structural and functional aspects of recognition concerning education and gives priority to institutionalised mechanisms of recognition. By granting or refusing certificates and degrees, for example, educational systems provide formal patterns of recognition, which do not only allocate social status but also influence mightily one’s access to further spheres of social recognition, especially regarding vocation and work. Which - formal, informal and hidden - patterns of recognition by means of education affect prospective participation in society? How do educational systems reproduce patterns of (mis-)recognition in society? How do altered structures of recognition, e.g., in work relations, react upon educational practices? And how do recognition practices in education particularly constitute powerful mechanisms of reification and heteronomy?

Schools, Difference and Discrimination: Students’ Voices
Rosanna Maria BARROS (University of Algarve, Portugal) | rb@sapo.pt
Maria José Manso CASA-NOVA (University of Minho, Portugal) | mjcasanova@ie.uminho.pt
Custódia ROCHA (University of Minho, Portugal) | mcrocha@ie.uminho.pt
Daniela SILVA (University of

This paper is a continuation of the paper presented at the mid-term Conference on Sociology of Education, held in Lisbon in September 2014, and it is the result of a research project developed since September 2013 called "Democracy, Difference and Social and Educational Inequalities: Effects of Hierarchical Perception of Difference". The main aim of this project was to study the processes and effects of inequalities that derive from the hierarchical perception of difference (and inherent discrimination) in relation to school performance (including differences deriving from class, ethno-cultural factors, phenotype, gender, sexual identity, motor and/or cognitive disabilities, psychological characteristics, regional belonging, etc.). One of the main issues of the project was to ascertain and understand how different school actors positioned themselves with regard to the hierarchy of differences and the complexity of its effects. The first phase of the project consisted of the development, implementation and statistical analysis of questionnaire surveys applied to 750 students attending basic and grammar school
Education in four schools located in the north and south of Portugal. From this analysis we highlight the fact that 36 students mention being victims of multiple discrimination (which refers to more than one cause of discrimination). Of these 36, 22 present 4 or more causes of discrimination, mainly related with physical appearance and psychological characteristics. Based on this data, in the second (qualitative) phase of the project 20 students subject to multiple discrimination from colleagues were selected and interviewed, with a view to understanding the effects (related to school performance and the self-image of the students) of the multiple discrimination to which they are subject. This paper highlights the students’ perception with regard to the causes of the multiple discrimination they suffer and their effects on behaviour and school performance.

Decreasing inequalities or enhancing differences?
Barbara WOREK (Jagiellonian University, Poland) | b.worek@uj.edu.pl
Marcin KOCÔR (Jagiellonian University, Poland) | marcin.kocor@uj.edu.pl

The lifelong learning idea is being adopted by educational systems across all Europe, where formal education is not the only accepted form of learning. Recently, a lot of initiatives have been undertaken to enhance the meaning of informal and non-formal education. The idea of lifelong learning originates from Faure’s report (1972) and nowadays, it is not only sought as a remedy for many labor market problems but also as a way to improve individuals’ quality of life and to assure social cohesion by training those who haven’t had such opportunity through the formal education system. Additionally, dissociation from formal learning is a process of egalitarization and giving equal opportunities. However, important question is how this idea is implemented in practice. In our presentation we will show how lifelong learning is being realized in Poland based on data from a project entitled Study of Human Capital in Poland that was conducted from 2010 to 2014. Our results address the question of whether informal and non-formal education decrease skill gaps between well-educated and those who have only basic education, or does it lead to the opposite outcome where the process increases differences between these two categories. The research also presents evidences that contributes to the discussion on whether opening educational systems for different methods of learning reduce inequalities, or they enhance such inequalities based on Mathew effect (Merton): the rich (well-educated) get richer (more skilled) and the poor get poorer.
RN11S01 - Emotions and Family Life

**Between Attachment and Dependence: Young Adults' Emotional Bond with Their Parents**

Ariane BERTOOGG (University of Zurich, Switzerland) | bertogg@soziologie.uzh.ch
Marc SZYDLIK (University of Zurich, Switzerland) | szydlik@soziologie.uzh.ch

While the relationships between adult generations of a family have been researched intensively regarding the exchange of money, care and help and have focused on support networks of an aging cohort, investigations of the emotional bond between adult children and their parents still remain sparse. This is especially true for the perspective of the offspring generation and young adulthood.

Young adulthood is a time of multiple transitions in all domains of life: entering the labour market and gaining financial independence, moving out of the parental home, establishing a partner relationship and eventually becoming a parent. In the wake of the economic and social changes of the past decades, such transitions can also pose challenges for young adults' families of origin. Economic insecurities have affected labour market entrants particularly strongly, and have led to a prolonged dependency on the parental generation. Furthermore, the pluralisation of ways of life, including new forms of partnership and family, require more efforts to maintain relations.

Based on a model of opportunity, need, family and cultural-contextual structures, we investigate the emotional ties between young adults and their parents. What are the dynamics in regard to gender, education and migration? Are there long-term influences of critical life events? Our multivariate analyses employ the Swiss panel TREE (Transitions from Education to Employment). The results show a remarkable degree of intergenerational cohesion. Nevertheless, straining effects of financial dependence can be found, and the long-term influences of critical life events, such as early unemployment or parental separations, point to a sustainable impact of strains at a dynamic age.

**Searching for the narrative of loss. Social dimension of grief accompanying the experience of miscarriage**

Maja SAWICKA (University of Warsaw, Poland) | maja.sawicka@gmail.com

Grief accompanying pregnancy loss is a particular emotional state. As miscarriage is culturally perceived as an event on the verge of “real” death, emotions following the loss of a yet-unborn child become private experience vaguely regulated by culture. Tension connected with the "cultural void" surrounding this experience is reflected in the narratives of pregnancy loss published by “might-have-been” parents on on-line discussion lists, complemented with commentaries by other users in a similar situation.

In my presentation I would like to propose that communication within on-line “communities of feeling”, which form around these narratives, could be seen as social context shaping the inner experience of grief arising from miscarriage. Basing on the results of a qualitative study - content analysis of chosen Polish discussion lists dedicated to this subject - I would like to reconstruct essential aspects of the "cultural void" surrounding the experience of miscarriage and subsequent social formation of this experience within the on-line communities. The essential themes of the communication process which will be discussed in the presentation.
include: (i) attempts to communicate emotional states and find legitimization for otherwise
disenfranchised grief, (ii) the ongoing construction of norms and normative expectations about
grief arising from miscarriage, (iii) accumulation of beliefs about such grief, (iv) discursive
formation of social role and identity of "might-have-been" parents, (v) linguistic means of
emotional disclosure.

The analysis constitutes part of empirical research conducted owing to financial support
awarded by the Institute of Sociology of the University of Warsaw (signature of the project:
DSM-107700/16).

Gender Equality and Emotional Participation in Couple Relationships
Fiona MCQUEEN (University of Edinburgh, United Kingdom) | fiona.mcqueen@ed.ac.uk

Work on the ‘stalled revolution’ in gender equality (Hochschild, 1989) focuses on the division of
labour within couple relationships, a highly researched area; however the ‘transformation of
intimacy’ (Giddens, 1992, 1994) also refers to an agenda of emotional fulfilment. This ESRC
funded doctoral research, employing a mixed methods design including in depth interviews,
focusses on how individuals understand their couple relationships, focusing on ideas around
‘emotional participation’ (Duncombe and Marsden, 1993). This paper argues that the ‘revolution’
referred to by Hochschild in gender equality is in fact no longer stalled, as men are trying to
engage emotionally in their couple relationships. Indicating that an understanding of how
emotional participation and equality interact is essential in order to understand how couples
continue to have a ‘sense of intimacy despite inequality continuing’ (Jamieson, 1998). This
paper focuses on understandings of emotional participation in couple relationships as well as
the nature of ‘feeling equal’, which, while both reported to be of paramount importance, are
conceptualised in plural ways.

New Momism: Motherhood Reconstructed Through Emotions and Feelings
Sibel EZGIN AĞILLI (Mugla Sıtık Kocman University, Turkey) | sblzgn1@gmail.com
Muammer TUNA (Mugla Sıtık Kocman University, Turkey) | muammert@hotmail.com

Motherhood identity is at the intersection point of both individual and social, and also it includes
individual experiences as well as social factors. Therefore, motherhood has an important place
in the social structure analysis. In one hand maternity as experience refers relationship of
mother with their child. On the other hand the institution of motherhood leads motherhood for
women to be an oppressive practice and it place women in inequal position with arguments
such as; child care is mission of mother and women born to be mother. In today’s capitalist
societies, motherhood as an institution is formed in oppression of ‘ideal maternity’ and ideology
of ‘new momism’ with emotional mechanisms such as stress, fear, anxiety, inadequacy, guilt.
However, the capitalist system make women to consume psychoanalysis and psychological-
oriented advisory books, media, baby care books, mother-baby or women’s magazines by that
aforesaid feelings and emotions of women have influenced and it is caused motherhood to
become a profession. In this sense, the ‘new momism’ engages with both language of
psychology and rules of emotions and feelings and thus it is socially reconstructed. Therefore,
this study examines theoretically how these new forms of motherhood emerge, its
transformation with the capitalist system and emotional meaning and feeling rules which
underlies of its.

RN11S02 - Emotions in Law and State Institutions
Professional emotion management in court: learning and habituation
Stina BERGMAN BLIX (Stockholm University, Sweden) | stina.bergmanblix@sociology.su.se
Åsa WETTERGREN (University of Gothenburg, Sweden) | asa.wettergren@gu.se

It is a widespread contention in the judiciary that emotions have no place in court procedures. In several respects the court is set up to tame emotions of lay people while the professionals acquire non-emotional/neutral expressions through years of training. Building on research that proves the prerequisite of emotional orientation in order to perform rationality, we analyse what happens to emotions when they are silenced in the judicial setting. We examine the professional emotional expressions that do appear in spite of the non-emotional standard, and how they appear. We also investigate the process of learning and habituating these often low key expressions. Focus is on the emotional exchange between the legal actors, building on field notes from court cases and interviews with professional legal actors at different stages in their career.

A process of professionalization of both emotional expressions and experiences can be traced. Professional expression of emotion develops from the novices’ self-conscious inexpressiveness, to the experienced legal actors’ habituated subtle and selective expressiveness. The relation between emotional expressions and experiences shows an interesting incongruence. Expressions related to the adversarial procedure, notably marked by aggressiveness between the parties, are toned down in reported experience. In contrast, subtle expressions of irritation in relation to the handling of the procedure, such as the judge ceasing to take notes during examinations, are toned up, and experienced as highly emotional. This incongruence between professional emotional experience and expression allows for the procedure to appear non-emotional.

Symbolic Violence and Affective Labor. A Case Study on Public Employment Services in Austria, Germany and Switzerland
Otto PENZ (University of Vienna, Austria) | otto.penz@univie.ac.at
Barbara GLINSNER (Vienna University of Economics and Business, Austria) | barbara.glinsner@wu.ac.at
Birgit SAUER (University of Vienna, Austria) | birgit.sauer@univie.ac.at
Myriam GAITSCH (University of Vienna, Austria) | myriam.gaitsch@univie.ac.at
Johanna HOFBAUER (Vienna University of Economics and Business, Austria) | johanna.hofbauer@wu.ac.at

Our paper examines the transformation of former state bureaucracies into modern, customer-oriented service providers within activating welfare regimes in Austria, Germany and Switzerland. In this process the ability to morally support and to motivate job seekers, to feel empathy but also to be demanding becomes a central work requirement for public employment agents, so that we can conceive affective labor as the centerpiece of interactive service work. However, as street-level bureaucrats who have to implement and enforce workfare policies public employment agents are also organs of state power, and they constitute state power in their interactions with job seekers. During the consultations codes of conduct and feeling rules govern the practices of employment agents while they subject job seekers through their affective labor. The strong focus on customer orientation and affective relations tends to veil the asymmetric power relations between state actors and citizens. We are concerned exactly with those “soft” forms of power – power disguised as affective relation, termed “symbolic violence” by Pierre Bourdieu – that characterize the interactions between public employment agents and their customers and intend to analyze such new forms of governance.
Methodologically, we investigate the constitution of affective labor in the interactions between employment agents and their customers by carrying out qualitative video-based research of the consultations and by ethnographic observation. From a theoretical point of view, we intend to discuss the questions of power and affects from a praxeological but also Foucauldian perspective, where the subjectivity of the "whole person" providing a service is at stake in an interplay of governance by others (the state or employment agency) and self governance. By applying the concept of affective labor we want to include Arlie Hochschild’s concept of emotional labor and emotion work but also go beyond her important findings by focusing on the interplay of mental and bodily, rational and affective processes in interactions.

Defending the indefensible: managing emotions in the courtroom
Lisa FLOWER (Lunds University, Sweden) | lisa.flower@soc.lu.se

Defence lawyers must at times represent clients who are accused of terrible crimes, crimes that many would consider indefensible and morally reprehensible. This leads to the question, how do defence lawyers manage their emotions in order to “show fidelity and loyalty towards the client” as stated in the Code of Professional Conduct for Members of the Swedish Bar Association? The courtroom can be an unpredictable arena where face-threats must be handled and emotions must be managed. This study is thus interested in how defence lawyers employ impression management in order to present the appearance of loyalty in the Swedish courtroom. Courtroom observations have been conducted along with interviews with defence lawyers. The study concludes that defence lawyers employ subtle face-saving practices in order to uphold and maintain the appearance of the good lawyer.

Do emotions matter in law enforcement? A social-emotional analysis of the citizenship case law of the Spanish Supreme Court
Alberto MARTÍN PÉREZ (Universitat de Barcelona, Spain) | amartinperez@ub.edu

The Spanish Supreme Court has produced over the last decade highly relevant case law on citizenship acquisition by foreign residents, following fast-increasing naturalisation demands. Increasing litigation regarding nationality denial has been observed, particularly related to the evaluation by the authorities of the concept of ‘integration’ into Spanish society. The quality of this ‘integration’ is assessed through an interview carried out by local judges, and through a set of reports by different authorities ranging from the local social services to the intelligence services of the State, in which applicants must prove their qualifications (their ‘good behaviour’) as ‘integrated’ citizens. In some cases, this results in loose interpretations of legal concepts such as ‘sufficient integration’ and ‘good civic conduct’ (or their absence), which certainly go beyond the literal wording of the laws.

The aim of this paper is to analyse the role emotions play within these interpretations of the law that provides on the acceptance or refusal of foreigners into or out of the national community. The paper particularly deals with the comprehensive meaning that the Supreme Court attributes to the idea of integration and its possible connection with the emotional aspects contained in the declarations of ‘belonging’ made by foreign applicants within their pleas. Through a textual analysis of 100 sentences enacted between 2011 and 2014, the paper will argue in favour of a meaningful role of emotions in law enforcement, and particularly when ‘belonging’ and national identities are at stake.
RN11S03 - Emotions and the Internet

The Virtual Wake of a stranger as a vector for the online discussion of death and dying
Andréia DE SOUSA MARTINS (University of Bath, United Kingdom) | adsm20@bath.ac.uk

This paper aims to show the main interactions between users of an online social network group in Brazil that often use the viewing of Virtual Wakes of strangers to discuss death and dying. The group, called “Dead people profiles” is a space dedicated to listing the profiles and causes of death of social network users and today has more than thirteen thousand members. Their points of view on Virtual Wakes and general interactions were analyzed during participant observation and private online interviews in 2013 as part of a netnographic work for a Master's degree in Anthropology, introducing this less explored feature of virtuality as a possibility to deal with death and dying.

Internet Dating, Heterosexual Pleasure and excitement
Mary HOLMES (University of Edinburgh, United Kingdom) | mary.holmes@ed.ac.uk

Internet dating as a way of meeting people and potential sexual or long-term partners is a relatively new phenomenon, with ‘the net’ becoming established in the 1990s and commercial dating sites soon following. These varied sites make use of new technology but follow similar principles to previous newspaper ‘personal ads’ and other existing forms of matchmaking. This paper charts some of that history, placing internet dating within the context of social changes around relationships, gender and sexuality, and technological changes in forms of communication. This work is a collaboration with Chris Beasley, in which we argue that there are a variety of reasons for the rise of internet dating, but that these should be understood using the strong theoretical position that the authors have developed challenging conventional approaches to heterosexuality that present it as nasty, boring and normative. This approach acknowledges the darker aspects of heterosexual intimacy, but does not regard queer or other alternative forms of sexuality as the only ones that can offer pleasure. This means charting to what extent internet dating might be part of a shift towards ‘pure’ relationships as Giddens has proposed, or of a commercialisation of intimacy emphasised by Hochschild, whether internet dating is about consuming relationships as Bauman might see it, or whether it can sometimes be a search for more mutual, egalitarian, exciting and pleasurable connections. This largely theoretical account will be illustrated by reference to some of the early findings of our empirical project on internet dating.

Metaphorical highlighting and hiding of emotions in online racist discourse
Karl MALMQVIST (University of Gothenburg, Sweden) | karl.malmqvist@socav.gu.se

The present paper aims to examine the role of online discursive interactions in processes leading to extreme racist violence, focusing specifically on the articulation and repression of emotions taking place in online arenas of racist discourse. The empirical material is collected from the Swedish discussion website Flashback and consists of racist exchanges taking place there prior to, and in conjunction with, actual incidents of violence against Roma EU-migrants that took place in Sweden during 2014. The paper builds on emotion-sociological theory and research on extreme violence that emphasize the role of repression and transmutation of some emotions (e.g. shame, empathy) and the articulation and cultivation of others (e.g. anger, in-group joy, pride) in processes leading to such violence. Furthermore, these perspectives are
combined with a notion of the repression of emotions as a discursive activity. Methodologically, emotional articulations in the discussion threads are examined using conceptual metaphor theory, and the analysis focuses on how metaphorical articulations highlight some emotions and aspects of them while at the same time hiding others. Preliminary results suggest that metaphorical articulations of emotions in online racist discourse are not only expressive of the emotional dynamics leading to racist violence, but also involved in producing these emotional dynamics. Thus, online discussion forums may be arenas where negative emotions are not only channeled onto “enemy” targets, but also repressed, transmuted, rearticulated, and therefore, in a sense, themselves constructed there.

Faraway, so close. Using social media in military missions to relate with families and beloved
Elisabetta CIONI (Università di Sassari, Italy) | cioni@uniss.it
Alessandro LOVARI (Università di Sassari, Italy) | alovari@uniss.it

This paper aims at discussing the main theoretical turns in sociology of emotions on the basis of an in-depth sociological study of a particular topic of social life: the communicative practices between soldiers involved in military missions abroad and their families and close networks, using social media and instant messaging applications. The topic is particularly interesting since it allows to focus on the management of emotions by people who work in a complex and hierarchical organization, such as the army, that traditionally proposes models of highly controlled identities, feelings, and emotions, even when soldiers relate with their close private networks in the typically liminal and stress conditions of military missions. The study involved a sample of Italian soldiers belonged to the Brigata Sassari, a special branch of the Italian Army located in Sassari, who participated to a peace mission in Afghanistan in 2014, using in-depth interviews, and the analysis of the digital conversations they exchanged with their families and beloved. Social media represent today an ordinary way to interact with families and friends, and they also propose new methodological challenges for sociological research aiming at studying the frequency and the content of communicative interactions within a network. Private emotions (i.e., love, affection, jealousy) emerge particularly in these conversations, highlighting traits of detraditionalization and informalization in the control of emotions. In the conclusions, we discuss in particular the implications on organizational behaviors and in general the changes in the boundary line between private and public spheres.

RN11S04 - Emotions and Intimate/Personal Life

“I don’t belong out there anymore”. Sense of belonging among people with medically unexplained long-term fatigue
Olaug S. LIAN (University of Tromsø, Norway) | olaug.lian@uit.no

‘Sense of belonging’ designates an emotional attachment to our social and material environment that involves a feeling of being part of something greater than us, and feelings of being included, united, recognized, accepted and understood. A sense of not belonging implies feeling alienated; as “matter out of place”. Although these emotions are individually felt, they are inherently relational and cultural as they are generated through interactions between human beings. People’s sense of belonging is a key link between a society and its individuals. Studying people’s sense of belonging therefore implies studying the relationship between self and social
structure more generally. Starting from these assumptions, we explore the sense of belonging/non-belonging expressed by people suffering from a medically unexplained debilitating long-term fatigue that is unaccounted for with observable biomarkers to verify organic disease. Because of the medically contested nature of their ailment, the social stigma it entails, the lack of medical treatment, and the severity of their symptoms, these people find themselves in an uncertain situation in a liminal borderland. Based on a narrative analysis of their experiences, we reflect on ‘sense of belonging/non-belonging’ as an inherently social phenomenon, including its nature, its foundation, its conditions and its functions. Our data illuminates these questions because belonging/non-belonging is tacitly experienced, and often taken for granted, and therefore most easily grasped and articulated when our feeling of belonging becomes disturbed, tested or lost. The study is framed within a sociological perspective sensitive to the issue of place.

Social enforcements in emotion activation” – everyday episodes characterized by impaired mentalizing in eating disorders
Hilde Berit MOEN (University of Nordland, Norway) | hbm@uin.no

This paper explores episodes characterized by impaired mentalizing in eating disorders. The mentalizing perspective understands eating disordered symptoms as regulation of painful emotions, indicating impairments in ability to attend to mental states in one self and others. However, the interpersonal and emotional processes associated with impaired mentalizing are insufficiently attended to in research. Based on interviews with eating disordered patients, this paper portrays everyday episodes characterized by impaired mentalization. Findings indicate problems with affect regulation and activation of eating disorder symptoms. In these episodes, a wide array of affects are activated, the two most prominent to be a) anger and b) feeling insufficient in different ways. The episodes described are mainly social, often with (significant) others present, physically or in mind. In conclusion, the specific social aspects of the process mediating the experience of being emotionally overwhelmed (impaired mentalizing) are highlighted, and implications for handling the identified aspects of this process, is discussed.

Adult children of alcoholics, sympathy and emotional reflexivity
Charlotte BLOCH (University of Copenhagen, Denmark) | cb@soc.ku.dk
Margeretha JÄRVINEN (University of Copenhagen, Denmark) | mj@soc.ku.dk

Alcohol misuse does not only affect the self and the relationships of the misuser. It also affects the family, the spouse and the children of the misuser.

The purpose of the paper is to present the results of an analysis of interviews with 30 adult children of alcoholics.

In analyzing the interviews, we use two classical theoretical approaches, one inspired by Clark’s theory of sympathy, the other by Denzin’s reasoning on different layers of emotionality.

In regard to Clark’s theory of rules of sympathy, we sort the rules into three analytical categories: A description of rules regarding how much and for how long a period persons in trouble may claim sympathy; social and cultural moral systems embedded in the sympathy etiquette and an analysis of the sympathy etiquette from the perspective of reciprocity.

To analyze the sympathy – or lack of sympathy – of adult children for their parents is a complicated undertaking. The interviewees’ accounts are a mixture of emotions experienced in the past and emotions experienced in the present. Denzin (1985) describes emotionality as having a three-fold structure: a sense of feeling, a sense of self-feeling the feeling, and a revealing of the interactional meaning of the feeling to the self. We will use Denzin’s ideas about different layers of emotionality in our analysis of the interviewees’ sympathetic or unsympathetic
feelings for their parents and, as the analysis progresses, combine them with more recent theoretical reasonings on emotional reflexivity.

Thinking Friendship on Virtual World
Maria Cristina BARRETO (Universidade do Estado do Rio Grande do Norte, Brazil) | mcrbarreto@gmail.com

The virtualization of relationships makes us rethink spatial and temporal coordinates as something that must be constantly questioned. Several people have friends who have never seen in person but that cultivate this relationship for a long time, communicating through Internet. Declare themselves as friends by empathy, by giving shoulder to each other and by the constant presence despite the physical absence. Then, friendly relationships do not depend on physical presence, since they consist in the consideration and affection of an individual by another, and lasting emotional connection. This paper aims to discuss some changes undertaken on relations of friendship between some Brazilian youths, aged between 15 and 17 years, since the spread use of the Internet and mobile devices as a means of approach and exchange of experiences.

RN11S05 - Specific Emotions

Understanding happiness: a mixed-methods approach
Laura HYMAN (University of Portsmouth, United Kingdom) | Laura.Hyman@port.ac.uk

Happiness is increasingly being recognised as something of concern amongst academics and policymakers across Europe. Many national governments are collecting statistical data on how citizens feel about their lives on an annual basis, and academics across the social sciences and humanities are taking a growing interest in what is needed for people to feel happy. Indeed, much of this work is undertaken within the subdiscipline of ‘social indicators’ research, which emphasises the importance of happiness measures as more ‘subjective’ alternatives to traditional economic or ‘objective’ indicators of societal progress, such as GDP-growth and per-capita income. Despite this proliferation of research in this area, there remains a notable absence of understandings of how happiness is experienced and perceived by people at the level of the everyday. This paper demonstrates the ways in which sociology can offer a contribution to such an understanding. It presents some preliminary findings from a mixed-methods study that combines analyses of statistical data collected by the UK government with analysis of data from qualitative interviews carried out with a smaller sample of adults in different regions of the UK. Taking into account the levels of happiness reported in different areas, the paper explores how people in respective regions experience it, and considers the role played by geography and social space in these experiences. It then concludes with a broader reflection on the ways in which happiness is socially shaped and situated, and embedded in culturally-rooted understandings.

Nostalgia – theoretical concepts and empirical evidence
Katharina SCHERKE (University of Graz, Austria) | katharina.scherke@uni-graz.at

Different disciplines got interested in nostalgia in recent years: besides social psychology and consumer research also literary and media studies as well as the growing field of memory studies can be mentioned in this regard. But, the way in which nostalgia is conceived
theoretically and empirically differs still significantly between these various fields of studies. Sometimes nostalgia is mainly seen as a conscious state of mind or an (political) attitude, whereas in other conceptions nostalgia is seen much more as an emotion which has strong consequences for personal wellbeing and strengthening social ties. Eric Hobsbawm has shown that “there is a twilight zone between history and memory; between the past as part of generalized record which is open to relatively dispassionate inspection and the past as a remembered part of, or background to, one’s own life” (Hobsbawm, The Age of Empire). Nostalgia is part of this twilight zone; it has individual functions but there are also mediated collective aspects in it. This paper is going to show what part sociology of emotions has to play in research on nostalgia and how it can approach nostalgia empirically by analyzing different kinds of material (e.g. interviews, literature, films, material objects).

‘Not Smiling but Frowning’: Sociology and the ‘Problem of Happiness’
Mark CIESLIK (Northumbria University UK, United Kingdom) | mark.cieslik@northumbria.ac.uk

Much of mainstream sociology has curiously neglected happiness studies despite growing interest in wellbeing in recent years. Sociologists often view happiness as a problematic, subjective phenomenon, linked to problems of modernity such as consumerism, alienation and anomie. This construction of ‘happiness as a problem’ has a long history from Marx and Durkheim to contemporary writers such as Ahmed and Furedi. Using qualitative interview data I illustrate how lay accounts of happiness suggest it is experienced in far more ‘social’ ways than these traditional subjective constructions involving forms of compassion and altruism. Notions of happiness can also be the site of struggle and conflict in people’s lives and illustrate how some people can use happiness in creative ways in pursuit of their interests. We should therefore be wary of using crude representations of happiness as vehicles for our traditional pessimistic depictions of modernity. Such ‘thin’ accounts of happiness have inhibited a serious sociological engagement with the things that really matter to ordinary people such as our efforts to balance suffering and flourishing in our daily lives.

Cross-Cultural Differences in Social Comparison: Benign and Malicious Envy in a Bargaining Game
Christian VON SCHEVE (Freie Universität Berlin, Germany) | scheve@zedat.fu-berlin.de
Becker KERSTIN (Freie Universität Berlin, Germany) | kerstin.becker@fu-berlin.de

Cultural differences in social comparison are well-established in the scholarly literature. However, no research has yet addressed the question of whether and how cultural differences in social comparison translate into corresponding behavioral differences. We investigate this question by looking at two kinds of envious behavior that are frequently observed in reaction to unfavorable comparisons and are highly susceptible to cultural norms: benign and malicious behavior. Participants from two collectivist (Indonesia and Japan) and one individualist (Germany) societies played a bargaining game in which decisions correspond to either benign or malicious envy. We used a triangulation design to overcome known limitations in dichotomous collectivism/individualism comparisons. Results show notable cross-cultural variation in malicious, but not in benign behavior. Further, our results suggest a positive association between self-esteem and malicious behavior regardless of cultural background.
Emotional responsivity and educational status
Georgios PAPASTEFANOU (GESIS Leibniz-Institut for the Social Sciences, Germany) | georgios.papastefanou@gesis.org
Jonathan GRUHLER (GESIS Leibniz-Institut for the Social Sciences, Germany) | jonathan.gruhler@gesis.org

The are still only a few of empirical studies, which examine the relevance of emotions in social structural contexts. While the meaning of social structure is widely agreed upon as resources, which influence cognitive, affective and conative aspects of life styles (framed by Bourdieu's habitus concept), it seems a challenge to refer adequately to the present state of neuropsychological emotion research for examining its social variation. While emotion research has found an automatic, non-deliberate appraisal of concrete stimuli/events which translates into a bunch of changes in physiological, somato-skeletal, motivational and maybe subjective feeling states, nearly all studies rely on subjective self-reports and are vaguely referred to some past time interval. So, studies about the effects of educational status as one main dimension of societally organized and effective human resources provide inconsistent results on its effect on emotion: While some studies found level of educational status has negative effect on anger, others find a positive correlation. The same is true for social status effects on self-reports on fear experienced. Actually, these results are ambivalent, as by using this kind of self-report data it cannot be disentangled if social status affects emotion display rules or/and actual emotional responses. To get deeper in to the social mechanisms of emotion responding, we used data from a research study, were several print advertisements with different aesthetic design, were presented to 106 individuals by an automated and randomized procedure. The participants wore a sensor wrist band, while the stimuli were presented as well as while the participants reported explicit affective evaluations of the stimuli. By the wrist band skin temperature and skin conductivity scores were transduced and store locally with 10 Hz capture rate. After purging the physiological data from hardware and artefact biases (which could detected by additionally measuring movement, skin contact quality and ambient temperature), these data were classified by algorithm, which allows to separate arousal response due to positive stimuli versus arousal responses due to negative stimuli. So educational status effects, as well gender and age effect, on unobtrusively measured, involuntary responses to specific visually communicative stimuli can be examined. As the physiological, emotion response indicating data were measured continuously all over the process of information processing, not only the prevalence of emotional responding, but also the responsivity, the disposition or proneness to respond emotionally are examined for hierarchical education status groups, in combination with age and gender.

Electoral disengagement and feelings of political dissatisfaction over time (1983-2010)
Nathan MANNING (University of York, United Kingdom) | nathan.manning@york.ac.uk

Overall patterns of recent electoral disengagement and dissatisfaction in Britain have been mapped by survey research. However, these studies tell us little about why citizens have chosen to disengage from electoral politics, the nature of their dissatisfaction or, conversely, what they get out of participation and how this may be changing. These questions demand in-depth research on citizens’ (dis)engagement with electoral politics and how this changes over time. Drawing upon the Mass Observation Archive, this paper explores data which covers the seven UK elections between 1983 and 2010 to provide a rare longitudinal, qualitative
investigation of political (dis)engagement. The analysis reveals that a full understanding of electoral disengagement requires a close examination of the feelings and emotions associated with electoral politics, which have largely been overlooked.

Social context and functionality of shame: critical content analysis.
Katarzyna CHAJBOS (Adam Mickiewicz University in Poznań, Poland, Poland) | katarzyna.chajbos@yahoo.com

The main purpose of my presentation is to demonstrate results of the second stage of the research carried out in the framework of my PHD thesis entitled "Shame in the life of Poles. Sociological analysis of the role of shame as a tool of social control ", as well as critically analyse the research tool I used. The described research phase is based on the analysis of media discourse in shame-themed articles from three different sources of newspapers published on the Internet.
As part of a critical analysis of the used methodology I would like to discuss functionality of the research tool created on the basis of content analysis model by G. Gerbner (extended by later modifications by R. Holsti and based on the understanding of the function of shame following Kemper and Scheff and definition of values by Scheler) which includes content analysis at both quantitative and qualitative levels (thanks to differential coding system).
During the presentation of the main results of the study, I would like to emphasize the relations between the observed actors of shame, indicate the nature of the conflict between them and their value systems as well as address the role of the category of shame in the analysed articles. In respect of the above categories, I will also cite the most important results of the quantitative analysis carried out using the same tool.

Emotional Memories in Autobiographical Narrations
Natàlia CANTÓ MILÀ (Open University of Catalonia, Spain) | ncantom@uoc.edu
Swen SEEBACH (University Abat Oliba CEU, Spain) | swen.seebach@gmail.com

Autobiographical narrations offer us an interpretation of the way in which a person understands what has happened in his or her life. However, the facts, anecdotes, crisis and joyful moments are structured and coloured by the emotions which are remembered to have been felt at those moments that are depicted, and moreover by the way in which the person that depicts them feels about all those moments in the present. This paper analyses 20 autobiographical interviews focusing upon the emotions that are depicted and expressed within the narration, seeking to understand how emotional memories mould our autobiographical narrations, the way in which we depict what has been important for us, but also what we select as important, and how we relate to it. We will furthermore explore to what an extent these emotional memories relate one’s autobiography to the wider social context in which this biography has taken and is taking place.

RN11S07 - Emotions and Civic Action

Our houses are collapsing! Framing fear of and anger on the ‘gas-quakes’ in Groningen, the Netherlands
Imrat VERHOEVEN (University of Amsterdam, Netherlands, The) | i.verhoeven@uva.nl
Tamara METZE (University of Tilburg, Netherlands, The) | t.metze@uvt.nl
In the Netherlands, natural gas exploration has been fairly uncontested since the 1990s. This changed dramatically due to an increase in induced earthquakes in the North East of the country. An energy controversy developed among citizens, experts, governmental actors, gas companies and action groups.

In this paper we conduct a dynamic frame analysis of an energy controversy. We study how opponents and proponents frame emotional appeals to fear and anger in relation to risk and procedural arguments. These contesting and changing interpretations provide us with more insights into how the framing of arguments and emotional appeals shapes conflicts and their underlying power struggles.

The research question is: what is the influence of framing emotional appeals to fear and anger in combination with risk- and procedural arguments (by all sorts of actors) on the political repertoire deployed by (local) action groups? Based on preliminary results, we expect the framing of appeals to fear and risk arguments to coincide with a moderate political repertoire, whereas the framing of appeals to anger and procedural arguments may coincide with a more radical political repertoire.

Mobilizing fear and hope, mitigating guilt – Environmental movement strategic emotion management in response to climate change

Åsa WETTERGREN (Göteborgs Universitet, Sweden) | asa.wettergren@gu.se
Jochen KLERES (Göteborgs Universitet, Sweden) | jochen.kleres@gu.se

To what extent is the management of fear a driving force in the consciousness raising and mobilization against climate change? What is the role and nature of hope in this context? And to what extend does this involve the mitigation of guilt? Climate change has prompted the partial institutionalization of the environmental movement at global and national levels during the past two decades. In some cases whole nations, like Denmark, adopt a consensus-based reformative "green growth" concept maintaining the possibility to mitigate, adapt to, and possibly halt climate change within the framework of the neoliberal agenda. Other countries, like Sweden, have seen the emergence of new radical environmental activism demanding profound socioeconomic changes. Based on interviews and website material from environmental movement groups and NGO’s in Denmark and Sweden, as well as on participant observations and interviews at COP 19, COP 20, and COY 10 we analyse the role and function of fear, guilt and hope in movement mobilization and action. Fear signals danger to the subject’s physical or social status. Fear may be both paralyzing and action-instigating. Guilt has equally ambivalent consequences. It may either inspire efforts to compensate for one’s harmful action or lead to a defensive or ashamed retreat. Hope signals the expectation or presumption that one’s status will improve in the future. Hope appears to be the decisive element that determines the power of fear and guilt. It may keep fear and guilt at a distance to the extent that the self-preserving function of fear and guilt dissipates. In the environmental movement, activists work on balancing fear, guilt and hope both inwards, to make action meaningful, and outwards, to mobilize and raise public and political consciousness. Fear, guilt and hope seem to be differently blended in these different orientations. Sometimes the balancing of fear, guilt and hope contradicts instrumental reason and we can speak of an ironic disposition, that, it has been argued, is a necessary philosophical foundation for environmental activism.

The Nature of Mass Behavior: from “irrationality” to “rationality with emotions”

Stanislav MOISEEV (Higher School of Economics, Russian Federation) | spmoiseev@gmail.com

According to the classical interpretation of mass behavior, this phenomenon was usually described as "irrational". This point of view was strongly criticized in 1950s, when ideas of
Purposeful mass behavior and consciousness of its participants became rather widespread. Recent studies of mass behavior incorporate this rational model but also include the idea of "emotionality" of mass behavior. Following this idea, scholars are trying to explain how pride, shame, fear, sadness and other emotions can serve the purpose and means of mass protests and social movements.

Drawing upon this historical development, we analyse the turn from "irrationality" to "rationality with emotions" in studies of mass behavior. Our research considers the question how theoretical debates and historical circumstances affect emotional turn in this particular field. We use methods of historical reconstruction and critical analysis of social theory to answer it. We divide history of studying mass behavior on three particular stages and analyse each of them. Findings from this study will contribute to scholarship on emotional sociology and social movements.

The emergence of norms in Occupy Geneva
Frédéric Christian Henry MINNER (University of Geneva, Swiss Center for Affective Sciences (CISA), Germany) | frederic.minner@unige.ch

Emotion norms have diverse forms and occur in various social situations. They prescribe the type of emotion that one ought to feel and display (e.g. sadness during funerals or happiness during a marriage) (Hochschild 2003; Mauss 1968-69). But how do emotion norms emerge and how can we explain their forms? The first answer is that they emerge according to the appraisal of concrete situations that exemplify the core relational theme of a type of emotion; the second is that the form of the norms depends on the structure (appraisal, intentionality, action tendencies, etc.) of the related emotion (Durkheim 2007; Ranulf 1933-34); the third is that they are collectively adopted inside the institutions of the society in which they emerge.

Following this line of thought, I will show in my ethnographic study of the political collective Occupy Geneva how specific norms emerged from different emotions. Indeed, after two sexual aggressions and other forms of disrespect that occurred in their camp, the members of the collective initiated, during a general assembly, a debate about unjustified violence. The collective deliberation, led along the institutional principles of deliberative and participatory democracy, was principally shaped by indignation, contempt, compassion and fear. It resulted in the adoption of norms that prohibited disrespect, permitted to punish and expel aggressors, and ensured the protection of potential victims.

Bibliography

RN11S08 - Emotions and Work Life
Cooling the Fiction Writer Out
Henrik FÜRST (Uppsala University, Sweden) | henrik.furst@soc.uu.se

Fiction writers who attempt to be published, by sending their manuscript to a publisher, are either selected or rejected. The situations where the fiction writers send manuscripts to the
publishers and receive a response are charged with emotions. The publishers take this into consideration when they prepare fiction writers for manuscript submissions and when they give their response. The fiction writers’ peers are sometimes also part of these situations. These actors take part in dealing with and adapting the fiction writer to the situation before being evaluated and after the evaluation when the manuscript is selected or rejected. Erving Goffman has used the notion “cooling the mark out” to explain situations where people are conned and attempts are made to adapt the person to having failed. This concept, and others developed by J. L. Austin and Harold Garfinkel, will be elaborated and used to analyze how actors deal and cope with the situations when a fiction writer is either rejected or selected. The analysis draws on a rich material of interviews with publishers and selected and rejected fiction writers who have attempted to become fiction debut authors.

Go Go Capitalism: The Emotional Dynamics of New Capitalism
Anu KANTOLA (University of Helsinki, Finland) | anu.kantola@helsinki.fi

Drawing from a growing body of research that focuses on emotions as social and cultural phenomena, this article examines how publicly performed emotions can be employed in the exercise of power. The paper examines the emotional dynamics of the anti-hierarchical ‘flat’ and revolutionary styles of management that emerged in late twentieth century corporate capitalism. A qualitative analysis of Finnish current affairs magazine Suomen Kuvalehti and business magazine Talouselämä tracks how corporate leaders performed publicly in Finland from 1940 to 2005. I suggest that corporate capitalism developed an emotional regime of enthusiastic individualism; styles of authority, which built on leaders’ personalised approach and revolutionary self-actualisation and empowerment of employees. The new style challenged the dark side of the previous regimes of paternalism and bureaucratic managerialism. The article demonstrates how media provided an emotional refuge that became a public platform through which business leaders could formulate the new emotional regime. The mediated performances of corporate leaders became rituals that borrowed from the affect economy of revolutionary social movements and fuelled the rise of the new capitalism. The rise of ‘flat’ authority styles is thus seen as indicative of the dynamic and aggrandized societal role of corporate capitalism in contemporary societies. In recent years, the revolutionary call has become, somewhat ironically, a standard technique in corporate capitalism. New fast and flexible capitalism often flirts with countercultural ideas and circulates them. The paper discusses how corporate leaders have circulated revolutionary ideas and turned them into toolkits for corporate management.

Empathy by Design - Shaping Emotions
Eva KÖPPEN (FU Berlin, Germany) | eva.koeppen@gmail.com

The article conceptualizes an empathy-led regime that may contribute to our understanding of how mechanisms of western, late modern capitalism work. Based on an interview study in a large software company and using a Grounded Theory approach, the article analyzes an empathy program that leads to forms of control of the own and others’ emotions. Empathy unfolds as a form of control, on the team level as well as on the individual level. As an individual strategy, empathy can be used to produce or reproduce power relations. This study on empathy in the workplace explains the consequences of emotionally charged requirements of the modern working world and adds to the body of research on emotions in organizations.
Feeling our way: An investigation of university staff experiences of participation in personal and professional development programmes of the emotional competency and ‘soft skills’ variety.

Alison Marie FIXSEN (University of Westminster, United Kingdom) | A.Fixsen@westminster.ac.uk

Introduction: Personal and interpersonal skills and competences are now considered important for career progression (Musa, Mufti, Latiff, & Amin, 2012) but also for individual and organisational ‘wellbeing,’ and to deal with challenges of working life constructively.

A striking characteristic of the concept of ‘soft skills’ as a concept is its focus on the affective (as opposed to purely cognitive or practical) domain. To date however, the impact on staff of participating in different types of ‘soft skill’ personal and professional development programmes, and their implications at individual, team and organisational level, have yet to be examined in depth. Using a heuristic methodology incorporating autethnography, participant observations and interviews, my project investigates the reasons why staff members choose to participate in activities, the emotional labour performed through participation in them, the translation of emotional labour into ‘emotional competencies’ and their implications for cultural and practical changes at institutional level. In the process I expect to develop theory concerning group emotion work, and other shared or unique attributes of this type of collegiate interaction.

A range of staff personal and professional development (PPD) programmes incorporating soft skills (including coaching, mindfulness, communication skills, self assertiveness, emotional intelligence, resilience) are now being offered to staff across a wide range of sectors, including to university staff across all levels. There are a growing number of studies focusing on soft skills programmes (Devadason et al. 2010; Wats 2009) and their effects, but none that involve Higher Education staff. This study represents a unique contribution to knowledge and theory concerning development of soft skills in staff and its impact at personal, professional and organisational levels, providing valuable insights into deeper levels of learning associated with PPD activities (Shapiro et al. 1998; Goleman 2006), and the importance of this type of collegiate interaction.

Project and presentation aims: As more and more courses are delivered eLearning, the benefits of face-to-face training can be overlooked. My project focuses face-to-face peer group work, including role-play and simulations featured on ‘soft skills’ staff development courses. My aim is to offer a unique perspective on the use of emotion work in soft skills programmes, to develop theory concerning group emotion work, and to consider the long-term consequences of this unique type of collegiate interaction. In addition the study findings will contribute to critical discourses on individual and organisational health and their development. Data for this professional doctorate study is still being gathered, however its methodology and context aligns with previous qualitative studies on emotions in Higher Education contexts for which I was principle researcher. For my presentation I will compare and build upon the findings of these two studies to examine and develop emerging themes and theory on emotion work and PPD.

Background: The ‘healthy organisation’ has been described as one in which, along with the profitability, the culture, climate and practices create an environment that promotes employee health and safety, and strategically integrates employee wellbeing into its business objectives (Raja and Panneerselvam, 2014). One means of improving organisational health is through personal and professional development programmes. Studies of social and emotional learning skills in teaching staff suggest such skills can improve mitigate against staff burnout, create a climate more conducive to learning, and improve relationships with students (Jennings & Greenberg 2009). In addition to personal and professional gains, in terms of job satisfaction, well-being, improved relationships and so forth, emotionally competent staff may provide a pool of emotional resources or ‘emotional capital’ (Zembylas, 2007), with the potential to increase
productivity and energise and empower other individuals within the organisation (Gendron, 2005).

Training courses and workshops featuring group activities and games can be fun (Hromek & Roffey 2009) and are time out from one’s daily work routine. My own earlier studies of the learning experiences of students (and staff) undertaking Personal and Professional Development programmes suggest that this type of interactive learning can also be emotionally challenging and sometimes painful (Fixsen and Ridge, 2012, Fixsen et al; 2014). Another interesting aspect of peer group work is the ‘emotional energy’ and congruence generated by and through close interaction with work colleagues. Sociologist Randall Collins (2004) depicts individuals as strategic pursuers of ‘emotional energy,’ constantly feeling their way through situations (2004, p. 3), but generally seeking moral cohesion within the group. For Collins, it is this emotional energy that individuals seek from interaction rituals (p. 44), that determines success or failure. Emotional responses become incorporated into the individual's perception of self and relationship thus providing a bank of emotional resources for subsequent interactions (Fixsen et al., 2014).

Methodology: For this project I use a mixed method qualitative approach, incorporating autoethnography, participant observation, in-depth interviews, and personal journal writing. By linking personal experiences of soft skills programmes to data derived from participant observation and interviews, I aim to develop a richer and deeper understanding of this topic. Autoethnographic work and participant observation began in September 2014. So far this has included participation in a women’s PPD programme (Springboard) a coaching programme for managers, and a number of one-day workshops (on Emotional Intelligence, sociodrama, communication skills, resilience etc.). Since January 2015 I have been conducting individual semi-structured interviews with staff who have participated in these and other programmes. These interviews are still in process, and will be completed by June 2015.

Data analysis: A modified constant comparative approach, focusing on inductive coding (i.e. coding emerging from direct examination of the data) at open level (labeling and defining raw data) and axial level (connecting of open codes) is used, and emerging concepts cross-referenced with existing theory and literature (Strauss and Corbin 1998), including my previous study data (Fixsen 2012; Fixsen et al., 2014).

Preliminary Results: Themes emerging from the data include positive reinforcement, self worth and personal values, time out, enjoyment, self-disclosure, social embarrassment and performance anxiety, emotional regulation and distrust of facilitators, sharing of emotions, peer group support, nurture and validation. I anticipate that by July 2015, more concepts and themes will have emerged to present for discussion.

RN11S09 - Emotions and the Capitalist Economy

Economic value of emotions – creation and use of the technical knowledge of emotions in business

Agata DEMBEK (Kozminski University, University of Warsaw, Poland) |adembek@kozminski.edu.pl

In recent years in social sciences we observe the rise of interest in the mutual relations between emotions and economy. They are discussed – on the one hand – as a process of colonization of the private sphere by the market. The private life of individuals and intimate relations are seen as managed by economic logic. On the other hand, different activities and human actions in the reality of late capitalism are contingent upon emotions and affects. Everyday life of individuals in contemporary capitalism is saturated with emotional content in such different contexts like workplace, consumption, advertising and media. While working and consuming, people are expected to perform ‘an affective work’ by identifying and managing their emotions and feelings. The agents operating on the market intentionally refer to emotions and feelings of their business partners and clients. New fields of economic activity, such as the experience economy, are developing. Behind all these phenomena there is – I presume – the assumption of the (direct or indirect) relation between emotional quality of the product or activity and its economic value. Therefore, we observe the dynamic development of different kind of psychological expertise that create and manage the technical knowledge of emotions, usable and useful for business. The paper aims to depict and analyse cultural conditions in which the technical knowledge of emotions is used for generating economic value. I also intend to discuss the following questions: In what way the psychological expertise influence and defines the principles that rule the economic relations? How the economic value of emotions is defined and estimated? What are the background normative assumptions that justify emotions-value relation?
Real fear of imagined reality? Get ready for the zombie apocalypse
Nils MEISE (Konstanz University, Germany) | nils.meise@uni-konstanz.de

My presentation shows how the fear of the zombie apocalypse materialized in our everyday world. Organizations like the Center for Disease Control in the US and several private companies use the (fictional) zombie theme and the struggle of survival by offering services or products to survive the zombie apocalypse. E.g. you can participate in zombie survival trainings with your green colored zombie survival hatchet that you have in your zombie-apocalypse-ready backpack. Once a critique on consumerism, the zombie trope is now used as a catalyst for consumption. These objects and their arrangement mark the transgression between “fictional” and “real.”

From a cultural sociological perspective I argue that the culturally embedded narrations of the (zombie) apocalypse and the above-mentioned materialization of it in our everyday world form a complex network of meanings. On one hand it makes us aware of the zombies we are confronted with every day when we use public transport, at the work place or while shopping and on the other hand it shows us the fragility of social order in general. Consequently, the zombie theme is easily applied to our everyday experience. Then, by means of specific material objects, it frames such experiences in a very peculiar way – provoking, objectifying, and enhancing the fear of the soon collapse of society. By pointing out the effects I want to contribute to a better understanding of the embeddedness of emotions in material culture and enclosed narratives.

Middle Class Shame: Sociological Analysis of the Relations Between Emotions and Culture in 1980's Turkey
Merve Betul UCER (Istanbul University, Turkey) | m.betul.bayrak@gmail.com

1980’s Turkey is a critical transitional period in the history of Turkey with respect to economics and culture. Social changes of the said period like the movement towards a liberal economy and open market system, the emerging of a middle class and entrepreneurial culture caused the sociocultural transformations in the traditional patterns of emotional relations. Particularly cultural conditions of 1980’s Turkey, which was based on a supposed “openness” and “show culture”, effected the emotion of shame within the new middle classes of the cities. In 1980’s, as a freedom quest period, being a member of middle class means not only possessing higher income level but also an embracement of a new life-style. As a feature of this new life-style, desiring without shame and without stint and trying to realize this desires has been called as “desire explosion” in related literature. This study aims to analyze the changing situation of emotion of shame with respect to the socio-cultural transformations in 1980’s Turkey, through documentary films, movies and song lyrics as indicators of social changes.

The new world of work and its sensitive residents?
Falk ECKERT (Universitaet Hamburg, Germany) | falk.eckert@uni-hamburg.de

The present world of work and organizations is undergoing a transformation called post-fordistic transition-regime. The increased self-responsibility captures, besides the configuration and control of the individual life course, prior the labor-process itself. Regarding the “post-fordist production regime” a new “recommodification” of labor-force is stated. This development goes
along with an upgrading of subjectivity as productive forces which is demanded within the labor process. My research asks: How is the practical labor process by different employees in various industries experienced, considering Emotions and Affects? What are subjectivity supporting or repressing factors and what is their impact on processes of subjectivization through practical labor?

Understanding the labor process as a practical process (Burawoy, 1979), it is primarily not only crucial what and how is to do, but rather what and how is really done. Hence emotionality is seen as core characteristic of subjectivity and labor force within the labor process. The research questions will be answered by using a qualitative method approach. The subjects under study are German contractual employees in IT and manufacturing industries, as well as attorneys in chambers: 40 narrative interviews will be compared and analyzed. The sample under research is seen as standing for the German middle-class.

Finally, the results show that emotional or rather affective, sensual and experienced labor matters in practical labor processes, in different labor environments which are not essentially marked as interactional- or emotional labor demanding work-places. On the other hand it is to be pointed out, that post-fordist production arrangements, characterized by demands of flexibility, autonomy and self control, empowers the employees, but at the same time continuously disables them. In the consequence new conflicts, ambivalences and deficits in acknowledgement but also in individual claimed subjectivization seems to raise.

RN11S10 - Emotions and Media

Emotional communication as institutional resource in television discussions: the use of facial gestures in ascribing normative identities in the program opening
Hanna RAUTAJOKI (University of Tampere, Finland) | hanna.rautajoki@uta.fi

In my PhD I have studied the formation of participation framework in socio-political television discussions on 9/11. Live multiparty discussions represent a long-established program format in Finnish television. My data consists of three discussion programmes broadcast within three weeks after the terrorist attacks in USA in 2001. They share the same topics but differ markedly from each other in their constellation, which allows comparison between three different realizations of public sphere on the same agenda. I am especially interested in the ways television audience is addressed in the discussions. The methodological framework is provided by ethnomethodology, the analytic focus being on the situated accomplishments of actions and identities, manifested in the details of interaction.

In this presentation I will take a close look at the multimodal recipient design in the opening of the programs, where talk is addressed directly to the audience. It is taken that in the triangular participant structure of television discussion (the journalists, the studio guests and the audience), positioning one of these participant roles always suggests identities for the others as well. It turns out that facially expressed emotions are one important resource in managing the participation framework in the opening. The use of gestures is communicative and strategic here. The journalists deploy emotional signals to guide and enhance the message in the verbal introduction and to elicit certain response from the recipient. Emotions activate and support normative identities and interrelations in the field of public discussion and serve to mobilize a configuration of political community.

The Recursive Logic of the Mediated Emotions
Monika VERBALYTE (Freie Universität Berlin, Germany) | monika.verbalyte@fu-berlin.de
Nowadays, when loads of information are coming from different sources and are easily manipulated, for the media it is not enough to report “just the facts”, it is necessary to put weight on their opinion, to endorse it with passion. On the other hand, as much as emotional investment and side-taking in media’s landscape become indispensable, they also should be justifiable. As acceptable reasons for dramatic exaggeration and emotion consolidation count struggle for justice, fighting norm violation, defending the public interest, or other similar motives. Media try to establish a link between their news and these reasons: They refer to the central norms of society, claim to speak in the name of the people, use dialogic and inclusive writing style even if in reality their reporting is highly monologic. All this aims at creating an impression that the only motive for the intense coverage is its moral necessity.

This process seems to include a lot of work on public’s emotions which comprises emotion elicitation as well as its normative justification. However, even if in the last decades, in communication sciences, interest in emotions increased, emotion theory which would be able to incorporate both of mentioned elements and the link between them is still absent. For this, we need a more extensive emotion definition than some kind of “emotional charge”, intensity, or automatic, immediate and effortless bodily reactions of the people to the media stimuli. The function of the bodily counterpart of emotion is not more (but also not less) than to attract attention to the event. Primary affective reaction signals insecurity, inconsistency between one’s expectations and occurring event, insufficiency of available action repertoires and/or attitudes. In general, it is the first sign of the personal relevance of event as well as motivation to follow the forthcoming narrative in order to receive more information on what is happening and, then, to be able to assess the situation and to act accordingly.

The Cognitive theory of emotion confirms that affective reaction processed unconsciously and automatically is by far not the end of emotion building process. It is too vague and too imprecise to be called emotion. Much more decisive is the secondary – more elaborated - appraisal of the emotional situation. This secondary appraisal includes subjective meaning of event, correct labeling of emotion, definition of its object, causes, and possible consequences, evaluation of one’s capabilities to cope with this emotion, guidance for action, emotion’s desirability, compatibility with one’s motives and general normative standards.

Thus, emotions seem to compose a great part of those narratives to which they are supposed to prepare. Primary affective reaction already triggers an associative network of loose references to interpretation schemes, social representations, symbolic formations, categories and memories facilitative for involvement into the forthcoming story. But emotions left to float freely in associative networks are hardly of use for an individual because they are of low informational value. People enjoy meaningful narratives, so in order to make sense, primary affective reaction must be picked up and further developed by the causal attribution, interpretative frame or narrative, attached to symbols and embedded in meaning structures.

The named interpretation of one’s affective state should not be a highly reflective process. In the life course, people acquire a lot of implicit emotion knowledge how certain meanings and symbols are related to specific emotions, how certain situations are related to emotion labels as well as causal attributions or particular narratives are connected with reasons and objects of emotion. This emotion knowledge enables people to imply emotion from some category or narrative, without investigating the whole emotional situation. Especially when the general arousal is already present, it does not cost much additional energy to get to the meaningful emotion interpretation using one of the links in the associative network triggered by the affect. However, as regards more complex emotions, the exact examination of eliciting circumstances is needed. Based on the results of this examination, implied emotion may be further developed, corrected, or transformed. This way, further articulation might “displace” the primary meaning of emotion.
Media influences on both, feelings as well as emotions of the people. They do the first by presenting news which are unexpected, shocking, evoking insecurity and excitement, and by using figurative language and rhetoric which increases the intensity of that excitement. They impact on the second when people are searching for a meaningful explanation to their excitement or for the confirmation of their already formed emotions in the public space. Since very often people have less or no personal experience with events with which they are confronted in the media, people are very often keen to accept an interpretation of their feelings suggested by the media. To make their suggestion even more implicative, media use familiar narrative patterns, schemes and practices, so relating to one of the nods in the associative network triggered by the primary affective state.

Thus, adequately defined, emotions of the audience are interpretations of their affective states. For the media, emotions are reality versions articulated in them which need public approval and therefore underlie requirements of believability and justifiability. Mainly, if successful, media make one version more available and better founded than others. Alternative interpretations of events are appeased by presenting them as not upholding with the requirements of legitimacy or sincerity, e.g. based on selfish motives. The dominating reality version and emotion, on the other hand, are enhanced to a normative standard. This way, media transmit emotion norms and teach people appropriate emotional reactions.

Paradoxically enough, when the process of establishing one version of reality is successful, the efforts of articulating desirable emotions and combining feelings with their normative explanations remain masked under the facade of coherent end story. What the public senses is a common emotional experience and strong consensus on its meaning, and impression that emotion was elicited by this concrete meaning of the situation; whereas in reality, it took much time and energy for the media to elicit, intensify and structure the affect, to give it a shape of a meaningful emotion and unified narrative, and to turn it into the evidence of the significance of this narrative.

Journalistic Deployment of Emotionality in the News – a Cross-national Comparison
Antje GLÜCK (University of Leeds, United Kingdom) | csag@leeds.ac.uk

Can journalists influence the framing of serious news issues via the usage of emotionalizing elements in their news coverage? And does the idea of an ‘emotional public sphere’, introduced by scholars like Barry Richards, also translate to an emotionalization of news? This trend towards an increasing emotionalization in its different forms is observable internationally, but little research about it has been done so far.

This paper (and my Ph.D.) aims to explore this question by examining television news in two different highly competitive news markets – the United Kingdom and India. India is known for sensationalising and dramatizing its news, while in the UK, BBC and ITV leave behind old paths of reporting in search for audiences. The paper presents first findings of how ‘emotional’ news journalism across continents is structured and presented.

A qualitative content analysis involving discourse analysis (Foucault) is used as the basic method. I look upon a sample of recent television news events (Peshawar attacks, Charlie Hebdo), to investigate the variety of representation or absence of emotions in word, image, symbol, and subsequently (trans)cultural emotion patterns and the ‘(un)emotional’ discourse generated by it.

This paper presents a holistic qualitative approach which incorporates textual and visual elements and includes syntax, semantics, cinema studies, cultural studies and more. At the core of the analysis will be not only emotion words, argumentative patterns, narrative structures, and
metaphors, but also gestures, mimics, sound, voice, perspective, light, movement, or facial expressions, drawing from Dellinger's approach to audio-visual analysis.

RN11S11 - Space and Place: Emotions from the Local to the Global

**Impasses: 40+1 years along the Green Line. Affective implications on public space.**

*Vicky KARAISKOU (Open University of Cyprus, Cyprus) | v.karaiskou@ouc.ac.cy*

This paper will explore the affective experience of cultural memory produces and reiterates in public space. In particular it will focus on the liminal situation of Greek Cypriots where uncertainty and ambivalence during the last decades seek reassurance in cultural memory. The consequent reinforcement of cultural identity renders affective reactions an effective power tool and a key component of political rhetoric. The “Green Line” which divides Nicosia, the capital of Cyprus, since 1964, and cuts along the island since the Turkish invasion in 1974, remains an open wound, physically and symbolically. The paper will walk along the dividing line on both sides of Nicosia. It will discuss the visual imprint of the political and cultural partition, and analyze the affective implications on space and place. In conjunction, it will explore the importance of location in memorialization and argue that collective memory converges towards specific locations that turn into emotional ‘hot spots’ and, hence, create ‘realities’. The reference to the involved actors/heroes, especially through their figural representation, turns them into ‘loci’ of storytelling and affective mnemonic devices that bridge the past with the present; construct and reconstruct the recursive narratives of historic memory; reinforce cultural identity consciousness; and cement dominant national narratives.

**Emotions in the Bloodlands**

*Jacek Maria KURCZEWSKI (University of Warsaw, Poland) | j.kurczewski@uw.edu.pl  
Joanna KURCZEWSKA (Institute of Philosophy and Sociology, Polish Academy of Sciences) | jkurczew@ifispan.waw.pl*

Paper presents results of 2014 nationwide representative survey made in Poland on emotions declared as felt towards major neighboring nations as well as the assessment of the recent state of relations between Poles and those nations on the antagonism - reconciliation dimension. The social background data are introduced in the statistical analysis of these emotions and assessments. The national level data for Poland are then compared with the local surveys made in 2014 in Poland, Western Ukraine, Eastern Latvia and in the Romanian Transylvania in 2014 as well. These yet unpublished results are interpreted in reference to the wider emotional infrastructure of national and international relations and emotional theory of reconciliation developed by authors in recent publications (J.Kurczewski (ed.) Reconciliation in the Bloodlands, Peter Lang 2014).

**The emotion work of careworkers in Italy**

*Rossana TRIFILETTI (University of Florence, Italy) | rtrifil@unifi.it*

The paper is based on a qualitative survey conducted in three towns of Tuscany Region with (female and male) immigrant careworkers coming from Ukraine, Moldova, Romania and Peru and working (or having worked) in cohabitation with frail elderly people. These jobs always
include bodywork, low recognition, mobility and backstage limitations and, often, not so easy relationships with other family members beyond the cared for: all this implies a great deal of emotion work. Previous research did not investigate enough this aspect, as if emotions were limited to family caregivers. The long biographical and narrative interviews of our research (47) illustrate how common and exhausting this conscious management of disruptive emotions may be, how similar it results beyond gender barriers and beyond differences in the type of migrant flows involved, how improper the concept of successful socio-cultural integration is in describing these trajectories and their recent changes in the economic crisis. We try, instead, to describe careworkers’ narratives as a practice of defining nonexistent feeling rules, drafting a new social identity, very different from the one of victims of globalization, one not without a dignity, against the danger of a crush on slave work, and not without spaces of agency (perhaps increased by the circumstances of the crisis).

Emotions and Globalization. Towards a Research Agenda
Jochen KLERES (Göteborgs Universitet, Sweden) | jochen.kleres@gu.se

While social research on emotions has been an ever expanding field in recent years, encompassing an increasing number of scholarly disciplines and specialized subfields under such labels as the emotional or affective turn, emotional aspects of globalization—another vibrant topic for many years—have by and large not received much focal scholarly interest to date. Existing pertinent research in this field remains scant and focuses on specialized aspects. Overall, bits of existing research remain disparate and unintegrated. Given this disjointed situation it is timely to draw existing research together having different findings bear on each other and advance new perspectives on the emotional dimensions of globalization. Based on this, the present paper will develop a research agenda that proposes possible perspectives on emotions and globalization and identifies fields of interest for future research.

RN11S12 - Theorizing Emotions I

Dynamics of the moral self: certainty and doubt in processes of moral elaboration and moral closure
Sylvia TERPE (Max Planck Institute for Social Anthropology, Germany) | sylvia.terpe@googlemail.com

Many approaches on identity agree upon the premise that ‘identity’ is an ongoing process. They emphasize its dynamic character and they portray the self as something that is produced and (de)stabilized continuously. In my presentation I will focus on moral identity and I will elaborate on the argument that the dynamic character of moral identity can be uncovered by looking closely at its affective dimensions. This look, however, has to go beyond the so called ‘moral emotions’ (like shame, guilt, remorse etc.), which are discussed in, e.g., ‘identity theory’ (Stets 2013) and the ‘social intuitionist’ model of moral judgement (Haidt 2003). These approaches (over)emphasize the integrative force of moral emotions; in this way they reduce identity dynamics to processes of moral stabilization and at the same time they underestimate the complexity of such moral reproductions. I will argue that one has to complement the perspective on ‘moral emotions’ by an additional focus on so called ‘epistemic feelings’ (in particular feelings of certainty and evidence on the one hand and feelings of doubt and uncertainty on the other). On basis of qualitative interviews I will show, first, that ‘moral topographies’ can be characterized by different shades of epistemic feelings and, second, that these particular
shades and mixtures contain information regarding the potential scope and direction of moral transformations. I will discuss the deduced mechanisms of two such potential transformations in detail. First, a moral topography which is characterized by a mixture of certainty and doubt, i.e. which is open for (situational) doubt against a background of moral certainties, thus may motivate attempts for new and more elaborated moral articulations. In contrast, a moral topography which is characterized by strong feelings of evidence and certainty and which blinds out doubt and uncertainty may lead into ‘defensive closure’, which sometimes takes the shape of moral dogmatization.

The ‘possibility’ of happiness: going beyond the discreet charm of happiness
Alessandro PRATESI COOREN (Universtiy of Chester, United Kingdom) | a.pratesi@chester.ac.uk

Recent research on human happiness has been described by some scholars in terms of ‘happiness turn’ and/or ‘happiness industry’: a growing literature provides instruction on how to be happy, drawing on a variety of disciplines, including economics, sociology, psychology, history and social policy, and happiness is both produced and consumed through such literature as a form of emotional, cultural and social capital (Diener, 2008; Duncan, 2005; Frey and Stutzer, 2010; Harris, 2008; Haybron, 2010; Ahmed, 2004; 2010; Layard, 2011; Warr, 2011). While happiness research has stimulated some self-critical reflection about present and past deceptive and taken for granted assumptions on happiness, it still tends to locate happiness in certain places, commonly described as the ‘primary happiness indicators’, and to be trapped into prescriptive, conventional and dominant definitions of happiness. The prescriptive power of happiness as the object of human desire manifests itself in describing not only what we aim for but also what we should aim for. Furthermore, there are significant terminological issues, ambivalences and grey areas implicit in the contemporary uses of the words happiness and happy. Even assuming that happiness may be associated with ‘feeling good’, can we hereafter assume that unhappiness automatically involves ‘feeling bad’ and not rather ‘feeling good in a different way’ and/or wishing things were different?

Based on Sarah Ahmed’s critique of the intrinsic conservative power of happiness and her proposal of ‘rethinking happiness as possibility’ (Ahmed, 2010), which involves giving voice to silenced subjects and introducing issues of difference and inequality into current debates about happiness, this paper aims to open up a discussion on how more inclusive, reliable and situated definitions of happiness can be attained in contemporary societies.

It also aims to discuss the potential contribution of those unequally entitled social actors who have been conventionally banished from dominant discourses on happiness—such as sexual and ethnic minorities—and their capacity to produce alternative and unconventional forms of ‘contextual and situational happiness’ which intersect and overcome traditional dichotomies (i.e. happy/unhappy; public/private; inclusion/exclusion; micro/macro; assimilation/marginalisation, etc.) In other words, it aims to analyse the ‘possibility’ of happiness by situating it in empirical, phenomenological contexts and going beyond its categorical, prevailing and prescriptive definitions.

Love and Morality
Natasha Kate BARNES (University Of Leeds, United Kingdom) | N.Barnes@leeds.ac.uk

There are secular sociological theorists – Weber, Fromm, Bauman – who rest upon the Christian precept to ‘love one’s neighbour as oneself’ as a guiding principle to the creation and maintenance of social solidarity. To love one’s neighbour, they argue, is to be responsible for them, to orientate ourselves toward them. Loving one’s neighbour, then, is both morally good
and a moral good. Capitalist society, they argue, is too self-centred to love ‘authentically’; thus capitalism undermines moral living because it undermines ‘authentic loving’. Based on qualitative research data, this paper proposes that contemporary understandings of love are characterised by the notion of choice. This is not the choice to love all people; rather, it requires we love only those we choose to. This type of love is particularised and although it is Other-focused, the sphere of ‘Otherness’ is very narrow; we are more likely to love our partners, like our friends and remain ambivalent — at best — to our neighbours. According to Bauman, Fromm and Scheler the major consequence of a ‘selective love’ is the diminished responsibility we feel for others; this undermines social ties and weakens social solidarity. Thus, where unconditional (Christian) love has a moral dimension, selective love does not. The challenge, then, is how to transform an attitude — both individual and social — from one of ‘love-who-I-choose’ to ‘choose-to-love’.

Thus far sociology has provided distinctly unsociological accounts of love and morality — more work is needed to engage with love and morality sociologically, or build a stronger bridge between sociology and theology.

Counterbalancing the feminine and masculine

Päivi ALHO (The University of Helsinki, Finland) | p19002@outlook.com

Hofstede found two underlying main dimensions in cultural values: individualism versus collectivism and masculinity versus femininity (Hofstede 1997, p. 51). The stereotype of masculine individualism finds support in gendered differences in emotions; while masculine emotions underpin competitiveness, fulfilling thus the collective expectation of individualism, female emotions are more social in character and convey a natural tendency towards cooperation. This detail has been quite negatively met in modern psychology that has for long recommended personal success and material wealth to any other aim in life (Gilligan 1982). In the same proportion as the masculine in women has become but an effort to resample the masculine in men, the empathetic and caring nature of emotions and values in general has disappeared (Nüber 1998). Lack of the feminine values distresses women but also demonises the masculine at large because it appears as the cause as well as the target of negative projections from the destructed feminine. According to Hofstede masculine countries strive for a performance society and feminine for a welfare society. Most people surely prefer some kind of a combination of the two, in other words, counterbalancing of the masculine and feminine values. How this can be done in practice is shown by the Jungian interpretation (Alho 2006) of the implicit theory of mind (Peabody and Goldberg 1989) which is now compared with Hofstede’s value diagrams, Eysenck’s attitudinal space (1981) and Schwartz’s circle diagram of human values (1992).

RN11S13 - Theorizing Emotions II

Emotions and Social Structure: An Exploration of the Affective Sanctioning’s role in the Constitution of Macro-social Phenomena.

Irene RAFANELL (University of the West of Scotland, United Kingdom) | irene.rafanell@uws.ac.uk

Micro-interaction dynamics of affective sanctioning have been widely acknowledged but rarely related to the theories of the emergence of social phenomena. This presentation aims to highlight the constitutive force of emotional sanctioning in interaction activity by critically analysing two sociological models, Bourdieus’s theory of practice and Barnes’s Performative
Theory of Social Institutions (PTSI). Such a comparison allows me to reveal two differing models of social phenomena currently operating in sociological debates: an extrinsic structuralist model which tacitly conveys macro-structural phenomena as prior and determinant of individuals and their micro-interactions, and an intrinsic structuralism model which prioritizes individuals’ interactions and conceives them as constituting both the individual and the structural. I argue that the latter’s emphasis on the dynamics of mutual susceptibility to affective sanctioning as underpinning consensus among inherently heterogeneous individuals provides a platform to further support the tenets of Interactionism and helps to expose Bourdieu’s over-deterministic methodological individualism prevalent in most sociological theory. I conclude that by conceiving emotions as causal, rather than the effect of social forces, sociological theory can provide an explanation of both individual practices and systemic phenomena which offers a path to the resolution macro-structural tensions. In doing so, I suggest an ontological understanding of the ‘social’ which supports the Interactionist central tenet that the local takes priority over wider structural phenomena.

Struggling for Authenticity? Emotional Ambivalences in Contemporary Society

Eva-Maria BUB (Goethe-University Frankfurt/Main, Germany) | evamariabub@gmail.com

Within my lecture I am dealing with emotional ambivalences in the context of modern society. It will be analyzed as a typical phenomenon of our time especially in the context of decision making and discord. What I define as emotional ambivalence is the simultaneous experience of both positive and negative emotions towards the same target in contrast to ambivalent feelings which are confined to a special emotion, which is felt as a positive and a negative experience at the same time.

Based on several popular diagnosis of our time – for example postmodern theory referring to Zygmunt Bauman, reflexive modernization following Ulrich Beck and the neoliberal discourse subsequent to governmentality studies – it can be stated that in today’s western societies more and more certainties in decision-making erode. Instead of certainty, a pluralism of norms, rules and values prevail in modern societies. As a result a culture of self-responsibility was established which can be seen as the lowest common denominator of these different diagnoses. In this sense, an itself-responsible self must find other criteria instead of traditions, predetermined rules or external recognition to overcome the contingency of our time. Parallel to these developments the formation of a therapy culture can be stated, which forces the quality of living and authenticity as promise of happiness and a way to gain certainty in decision making. In this context, psychoanalysis as first outpatient form of therapy and soon also other forms of treatment, developed into a “service science” for everyone. This is accompanied by a shift from a diagnosis of the pathology to the treatment of the normal. Or in other words: the assignment to cure the subjects from mental illness became the aim to optimize them and their quality of living. In this context also psychological terms spread rapidly and became common knowledge such as authenticity as the key to live a happy life. Along this lines, authenticity is linked with honesty, integrity, vitality and truth and is therefore diametrically opposed to external constraints and foreign control. Following this point of view you just have to get to know yourself – also through forms of treatment – and you will know for instance how to decide in the context of indecision. As a result the attention of one’s self increases. In this sense therapy culture and the culture of self-responsibility perpetuate mutually: on the one hand the culture of self-responsibility can be seen as a cause to find other criteria to manage decision discord whereas the therapy culture gives the answers to deal with these challenges; on the other hand through therapy culture the culture of self-responsibility is reproduced.

In this regard subjects are forced to pay more attention to their inner thoughts and feelings in order to find orientation and directions of actions. In this manner, the orientation function of
feelings has frequently replaced powerful traditions, norms and institutions which once directed subject’s lives. Here, unlike classical rational-choice theories, emotions are considered in the light of their particular orientation function, especially in the context of decision uncertainty and discord and referring to E. Doyle McCarthy emotions become the new senses of modern self. So listening to your heart, which also stands for being authentic, can be seen as the new axiom of action. This point of view is based on the assumption that emotions can always be interpreted unambiguously. But emotions aren’t always clear. They underlay dynamics and moods and the experience of emotional ambivalence can be considered as another inherent feature of the human condition. This may lead to some difficulties, especially in the context of decision uncertainties.

Of course these diagnoses of our time are middle-range theories, because ambiguities and ambivalence are ubiquitous and in today’s western societies not omnipresent either. But what I would like to capture is that ambivalence and ambiguity intensify and expand in the modern world as they bind individuals to multiple groups and expose them to even more and potentially contradictory normative demands. Indeed, today we still often act out of habit and do not reflect endlessly on our decisions to be authentic. But particularly in the context of action problems, there is a lack of orientation, which must be overcome self-referentially, which also means emotionally.

Following this central hypothesis, the question arises what happens to the orientation function of emotions when they can no longer be classified clearly. Because of the complex and contradictory character of culture as explained before, the experience of emotional ambivalence can be viewed as an inherent feature of the human condition. So how is emotional ambivalence perceived from the subject’s point of view? Which mechanisms does our present culture offer to deal with emotional ambivalences?

A natural assumption would be that the experience of emotional ambivalences turn into overextension and an itself responsible self might become a depressive self. Against this background I would like to propose and discuss my proposition of emotional ambivalences as solution - rather than problem - for an itself responsible self:

In this sense, emotional ambivalences are shown as a comfort zone to emancipate from the claim to decide: In this manner the emotional ambivalence can be conceptualized as a transition between the problem and the action resulting from the successful self-production. Despite the crisis-ridden character to a subject who aspires clarity, the emotional ambivalence must not necessarily be understood as a problem. I would like to pose that they rather represent the temporary solution because the subjects are allowed to stay undecided. In this manner the emotional ambivalence relieves the pressure to act. In this regard, the waiting and persistence in the emotional ambivalence - so my central thesis – temporarily offers a way to escape the self-responsibility within the culture of self-responsibility. While being emotional ambivalent the contingency cannot be overcome and therefore it has not to be bettered. Therefore, justified by the emotional ambivalence, the problem of discord becomes paradoxically the emotionally legitimated solution within the culture of self-responsibility. Or in other words, in a situation that is so complex that there are no simple solutions, a temporally comfortably situation occurs to emancipate from the pressure to act by not acting, which became possible through the emotionally justified indecision. In this regard, the often overextending discourse about being authentic contains as well a solution in the situation of ambivalence.

Banal Affections. A Micro-Political Enterprise?
Veronika ZINK (Justus Liebig University Giessen, Germany) | veronika.zink@gcsc.uni-giessen.de

»Wash the dishes with all your heart!«. In her guide to a charmed life bestselling author Victoria Moran offers a multitude of advices how to create and liberate oneself notwithstanding the
Feeling at home: Exploring the entanglements of emotionality and materiality in the imaginaries of home(-to-be)

Petr GIBAS (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | petr.gibas@soc.cas.cz

Across social sciences, home has become to be revered as a complex phenomenon, multifaceted, produced, consumed and contested by means of mundane and gendered practices, harbouring often contradictory emotions and extending beyond the confines of material dwellings. In my paper, I attempt at disentangling the connection between the materiality of home and its emotionality based on interviews with people who decided to buy flat to become their home(place). In the 40 interviews I analyse, the prospective buyers coming from two cities in the Czech Republic put forth the ideas of home that motivate the purchase. Though often couched in material and financial narratives, the imaginaries of home are of emotional nature and revolve around the notion of feeling at home. Throughout the interviews, these imaginaries have been produced by means of emotionally charged snapshots from the imagined and ideal future home, which the informants strive for, to which they contrast their current situation and with respect to which they compromise and make decisions in their actual context. These snapshots populate particular (imagined) materialities with specific practices that turn the material settings into home, which is characterised by being filled with (positive) emotions. In my paper, I analyse the narratively produced images and their emotional charge. This leads me to the argument that in the imaginaries of home, materiality is inextricably fused with emotions and that home is imagined as sprouting from materiality which however needs to be tailored to its emotionality.
Why are groups formed for acting on heritage protection and valorization of a space? What are the motivations of the people involved in these processes? From these questions, we propose a reflection on the functions of the emotions felt and expressed by individuals who are mobilizing for the heritage protection and valorization of neighborhoods in Santiago de Chile. Practices and claims that aim to stop the destruction of part of these neighborhoods, product of multiplication of real estate projects that have occurred in the city since the 2000s. The paper is based on ethnographic field work conducted in 2014 with residents of the Matta Sur neighborhood, in the municipality of Santiago Centro. This paper aims to identify the functions of emotions in heritage mobilization. We are specifically interested in how emotions are shared by each participant and sometimes manipulated by the leaders. The argumentation is organized in three parts. The first part reflects on the links between emotions and heritage and the methodology to analyze these processes. The second part analyzes the different types of emotions observed in field work and their functions within the heritage mobilization. The third part asks how emotions are conveyed, shared and sometimes imposed between participants of mobilization.

Emotional Background of the Soviet past in Political Discourse on Modern Russian Identity
Nataliya REPINA (Russian State Social University, Russian Federation) | nataliya714@yandex.ru

The USSR collapse created the problem of molding the new Russian identity. Contrary to the former Soviet republics where new identities were being formed on the ethnic basis, Russia as a multinational country could not follow this way. Its new identity as a set of attitudes, beliefs, rules of behavior shared by people of different cultures and traditions could be based both on a civic conception of citizenship and emotional basis uniting people and providing their integrity. What deep emotional roots of the Russian post communist identity could be opposed the idea “We are Soviet people!”?

In the paper I will firstly prove that emotional component of the modern Russian identity reproduces some emotions and feelings which could be defined as emotional background of the Soviet past and this phenomenon is being intensely discussed. Secondly, I will focus on the attitudes to the emotional component of the Soviet identity shared by Russian liberals and nationalists who are advocating opposite conceptions of post Soviet Russian identity. Thirdly, I will assert that both anti-communism of liberals and ethnocentrism of Russian nationalists destructively affect the process of creating modern Russian identity splitting the nation and contribute to polarization and radicalization of emotions. Finally, I will try to answer the question: what is special in molding the modern Russian identity compared to other post-communist countries?

Building Emotional Cleavage: Emotional Narrations as Meaningful Sources of Political Affiliation
Jakub WYSMUŁEK (Polish Academy of Sciences, Poland; Department of History, University of Warsaw; The National Library of Poland) | jakub_wysmulek@yahoo.com

The paper aims to demonstrate the role which emotions play in the political discourse of contemporary Poland. It concentrates on the concepts around which ideological divisions and narratives of competing political camps are formulated. The central issues of the study, though, are not ideologies, but different images of emotions. I analyze the discourses of the two dominant political parties in Poland: Law and Justice and Civic Platform, in the time frame from 2005 to 2011. After the presidential and parliamentary elections of 2005, the dominance on the Polish political scene captured two young parties originating from the post-Solidarity camp. This event forced them to introduce serious changes
in the current political discourse along with the reorientation of the new dominant cleavage of conservatives-liberals axis line. As the consequence, the current political discourse about emotions has changed in both parties, while the very concept of emotionality has gained importance in the political competition.

The main hypothesis of my research is that the new political division in the analyzed time period gained the features of "emotional cleavage", i.e. the attributed and widely perceived labels of specific "emotionality" of parties played a decisive role in their assessment, evaluation and consequently voting. The paper is based on the research conducted for my MA dissertation under the title "The Role of Emotion is Contemporary Polish Political Discourse", defended in the Institute of Philosophy and Sociology in Polish Academy of Science.

Emotions, affinity and party politics: Fooling the void?
Jonathan G. HEANEY (Queen's University Belfast, United Kingdom) | j.heaney@qub.ac.uk

The political sociology of emotions is continuing to emerge as an increasingly important arena within the wider scientific study of affect and emotion in social life. This has been particularly true in relation to the mobilization of emotions by social movements, and in the dynamics that attend to social movement formation and disintegration. Less attention, until quite recently, has been paid to the role of emotions in the field of power, and in one part of this field in particular: 'old fashioned' party politics and in the analysis and explanation of voter behaviour in contemporary, late modern polities. In this paper I critically engage with some recent work that does exactly this. There is, for instance, a small, but growing, literature on 'affective' or 'emotional' citizenship that engages with these topics in various ways, but could be strengthened by a deeper engagement with more recent developments in the broader sociology of emotions. Here, for example, recent work by Mary Holmes and Nathan Manning ((Holmes and Manning 2013, Manning and Holmes 2013) deploys a concept of emotional 'affinity' in relation to voter engagement in and disengagement from contemporary politics, foregrounding the concept of 'emotional reflexivity'. These are interesting and welcome contributions. In this paper I will critically engage with these issues, and the notion of 'affinity' in particular, using examples from a European context. I will focus especially the role of emotions in the politics of the Irish Republic. I argue that a more critical reading of these recent developments is possible.

Organizing emotions: a case study of merging social cooperatives
Giulia COLOMBINI (Pisa University, Italy) | colombini.giulia@gmail.com

With the recent crisis, many third sector organizations in Italy have been going through profound changes. The challenge in this situation resides in the need to reallocate capabilities and resources and to do so relying on a democratic participative process involving every level within the organization.

This research follows the experiment undertaken by two social cooperatives based in northern Italy that has ultimately led them to merge. The organizations we studied operate in the Veneto region and have mostly overlapping fields of intervention, but decided to try joining forces on some projects instead of competing for increasingly scarce resources. After collaborating for some time, the two cooperatives started an experimental phase to evaluate the possibility of merging. During this time they temporarily integrated some units to work on specific projects and opened a discussion about the advantages and disadvantages of being a unique entity. The joint work proved to be a success even if collaborating was not always easy. The existence of information asymmetries between the parts created fear of manipulations and a lack of trust.
There has been a debate among the workers about these emotions, their causes and possible consequences in the attempt to understand these feelings and prevent them from interfering with the joint activity.

This paper analyses all the phases of the process and tells the story of how Evaluational action-research, proposed and administered by the researchers to the shareholders, has fueled the discussion and led emotions to surface and conflicts to be understood and overcome.

**JS_RN11+RN20 - Emotions and Qualitative Methods**

**Investigating Emotions by Using Computer-Assisted Qualitative Data Analysis Software**

Elgen SAUERBORN (Freie Universität Berlin, Germany) | Elgen.Sauerborn@fu-berlin.de

In the context of sociology of emotions qualitative researchers always face the challenge of making the invisible tangible. Referring to Konopásek's idea of making thinking visible through computer-assisted qualitative data analysis software (CAQDAS), I argue that this software also has the power to visualize emotions in (interpretative) research processes. Using MAXQDA as an example, I will illustrate how software packages can be understood as more than simply a tool to structure data in emotion research. CAQDAS can rather be utilized as an instrument to visualize and therefore grasp emotions in your data. Furthermore, I want to emphasize the importance of cross-linking between different data sources for a better and deeper understanding of emotions.

I want to outline how sociological (not social!) interpretations in terms of memos, hyperlinked data segments, codes etc. within a variety of existing and gathered data sources can be visualized with the help of CAQDAS tools. When feeding the digital data with your own scientific interpretations, patterns and structures emerge out of your data that can assist in the analysis of emotions. This process of interpretations leads to new data that connects different sources and help qualitative researchers to disentangle the complexity of emotions via their visualization.

**Narrating emotion and affect: from examples to suggestions**

Jan K. COETZEE (University of the Free State, South Africa) | coetzeejk@ufs.ac.za

Narrative analysis is a qualitative way to unwrap the meaning ordinary people give of their experience of the life-world. This opening up of meaning cannot, however, be achieved without us understanding the rich variety of the experience in the life-world. We need to know more about taken-for-granted, familiar and largely unnoticed parts of everyday life, but we also need to know more about the experience of crises and turbulences, about turmoil and transformation, about the emotive issues embedded in experiences.

Everyday life is not only situational and problematic; it is also experienced as a drama that does not follow any script. We are all—researchers and research participants—simultaneously writers, producers and actors on a stage that is not necessarily of our own choosing. This paper reflects on the need to capture sensibilities, passions, orientations to flux and emergence, and even irrational aspects of life. The focus includes positive feelings as well as emotions such as greed, envy, pride, shame, hate and anger, all of which are part of the experience of being.

The paper touches on the need to access down-to-earth, but rich and passionate data. Only through “thick descriptions” (Clifford Geertz, 1973) by our research participants can we come to understand, account for and enter their everyday life. By using examples of "impressionist tales" (John Van Maanen, 1988) from my programme The Narrative Study of Lives the paper offers methodological suggestions how affect and emotion elicit dramatic vignettes.
Emotions in evaluation research
Sanja MAGDALENIC (Independent researcher, Sweden) | sanjamagda@hotmail.com

Drawing on recent methodological discussions that identify qualitative research as emotion work, this paper sets to explore how evaluators who work with qualitative methods manage emotions while doing evaluation research. Like research in general, evaluation research was traditionally viewed as an endeavor based on rational thinking and emotional neutrality. By focusing on experiences of evaluators who evaluate issues within the field of health and social care, in which they typically come into contact with people and social problems, the paper seeks to illuminate emotion management that may arise in the process of evaluating potentially sensitive topics – for example violence, poverty, cancer and dementia – and how evaluators deal with these. In addition, the aim is to address the knowledge gap, and encourage a debate, regarding emotion management in this particular context. The theoretical framework draws on emotion work theory and evaluation theory, including the concept of “emphatic neutrality” (Patton, 2015). Empirical evidence comes from interviews with evaluators who have carried out evaluations on sensitive topics. Preliminary findings suggest that emotions may appear in different phases of the evaluation research process: from choosing the topic of evaluation, developing project design, data gathering and analysis to presentation of results, and may encompass both research participants and the evaluator. The paper argues that a more reflexive understanding - and an acknowledgment - of the ways in which emotions intertwine with evaluation research may improve both the quality of the evaluation process itself and evaluators working conditions.

Emotions and belonging—from individual experience to organisational functioning. Exploring the process
Asta Helen RAU (University of the Free State, South Africa) | rauahm@ufs.ac.za

Evaluation as a methodological approach gave access to very hard-to-reach populations: orphans and vulnerable children (OVC) and their primary caregivers. Secondary data from case files provided quantitative measures on the efficiency of the OVC programme, but this paper focuses on qualitative insights from interviews, focus group discussions, observations, field notes, and child-contact sessions that included activities such as drawing and decoupage. Using multiple methods and a range of participants generated rich in-depth data that reflected multiple perspectives and allowed for insights on emotions and belonging, which go beyond findings normally obtained in an evaluation of organisational functioning. For instance, the OVC programme was initiated specifically to address issues of inequality in relation to the children and their households, but what was not anticipated is how these very inequalities would manifest and operate within the organisation itself. In interacting with participants and analysing data researchers had to be very vigilant of their own assumptions and emotional hooks. One hook was to buy-in to dominant discourses of orphans and vulnerable children—discourses that emphasise their difference in relation to other children. Data show how real needs of children, the organisation itself, as well as the wider community remain unaddressed when such assumptions are not challenged. What also struck researchers as sociologically significant—and which relates to the notion of the sociological imagination, was how themes within the organisation echoed themes in the wider social milieu—and how these themes reverberated in the individual as well as the collective emotions of participants.

Transcending science and policy. The role of expertise in handling environmental problems
Rolf LIDSKOG (Environmental Sociology Section, Orebro University, Sweden) | rolf.lidskog@oru.se
Göran SUNDQVIST (Department of sociology, University of Gothenburg, Sweden) | goran.sundqvist@gu.se

This paper focusses on the conditions and roles of expertise in contemporary societies, and in this uses findings from Science and Technology Studies (STS). The aim is to elaborate a conceptual meaning of expertise that is relevant for the sociological understanding of environmental problems in a society, which simultaneously can be characterised as scientised and uncertain. This elaboration is done in four steps. First, the concept of expertise is explored, foremost by discussing whether expertise is based on possessing a specialised knowledge (substantive view) or by seeing it as authoritative and trustworthy (relational view). Secondly, some recent contributions that aim to tackle the situation of scientific overflow in society – that science has great and many time unforeseeable influence on society – are discussed: one proposing a stronger but more restricted role for experts (Harry Collins) and one proposing a hybrid view where expertise more closely cooperates with other groups outside of science (Michel Callon). Based on this discussion, the paper finds that in order to create a niche for expertise in the understanding and handling of environmental problems in current societies, there is a need of transcending some of the dichotomies deeply rooted in the modern society, namely that of science and policy and that of professional and lay. Thus, the conceptual meaning needs to be unleashed from its tight connection to science and abstract knowledge thereby also including practical and embodied knowledge. Thirdly, the paper explores how expertise works, and this is done by discussing the role of boundary work to make authoritative knowledge claims possible. In what ways do experts use the dichotomies discussed above as resources when making knowledge claims on environmental problems? Thus, these dichotomies should not be seen as static obstacles in the developing of new forms of expertise, but as resources for new directions and possibly fusion between different kinds of knowledge. Fourth, the paper concludes by stating the need of a concept of expertise that i) transcends the science-policy dichotomy; ii) stress the contextual and relational character of expertise; iii) includes both abstract knowledge and other form of knowledge; iv) understands the performative outcomes of not only expertise but also of our sociological understanding of what expertise is and how it works.

Socially Constructing a Bridge Across the Atlantic: Towards a Cosmopolitan Environmental Sociology
Raymond MURPHY (University of Ottawa, Canada) | rmurphy@uottawa.ca

Prominent American environmental sociologists (see Dunlap 2014) have argued that there is a deep and wide divide between American and European environmental sociologies, and claim that the American realist, pragmatic perspective is superior to the European agnostic, constructivist, ecological modernisation approach, especially with respect to the analysis of anthropogenic climate change. Prominent European environmental sociologists (see Lidskog et
al. 2014) agree there is an ocean of difference between European and American environmental sociologies, but claim that the European contemporary-sociology-of-science based, reflexive, reformist framework is superior to the American radical, classical-theory based, critical approach. These issues are significant for environmental sociologies in other societies as well because these two sociologies are particularly influential. This paper examines whether there is such a huge difference between American and European contributions to environmental sociology, and whether apparently contradictory approaches, be they geographically based or not, can be integrated to form a stronger environmental sociology. It also explores whether differences in environmental sociology between these two continents explain, or can be explained by, the environmental performances of their societies, or whether sociology is an ivory-tower pursuit without influence on, or without being influenced by, other real-world social practices. Beck (2015) has argued for a cosmopolitan perspective to replace national perspectives, and the paper seeks to contribute to a more cosmopolitan approach transcending parochial continental viewpoints without sacrificing national comparisons and interrelationships.

**New Responsibilities in the Anthropocene: A Sociological Perspective**
Birgit BLÄTTEL-MINK (Goethe-University Frankfurt/Main, Germany) | b.blaettel-mink@soz.uni-frankfurt.de

Among international experts in climate research consensus is growing upon the fact that, with the industrial revolution, a new epoch began with human activities causing significant impact on the ecosystems of the Earth. From a sociological point of view it is interesting to reflect upon the implications of this recognition. For example, if the “normativity” of the concept of sustainable development has to be forgone, what does this mean for steering transformation processes towards sustainability and its legitimacy? What are the implications for bearing responsibility for the consequences of individual behavior? Referring to Max Weber we know the ‘ends-rational’ social actor who takes into account the consequences of its action. Whereas Weber mainly refers to the social consequences of one’s own actions, in the epoch of the Anthropocene, we also have to take into account the ecological consequences of our decisions, at least to a greater part than before. On the other hand, the consequences of climate change are not bad in itself but bad in the eye of the subject concerned. Though, has the recognition of human-caused climate change any consequences at all?

In my presentation I firstly wish to elaborate on the challenges of the Anthropocene for sociological environmental thinking as such and secondly search for concepts useful to handle those new challenges. Promising candidates could be the sociological concepts of risk, of not-knowing, of hybrids or, of justice.

**A practices approach to social learning, and its implications for environmental education of citizen-consumers**
Kris C.S.A. VAN KOPPEN (Wageningen University, Netherlands) | kris.vankoppen@wur.nl

Education and social learning are widely regarded as key elements of environmental reform, and have been explored in a vast range of studies. In many of these studies, however, the social mechanisms of learning remain implicit, and can be traced down to disputable concepts of knowledge transfer, reflexive communication, or social emulation. This paper presents a framework for education and learning that combines recent insights from social practice approaches (Schatzki, Reckwitz) with contextualization approaches in learning theory (Vygotsky, Van Oers). Vygotskian cultural contexts of learning can be analyzed in terms of practices. Learning occurs when new concepts are successfully (re)contextualized within a practice. This framework, it is argued, is more helpful for understanding and promoting learning
than other major approaches to learning in environmental reform (such as changing planned behaviour; or critical reflecting on systems). The paper then illustrates the framework by applying it to concrete examples of environmental learning with regard to consumer activities.

The relevance of social ontology: views on society in transdisciplinary research on socio-ecological systems and resilience
Sebastian SVENBERG (Environmental Sociology Section, Örebro University, Sweden) | sebastian.svenberg@oru.se

A fundamental characteristic of sociology is its ontological assumption that society is separable from other spheres. This assumption has, however, recently been challenged by claims that the social is merely networks of human and non-human entities implying the inseparability and hybridity of the social and the physical. Sociology has also been challenged from another angle, namely inter- and transdisciplinary environmental approaches which implicitly or explicitly foster a specific view of the social. However, the ontological presuppositions of these conceptualizations are rarely reflected upon. The aim of this paper is to explore the different characteristics and typologies of society and the social in applied interdisciplinary research on the current ecological crisis. A case is the Stockholm Resilience Centre which is a world-leading transdisciplinary centre that studies the governance of social-ecological systems with a special emphasis on resilience. Drawing from interviews with researchers as well as documents such as research programmes and research reports, this paper investigates how the Centre understands, conceptualises and demarcates the social as well as society. In particular, it analyses how the two concepts “resilience” and “transformation” – which recall classical sociological positions of stability and change – are used in their research. The paper concludes by stressing the importance of seeing the social and the ecological as distinct ontological spheres.

RN12S02a - Sociology and Climate Change I

Urban Climate Change and Energy in a Global City: A Case Study of Tokyo
Kazumi KONDOH (Michigan State University, United States of America) | kondohk@hotmail.com

Recent urban redevelopment in Tokyo made it a major global city with high-rise buildings accommodating multinational corporations and global business elites. Yet some experts claim that it has adversely affected its environment, which was already suffering from the burden of a dense population. In particular, Tokyo is currently affected by an environmental problem called “urban heat island,” which is caused by intensive land use and heat emissions due to energy consumption. It results in severe and prolonged heat during summer, thereby consuming a greater amount of energy for air conditioning. It also has negative impacts on human health and ecosystems. Applying Molotch’s “growth machine” concept this paper examines the Tokyo Metropolitan Government’s policies on urban renewal, the environment, and energy. Data for this study are derived from multiple sources such as government reports and statistics, newspaper articles, scientific articles, and interviews with government officials and scholars. The study finds contradictions and hidden connections in these policies that resulted in ripple effects on the environment as well as social injustice within and outside Tokyo. A lack of growth management has undermined the benefits of measures proposed to mitigate urban heat island. Construction booming of high-rise buildings has led to population growth, and hence, an increase in energy consumption. Renewal projects have displaced senior and low-income residents. Moreover, a growing demand for electricity has been responded by an increase in nuclear power supply, including that from the Fukushima Daiichi Nuclear Power Plant, whose
meltdown accident suffered hundreds of thousands of people in Fukushima and neighboring prefectures.

**ClimAdaPT.Local: A Portuguese case of municipal adaptation**

Luisa SCHMIDT (University of Lisbon, Portugal) | schmidt@ics.ulisboa.pt  
João GUERRA (University of Lisbon, Portugal) | Joao.Guerra@ics.ulisboa.pt  
Joao MOURATO (University of Lisbon, Portugal) | Joao.Mourato@ics.ulisboa.pt  
José GOMES FERREIRA (University of Lisbon, Portugal) | Jose.Ferreira@ics.ulisboa.pt  
Adriana ALVES (University of Lisbon, Portugal) | Adriana.Alves@ics.ulisboa.pt  
Alexandra BAIXINHO (University of Lisbon, Portugal) | Alexandra.Baixinho@ics.ulisboa.pt

This is a very first presentation of ClimAdaPT.Local project, as well as some of its first results. The project is aligned with the main aims of the European Strategy for Adaptation to CC and of the Portuguese Strategy for Adaptation to CC (ENAAC). Searching for an effectively promotion of CC adaptation at local level, the following are the main objectives: 1. Embedding the climate change adaptation dimension on municipal level in Portugal; 2. Creating a community of municipal actors, aware of climate change issues and trained for the use of decision support tools on adaptation; 3. Promotion and provision of local adaptation knowledge particularly in the definition of strategies, planning and implementation of measures and results communication; 4. The reduction of barriers and constraints on the local actors involvement on adaptation process; 5. Integrating adaptation into municipal and sectoral agents decision and planning processes. A transdisciplinary and highly recognized team is supporting 26 pilot-municipalities in elaborating their own Municipal Adaptation Strategies and facilitating their implementation. This team is simultaneously raising awareness of local stakeholders and providing training to municipal technicians regarding Climate Change Adaptation issues, while promoting Adaptation mainstreaming into local planning tools/policy. It will also develop products that will facilitate municipal strategies elaboration and implementation by the pilot-Municipalities involved in this project and, in the near future, the goal is to spread this approach to all the other Portuguese Municipalities.

This presentation will be focused on the methodologies/process of engagement of stakeholders, and in a first diagnosis of reality, drawing on the results of the first questionnaire survey applied to 52 participants (municipality’s representatives) in the project.

**Saving the Earth is Fun! - A Paradigm Shift in Narrating Climate Change**

Dominik SCHREIBER (University of Mannheim, Germany) | dominik.schreiber@uni-mannheim.de

Since its very beginnings in the 1970s western discourse on anthropogenic climate change has had a strong preference for apocalyptical and cataclysmic narratives. Nothing less than the end of the world and the destruction of our environment have been imagined over and over again. The rhetorical strategy behind these narratives was, to put it simple: Scare to initiate action against global warming. But recently it has been realised that the strategy does not work, yet arouses counterproductive effects such as fatalism, neglect or even denial. There are growing signs that, as a reaction to this, a paradigm shift is taking place. Terrifying narratives such as the opening video clip for COP15 or the controversial British ‘Bedtime Story’ are being replaced by a new way of framing the issue. Saving the earth is fun!, seems to be the new message. Examples are videos of the current campaign “Zusammen ist es Klimaschutz” by the German Federal Environment Ministry, in which a teenager catches his parents literally with their pants down, or a online advertisement produced by Greenpeace UK with highly visible quotations of the well known computer game Street Fighter II.
In my presentation I would like to scrutinize this paradigm shift using the example of the aforementioned social marketing video clips from a socio-narratological point of view. I would like to analyze how within the genre of social marketing videos the communicative potential of fictitious and creative storytelling is used to cope with well known communicative problems, for instance invisibility of concrete climate change phenomenon or complexity of geophysical scientific knowledge. The presentation describes two innovative moments: First topically in the exploration of a new paradigm and second methodically in the narratological approach to climate change video clips.

The Significance of Cosmopolitanism and Nationalism for Environmental Concern
Sara S. ÖLDUDÓTTIR (University of Iceland, Iceland) | sso11@hi.is

Climate change is the prime example of a thoroughly global environmental problem. While aspects of this problem are shared across the global population, its consequences are mostly felt by poor people in poor countries. An affluent country like Iceland has and keeps contributing to global environmental problems through high consumption levels and heavy industry while its public’s direct experiences of environmental problems are among the lowest in the world. This leads to the assumption that the extent to which members of richer populations empathize with ‘distant Others’ will impact their evaluation of such unevenly distributed problems. There is a strong tradition for survey research into the value basis of environmental concern within sociology and an increasing interest from outside the discipline in how people’s values circumscribe particular attitudes and beliefs about the environment, such as ‘climate-denial’. However, cosmopolitan and nationalist value-orientations have to a large extent been overlooked in such research. The aim of this paper is therefore to examine the significance of cosmopolitanism vs. nationalism for public attitudes to global environmental problems, more particularly in a rich country with good environmental conditions. Data from the Icelandic part of the International Social Survey Program’s (ISSP) third module on the environment was examined. Supplementary items tapping cosmopolitan and nationalist value-orientations were added to the standard questionnaire. The data was gathered in March 2012. Findings from regression modelling reveal the negative association of national chauvinism as opposite to positive association of cosmopolitanism with a variety of measures of environmental concern.

RN12S02b - Sociology and Climate Change II

We know… but why do we not act? A sociological look at an apparent paradox
Josef UNTERMARZONER (University of Innsbruck, Austria) | untermarzoner-j@gmx.net

Knowledge about causes and effects of climate change is widespread and is generally accepted, but still large parts of society don’t seem to act according to this knowledge. I will try to provide a sociological answer to this apparent paradox by combining elements from the works of Kari Norgaard, John Urry and Elizabeth Shove. First, agreeing with Norgaard, I argue that the main reason for “not acting” in the face of climate change is not a lack of information. Instead, negative emotions trigger the process of the “social organization of denial”. However, this is only a part of the answer: Second, I argue that Urry’s analysis of resource-intensive, socio-technical systems that are “locked-in” provides an additional explanation for why we continue to perform emission-intensive practices instead of acting more responsibly. While Norgaard’s analysis remains largely situated in the cultural sphere, Urry’s work adds a structural
viewpoint to the discussion. Third, Shove’s notion of “services” as complexes of practices which always persist of a cultural and a socio-technical component helps to link Norgaard’s and Urry’s explanations. Additionally, the focus on everyday practices helps to overcome the division between a micro- and macrosociological examination of the problem. Only by combining these three perspectives it is possible to grasp all the cultural and structural barriers that lie between “knowing” and “doing” in the face of climate change. I conclude by pointing out some suggestions which follow from this combined perspective that can help to overcome the “paradox” by stimulating the sociological imagination.

The Social Justice Prism of Climate Change Policy - The Case of Israel
Carmit LUBANOV (The Association of Environmental Justice in Israel (AEJI), Israel) | don1298@netvision.net.il

The summer of 2011 saw one of the largest social protests in Israeli history. For many years the main discourse of both the public and decision-makers have dealt primarily with security issues, whereas today it seems that social-economic issues have become pivotal on the public-political agenda.

New research uses tools from the socioeconomic field to examine and analyze recommendations, for the promotion of GHG emissions and mitigation policies. It addresses claims made in international policy forums, according to which the continued disregard of inequalities in many consumer sectors, constitutes a major barrier in processes striving for international agreement on greenhouse gas emission mitigation, and their consequent implementation.

The aims are to advance effective greenhouse gas mitigation policies, while ensuring equal distribution of the burden without exacerbation of inequalities; The research studied the impact of climate policies on social justice in Israel, based on two main questions:
1. Do GHG mitigation plans in Israel lead to an increase or a decrease of disparities between socioeconomic deciles in Israel?
2. What impact do the measures for GHG mitigation have on poverty and vulnerable population groups in the country? This section also explores the situation with respect to disparities between geographical regions in Israel.

The article describes the research working process and the analyzing methodology of the main recommendations featured in government decision the official greenhouse gas emissions mitigation plan, as well as other activities by state agencies to mitigate emissions identified by five main sectors: electricity, building, transportation, fuels and waste.

Effectiveness, fairness and acceptability of climate change mitigation policies: the role of trust
Eva KYSELÁ (Charles University Environment Center, Czech Republic) | eva.kysela@ff.cuni.cz
Iva ZVERÍNOVÁ (Charles University Environment Center, Czech Republic) | iva.zverinova@czp.cuni.cz
Milan ŠČASNÝ (Charles University Environment Center, Czech Republic) | milan.scasny@czp.cuni.cz

While experts and policy makers may actually agree on policies which are effective in mitigating climate change, the public might not always agree with them and perceive these effective policies as ineffective. The public perception of policy effectiveness is influenced by several factors, while it also plays a key role in whether the individuals are willing to support or even pay for the proposed policy or instrument. Based on the results of a systematic review of empirical
studies exploring the factors influencing policy acceptability, a quantitative survey into these factors was conducted on a representative sample of population in the Czech Republic, the United Kingdom and Poland. One of the objectives of our survey is to examine the role of trust – both in institutions and fellow citizens – in the formation of policy specific beliefs, such as perceived policy effectiveness or infringement on freedom, while controlling also for socio-demographic variables, environmental attitudes, values, and personal norms. There are two key questions behind the analysis: whether individual attitudes and values, and second, whether trust in institutions are strong factors to enhance positive evaluation of policy instruments, especially if trust was raised and built by increased credibility of the institutions proposing and promoting the policies. The presentation summarizes the insights from the literature review in regard to the influence of policy specific beliefs on policy acceptability and the empirical results from the survey.

"Climate crisis if we don’t cut meat eating in half": Swedish news media framings of meat

Kajsa-Stina Simone BENULIC (Södertörn University, Sweden) | kajsa-stina.benulic@sh.se

The Swedish meat consumption has been deemed ecologically unsustainable by NGOs and government authorities alike. According to the Swedish Board of Agriculture (SBA) most Swedish consumers should be aware of the negative environmental impacts stemming from meat production. Yet meat consumption is continuously increasing in Sweden, remaining at levels twice the global average. The same actors questioning the sustainability of this development, e.g. the Swedish Environmental Protection Agency and SBA, conclude that the most plausible route to change is to pave the way with communicative informational efforts. Despite the claim of consumer awareness and despite the often emphasized role of news reporting in meeting environmental challenges the Swedish media content on meat has not been analysed. This article fills that gap through an examination of the media content on meat in four Swedish newspapers between January 2006 and May 2013. Assuming that news media hold a pivotal position in facilitating individual or collective activities to meet ecological sustainability challenges, through the empowerment of citizens (Olausson, 2011), the following main questions are answered: How is meat consumption and production framed in Swedish news media? How may the framing facilitate sustainable consumption?

The analysis showed that meat consumption is often defined as a cause to environmental problems and that the most common treatment recommendation is decreased meat consumption. This echoes SBA’s claim of consumer awareness and in that sense the news media framing of meat may facilitate sustainability changes. But it remains to be shown how consumers interpret the frames.

RN12S03a - Natural Disasters, Resilience, and Vulnerability I

Cooperation in unequal transnational settings: The roles of vulnerability, state interests and capacity in implementing the Baltic Sea Action Program (BSAP)

Björn Åke Anders HASSLER (Södertörn University, Sweden) | bjorn.hassler@sh.se

Regional environmental governance is an emerging research area focusing on the roles played by regional institutions and organizations in the management of transnational ecological disturbances. Intergovernmental organizations such as the Helsinki Commission (HELCOM) may allow smaller groups of proactive countries to go further than what is possible in broader
regulatory structures at higher levels. Potentially, they could therefore become important complements to e.g. global conventions, as well as mechanisms for putting pressure on laggard states and serve as role models for other regions. Moreover, regional organizations can serve as mechanisms for rescaling national initiatives to regulatory structures at higher levels in order to increase transboundary impact. However, potential mutual benefits from trans-national cooperation are not always forthcoming, as collective action problems such as free-riding could hamper collaboration and invite opportunistic national strategizing among governments that may tend to prioritize national interests over regional improvements. The empirical work in this study involves examining the progress of HELCOM member states against the targets set out in the Baltic Sea Action Programme (BSAP; agreed upon in 2007), noting that there are substantial differences between the member states in terms of e.g. administrative capacity, available resources and vulnerability to loss of Baltic Sea ecosystem services. Agricultural run-off is the actionable area that has been selected for this case study because it is the largest contributor to Baltic Sea eutrophication and as its diffuse character makes it difficult to address. The research questions being asked in this article are: (1) to what extent do the National Implementation Plans (NIPs) of the HELCOM members states correspond to the BSAP agreement, (2) how did the formulation and reporting of these NIPs influence the revision of national nutrient reduction targets that took place during the preparation for the follow-up Ministerial meeting in 2013 and (3) how could these revisions be analyzed and explained by factors related to vulnerability, interests and capacity in the formation of national strategies? To answer these questions, the content and approaches in the NIPs will be compared with the BSAP, using minutes from relevant HELCOM meetings, reports from the Ministerial meeting and other forms of documentation, complemented by interviews with national delegates and other key participants in the this phase of the BSAP process.

Floods in a changing climate: Understanding the role of crisis in policy change
Catherine BUTLER (University of Exeter, United Kingdom) | c.butler@exeter.ac.uk

Climate change brings imperatives to transition societies in ways that are both consistent with mitigation targets and responsive to socio-environmental impacts associated with increases in global temperature. Governmental policy and related forms of socio-political action are likely to play a major part in achieving the necessary transformations and resilience across broad spectrums of social life. In this context, there arise an important set of questions around how policy change occurs and what its role might be in such processes. Previous theory and research (e.g. see Kingdon, 1995; Johnson et al. 2004) has pointed to the importance of socio-environmental crises in creating windows of opportunity for policy change. Taking the UK’s 2013/14 winter floods as a case study, this paper will examine how governmental policy and collective responses involving multiple actors are unfolding in the aftermath of the floods, and the implications this has for longer-term climate adaptation and wider processes of transformation. The paper uses insights derived from interviews with members of the public affected by the floods and stakeholders with professional roles related to flooding and climate change, to re-examine existing political and social theory on policy change. Insights into the processes of policy and wider socio-political change following these major floods are presented and implications for the long-term transformations likely to be necessary for climate adaptation are discussed.

Preparedness to natural disasters within the nuclear industry
Marja YLÖNEN (University of Jyväskylä, Finland) | Marja.k.ylonen@jyu.fi
Natural disaster, earthquake and the subsequent tsunami caused a loss of electrical power and led to the ultimate heat sink in Daichi nuclear power plant in Japan, in 2011. Since then safety standards by the International Atomic Energy Agency, and the reference levels of reactor safety by the Western European Nuclear Regulators’ Association have been revised. This paper studies how nuclear industry has prepared for the natural disasters especially after the Fukushima disaster. It also examines differences between the nuclear industrial countries (UK, Sweden, Finland) in preparation to natural disasters before the Fukushima. The paper draws on the concepts of risk and resilience and it looks at the recent developments within the field of resilience engineering and risk assessment to provide possibly new insights into the risk and precaution discussion. Hence paper combines both conceptual and empirical study. The objective of the paper is to gain understanding of conceptual insights into risks and resilience as well as concrete empirical answers to risks and dangers within the high risk industry. The data consist of documents of the international nuclear energy organisations and national regulatory bodies, as well as interviews with nuclear safety authorities. Content analysis is deployed as the method of analysis.

In-between sufferings – Vulnerability, Risk and Damage in Relation to the Fukushima Nuclear Accident
Atsushi NOZAWA (MEIJI UNIVERSITY, Japan) | ats.nozawa@gmail.com

As Riley Dunlap called an orientation of the Japanese environmental sociology “victimology”, the Japanese researchers have focused on the understanding suffering based on fieldworks in the damaged areas. This presentation discusses sufferings caused after Fukushima nuclear accident.

It has become clear that the effects of the accident have been distributed unevenly over vulnerable people. The survey focuses on people with disability in Fukushima city and the main purpose is to reveal what kinds of risks and damages they have been confronted with.

Now, just only four years on from the accident, medical symptoms caused by exposure to radioactive substances have not yet appeared, In that sense, no damage can be found. However, the lack of care assistances has made it more difficult for people with disabilities to lead normal everyday lives. In near future, they may be exposed to risks of deprivation of opportunities for independent living or the right of self-determination. This is the problem before the accident, but has become more severe after the accident. These deprivations can be called kinds of damages by the nuclear accident.

Risks and damages closely related to social contexts that a person belongs to. In order to understand the meaning of today’s sufferings by environmental pollution, environmental sociologists need to collaborate not only with social science about environment but also with other social science, in this case, like social welfare studies or disability studies. These interdisciplinary works will contribute the paradigm of environmental sociology to meet the needs of the times.

From Britanny Cyanobacteria to ontological regims. A case study to adress sociological imagination
Philippe BOUDES (Agrocampus Ouest & UMR ESO CNRS, France) | philippe.boudes@agrocampus-ouest.fr

During this communication, i propose to develop a case study related to water and cyanobacteria management in a rural area, in order to discuss questions uderpined by the call for paper. The example I took is an interdisciplinary study about the Marcille Robert’s pond. Its water level has been modified because of the discovery of cyanobacteria within it, depending now of ecological
