controversies, leeway of public institutions pond owners, and local mobilizations of residents and inhabitants of the town. The choice to lowering and raising the water level has generated a conflict between the residents and users of the pond and administrative, technical and scientific actors. It is in this context that a research was conducted, mobilizing documentary sources and interviews with involved actors and local population.

Through this case study, I would like to demonstrate, as other scholars before me, that this type of conflict around environmental issues reveals latent issues: here behind the dispute regarding the lowering of the pond, opponents express a vague feeling of abandonment of their village or questioning their identity and claim the recognition of their local experience as well as other forms of knowledge.

We will insist on highlighting the different logic of definitions of the report to the pond by the actors, taking here a model already developed by Micoud and repeated elsewhere. While questioning the conceptual, normative and ontological dimensions convened by the various players, related to the actual management of the pond and its water level, we will complete this analysis by combining the themes highlighted by the call for papers.

**RN12S03b - Natural Disasters, Resilience, and Vulnerability II**

**James Cameron's “Avatar” as a sustainability tale or: How to avoid the apocalypse of growth and come to harmony with nature**

Jens JETZKOWITZ (Martin Luther University Halle-Wittenberg, Faculty of Philosophy I, Germany) | jens.jetzkowitz@soziologie.uni-halle.de

Since the discourse on sustainable development has established itself in public political debate, cultural industry produces sustainability tales which have a broad impact on the reception of these ideas. While most of these tales are told by the means of documentary film, feature films envisioning an alternative sustainable society (or the transition to it) are rather rare. Among those movies with a fictional storyline Cameron's Avatar [2009] is the most successful production. It presents a science fiction novel featuring Jake Sully, a paraplegic marine who became disabled in a war over energy. Replacing his deceased twin brother on a mission requiring his identical genome, Sully is given the opportunity to become acquainted with rainforest moon called Pandora and its resident society, the Na’vi. The supremacy of the Na’vi civilisation over humans' destructive patterns of action is the overall issue of the movie.

Since both the popularity and the logic of construction support the view on Avatar as an exceptional case worth to be studied in order to understand form and function of narratives of sustainable development in popular culture. In my presentation, therefore, I provide a case study (Flyvbjerg 2011) to discuss the formative role of world views and values for the anticipated future of society, may it be catastrophic decline or hopeful beginning or both. I interpret Avatar as a tale of a transition from our growth-driven society to a society that is harmoniously embedded in nature. Based on reflections on cinematic history I take a semiotic approach to analyse the narrative structure of Avatar and the characteristics of both societal dynamics presented in the movie. Based on structuralist theory of mythology I finally identify the core problems of the pantheistic worldview and the cultural change toward sustainability which are implied in this tale.

**Disaster governance: An investigation of the 2013 flood in High River, Alberta**

Eva A. BOGDAN (University of Alberta, Canada) | ebogdan@ualberta.ca
Numerous jurisdictions in Europe have found that wicked issues like flooding are effectively addressed through systems-approaches that incorporate environmental and sociopolitical dimensions, as well as more integrated approaches, such as inclusion of, and collaboration among, key stakeholders (Ashley et al., 2012). Moving towards such approaches requires institutional, rather than technological, innovation (Shrubsole, 2013), and a cultural shift since culture is one of the main factors for disaster losses (Mileti, 1999). Culture shapes disaster governance, consisting of norms, organizational and institutional actors, and practices designed to reduce the impacts and losses associated with disasters (Tierney, 2012). This study explores disaster governance and its decision-making processes with regard to Alberta’s 2013 floods, the costliest natural disaster in Canada's history. Alberta, home to the largest oil sand operations in the world, has had the strongest performing economy in Canada in recent decades and historically focused on large-infrastructure mitigation approaches. The estimated $6 billion cost of the disaster, excluding mitigation expenses, and a growing sensitivity to the implications of climate variability, has triggered reassessment of costly structural solutions and exploration of European approaches to flood management. This research aims to address the dearth of literature on contextual factors affecting disaster governance (Tierney, 2012).

Future changes of human-nature relationship and socio-ecological resilience - Lessons from a participatory scenario building process in Kiskunság, Central Hungary

Orsolya LAZANYI (Environmental Social Science Research Group, Hungary) | lazanyi.orsolya@essrg.hu
Eszter KELEMEN (Environmental Social Science Research Group, Hungary; Szent István University, Hungary) | kelemen.eszter@essrg.hu
Boldizsár MEGYESI (Hungarian Academy of Science, Centre for Social Sciences, Institute for Sociology) | megebold@gmail.com
Bálint BALÁZS (Environmental Social Science Research Group, Hungary) | balazs.balint@essrg.hu
György PATAKI (Environmental Social Science Research Group, Hungary; Corvinus University of Budapest, Hungary) | gyorgy.pataki@uni-corvinus.hu

The coevolution of natural and the social systems – affecting human-nature relationships – influences the resilience of socio-ecological systems and determines their future viability. Co-evolutionary processes of nature and society are usually studied from a historical perspective. Exploring the possible future changes of human-nature relationships, however, sheds light on how socio-ecological resilience might change and offers possibility to consciously shape human-nature interactions. A participatory scenario planning process is presented to discuss the consequences of changing human-nature relationships on the resilience of the socio-ecological system of Kiskunság, Central Hungary. Open and transparent discussions engaging local stakeholders have been initiated to identify key drivers and develop exploratory scenarios as part of the OpenNESS project. Four scenarios were developed by a group of 25 inhabitants along two drivers: policy centralization and community strength. Centralized policy was correlated with a technological-instrumental approach to mitigate the impacts of ecological changes, while decentralized policy was considered to help building adaptive capacities at local scale. Strong local community was seen as the source of community based solutions that revitalize traditional human-nature relationships, while weak communities were regarded as the arena of competing solutions that utilize experiential knowledge of individuals. Tightening human-nature relationships and applying strategies that flexibly adapt to changes of nature were seen as key factors in maintaining the resilience of local communities. However, while strong community was unambiguously preferred by participants, the optimal level of policy centralization was debated.
This indicates that competing standpoints over adaptation or mitigation strategies exist in the local community.

Rural communities of eastern coast of Madagascar: climate change, vulnerability to natural disasters and their consequences
Marek HALBICH (Faculty of Humanities, Charles University in Prague, Czech Republic) | marekhalbich@yahoo.com

The whole eastern coast of Madagascar is often called the Coast of Pirates, Vanilla coast or Cost of Cyclones. While the first name has rather a historical character nowadays, the latter is especially true for the northeastern part of the province of Toamasina and the southern part of the province of Atsiranana, and the third name is probably the truthful expression of reality. Devastating cyclones, whose frequency can be caused by global climate changes, in a relatively short intervals affect this part of Madagascar on the shores of the Indian Ocean. It causes that the local people are getting into a spiral of social, environmental and economic changes which is increasingly difficult to cope with, furthermore as a result of the deep political crisis which broke out on the island in March 2009. Firstly, the paper deals in the theoretical level with sociological issues of climate change and secondly, shows in the more specific level on the basis of a field research in a few communities of eastern Madagascar the current consequences such as those associated with the recent strong cyclone Giovanna, devastating rains and burning of land for the purpose of obtaining small agricultural land, etc.

RN12S04a - Renewable and Non-renewable Energies I

Shale gas and the politics of knowledge – A comparative analysis of the controversies on Hydraulic Fracturing in Poland, France and Germany
Matthias Sebastian KLAES (Augsburg University, Germany) | matthias.sebastian.klaes@phil.uni-augsburg.de

One of the crucial questions for the 21st century is how the global energy system can become more sustainable. With the decline of nuclear energy, the exploitation of shale gas and oil by hydraulic fracturing, or fracking, seems to be a key issue in current energy debates. Although advocates of this technology underline both its economic and ecological potential, fracking is highly controversial due to the potential risks it involves. Throughout Europe, there is an ongoing debate that has generated a wide range of positions. In Poland, fracking is considered as a matter of national energy independence whereas in France, it is primarily regarded as a risk technology. In Germany, fracking is seen both as a risk technology and a transitional technology. Based on case-studies from each of the three countries, I suggest a comparative analytical framework to explain these different ways of handling shale gas and oil extraction. Drawing on the Sociology of Knowledge Approach to Discourse (SKAD, Reiner Keller), I assume that the debates on fracking can be analysed as knowledge conflicts and thus occur as competing politics of knowledge. In addition, I use the concepts of Civic Epistemology (Sheila Jasanoff) and the Economies of Worth (Luc Boltanski/Laurent Thévenot) to understand the different ways of evaluating and justifying the technology against the background of country-specific institutional, political, and cultural differences. Thus, I intend to provide a better understanding of current energy debates under the conditions of transformative energy politics.

The Effect of Local Government’s Finance on Siting Nuclear Facilities
Yoichi YUASA (Kanto-Gakuin University, Japan) | yuasa@kanto-gakuin.ac.jp

The aim of this presentation is to examine the effect of local government’s finance on siting nuclear facilities in Japan for comparing with European countries.
Siting nuclear facilities can provide some economic benefits like as job opportunities to local communities and governments. In many countries including European countries and Japan, economic benefits work as incentives to acceptance of nuclear facilities. But we need to note that Japan has an original incentive system, comparing with European countries. This system consists of the property tax and subsidies based on Three Power Source Development Laws (known as the Dengen-Sanpo in Japanese). By this system, host local governments can receive 2 or 3 times amount of income as much as the former size of its’ budget.

We have to ask 2 questions on this system.
1. What kind of influence does this system has on the decision making process of siting?
2. What kind of influence does this benefit has on economy and society in host communities and governments?

The answer to the first question is that local governments are highly likely to accept nuclear facilities for receiving those benefits. This likelihood is influenced by some characteristics of the system of local government’s finance in Japan. The Japanese local government takes much more responsibility for management and development of its’ area than in European countries. However, the system can distort the democracy of the decision-making processes of siting.

The answer to the second question is that this system can let local governments go to bankrupt. Local governments can receive huge size income but temporary. The property tax from nuclear facilities is going down gradually and the term that subsidies provided is limited. In addition, construction jobs for nuclear facilities are also temporary. Then, local governments are suffering from downsizing of its income and job opportunities in the area. Consequently, those governments hope to construct more nuclear facilities. Benefits from nuclear facilities are not stable and sustainable. We are wondering if this is truly good for local communities and governments.

We are showing data on local governments’ finance chronologically and ‘a cycle of addiction to nuclear facilities siting’. Finally, we are pointing out a relationship between democracy and temporal huge benefit.

Exploring the categories of social acceptance for wind energy based on rural field of China
Qian WANG (Nagoya University, Japan) | qian.e.wang@gmail.com
Yasushi MARUYAMA (Department of Social and Human Environment, Nagoya University) | qian.e.wang@gmail.com

In China, power generation via renewable energy, especially wind energy, has been financially supported by Chinese government and the scale of wind power plants has increased rapidly during the past few years. The present socio-scientific studies associated with social acceptance towards wind energy paid more attention to technology innovation and energy policy design in those developed countries, but the conclusion drawn from those cases was not suitable to China. Although there are several studies focus on quantitatively evaluate the public attitude and perceptions towards promoting wind energy, the local people’s acceptance towards installing wind turbine and its influence of on their quality of life are still not investigated. This article explores the acceptance of wind energy by rural residents who live surround wind farms and affect by wind energy (visual perception, auditory, economic benefit) in their daily life. Qualitative data were analyzed based on the grounded theory and indicated that among all the investigation cases, there were four categories of social acceptance towards wind energy:
resistance, indifference, tolerance, and altruistic. From the level of villages, these four categories of acceptance were apparently like a general collective tolerance status, even if some residents are unsatisfied or resistant with wind energy. Especially, it is found that the causes of deviation between collective performance and individual attitude are strongly relevant with the corporate property, government participation, and indigenous traditional culture. Furthermore, the level of acceptance by local residents for wind energy was influenced by the transparency of compensation process and top-down’s distribution approach.

Coal and wind. Socio-culture aspects of energy discourse in Poland

Maria ŚWIĄTKIEWICZ-MOŚNY (Jagiellonian University, Poland) | maria.swiatkiewicz-mosny@uj.edu.pl

Polish power industry is based on coal. Sustainability, energy safety and EU policy concerning CO2 cause necessity for rethinking and searching alternative energy sources. One of those is wind energy. In the presented paper I will analyse media discourse about energy in Poland especially about coal and wind.

Coal, particularly in Upper Silesia (coalfield in Poland), is something more than energy source. Coalmine is a life style. Since XIX century coal miners created their own culture around hard and risky work underground, affirmation of family and religion (in this context it is important). They are very deeply engage in all tradition. Mining settlements (very characteristic) round the coalmine - breadwinner, coalmine-“mother” are very characteristic in Silesian landscape. Nowadays black gold is problematic, stigmatized as no ecological and uneconomic. Governmental plans for restructuration cause strikes and social unrest, which are feed by trade unions.

Wind plants and their social existence is diametrically different. It is “new”, “innovative” and renewable energy source. There is no specific cultural tradition round wind plants (and I do not suspect the wind-plant could create its specific culture), and no powerful trade union, but there are unwind groups (new social movements), which protest against. But wind-plant (any other “new” energy plant) require deliberative and participating procedure, which could be treated as a new political culture.

Comparing and contrasting media discourses about this two energy sources (“traditional” and “modern”), analysing socio-cultural aspects of energy policy in Poland I will try to show perspective of development renewable energy.

RN12S04b - Renewable and Non-renewable Energies II

Coloniality in the appropriation of nature: agrofuels production, dependency and constant primitive accumulation in the periphery of capitalism

Wendell Ficher ASSIS TEIXEIRA (University Federal of Alagoas, Brazil) | wwficher@yahoo.com.br
Sérgio Henrique ROCHA FRANCO (Universitat Autònoma de Barcelona) | francoshr@yahoo.com.br

This paper aims to understand territorial reconfigurations in the Brazilian countryside from the early 2000s on due to the expansion of sugarcane monoculture for production of agrofuels. Inspired by contributions of Latin American intellectuals converging around the so-called paradigm of modernity-coloniality, we propose that the asymmetric ownership of natural resources has been part of a condition of coloniality in the appropriation of nature. In doing so, we analyze data on direct foreign investment applied in ethanol production in Brazil and discuss the expansion of agrofuels production from Brazil to other peripheral countries. Furthermore, relying on concepts such as coloniality, imperialism, dependency, and constant primitive
accumulation, we inspect how territorial expropriation has been taking place in the Brazilian countryside. To achieve this goal, the paper is structured around two inter-locking parts. The first part focuses on data analyses of the amount and origin of foreign direct investment applied in ethanol production to point out that agrofuels production has been a profitable way to avoid over-accumulated capital devaluation in centralized economies. In this sense, the territorial reordering that accompanies sugarcane monoculture represents both a lucrative way to employ idle capital and the geographical expansion of capital domains. In addition, we suggest a connection between financial and climate crisis through which new markets are created and leveraged by discourses of environmental conservation. In this process, air, soil and water are depredated, and diverse social groups, such as indigenous people, riverside communities, and peasants, have been dragged into new circuits of accumulation.

Emerging energy practices in the smart grid
Robin SMALE (Wageningen University, Netherlands, The) | robin.smale@wur.nl
Gert SPAARGAREN (Wageningen University, Netherlands, The) | gert.spaargaren@wur.nl
Bas VAN VLIET (Wageningen University, Netherlands, The) | bas.vanvliet@wur.nl

Smart grids are a key feature of future energy scenarios in Europe, intended to facilitate more sustainable patterns of energy consumption which match (renewable) energy generation. Householders would become domestic energy co-managers, who, by monitoring and timing their consumption, contribute to the sustainability and stability of the energy grid. However, the roll-out of smart grids constitutes an intervention into established domestic energy practices. Individualistic and economic understandings of householders do not provide adequate insight into the dynamics of everyday energy consuming behaviour. The enrolment and empowerment of householders in smart grids is a complex and problematic process. In this paper, a literature review is combined with interviews conducted with householders and system actors to shed light on the role of householders in co-shaping the smart grid through energy practices. A dynamic practice-theory-based model is presented which conceptualizes domestic energy practices as relatively stable patterns of behaviour. At the same time they are embedded in energy systems of provision under change and (re-)produced through (inter)actions within households. In addition, the paper addresses new interactions between householders, individual and shared learning trajectories, and renegotiations of domestic moral economies and standards of comfort, cleanliness and convenience. It is argued that a thorough understanding of these processes of change in domestic energy practices will lead to better informed policy interventions concerning the roll out of smart grid infrastructures in Europe.

How resource use caps deliver social justice
Veronika KISS (Budapest Corvinus University, Hungary) | veronikakissphd@gmail.com
György PATAKI (Budapest Corvinus University, Hungary) | gyorgy.pataki@uni-corvinus.hu

Scientific evidence has long called attention to the unsustainable scale of resource use on Earth and the rising inequalities and social injustice related to it. Scientists have proposed different concepts and tools to remediate this issue (Daly, 1992). Unfortunately, not much has been achieved with regard to policy change to date. Humanity uses more resources than can be regenerated, but not share them equally among all people on this planet. Public policies still do not send clear signals to change these trends and find new ways for sustainability transitions. Especially due to the fact that post-WWII enhanced consumption trends have been coupled with neither a clear rise in subjective well-being, nor reduction in unfair distribution of benefits from resource use. The current economic and social arrangements underpins these patterns, thus
the need to re-adjust our way of living to our environmental space considering social justice is still unfulfilled.

The present paper aims to put into the spotlight the need for sustainable resource use, while ensuring dignity and fair benefit sharing for all by examining social aspects of resource capping proposals. Resource caps not only influence the size of the economy and thus contribute to sustainable scale, but, combined with access allocation/distribution mechanisms, they could also ensure, or hinder the necessary transformation towards a fairer distribution (Spangenberg, 2013).

This paper focuses particularly upon energy resource caps, since energy is a holistic resource and is needed to produce any of the goods and services we buy. Energy contributed to the Industrial Revolution and to all that has happened since possible by acting as a sort of multiplier to all other kinds of resource use. If it starts reaching diminishing returns, it would be harder for the economy to grow and thus providing well-being (Tverberg, 2014).

There are already some tools developed to limit energy use (Gyulai, 2010; Fleming et al, 2011). These tools involve capping the economy’s non-renewable energy consumption of a country/region and then essentially rationing out the energy available under the cap. The cap would be lowered year by year until it reaches sustainable levels. The tools intend to ensure that every individual receive the same amount of energy units covering their fair share in using energy. Over- and under-consumers can trade with the units saved. This trade preserves what's good and popular about rationing, in other words it guarantees minimum shares for all. At the same time, the trade (while considering absolute limits) allows people to consume based on their choices regarding their lifestyles and it avoids the unnecessary criminalization of ordinary people who wish to trade.

The social benefits these kinds of tools would deliver, however, are often forgotten. The public as well as scientific perceptions are dominated by the view that they primarily target the challenge of unsustainable resource use and thus aim to tackle environmental problems. Examining them more thoroughly, it may turn out that they contribute significantly to human well-being, especially of the poor. The system developed in the UK (Fleming et al, 2011) rewards primary marginalized people who use less energy (Dresner, 2004; Centre for Sustainable Energy, 2008), while the tools developed in Hungary (Gyulai, 2010) opens up opportunities for everyone equally through providing interest free loans and professional advice to transform their energy consumptions.

Furthermore, energy capping tools create jobs directly in the construction; renewable energy and energy efficiency sectors (Tomboicz, 2009). Furthermore, new jobs are also directly established in the advisory system set to provide proper life-style related recommendations for citizens affected by the schemes. Due to the spread of sustainable, labor intensive practices and the income generation of the poor, access to environmentally friendly goods and services would be enhanced, which contributes to the well-being of the whole society.

The expenses of households will be reduced if these kinds of schemes are implemented. On one hand, those who consume less energy than the fairly shared units under the energy cap can sell their received, unused units for those who consume more than their share and thus acquire income. The systems would contain assistance (Gyulai, 2010, Center for Sustainable Energy, 2009) for those poor people who consume more energy due to cheap and inefficient appliances or to the lack of control over home insulation either through providing interest free loans or governmental support. With the income gained they can either invest in energy reduction, thus further lower their energy use or they can spend it to other purposes, assumingly also contributing to their well-being. On the other hand, due to the absolute limit set for energy use people who consume more than their fair share would be forced to use less, and thus to invest in energy reduction or to simply change their attitudes and behavior.

Behavioral studies have consistently shown that intrinsic motivation drives us more than extrinsic motivation. This point is valid also to environmental issues (Crompton, 2010). These
schemes, being aware of this, may contribute to the transformation of values and consumer behavior through creating individual as well as common motivation with the limit set and the units distributed. Therefore, it is in everyone’s interest to assist each other and to work cooperatively to reduce our energy demand. Only this kind of encouragement of common purpose and actions deriving from them can benefit the individual and also the wider community, while can meet the requirement of the energy caps set. Meeting the annually decreasing energy caps provide a proper measure of how well a community affected by the proposed scheme is progressing towards a sustainable energy future. If the targets set are not going to be met, it will provide a clear signal that people affected collectively need to do more. Reviewing these theoretical proposals and studies on their social impacts, the present paper will consider both environmental and social aspects of energy use cap proposals and by doing so it aims to provide input to environment and society debates and suggest new ways for practical sociological research.

Articulating tensions in renewable energy knowledge practices
Dagmar LORENZ-MEYER (Faculty of Humanities, Charles University in Prague, Czech Republic) | d.lorenz-meyer@fhs.cuni.cz

The transition to low carbon energy systems is an explicit policy aim of the European Union. Amongst social scientists it is regarded as historically distinct, urgent and contested since it requires deep structural transformations not only in energy infrastructures but also in markets, policy and everyday practices and imaginations. Yet thus far research has focused most often on technical innovation and market incentives at the expense of more situated understandings of heterogeneous energy knowledge practices. In the Czech Republic the government introduced feed-in tariffs and tax exemptions to meet European targets of increased electricity production from renewable sources. Together with a decrease in costs for photovoltaics, this led to an unexpected boom in photovoltaic installations in 2010 that was subsequently back-scaled by the largely state owned electricity utility. While the grid provider referred to the inability of the power grid to handle the fluctuations that come with renewable source, environmental activists refer to the profit motive of the utility and its investment in the expansion of nuclear power. Drawing on ‘material semiotics’ (Law) and multi-sited ethnography this paper explores the
material renderings of a lively electricity grid in the laboratory of electrical engineers, and examines how science and technology are drawn on in recent campaigns of environmental movement organisations. A third entry point is the experiences of actors who live with or nearby solar power installations. What dis/continuities and partial connections in knowledge practices and ontologies become visible and what might this mean for the call to develop ‘post-carbon thinking and practice’ (Urry)?

RN12S05 - Social, Environmental, and Financial Pillars of Sustainability

The spatial demands of practice: the demand for and design of allotments and car parking in Stevenage
Nicola SPURLING (The DEMAND Centre, Lancaster University, United Kingdom) | n.spurling@lancaster.ac.uk

Problems of climate change present new challenges for social theory. Through the example of allotments and car parking in Stevenage 1950-present, this paper focuses on one of these challenges: the connections between planning, urban space and the changing contours of social practices. Rather than taking matters of provision as a starting point, the paper asks how do social practices demand space? and how do planners understand and prioritise the distribution of space for different practices? This is a combination of questions that has not been asked by those interested in urban space, a broad area of work that has considered how the structuration of spaces contributes to inequalities; explored how the agendas of multiple interest groups are negotiated into (and out of) plans; and, evaluated different national and local governance arrangements in achieving social ambitions. For those interested in climate change, the design of urban environments is a focus for transition to lower carbon, ecologically sustainable ways of life. Despite their varying agendas, these traditions take the provision of space as their focus, and consider how this plays out in the long term. The paper explores the multiple spatial demands of social practices, and considers how the changing contours of these demands and the activities of planners intersect. In doing so the paper highlights some of the processes of change and obduracy in urban structures and social practices that have implications for present urban environments, and shows how national policy has effect on the local. The paper contributes to topic 17 ‘Urban structures and environmental change’.

Bad Austerity, benign austerity: how antisocial cutbacks result in environmentally unsustainable poverty and why we should drop any growth-related hope
Ernest GARCIA (Universitat de València, Spain) | ernest.garcia@uv.es

Since the current economic, social and political crisis began in 2007, several magnitudes that are significant for sustainability have decreased in Spain, from the population to cement consumption or greenhouse gas emissions. However, the relative easing of the pressure on the environment has not resulted in better sustainability prospects, as the population is even more chained to a system of production and consumption whose environmental costs are far too high. Based on data on the environmental impact of life styles, obtained at the POSTCARBON
research project (CSO2011-24275), the following thesis is maintained: the addition ‘recession plus cuts in wages and rights’ not only brings suffering to large sectors of the population but also makes it harder to get out of the road to ecological collapse. In this regard, the desirability of a positive reconstruction of the idea of austerity is underlined.

Perception of smart technologies. The case of Media-TIC building in Barcelona
Monika KUSTRA (Open University of Catalonia, Spain) | mkustra@uoc.edu

In the midst of climate change, global economic crisis and ongoing urbanization processes, contemporary cities are facing numerous challenges. In this regard, there is a general consensus that smart city model based on ICT (Information and communication technology) solutions can become a key driver for providing sustainable development in urban areas. Smart city concept is strongly affixed with the demand for smart buildings, which optimize the management of resources by reducing energy costs and increase buildings’ occupants quality of life. So far considerable research has been devoted to the technical aspect of smart buildings and less attention has been paid to the perception of smart technologies by their users. Therefore, the goal of the research is to investigate social perception of smart and ICT-driven technologies as well as factors that support and barriers that hinder their use. The study will critically analyze if smart ICT solutions are considered to be universal and significant from the point of view of the users of the building. Interviews as well as a focus group were performed to investigate the social perception of smart and ICT-driven solutions by their users. In terms of case study, the analysis concerns occupants of Media-TIC building. The building represents Barcelona smart city concept by providing a platform that would act as a vehicle for the dissemination of new technologies, innovativeness and knowledge.

Sustainable Development or Sustainable Degrowth?
Iker AZKUE (Faculty of Humanities and Education (Mondragon University), Spain) | iazkue@mondragon.edu
Andoni EIZAGIRRE (Faculty of Humanities and Education (Mondragon University), Spain) | aelzagirre@mondragon.edu
Aitziber SAROBE (Faculty of Humanities and Education (Mondragon University), Spain) | asarobe@mondragon.edu

The sociology of ecological modernization and many of the theories regarding social change comprise the idea of a linear relationship between economic growth, technological efficiency, social-environmental conscience and environmental protection policies. The prevailing notion of sustainable development also suggests that economy and environmental protection are both compatible and interdependent, and that economic growth is a sine qua non in the correlation. However, these ideas are starting to be questioned from such disciplines as: Bio economy, Ecological economy and Theories of Post-development. These analyses question the idea of unlimited growth, explore the data of natural limits and question the theory of the unconditional relationship between growth, well-being and sustainability. The paper deals with above mentioned theories and substantiates the relevance and the need to incorporate the reflections on the planet’s carrying capacity to the theories about modernization. The paper also identifies the different variables used to quantify the magnitude of human impact on the biosphere. On this ground, the environmental and social sustainability of the Basque Country is empirically analyzed as based on a number of synthetic indicators and aggregates. The results indicate an overload of the natural capacity to offer resources, absorb waste and provide territory for the population and its technological, economic and consumer activities. The research findings specify that theories of social change, indicators of well-being and economic activity must be revisited under the premises of environmental sustainability.
RN12S06a - (Un-) Sustainable Consumption I

The Society of Waste

Jarno VALKONEN (University of Lapland, Finland) | jarno.valkonen@ulapland.fi
Olli PYYHTINEN (University of Tampere, Finland) | Olli.Pyyhtinen@staff.uta.fi
Heikki Sakari HUILAJA (University of Lapland, Finland) | heikki.huilaja@ulapland.fi

Waste is widely recognised as one of the most urgent environmental and social problems faced by humanity today. Curiously, and despite its ever-increasing quantity, waste has for long remained a visible invisible, something that we are faced with and yet find too disturbing and disgusting to encounter. Correspondingly, for the social sciences waste has been something like a ‘lost continent’ largely absent from the analyses of production and consumption. The main objective of the project The Society of Waste is to produce novel theoretical and empirical insights into waste and its role in society, consumption and the contemporary way of life. We study the municipal solid waste practices firstly in the private sphere by exploring what people do with and how they relate to the surplus material surrounding them. Secondly, we study the institutional waste management practices by exploring how waste is transformed into business and work. The Society of Waste proposes that not only is it necessary to redefine both production and consumption through and in relation to waste, but waste may also be more emblematic and constitutive of our contemporary way of life than, say, consumerism. The project consists of four empirical case studies that together reflect the various scales of waste as well as stress the linkages between them. The presentation introduces the case projects and their contributions in seeking answer to the main question of the project: what is the society of waste like?

Not-so-rich but still very consumerist

Mercedes MARTINEZ-IGLESIAS (University of Valencia, ERISOST-Interdisciplinary Research Structure on Sustainability Studies) | mercedes.martinez@uv.es

Within the framework of the research project POSTCARBON,CSO2011-24275 -Transitions towards a Post-carbon Society- the paper will present the results of the survey ‘Society Prospects’, conducted in December 2013 as an online questionnaire with a sample representative of Spanish society. Quantitative data are provided on the environmental impact associated to different income levels, consumption patterns and lifestyles. There is a correlation between income levels and environmental impact; even those groups with relatively low income have an environmental impact above sustainable level. In this sense, the current economic crisis does not point to a better environmental scenario.

The coolest waste: teenagers, electronic media, energy consumption and the problem of e-waste

Growing use of information and communication technologies (ICT) raises many environmental issues, including exposure to hazardous substances and energy consumption in manufacturing, operation and disposal, which are heightened by the short life-cycle of these technologies. This paper aims to explore practices and discourses related to the environmental impact of ICT.
devices by focusing on electricity consumption and electronic waste production among teenagers. It is especially interesting to center attention on teenagers due to their strong engagement with digital technology, energy-intensive lifestyles and technological optimism (Schmidt et al., 2014). The paper draws on a survey administered in three secondary schools in Lisbon and interviews conducted with Portuguese teenagers enrolled in the ninth to twelfth grade. Patterns of electronic media use and replacement by newer devices are outlined. The paper discusses how the meanings attributed to technological innovation and to owning improved products, and embodied habits and skills may be useful to understand the problem. This research received financial support from the Fundação para a Ciência e a Tecnologia under the grant EXPL/IVC-SOC/2340/2013.

The role of social inequalities in the transition to sustainable consumption: lessons from a participatory system mapping exercise

Gabriella KISS (Budapest Business School) | kiss.gabriella@pszfb.bgf.hu
György PATAKI (Corvinus University of Budapest) | gyorgy.pataki@uni-corvinus.hu
Gábor KIRÁLY (Budapest Business School; Corvinus University of Budapest) | kiraly.gabor@pszfb.bgf.hu

Though social inequalities have been a research topic for many fields of sustainability inquiry, including environmental sociology, ecological economics, political ecology, not many empirical investigations were conducted that is able to shed more light onto the relationship between sustainable consumption and social inequalities. Most recently, the de-growth perspective has put this topic on the theoretical and policy agenda. Sustainable consumption itself is a widely researched topic, though previous research has primarily focussed on the construction of theories, used methods that assessed the attitudes of large segments of the population analysing large datasets or applied qualitative techniques (interviews, focus groups) to uncover typical patterns of sustainable consumption. The research reported here, however, opted for applying a participatory exercise, namely participatory system mapping in order to uncover perceived causal relationships among the determining factors of sustainable consumption. By revealing the mental models of an expert and a lay panel, we can shed light on the cognitive constructions of sustainable consumption and their implications on policy-making. The two participatory system mapping exercises have shown that – as the theory of positional competition predicts – the widening of the social gap reinforces, on the one hand, the unsustainable positional contest and, on the other, serves as a strong base for group identities that are dissociated from sustainable consumption. The causal constructions of participants have also pointed out the incompatibility of social inequality and sustainable consumption. The policy-related lesson learnt is not to be underrated: social and economic policy that leads to the widening of the social gap work also against sustainable consumption patterns. Relatedly, policies targeted against social inequality can structurally support enabling conditions for sustainable consumption.

RN12S06b - (Un-)Sustainable Consumption II

Parasites of the Consumer Society: Dumpster Diving as a Way of Life
Olli PYYHTINEN (University of Tampere, Finland) | olli.pyyhtinen@uta.fi
Turo-Kimmo LEHTONEN (University of Tampere, Finland) | Turo-Kimmo.Lehtonen@uta.fi

The presentation draws from an ongoing study of dumpster diving as a way of life, using interviews, on-site participant observation and newspaper articles as its main materials. Waste provides a revealing vantage point to the contemporary consumer society. The dumpster divers, salvaging other people's rubbish, are placed simultaneously outside and within the consumer society, to which they have a critical relation, and from which they wish to disentangle themselves. Yet at the same time, with the culture of collective celebrating of the daily catch, the pleasure of discoveries, or the satisfaction given by the ability to save money, the joys and desires related to dumpster diving resemble very much those of consumption – an important difference being that the dumpster diver receives for free, without paying. Indeed, dumpster divers are parasites living off others' wastefulness. Ultimately, however, their dream is the abolition of the preconditions of their own way of life through bringing unsustainable consumption to an end. The controversies and conflicts related to dumpster diving have multiple sources: they are related to the problem of the wasteful western way of life; to dumpster divers transgressing the conventional ideas of cleanliness and hygiene; to the scandal of some people parasitising others; and finally, to the fact that dumpster diving violates the property rights of the waste management firms for which binned rubbish is a resource. All in all, the case draws attention to the fluidity and indeterminacy of waste.

Consuming sustainability narratives: cultural branding and social activism
Paul HAYNES (Royal Holloway University of London, United Kingdom) | paul.haynes@rhul.ac.uk

Many well known brands use sustainability narratives very effectively to differentiate themselves from similar products. If promotion strategies are to expand the influence of these narratives to support patterns of viable sustainable consumption they must meet two criteria: a) increase the range and type of products to which such narratives apply; and, b) ensure that such narratives produce outcomes for improved sustainability. Businesses, environmental organisations and campaigners are finding it difficult to meet either of these criteria. This is because narratives that conflict with existing cultural values are unlikely to influence consumers, while narratives that fail to reduce environmental impact are not effective. Using insights from cultural branding, social campaigns, ethical food consumption research and climate change narratives, this paper will challenge the consensus view on promoting sustainable consumption, proposing an alternative strategy

Logging systems – Starts, stops and storages of consumption
Jenny RINKINEN (Aalto University School of Business, Finland) | jenny.rinkinen@aalto.fi

In Finland, 19% of the building stock use wood as the main source of heat, 40% of the energy used to heat residential detached houses comes from wood sources, and every newly-built residential house is built with a fireplace by the building act since the 1980s. Behind this statistical picture of wood heating, logs – pieces of wood – are chopped, dried, grafted, stored, and finally burnt in fireplaces of different scales and types to produce heat and comfort. This paper takes the routing and sequences of wood to work along and against the idea of static, a-temporal heat provision produced through large-scale infrastructures. Drawing from interview and diary material on wood heating practices in Finland, I illustrate how wood heating in different scales is matched by other rhythms of everyday life, and compare it conceptually to other more industrialised systems of provision that flatten these rhythms. The conclusions of this paper urge us to see how flows of resources are in responsive, relative dynamics with the spatial and rhythmic patterns of consumption, and as such bring insights on the flexibilities and
The reduction and elimination of emissions such as ozone, nitrogen dioxide and particular matter (PM) remain the main focus of greenhouse gas emissions (GHG) policy in EU, including all sectors and activities. In 2003, European Union's policy decreed the formally adoption of the European Emissions Trading System (EU-ETS) with the goal to reduce GHG by 20% in 2020 (concerning to the base date of Kyoto Protocol in 1990). Launched in 2005, the EU-ETS is in its third phase of the program, running from 2013 to 2020. As major focus, the EU-ETS member countries have developed regulation for the decrease of emissions. According to the EU-ETS, the Spanish emissions agriculture policy covers regulation which is based on the application of environmental friendly ethics. This research analyses the effect of the ethics change based on environmental education which are focused on the prevention and reduction of emissions related to the EU-ETS applied in Spain. The methodology is the following: First, an analysis and identification of the agricultural environmental education is provided by the analysis of the policy and legal rules which includes the analysis of public social and agriculture associations’ databases. Second, data of emissions which proceeded of public database are assessed. Third, an analysis of eco-agricultural, eco-livestock, and new sub-rural sectors are provided to reveal the possible impact of GHG. The data are compared statistically with similar agricultural countries. The results expose that the agricultural education based on environmental friendly attitudes would contribute to the reduction of GHG in rural processes.
The presentation is based on two in depth case studies and a quantitative online research on GT in Germany. There is little research results on the social side of GT worldwide yet, (Kousis 1993, Kubota et al. 2013, Dowd et al. 2011, Leucht 2010) and the presentation will sketch a sociological approach to GT, the main reserach questions and some results.

Advising uncertainty. The forest professional claim and epistemic authority in the face of societal and climate change.

Erik Vilhelm Löfmarck (Örebro University, Sweden) | erik.lofmarck@oru.se
Rolf Lidskog (Örebro University, Sweden) | rolf.lidskog@oru.se

Knowledge uncertainties threaten all expertise, because they risk calling the professional claim (“we know this”) into question and to undermine the professional’s epistemic authority (the ability to create discursive closure). Therefore expertise has to develop strategies for how to give advice in situations where the uncertainties are not only known by themselves but also by those who ask for guidance. This paper focusses on how a specific category of experts – forest professionals – handle uncertainties in their counselling activities. The empirical material consists of an interview study (conducted autumn 2014, N=20) with forest consultants employed by the Swedish National Forest Agency. The forest professionals studied constitutes a critical case because they i) encounter uncertainties in the intersection of societal and climate change, and ii) have a central role in the Swedish forest management system which due to deregulation heavily relies on social norms and knowledge distribution to shape forest owners’ actions. The counselling activity particularly analysed is advisement on how climate change may affect forestry. The intrinsic knowledge uncertainties related to this, paired with the heterogeneity of contemporary forest owners (including non-residential owners with little practical knowledge yet theoretically informed and often critical of authority) makes this a challenging task. Guiding research questions are: how do forest consultants develop advices in the face of societal and climate change? How do they meet their professional claim and develop epistemic authority in their counselling activities? The analysis shows how the forest consultants handle uncertainties by strategies of articulating uncertainties, advocating risk diversification and using historical references. These strategies may be effective in enabling advisement, but this advisement needs to be contextualized to handle the heterogeneous composition of forest owners.

Between abstract risks and embodied practices. Forest owners’ appropriation of advice concerning climate change and forestry

Ylva Ugglä (Örebro University, Sweden) | ylva.uggla@oru.se
Rolf Lidskog (Örebro University, Sweden) | rolf.lidskog@oru.se

How are abstract messages of climate change and other environmental risks translated and transformed when they are converted to local practices? This is the guiding research question for this paper that investigates how forest owners in Sweden make sense of recommendation for changed forest practices due to expected climate change. The Swedish forest governance system has undergone a far-reaching deregulation, which implies that social norms and knowledge distribution are seen by the state as important vehicles to influence the understandings and practices of the forest owners. Thus, as the theory of governmentality stresses, there is a strong belief that the forest owners will govern themselves into alignment with political objectives. Through an interview study of forest owners’ appropriation of advice provided by forest agencies and other actors, this paper examines how the forest owners navigate between abstract risks of climate change and more experience-based risks closely related to their embodied knowledge on how forestry works in practice. From whom do they take advice? How do they use and make sense of the advice given? The paper concludes that the
process of knowledge dissemination and appropriation cannot be seen as a clear-cut process, but is better understood in terms of co-production where expert advice and embodied knowledge are negotiated. In this process, also the norms are negotiated based on “reasoning of the reasonable”, i.e., a pragmatic approach to risk management in forestry.

**Micro-macro relations within participatory democracy: the case of decision making processes in Polish energy sector**

Katarzyna IWINSKA (Collegium Civitas, Poland) | kiwinska@civitas.edu.pl
Paweł RUSZKOWSKI (Collegium Civitas, Poland) | pawel.ruszkowski@collegium.edu.pl

This article tackles the idea of environmental and participatory democracy in Poland. We describe some of the problems in implementing European environmental law (including: Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters known as the Aarhus Convention) and introduce the participatory democracy in the context of macro conditions which influence the citizens' decisions. Every large investment, and those are certainly investments in energy infrastructure, particularly the construction of the first nuclear power plant in Poland, is associated with a variety of interest groups and organizations. We present the possible structuring of the energy behavior of various individuals and collective actors and show the systematization of different types of energy awareness. From this point of departure “the structural model of energy decision making processes” is described in which we distinguish the micro-, mezzo- and macro level energy decisions. The focus on individual entitlements at the macro (national) level is in deference to established state sovereign powers and citizenship rights, so the idea of broadening public participation may need additional forms of support. To show the context and background for the structural model of energy decisions we use and interpret the newest representative data from the opinion polls on various sources of energy in Poland.

**Project of a Deep Geological Repository in the Czech Republic: The General Public’s and Local Inhabitants’ Views of the Decision-making Process**

Kateřina BERNARDYOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | katerina.bernardyova@soc.cas.cz
Martin ĎURĎOVIC (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | martin.durdovic@soc.cas.cz
Daniel ČERMÁK (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | daniel.cermak@soc.cas.cz

A process of deciding where to locate a deep geological repository of nuclear waste has been under way in the Czech Republic in recent years. The aim of the paper is to describe sociologically how the Czech public and the inhabitants whose localities have been considered as candidate sites for the construction of the repository perceive the decision-making process. The analysis is based on unique empirical sociological data gathered in 2014 and 2015. Both quantitative and qualitative data are used:
1) A questionnaire survey on a representative sample of the population of the Czech Republic that captures the basic views of the general public on the problem of managing nuclear waste.
2) 8 focus-group discussions with inhabitants of 4 considered localities: findings of these discussions shed light on how inhabitants perceive and understand the process of decision-making.
3) A questionnaire survey implemented in 4 localities on a representative sample of the local population, which provides the findings from the focus-groups with stronger statistical evidence.
The opinions of the general public are taken into account only for the purpose of comparison, while the main analysis focuses on local inhabitants as the most important stakeholders and addresses the following points: the available information about the repository project, trust in the information from other stakeholders, risk perception, the identification of local interests, evaluations of the decision-making process and the expectations of locals regarding participation in this process, self-confidence in negotiations. The paper closes with a summary of the theoretical implications.

**RN12S08 - Local and Global Food Chains**

**Complex Shades of Green: Gradually Changing Notions of the 'Good Farmer' in a Swedish Context**

Fred Phillip SAUNDERS (Södertörn University, Sweden) | fred.saunders@sh.se

There are ever growing demands on farmers to consider the wider environmental implications of production, not least in the Baltic Sea Region where concerns about agricultural related eutrophication are significant. In Sweden, farmers are being nudged through voluntary agri-environmental measures, enticed by the market and compelled to transition from a productivist agriculture to a multifunctional agriculture. Drawing on the ‘good farmer’ concept, inspired by Bourdieu, this paper studies Swedish conventional and agri-environmental farmers’ views and reflections on the changing relationship between farming practices and the environment. The paper finds that despite over 25 years of agri-environmental policy in Sweden, some conventional farmers are still mired in a narrow productivist mindset and thus approach change circumspectly or even negatively. This paper finds that the dynamics of the ‘rules of the game’ in the agricultural field in Sweden have provided an alternative good farming ideal, which is leading to the increasing eclecticism of farmer habitus. Farmers are looking for opportunities within the multifunctional agriculture field that increasingly demands and expects all farmers to embed environmental goals into production considerations.

**Food consumption and transformations in the interactions between society and nature**

Peter OOSTERVEER (Wageningen University, Netherlands, The) | peter.oosterveer@wur.nl

In reflexive modernity the conventional separation between the social and the natural worlds is increasingly bursting and there is a growing number of hybrids where society enters the domain of nature and vice versa. This separation disappears for instance through technological innovations such as GM, and nano-technology. As environmental research has shown the finite limits of global natural resources thereby underlining that the environmental impacts from human interventions cannot be ignored nature enters the social domain as well. Food consumption food offers an excellent domain for analysing these transformations in the interactions between society and nature. Through food, consumers consume nature, transform nature, acknowledge nature as a prerequisite for human existence, etc. In food, nature is not simply an external object available for appropriation by human beings but demands their active involvement of producers as well as consumers. Food consumption and sustainability has become an important subject of study because consumers engage with these challenges in many different shapes and forms. Multiple pathways towards more sustainable food consumption are being developed but in sociological thinking there remains a gap between the
everyday practices of food consumption and the wider transitions towards sustainable food provision. This paper intends to develop an appropriate conceptual framework to analyse these transformations in food consumption. It does so by establishing connections between the social practices approach and the transition framework.

**Exploring the role of local food chains in Greece. What opportunities for sustainable, just and democratic food systems in times of crisis?**

Eugenia PETROPOULOU (UNIVERSITY OF CRETE, Greece) | petrope@uoc.gr

Criticism against agro-industrial food systems and intense farming practices is increasing. Local food chains have emerged as a promising approach for transitions towards sustainable food systems (in terms of environment, social equity and regional development) (Marsden, 2002, Sonnino and Marsden, 2006, Brunori et al., 2011, Renting et.al., 2012). The current dire economic situation in Greece has ‘stimulated’ the emergence of ‘alternative’ local food chains enabling the economic crisis to be understood within the context of social resilience (Pretty, 2011). This paper aims to define social resilience as the ability of groups or communities to cope with external stresses and disturbances as a result of social, political and environmental change. This relatively new tendency could also be viewed as part of a wider revival of socially-motivated and solidarity based economic activities in the past decade. ‘Alternative’ local food chains exist in a range of forms in both commercial and non-commercial settings. In this paper a comparison of different types of ‘alternative’ food networks will be made. Key issues of the analysis will focus on activities, actors, type of products and territory. The methods employed will be based on a literature review and desktop research in Greece. Case studies will be carried out by interviews and document analysis to additionally investigate changes in aspects like farm labour organisation, cropping patterns as well as opportunities for the incorporation of young producers. A special focus of the paper will be on the contribution of ‘alternative’ local food chains to health and sustainability.

**Risk perception of food chain terrorism and design of security system - a case study in Romania and Turkey**

John M. WATT (Middlesex University London - School of Science and Technology - Centre for Decision Analysis and Risk Management, United Kingdom) | J.Watt@mdx.ac.uk
Irina STĂNCIU-GELU (Middlesex University London - School of Science and Technology - Centre for Decision Analysis and Risk Management, United Kingdom) | irina.stanciugelu@gmail.com
Hami ALPAS (Middle Est Technical University Ankara, Turkey) | imah@metu.edu.tr
Dan Florin STĂNESCU (National University of Political Studies and Public Administration - Faculty of Communication and Public Relations Bucharest, Romania) | dan.stanescu@comunicare.ro

The trends in global food production, processing, and distribution present new challenges to food safety and food defence activities. Food grown in one country can now be transported and consumed halfway across the world. Terrorists could use food products as a vehicle for introducing harmful chemical or biological agents into the food supply. This study shows how risk perception of CBRN food terrorism and perceived vulnerability influence each other, and contribute to the design of a food company safety & security system. The study is based on a survey applied to food company managers and directors of regulatory agencies of the food chain in Romania and Turkey. The theoretical framework is a contextualized psycho-sociological model incorporating cognitive, social-contextual and behavioral factors as predictors of individual responses to the security threat. The analytic
method consisted in a self-completed individual questionnaire (55 questions), distributed online through e-mail to a random sample of managers and decision makers from organizations operating in the food industry in Romania and Turkey (n = 319 cases, 217 Romania, 102 Turkey). Results will be presented that examine relationships between cognitive factors (perceived risk, perceived probability), social-contextual factors (perceived own vulnerability, perceived company preparedness) and behavioral responses (introducing security measures as inspection, recall systems, crisis management procedures).

The research was financed by Romania National Authority of Scientific Research and The Scientific and Technological Research Council of Turkey under the bilateral research project "Risk/Crisis Communication during Bio-terrorism Threat. The Management of Messages and Social Behavior".

**RN12S09a - Environmental Communication, Values, and Attitudes I**

**Formation of social-professional group of ecologists in Post-Soviet area: competency approach**

Olga Nikolayevna MAMONOVA (Russian Society of Sociologists, Russian Federation) | foxie@inbox.ru
Irina Alexandrovna SOSUNOVA (Russian Society of Sociologists, Russian Federation) | sossunova@mtu-net.ru

The present study is devoted to the phenomenon of institutionalization of quite new social-professional group in contemporary Post-Soviet area. The competency approach is used for better understanding of their status in society. The findings of the expert survey present the social attitudes and system of values of these professionals and the views of the lay public about their role in the society. The data selected in the article is the result of comparative sociological research, conducted in Post-Soviet area since 2006 till 2014 under the sponsorship of Russian Foundation for Basic Research. The main hypothesis of research is that the new social-professional group is institutionalised, which features are: adequate axiological and emotional relation to society and nature, the availability of specific knowledge, capacities to creative action and thinking, which help them to analyze the real socio-ecological problems and to make the balanced optimal decisions in the sphere of nature protection. The institutionalization of the ecologists is influenced by its special characteristics: firstly, the special role of ecological ethics and morality in activity of the professional and secondly, the importance of professional activity of ecologists in conditions of local ecological crisis which leads to development of professional self-identity and appearing of professional pathos. We consider that the new profession of ecologists differs a lot from the traditional specialists of ecology as a part of biology and “improvising” specialists of other specialties, who is occupied by socio-ecological problems of necessity because of the absence of true professionals. Nowadays the “ecologist” is characterized by unique specific – its sphere of activity for mass consciousness is quite uncertain and vague, even inside of scientific community there is the free interpretation of this definition. The modern practice gives the evidence that the disadvantage of professional ecologists leads to social, economic, political and other expenses which are predominant to the costs for their training and education.

Narrating on the fly. A case study of the monarch butterfly and the management of scientific ambiguity, complexity, and uncertainty.

Karin M GUSTAFSSON (Örebro University, Sweden) | gustafssonkarin@live.se
To translate scientific knowledge into actions in social practices outside of science has been highlighted as one of the biggest challenges in environmental conservation. What has been presented as a key in this process is to balance between the need of new knowledge to explain details of nature’s complexity and the need to simplify the complexity to make it manageable, a balance that is supposed to contribute to transform knowing into doing. As this challenge is faced to meet the need of science based environmental decisions, it becomes more and more important to also ask the question of how this translation is done, this to understand what consequences it brings to what is, and could be, known and done.

By using the case of the monarch butterfly, this study provides knowledge of how the translation of knowledge between different social settings, such as science, citizen science, and policy, are being executed in an ongoing scientific and policy discussion. The study combines document studies with an interview study including scientists, citizen scientists, and ENGO representatives, all positioned in the center(s) of the monarch community. The analysis shows how a strong and engaging narrative are being constructed of the monarch butterfly by balancing detailed knowledge with general descriptions, inclusion and common knowledge with particularities and expertise, and consensus with conflicts. The study shows how scientific ambiguity, complexity, and uncertainty are managed throughout the process of trying to translate knowing into doing, findings of importance to environmental conservation as well as to scientific communication more generally.

Conflict Over Teaching Climate Change in American Public Schools
Andrew SZASZ (University of California, Santa Cruz, United States of America) | szasz@ucsc.edu

Every week scientists issue ever more dire warnings about climate change. Each such warning is met, in the United States, with a hailstorm of “skepticism” from right-leaning television and radio hosts, conservative politicians, enraged internet commentators. This struggle over climate change – is it real? is it caused by human activity? is it really all that serious? – is now also taking place over curriculum – what is to be taught to students in public high schools. In several States, Boards of Education debate how, if at all, climate change is to be taught to students in public schools.

This paper presents case studies of such conflict taking place in what, in the U.S., are referred to as “red” States, such as Kansas, Oklahoma, West Virginia, Tennessee, Wyoming and South Dakota. Special attention is paid to Texas because its decisions on textbook adoption have a huge impact on textbook selection in other States. For contrast, I discuss the case of California, known for its “green,” liberal policies.

Various explanations are explored. Are these conflicts: (a) a contemporary continuation of the historic conflict over teaching evolution? (b) one facet of a continuing conflict over why educational outcomes are so poor in America and what to do about it? (c) evidence that views about climate change have been subsumed into the larger “culture wars” that have riven American political culture over issues that range from abortion and gay rights, to religious displays on public buildings, to gun control? or (d) all of the above?

Habitus and Habitats: A Study on Spatial Structure, Lifestyles, and Environmental Impact on all 11,000 municipalities in Germany
Johannes SCHUBERT (Ludwig-Maximilians-Universität, Germany) | johannes.schubert@soziologie.uni-muenchen.de
Bernhard GILL (Ludwig-Maximilians-Universität, Germany) | bernhard.gill@lmu.de
Anna WOLFF (Ludwig-Maximilians-Universität, Germany) | anna.wolff@soziologie.uni-muenchen.de
Inspired by Bourdieu’s studies about geographic and social space, our contribution deals with spatial correspondences between habitus, socio-technological systems, and their combined effects on CO2 emissions in Germany. The analyses are based on an assemblage of official data about settlements structures, occupational status, voting behavior and religious affiliation for all 11,000 German municipalities. Two central factors are explaining elective affinities between socio-economic structures and socio-technological systems (and related CO2 emissions) in space: centrality (in terms of transport accessibility) and physical density (in terms of inhabitants per are of constructed area). These factors demarcate four different spatial types: cities, suburbs, provincial towns, and villages. The four spatial configurations strongly correspond with distinct matches between technologies in the realms of housing and with socio-cultural indicators such as strength of religious sentiments and voting behavior – habitus is shaping habitats and vice versa in a co-evolutionary way. In the course of this study, and theoretically informed by the “smart-cities” hypothesis and the “environmental Kuznets curve” hypothesis, we also ask the following questions: is it true that cities are characterized by lower per capita CO2 emissions than rural areas? Are there any signs of decoupling between economic development and CO2 emissions in economically more developed municipalities? Subsequently, we discuss the political and practical relevance of our findings for the German “Energiewende”. We argue that our typology of socio-economic and socio-technological habitats could be helpful in identifying which environmental policies would be accepted (or rejected) in the respective planning spaces and their socio-cultural milieus.

Who takes care of the environment in China: A realistic choice
Hongwen ZHU (Beijing Normal University, China, People's Republic of) | zhuhongwen@bnu.edu.cn

Serious environmental crisis has happened in China. Who should deal with the environment problem in China is an urgent question. Many existed answers could be found from various standpoints. The answer from right-wing or liberalism is that only public or social organizations formed by public could represent the environmental justice. While the representatives from left-wing insist that the liberalist way would challenge the authority and the legality of the government and cause social chaos. It is helpless to realize the social and environmental justices. Compared with the thousands of years of the Chinese agricultural civilization’s tradition, the period of opening up and reform is short. The majority of the public just leave rural area for urban life. They have not enough time to learn how to take care of the environment as public interest. Worse, a certain number of entrepreneurs and their managers do not pay much attention on their public image and ethical responsibility due to the incomplete market system. It is concluded that an elitist and law-abiding government will play a crucial organizing and guiding role in a long term for dealing with the issue of the China’s environment. This could be understood as the Chinese paradigm of environmental sociology.

RN12S09b - Environmental Communication, Values, and Attitudes II

The Green Roots of Gender: Examining the Gender Effect on Environmental Concern in a Cross-national Study
José ECHAVARREN (University Pablo Olavide, Spain) | jmechavarren@upo.es
Manuel Magno GARCÍA (University of Seville) | mangargar5@alum.us.es

Gender has been traditionally a widely used variable in studies dealing with environmental concern. In most cases research showed that women are more environmentally concerned than men. The two most prominent theories explaining this fact are the essentialist perspective and the socialization hypothesis. The essentialist perspective states that women are more environmentally concerned because of their closer relation to life-cycles provided by their capability to bear children. The socialization hypothesis states that cultural traditional values destined to women highlight nurturing and care for others; those values are easily transformed into nurturing and care for nature in a context of global ecological crisis. Surprisingly both hypotheses remain largely untested. Using multilevel regression techniques with longitudinal data from ISSP and WVS we reject both hypotheses and propose a new explanation based on political mobilization and feminist movement traditions.

Can Mr or Ms Citizen make contribution to the energy policy? Media communication as the space for public deliberation.
Aleksandra WAGNER (Jagiellonian University, Poland) | aleksandra.wagner@uj.edu.pl

Purpose: The aim of my presentation is an analysis of the connections between media communication and modes of creating energy policy. It is the consideration of the media sphere as the possible space of public deliberation – its challenges and barriers.
Reason: The deliberative turn in politology and sociology of the public sphere makes demands of citizens’ participation in creating public policy more visible. However, energy policy seems to be especially challenging: on the one hand it is created on a systemic level; it regulates other macro systems such as politics or economics. On the other hand it directly influences citizens’ everyday lives through energy price, infrastructure, and impact on the environment. Mass and social media are criticized for the unfair owning of the public sphere, but are still underestimated in deliberative democracy perspective for their potency of being the space of deliberation.
Overview: Citizens’ participation in shaping energy policy is especially difficult because of several barriers that social actors face. They use different discursive resources such as expert knowledge, moral values, and communication skills, each of which have different interests and motivations.
As a result, the common tools of participation, such as public consultation, are often predetermined. The confrontation of various social actors and their differing interests soon becomes a negotiation of interest rather than the search for a common good solution.
The important problem is the lack of deliberation in the public space. Instead of a common reflection on crucial issues, we can observe the quasi-debate in parliament where people represent the interests of their parties and deliberations in private citizens’ spheres where people within their groups construct the social representations of the problems.
The mass media seems to be the perfect candidate for such a space for public deliberation, where both systemic and private debates could meet, but in reality it is not. And even if the media were to report various perspectives equally, there is no mechanism for creating what Schutz called a ‘discoursive sub-universe.’ Creating the space for quality deliberation demands a few conditions:
• Inclusivity, such as the broadening of the range of social actors as participants in discussion and their hypothetical readiness to change their former opinions
• Equality in media exposition
• Dialogically referring to other’s arguments
• Common good orientation instead of simple representation of some interests.
The aim of the presented research was to compare the media reality to an ideal type of deliberation space. Using the example of nuclear energy in Poland, I illustrate how traditional and social media answer such demands and draw the primary mutual connection between media communication and the process of creating public policy.

Methods

Through media monitoring we obtained the data necessary to do proper trend analysis of nuclear discourse density. Then, basing on the results, we distinguished a few select periods for deeper qualitative discourse analysis. In our research material we include various television and radio broadcasts, press and Internet articles, and social media posts.

Our code book includes such information pertaining to social actors (active and passive) and their resources used in discourse (social status, knowledge, nonknowledge, values, interests, power, etc.)

Based on the example of nuclear energy discourse we reconstruct the discursive mechanisms of inclusion and exclusion, strategies of argumentation, and the tools of arguments development in media communication.

Influence of biographical situational factors upon environmental activist behaviour: empirical evidence from CEE countries

Audrone TELESIENE (Kaunas University of Technology, Lithuania) | audrone.telesiene@ktu.lt
Aiste BALZEKIENE (Kaunas University of Technology, Lithuania) | aiste.balzekiene@ktu.lt

The study aims at providing empirically verified explanation of factors influencing environmental activist behaviour. Presentation is based upon a submitted article. In this presentation authors focus on the determinants of personal activist environmental behaviour as characteristic to culturally specific group of Central and Eastern European countries. A two stage model of biographical availability thesis is being explored. Results reveal evident regional differences of patterns of public sphere environmental behaviours in Europe. Central and Eastern European countries exhibit lower levels of engagement in activist environmental behaviours than Western and Nordic European countries. A two-stage model of biographical availability thesis is only partially approved. Age and main employment status have significant influence on behaviour. Specifically, being 17-24 years old and being in education, increases the availability for environmental activist behaviour. Low commitment partnership status has additional influence on behavioural intentions. The results imply the need for further research into context and cognitive determinants of activist environmental behaviour in CEE countries.

The analysis has been performed under the project “International Social Survey Programme: citizenship, work orientations and social welfare in Lithuania (ISSP LT-CIWO)”, funded by a grant from the Research Council of Lithuania.

Thinking the Environmental sociology in postcolonial context: From public policies to the private relationship with nature

Aurélie ROUSSARY (The University of Reunion Island, Réunion (France)) | aurelie.roussary@univ-reunion.fr
Marie THIANN-BO MOREL (The University of Reunion Island, Réunion (France)) | marie-eugenie.thiann-bo-morel@univ-reunion.fr

To what extend does the sociology of environment help us to understand and interpret the complexity of social relationship to nature in a postcolonial context? This communication aims to jointly demonstrate the limits of traditional frames of thought in the field of the sociology of the environment and the relevance of the postcolonialism theory to explain the reproduction
mechanisms of social and environmental inequalities in Reunion Island. The Reunion Island is a former French colony, became French department in 1946. Since then, France has shown national solidarity as the only means of overcoming multiple developmental delays that were (and still are) inequally distributed over the territory. The storytelling of the passage to modernity brings out a republican idealism that overvalues the living together and the apparent peaceful ethno-racial coexistence. This story evacuates the logic at work in the reproduction of inequality of the plantation society (unemployment and ethnically distributed poverty). Through this story, Reunionnese society appears as an autarkic laboratory where many social and environmental experiments require significant public funds (national and European).

Two field studies illustrate our proposal: the first focuses on the implementation process of a major hydro-agricultural project (tilting of waters from east to west) and the second focuses on studying the social construction of the interest for the protection of biodiversity (which led to creating two protected natural areas: marine reserve and national park).

**RN12S10a - Participation, Citizenship and Environmental Democracy I**

**Energy projects from the perspective of society: analyzing responses and actions of environmental organizations**

Ekaterina TARASOVA (Södertörn University, Sweden) | ekaterina.tarasova@sh.se

Although at the turn of the centuries world nuclear industry with certain exceptions has started shrinking down (WNA 2012) a number of countries announced the plans to develop nuclear programs. Since these projects have long-term implications for societies, it becomes crucial to analyze how societies react to these policies. The focus on environmental NGOs and environmental movements is in a way a litmus test of how society reacts. Biermann and Pattberg acknowledge that increased number of actors in politics, variety of new types of organization, adaptation of new roles and responsibilities are elements of new world development, in particular in environmental politics (2008). So the actions of environmental NGOs and environmental movements can vary significantly. Following these lines, this paper investigates the roles of civil society, types of organization and civil actions in relation to the nuclear energy policies of the so called “Nuclear Renaissance”. In other words, the research question is what kind of genres (ways of acting) are considered to be legitimate and pursued by environmental movements. The theoretical framework of the paper is based on the concept of political opportunity structures (McAdam, McCarthy and Zald 1996) and discursive opportunities (Koopmans and Olzak 2004). This paper extends theoretical model of political opportunity structure with adding the dimension of public environmental discourses. The paper examines three countries of the Baltic Sea region, Russia, Sweden and Poland, that have new energy strategies that plan to maintain or develop nuclear energy in national energy mix.

Barriers in Natura 2000 implementation: a catalogue of factors and experts’ assessment.
Krzysztof MACZKA (Adam Mickiewicz University, Poland) | krzysztof.maczka@amu.edu.pl

Studies on Natura 2000 implementation in European countries show that it is a problematic issue throughout Europe – both in post-communist new member states as Poland but also in old member states as Germany or France (Grodzińska-Jurczak, Cent 2010; Hiedanpää 2002). Moreover there were focused on various issues in different countries eg.: 1) Finland (Local people opposition to Natura 2000 changes - Hiedanpää 2002); Germany (strong local opposition to the designation of Natura 2000 sites - Stoll-Kleemann 2001); the Netherlands (Natura 2000 as provoking a procedural complexity in spatial decision making and a brake on economic development - Beunen et al. 2012); Austria (the conservation site in direct conflict with economic development - Getzner et al. 2002); France (opposition from local wine producers - Alard et al. 2002). Broad research of such issues can be found. Problems in countries implementing Natura 2000 later but repeating mistakes of predecessors e.g. strong opposition of local governments and inhabitants (Grodzińska-Jurczak et al. 2010) or equivocal support from environmentalists (Boltromiuk 2011).

The main aim of this paper is to present the results of literature review on problems with Natura 2000 implementation to prepare a catalogue of experiences with such problems. Moreover on the basis of expert in-depth interviews the experts reception of problems with Natura 2000 implementation in Poland after 10 years will be explored to answer the question why implementation of the Natura 2000 network in Poland did not benefit from experiences of other countries implementing Natura 2000 network earlier.

Who can decide about nature? Multi-level and participatory characteristics of the protected areas governance in Poland
Krzysztof NIEDZIAŁKOWSKI (Mammal Research Institute Polish Academy of Sciences, Poland) | kniedz@ibs.bialowieza.pl
Monika PIETRUCZUK (Mammal Research Institute Polish Academy of Sciences, Poland) | mpietruczuk@ibs.bialowieza.pl
Agata PIETRZYK-KASZYŃSKA (Institute of Nature Conservation, Polish Academy of Sciences) | agata.pietrzyk@uj.edu.pl
Małgorzata GRODZIŃSKA-JURCZAK (Institute of Environmental Sciences, Jagiellonian University) | m.grodzinska-jurczak@uj.edu.pl

It is often argued that for the sustainable management of ecosystems the governance of protected areas should become less centralized and more participatory. Protected areas' objectives should not only include biodiversity conservation but also have wider goals connected with sustainable development of local communities. Such approaches have become increasingly present in the legal acts, such as European Landscape Convention or Aarhus Convention, and in policy documents. Poland and other countries of Central and Eastern Europe have a history of top-down, command-and-control governance of protected areas which hardly engaged non-state actors into decision-making. It is often argued that, despite socio-economic changes following democratic transition after 1989 and the reconceptualization of the
role of protected areas, the way these areas are managed still follows the traditional, centralised path.

To investigate the changes of participatory characteristics of the protected areas governance in Poland, we carried out a two-step study, constituting a part of a larger project called LINKAGE (Linking systems, perspectives and disciplines for active biodiversity governance) financed under the Polish-Norwegian Research Programme. The data was gathered and analysed between May 2013 and January 2014. First, we conducted an analysis of the legislation concerning national parks, landscape parks, areas of protected landscape, nature reserves and Natura 2000 sites in Poland between 1990 and 2013 to identify multi-level and participatory features. We focused on five domains of protected areas governance: (1) establishing or changing a designated area; (2) introducing restrictions; (3) creating management rules; (4) determining organisation of a designated area administration and (5) choosing a person in charge of the administration. The analysis indicated that while some protected areas, such as nature reserves, indeed changed little with regard to the involvement of non-state actors, other designations such as national parks and landscape parks provide increasing opportunities for local and regional actors to participate in some aspects of their governance. Natura 2000 regulations has the most comprehensive governance structure, including state-actors, European actors, NGOs and representatives of local communities.

Secondly, to investigate factors contributing to the legal changes in protected areas governance, we qualitatively investigated a socio-political background of these legal changes, using available policy documents, reports, parliamentary proceedings, etc. gathered and coded using Atlas.ti software. Based on this, we identified major conflicts around protected areas, actors involved and their discourses. The results suggest that factors influencing governance changes in particular types of designations were not uniform. For national parks they resulted mainly from the conflicts between hands-off conservation and sustainable economic use of ecosystem services (mainly timber harvest). For landscape parks and areas of protected landscape the major change factor was decentralisation policy, under which the authority over these designations was transferred from the central government to regional self-governmental authorities. Finally, for Natura 2000 areas, the crucial factor was the EU accession of Poland and European regulations in this respect. The qualitative analysis also showed that in many cases non-state actors can impact the governance of protected areas even without formal avenues to do so.

The result of the study indicate that the influence of non-state actors on the governance of protected areas in Poland is increasing and is more significant than previously suggested in the literature. At the same time, the transition paths to new arrangements are complex and only to some extent are informed by the more sustainable use of ecosystem services provided by these areas.

**Beyond mining activity: risks, debates and social approaches related to gold exploitations in Romania, Finland and Portugal.**

Ionela-Maria RĂĈĂTĂU (Babes-Bolyai University, Faculty of Sociology and Social Work, Cluj-Napoca, Romania) | ionela_racatau@yahoo.com

Dan CHIRIBUCĂ (Babes-Bolyai University, Faculty of Sociology and Social Work, Cluj-Napoca, Romania) | dchiribuca@socasis.

The environmental and social impact of the mining activities and the need to harness more resources for society have raised significant concerns among scholars, varying from the potential risks that these practices can hold over the natural environment and the local inhabitants, to the way it could possibly generate social change, differences and inequalities related to human development. Often labelled as negative, harmful and with notable
consequences over what humans value, the mining operations bring intense debates among stakeholders and the professional community who strive to keep the associated risks under control, even to avoid or reduce them. Seen as integral factors in every activity which is oriented towards achieving certain goals, risks are not taken as independent actions or events but rather as dimensions which may fuel social tensions and weaken social cohesion. When it comes to mining exploitations, the impact is immediate, visible and bears various effects over the environment and society; this is why rational and common approaches and decisions are needed. Using comparative data, the current contribution aims to offer some descriptive insights of the mining activity in Romania, Finland and Portugal and its impact on the local community, emphasizing at the same time the official positions of some authority representatives related to the rationalities of exploitation. Next to information regarding the risks and the social inequalities it brings, the findings lead to an in-depth perspective about the attitudes people have towards the dynamics of mining actions.

Acknowledgments: The present contribution was financially supported by a grant of the Romanian National Authority for Scientific Research, CCCDI – UEFISCDI, project 3-005 Tools for sustainable gold mining in EU (SUSMIN).

Local Social perception of a mining artificial lake in Spain
Xaquin S. PÉREZ-SINDÍN LÓPEZ (University of A Coruña, Spain, Gdansk University of Technology) | xaquin.perezsindin@udc.es

The construction of a large scale power plant in the town of As Pontes in the late seventies and the associated influx of new workers would definitely change a place that by that time was not far from many others villages that form the most genuine rural Galicia. The closure of the adjacent opencast coalmine in recent years and its conversion into an artificial lake finally defined its particular idiosyncrasies up to date. By mean a mixed methods analysis (in-depth interviews, focus group and observation), this paper aims to study the social perception of the new artificial lake among locals, while also looking at the more theoretical questions about interdependencies between natural, social and built environment. Specifically, this paper is an opportunity to build upon the legacy of the American environmental sociologist William Freudenburg and his concept of Opportunity-threat. Results accounts for the existence of two divergent social constructions that could be associated to an old social category and identity strategies among neighbours: long term residents and newcomers. First and most dominant, a perception of the lake as both a new symbol of the town due to its grandiosity and as an opportunity for an industrial development associated to water that could bring a new boom. On the other hand, a more sceptical perception among long term residents who not only distrust about the security of the lake itself but also see a menace to the social centrality of other historical symbols of the town, as the river or the town square.

RN12S10b - Participation, Citizenship and Environmental Democracy II

Ecologic Footprints versus Gross Domestic Product: how indicators of societal development appear and operate in public media
Lars Kjerulf PETERSEN (Aarhus University, Denmark) | lkp@envs.au.dk

Public communication about societal concerns and challenges revolve to a large extent around different indicators, the prominence and use of which may reveal the status of social values and discourses, including sustainability values and environmental discourses. This paper presents a study of one of the more prominent sustainability indicators, the ecological footprint, and how it
appears in Danish media compared to the appearance of the most prominent economic indicator: the gross domestic product. The study applies a newly developed analytical framework based on actor network theory and perceiving indicators – as well as standard phrases which serve as substitutes for these indicators – as knowledge artefacts and as such as actors which connect to other actors and thereby perform specific functions within and beyond the media texts. The study suggests that the Ecological Footprint operates in different ways by serving as an alarm, assessing policies, prompting appeals etc., but it does not give a strong voice to sustainable development. It is rarely mentioned, and its operations in media texts tend to be vague, it speaks in terms of potentials, appeals and urgings, and it does not connect much to policy making or changing practices.

Digital public communication and environmental sustainability in the european smart cities.
Gea DUCCI (University of Urbino Carlo Bo, Italy.) | gea.ducci@uniurb.it

At the center of the phenomenon of smart cities in Europe, we find the concept and the challenge of environmental and social sustainability of a territory, through a consistent use of advanced network technologies and a process of rationalization of the use of public resources that is based on the exchange and sharing of data and knowledge by various actors, public and private, who inhabit the city. Advanced web technologies, including the latest open data system, have the characteristic of enabling citizens and institutions to a greater sharing of data and content on the network, the adoption of forms of dialogical and relational communication, therefore favoring citizens' involvement and participation in the decision-making, with an overall improvement of institutional transparency and accountability. Public communication promoted by institutions plays a crucial role, because it impacts on the ability to extend forms of participatory democracy, "inclusive", to give citizens a voice, to engage them in the processes of environmental policies, very important for the entire community. The analysis of some smart cities in Europe, allows to highlight strengths and weaknesses of open data system and the communication strategies that local governments adopt towards the citizens, in order to create shared and participated environmental policies (eg.: participatory urban design and environmental reports).

Explaining the reproduction of transnational systems of natural resource governance: Forest certification and institutional work in governance generating networks
Olga MALETS (Technische Universität München, Germany) | olga.malets@tum.de
Maria TYSIACHNIOUK (Wageningen University, Center for Independent Social Research) | tysiachn@yandex.ru

How do transnational systems of governance of natural resources reproduce themselves? The existing literature focuses primarily on their emergence and institutionalization. Significant attention has also been given to the challenges to their legitimacy and effectiveness that at least in theory can lead to their gradual erosion and deinstitutionalization. Less attention has been paid to the efforts of governance actors to maintain governance institutions. We build on the theory of governance generating networks and the theory of institutional work in the organization studies and identify the strategies actors in governance generating networks employ to respond to the challenges and sustain governance institutions. The strategies include
Sociology and technical innovation for energy transition: some multiscalar stakes
Amélie COULBAUT-LAZZARINI (UVSQ, France) | amelie.coulbaut@uvsq.fr

In the current context of technical innovation for energy transition development, we will focus on two types of eco-innovation. One is intelligent energy management in buildings and the other charging stations for electric cars. Taking the example of French eco-innovative projects we are involved in with many industrial partners, we will study social sciences facing innovation processes, knowledge and practices in technical spaces. To achieve this objective, we will use participating observation as well as semi-structured interviews and questionnaires. Our sociological framework is based on organizational aspects (Crozier & Friedberg, 1992) and actor-network (Callon et al., 1998), but also governance (Too & Weaver, 2014) and pragmatic highlights.

We will try to show the different stakes depending on scale level. At a national level, research policies changes make sociology integrated in all projects wanting to be funded (APR ADEME 2015). At a territorial level, social sciences are more integrated in public space, social sciences researchers being called by conurbation they worked in. At a project level, we will explore consortia construction process and actor games implied. There, industrial partners request sociological researchers work, while they were skeptical at the beginning of the first project. At last, the field work inside a project shows the complexity and the true impact of social sciences towards innovation processes. We will present the second wave of questionnaires about charging electric cars, to illustrate distribution and barriers to innovation from a social sciences perspective.

RN12S10c - Participation, Citizenship and Environmental Democracy

Micro-producers of energy: energy citizens, prosumers or everyday activists?
Kristiina KORJONEN-KUUSIPURO (Lappeenranta University of Technology, Finland) | korjonen@lut.fi
Laura OLKKONEN (Lappeenranta University of Technology, Finland) | laura.olkkonen@lut.fi

The proposed paper looks at participation and citizenship from the viewpoint of renewable energy micro-producers. In recent years micro-producing has challenged the centralized way of energy production. Energy production has become ubiquitous; it is now omnipresent, fragmented and merged in everyday environments and practices. People can no longer be seen or treated merely as “statistically predictable units” (Schleicher-Tappeser 2012), but as energy citizens (Devine-Wright 2007), prosumers (Toffler 1980) and/or everyday activists (Pink 2012), who may form dynamic prosumer communities with people who share similar goals and interests (Rathnayaka et al. 2011). Micro-generation devices can also be part of one’s identity-building process (Juntunen, 2014, 18).
In our paper we rethink the ways micro-producers have been conceptualized and we ask what micro-production means for the energy system. We focus especially on the local aspects of micro-production and how micro-producers understand their new role as producers of energy within their local community. Our hypothesis is that micro-producing has more dimensions than Toffler’s (1980) conception of the prosumer as a hybrid producer consumer suggests, as micro-production takes place locally, often in private homes and within local communities (Olkkonen, Korjonen-Kuusipuro & Grönberg, forthcoming). We investigate whether these dimensions can be explained, for example, by energy citizenship or everyday activism, or whether completely new explanations are needed.

Our paper is based on empirical material from three non-commercial joint acquisitions of solar panels for Finnish private homes in 2013 and 2014. We draw on semi-structured interviews (N=12), a questionnaire (N=59) and participant observation.

The Renaturation of the Isar River in Munich – an example of successful environmental democracy?
Georg JOCHUM (Technische Universität München, Germany) | g.jochum@tum.de

Around 1900 significant changes were caused on the Isar River in Munich by dams built to claim land and prevent floods. A long-term consequence of the measures was the destruction of the river’s natural dynamic.

Beginning in 1993 the idea to revitalize the river in order to compensate the wrong turns in the system has led to the creation of the Isar-Plan in Munich. A group of NGOs, called the Isar-Alliance, initiated the plan. It was adopted by Munich officials and developed further together with the Alliance and local citizens. With the realization of this plan, concluded in 2011, the river banks were redesigned more naturally and nevertheless flood protection was ensured. The Isar-Plan became an international model for reorienting the technical regulation of rivers as well as an example for successful citizen participation.

In my presentation I address the following questions:
1. What institutional innovations led to the successful conclusion of the Isar Plan?
2. How did the different actors interact and communicate in the process?
3. How do the participants now evaluate the processes and results of the Isar-Plan?

The presentation is based on a secondary analysis of interviews with the different actors from NGOs and Munich officials involved in the process. The results suggest that hierarchical planning was replaced by a new form of collaborative processes of agreement finding.

‘Participation is about our way of life’: A Qualitative Journey into Knowledge Cultures, Discourses of Sustainability and Participation in Rural Ireland and (Supra)-national governance arenas
Lisa Martina MORAN (Teagasc, the Agricultural and Food Development Authority of Ireland, Ireland) | lisa.moran@nuigalway.ie

This paper focuses upon knowledge cultures, discourses of sustainability and participation in Connemara, a predominantly rural community in the West of Ireland. Drawing upon a dense corpus of qualitative and ethnographic materials collected by the author in the study region from 2004 to 2010, the paper argues that sustainability and participatory discourses are intricately linked, and notions of sustainability indelibly shape local trust in environmental experts, including (supra)-national and local government officials. In the community under study, discourses of sustainability are multi-layered and contested. Among groups of insiders, defined as persons who are seen as possessing deeply-seated knowledge of place, a predominant discourse of sustainability prevails, which shapes and reflects patterns of community
governance. This sustainability discourse mainly prioritises preserving local knowledge and ways of life which are frequently viewed as culture-specific to the area, encompassing local agricultural practices, human-environmental interactions and patterns of environmental protest. Nevertheless, decisions about knowledge and practices that are deemed ‘worthy’ of preserving are complex, relating to ideals about community identity, insider/outside distinctions and tacitly-based power gradients that shape interactions between locals at local meetings, environmental protests and social gatherings. The paper compares and contrasts these knowledge-based participatory and sustainability discourses with policy narratives from EU and Irish government actors, arguing that such sustainability concepts compete and converge with one another, albeit in surprising ways.

Local opposition towards permanent radioactive waste repository in the Czech Republic: mapping the discourse network
Petr OCELÍK (Masaryk University, Czech Republic; International Institute of Political Science of Masaryk University, Czech Republic; Center for Energy Studies, Czech Republic) | petr.ocelik@gmail.com
Jan OSIČKA (Masaryk University, Czech Republic; International Institute of Political Science of Masaryk University, Czech Republic; Center for Energy Studies, Czech Republic) | osicka@mail.muni.cz
Veronika ZAPLETALOVÁ (Masaryk University, Czech Republic; Center for Energy Studies, Czech Republic) | zapletal@fss.muni.cz
Filip ČERNOCH (Masaryk University, Czech Republic; Center for Energy Studies, Czech Republic) | cernoch@mail.muni.cz
Břetislav DANČÁK (Masaryk University, Czech Republic; Center for Energy Studies, Czech Republic) | dancak@fss.muni.cz

The permanent radioactive waste repositories (PRWR) are designed as storages of spent nuclear fuel and high-level nuclear waste. Since the risks connected with construction and operation of the PRWR are perceived as extremely severe, the processes of the PRWR siting are typically accompanied by local opposition. The presented research is focused on the case of the Czech Republic. There are seven localities which had been chosen as eventual PRWR sites. The research aims to reveal prevailing schemes of interpretation both for respective localities and major stakeholders (municipalities, NGOs and state institutions). It draws on relational sociology and frame theory. Methodologically, it uses discourse network analysis (Leifled and Schneider, American Journal of Political Science 56(3) 2012) to explore discursive underpinnings of the local opposition as well as local acceptance. The research further identifies dominant framings of the PRWR issue and discourse coalitions. Data consists from 47 semi-structured elite interviews with (mayors of municipalities, activists and state officials) coded by two independent coders (Krippendorf's alpha = 0.81). In conclusion, the research stresses the importance of “dysfunctional state” frame (that condenses a lack of trust in political elites and political institutions) which is shared by opponents and proponents of the PRWR. On the other hand, there is only a little evidence for so called “Not-In-My-Backyard” effect.

Redistributing water allocations in South Africa’s post-Apartheid context
Magalie BOURBLANC (GovInn, University of Pretoria, South Africa) | magalie.bourblanc@cirad.fr

In South Africa, the newly democratic Government voted in 1998 a Water Reform Act (National Water Act, NWA 1998) whose ambition has been to transform the water sector and redress past inequalities in particular in the access to potable water and access to water for agricultural purposes for previously disadvantaged people. In that respect, the NWA has created a Reserve that sanctifies a right to water for basic human needs (25 l/person/day) free of charge and called
the human reserve. This Reserve is also composed of an ecological reserve (also known as “instream flow requirement”) that caters for the ecosystem needs. In some specific areas, it was clear that providing for this ecological Reserve together with enabling access to water for emerging Black farmers would put an additional pressure on an already stressed resource. Yet these were defined as one of the priority uses by the new ANC government. In a bid to accommodate all the water demands in an equitable way, previous water allocations had thus to be re-negotiated. The Inkomati river basin and its Crocodile sub-catchment is one of the 4 pilot projects initially identified by the Department of Water Affairs, to undergo a process of “Compulsory licensing”, i.e. a process of renegotiating and when necessary curtailing previously existing water rights. This paper examines the process that eventually enables the Crocodile sub-basin to avoid a procedure of compulsory licensing. We pay a particular attention to the role played by knowledge production and the use of information system in this outcome.

RN12S11 - Science, Technology, and Environmental Innovation

Re-configuring energy systems and practices: users’ perceptions of engineering solutions to electricity consumption and overload
Isabel SHAW (Imperial College London, United Kingdom) | isabel.show@imperial.ac.uk
Ritsuko OZAKI (Imperial College London, United Kingdom) | r.ozaki@imperial.ac.uk

Our society is increasingly using more electricity. Our daily lives are full of electronic goods: mobile phones, tablets and Internet hubs are part of everyday sceneries, for example. Radical transformations in heat and transport services, such as electric vehicles and domestic electric heat-pumps, will also happen in the near future. These changes will make the local electrical distribution heavily loaded with an increasing level of carbon emissions, as a result. To tackle this problem, engineers have proposed to transform energy systems: to relax voltage quality to drop outside the permitted 230 V +10%/- 6% range. This paper examines how housing developers consider the engineers’ solution(s) to increasing electricity consumption and their attempts to transform current electricity systems. Focusing on current and imagined sociotechnical systems, we discuss how engineers’ conceptions of low voltage networks are perceived and understood by developers in relation to their own work practices. In collaboration with a large social housing association in South East England, we explore professional actors’ assumptions and expectations of the low voltage network and its impacts on their work, including possible changes in their current work practices, identities and relations. We will present our findings from semi-structured interviews with professional actors working on new housing developments and regeneration projects.

Science, technology, social innovation for social and environmental development in small population groups in the Flooded Forest Amazon, Brazil.
Edila Arnaud Ferreira MOURA (Universidade Federal do Pará, Brazil) | edilamoura@hotmail.com
Ana Claudeise NASCIMENTO (Instituto de Desenvolvimento Sustentável Mamirauá, IDSM) | claudiese@mamiraua.org.br
Davila CORREA (Instituto de Desenvolvimento Sustentável Mamirauá, IDSM)

The socioenvironmental movement in Brazil, after the 90, put in evidence knowledge of traditional Amazonian populations of significant relevance to the purposes of sustainable development. Also, highlighted the enormous absence of the contributions of science and technology to improve the living conditions of people living in remote places within the Amazon flooded forest. This study presents results of technology and social innovations designed to
provide healthier living conditions of these populations. The study analyzes experimental situations in 18 small population groups located in the sustainable development reserves Mamirauá and Amanã, between 1998 to 2014, in the state of Amazonas, Brazil in an area of more than 3,000,000 ha. Social technologies have been developed in experiments with the use of photovoltaic solar energy for lighting and home use in pumping systems and water treatment; and also, construction and using of clay ovens and stoves without direct contact with the smoke. The study highlights the interdisciplinary practices in the construction of technologies, forms of social management and especially the social conflicts field arising from these social innovations. The data show that families were satisfied with the innovations since they have healthier conditions and that experiments of this nature require more support from government policies.

Innovation for low–carbon meat: A sociological perspective on changes in consumption and production systems
Josephine MYLAN (Sustainable Consumption Institute, University of Manchester) | josephine.mylan@manchester.ac.uk

Both academic and policy debate around low-carbon innovation pay relatively little attention to agriculture and food in comparison to energy and transport. This paper addresses this relative neglect by analyzing low-carbon innovations in meat consumption and production in the UK. A range of alternative ‘solutions’ to render meat consumption more sustainable are advocated and supported to different degrees by academics, policymakers, consumers, NGOs, and the food industry (e.g. ‘Meat-free-Mondays’, vegetarianism, alternative farming, lab-cultured meat, anaerobic digestion, methane-capture). Most solutions, however, are still relatively small and insignificant compared to wider trends in existing system of provision (e.g. toward the ‘meatification’ of diet and agriculture). The paper analyses how these low-carbon ‘solutions’ align (or not) with existing dynamics, contributing to the wider debate on the relations between emerging low-carbon innovation and incumbent production and consumption systems. The analysis mobilizes conceptual insights from the social construction of technology approach (Bijker), paying attention to the emergence of technical innovations through social networks and interactions, and from social practice theory (Shove, Southerton, Warde), conceptualizing consumption patterns as arising from routines, material infrastructures and cultural conventions. A processual methodology is adopted (Abbott, Van de Ven), focusing on actions, event chains and contextual trends. Analysis draws from data collected using a mixed-method approach including survey of existing statistical data to establish longitudinal trends, systematic literature review across disciplines, documentary analysis of industry and government strategies, and semi-structured expert interviews.

Reframing the GM debate: A guide to critical analysis and practical policy
Aristeidis PANAGIOTOU (The Papaeliou Institute, Greece) | aris@posteo.de

Despite the growing publicity of GMOs, there appears to be little, if any, scientific consensus regarding key aspects of GM technology (Hilbeck et al., 2015). In fact, the GM debate is quite often depicted as a deeply schismatic controversy where involved parties appear to share little common reading of scientific findings. In this paper, by critically integrating recent contributions of contemporary Sociological Theory and Conflict Resolution, I will offer a different reading of the GM debate by moving beyond dualistic aphorisms and suggesting practical ways that the rift can be bridged. It will first be suggested that the GM debate should not be construed as a typical scientific controversy because the networks of engaged actors stretch well beyond the scientific community and the ramifications of genetic engineering deeply penetrate the social and natural worlds. It will, therefore, be argued that, following Sjöstedt’s (2009) typology, the
GM debate should be more accurately classified as an ‘embracing ecological conflict’ with its distinct characteristics. Once this shift in viewpoints is consolidated and the GM controversy is conceptualized as an ecological conflict, it will be further argued that it should also be treated as one in practical and policy terms. This would enhance the possibility of tensions and conflicts being resolved within a non-violent and structured environment of mediation (Bercovitch, 2009). Following Chufrin and Saunders (1993) and their influential writings on the concept of Peace Process, I will suggest that the dialogue on GMOs should have both a public and an official process. Both processes of sustained dialogue have a pre-negotiation stage, which sets the foundations for the resolution, and involves the procedure of ‘mapping and naming problems and relationships’ (Saunders, 2001). As part of this process, I will offer a holistic way of framing the GM debate drawing from the suggestions of Mouzelis’ TAI scheme (1990), Stones’ Strong Structuration Theory (2005), but also from contributions in the field of Conflict Resolution such as those of Burton (1990), Jackson (2009), and Dalby (2004). Concluding, it will be demonstrated that the frame can be used both as a guide to a critical understanding of the controversy and as an initiative towards sustained dialogue and policy initiatives.

The Wise Salmon That Returned Home – The Agency of Migratory Salmon
Outi Marja AUTTI (University of Oulu, Finland) | outi.autti@oulu.fi

Migratory fish have played a major role in the history of societies and cultures in northern Europe. Fishing migratory fish was an important source of livelihood and one of the main things that drew permanent settlements to the northern riversides. Migratory fish and their annual rhythm belonged to the rivers’ landscapes, defining the annual rhythm of riverside villages that adapted to the salmon migration (Vilkuna 1975). However, the role of the fish in local riverside cultures was much more than just economic.

I will analyze interview data collected among salmon fishermen living along two rivers in northern Finland, the Iijoki and the Kemijoki. The fishing stories of the interviewees go back to the 1920s and end with the electrification of both rivers (Autti & Karjalainen 2013). I analyze the variety of features associated with salmon, and investigate how the interviewees justified these
associations. By observing how the fish were represented and described in the interviews, I seek to understand the essence of the human-salmon relationship. Many interviewees saw salmon as a strong actor. Salmon were believed to possess agency and intentions. Symbolism, as well as humanizing and caring for the fish, was common in my data. Salmon were enmeshed within social and cultural relationships. The fish were seen as having the ability to take action, as well as possessing thoughts, emotions, and intentions. Attitudes toward specific species are largely shaped by our innate anthropomorphism (Zelko 2012). That is, when we think about animals, we are also thinking about ourselves.

Biodiversity, its institutionalization and a relational perspective.

Norman LAWS (Leuphana University Lüneburg, Germany) | laws@leuphana.de

The question of biodiversity is becoming a more prominent and a more pressing problem as it is one of the planetary boundaries that has already been crossed (Rockström et al. 2009). Therefore, it is of importance to review the status of biodiversity in the political and administrative process and to offer analysis and solutions to its governance challenges. A new study conducted at the Leuphana University Lüneburg on behalf of its cooperation partner WWF is focusing on biodiversity politics and its integration in the overall political process and how biodiversity is institutionalized as a topic on its own in politics and administration (Laws 2014). In order to take a fresh look on biodiversity politics and to gain a better understanding of how well-established biodiversity politics is as a distinct political realm, the new study reviews almost every federal ministry as well as the political parties in the German parliament by conducting interviews and the analysis of official documents.

The results of this study can be used to verify the rhetoric in politics and administration when it comes to sustainability. But it can also be viewed from a relational or strategic-relational perspective (Jessop 2010). Interpreting the state as a social relation (Poulantzas 1978) where different fractions of a dominant power bloc lead to a “contradictory unity of dominant classes or fractions whose interests are antagonistic rather than monolithic” (Resch 1992: 332), it is possible to identify the status and interests of different ministries or departments within the existing power bloc.

Science-policy interactions for seagrass restoration within the Dutch Wadden Sea

Judith Rosanne FLOOR (Wageningen university, Environmental Policy Group, The Netherlands) | judith.floor@wur.nl
Kris C.S.A. VAN KOPPEN (Wageningen university, Environmental Policy Group, The Netherlands) | kris.vankoppen@wur.nl
Jan P.M. VAN TATENHOVE (Wageningen university, Environmental Policy Group, The Netherlands) | jan.vantatenhove@wur.nl

Nature areas have been largely affected by human activities, resulting in current attempts to not only conserve nature but also restore nature. Nature restoration is a broad field: ranging from
restoring an 'original' natural state to engineering new ecosystems. In the decisions over nature restoration ecological knowledge plays a crucial role, closely knit with nature preferences and political views. In this research we analyse the empirical case of seagrass (Zostera marina) restoration in the Dutch Wadden Sea. After a period of small research projects the restoration effort increased in 2011 when a nature organisation aimed to restore seagrass to create a climate change buffer. We analyse the interactions between nature organisations, governmental organisations and researchers, to show the dynamic process in which meaning is given to the nature restoration. We zoom in on two elements: 1) the perceptions of re-introduction of seagrass by nature organisations, governmental organisations and researchers and 2) how these perceptions were constructed through science-policy interactions. Here, we perceive science-policy as a two-way dynamic interaction between knowledge production and decision-making, within the tradition of Science and Technology Studies. We used the policy arrangement approach to analyse the dynamics in the dimensions of actors, resources, rules and discourses. Our findings are based on document analysis, interviews and observations. The perception of the seagrass plant as ecosystem engineer has been crucial, which was based on scientific insights and strategically used to claim that seagrass restoration could play a role in the adaptation to sea level rise.

A Q-Methodology Study of perspectives on biodiversity and ecosystem services in Hungary

Veronika FABÓK (Szent István University, Institute of Nature Conservation and Landscape Management, Hungary; Environmental Social Science Research Group (ESSRG), Hungary) | fabok.vera@essrg.hu
Eszter KOVÁCS (Szent István University, Institute of Nature Conservation and Landscape Management, Hungary; Environmental Social Science Research Group (ESSRG), Hungary) | kovacs.eszter@kti.szie.hu
Györgyi BELA (Szent István University, Institute of Nature Conservation and Landscape Management, Hungary; Environmental Social Science Research Group (ESSRG), Hungary) | bela.gyorgyi@essrg.hu
Mette TERMANSEN (Department of Environmental Science, Aarhus University, Denmark) | mter@envs.au.dk

Biodiversity policies always tended to use different arguments that are based on different values on nature to support biodiversity protection (Montgomery 2002). We used Q-method to reveal perspectives and underlying values towards biodiversity and ecosystem services among experts who were involved in biodiversity conservation in Hungary. The Q-method can be used to reveal different social perspectives and attitudes that exist on an issue or a topic (Dryzek and Berejikian 1993; Webler et al. 2009). We studied views on the arguments used in biodiversity policy to justify conservation efforts. The list of 42 arguments that formed the body of concourse was compiled from the biodiversity conservation literature. Experts involved in biodiversity conservation policy but with different scientific backgrounds (e.g. biology, environmental economics, environmental law) were chosen to participate. We used PQMethod software to analyse the Q sorts. Based on our analysis two perspectives could be distinguished, the first was based on arguments that were mostly related to the intrinsic value of nature. This perspective represented beside some utilitarian arguments the view that biodiversity is valuable in itself, that species have a right to exist regardless of their benefits for humans. It also comprised the scientific claim that each species has a function in the ecosystem and therefore losing any of them can be critical and a statement about the perception of the landscape as the product of a coevolutionary process between humans and ecosystems. The second perspective was attached more to arguments that were connected to the utilitarian value of nature. It included statements that protection of nature is important because of its economic value and
that the extinction of species reduces the possibilities of future generations. Beside the utilitarian elements, the second perspective emphasized the importance of the application of the otherwise human centered ecosystem service concept in the conservation policy and it also contained an argument that was based on the intrinsic value of species.

Contentious Management of the Tatra National Park
Jana KLOCOKOVA (Institute for Sociology, Slovak Academy of Sciences, Slovak Republic) | jana.klocokova@savba.sk

The paper presents a case study of contentious management of the Tatra National Park in Slovakia, in the 2000s. The park has undergone a series of substantial changes since 1989 which resulted in the multiplication of actors and stakeholders involved at various levels of governance. This process has been paralleled by accumulation of legislative and administrative rules which, being often contradictory, hugely contributed to the increase of conflicting positions between these actors. Considering these changes, the paper focuses on the dynamics of disputes that have accompanied the work on a new management plan and series of investments in recreational and sports infrastructure. The paper highlights the role of natural events and actors that influenced the evolution of the disputes and changed configurations of human actors. Special attention is given to the strategy of environmental NGOs. The paper demonstrates how their mobilization of scientific expertise and selective use of the European regulations constructs the “natural order” as separated from the social issues. It is argued that this strategy has had important consequences. First of all, the NGOs have failed to mobilize local communities and to build a broader coalition that would support the idea of the park as a common public space. Second, it is developers and investors who have progressively become spokespersons of local communities and their interests without anyone questioning these representatives to the same extent as those representing the interests of the nature.

RN12S13a - Energy Transitions and Sociological Theory I

Energy and Human Societies. An Historical Sociology Perspective
Alfredo AGUSTONI (G. d'Annunzio Chieti-Pescara University, Italy) | consiglatodaglielfi@gmail.com

From the point of view of Historical Sociology and Materialist Anthropology, also in order to foster a critical reflection on widespread concepts such as Energy shift and Energy transition. Actually, we share the opinion that, despite their hutility, short term and policy oriented analyses risk to misunderstand social processes and to stress only variables such as policies and public opinion, avoiding to understand, for instance, the relevance of metabolic relations between Societies and the Environment in their reciprocal shaping, such as the continuous "emergency" of Societies from Nature and the continuous reshaping of borders between the firsts and the latter. Therefore, in our intervention we try to sketch a synthesis of the relations between the increasing human capacity to manage non-human Energy Social Change. We pay a particular attention to the use of more and more sophisticated forms of “energy converters”, also the
organization of human labor (what Mumford calls a “megamachine”) being one of them. At the same time, we try to stress the ability of particular human groups to take advantages from Energy innovations and transitions.

Yannick RUMPALA (Université de Nice, France) | rumpala@unice.fr

Energy choices that are made in a society are first and foremost political choices. The techniques developed and the infrastructures deployed are but the tools of a collective organization. This sedimentation of visible or invisible choices has an influence on living conditions, both for individuals and the communities to which they belong. According to those choices, different forms of access to energy will take place and engage users in more or less binding chains of relationships and more or less heavy situations of dependency.

How then can new technological developments contribute to a redistribution of possibilities (by accompanying new ways of thinking, by disturbing and eroding routines, by extending and changing practices ...) and subsequently to social reorganizations? Compared to fossil fuels and electricity production methods that have accompanied the development of industrial capitalism, certain energy production methods related to alternative sources (wind, solar, etc.) seem to have such a potential of reconfiguration. The reopening of technical possibilities seems to enable the challenging and displacement of dominant logics. It gives people opportunities to unravel some constraints and to develop new resources. In such a process, socio-technical networks (Latour, 2005) are reconfigured out of certain previously instituted logics, while exploring other paths.

Starting from the study of the technological solutions currently being explored and the organizational patterns associated with the exploitation of renewable resources, my paper attempts to highlight these logics and the possibilities to displace and modify them, while showing the usefulness of a sociology of networks and flows (Spaargaren, Mol, and Buttel, 2006). Indeed, energy alternatives seem to enable a series of changes:

- from centralization to decentralization (reconfiguration of polarizations)
- from distance to proximity (reconfiguration of scales)
- from dependency to self-sufficiency (reconfiguration of relations to “large technical systems” [van der Vleuten, 2009])

Do these technological solutions open possibilities for the installation of new social relations (which can also include the vicarious confrontation of actors)? Of course, it is not a question of returning to a technological determinism of sorts, and my research therefore aims at studying what might be termed “technological potentialism,” as this entails thinking in terms of conditions of actualization—notably, adaptability of techniques, acceptability by the people, and possibilities of appropriation. In other words, this potentialism does not depend on an essence, intrinsic nature or autonomous force of technics, but rather on the way interested actors will be able to open up or find new opportunities in technological advances or so far unexplored technological solutions.

Three steps are proposed to show that while the development of alternative energies depends on technological advances, it can, in this process, also reveal political potentialities. At first, we will clarify the theoretical arguments in favour of an approach in terms of “technological potentialism.” Then, we will extend this approach by identifying a set of potentialities linked with renewable energies—mostly, arguments legitimizing them—and the model that could arise from these alternative forms or approaches. Finally, we will examine how these potentialities could become effective.
Infrastructures, consumption and practice: conceptualising energy demand
Elizabeth SHOVE (University of Lancaster, United Kingdom) | e.shove@lancaster.ac.uk

It is plain that people do not use energy for its own sake: rather, energy demand is an outcome of changing patterns and rhythms of daily life. This observation provides the starting point for a more detailed discussion of how such patterns evolve, and of the parts that material elements and arrangements, from appliances through to infrastructures, play in these processes. There are excellent sociologically informed histories of the social and political processes involved in constructing and configuring networks of power and on a smaller scale the design and architecture of the home itself. These accounts show how various interests are inscribed in the urban fabric, and in the material arrangements amongst which we live. However, further questions arise when we move beyond the moment of design and consider infrastructures and related networks of appliances as elements in living systems of practice. From this point of view, infrastructures are more than the means by which resources and energy services are provided: they also have a constitutive role in shaping social practices including habits of heating, cooking and laundering along with sociotemporal rhythms and patterns of mobility. In this paper I draw on a range of empirical case studies (of laundry, car-dependence and home heating) to show how social theories of practice, and of environmental consumption might be extended and used in explaining how past and present artefacts, appliances and infrastructures combine to enable and constrain future patterns of energy demand.

Social Innovations in Local Energy Transitions
Pia LABORGNE (Institute for Sociology/University of Freiburg and EIFER/KIT, Germany) | pia.laborgne@soziologie.uni-freiburg.de

Cities are major context for the consumption of resources as well as centers for innovation and privileged level for experimentation and implementation of new approaches for problem solving. They are thus important starting points for sustainability transitions. These transitions are only in part technical ones but essentially embedded in, based on and consisting of changes in practices, e.g. in organization and behavior. Following the definition by Zapf (1989), these can be social innovations, e.g. new ways of societal problem solving that are worth imitating and of being institutionalized. Based on case studies in German cities, the paper analyzes local energy strategies focusing on the role of social innovations. These can concern practices in energy usages but also in the organization and financing of energy transitions (e.g. building renovations and renewable/decentralized energy production). The presentation builds on findings from the work on a PhD thesis realized in the framework of an interdisciplinary researcher group on urban infrastructures (2010-2014) at the Technical University of Darmstadt and the University of Freiburg. It is applying the multilevel perspective which analyses transformations as interplay of three different levels: landscape, regime and niches. The thesis intends to enhance the empirical basis on local transformations. It analyses what kinds of and how local niche-experiments are created locally. Following Konrad et al (2004) such niches are defined here as new configurations of structural elements. Case studies in major urban regions have been realized (Berlin, Frankfurt/Main and Ruhr Metropolis). The results are based on the analysis of semi-structured qualitative interviews with local actors and experts, a literature study, official documents and a media analysis.

Contested Transitions? Scale, Cities and Regions in the UK Energy Transition
Larry REYNOLDS (Institute for Advanced Studies, Paris, France) | larry.reynolds@fu-berlin.de
The UK’s energy transition, spurred on by series of policy announcements throughout the last decade, continues to unfold. Yet this development occurs amidst a shifting political, social and economic landscape that may alter its trajectory, scale and pace. This study plays particular attention to how recent moves towards devolved ‘City-Region’ forms of administration, along with changes in UK regional economic development policy are being worked out in relation to energy transition plans and practices. The scale of a City-Region in relation to both the national economy and to units of local governance with their possibilities for civil society participation makes it an important site of transition, especially as it also maps onto the pattern of existing energy, transport and other infrastructures.

However, both ‘City-Region’, as well as ‘energy transition’ are contested concepts, with multiple possible scenarios, scales and agents of change envisaged by various actors. Rather than a singular vision or consensus around energy transition, different ‘sociotechnical imaginaries’ inhabit the field. These range from those around community energy and distributed grids to imaginaries of non-disruptive transition or a simple switch of centralised sources, with differing assumptions about economic growth and the social purpose of energy. This paper reports on early findings from a study of energy transition and conflicts around moves towards City-Regions in North-West England, and discusses them in relation to some key problems in sociotechnical transitions theory.

**RN12S13b - Energy Transitions and Sociological Theory II**

**The social movements for energy transition. The limp pace of Mediterranean countries**

Giorgio OSTI (University of Trieste, Italy) | ostig@sp.units.it
Giovanni CARROSIO (University of Trieste, Italy) | pegua_ts@yahoo.it

The sustainable energy transition (SET) appears to be stalled. Oil prices very low, the disappearance of strong government incentives for the renewables deployment and the low development of energy building retrofit initiatives are the signs of an uncertain phase, in which it is difficult to build a critical mass of actions and investments that makes the energy transition irreversible. The contradictory role of public policies and the presence of very constrained energy markets make difficult for a number of innovative devices (e.g. accumulators) to penetrate the energy provision system. These elements should be added to the active role that major energy groups exert to counter the SET (carbon lock-in).

Thus, there is not only one causal factor of SET weakness. In the recent past a great drive of environmental change arrived from social movements; they created a critical mass of protest that moved institutions in a more sensible action toward environment. Nature protection measures and a more severe legislation against pollution matured thanks to a precise line of social action started by social movements.

For SET the picture is quite different: the bulk of innovation is arriving from a virtuous combination of norms favourable to renewables and the modularisation of energy tools (PV panels, batteries, turbines and plants of every size). The role of civil society and final consumers has been this time more passive; mass adoption started only after generous grants.

In this critical moment for the virtuous technical and institutional combination, the question could be whether social movements and civil society organisations can recover their traditional change agent role. The fields where they have working margins are green energy purchase, self-provision and accumulation alongside the food/clothes/open source consumerism. Grid management is usually out of nonprofit organisations, at least in Italy. In this country there are electric cooperatives managing grid and hydropower plants, but they are very marginal for
dimension and location. Thus, possible smart grids realisation is in the hands of medium-large utilities, most of them public owned but working as private companies.

Residual action of civil society organisations working in the energy sector in Italy will be analysed according to a social movement approach, based on resources mobilisation. The capacity of such organisations to change economic and institutional balances arrives when they are able to apply their specific means (reciprocity, coordination, gratitude) to technological packages resulting too rigid to be assembled by themselves, with the understanding that such organisations are not only charities but also social or responsible enterprises.

**The Transformation of the German Electricity System - A Field Perspective**
Gerhard FUCHS (University of Stuttgart, Germany) | gerhard.fuchs@sowi.uni-stuttgart.de

The paper analyzes the role of institutions in the process of the transformation of the German electricity generating system. The transformation will be studied by distinguishing between three phases of institutional development. In phase one lasting from the late 1980s until 1998 the institutional setting of the electricity system was characterized by its decentralized and semi-public character, legitimized by the idea that electricity generation and supply constitutes a natural monopoly. As a “niche development" we observe the growing importance of actors interested in the development of renewable energies, which in those years could not really grow because of institutional and regulatory hurdles.

Phase two is characterized by a double institutional re-alignment. Due to liberalization electricity markets are created which become dominated by the four big utilities. Former decentralized entities are mostly bought out. A wave of merger and acquisitions takes place. In parallel but also somewhat disconnected from these developments, a new regulatory framework for the development of renewable energies had been created. The developing institutions for renewables had little overlap with the main stream electricity system. Different actors, rules and organizations were dominant. This resulted in a very dynamic development of the renewables sector.

Phase three finds its symbolic expression in the Energiewende decision of the Federal Government (2011). The constant growth of renewables and the definite end for nuclear energy necessitated a re-alignment of the electricity sector. Renewables no longer were a niche activity and the incumbent actors were forced to accommodate their business models to the new situation. The interests of incumbents and challengers are directly clashing and the government is working on a new market design. A process which is of yet undecided. The new institutions under construction, however, will neither mirror the “liberal market spirit” of phase two, nor the enabling mood of phase two as far as the renewables were concerned.

The paper will use the neo-institutionalist theory of strategic action fields as developed by Neil Fligstein and Doug McAdam to analyze the transformation of the electricity system. The theory puts the conflicts between challenger (renewables) and incumbent actors (utilities) center stage for explaining institutional stability and change. The case of electricity generation is insofar “special” as the field (more than others) is constantly the object of government interventions and prone to be influenced by the broader macro-cultural discourse (nuclear energy, climate change). Institutions in this contexts are both constraining actions but also enabling new activities.

**Sequences, services, and spaces of energy use: using theories of practice to move beyond segmented understandings of energy demand**
Allison HUI (Lancaster University, United Kingdom) | a.hui@lancaster.ac.uk
Many discussions of energy demand (re)produce distinctions between different energy services (transportation, heating), forms of energy (petrol, natural gas, nuclear power), and sites of energy usage (domestic, public, industrial). Conceptualizations of peak demand, rebound, and the users in socio-technical systems, for instance, often foreground dynamics within only one sector, such as electricity networks or transportation. Yet steering societal transitions in energy demand will require nuanced understandings of the links between these areas. In order to contribute understandings of energy demand that foreground connections and relationships rather than commonly-articulated differences, this paper engages with social theories of practice. It argues that starting from an understanding of how energy is used in practice can draw attention to the links and dependencies, constraints and trade-offs that exist between different energy forms, services and sites of use. In particular, it highlights three conceptual resources that capture interlinked dynamics of energy use. Firstly, it extends Schatzki’s work on the temporality and spatiality of social practices and Warde’s understandings of consumption to argue that the procedures by which people sequence multiple practices affect the dynamics and forms of energy use. Secondly, it suggests that attending to the organization of ‘energy services’ can create important links between energy use at home, in non-domestic spaces, and on the move. Finally, it argues that the relationship between spatial arrangements of energy services and of appropriate places for practices (Schatzki’s ‘activity timespaces’) is crucial for understanding excessive, wasteful, and unequal uses of energy across multiple spaces.

**Post-fossil lifestyles - About the implementation of social innovations in everyday life**

Michael KUNKIS (ISOE-Institute for Social-Ecological Research, Germany) | kunkis@isoe.de

Households contribute through their everyday actions significantly to climate change. Therefore, the transition to a post-fossil fuel society demands an extensive adaptation of everyday action. Ambitious climate protection objectives can therefore not only be achieved through technological innovations. Moreover, a drastic change from everyday practices and consumption patterns is required. In this regard, post-fossil lifestyles are disseminating from a niche movement to a part of the social mainstream. At the micro level, this means a change and adaption of a variety of social practices (e.g. heating and ventilation behavior, forms of mobility). These changes can be regarded as a social innovation.

On basis of the research project KlimaAlltag (2010-2013) the conditions and prospects of a transformation of everyday action and the distribution of everyday practices towards consistently post-fossil fuel resp. low-CO2 lifestyles were investigated. The aim was to identify guidance-, system-, and transformation-knowledge for this change. Based on the research results we will show what obstacles and blockages must be overcome in order to make everyday routines CO2-poorer and in what areas - in particularly in which social milieu - the willingness to change their own daily practices is existing. Closely related to this is the question of how to enforce certain everyday practices as socially prevailing norm.

**Dynamics of energy infrastructural transitions: linking practice theory and political economy?**

Mattijis SMITS (Wageningen University) | mattijs.smits@wur.nl

This paper links insights from practice theory and political economy to improve the sociological understanding of transitions in energy infrastructure. Political economy approaches have frequently been used to analyse changing energy infrastructure. This tradition offers excellent tools to understand the power dynamics at play in the development of such infrastructures and which actors stand to win or lose in the process. However, political economy perspectives fall
short in explaining what transformations take place in the ways people actually use the services infrastructures provide. As such, it offers a rather one-sided perspective on infrastructures and practices, treating 'practitioners' as mere consumers of energy. Practice theory helps to open this black box by studying what - in this case - energy is actually used for in transforming people’s lives. Linking such insights to the political economy of infrastructure enables an understanding of how the dissemination of practices affects the power dynamics involved in infrastructural development, and, conversely, how the (un)availability of infrastructure leads to new or changing practices. As such, the political economy lens needs to be extended to understand how actors and infrastructure shape the different elements of practices, while practices can be seen as constitutive of what are often seen as ‘wider’ political economical processes. The aim of this paper is to explore these dynamics in more detail, drawing on empirical examples from Southeast Asia, a rapidly developing region offering great opportunities to study the dynamic nature and tensions involved in energy infrastructural development.

RN12S15a - Environmental Justice I

Analysis of National Environmental Government Organizations in Turkey: Rise of Professionalism and Protests
Cagri ERYILMAZ (Artvin Coruh University, Turkey) | cagrideniz@gmail.com

This study aims to analyze the transformation process of environmental NGOs in Turkey. Since 1990s, traditional voluntary organizations became more professional focusing on lobbying and partnership activities with state and private sector. On the other hand, local and confrontational environmental organizations overspread all over the country. Desktop study of internet sites, documents, media coverage of environmental organizations are examined. Semi-structured interviews are performed with environmental NGO and government representatives.

As a result, neoliberal process not only changes environment but also the environmental organizations. Emerging professional, central and hierarchical NGOs are challenged by local, horizontal and voluntary organizations.

‘Are smart cities a tool for social equity?’
Ilaria BERETTA (Università Cattolica del Sacro Cuore, Italy) | ilaria.beretta@unicatt.it

Nowadays, it seems that politicians and administrators supranational, national and local rely on the concept of 'smartness' to solve most of the problems that plague our cities, such as environmental emergencies, traffic, poverty, unemployment. Almost always, main European policy documents focus on the cities: suffice it to mention, for example, the ‘Europe 2020 growth strategy’ or the European funding program ‘Horizon 2020’, aimed mainly to cities and, in particular, to the development of projects 'smart'. After all, with a population of 70% already lives in urban centers and is expected to continue to grow rapidly (80% in 2020), it would be at least short-sighted not to recognize adequately to the city the role of engine of the economy, places of connectivity, creativity and innovation, and service centers for the surrounding areas.

Yet, there are several issues that can be obscured by the target of becoming dazzling city 'smart'. In this paper I’ll analyzed one: the effective capacity of the smart cities to be ‘inclusive’, i.e. to cover all the different segments/groups of the population, from the strongest to the weakest, thus proving to be a tool for greater social equity. Indeed, despite appearances and what is stated in the official documentation, analysis (secondary type) conducted on some of the
major Italian and European smart cities show how the projects implemented mainly concern strong stakeholders of civil society, and exclude instead the weakest brackets of population.

Sinking Islands and Environmental Justice
Tomáš BRUNER (Faculty of Social Sciences / Charles University Prague, Czech Republic) | Bruner@seznam.cz

Island states in Pacific Ocean such as Kiribati, Tuvalu or Marshall Islands are located just few meters above the ocean. The rising sea level may cause them to sink either entirely or to the extent that would make them uninhabitable. Nearly a million citizens may be forced to flee their countries that would subsequently lose their very defining feature – territory. Representatives of those countries, motivated by the imagination of undesirable future, primarily attempt to solve the situation through international treaty that would reduce emissions causing greenhouse effect. The countries with rapidly developing industry oppose this solution, motivated by the imagination of future where their economic development would be significantly hindered by this reduction.

The paper investigates how those chosen state actors in the case of sinking islands construct environmental justice in the speech acts and how they interconnect the imagination of possible future with their construction. Empirical analysis of accessible negotiations and statement records of official representatives of the chosen states outside and within the UN framework specifies how the actors discursively shift the meaning of environmental justice, exploiting its different perceptions, e.g. commutative and distributive justice.

Human biomonitoring: a promising tool for environmental justice advocacy?
Bert MORRENS (University of Antwerp, Belgium) | bert.morrens@uantwerpen.be
Ilse LOOTS (University of Antwerp, Belgium) | ilse.loots@uantwerpen.be

Environmental justice research suggests that inequalities in the distribution of environmental quality systematically disadvantage the lower social strata of society. The effects of these inequalities on the human exposure to specific chemical pollution remain however to a large extend unknown, especially in industrialised regions were people are exposed to a mixture of diverse pollution. Human biomonitoring (HBM) is an innovative method to measure the body burden concentrations of chemicals in blood and urine samples.

We conduct a socio-stratification of HBM results from Belgium by associating body concentrations of different chemicals with individual socioeconomic status. Social gradients in exposure to these chemicals are assessed with geometric means and odds ratios, using multiple regression models. Our results show that, depending on the (type of) pollutant, people with lower socioeconomic status can either have higher or lower concentrations. Socially constructed factors, such as dietary and lifestyle habits, play an important role in these relations indicating that exposure is not only an environmental but also a social process.

We conclude that when assessing body concentrations of chemicals, more complex patterns of social stratification emerge than can be assumed on the basis of the environmental justice hypothesis. It therefore remains important to consider the chemical environment in relation to the social environment when monitoring environmental health risks. By emphasizing on transparent communication and dialogue between stakeholders and scientists, HBM has the potential to mobilize and empower disadvantaged individuals and communities and could be a promising tool to advance the goals of environmental justice advocacy.
Bridge over troubled waters? – The link between procedural justice and legitimacy in multi-leveled coastal governance
Linn RABE (Södertörn University, Sweden) | linn.rabe@sh.se

Can procedural justice contribute to legitimacy of decision-making in wicked problems like marine and coastal governance? If so, how? The answer to these questions could offer insights into factors needed for achieving effective decision-making and compliance. Theoretically, the paper will contribute to a better understanding of the links between procedural justice, legitimacy and local implementation of nature conservation in a multi-level governance context. The Baltic Sea macro-region is used as an example.

The Baltic Sea area is commonly pictured as a proactive macro-region with a long-standing tradition of cross-country cooperation in environmental management and ambitious sustainable development goals. The Baltic Marine Environmental Protection Commission (HELCOM) is a prominent intergovernmental platform for environmental cooperation. In this case the issues of justice is only superficially dealt with on the trans-national level, leaving local institutions to deal with complex justice situations when implementing agreements. The regionalization of the Baltic Sea management creates a mismatch between the transnational level where possible injustice is reproduced and the local level where injustice is experienced.

This paper will present findings from two comparative case-studies of local processes in Sweden where the HELCOM’s agreement to establish a System of Coastal and Marine Baltic Sea Protected Areas in the Baltic Sea (BSPA) is implemented. The cases of Gräsö Eastern archipelago and Sankta Anna/Missjö archipelago offer interesting empirical material as the level of procedural justice differs in ways that effect the legitimacy of decisions, which in turn can have consequences for stakeholder compliance and the over-all outcome of these conservation projects. In both cases the core conflict centred on local actors’ perceived risk of losing decision-making control. The local actors’ experience of outside intervention in nature resource management is in general negative and the level of trust in the authorities is low. The local actors perceive they, for an extended period of time, have lost entitlement and capability in relation to the state. The islanders perceive themselves as an “endangered species” and that they need to fight against the state in order to survive. In the Gräsö case stakeholders perceive the BSPA as just another example on how the state have overruled them, while in the St Anna case the BSPA offers a first step towards reconciliation, trust and co-management. Perception of justice played a key role in both cases, but only in the latter did it facilitate a constructive management of mistrust and the creation of legitimate decisions. This paper shows why.

RN12S15b - Environmental Justice II

Towards linking the concepts of ecosystem services and environmental justice: A Hungarian case study
Ágnes ROBOZ (Corvinus University of Budapest, Hungary) | agnes.roboz@uni-corvinus.hu
György PATAKI (Corvinus University of Budapest, Hungary) | gyorgy.pataki@uni-corvinus.hu

To interlink the concept of Ecosystem Services and Environmental Justice is new frangled in national and international level also. Some example and case study can be found but they are elementary, mostly they start to framework the connection of this two concept. This paper try to presentate a hungarian case study in connetion to the second biggest river of the country which called Tisza. The issue based on freshwater ecosystem services and that the different social classes how to access them in Szeged city which found in the Great Hungarian Plain. An environmental justice issue linked to the river bank, because the governance of the city stated a
river side development project within the framework of it, there will be a lot of change in the landscape of the city, in the use and in the accessibility of the river coast. This development is about to renew the water wall of the River Tisza. This is a big issue in Szeged nowadays, because that water wall that stood near by the river was started to get old and it can not fills the function of the protection of the city from the floods. So now exist a project about a new mobile water wall, what is still going on. This project mainly finance by the European Union but also by the city of Szeged. The decision makers of Szeged comissioned some experts to design and carry out the project. There are expert of water management, architects and landscape architects also, who are mainly the top-middle class inhabitants of the city. They see this project only trought their glasses, but do not think about the f.e. the poorer middle class or the minority of the city.

As any other ecosystems freshwaters are provide a wide range of benefits of the nature. In the scientific literature different type of categorization exist for categorize the freshwater ecosystem services. In this case the grouping of Millenium Ecosystem Assessement will be used with the aim to presentate the classes of freshwater ecosystems. In this case of river Tisza all of these freshwater ecosystem services are available but not for every social classes.

As the ecosystem services the environmental justice issue could be discussed from several approaches. In this case only one will be detail. A hungarian categorization by the research group of a non-govenmantal organization (Védegylet) builted up an alternative alignment, in the course of this grouping they categorize the circle of the injustices by social classes. According to them exist marginalised, non-privileged and privileged (elite) groups whom effected by environmental hazards. This is an extended ranking because the traditional environmental justice interpretation separate the society only to two groups: marginalized and privileged parts. This categorization is complete it with the third non-privileged group. So in this case a 3-divided structure from was created from the 2-divided dichtiome. The non-privileged group means the greater proportion of the society, mainly this is the middle-class. The environmental justice problems mainly to apply to the minority groups of the society. However potentially the greater part of the society exposed to environmental injustice problems what are affect on the quality of life. For the non-privileged groups these are those neccesities which are non important for the physical survival but influence the material wealth and the quality of life. These are the "environmental public services" for example the parks, the fresh air or the silence.

In Szeged some of the ecosystem services are available for everybody independently of social class or income, because they are free. These are of course the regulatory and the supporting services and water quantity and quality as provisioning services, moreover existing use as cultural services. Those services which are available for the most part of the middle class or the elite are those which for the people have to pay. As fishing as provisioning or cultural services also because fishermans have to eliciting the fishing licence. Turism as river viewing or recreation as hiking could be free also for everyone, but kayakin or canoeing are also paying activites. Environmental education or send the children to ecoschools are also the privilege of the top-middle class or elite. These previous services are the most commons among them. There are some special cases what are connect to the river Tisza near by Szeged and there is some differences between them independently of the state of the developement. In the pre-developement state, before the water wall construction started mostly all social class used the river bank in different ways. There are some floating houses witch function as fancy restaurant, caffé or nightclub for the elite. Also they have private holiday or floated houses in the river side. There is a paying but trimmed beach. For the poorer classes there are some free beach where they can swim in the summer time, but all of them are illegal as gathering and alkochol consumption fot the youngest people. For this classes the before mentioned entertainment facilities are too expansive not to mentioned the marginalized groups for example the homelesses whom are lived under the bridge or car ramp or in the subs forest near by the river. After the developement project these slight quantity of the opportunities will narrow because the
aim of the governance not only innovate the water wall, but the whole river stage. They would like to be favour for the well-to-do classes with more fancy floating houses or restaurants in the river side, with a beautiful walking side and park without enjoy themselves teenageers or sleeping homelesses because the governance already criminalized these activities. Consequently we can see that not only the marginalized or poor social classes could to exclude from the benefits of the nature. For the fair distribution of the goods and services it is neccessary to study all social classes not only the marginalized ones as it is usual in environmental justice cases.

Desire for ecology and social inequalities in Western Europe
Jean-Paul BOZONNET (Sciences Po Grenoble, France) | jeanpaul.bozonnet@iepg.fr

When the environmentalism emerged in the 70s, a vigorous debate arose between the movement spearhead, the associations’ members from new middle-classes (Boy 1981; Cotgrove et Duff 1980) and the representative unions of the traditional industrial and agricultural world. These latter feared that the new middle classes, by curbing growth, «remove the scale" that they have themselves climbed into their social ascent, and deprive them of access to the benefits of affluent society to which they aspired (Prendiville, 1993). This opposition was analyzed as a new transverse cleavage, basis of "new politics", and responding to "post-materialist" voters (Inglehart, 1993). Thereafter, the promotion of sustainable development with its three pillars and the theory of ecological modernization, have tried to show that there was no real conflict between social claims and ecology. But more recently, some researchers tell a different story: they highlight the growing dramatic opposition between winners and losers of globalization (Kriesi et al. 2008). What are the consequences today of these inequalities on the desire for ecology? Is the divide reducing or enlarging between those claiming priority to the protection of the environment, and those who prefer first growth and the fight against poverty? We will examine the evolution of these positions in the different social classes of the Western Europe countries since 1974. To display these historical trends, we will rely on major European surveys: Eurobarometer, EVS, ISSP and ESS.

Carolina PIMENTEL CORRÊA (University of Porto, Portugal) | carolpimentelcorrea@gmail.com

The concept of sustainable development is present on a global scale, at different levels of debates. Brazil, for example, had two important Conferences promoted by the United Nations about it - Rio 92 and Rio + 20. In these meetings, through official documents, the countries made commitments in the idea of multilateral decision-making. Accordingly, the theme of sustainable development suggests a reflection on its practical applicability. Therefore, one may ask: which Brazilian institution, at the federal level, undertook to do and claimed for itself the interest in sustainable development? The Chamber of Deputies, since 2004, keeps the Environment and Sustainable Development Commission, which seems to be a possible answer to the question raised. This Commission has a permanent basis, acts in the legislative level. It is its responsibility, according to the Resolution no.17, 1989, discuss and vote on the proposals subject to the decision of the Plenary and hold public hearings with civil society. Thus, the aim of this study is to understand how the Commission works, ie, what are the dynamics developed so that this can act in relation to its duties and responsibilities, as well as realize the profile of actors which form this bureaucratic field. This design is part of a
sociological research that is underway, however, in an exploratory phase, the objective is to prepare a theoretical framework this Commission in terms of organization and themes, taking into account the context and the specificities of the Brazilian legislative.

Social diffusion of energy-related practices in two European areas: A way for reducing inequalities?
Françoise BARTIAUX (Université catholique de Louvain and FNRS, Belgium) | francoise.bartiaux@uclouvain.be
Luisa SCHMIDT (University of Lisbon, Institute of Social Sciences) | schmidt@ics.ul.pt
Ana HORTA (University of Lisbon, Institute of Social Sciences) | ana.horta@ics.ul.pt

The social-class dimension of the research on energy consumption has been rather neglected relative to other theoretical approaches, despite its potential that has not been exploited in energy research and policy. This presentation aims at showing the relevance of social class as an analytical category for energy research and the usefulness of social diffusion theories, both vertical and horizontal diffusion, when analysing energy consumption in the residential sector and reflecting to paths for reducing socio-economic inequalities. Two countries with contrasted patterns of income inequalities, Belgium and Portugal, are compared to empirically ground the analysis. Qualitative data were collected in both countries in 2009-2011. Results are framed by the environmental-justice theory and its three dimensions: distributional injustice, procedural injustice, and lack of recognition. In the conclusion we discuss the relevance of integrating the social diffusion dimension in energy analysis and propose some policy instruments to do so.

RN12S16a - New Trends in Environmental Movements Research I

Sustained transnational action: environmental movement organizations
Magnus BOSTRÖM (Örebro University, Sweden) | magnus.bostrom@oru.se

Most environmental problems have long term and cross-border implications. Therefore, environmental movements that want to impact on environmental politics and policy must be able to operate across borders and to sustain their activities. This paper will contribute theoretically to research on social movements in general and environmental movements specifically, and a particular theoretical innovation is to combine focus on the spatial and temporal dimensions. It is relevant to focus on environmental movements as they are often seen as particularly attuned to engage in transnational action, and on issues which are global and long-term. Given these spatial and temporal aspects, what opportunities and challenges do these movements face? How can they build on domestic capacity to develop cross-border actions? How can they sustain transnational action over longer time periods? The analytical framework is drawn from familiar concepts from social movement research: political opportunities, resource mobilization, and framing. A spatial and temporal perspective is connected to these concepts. The paper builds on an extensive literature review on environmental movements and transnational action. It is also informed by a research project that involved empirical material and analysis of environmental movement organizations from six countries (including organizations from Sweden, Germany, Poland, Slovenia, Croatia, Italy) and with focus on their capacities to develop transnational action. The analysis demonstrates the important role of transnational ENGOs, international institutions as well as the role of a facilitating domestic political context for ability to develop sustained transnational action.
Environmental Justice in Scotland: Understanding the links between pollution and deprivation

Nick BAILEY (ESRC AQMeN Research Centre, School of Social and Political Sciences, University of Glasgow, UK) | nick.bailey@glasgow.ac.uk  
Guanpeng DONG (ESRC AQMeN Research Centre, Sheffield Methods Institute, University of Sheffield, UK) | guanpeng.dong@sheffield.ac.uk  
Stephan HEBLICH (ESRC AQMeN Research Centre, Department of Economics, University of Bristol, UK) | stephan.heblich@bristol.ac.uk  
Jon MINTON (ESRC AQMeN Research Centre, School of Social and Political Sciences, University of Glasgow, UK) | nate.minton@gmail.com  
Gwilym Benjamin PRYCE (ESRC AQMeN Research Centre, Sheffield Methods Institute, University of Sheffield, UK) | g.pryce@sheffield.ac.uk  
Chris TIMMINS (ESRC AQMeN Research Centre, Department of Economics, Duke University, USA) | christopher.timmins@duke.edu

For an informed debate about environmental justice, and to make informed and effective planning policies, it is important to understand the social and economic mechanisms that could lead to associations between pollution and social disadvantage. In this paper we begin with empirical analyses that combine data on air pollution and landfills with data on social characteristics, to understand how these variables relate to each other at the small area level in Scotland. Firstly, we explore whether there is evidence of ‘environmental injustice’ – that is, whether more socioeconomically disadvantaged populations tend to live in areas with more pollution. Secondly, we explore whether the strength of this relationship becomes stronger or weaker as additional variables are controlled for. We conclude by reflecting on the knotty issue of causality in understanding such associations, and discuss the potential role of equilibrium sorting models to help disentangle this issue.

The impact of Urban Agriculture on urban dweller’s happiness: social dimensions of urban farming

Renato MARIN (University of Barcelona, Spain) | renato.marin@ub.edu

How Urban Agriculture may help to achieve better cities? In what extend can UA contribute to dwellers' happiness? How cities are nourished is one of the challenges of tomorrow’s urban life. UA is a social phenomenon that may have social effects in terms of inequality, food security, health even happiness and subjective well-being. UA is defined as growing vegetables, raising animals and other interrelated activities for household consumption and income generation in cities. Nowadays, in global-northern cities UA practice is linked with post-materialistic values as well. UA can be promoted as a device or policy instrument, as a grassroots experiences or a vindictive political expression. The main hypothesis of this article is that UA is an opportunity for greening the city and it has positive impacts on wellbeing of dwellers when it is embedded in communitarian grid of the city, contributing with a social meaning of its practices. Consequently, the value of UA lies in its social features instead of technical characteristics. This work is interested in how UA is a “de-alienating” force for urban dwellers and increase their subjective well-being. UA usually is an expression of the individual and collective right to decide and feel the city as the dwellers want. Is needed to analyze the urban context and the systems of use and meanings of the UA spaces. This paper use a sociological definition of happiness based on social engagement and social action oriented to others. This paper analyze cases of UA performance from Barcelona, Berlin and Detroit.
Challenging the throw-away society. Socio environmental movements’ practices on waste prevention in Gothenburg, Sweden

Maria José ZAPATA CAMPOS (University of Gothenburg Sweden) | mj.zapata@gri.gu.se
Patrik ZAPATA (University of Gothenburg Sweden) | patrik.zapata@spa.gu.se

The Swedish national waste management policy, following European Union directives, shifts the focus from reducing landfilling and increasing recycling, to reducing and preventing waste. In this context, new values, practices, and narratives enacted by socio environmental movements have the ability to challenge the dominant socio-technological regime of waste as a resource. Also, they can contribute to envisioning, conceptualizing, and performing new relations between society and nature.

The paper examines the role of socio-environmental movements in waste prevention policies and practices, based on the case of grass-root initiatives on food-waste recovery and freeganism (The food-waste recovery Chalmers students' project), the creation of common reuse and reparation spaces in tenants apartment blocks (The Majorna Ecological District), and the establishment of bicycle repair shops and clothes exchange (The Bicycle kitchen) in the city of Gothenburg, Sweden. The paper is based on ethnographic interviews, and observations in repair shops and of waste recovery practices.

The paper analyzes the similarities and differences between these socio-environmental movements and draws upon theories on social movements and organization theory, to explain how, as the recycling movement in the 1980s, these new waste-prevention movements not only share a common critique against the throw-away-society but they invite us to imagine new possible practices for a more sustainable, equal and just society.

RN12S16b - New Trends in Environmental Movements Research II

Environmental Justice and Social Priorities: A Portuguese Case

João GUERRA (University of Lisbon, Portugal) | joao.guerra@ics.ulisboa.pt

The redefinition of social priorities in ecological scarcity context (Schnaiberg, 1980) is not new in contemporary societies. However, a relatively clear separation between the environment and social justice remains. It is this apparent mismatch that this presentation will consider.

The holistic view of sustainability — while promoting human welfare and preservation of the natural environment — is becoming a programmatic and cross dominant ideology that has shaped the generality of environmental policies, but its effective implementation has basically been done in an evasive (Adger and Jordan, 2009), superficial (Redclift, 2005), and inconsequential (Lélé, 1991 [2005]; Carter, 2001) manner. In rough economic times — and despite the inevitable end of the “age of irresponsibility” that assumed infinite resources (Jackson, 2009) — those features tend to worsening and, nevertheless, do not release an engaged, empowered and collective movement able to request and support just, equitable and pro-sustaining measures. Based on the testimony of representatives of Portuguese civil society organizations (focus group, on-line survey, and document analysis) and International Social Survey Programme data (Environment III), we will seek to look at sustainability and their results in a critical perspective, questioning the role of international governance and national governments, without forgetting the practices and attitudes of citizens and civil society organizations.

Taking into account that, despite the rhetoric of holistic sustainability, environmental groups tend to ignore social problems and overestimate ecological ones, while the remaining groups tend to take a reverse position.
Potentials of Emergence and Development of Environmental Movement in Serbia within the Post-socialist Context
Jelisaveta VUKELIC (Faculty for Special Education and Rehabilitation, Belgrade University, Serbia) | vukelic.jelisaveta@gmail.com

This paper deals with the issue of potentials for creation and expansion of the environmental movement in Serbia, in the context of post-socialist transformation and the EU integration process. The research is based on a combination of different methodological techniques: a survey of attitudes and practices based on a representative sample of Serbian citizens (N = 1952) and local government representatives (N = 232), in parallel with the semi-structured interviews with representatives of non-governmental organizations (N = 44). The main research finding is that participatory type of environmental movement that is typical for the Western countries has not been formed in Serbia. There are even no indications of the development of transactional environmental activism (movement), that is present in the countries of Central Europe. Instead, we are witnessing the emergence of a distinct model of collective environmental action that we have labeled "the third environmental sector". In order to explain the development of the specific hybrid form of the environmental third sector, a synthetic explanatory model was established, combining elements developed within different social movement theories. The analysis showed that through the four direct factors (social – construction of environmental risks, the availability and characteristics of resources, the structure of political opportunities, the value system), the process of development of the environmental movement is indirectly affected by wider-scale social processes – the post-socialist transformation and Europeanisation of Serbian society, as well as by the factors of longer duration ((pre-) socialist heritage).

Rediscovering and Daylighting Urban Rivers: A Case Study of a Movement in Ankara Turkey
Çigdem ADEM (The Public Administration Institute for Turkey and the Middle East, Turkey) | c_adem@yahoo.com

Many cities have developed around rivers due to the resources that they provide including food, water, power, flat land for development and for transportation. Today, 54% of the world population live in urban centres and this is predicted to increase. Urban development has rarely been sympathetic with its environment and has often overlooked the value of functional aquatic systems (Baron et. al, 2002). Consequently, urbanization has degraded many urban rivers to the extent that some cease to provide the very resources for which the settlement developed. In the recent decade, there is an increasing recognition of the need to restore and sustainably manage freshwater ecosystems. A growing movement exists towards the uncovering, or ‘daylighting’ of urban rivers, exposing them to view once more and making them focal points within urban environments. Daylighting of urban rivers started to occur across the world in many countries including the US, China, UK, Canada, Morocco and South Korea. Ankara (Turkey) was a city developed around rivers but due to severe flooding and rapid urbanization most of the rivers were covered and the rest were left in severe neglect. In 2013, a movement started with the formation of the Study Group on the Rivers of Ankara whose aim is raising awareness on the rivers of Ankara and eventually daylighting them. The research will elaborate on the change in the approach to and perception of urban rivers and focus on the movement to daylight the rivers of Ankara.
Environmental conflicts in Portugal during the past five decades: the EJatlas
Portugal conception
Lúcia de Oliveira FERNANDES (Centre for Economic and Organizational Research) | luciaof@gmail.com
Sofia BENTO (Lisbon School of Economics and Management, Portugal; Centre for Economic and Organizational Research) | sbento@iseg.utl.pt
Stefania BARCA (Centre for Social Studies, Coimbra) | sbarca@ces.uc.pt
Lays SILVA (CETEM, Brazil) | layshelena@hotmail.com

Our proposal is to present the methodology and the results of the selection and preparation of the Portuguese environmental conflicts for the EJatlas (EJOLT project FP7). This project aims to bring science and society together, in order to catalogue and analyse ecological distribution conflicts and environmental injustice. Even though cases of environmental conflict have been recorded in Portugal as early as the 1930s, our starting point for this study is the end of Salazar’s dictatorship (25 April 1974), when rapid social change (e.g. agrarian reform and mass emigration) and new developmental policies (e.g. intensive urbanisation along the coast and the extension of road and energy infrastructures) were implemented as part of the ‘modernisation’ of the country, especially after its integration into the European Union (1986). To facilitate the selection of examples of conflict in Portugal, several ‘experts’ (mainly activists and academics) on environmental conflicts in Portugal were consulted. After the analysis and systematisation of all the information, a list of approximately 160 conflicts was compiled, and these have been distributed across the following different areas: waste, industry, mining, agriculture, energy, mega projects, public administration and territorial management. 25 cases of environmental conflicts of greater intensity and relevance were selected to be appreciated by a pool of Portuguese activists, academics, public servants, technicians, journalists, parliamentarians and politicians, who were asked to choose the 15 cases they considered to be most relevant. The selection of Portuguese cases for the EJatlas gives a general view of the socio-economic and environmental change that have occurred in Portugal during the past five decades, as well as the consequent changes in environmental mobilisation patterns and also the reaction of society to these transformations.

RN12S17a - Urban Structures and Environmental Change I

Global environmental problems as urban problems or: How climate change is reconfiguring urban development trajectories
Emiliano SCANU (Université Laval, Canada) | emiliano.scanu.1@ulaval.ca

Climate change has already been addressed by much sociological research interested in societal responses to global environmental problems. However, urban climate governance has been quite neglected to date. This is rather curious if one considers that we now live in an urbanized global society, and that most significant and promising climate initiatives are being carried out by cities. This paper thus explores this line of research. Using insights from the sociology of environmental problems and urban theory, this paper presents an empirical comparative study of climate policies in Genoa, Italy, and Quebec City, Canada. The aim is to understand the way climate change becomes the subject of discourses and actions at the urban level, and to what extent it influences choices affecting urban development trajectories. Results show that these two cities have undertaken efforts to deal with climate change. However, while Genoa made the strong decision to take the path of low-carbon urban development, Quebec City adopted a rather timid approach, which is essentially symbolic in nature. These
divergences are due both to socioeconomic and political background of each city, and to their wider institutional contexts (European and North American). An original typology based on the degree of institutionalisation of climate change in urban development is also used to illustrate theses results. By focusing on the growing phenomenon of cities’ implication in climate governance, this paper contributes to shed some light on how and why contemporary societies change and adapt to cope with global environmental challenges.

Towards a low carbon future: urban electricity experiments and new forms of governance in Germany
Nele HINDERER (University of Stuttgart, Germany) | nele.hinderer@sowi.uni-stuttgart.de
Gerhard FUCHS (University of Stuttgart, Germany) | gerhard.fuchs@sowi.uni-stuttgart.de

While the traditional form of electricity generation and supply is based on centralized structures with large-scale power plants, the objective of a strongly decentralized form of energy supply is increasingly becoming of importance. In the current existing regulatory and market frameworks in Germany and elsewhere, important technical and institutional innovations for energy transitions were and are being developed, tested and brought to application on regional and local levels. Regions, cities and villages experimenting with socio-technical innovations and aiming to implement new concepts have to develop governance structures under high uncertainty. These governance structures mirror space-specific social, political, technological and economic constellations. The present paper introduces an analytical approach for studying emergent forms of governance and uses some cases from Germany to apply the approach. In this context the proposed paper will analyze the development of decentralized situational governance as a basis for innovation impulses for the transformation of the electricity system in Germany. Assuming that urban governance structures develop in conflict with the established structures of the field “electricity generation”, the paper analyzes a range of German initiatives as “strategic action fields”, within which socio-technical innovations are being developed. Based on recent theorizing by Neil Fligstein and Doug McAdam (2011/2012) the paper stresses the importance of the actions of so called challenger actors, which eventually might contribute with their activities to a change in the overall system of electricity generation.

Urbanization and Socioenvironmental Dynamics in the D. Pedro I - Tamoios Road Axis: Some Enviromental Sociology Contributions
Sonia Regina da Cal SEIXAS (UNICAMP, Brazil) | srcal@unicamp.br
João Luiz de Moraes HOEFFEL (FAAT, Brazil) | jlhoeffel@gmail.com
Jansle Vieira ROCHA (UNICAMP, Brazil) | jansle.rocha@feagri.unicamp.br
Estevão Brasil Ruas VERNALHA (UNICAMP, Brazil) | este

An intense process of urbanization, industrialization, tourism development, and population dynamics has accompanied the recent decade’s expansion of major roads in the state of São Paulo, Brazil. These processes contribute to changes that affect natural systems and accelerate...
climate change in urban environments. At the same time, the use of transportation by both people and cargo involves heavy consumption of natural resources and the generation of negative impacts such as pollution, congestion and accidents intensified by the increase in private motorized individual transport, which promotes a growing privatization of the circulation space. The study of these impacts and its expansion are important from a socioeconomic perspective, as analysis on how they impact the urban structure, the environment and different social groups, and are fundamental to indicate social public policies for planning a more suitable environment. This paper aims to analyse the process of urbanization and socio-environmental changes in 10 municipalities located along the road axis D. Pedro I - Tamoios chosen for their regional relevance. Thus, sociodemographic data, the expansion of industry, services, tourism development and agricultural production of these municipalities and the increasing current fleet in the road axis for the 1998-2013 period were analysed. Data were analysed with focus on social and environmental changes taking place in the municipalities, especially urbanization processes, risks and vulnerability and its potential relationship with urban global environmental changes.

What does environment mean? A question renewed by social movements.

Sophie NEMOZ (RT38 AFS) | sophie.nemoz@gmail.com
Anahita GRISONI (RT38 AFS) | anahitagrisoni@gmail.com

This two-voice communication aims to cast a fresh eyes on the classical topic of environmental mobilizations. With a four-year straight collaboration by leading panels in national and international academical events –French Sociological Associations Congress, September 2013 ; 18th International Sociological Association Congress, July 2014 - we gathered several contributions around this topic and will present at the 10RC12 ESA session some of our theoretical conclusions. This demonstration will be illustrated by those empirical works and by our personal researches in the field of environmental mobilizations: natural health movement in France (Anahita Grisoni) ; ecobuildings initiatives in France, Spain and Finland (Sophie Némoz) ; Transition Towns in Brussels (Sophie Némoz) collective protest against the Torino-Lyon rail line construction (Anahita Grisoni).

The main issue that we observed is the reformulation of social struggles from an ecological perspective. Far from being reduced to environmental claims, the contemporary social movements recompose financial, social and environmental categories toward the goal of a social justice. The particular context of the financial crisis gives raise to a reassessment of social issues, where environmental topics are integrated to the global claim for alternatives. Most of them can be approached from a postcolonial perspective, not only because they are located in the South, but also because they concern economically dominated or rural populations of Northern countries.

RN12S17b - Urban Structures and Environmental Change II

Policy tools, energy certification agencies and social practices of energy retrofit in the compact city: a case study from Italy

Natalia MAGNANI (University of Trento, Italy) | natalia.magnani@unitn.it

The paper analyzes policies and practices of energy retrofit in the city of Bolzano, in the Northern alpine area of Italy. Among Italian cities Bolzano is especially characterized by a search for a sustainable urban development that limits the impact of the capital city on the surrounding rural Alpine landscape through innovative instruments. Tools for the promotion of
energy upgrading of existing private buildings have been developed within this perspective by the local planning office. These have included regulatory instruments, such as the presence of energy parameters (that consider not only the building envelope but also the heating and cooling inside the building) in the municipal development regulation. In addition volumetric incentives aimed at stimulating the construction sector and bounded to the achievement of certified high energy standards have been adopted. In the town of Bolzano these instruments of urban policy are intertwined with the strong role played by the tool of energy certification, which is compulsory for any important retrofit intervention and is undertaken by a nationally renowned regional agency. In spite of this variety of policy tools, and unlike in the rural area where the German speaking minority predominates, in the city the number of renovated buildings is very low. Based on a social practices theoretical framework in my contribution the policy tools to promote urban retrofit will be critically analyzed by reconstructing the socio-technical process of energy retrofit implemented in some cases of multi-apartment buildings. The aim is to highlight virtuous mechanisms but also critical and missing links between sustainable urban development policies and social practices of energy retrofit.

Keep cool - individual, social and housing effects on the experience of heat stress
Katharina SEEBAESS (University of Nuremberg-Erlangen, Germany) | katharina.seebass@fau.de

The ongoing climate change leads to an increase in extreme temperatures like heat waves. But negative effects of heat do not all of us affect to the same degree. Deprived neighborhoods have a higher likelihood of exposure to environmental burdens such as heat. An individual is affected by heat depending on how much an individual is exposed. Bad housing conditions and a living environment that has little (access to) greenery have a higher likelihood for the development of heat. Additionally, individuals are not vulnerable to heat in identical ways. Age and individual health status are important determinants for the individual to cope with heat, otherwise one experiences heat stress. The study attempts to answer the question of who is affected by heat stress. Heat stress is measured on a subjective scale. Individual characteristics, social factors as well as the living environment will be considered in explaining heat stress.

Results from a representative survey (“Adaption to climate changes in Nuremberg 2011”) are presented. The data were retrieved in two districts (n=1176 respondents from CATI and PAPI interviews). One district is characterized by dense old historic housing; the other city area is shaped by industry, little access to greenery and people with low socio-economic status and a great ethnic diversity. The multivariate analyses reveal that individual and social factors matter. Moreover, the housing conditions and the living environment show interesting results.

Urban Planning and Electrification of sub-Saharan African Informal Settlements: between Recognition and Eradication
Xavier LEMAIRE (University College London, United Kingdom) | x.lemaire@ucl.ac.uk

Informal settlements constitute a major part of African cities - 72 % of the urban population of sub-Saharan Africa lives in slums (UNFPA, 2007). The research presented in this paper focuses on the electrification of informal settlements and the attitude of institutions like utilities and municipalities in front of the expansion of “illegal” connections. Numerous problems come with illegal connections like safety and fire hazard, overload of the network and substations, loss of revenues for utilities, economic exploitation of the poorest by resellers of electricity... While some countries manage to adopt a flexible and adapted approach to the electrification of informal settlements, the reluctance of the majority of authorities to
provide access to electricity in these areas can be rooted in the colonial history and urban policies of countries denying any legal rights to the poorest - taking refuge behind laws and spatial planning schemes conceived to protect the wealthiest. Electricity access does not need to be necessarily a deeply contentious issue between local communities trying to connect to the network with or without authorisation and utilities and municipalities trying to discourage illegal connections often without proposing any alternatives. This paper details different attitudes from countries like South Africa which after the apartheid has adopted innovative approaches to enable the electrification of the majority of informal settlements, to countries where the only answer is a permanent fight against illegal connections. It also describes the work of utilities’ agents in informal settlements and the way they engage with local communities.

**Environment and industrial experience. The future of an Italian Southern city**
Marta VIGNOLA (University of Salento, Italy) | marta.vignola@emui.eu

The aim of the paper is to study the case of Taranto, an industrial city in the South of Italy, where the largest steelworks in Europe, ILVA, is located. The research starts out from an analysis of past development models, their effects on environment and health, their negative effects on the present and future of the city. The analysis is based on re-building the memory of industrialization processes and on the involvement of citizens, associations, stakeholders. The research result is a biography of the city written by its collective actors. The object of this study is not to consider Taranto as a place of the memory but to recover the memory of a place: the cultural memory of the inhabitants and their representations. Places are intended as socially determined dimensions capable of incorporating stories, memories and individual experiences that become collective when they are told and evoked on the basis of social frameworks structured in the present (Halbwachs, 1950). What is reconstructed from the empirical material is a collective social framework of memories capable of telling the story of a factory city, the development paradigm on the base of which it was planned in the 70s and alternative models, which the citizens foster, based on different de-industrializing paradigms as well as new environmental values. Taranto is a metaphor of the capitalist modernization that produced contradictions, conflicts, and pollution, thus a clear-cut example of the aporia of the twentieth-century development and of the human and environment costs.

Lisa PIZZOL (Ca'Foscari University of Venice, Italy) | lisa.pizzol@unive.it
Andrea CRITTO (Ca'Foscari University of Venice, Italy) | andrea.critto@unive.it

This article explores the role of cultural entrepreneurs in contemporary urban growth coalitions with the aim to distinguish between old and new development paradigms. In the new paradigm, it is argued, entrepreneurs play a key role in devising radically different strategies for growth. The question is whether the difference produced by these radical strategies amounts to a shift in social relations within the post-industrial city or to a preservation of the status quo. In order to address this question, we investigate the concept of green landscape economy developed for the rehabilitation of a former industrial site, currently known as Vega, and located in the industrial area of Venice, Italy. We rely on seven in-depth interviews and the analysis of the social networks of actors engaged in the requalification of the Vega area, as part of a Marie Curie individual research project entitled Network-based Expert – Stakeholder Framework for
Sustainable Remediation (Nexsus). We aim to show how network mapping and qualitative analysis can indicate whether these ideas could initiate a thorough transformation of spatial and social relations but also if they could present just a limited alternative to the current growth strategies premised upon technological and industrial development.

**RN12S18 - Transition Theory and Environmental Reform**

**Towards Sustainability Transition: The Dynamic of Relational Wellbeing**
Tuula Terhikki HELNE (Research department, Kela (The Social Insurance Institution of Finland), Finland) | tuula.helne@kela.fi
Tuuli Ilona HIRVILAMMI (Department of social research, University of Helsinki) | tuuli.hirvilammi@helsinki.fi

The great legitimizing idea of progress was prosperity for all. However, confusing wellbeing with material wealth has had ecological consequences that threaten our wellbeing and survival. Also the social achievements of the pursuit of wealth are disappointing (rampant inequality). Consequently, maintaining the status quo and holding on to the current conception of wellbeing are not an option if sustainability is to be achieved. Instead, an ecosocial transformation based on a sounder understanding of wellbeing is called for.

Leaning on sustainability research and needs-based theories of wellbeing, we present a multidimensional and relational conception of sustainable wellbeing. It involves setting limits to wealth and unsustainable consumption, and shifts the focus away from mere ‘Having’ towards placing value on ‘Loving’, ‘Being’ and responsible and meaningful ‘Doing’. This four-dimensionality of wellbeing is founded on a conception of man not seen as ‘homo economicus’ but as ‘homo iunctus’: a relational being connected to his social and natural environment and thus a self-evident agent of the ‘ecosocial work’ that the sustainability transition requires. The model also places the fulfillment of needs in their social-ecological context, which captures the ethical obligations to meet our needs sustainably. In sum, we illustrate how a multidimensional conception of wellbeing could serve the sustainability transition.

**Is Urban Agriculture a Game Changer or Window Dressing? Seeking Avenues for Agri-Food System Transition in an Era of Rapid Climate Change.**
Debra J. DAVIDSON (University of Alberta, Canada) | debra.davidson@ualberta.ca

Many social and natural scientists alike suggest that climate change has progressed to such a stage that incremental shifts to existing institutions and processes no longer offers a viable response. To the contrary, both adapting to, and mitigating, climate change would demand Transition—in other words a full-scale re-thinking and re-ordering of our socio-economic systems. Just how such a dramatic social change might occur is subject to debate, but researchers from a number of different theoretical backgrounds postulate the likely process consisting of emerging actors that initiate small-scale innovations, which then are upscaled to effect broader system change.

One particular avenue of climate change impact that is particularly worrisome is its implications for food security. While the actors and activities that constitute the prevailing global industrial agribusiness complex in many ways expresses limited propensity for Transition, several alternative food movements on the ground have served to challenge this dominant system, and may be considered just the sort of small-scale innovations with the potential for up-scaling. Urban agriculture, long a component of cities in the developing world, is an emerging form of citizen engagement in many developed countries that is expanding rapidly, and represents one such innovation. Many commentators have expressed enthusiasm for these activities as
potential vehicles for everything from urban ecological sustainability, to food security, to community building. But to what extent does urban agriculture offer promise as a new sustainability innovation with the potential to instigate a Transition in our agri-food systems? In this paper, I offer a critical assessment of current trends in urban agriculture in Western countries, treating these activities as small-scale innovations within complex agri-food systems. I rely on a comparative assessment of activities in Canada, the U.K., and Australia to inspire a discussion of what the observed and potential outcomes of these practices are for urban sustainability, food systems, communities, and ultimately their potential contribution to Transition.

Environmental migration: a sociological contribution to understand transition societies

Marcela da Silveira FEITAL (Instituto de Filosofia e Ciências Humanas - Universidade Estadual de Campinas, Brazil) | mafeital@hotmail.com
Lúcia da Costa FERREIRA (Núcleo de Estudos e Pesquisas Ambientais - Universidade Estadual de Campinas, Brazil) | luciacf@unicamp.br

This article is a first theoretical research of transition societies formed from the displacements influenced by the climate changes. These changes have drawn the attention of several social sectors due to their alarming consequences such as the rising sea level and the frequency and intensity of extreme events. Some local actions are adopted to face this global scenario; migration is one of the most frequent. Thus, several studies have been developed about this kind of migrants, debating mainly the environmental determinants of population displacements. However, there is little knowledge production about the transitional condition of these societies – which are dissolving while being forced to restructure due to the consequences of climate change along with the myriad of other structural factors (i.e. economic, social, political and cultural). In addition to the elements that influence decisions about migrating or not, there is little question about how this experience of being in transit influences the behavior and action of these people. Thus, this article aims to contribute to the theoretical framework of the theme of transition societies, from a relational sociological approach, attentive to the actions of social actors in transition, but also to structures that make up these actions. For this, the article brings a bibliographic review and a meta-analysis of some data about indigenous people communities in Alaska (the U.S.A.), being impacted by the rising sea level and the global warming. This case presents a good study opportunity, as the migration is showed as inevitable, necessarily implying the transition of this social group.

Portuguese transition towns. Challenges and constraints for participation and engagement of local communities.

Sofia BENTO (Lisbon School of Economics and Management, Portugal; Socius- Research Centre in Economic and Organizational Sociology) | sbento@iseg.ual.pt
Lúcia de Oliveira FERNANDES (Socius- Research Centre in Economic and Organizational Sociology) | luciaof@gmail.com
Anabela CARVALHO (University of Minho) | carvalho@ics.uminho.pt
Maria FERNANDES-JESUS (Aston University) | m.fernandes-jesus1@aston.ac.uk

This paper presents a qualitative analysis of both participation and community engagement in transition towns in Portugal. More than 20 initiatives appeared over the last 5 years, and the movement is passing through an active phase. Transition gives strong emphasis on the mobilization of citizens and also the integration and participation of local communities which have become debilitated by the process of globalization. Community engagement is seen as being a means of empowering and improving local communities. These experiences are based
on the following aspects: local production and organization, relationships enforcement and collective involvement, less consumerism, relocation of the economy, and food self-sufficiency. Our main research questions are the following: What do those who promote and participate in transition projects associate with the term ‘community engagement’? How has participation taken place in the examples of transition in Portugal? What strategies have been used to promote community engagement and citizenship? What challenges and constraints have been experienced during these projects? The study is based on 45 interviews with facilitators from 15 transition projects, 36 interviews with community members from two projects, and also observation in the field. We analyze the strategies used to promote community engagement (within communities, with partners, and also within the international movement of transition towns) during the conception and subsequent growth of transition projects, by identifying the challenges and constraints experienced by both citizens and projects alike, and also through the examination of the profiles and motivations of those who are most involved in these projects.

RN12S19 - Human-Animal Studies and Environmental Sociology

**Consumer views about the acceptability of animal farming: questions of animal visibility and food chain transparency**

Saara KUPSALA (University of Eastern Finland, Finland) | saara.kupsala@environment.fi
Markus VINNARI (University of Eastern Finland, Finland) | markus.vinnari@uef.fi
Pekka JOKINEN (University of Tampere, Finland) | Pekka.T.Jokinen@staff.uta.fi

In sociological debates on sustainable food systems consumer contact to food production has been considered a central factor in encouraging sustainable food consumption practices. Likewise, in human-animal studies, consumer distance to animal farming has been suggested to be a major reason for weak protection of farm animal interests in contemporary societies. Concurrently, a tendency to consume meat in processed and de-animalized forms has been considered to reduce consumers’ attention to moral aspects of their food consumption choices. In this paper, we aim to contribute to the debate on the consumer contact to food production by critically examining how different consumer groups construct farm animal visibility and what implications this has for the moral valuation of animals. The analysis is based on five focus groups (vegetarians/vegans, organic consumers, gastronomes, rural women and regular supermarket shoppers) and on two combination groups of different consumers. Regular supermarket shoppers expressed much reflection on their contact to animal farming; yet, they tended to transfer responsibility for animal welfare to public authorities. For vegetarians and vegans, plant-based eating represented a direct challenge toward the culture of denial around meat consumption. Organic consumers, gastronomes and rural women aspired to increase their contact with animal farming since knowing the life of farm animals was conceived to give moral legitimacy to consume animal-derived products. Yet, maintaining psychological distance to animals helped these consumers to continue perceiving animals as commodities. In conclusion, we will critically evaluate the role of spatial proximity and food-chain transparency in enhancing ethical consumption practices.

The livestock revolution and the intersectionality of oppression. An analysis of the animal-industrial complex from the perspective of critical animal studies

Livía Laura BOSCARDIN (University of Basel, Switzerland) | livia.boscardin@unibas.ch
Every year, human beings raise and kill 66 billion non-human land animals and more than a trillion aquatic animals for the purpose of consumption. This paper delves into the complexities of the animal-industrial complex (Noske, Twine) and its societal and ecological repercussions from the perspective of critical animal studies. Critical animal studies explores the political and economic conditions of our societal relationship with non-human animals, which is oftentimes a relationship of oppression. Drawing on insights from intersectionality theory (Crenshaw, Deckha, Nibert) and political ecology, the animal-industrial complex is scrutinized as a paradigmatic lieu of intertwined oppression. Apart from commoditizing uncountable non-human individuals, it amounts to the waste of natural resources and environmental degradation and emits more greenhouse gases than the global transport sector. These environmental consequences affect the Global South first and foremost. Moreover, almost one billion human beings concur in the demand for food with the animal industry’s use of grain for fodder, which today makes up 35% of the global grain harvest (FAO)—facts that have led to the concept of “environmental racism.” Meanwhile, the industry pushes for the “livestock revolution,” a planned doubling in production by 2050 which will entail a significant increase not only in the number of slaughtered animals, but also of the abovementioned hazards to ecological sustainability and social justice. In the age of the Anthropo- or Capitalocene, the issue clearly demands greater scholarly attention. It is thus critical animal studies’ task and opportunity to contribute to topical analysis within environmental sociology.

**RN12S20 - Corporate Social Responsibility and the Circular Economy**

*From Intention to Action: The Social Reality of an Attitudes-Driven Decline in Carbon Emissions.*

Ivaylo D. PETEV (CNRS EXCESS-CREST, France) | ivaylo.petev@ensae.fr
Philippe COULANGEON (CNRS OSC-Sciences Po, France) | philippe.coulangeon@sciencespo.fr

The worldwide trend of growing environmental sensibility raises the question: Can a change in attitudes of individuals spur a change in their behavior and therefrom a decline in carbon emissions? The preponderant place of individual responsibility in the contemporary debate on climate change would suppose a positive answer. Research in social psychology however shows that the causal link that goes from attitudes to behavior to lower environmental impact is modest to insignificant. Importing some of the insights of that literature, we test its relevance with 2011 Eurobarometer data on environment-related attitudes, actions and policy preferences for the 27 European Union member states. Our results nuance considerably previous observations from micro-level, experimental studies. We find a positive relation between intent and extent of pro-environmental engagement. Only 15% of European respondents however translate their declared intent into a diverse and impact-prone set of pro-environmental actions. The remaining majority is split across patterns with various levels of commitment though mainly to actions with lower impact and/or difficulty. Economic development and income inequality, at the country level, and age, education and social class, at the individual level, are strong predictors of pattern membership. Interestingly, from a policy perspective, within each pattern we find a fundamental divide between respondents in favor of punitive policies (stricter legislation and higher fines) and respondents in favor of incentive-based policies. The results are potentially instructive for policies aiming at reducing carbon emissions through an attitudes-driven change in behavior.

**Structural Impediments to the Greening of Universities**

615
Manuel VALLEE (University of Auckland, New Zealand) | m.vallee@auckland.ac.nz

Since the 1970s there has been growing international pressure for the provisioning of environmental education, as witnessed by the numerous international intergovernmental meetings organized around the issue, and the ratification of numerous international resolutions (Haigh, 2005). Moreover, universities have been seen as central to those efforts as they hold the potential to significantly shape both the next generation’s ideology around the environment, and their behaviors towards it (Haigh, 2005). Unfortunately, however, universities have only made tokenistic progress in the greening of their curriculums. Shedding light on why is the goal of this paper.

Towards that end, I analyze efforts to green chemistry curriculums at six American universities: University of California at Berkeley, UC Santa Barbara, UC San Diego, University of Massachusetts Boston, UMass Lowell, and UMass Amherst. These schools make for a strategic selection because while they share key characteristics, they vary significantly in the progress they have made on the issue. For theoretical insight I draw from Schneider and Gould’s (1994) work on the “treadmill of production,” John Bellamy Foster’s (1999) work on the “scientific-technological revolution,” and Sarah Creighton’s book "The Greening of the Ivory Tower" (1998). The combination of these works allows for a synthetic analysis that considers the role of both institutional factors and political economy.

Beyond illuminating the particular cases, this analysis offers insights for explaining the limited success at other universities, whether we are talking of curriculum greening, or other efforts to green the ivory tower.

In and out of the environmental decision-making. Equal participation and social responsibility in European gold mining exploitations

Dan CHIRIBUCĂ (Babes-Bolyai University, Faculty of Sociology and Social Work, Cluj-Napoca, Romania) | dchiribuca@socasis.ubbcluj.ro
Ionela-Maria RĂCĂTĂU (Babes-Bolyai University, Faculty of Sociology and Social Work, Cluj-Napoca, Romania) | ionela_racatau@yahoo.com
Călin BACIU (Babes-Bolyai University, Faculty of Environmental Science and Engineering, Cluj-Napoca, Romania) | calin.baciub@ubbcluj.ro

Within the last few decades, the mining sector has been characterized by an increased emphasis on aspects related to social responsibility. Despite this and despite the economic benefits brought in by mining activities, local communities often denote reluctance for the mining operations and mistrust the extractive regulations and their impact over society and over the environment. In many cases, people may show increased solidarity, citizenship and need for social participation when it comes to the extractive operations, feeling empowered to become active contributors and participants at the local decision-making. These actions point to a call for equal rights when it comes for mining debates in which the environmental issues should be addressed by all relevant stakeholders, including the local inhabitants, not just the industrial parties and the governments. Addressing the environmental democracy, the paper discusses the challenges, the limits and the legitimate role of social participation in decisions related to the use and exploitation of the natural resources. The qualitative and quantitative data collected through interviews and structured questionnaires are used not only to analyze the trust, social acceptance and public perception against gold mining projects developed in selected sites from Romania, Finland and Portugal, but also to identify the factors that affect the social license to operate granted by local communities. The comparative perspective will put into light various approaches of the exploiting companies in these areas and different responses from the citizens, showing the important role of social inclusion and participation in such actions.
Acknowledgments: The present contribution was financially supported by a grant of the Romanian National Authority for Scientific Research, CCCDI – UEFISCDI, project 3-005 Tools for sustainable gold mining in EU (SUSMIN).

Contribute to estimate the sustainability values potentially induced by the redevelopment of rural brownfields with low market attractiveness: the case of S. Domingos Mine, Portugal

Idalina Maria DIAS-SARDINHA (SOCIUS, Researcher Centre in Economic and Organizational Sociology, University of Lisbon, Portugal) | idalinasardinha@iseg.ulisboa.pt
Isabel MENDES (SOCIUS, Researcher Centre in Economic and Organizational Sociology, University of Lisbon, Portugal) | midm@iseg.ulisboa.pt
Sergio MILHEIRAS (SOCIUS, Researcher Centre in Economic and Organizational Sociology, University of Lisbon, Portugal) | smilheiras@gmail.com
Daniela CRAVEIRO (SOCIUS, Researcher Centre in Economic and Organizational Sociology, University of Lisbon, Portugal) | daniela.craveiro@gmail.com
Pedro VERGA MATOS (ADVANCE, University of Lisbon, Portugal) | pvmatos@iseg.utl.pt

Up to now, most research on regeneration of brownfields has focused on cleaning up and revitalization in urban areas, and far less on regeneration in rural areas. Further, the integration of sustainable development principles in the regeneration process of these derelict and contaminated sites is growing priority in particular the principle of respect for the stakeholders' interests. Since 2000 the EDM (Empresa de Desenvolvimento Mineiro, S.A.) have been planning for full environmental remediation of São Domingos Mine (SDM), Portugal. However they are confronted with the lack of funds, lack of dialogue among social actors and a private rural brownfield with low financial attractiveness. The global purposes of the REHMINE research project were: to contribute for the integration of the principle of respect for stakeholders interests in the process of SDM redevelopment; to improve regional sustainable development supported on the SDM redevelopment; and to contribute to estimate the sustainability values potentially induced by the redevelopment of rural brownfields with low market attractiveness. The approach was based on methods comprising direct and indirect stakeholder's participation, less used in planning redevelopment of brownfields and serving to evaluate potential environmental and socioeconomic sustainability results; and compare these different valuation forms. The applied approaches included various stakeholder participation techniques to define strategic lines for planning, explore actions and feasibility and stimulate commitment and leadership among stakeholders. A Life Cycle Assessment method was applied in order to quantify and measure the current environmental impacts (emissions and waste streams) and to calculate the externalities (shadow prices) as well as to prioritize EDM waste streams for environmental improvement. A Contingent Valuation to assess the socioeconomic value of SDM redevelopment through a hypothetic cultural tourism project was made, intending to measure the individual utility of a project by specifically finding the individual willingness to pay for this. Finally a Multicriteria Analysis (MACBETH) a socio-technical approach following a series of iterative steps for group decision support to rank and select the best value for money/feasibility of intervention projects in a group expert decision process was completed. Orientations which may serve to further optimize decision makers and policies regarding SDM and planning rural brownfields regeneration with low market attractiveness in general are presented.

Ecological Conscience in the Context of Economic Crisis: Myths and Reality
Iveta BRIŠKA (Research Centre SKDS, Latvia) | bri888@inbox.lv
Along with the increase of the concerns of the society regarding environmental topics there increases the volume of research assisting in determination of the level of awareness of the society about environmental risks and environment protection. Latvia also gets involved in these studies. Information acquired in the course of the studies provides a good overview of the opinions of the Latvian people on environmental problems, their concerns and knowledge about these issues on the whole. Popularization of the results of these studies, in its turn broadens the awareness of the society and strengthens behavioural model of each individual in the solution of environmental problems.

However, the answer is not univocal. Firstly, is the awareness of the Latvian public about ecological risks strongly interrelated with their activities for the reduction of risks: if people feel themselves widely informed about environmental risks, do they actively participate in the solution of problems or are they ready to invest their time and money to facilitate risk mitigation?

In the context of “participation or readiness to contribute” it should be considered that the increase in the level of awareness does not automatically imply correct actions for risk reduction, as it was stated by Mary Douglas and Aaron Wildavsky (1982) and which is to a certain extent evidenced by attitude of the Latvian people regarding contribution that would affect the level of their personal welfare. Like Ulrich Beck (1992) comments on the possibility to reduce risk exposure of the society, provided that people are aware of situations involving risks, it can be also concluded that the Latvian society becoming aware of possible hazards by way of acquired knowledge will also become more active in the reduction of these hazards. Secondly, does economic crisis act as a catalyst activating the readiness of people to mitigate environmental risks or whether the myth stating that economic crisis deflects attention of the society from other problems existing in the country and the world is actually true?

The studies can provide different answers, opinions as well as allow analysis of narratives, results of public discourse to confirm or disprove myths, stereotypes, and assumptions.

**RN12S21 - Environment & Society**

**Advising parents on childhood health unsure issues - is the precautionary principle the way forward?**

Susana Maria DUARTE FONSECA (ISCTE - IUL, Portugal) | susanafonseca@yahoo.com
Joaquim Gil NAVE (ISCTE - IUL, Portugal) | joaquim.nave@iscte.pt

Social research on parenthood shows the importance of health professionals in advising parents during pregnancy and in the first steps of the child development. Some authors talk about doctors and nurses as the “moral guardians” of parenthood, to highlight the growth and relevance of their intervention in helping parents to take the best decisions about preserving the children’s health.

Recently new issues began to be included in advices of health professionals to new parents. This is the case of some environmental issues, particularly those associated to some chemical substances present in ordinary products of everyday life, whose impact on human health, above all in growth steps, is object of scientific controversy and that, in many countries, are still not usually included in recommendation guides to advise parents.

This paper aims at analyzing the institutional process by which the recommendations transmitted by health professionals are negotiated and established in the health sector in Portugal, and to what extent the precautionary principle is present in the guidance documents and recommendations on advising parents produced by the health authorities and health professional associations.
Redefining social license: The need to broaden understanding of social license to operate
Tapio LITMANEN (University of Jyväskylä, Finland) | tapio.litmanen@jyu.fi
Tuija JARTTI (University of Jyväskylä, Finland) | tuija.jartti@jyu.fi
Eero RANTALA (University of Jyväskylä, Finland) | eero.rantala@jyu.fi

The debate around the social license to operate (SLO) approach has been lively in recent years. Actors in the mining industry have invoked the SLO in their efforts to respond to problems of social acceptance. In its elementary forms the SLO is seen as referring to social acceptance granted by a community to either a mining project or an exploration project. In spite of the SLO’s popularity as an instrument of the mining industry, it has been relatively little studied theoretically, nor has there been much empirical testing of the approach. In our study we have focused on the preconditions and limits of the SLO, starting from the idea that a narrow definition of the SLO requires a more thorough analysis of the societal prerequisites of the approach and also empirical testing of the assumptions and factors potentially related to it. We share the view that the SLO develops mainly in local level interaction, but more attention should be paid to its spatial, socio-historical and socio-demographic factors. The importance of pre-existing conditioning attitudes underlying the SLO will be indicated by analysing the empirical data (N = 1,064). A survey was conducted in January-February 2012 with a questionnaire targeted at the Finnish administrative areas of Uusimaa, North Karelia, Kainuu and Lapland. Eastern and Northern Finland are areas with increasing mining activities. Uusimaa represents the increasingly urban part of southern Finland, which has not been the main geographical area for the current, growing mining industry.

Identifying social factors and barriers in industrial symbiosis networks
Borut RONČEVIČ (Faculty of Information Studies, Slovenia) | borut.roncevic@guest.arnes.si
Urška FRIC (Faculty of Information Studies, Slovenia) | urska.fric@fis.unm.si

Industrial symbiosis is an emerging topic within the domain of industrial ecology. It takes place in the social milieu, where two or more economic actors exchange material resources in a way that aligns the pursuit of individual economic goals with ecological and social challenges of the society at large. The study hence applies the concept of embededness to identify and analyse the social aspects that constitute industrial symbiosis in the context of inter-organizational networks and its interdependecies with the social milieu. The proposed analytical framework includes the following aspects: inter-organizational cooperation, inter-organizational trust, motivation, flexibility and creativity. On the one hand, knowing these aspects allows economic actors to accommodate social, ecologic and economic considerations of industrial symbiosis in order to secure their license to operate. On the other hand, this knowledge supports economic actors in decision-making processes for their symbiosis-related activities and in forming strategies for realization of industrial symbiosis. Their role is observed and treated by means of a meta-analysis contrasting several existing industrial symbiosis case studies, focusing on industrial symbiosis in manufacturing and heavy industry. Degree of factor influence and its contribution to the functioning of industrial symbiosis are characterized, as well as associated barriers to their successful inclusion and corresponding inhibition of potential symbiotic relationship.

RN12S22 - Green Economy
Economic Transformation, Environment and the Manufacturing Industry in Slovakia: from High Environmental Impacts and High Employment to Treadmill of Production?
Richard FILCAK (Institute for Forecasting Studies Slovak Academy of Sciences, Slovak Republic) | rfilcak@yahoo.co.uk

The past two decades in Slovakia were the years of rapid development of the new environmental policies and institutional frameworks, mostly propelled by the European Union integration process. In the same time, it was the time of rapid economic transformation, opening to the global market, privatization and changes in the labour market. Environmental norms and standards are often perpetuated in public debate as the obstacle and threat to employment. At the other hand, industry is seen as one of the main factors in production of the negative environmental impacts. The question we explore is, what si the environmental performance of the industry vis-à-vis employment in the industry? The key indicators we analyse are CO2 emissions and number of jobs in the manufacturing industry. We claim, that the industry-environment relationship went through 3 interlinked and overlapping phases. The first one (1990-1998) was marked by deindustrialization of whole regions, and collapse in many branches of the economy. It was the time of rapid development of environmental policies, yet enforcement was limited. The second phase (1998-2008) is characteristic by gradual re-industrialisation caused by orientation of the industry on semi-products for the European market and by shift of production from Western Europe to the Eastern countries. Access to the European Union and especially Single European Marked supported implementation of the environmental norms and standards. The third phase (2008 on) shows trends, which may be analysed using conceptual framework of the Treadmill Theory suggested by Alan Schnaiberg. Keeping the production costs low, while increasing amount of outputs leads to the most challenging and problematic discrepancy we find between the environmental impact and employment. It is automatisation accompanied by gradual decrease of workforce and parallel increase in energy and material consumption. While deindustrialisation was characterised by abrupt fall of emissions accompanied by a sharp decline in employment, the second and especially the third phase is more complicated and is characteristic by increasing economic output on the account of increasing energy/material consumption and decreasing amount of jobs in the economy. In conclusion we discuss several macro-level policy option how to revert adverse economic and social trends. Here we focus on merging the environmental and social agenda and critical evaluation of green jobs concept. In the second flow of argument we discuss concept of re-localization, or approaches of how to return green economic activities back to the people in marginalised regions.

Air pollution perceptions and reported behaviours: a survey study in four cities
Christian OLTRA (CIEMAT, Spain) | christian.oltra@ciemat.es
Roser SALA (CIEMAT, Spain) | roser.sala@ciemat.es

Our study examined how public perception of air quality, beliefs about the health consequences of air pollution and reported self-protective actions varied with locality and individual characteristics. Data was collected from an online questionnaire on 1300 adults resident in four cities in Spain. We found significant differences among the four samples with respect to perception of air quality levels in the neighbourhood and annoyance. There was a small to moderate variation in the levels of perceived severity, concern about the health effects of air pollution and coping responses. Small to non-relevant differences were found in controllability beliefs, self-reported information seeking and self-protection actions. Preliminary modelling of two self-reported protective behaviours suggests that attention to air quality levels, annoyance,
worry about the health effects, controllability beliefs, sex, age and having a respiratory disease are significantly associated with behaviours to reduce one’s exposure to air pollution.

Hydroelectric projects in Brazil: discursive affinity and the dominance of the techno-economic rationale
Guadalupe ORTIZ (University of Alicante, Spain) | guadalupe.ortiz@ua.es
Antonio ALEDO (University of Alicante, Spain) | antonio.aledo@ua.es
Hugo GARCIA-ANDREU (University of Alicante, Spain) | hugo.andreu@ua.es
José Andrés DOMÍNGUEZ-GÓMEZ (University of Huelva, Spain) | andres@uhu.es

The hydroelectric dam projects recently developed in Brazil have led to a strong social debate that articulates the conflict among diverse stakeholders. This paper addresses the study of the social discourses that respond to the Brazilian hydroelectric policy and it examines the commonalities and divergences among the multiple arguments that are emitted by the social actors. Sixty-three in-depth interviews were conducted with stakeholders from the private and public sector, NGOs, social groups affected by the development of dams, and academic researchers. A content analysis of these interviews was developed in order to deconstruct the stakeholder’s discourses into their basic elements (arguments). Then, a principal component analysis was developed and it showed four coherent combinations of arguments. Among the main outcomes of this analysis it stands out the discursive isolation of those affected by the construction of dams, as opposed to the rest of actors, who use a shared techno-economic rationale, even when they express opposed arguments. On the contrary, those affected by the dam projects use arguments related to emotions, identity and their daily experience of place, which are not present in the discourses of the rest of actors. This lack of a “common language” is essential to understand the difficulties of those affected by the projects to effectively gain access to the decision-making processes. The results can be interpreted in the light of Hajer’s work (1993, 2006) as the success of a “discourse coalition” at structuring and institutionalizing a techno-economic discourse that has become dominant in this social context.

Green Economy agendas: NGOs’ divergent alliances around natural capital and justice
Les LEVIDOW (Open University, United Kingdom) | L.Levidow@open.ac.uk

The UNEP agenda for a ‘green economy’ links resource-protection, social equity (justice) and social inclusion. This agenda has generated new alliances and new controversy. This paper analyses empirical material from a study of those dynamics. As a key concept, natural capital portrays natural resources as stocks and flows, separate from human activity. This concept has informed agendas for monetising natural resources, thus neoliberalising the environment (Castree, 2008).

NGOs have formed three different alliances, each linking different accounts of resource degradation, social inequity, justice and natural resources. Through the Natural Capital Coalition, broader accounting has been promoted to make nature visible and so to conserve its stocks through economic decision-making. The ‘natural capital’ concept shifts political-economic control over natural resources away from communities, towards risk-management agents and financial instruments. By contrast, invoking the ‘justice principle’, the Green Economy Coalition proposes more equitable access to natural and financial capital. This corresponds to a liberal-individualist framework for fairly distributing goods and benefits. A third alliance, of transnational advocacy networks and social movements, demands ‘environmental justice’; they highlight collective responsibilities for sustaining natural resources through commons – which are undermined through ‘natural capital’ initiatives.
As the latter alliance illustrates, environmental justice has been ‘attempting to make something visible that was previously invisible’ (Kenis and Mathijs, 2014). The concept ‘shifts from resistance to reconstruction’, aiming to transform unsustainable practices of production and consumption (Schlosberg, 2013). Thus the three NGO alliances express divergent relations between natural capital and justice.

Economic argumentation in the fledgling nuclear renaissance in Europe: the saga of the EPR reactor in Finland, France, and the UK
Markku LEHTONEN (Ecole des Hautes Etudes en Sciences Sociales & University of Sussex, France) | m.lehtonen@sussex.ac.uk

Public debate on nuclear energy has until recently been largely dominated by topics such as accident risk, energy security, and radiation-related environmental and health risks. Controversies over the economic viability of nuclear energy have, by contrast, to a large extent remained an exclusive domain of “accredited”, “official” experts. This paper examines the increasing weight and the changing forms of economic argumentation in the discourses of various actors participating in public debate around nuclear power. The empirical analysis focuses on the way in which economic argumentation concerning the EPR (European Pressurised Reactor) has evolved in Finland, France and the UK since the launching of the technology at the end of the 1980s. The EPR case is illustrative, given the rapid transformation of the reactor from a showcase of French-led nuclear renaissance to an economic nightmare potentially highly damaging to the reputation of the industry. The paper examines the key turning points in the debate, changes in argumentative strategies, roles of various economic experts, and the types of economic thought advocated by the different protagonists. Observations from the comparative empirical analysis of the evolving economic argumentation around the EPR in 1995-2015 are examined in the light of earlier research on nuclear energy from the perspective of technopolitical regimes and cultures (Hecht 1998; Felt & Müller 2011), sociotechnical imaginaries (Jasanoff & Kim 2009; 2013), and “state orientations” (Dryzek et al. 2002; Teräväinen et al. 2011).

How the parents retire from the social life? The Pediarchy among the middle-class families in contemporary Turkey

Derya FIRAT SANNAN (Mimar Sinan Fine Arts University, Istanbul, Turkey) | deryafirat@hotmail.com
Barış ŞANNAN (Mimar Sinan Fine Arts University, Istanbul, Turkey) | sannanbaris@gmail.com

Since the late nineteenth century, the traditional family was transformed into new and various forms especially in European countries, such as bi-parental families and parents from same sex. It is largely accepted that this transformation allowed each family member to have a distinct identity and more personal freedom with the help of the right to divorce and seperation, the process of individualization of women and children and the decline of the heterosexual norms. To some extent, it can be assumed that the Turkish society has experienced relatively similar changes in family forms and concepts in the same period, as well. However, the radical changes within the composition of middle classes in Turkish society during 2000s led recent transformations. Especially, a certain vertical social mobility occurred in favor of conservative and religiously high-motivated middle classes, who are represented by the Ak Party, and with an absolute power for over a decade these middle classes have been enjoying the opportunity to emphasize their values and forms of traditional family in public space. During our field research on the middle classes and their lifestyles in a highly disintegrated Turkish society, we have encountered different middle class fragments which are extremely polarized in respect of the lifestyle and values – the famous Gezi Parkı protests can be counted as one of signs and outcomes of this polarization. Despite these certain differences which determine most of the contemporary conflicts of Turkish politics, a new phenomena of ‘pediarchy’ shows itself in the middle-class families. Whether in the mundane-established and traditional or the conservative-socially climbing middle class families, children dominate both leisure time and socialisation and above all future expectations and imagination of parents. We aim to present the primary results of our research and seek to discuss how this pediarchy shapes middle class families of contemporary Turkey, and how this change should be understood. For this purpose, we seek to make a comparison between symmetrical mechanisms of this pediarchy and the division of labour in the family life based on gender roles among the socially climbing and conservative middle classes and established and mundane middle classes.

Same-sex families as an emerging phenomenon of social change in the Polish society

Miłosz UKLEJA (University of Warsaw, Poland) | miloszukleja@gmail.com

Homosexual families are currently one of the most frequently discussed alternatives to a traditional family. They emerge as a visible element of the modern European generations. This phenomenon was also noticed by Polish media, politicians and scientists. The number of media releases does not correspond with the level of the discussions which are still marked with
prejudices and refer rather to the foreign context than to the current situation in Poland. It is worth underlining that the research on the homosexual families has been carried out in Western Europe and North America already since 60’s, whereas in Poland this topic has been tackled only after the fall of Communism.

My paper aims at presenting own PhD research on the everyday functioning of homosexual families in Poland and public acceptance of same-sex families in specific Polish tradition. I would like to refer mostly to the narrative strategies of partners in homosexual families as well as their relations with children brought up by them. While doing research, I have focused on the most crucial element which influences and defines relationship of the partners - their everyday life reflected in division of domestic chores and responsibilities of bringing up a child. Additionally, I would like to mention the recent parliamentary and social discussion on introducing civil unions, which are widely equated with same-sex relationships, and its consequences. I place my findings in a wider context of the acceptance of homosexual families by the Polish society (both nowadays and before 89’), particularly in comparison with other European countries.

Do consensual unions differ from marriages? A study of family characteristics and received help in Italy

Eleonora MELI (Istat, Italy) | elmeli@istat.it
Romina FRABONI (Istat, Italy) | fraboni@istat.it

Although still prevailing in Italy, marriage postponement and decline have been witnessed since the second half of the ’70s. At the same time an increasing proportion of young adults leave the parental home to cohabit and, in recent years, the proportion of births out-of-wedlock is rising, too. Italy is characterized by strong family ties and intergenerational support occurs along all phases of the life-course. First, we show the spread of cohabitation in Italy over the last twenty years and analyze the differences to married couples of never married partners. Particularly, we take into account structural differences in terms of partners' age, education and labor force participation and we compare their changes in the two union typologies. Secondly, we apply a logistic regression analysis on the differences in the probability to receive help and its change across time.

We use data from the Multipurpose household surveys on “Daily living conditions” (1993-2013) and on “Family and social subjects” (1998, 2003, 2009) and we focus on couples with women in reproductive ages, distinguishing first marriages and consensual unions of never married partners. Results show that consensual unions of never married partners preserve distinctive traits related to age, education and labor force participation of both partners in comparison to more traditional couples. Moreover, cohabiting couples have less and younger children than married ones. Finally, the most relevant determinant of received help is the presence of young children. However, couples at their first marriage show a higher - and increasing over time - propensity to get help than cohabiting couples.

Factors Influencing the Entrance into Cohabitation versus Marriage

Xiaoteng HU (Autonomous University of Barcelona, Spain) | angellmay1989@gmail.com

Cohabitation has become an increasingly attractive option for couples in many European countries, accompanying with other changes happened in the second demographic transition, such as the delay of marriage and fertility, the increase of divorce and women's economic independence (McLanahan, 2004; Lesthaeghe & Surkyn, 1988; Mason & Jensen, 1995). In addition, it is established that cohabitation varies between countries and generations, in terms of its diffusion, similarity to marriage, and duration (Heuveline and Timberlake 2004). At the very
start, only some subgroups choose un-marital cohabitation: the very poor people (“the Stockholm marriage”); couples whose relationship had broken up but could not divorce due to the lack of relevant legislation, etc. Then, cohabitation was diffused from Sweden and Denmark, to some Western European countries and other Nordic countries. Young people began to treat cohabitation as trial marriage, also, it became popular among divorced people as a trial or an alternative to remarriage (Kiernan, 2000). Nowadays, cohabitation and childbearing in cohabiting union are highly spread and frequently accepted as an alternative to marriage in most European countries.

The existing literature consistently suggests that there is a gap in well-being between cohabitants and marrieds, which is termed as the cohabitation gap. More exactly, cohabitants are more likely to report lower relationship quality and their relationship are more probable to break up than their married counterparts. Additionally, children born in cohabitation are more likely to experience single-parent family and poverty. Examining the determinants of living arrangements could shed light on the cohabitation gap. Previous studies have attempted to compare the differences between cohabitants, marrieds, however, most of them focused on a single country. Claims about the determinants of cohabitation lack a solid empirical basis that enables comparisons between countries. As a result, this paper contributes to the debate about the indicators of cohabitation and marriage by assessing the effects of both individual-level and societal-level factors across European nations.

From the macro perspective, social welfare for family and children may prompt the prevalence of cohabitation and reduce the incentives to marriage. Because the availability and level of social welfare will reduce the gains individuals could obtain in marriage. In addition, countries may seek to regulate or encourage certain family forms by laws and policies. Through quantifying the differences of legal rights and obligations between marrieds and cohabitants, the impact of legislation on union formation can be measured and compared across nations. From the micro perspective, theories can be classified into positive selection or negative filtering. Positive selection means that people with some certain traits are more prone to cohabit rather than getting marriage. It is the subjective aspiration that encourages un-marital cohabitation, namely, the select effect theory. Although there are theories regarding the hypothesis that those who espouse more egalitarian gender-role attitude are more prone to cohabit, few empirical studies have examined this association (Willoughby & Carroll, 2012; Manning, Longmore & Giorano, 2007). Negative filtering refers to a group of people who do not meet the basic requirements to enter into the marriage market. The theory that ascribes the cause of cohabitation to adverse material conditions is called the human capital theory. Those who have the higher level of human capital are more likely to get married rather than to cohabit.

I examine the previous arguments concerning the traits of cohabitants and marrieds by binary logistic regression, and employ the multi-level analysis to reveal the effects of two new societal-level factors: social expenditures on family and legal protection to cohabitants. The data for the analysis comes from the International Social Survey Program (ISSP) “Family and Changing Gender Role IV” (2012), which consists of 9879 people across 11 European countries. Given that the affecting factors of couples’ choice on marital union or unmarried cohabiting union may vary with the length of their relationship, the respondents are divided into three groups: less than three years (short), four to ten years (middle), more than eleven years (long). To some extent, short length of couple’s relationship means fragile and unstable, particularly for cohabitants. During the middle length of relationship, childbearing will be taken into account, while children become one of the most important reasons to get married. Eleven years and above is a long length for a relationship, factors to shape union patterns may differ. Thus, it is necessary to compare couples’ living arrangements based on their union duration.

The results show both inter-group and inter-national contrasts. Among those who have a short relationship, people holding less egalitarian gender role attitudes and valuing marriage are more likely to choose marital union rather than consensual relationship. Also, contrary to previous
research, my results demonstrate that people with high level of income are more likely to cohabit. However, for people whose relationship lasting four to ten years, only attitudes toward cohabitation and gender-role play a significant role in couples’ union formation. For those whose relationship lasting more than eleven years, attitudes toward marriage and cohabitation still positively affect partnership formation, but, the influence of gender ideology on partnership formation disappears. As far as people’s income is concerned, we find significant, but very weak, relationship. The coefficient indicates that low income people are with higher possibility to get married. Finally, the differences between marrieds and cohabitants on legal rights and obligations, as well as social supports for families could interpret the variation in prevalence of cohabitation across nations.

In conclusion, at the beginning of a relationship, couples would consider more when they choose their living arrangements, for example, the economic foundations and prospects, the gender division of household labor. With the relationship lasting, couples may have accepted the current economic conditions. While the birth of children may bring more problems, such as childcare, related to decision on living arrangements. For those who have a relationship longer than eleven years, choosing to get married may be associated with the economic benefits for married couples, for instance, heritance rights or survivor’s pension.

Factors of Realization of Marriage and Partnership’s Intentions of Population in Russia

Sofia MEDVEDEVA (Higher School of Economics, Russian Federation) | medvedevahse@gmail.com

The present study refers to the intimate relationships in sociology particularly to the practice of cohabitation. In the modern society the cohabitation becomes more and more popular among young and middle-aged people. There are several explanations for this phenomenon: the Second Demographic Transition, the changing values of the society, the Marriage Market by Becker and the influence of the previous partnership. The general purpose of the study is to identify the key factors influencing the cohabitating couples’ decision to marry or to separate. The empirical data is represented by the Generations and Gender Survey database and provides information about the changes of relationships between generations and gender in Russia over time. It is the panel data with three waves in 2004, 2007 and 2011. The regression and correlation analyses serve the purposes of the present inquiry. The results are likely to determine what factors determine the implementation of intentions to marry or to separate and help to design two models for young and middle-aged people. The findings demonstrate that cohabitation is not only a preparation for an official marriage, but also a new format of relationships, because young people sometimes have less financial freedom and prefer to live in cohabitation in order to spend less. Cohabitation for the middle-aged people is a comfortable union without an official confirmation and the union is particularly useful for partners, who had unhappy marriage in the past.

Relationship satisfaction among partners within stepfamilies: an empirical test of the incomplete institution hypothesis

Sofie VANASSCHE (KU Leuven, Belgium) | sofie.vanassche@soc.kuleuven.be

International research evidences point out that children in stepfamilies often report no higher scores on different wellbeing measures compared to children in single-parent families. These
findings raise questions about why it is that children do not benefit from the additional parental figure within a stepfamily. A well-known hypothesis is the incomplete institution hypothesis of Cherlin. He argued that the instability and dysfunctionality of stepfamilies may to a large extent be explained by the lack of a normative framework for these relationships. Although this hypothesis is extensively discussed within the research literature, studies testing its appliance from a cross-national perspective are hard to find. Typically, studies make conclusions on the validity of the incomplete institution hypothesis by comparing stepfamily outcomes with traditional two-biological parent families or first marriages. The limitation of this approach is that the context of stepfamily life is not measured directly and selection processes cannot be ruled out. My goal is to explicitly measure the context of stepfamily formation in order to explain problematic family relations and outcomes, rather than to use the latter as indicators of the context of stepfamily life.

In the present paper, I focus on the relationship satisfaction within stepfamilies. The objective is to describe and explain cross-national differences in the relationship quality between partners living in a stepfamily configuration compared to partners within other family configurations. We use data from the European Social Survey, an international survey program aiming for high-quality, cross-national data. In order to explain the reported cross-national variety, different indicators expressing the degree of (de)institutionalization of stepfamily life are introduced.

"Couples’ Education, Fertility and Union Stability in Britain: Implications of the Changing Educational Gender Gap"

Nitzan PERI-ROTEM (University of Cambridge, United Kingdom) | np428@cam.ac.uk
Jacqueline SCOTT (University of Cambridge, United Kingdom) | jls1004@cam.ac.uk

The sharp increase in women’s education over the past decades has led to a diminishing educational gap between men and women and to the reversal of the gender gap in education among younger age groups in Britain. These changes are assumed to have important implications on power relationships within couples and family patterns. Since woman’s level of education is becoming an increasingly important determinant of household living standards, union stability in couples where the woman is highly educated is expected to rise. In addition, increasing gender symmetry among highly educated couples may also have positive effects on fertility. In the current study, we use British longitudinal data sets (UKHLS and BHPS), covering the period from 1991 to 2014, in order to examine the consequences of couples’ educational composition on childbirth and union stability and the way these relationships have changed over time. For this purpose, a multinomial regression analysis has been employed to estimate the likelihood of couples experiencing childbirth, union dissolution or neither of these events over different time periods. Initial findings point to an increasing likelihood of progression to second birth among highly educated couples compared to less educated couples. In terms of union stability, data from recent years show that woman’s higher earning potential (in comparison to her male partner) increases the likelihood of separation only among couples who already have children. This may be the result of consistent gender inequality in the division of household labour, especially when children are present.

Sharing day light with family members. How do individuals share time with others?

Giacomo VAGNI (University of Oxford, United Kingdom) | giacomovagni@gmail.com
Eric Daniel WIDMER (University of Geneva) | eric.widmer@unige.ch

Family relationships have a time use dimension that has often been stressed as important but seldom studied using quantitative methods. Based on time use diaries filled by 434
heterosexual couples living in Switzerland with children, we investigate the structure of time shared with others on a typical Saturday. The time shared with others is put in perspective with conjugal satisfaction and desire of separation but also to issues related with ‘time crunch’. The data provide time use diaries of activities and network for each partner of the couple and an extensive set of questions about personal beliefs about the relationship. Sequence Analysis is used extensively in this research in order to highlight the structure of time shared with others. The core of the analysis relies on clustering of sequences with multichannel distances (in order to take into account both partners’ trajectories). Results reveal five clusters of time use of relationships: Solo (37%), Nuclear (19%), Partner (18%), Friends (13%), Children(13%). Each cluster has a distinct investment with children, partner, parents, other relatives and friends. Those distinct ways of shaping time use of personal relationships in a typical Saturday are structured by gender and level of education, and have consequences for satisfaction towards time use, the partnership and family overall.

Long-distance relationships: Breaking up or moving in together?
Sandra KRAPF (University of Cologne, Germany) | krapf@wiso.uni-koeln.de

A share of about 10 percent of Western European couples live in a “Living apart together” (LAT) relationship. Many LAT relationships are temporary and partners have to travel only a short distance to meet each other. However, the geographical separation between some partners involves travelling long-distances which might be related to different reasons, e.g. career opportunities, educational goals or immigration restrictions. But what are the consequences of long geographical distances for relationship stability and institutionalization processes of partnerships?

This study focuses on the effects of living in a long-distance relationship on union dissolution and moving in together. For our statistical analyses, we use five waves of the German Family Panel pairfam, period 2008-2013. This dataset offers the opportunity to distinguish between short-distance (less than 1 hour travel time for partners) and long-distance LAT relationships (1 hour or more travel time for partners). The prospective design of the study allows us to follow respondents and their partner over the period of 5 years. In a first step, we identify the characteristics of long-distance LAT relationships in Germany. In a second step, we estimate a discrete-time competing risks model to analyze whether couples in long-distance relationships differ significantly from those living in close-proximity LAT relationships in their separation risk and the risk of starting a cohabiting relationship.

Socioeconomic issues inside couples as a reason for divorce within Moroccan family
Touria HOUSSAM (University Hassan II, Morocco) | touria.houssam@yahoo.fr

The new conception of the family and the marital relationships in Morocco require the autonomy of the couple and the emergence of new relations between men and women. However, there are mechanisms of sociocultural and socio-economic resistance that interfere, to varying degrees, and hinder the realization of such a conception.

This research paper is based on thirty semi-structured interviews that were conducted with divorced men and women in the city of Casablanca. The data gathered shows that the reasons that led interviewees to divorce are many and varied, among which we can consider financial issues within family life. This project also aims to highlight the socioeconomic challenges that the new Moroccan family is facing. The analysis of some economic factors shows how they do develop in the couple’s life and make it, as a result, impossible.
The data reveals simple socioeconomic causes. But it also reveals some other complex engagement-disengagement processes that reverse the distribution of social roles within the couple and are likely to lead to divorce. These causes may give the impression that the decision of divorce seems to be the most relevant and the most profitable especially for the wife. However, for daily life, these economic challenges are being confined in sociocultural considerations. These cases will be analyzed in the light of theories of individualism and rationality of the actors. This framework will allow the understanding of the economic issue within separated men and women and that could have led to the decision of divorce.

RN13S01c - Couple, Cohabitations and Family Forms III

Who do you partner with in the United Kingdom?
Muzhi ZHOU (University of Oxford, United Kingdom) | muzhi.zhou@sant.ox.ac.uk

Past literature about assortative mating is mostly concentrated on a contextual or macro-level to explain the effect of social change on personal partnership selection. When it turns into individual marriage patterns, the timing of marriage is usually focused with a life course approach. In this paper we would like to combine the two and discuss who marries whom from an individual life course perspective. By investigating the partnership pattern of a recent birth cohort using event history analysis, the effect of the educational system on people’s first partnership formation is examined if we treat schools as the marriage market. With the help of wave 1 retrospective data from the UK Understanding Society, results have shown that young people with the highest level of education have the fastest rate of homogamy, which is consistent with most studies. On top of that, one’s family background represented by father’s social class when the respondent was fourteen years old has a positive effect on marrying up and a negative effect on marrying downwards in terms of the educational attainment of the spouse relative to the respondent. Therefore, it is worth thinking about how one’s family background can add in additional resource during one’s marriage formation process.

Time, care and one parent families: the case of Spain
Marius DOMÍNGUEZ AMORÓS (University of Barcelona, Spain) | mariusdominguez@ub.edu
Rosa ORTIZ MONERA (University of Barcelona, Spain) | rortizmonera@ub.edu
Dino DI NELLA (Universidad Nacional de Río Negro, Argentina) | dino.dinella@unrn.edu.ar
Elisabet ALMEDA SAMARANCH (University of Barcelona, Spain) | elisabet.almeda@ub.edu

Our paper analyses the results of a research undertaken by the International and Interuniversity Research Group COPOLIS (University of Barcelona): “One-parent families in the new century. Challenges and dilemmas in times of change” (CSO2011 - 29889) which is currently being developed by the group. We discuss how the normative model of nuclear, two-parent, heterosexual and patriarchal family still remains, causing discriminations, exclusion and inequality for those families which do not comply with this standard. To do this, in the theoretical framework we use the contributions of sociology of the family from a feminist perspective and from an approach that consider family diversity.

The initial phase of the project involved designing and implementing the One-parenthood and Family Diversity Survey (EMODIF) that has been applied to 300 people who head one-parent families and who are living in Catalonia. The EMODIF has been designed from a non-androcentric perspective, which has required use gender as a basic analytical category and flee the bias from other surveys that consider only the welfare generated in the public sphere through productive activities and benefits from State. This has involved taking into account the
The Role of Education in Shaping Marriage Patterns in a Developing Society: The Case of the Palestinian Society in Israel
Maha SABAH (Haifa University, Israel) | mahasab71@hotmail.com

Sociological studies have shown that a considerably higher level of education, especially among women, has become one of the most significant agents of change in various aspects of women's lives, including their marriage patterns. Two main social factors could elucidate the link between education and marriage patterns: structural changes that produces a structurally increasing likelihood of establishing a social relationship with a similarly qualified partner, and the characteristics sought in a marriage partner according to the gender role ideology in the society. In a traditional society, where men as providers and women as housekeeper, women tend to marry upward. In the modern societies, where the gender structure has changed significantly, especially in view of the growing number of women who work for wages, the level of homogamy by education has been increased (Oppenheimer 1988, 1997). According to this theoretical background, it remains an empirical question: to which extent structural changes in educational attainment in a cultural context of family roles that emphasize the gender division of role will change the assortative mating towards a higher level of homogamy by education?
The answer to question is central in this study for understanding the social change in terms of educational attainment, family formations and gender relations in the Palestinian society in Israel.
In particular, whether the changes in the educational attainment of Palestinian women affected their mate selection with regard to education? Does the woman attainment of education will be a main factor in the marriage mark, where the patriarchal structures are still alive?
This study is based on data obtained from the population census conducted by the Israeli Central Bureau of Statistic. In this study, I use the three latest available censuses, conducted in 1983, 1995 and 2008, to learn about the changes in marital choice over the years. The analysis is restricted to Arab women 17 to 40 years old at the time of each census and their spouses. For each respondent I have the following variables: Education was measured as the highest diploma obtained, and the time exposed to the risk of marriage-exposure time- measured as the number of years from age seventeen until the year of the first marriage, or, for those who remained single to the census year. The dependent variable indicates whether the spouse was more educated than the woman (upwards marriage), less educated (downwards marriage), or equally educated (homogamous marriage).
The main analysis has been done in the context of multinomial logit models. The main results are: in most educational categories there was a decline in the rates of upward marriage, increase in the downward marriage especially among academic women. The most interesting result was a decline in the rates of homogamous marriage among the lowest and the higher category of education.
The study conclusions were that although Palestinian women increase their educational attainment and they improve their socio-economic status but that did not ensure a 'good' marital choice. As a consequence of their own education surpassed that of men, in the last period, they face a shortage of potential husbands with similar or higher education. In response, some women will change their preferences for marrying a good educated man and equal marital
relationship and marry downward, especially, in a patriarchal society that encourages women for marrying and not remaining single.

**Single mothers’ families in Serbia and risks of social exclusion**  
Smiljka TOMANOVIĆ (Faculty of Philosophy University of Belgrade, Serbia) | smiljkat@hotmail.com

The paper deals with everyday life context, resources and strategies of representative sample of 272 single mothers’ families (SMF), which were the subjects of the survey on three types of one-parent families with children under 18 in Serbia. Against the background of the academic and public discourses on one-parent families as social threat, social problem or life-style choice, we tested the thesis on SMF as an effect of detraditionalisation of family life. Our findings, nevertheless, did not support the thesis, since SMF are in a very structurally vulnerable position. Compared to other two types of one-parent families – divorced and widowed parents with children, the single mothers are less employed, they have the lowest level of education and the lowest educational aspirations for their children, and their households are more exposed to material deprivation. Since they are more often financially dependent and are bounded to live within extended households more often than other lone parents, SMF are very dependent on their social networks – particularly their parental families. Nevertheless, the analysis shows that they are more prone to be stigmatized and that their social support networks are less developed as compared to other one-parent families. In the context of underdeveloped and inaccessible system support, the families of poorly educated and unemployed single mothers without support from their social network are at multiple risks of social exclusion. Although among them exists stratificational diversity, mainly related to mother’s level of education, many SMF are burdened with problems and perceived as social problem, rather than emancipated life-style.

**Short-term relationships - partners and sexual relations of Polish single women and single men**  
Emilia PAPRZYCKA (Warsaw University of Life Sciences - SGGW, Poland) | emilia_paprzycka@sggw.pl

Currently we may observe variety and complexity of intimate relationships and single people’s short-term relationships of emotional and/or sexual character may be included in this variety. By definition people living on their own do not have a regular partner and are not in a long-term exclusive relationship and in social awareness they function as opposite stereotypes. Single women are perceived as unattractive, asexual and undesired or quite the opposite as promiscuous. As for single men they are usually seen as no-hopers, having problems or a lot of promiscuous sexual contacts. This presentation will be focused on answering the questions: What is single people’s sexual life like and what kind of intimate relationships do single people enter? The answers to these questions will be provided on the basis of findings of qualitative research conducted on single men and women and quantitative research carried on representative group of Polish people. The research shows that single people’s emotional life, intimate relationships and sexual activities vary in terms of gender, age, place of living, religiousness, level of education and attitude towards single life. Gender perspective was taken under consideration while preparing the project and analysis of research findings, which allowed to identify distinctness of definitions of intimate relationships and variety of meanings assigned to these relations by single men and women. This otherness was noticed not only among men and women but also within biological gender i.e. (that is) among people representing different types of femininity and masculinity.
Under the same roof: towards an understanding of the everyday relational practices of contemporary shared living arrangements in the UK

Sue HEATH (University of Manchester, United Kingdom) | sue.heath@manchester.ac.uk
Gemma EDWARDS (University of Manchester, United Kingdom) | Gemma.M.Edwards@manchester.ac.uk
Rachael SCICLUNA (University of Manchester, United Kingdom) | rachael.scicluna@manchester.ac.uk
Katherine DAVIES (University of Sheffield, United Kingdom) | k.davies@sheffield.ac.uk

Within societies dominated by privatised notions of housing and domesticity, shared living arrangements confound normative expectations of the place of non-kin in most people’s lives. Popular responses to 1970s communes exemplified this, with many sociologists at the time equally bemused by the phenomenon. Most Britons who today share accommodation with non-kin do so not in intentional communities but in shared rentals and private lodgings. These arrangements have recently increased hugely, not primarily through choice but in response to rising housing costs and the impact of recession. Simultaneously, there is growing UK interest in new forms of intentional sharing, eg cohousing. Despite these trends, and the emergence of approaches to studying intimate life which more readily acknowledge alternative household forms, shared living remains marginalised and little is known about the everyday relational practices of sharers. This paper draws on new qualitative research on shared living arrangements in the UK involving 70 sharers of all ages, living in both intentional and non-intentional contexts. Utilising interview and visual data, the paper will explore the ‘critical associations’ underpinning shared living arrangements, using Belk’s (2009) distinction, following Ingold (1986), between everyday practices of ‘sharing out’ and ‘sharing in’. It considers how these practices relate to the temporal, spatial, economic and ideological organisation of different shared living arrangements and how they serve to either foster or discourage intimacy and communality in shared settings. Through exploring forms of connectedness involving non-kin, we aim to contribute to a growing body of sociological work focusing on non-familial intimacies.

Family configurations of young parents in Italy. The role of networks between the crisis and the future

Matteo MOSCATELLI (Catholic University Milan, Italy) | matteo.moscatelli@unicatt.it
Donatella BRAMANTI (Catholic University Milan, Italy) | donatella.bramanti@unicatt.it

The exploratory research on family configurations of young Italians (under 40), who are planning their future life with a baby (0-3 years), involved over 150 parents. Because of the weakness of the Welfare State as well as the blows of the economic crisis, many young people are experiencing deep trouble in a context that enhances the importance of the role of the networks (both ascribed - relatives, grand parents, whether acquired - friends) to ensure the well-being of individuals and families (Bramanti, 2014). The methods of analysis of the familiar space are refined through the structural approach to family diversity (Widmer, 2010,2014) focusing also on the relational network that goes beyond domestic boundaries and guided by the relational approach (Donati, 2010, 2014) analyzing the structural level (constraints and resources) and the referential one (values and wellness goals) of relationships.

The purpose of the study was to observe what is exchanged within the configurations of young parents in terms of support, interdependencies and conflicts in relation to different projects of
life. It was possible to reconstruct how the diversity of family configurations (morphology) influence the share capital made available to individuals. Another goal was to study who the pattern is focused on and to verify some compensatory hypothesis on the role played by some net sources. The first results show that, within a general historical trend that makes families increasingly fragile, the importance of the family configuration and networking resources available is relevant not only on the level of satisfaction with their parental experience with children, but also on the ability to look at the future and to be prosocial and generative.

Co-residence as a mechanism for relational proximity The impact of family trajectories on the diversification of personal networks

Rita GOUVEIA (ICS - ULisbon, Portugal) | vasco.ramos@ics.ul.pt
Vasco RAMOS (ICS - ULisbon, Portugal) | rita.gouveia@ics.ul.pt
Karin WALL (ICS - ULisbon, Portugal) | karin.wall@ics.ul.pt

Close relationships are built according to the articulation of old and new relational principles, such as kinship primacy, generational proximity and affinity criteria, but also co-residence history. Therefore, sharing the same household over the lifecourse enhances the feelings of closeness between individuals who are mutually interdependent, even if relationships may be characterized by solidarity, conflict or both. On the other hand, the pluralisation of the lifecourse and the diversification of family arrangements have been contributing for the development of personal relationships beyond the limits of the household unit. Thus, the heuristic potential of household composition to capture family life has been challenged by recent research. This chapter (re)evaluates the importance of co-residence in the construction of personal networks, by exploring the impact of both family trajectories and current household composition on the configurations of personal networks in which individuals are embedded at the present moment. We draw on data from a Portuguese survey on life trajectories and social networks, which was applied to a representative sample of 1500 Portuguese born in three different cohorts (1935-40, 1950-55,1970-75). Findings highlight the interdependency between the history of co-residence and the generational, biographical and structural contexts, which in turn, shape the type of personal configurations, in particular, the openness of the boundaries to non-kin.

Intimacy at a Distance – the Mediatized Social Belonging of Academic Transnational Elite

Jenny JANSDOTTER (Karlstad University, Sweden) | jenny.jansdotter@kau.se

Referring to a notion of intimacy from the phenomenology of Schutz (1964) as the imagined proximity to the other in a stream of consciousness and converging focus in a co-presence, this paper aims to scrutinize how experiences of intimacy are transformed when spatial connected presence in the everyday is ruptured and connectivity is media-dependent, and thus how family constellations and life planning is affected. In the panorama of the mobilities turn (Sheller & Urry, 2006) and mediatization (Krotz, 2007) as meta-processes co-constituting social change in late modernity, many professions presupposes increasingly higher expectations on physical mobility and, dichotomizing, ubiquitous mediated connectedness. Consequently, this limits family co-presence in the everyday and, concurrently, the professional realm leaks over into the home, a concept under re-evaluation (see Tuan, 1974).

This diachronic ethnographic study of transnational academic elite persons within the humanities and social sciences considers how intimacy, confidence and familiarity in close relations is negotiated via different media at durable or repeated times of physical separation. While some inequalities are structural, for example the mobility being by one part voluntary
The changing patterns of lifelong singlehood
Daniela BELLANI (UPF, Spain) | daniela.bellani@upf.edu
Lesia NEDOLUZHKO (UPF, Spain) | lesia.nedoluzhko@upf.edu

There is a growing body of literature which has documented recent increase in educational homogamy, particularly among highly educated individuals. This tendency, although not universal, is observed in many culturally and socio-economically diverse settings and said to be a product of modernization, female educational expansion, and rising share of women in tertiary education (Cheng 2014, Han 2010, Park and Smits 2005, Pencavel 1998, Smits et al. 2000). Few studies have projected the long-term consequences of the growing proportion of highly educated women for marriage market and spouse selection. They predicted that the emergence of new gender imbalance when women outnumber men in tertiary education is likely to reverse current trends in educational homogamy and to increase the incidence of singlehood among highly educated women (e.g., Van Bavel 2012).

Demographic and sociological research has also shown that the direction and strength of educational gradient in marriage depend on societal context. In gender-equalitarian countries better-educated women are more likely to be married compared to their less-educated counterparts whereas the opposite holds true for the countries where gender roles and attitudes are traditional (Domínguez-Folgueras and Castro-Martin 2008, Kalmijn 2013). Despite the abiding interest in relationship between marriage/cohabitation and education and in its change over time, contemporary research lacks comparative cross-national analysis. Our study covers the broad range of industrialized countries, including European countries, Australia, The United States, and Canada. We investigate the dynamics of educational gradient in partnering through changes in lifelong singlehood. We focus on women who in their midlife ages (40-45) have never lived in a marital or cohabiting union and estimate likelihood of being single by educational level - highly vs low educated women. Following earlier research, in our analysis we account for the effects of two contextual characteristics - prevailing gender attitudes and gender gap in higher education. The second characteristic is aimed to capture the availability of highly educated bachelors on the marriage market.

The preliminary results of our study suggest that in almost all countries highly educated women are more likely to remain single compared to their low educated counterparts. We also found that for many countries the gap between higher and lower educated women declines.

RN13S03a - Intergenerational Relationships I: Old People and Family Relations

Intergenerational Relations in Stepfamilies: A Comparison of France, Germany, and Russia
Anja STEINBACH (University Duisbug-Essen, Germany) | anja.steinbach@uni-due.de
Karsten HANK (University of Cologne, Germany) | hank@wiso.uni-koeln.de
Our study examines cross-national variations in intergenerational relations of partnered parents aged 50 and over with adult non-coresident children by family structure. We focus on three European countries – France, Germany, and Russia – which have in common a relatively large proportion of stepfamilies, but differ with regard to contextual characteristics potentially impacting the stepfamily-intergenerational-relations nexus. The analysis is based on data from Generations and Gender Surveys (Wave 1). Our pooled analytical sample consists of 14,309 parent-child relationships derived from responses by 6,590 surveyed parents with children aged 18 or older living outside the parental household. We consider two core dimensions of intergenerational solidarity as dependent variables, namely frequency of contact and emotional closeness. Our results support the notion of universally weaker intergenerational relations in stepfamilies. However, compared to France and Germany, Russia stands out in that the negative relation between being a stepparent and contact with the adult child is weakest, whereas it is strongest with regard to emotional closeness. The observed cross-national differences are proposed to result from widowhood being a more important pathway leading to stepfamily formation as well as a stronger ‘functional’ basis of stepfamily intergenerational relations in the Russian context.

„The Nesting” – life necessity or (family) choice? Based on Polish example
Mariola PISZCZATOWSKA-OLEKSIEWICZ (University of Warsaw, Poland) | mpiszczatowska@o2.pl

The nesting is a situation where young adults prolong their stay at their family home. In Poland living with custodians in spite of becoming major is getting more and more popular among young adults during economic crisis. In my project I would like to show the particularities of the postponing separation from the family of origin in Poland. I begin with putting the question: is the nesting life necessity (because of economic crisis) or choice in Poland? So far I have designed and analysed two nationwide quantitative projects: the first one conducted for diagnostic and descriptive purposes before crisis, and the second aiming at exploring the crisis reality. After crisis, in 2013 I have conducted the qualitative research (IDI’s) with the Nesters and with their parents.

The results of a quantitative studies indicate that the external factors (e.g. economic situation of the country, increasing enrolment ratio, etc.) have limited impact on young people postponing their final departures from the parental home. There are strong non-economical reasons too (intergenerational relationships), like parents’ expectations or demands towards their adult children. Nesters are not the only actors of the crowded nest arrangement, as parents also play their significant role there.

Family Matters? – The Effect of Parental Unemployment on Children Socioeconomic Achievement in Different Family Types
Hannu Paavali LEHTI (University of Turku, Finland) | hpleht@utu.fi
Aleksi KARHULA (University of Turku, Finland) | aleksi.karhula@utu.fi
Jani Petteri EROLA (University of Turku, Finland) | jani.erola@utu.fi

It is well known that unemployment has disadvantageous social and psychological effects. Yet the evidence on long term intergenerational effects of parental unemployment is weak. We study how the intergenerational impact of unemployment on children’s socioeconomic status varies by different family types and parental gender. This allows us to contrast normative
and economic explanations for possible negative intergenerational effects of parental unemployment, often brought up in the theoretical literature. We distinguish single, step and two-parent families and further, dual earner families among the latter. We use Finnish register data on children who faced paternal or maternal unemployment when they were 16-17 years old. Children’s social status is measured on ISEI scale when they were 30 years old. Analysis conducted by propensity score matching showed that parental unemployment only harms socioeconomic attainment of the children growing up in the dual earner families; the children growing up in other family types are fare worse because of the parental selection in to unemployment, not because of unemployment as such. Father’s unemployment has a negative statistically significant effect on children’s SES – but mother’s unemployment has not – compared to children who did not experience parental unemployment. Children having both parents unemployed have a lower level of attainment than those having only one unemployed parent. However, this appears to be largely due to the selection to the group at risk; those with similar family background but not experiencing unemployment do equally badly.

**Housing Pathways of Young People and the Changing Concepts of Family**
Yung-Han CHANG (University of Kang Ning, Taiwan, Republic of China) | yhchang@ukn.edu.tw

In the context of rapid social change, the traditional life course in Taiwan is challenged by the extension of studies, delay in marriage, and a growth in singlehood. As Confucian maxim of "independence at the age of thirty" no longer applies to Taiwanese young people, many of them face the housing problems under the ambiguous timing of family formation. While some young people choose to rent an apartment and live alone or live with friends, some may return to their parents’ home and stay until they get married. However temporary this living arrangement was expected originally, it has gradually become a long-term settlement as family formation and housing pathways of young people change. In terms of the said changes, previous studies of the living arrangements and housing issues of Taiwanese young people usually focus on the structural factors, including the availability of houses and the economic status, but fail to investigate the transformation of family concepts or household imaginations of young people. Thus this study aims to examine the change of family concepts and its relationship with the housing pathways of Taiwanese young people. In order to answer the research question, besides using the quantitative data collected from 2000 to 2012 in Taiwan Social Change Survey, in-depth interviews with young people aged 20-35 are conducted. The results show that given the structural constraints, young people’s personal expectations and imaginations about family and households still affect their housing choices.

**RN13S03b - Intergenerational Relationships II: Grandparents and Children**

**Balancing the moral budget: intergenerational relations between private troubles and public issues**
Bella MARCKMANN (University of Copenhagen, Denmark) | bm@soc.ku.dk

Current trends of longer life expectancy and smaller birth cohorts in Europe have spurred extensive scholarly and public debates about intergenerational exchanges, “generational theft”, and the transmission of inequalities across and between generations. However, few studies look at the moral micro-economies of interactions whereby adult kin actively maintain and interpret
their intergenerational relationships – or omit to do so – thus in varying degree making themselves reciprocally available as network resources. In Scandinavia, the last 70 years have seen the growth of universal welfare institutions which to a great extent made parents and adult children economically independent of one another – but also a growing crisis and political criticism of the welfare institutions. The theoretical background for this paper is one of symbolic interactionism and the concept of moral economy. Methodologically, the paper draws upon biographical interviews conducted in Denmark with men and women aged between 20 and 70 to throw light on the ways in which parents and adult children from a variety of social backgrounds relate their own family histories to the larger societal tendencies. Main findings: The paper demonstrates how the interviewees bring concepts such as gratitude, reciprocity, independence, debt, and merit into play in order to interpret and negotiate understandings of intergenerational relations both in the private and public domains.

Intergenerational exchanges and social networks of Italian active elders. A quantitative analysis

Donatella BRAMANTI (Università Cattolica del Sacro Cuore di Milano, Italy) | donatella.bramanti@unicatt.it
Giovanna ROSSI (Università Cattolica del Sacro Cuore di Milano, Italy) | giovanna.rossi@unicatt.it
Matteo MOSCATELLI (Università Cattolica del Sacro Cuore di Milano, Italy) | matteo.moscatelli@unicatt.it

The present paper is focused on active ageing and intergenerational exchanges at the level of values and personal orientations and at the level of relational networks. Analyses are based on the data gathered through a national survey (N=900 participants aged 65-74 years; http://anzianiinrete.wordpress.com). The theoretical premise of this work is that the practical and symbolic aspects of exchange between generations introduces new differentia-tions between subjects (Dykstra, Fokkema 2011; Angelini et al. 2012; Silverstein et al. 2006; Rossi, Bramanti, Moscatelli 2014; Bramanti, Meda 2015).

We measured structural and cultural factors that favour or hinder the likelihood to put in place forms of intergenerational exchange on the side of the young elders. We also identified elements of ambivalence interfering with active ageing, which is assumed as the propensity to be engaged in activities for oneself or for the others in later life.

Data analysis is performed through synthetic indexes, a cluster analysis (SPAD software), social network analysis (SNA), as well as logistic re-gression (Maximum Likelihood Estimation method).

The analyses confirm the existence of a relationship between the mag-nitude of the social network and the propensity to exchange with other generations. They also confirm the importance of value orientations and experience. In conclusion, believing in the importance of generations and drawing a positive balance in one’s experience as a parent are strictly related with the capability to support the youngest and the old-est (intergenerational solidarity).

Intergenerational Solidarity and Family Cohesion in Elderly Care

Hynek JEŘÁBEK (Charles University in Prague, Faculty of Social Sciences, Institute of Sociological Studies, Czech Republic) | hynek.jerabek@gmail.com
Jiří REMR (Charles University in Prague, Faculty of Social Sciences, Institute of Sociological Studies,

The paper discusses the results of the research project ‘Family Cohesion in Elderly Care’ in the Czech Republic. We tested V. L. Bengtson’s six-dimensional model of intergenerational
solidarity and return to Bengtson’s original question of whether it is possible to model intergenerational solidarity as a one-dimensional construct. Unlike the answer to this question given by Roberts and Bengtson (1990), our response is ‘yes, a one-dimensional construct is possible’. We explain in our paper, how Bengtson’s and our models of measurement differ. According to socio-psychological theory summarized in the works of McChesney, Bengtson, Roberts & Richards (in the years 1988-1991) we assume that if there exist strong emotional bonds between members of a group, frequent contact and mutual assistance among them, and assuming that the members share ideas, goals, and responsibility for the group as a whole, it is possible to expect that this group will be cohesive. Our studied Czech families are valid candidates to which the theory of family cohesion can be applied. Our generalization refers to ‘family cohesion’ among the generation of Czech families that are caring for their elderly members and to the existence of one-dimensional latent variable for measurement of family cohesion for Czech caring families. for subtopic 3 ’Intergenerational Relationships’

The 'dark side' of intergenerational transfers in shaping family relations in Britain, Germany and Japan
Misa IZUHARA (University of Bristol, United Kingdom) | M.Izuhara@bristol.ac.uk
Stephan KOEPPE (University College Dublin) | stephan.koeppe@ucd.ie
Karen ROWLINGSON (University of Birmingham, United Kingdom) | K.Rowlingson@bham.ac.uk

This paper explores the negative impact of intergenerational transfers on family relations cross-nationally in Britain, Germany and Japan. Inheritance shapes family relations in ways of material support, symbolic practices and moral reasoning. While it contributes to strengthening family ties, it can also be a source of tension and conflict. In contemporary societies with slower economic growth and increased rates of home ownership, transfers of home ownership and financial assets transmit opportunities and advantages over generations, especially in the neoliberal policy context. Compared to the positive impact of the transfers on future generations, however, there is a gap in knowledge and understanding of the ‘dark side’ of intergenerational transfers including how transfers generate conflict, tension or dissatisfaction among family members; and how people prepare for and respond to such risks. For example, unequal distribution of parental assets may cause dispute among siblings. Adult children may inherit housing with negative equity. Divorce and remarriage may lead to complication in relation to asset ownership and the right to transfer in step families. Moreover, the notion of fairness in (re)distribution, governed by law, policy and social norms, varies significantly across cultures and societies. How contemporary families deal with the processes and outcomes of asset transfers thus have compelling national and international resonance. This exploratory paper will examine how different welfare systems, inheritance laws, tax systems, cultural practices and housing markets combine to produce different patterns of and responses to intergenerational transfers. It will contribute to further develop theories of ‘family solidarity and conflict’ in relation to asset transfers.

RN13S03c - Intergenerational Relationships III: Parents and Children

The generational Transition. Do relationship patterns change after the first birth of a grandchild in Germany?
Veronika SALZBURGER (University of Cologne, Germany) | salzburger@wiso.uni-koeln.de
The birth of the first (grand-) child restructures the familial composition. This induces changes for existing relationship patterns between the generations. On the one hand, a birth increases opportunities for contact between grandparents and parents as well as the demand and supply of material and immaterial help, e.g. childcare, information and advice. This can result in closer emotional relationships. On the other hand, however, unidirectional resource flows may lead to increased intergenerational conflicts and alienation. Yet, more research on how intergenerational relationships adapt to the new family structure is needed. Only few existing studies examine changes of patterns over time and these studies do not differentiate the age and number of grandchildren. In addition, they analyze relationships mostly from the singular perspective of either parents or grandparents. Based on the Bengtson-Silverstein-Solidarity model, the present study considers the perspectives of both generations and analyzes the development of relationship patterns over time after the generational transition. The German Family Panel (pairfam; N=7,022 dyads) in 2010 and 2014 is analyzed. Five types of relationship patterns, derived from cluster analysis, are identified. Examining changes in these patterns after the generational transition, three types of shifts are differentiated: (i) any shift occurs, (ii) shift toward more distant relationship occurs, or (iii) shift toward closer relationship occurs. Logistic regression models show that the generational transition does mostly not trigger a shift. If a shift occurs, however, the generational transition prevents shifts toward more distant relationships. No significant effects are found for a shift towards closer relationships.

Significant and meaningful grandparenting practices in Scotland

Eloi RIBE (University of Edinburgh, United Kingdom) | e.ribe@ed.ac.uk

Grandparent-grandchildren relationships have substantial material, social and emotional implications for families. Over the last half of the 20th Century significant demographic and social changes have transformed population structures and family relationships. Three and even four generations are more likely to live at the same time while childcare is increasingly demanded by parents to reconcile work and family life. In this context grandparents have become more involved in family life by looking after their grandchildren or supporting their adult child. However, there has been little attention to the ways grandparent-grandchildren relationships are enacted and maintained over time and the significance of the everyday family and intimacy practices. This research is embedded within a theoretical and conceptual discussion of what constitutes ‘family’ and ‘practices of intimacy’ and adds to contemporary debate about family change. It explores the ways grandparents enact, enable and maintain significant and meaningful close and intimate relationships with their grandchildren across time. It particularly focuses on describing and grasping emotional (affective), conceptual (cognitive) and practical (body) grandparenting practices that create a sense of closeness and whether there are differences in these practices between couple and lone-parent families. Using the Growing Up in Scotland survey I investigate the factors affecting closeness between grandparents and grandchildren by lineage, gender of grandparents and marital status of parent families. These results are combined with data from face-to-face interviews with grandparents reporting on the significance and importance of family and intimacy practices in the relationship with grandchildren.

The influence of (potential) grandparents in adult child’s entry into parenthood

Roberta RUTIGLIANO (Universitat Pompeu Fabra, Spain) | roberta.rutigliano@upf.edu

Since women have acquired a new role in society, they and their partner have to struggle to reconcile career with family life. Further, extended family mechanisms have been substantially distorted because of the demographic changes. As consequence, all the main life course's
phases have been delayed or stretched. The general aim of this study is to explore and clarify the role of grandparents, in influencing couples’ decisions with a particular focus on fertility behaviors. Specifically, in this article I investigate the association between expected grandparental childcare provision and the change in the probability of first birth transition for the middle generation. The main idea is to consider grandparental characteristics as a proxy for future childcare provision, able to influence the adult child’s first birth transition. Data source is SHARE (Survey of Health Aging and Retirement in Europe). I analyze wave1 and wave2 and I implement a two step regression approach, namely linear probability model and mixed logit models to carry out the analysis. Results show a positive and significant effect of grandparent’s propensity of providing childcare on adult child’s first birth transition. Nevertheless, results suggest that context plays an important role too. In the future developments, in order to address this issue I plan to run the analysis for different group of countries.

'Imaginary Extended Family'. Structure in Rural Areas: Case of Avanos, Turkey
Ayşe GÖNÜLLÜ ATAKAN (Middle East Technical University, Department of Sociology, Turkey) | agonullu@gmail.com
Ayşe GÜNDÜZ HOŞGÖR (Middle East Technical University, Department of Sociology, Turkey) | hosgor@metu.edu.tr

This paper focuses on understanding the family pattern changes within the rural transformation of Turkey. Literature indicates that in Turkey rural transformation after 1980s resulted with dissolution of patrilocally extended household structure which was based on petty commodity production. Today i nuclear family structure has become more prevalent. From a socialist feminist perspective, this paper explores the changes in the lives of two cohorts of rural women in town Avanos in Central Anatolia. Depending on mother-daughter interviews, the main argument of this paper is that although young couples physically do not live with their elders at the same household anymore as they were in the past, still they continue getting labour support from their elders specifically for child care. Findings indicate that despite changes created relative liberation of woman from heavy workload of extended household, the nature of gender division of labour between women and men resists to change at domestic sphere. Particularly when both women and men enroll in paid employment outside home, child care becomes a central problem in nuclear households. Generally the solution is found through intergenerational arrangements between women and their mother/mother in laws. On the other hand, this arrangement prevents loss of value for elder women living outside of nuclear family by continuation of their reproductive labor through grandchild care. Consequently, this new patriarchal arrangement has created a new household form what we conceptualized as “imaginary extended family structure”. Such new household typology differs not only from traditional extended household structure in terms of spatial and organization structure of households but also from nuclear family definition of modernization theory.

RN13S04 - Family Networks and Care

When do children make parents happy? The economy, the welfare state and the varying value of children
Klaus PREISNER (University of Zurich, Switzerland) | preisner@soziologie.uzh.ch
Franz NEUBERGER (University of Zurich, Switzerland) | franz.neuberger@googlemail.com

In this paper we analyse the relationship between the economy, the welfare state, class, parenthood and quality of life in old age. We apply the concept of socially structured
ambivalence to theorize the link between quality of life and the value of children in different social structural settings. Our main rationale is that the effect of having children on Quality of Life – that is: the value of children – varies with social class, e.g. financial and health resources. We assume having children or not is of great importance in late life for older persons suffering from financial stress and bad health and for those living in less affluent countries and less generous welfare states.

The analysis is based on the Survey of Health, Ageing and Retirement in Europe (wave 4). We focus on respondents aged 50 and over in 16 European countries. We find both a class effect within and between countries on the “value of children” for older persons. The fewer individual financial and health resources and the lower the national wealth, the more respondents suffer from not having children, and the more they benefit from parenthood in late life respectively. We find no significant effect of welfare states on the value of children. We therefore refer to a within and between country concept of social class in later life in order to explain the relationship between parenthood and QoL.

International adoptive families in Spain. Material and emotional support networks.
Diana JAREÑO RUIZ (University of Alicante, Spain) | diana.jareno@ua.es
María José RODRÍGUEZ JAUME (University of Alicante, Spain) | mj.rodriguez@ua.es

Despite the delay with respect to our neighboring European countries, the phenomenon of international adoptions has emerged with unparalleled intensity in Spain. In fact, the 5,541 adoptions formalized abroad in 2004 made Spain rank as the world's second country in international adoptions after the USA. Adoptive families often live adoption as a bureaucratic and dehumanizing experience which leads them to feel misunderstood and alone. These perceptions are offset by networking the affective and emotional support, that is, creating your private 'kinship networks' or 'extended family'.

In this paper we focus on analyzing the construction of adoptive families based on their social networks support. Network analysis provides an original set of research tools to apply to the studies of the family, opening a scene to new indicators and analysis fields. This relationship highlights the building of 'maps' of family groups, to support and explain the current complexity of families and the extent of support ties located outside the domestic nucleus as sources of resources to meet their needs, both instrumental and expressive.

The results presented are based on the findings of the survey ‘Adoptive families and their lifestyles’ inscribed in the research project ‘The (baby) boom of international adoptions in Spain. A sociological research work on adoptive families and their lifestyles’ (R&D&i 2008-2011: CSO2009-14763-C03-03). The research involved 230 Spanish families who had adopted a child abroad. The survey included a section whose questions sought, firstly, to identify the main actors involved in adoptive families and describe the roles each one plays and, secondly, to know the different relationships established through virtual networks propitiated to search for information about the adoption process.

The (re)modernization of family life and the (re)configuration of social networks
Allan WESTERLING (Roskilde University, Denmark) | allanw@ruc.dk
Hans H. K SØNDERSTRUP-ANDERSEN (Roskilde University, Denmark) | hsan@ruc.dk
Lars Tomas DENCIIK (Roskilde University, Denmark) | lade@ruc.dk

What does processes of reflexive modernization mean for communality in everyday family life? This paper analyzes the change and stability in social networks and family relationship of adults during the period from 2003 to 2014 in Denmark. Based on longitudinal survey data with a panel of individuals, born in 1968 and living in Denmark, this paper analyzes how the centrality of
household members and kin relations in the everyday life of adults, have changed during 2003-2014. The first wave of data was collected in 2003 (n=1003) using Computer Assisted Telephone Interview. The second wave was collected during November and December 2014 (n=467) using a web-based adaptation of the original survey. We call this survey SONEFAL, Social Networks and FAmily Life (in Danish IFUSOFF) (Dencik & Westerling 2004). Analysis of the data from wave 1 documents how the 35year old mainly oriented towards the other members of their household and immediate kin in everyday life (Westerling 2008, 2010, Dencik et. al. 2008). The primary members of the social networks of the 35year olds were spouses, children and parents: generally the respondents had both a high frequency of contact and diverse forms of interactions with these categories of people. This paper investigates the changes in these networks after more than 10 years, and analyzes these findings informed by theories of reflexive modernization (Beck 1994, Beck et. al. 2003).

Traditional Songs and their Impact on Moroccan Family Life
Fouzia LAMKHANTER (university hassan II, Morocco) | lamkhanterfouzia@gmail.com
Touria HOUSSAM (university hassan II, Morocco) | touria.houssam@gmail.com

This research paper relates to a sociolinguistic study of Moroccan traditional lyrics which reflect the sensitive nature of the mother/daughter-in-law relationship. These lyrics produced and presented vividly in Moroccan traditional songs tend to create antagonism and conflict to Moroccan families. The data consist of recordings of some popular songs entertained in rural areas by ordinary women. We will shed light on the importance of oral tradition as a means of transmission of collective imagination and production of stereotypes and social representations. These representations and stereotypes are very dominant in the Moroccan oral tradition and continuously contribute to the maintenance of inequality and gender discrimination. We will scrutinize the connotations conveyed in these folk songs to be able to describe, analyze and subsequently enumerate the different stereotypes that this corpus reveals.

The information gathered in this study up to now, as well as others, reveal the existence of different stereotypes associated with the status of both, the mother in law and the daughter in law. It also describes the tense and confrontational nature of the relationship between the two women, a thing that seems inevitable. The nature of the relationship that these songs cause and tend to impart, consciously or unconsciously, influences family relationships. The Moroccan family lives under the weight of these representations that feed tensions and disrupt family life and consequently feeds moments of domination, power struggle and even moments of crisis. Indeed, the Stereotypes linked to this relation mother-in-law/daughter-in-law represent real cultural challenges for family life. All in all, We will highlight, on the basis of an extended corpus of popular songs the colorful relationship between the mother-in-law and the daughter-in-law through analyzing the relevance of these stereotypes and social representations as well as their impact on the Moroccan family. Finally we will touch on the future of this relationship based on the data we have gathered.

Caring at home: an ethnography of care practices
Joana Pimentel ALVES (Faculty of Economics University of Coimbra/ Center of Social Studies Associate Laboratory University of Coimbra, Portugal) | joanapimentelalves@gmail.com

The significant increase of population with long-term care needs brought an additional attention to welfare research. In recent decades, the attention has been turning to the role of families in
providing care for family members with permanent and long-term care needs (Nolan et al., 2003).

Historically the informal care to dependents has been provided at home by family (Horden et al., 1998). The reflection on the welfare state has concluded the central place of the family and extended networks in delivering support to older and disabled people across all European countries (European Commission, 2010). Mostly, care remains as a family issue, understood as a private matter in which families play a central role, specially, in the provision of long-term home-based care (Marin et al., 2009:7). Typically, this type of care is mainly provided by family, close relatives, friends or neighbours, for people with no special training for providing care, and not based their activities in any formal contract, or in specific services (Goodhead et al, 2007). Research carried out in Portugal has shown the significant importance that informal care has in the country. In a context in which welfare state protection never was very significant, the social networks respond first to the needs of citizens (Santos, 2011; Portugal, 2014). However, although the importance of informal care provision is well known in Portugal, the universe of home care work is almost unknown, especially in the field of disability.

Disability is a heterogeneous phenomenon where social and biological factors intersect and influence people’s life conditions. Nevertheless, it is not wrong to say that a large number of people with disabilities need personal assistance. Without that, many daily living activities would be compromised, with serious consequences for their quality of life, health and participation on society. In Portugal, people with disabilities found their “personal assistants” or “helpers” in their immediate family members, also designated as informal caregivers. More demanding are care needs, more being cared for family at home is the only response existence (Alves, 2011). Although its importance, we still know little about it since there are few studies on this subject, specially conducted from inside home. My PhD research – “Ways of caring: analysing daily, permanent and long-term care” – from which this paper is derived tries to contradicted this tendency.

Recognizing the role and place of family in permanent and long-term home care provision, as well the necessity of revealing care work and care practices and caregivers-care receiver interactions, I decided to enter on domestic sphere and be part of care production to comprehend how permanent and long-term care assistance is constructed and provided, in the field of disability. To explore this question I analysed who are the main actors; which role has the family; and how the context, in which care is provided, defines the practices and relationships.

Considering the above outlined the methodological strategy followed in empirical research draws upon qualitative methodologies. It included a participant observation at daily routine, tasks associated with home-based care work and the relationships between actors at home; and in-depth interviews to the family caregivers and home care aides to understand: how they became caregivers (by choice, by obligation or by economic necessity); how they understand their role; how they reconcile caregivers’ role with other social roles; and the impacts of care in their lives.

Based on fieldwork it’s possible to point some results. Firstly, home care provision is a complex phenomenon, conditioned by the social and economical context, but also by the characteristics of care receivers and the nature of the relationship between career and care receiver. Thus, the context in which care is provided matters, as well as the way that caregivers understand care and their role in that relationship: both define the care practices. Likewise, home-based care is specific and personalized to care-receiver necessities and personal biography. Family caregivers and informal paid caregivers point out emotional ties as a reason to care and value them, the impacts of care in their lives are huge and in multiples domains (work, job, leisure, health and so no). However, they are distinct according the nature of the relationship between caregiver and care-receiver.
When I decided being at home with a disabled people and their caregivers, I could experience how important is be in there to comprehend how the care practices and care relationships are defined by the home setting. Hence, being at home with disabled people and their caregivers, sharing their daily living routines, gives a unique insight for knowing home care. Observing and participating in the procedures is crucial to understand the phenomena, specially the impacts of this type of assistance on the lives of actors involved. The relevance of ethnography to understand the nature and intensity (both physical and emotional) of care practices was crucial to the study results.

Protection or selection? New insights into the effect of children on union dissolution in Germany
Thorsten SCHNEIDER (Leipzig University, Germany) | thorsten.schneider@uni-leipzig.de

Research on divorce or union dissolution demonstrates that the age of the youngest child is negatively correlated with the risk of breaking up. These findings apply at least to marital children. One line of argument is that children stabilize unions due to stronger feelings of obligation, stronger economic dependencies of mothers, etc. Another line of argument is that partners who are less satisfied with or committed to their relationship are less prone to have children in the first place.
To get new insight into this controversial topic of protection vs. selection we investigate the consequences of births resulting from unplanned pregnancies on the stability of (marital and cohabitating) unions. We frame women with an unplanned pregnancy as the treatment group. As unplanned pregnancies are highly selective we use the technique of propensity score matching (PSM) to identify one control group of women with planned pregnancies and one control group of women without a pregnancy. The union stability of these three groups is compared by survivor functions.
The data comes from the German Socio-Economic Panel Study, which asks mothers of newborns if the pregnancy had been planned or not. In order to estimate the propensity of having an unplanned pregnancy we control for a lot of variables, surveyed prior to the conception. The
initially lower union stability of couples with an unplanned pregnancy compared to a planned one decreases sharply after the PSM, and the differences in union stability between unplanned and no pregnancy vanishes completely. Obviously, the selection effect outweighs the protection effect.

Job-related spatial mobility and changing fertility patterns in a cohort perspective
Heiko RÜGER (Federal Institute for Population Research, Germany) | heiko.rueger@bib.bund.de
Thomas SKORA (Federal Institute for Population Research, Germany) | thomas.skora@bib.bund.de
Norbert F. SCHNEIDER (Federal Institute for Population Research, Germany) | norbert.schneider@bib.bund.de

In recent decades, many European countries have witnessed changes in fertility patterns, i.e. a decline in the total number of children per women, the spread of childlessness, and the postponement of childbearing. This paper examines to what extent job-related spatial mobility (i.e. commuting, business travel and long-distance moves) has increased and changed at the beginning of the professional life between cohorts and whether changes in mobility behaviour have been a driving force of changes in fertility behaviour. Empirical analyses are based on the second wave of the “Job Mobilities and Family Lives in Europe” study (N=1,735; 2010/2011), and include data from France, Spain, and Germany across three birth cohorts (1952–1960, 1961–1970 and 1971–1977). We examined mobility histories (form, number and timing of mobility episodes) and the probability (average marginal effects) of having at least one child at the age of 33. The results show that women of the youngest cohort are more mobile than women of the older birth cohorts and, as expected, have fewer transitions into parenthood. In the youngest cohort, mobility also occurs later in life, increasingly in form of circular mobility (i.e. commuting and business travel), and decreasingly in form of long-distance moves. Taking differences in mobility behaviour into account reduced initial cohort differences in the probability of having a child at the age of 33. In conclusion, future research on changing fertility patterns should pay greater attention to changing spatial mobility behaviour.

Family instability after the birth of the first child: uneven prospects of married and cohabiting couples with diverging fertility plans
Klára ČAPKOVÁ (Masaryk University) | klara.capkova@centrum.cz

Birth of a child is supposed to have a positive effect on partnership and family stability. This holds true for married couples, for cohabitators, nevertheless, the mechanism underlying this effect is less straightforward. Getting married and planning a family is often part of one decision. However, couples that start cohabiting not always enter the union with a plan for a lifelong relationship, or with family plans. Also the plans of both partners may differ considerably. The current study is devoted to the research on fertility intentions and their implications for the dynamics of partnerships and family forms. It targets the effect of fertility plans disagreement and realized fertility among married and cohabiting couples on the duration and timing of transitions out of the current union. Using data from five waves (2008-2013) of panel study PAIRFAM this research offers a unique view of the demographic behavior of couples within the context of ongoing family change in former East end West Germany. We employ discrete-time event-history analysis. Based on the dataset modified into couple-months, the model is equivalent to logistic regression with the union dissolution as dependent variable. Several models are estimated to assess the effects of socio-demographic and economic factors, and relationship satisfaction and commitment. The results suggest that contrary to marriages, cohabitations are highly prone to dissolution after unplanned children are born, and many of these children will grow up in families where father is missing.
The relationships between fertility behaviours and residential context in two age groups in Switzerland: a sequence-based approach
Jacques-Antoine GAUTHIER (University of Lausanne, Switzerland) | jacques-antoine.gauthier@unil.ch
Gil VIRY (University of Edinburgh) | gil.viry@ed.ac.uk

This paper examines how fertility behaviours and residential contexts interact over individual lives in Switzerland. Specific differences between people born in the fifties and seventies are investigated. Existing evidence from European countries tends to show that fertility levels are significantly higher in suburban and periurban areas compared with urban areas. The concentration of jobs in metropolitan areas, the tight housing market in metropolitan centres and the high-quality transport infrastructure in Switzerland may contribute to higher suburban and periurban fertility among younger cohorts. In particular, higher rents in large cities may encourage young parents to live in suburbs. However, human geographers highlight that lifestyles are less clearly embedded in the morphology and functions of territories than a few decades ago. This spatial disembeddedness may lead to more blurred patterns between fertility behaviours and residential contexts. These conflicting hypotheses are tested based on data from the national survey “Family tiMes” on two generations of individuals living in Switzerland. We use sequence analysis techniques to examine the relationship between fertility and residential context histories. Results show that the specific ways in which transitions to parenthood occur and fertility careers unfold vary not only from one cohort to another, but also according to factors associated with the residential context, as well as social positioning. Findings are discussed in the light of recent changes affecting residential choices in Switzerland.

Marital Status of Young Parents in Europe: Examining the effects of socioeconomic status, insecurity and societal acceptance.
Alexander MACK (GESIS, Germany) | alexander.mack@gesis.org

This research examines the marital status of parents of young children and aims to understand the decision to have a child within or outside of marriage and how the decision making process is shaped by social inequality and differences between European countries. Three key hypotheses are tested: the specialization hypothesis, which is derived from new home economics (Becker), assumes that marital births are more likely for couples with unequal socioeconomic resources. Due to selection effects this association should be more pronounced in contexts where women are better integrated into the labour market. The status attainment hypothesis, derived from the gains to marriage school of thought (Cherlin), assumes that the likelihood of a marital birth should increase with the socioeconomic resources of the household. This effect should be more pronounced in contexts where there exists a larger acceptance of births outside of marriage. The insecurity hypothesis (Oppenheimer) proposes, that the likelihood of a marital birth decreases the more insecure the labour market situation, particularly of the father. This hypothesis is tested at the individual and country level. The research is designed as a large scale country comparison and includes 27 European countries and pools data from the 2004-2010 EU-SILC cross sections. Multilevel models additionally consider a number of economic and attitudinal indicators at the country level. Results support the specialization hypothesis. The status attainment hypothesis can also be partially confirmed, while evidence for the insecurity hypothesis is less conclusive. Furthermore
results indicate confounding of economic, institutional and attitudinal factors at the country level as modernization theory would predict.

**The stability of early partnerships: What is the influence of labor market insecurity on union separation for younger cohorts in Germany?**

Cordula ZABEL (Institute for Employment Research (IAB), Germany) | cordula.zabel@iab.de  
Valerie HEINTZ-MARTIN (German Youth Institute, Munich, Germany) | ValerieMartin@gmx.de

In early labor market careers, young people often work in non-standard and insecure types of jobs. We are interested to see how these types of employment insecurities impact partnership stability. Our focus is on non-cohabiting partnerships. While early partnerships often are non-cohabiting partnerships, little is known about factors influencing the stability of these partnerships as well as their transformations into cohabiting unions. We make use of the opportunity to incorporate information on such non-cohabiting partnerships offered by PAIRFAM, a recent German panel and retrospective survey focusing on relationship dynamics for three young cohorts.

From a theoretical perspective, we build on Fischer and Liefbroer's (2006) considerations regarding the relative cost vs. relational stress arguments as to how economic insecurities may affect partnership dissolution. On the one hand, economic insecurities can cause greater stress for partnerships and thus lead to higher partnership dissolution rates. On the other hand, economic difficulties may prevent people from separating for financial reasons.

We analyze the impact of labor market status and type of employment on partnership transitions, applying event-history analysis. Non-cohabiting unions are compared to cohabitations and marriages. We treat union exits and union transformations as competing risks.

Our findings are that men’s employment insecurities lead to higher disruption rates of non-cohabiting unions as well as marriages. For women, on the other hand, we find that non-cohabiting unions in eastern Germany and marriages in western Germany are more stable for the atypically employed.

**Labour market entry and marriage timing – A longitudinal study on the effect women’s labour market entry on the timing of their first marriage**

Nora SKOPEK (GESIS, Germany) | nora.skopek@gesis.org

It is widely known that men’s entry into the labour market is an important event for the timing of first marriage. The related role of the female labour force entry and its potential change in the course of educational expansion going along with females increasing economic independency have so far been largely unexplored. This study finds evidence that nowadays women’s labour market entry has a particular effect on a couple’s timing of first marriage in Germany controlling for men’s entry into the labour market. In light of the still existing differences in marriage and employment behaviour of women socialised in the Federal Republic of Germany (FRG) and in the German Democratic Republic (GDR), I separately analyse East and West German women. For my analyses, I make use of the data from the National Educational Panel Study (NEPS). Applying piecewise constant exponential modelling I can show that the entry into the labour market leads to an acceleration of the timing of first marriage for both men and women. For women, the effect of the entry into the labour market on the timing of first marriage increases over cohorts. As expected, there exist significant differences between women originating from East and West Germany. This reflects the huge importance of different socio-cultural norms, attitudes and orientations in the two former German states, which seem to have an impact even 25 years after reunification.
RN13S06a - Parenting: Mothers, Fathers and Others I

Parenting in Italy: Exploring compliance and resistance to the expert-led parenting model during the transition to parenthood
Rosy MUSUMECI (Università di Torino, Italia) | rosy.musumeci@unito.it
Manuela NALDINI (Università di Torino, Italia) | manuela.naldini@unito.it

This work explores an area of research that has been investigated very little by contemporary sociology of family that pertains to the role of the scientific knowledge and professional expertise in shaping notions and standards of “good”, “adequate” parenthood and parenting to which mothers and fathers are required to conform and perform to some extent, and to which they comply or, on the contrary, resist (Faircloth, 2010; Favretto and Zaltron, 2013). Experts and professionals (midwifes, gynaecologists, paediatricians, infant developmental psychologists, and so on) whom women and men enter in relation with during this phase of their life course, are not only relevant actors in the process of social construction of the welfare services users as claimed by international literature (Rosenthal and Peccei, 2006) since – is demonstrated – they influence in different ways the delivery of these services and the pursuit of the policy goals defined at institutional level (Lipsky, 1980; Prior and Barnes, 2011; Dubois, 2010; Bjerregaard, 2011). They are also relevant others in the process of social construction of parental roles. We will explore ideas and believes of parents-to-be and first-time parents on parenting roles by analysing (by means of the software Atlas.ti7) 84 longitudinal interviews conducted between 2010 and 2014 with Italian middle-class dual-earner couples during the transition to parenthood, before and one and half year after their first child’s birth. In addition, we will explore, through interviews with public health experts who prepare mothers and fathers to assume parental roles, the experts’ discourses on parenting.

Parents’ perceptions of parenting practices and alcohol-specific socialization of their teenagers
Henna PIRSKANEN (National Institute for Health and Welfare, Finland) | henna.pirskanen@thl.fi
Marja HOLMILA (National Institute for Health and Welfare, Finland) | marja.holmila@thl.fi
Kati KATAJA (National Institute for Health and Welfare, Finland) | kat

In the presentation, we explore how familism and democratization of the family find expressions in parents’ parenting practices and in their attitudes and rules concerning their youngsters’ alcohol use. In particular, parents’ alcohol-specific socialization of their teenagers is examined. The study is part of a wider “Growing up in the Finnish Alcohol Culture” -project. The research questions are 1) How do parents describe their parenting practices and how does alcohol-specific socialization relate to these wider practices? 2) Do different rules apply to alcohol-specific socialization compared to parenting practices in general, and if so, why? The data consist of individual, pair and group interviews of parents of teenagers. Both parents with no alcohol or substance abuse problems (N=42) and parents who were diagnosed with these problems (N=32), were interviewed. The purpose was to collect data which represent a wide variety of parents with different drinking habits. The qualitative data were analyzed using thematic analysis and content analysis. The results indicate that parent-child interactions in families are negotiable and democratic. Emotion work, affection and caring play a significant role in parents’ perceptions of their parenting. Also discussions with their teenagers on alcohol are characterized by negotiation.
However, in relation to their youngsters’ alcohol use and intoxication, parents follow a different logic as their attitudes demonstrate considerable strictness. Parents reflect back to their own youth and experimentations with alcohol. In the presentation, these findings are discussed.

**Children’s activities and child rearing beliefs from a social class perspective**

Daniel Johannes SJÖDIN (Orebro University, Sweden) | daniel.sjodin@oru.se
Christine ROMAN (Orebro University, Sweden) | christine.roman@oru.se
Jan-Magnus ENELO (Orebro University, Sweden) | jan-magnus.enelo@oru.se

What is parents' view on the importance of activities for their children? Why are activities seen or not seen as important, and what are the parents’ own arguments for choosing or not choosing specific activities for their children? This paper analyses these questions from a social class perspective. International research has found class differences, where middle class parents underline the importance of activities to enhance the children's development and individuality while working class parents articulate a belief in children's natural growth and, thus, focuses on love, food and safety as essential components of childrearing. For the middle class parents childrearing is more of a project, in which child activities is a central part. For middle class parents children's activities has been found to increase the work load and stress and often shape the structure of day. This paper analyses to what extent these international results applies to Swedish parents. To answer this question an interview study of 60 parents with children in the age of 3 to 6 has been conducted. The analysis of the interviews finds both important class differences, but also similarities across social class that nevertheless contrasts with international research. The study show that Swedish parents, regardless of class, differ from others in their argumentation for the activities, that is, in the good they believe they do. Parents stress that activities help children develop solidarity and community values and make them more tolerant and understanding by being exposed to children from a different backgrounds than their own.

**Constructing 'Caring': Parenting practices, gender and modern family lives in the UK.**

Tina MILLER (Oxford Brookes University, United Kingdom) | tamiller@brookes.ac.uk

This paper will have at its core a focus on caring. Research shows that structural and demographic changes have reconfigured paid work practices, caring trajectories (the 'sandwich generation') and family lives (Ben-Galim and Thompson, 2013; Crompton et al, 2007) and urge a more critical review of the concept and practise of parental caring and work set against a broader context of 'intensified' parenthood. In this paper the taken-for-granted concept of caring will be examined as activity, relationship and emotional labour, drawing on the work of key theorists in the area (Sevenhuijsen, 2000; Hochschild, 1989, 1997; Hearn et al, 2006) and using qualitative longitudinal research data from two UK based studies on family lives. The focus on caring will necessarily be set alongside more recent and nuanced understandings of gender, masculinities and men's capacities to care, which have also changed the parameters of discourses and debates as policy initiatives in the UK (e.g. additional paternal leave) signal new opportunities for how care and work could be organised. However, although policies and changed discourses provide important societal frameworks, they are always suffused with, and reinforce, gendered expectations and behaviours (Miller, 2012). This paper engages critically with these considerations and challenges.

**Parents’ support of children’s education influenced by type of gender**

Michal JEŽEK (Faculty of Social Sciences, Czech Republic) | michal.jezek@klikni.cz
Hana PACÁKOVÁ (Faculty of Social Sciences, Czech Republic) | hpacakova@gmail.com

This abstract focuses on how parents invest into their children based on their gender. The goal of the thesis is to introduce a research perspective that seeks to understand the differences in parents’ attitudes into children's education primarily based on what sex they are. The investment into children is understood as a support of financial, social and emotional type as well as the investment of free time to spend it with children (e.g. activities that parents do with their children in free time, learning with children etc.) The majority of available studies related to this topic come from Asian countries. In eastern countries, compared to western ones, there is generally a higher orientation of parents to focus on sons, either because of a strong traditionalism-type education or because of an economical need to invest into someone who will eventually become a head of a family. On the contrary, studies conducted in USA show that the support of son or daughter is actually based on a region. In the group of siblings, the gender that is in minority is in disadvantage. In general, it is proven that a more support was given to daughters in USA region, which is explained by higher educational demands for a female gender, a result of an unpleasant status of the labour market. Considering the fact that there are huge differences in education system and also stronger role of “social government”, there is not much of studies in European Union region. However, even here, we can identify sources of imbalance in parents’ attitudes towards their children support according to gender. Therefore, this deserves a more in-depth probation and this work might help to analyse the issue.

RN13S06b - Parenting: Mothers, Fathers and Others II

Families in Transition. The influence of a trans parent on the general well-being of the child
Myrte DIERCKX (University of Antwerp, Belgium) | myrte.dierckx@uantwerpen.be
Dimitri MORTELmans (University of Antwerp, Belgium) | Dimitri.Mortelmans@uantwerpen.be
Joz MOTMANS (Ghent University, Belgium) | Joz.Motmans@uzgent.be
Guy T'SJOEN (Ghent University, Belgium) | guy.tsjoen@ugent.be

This paper focuses on teenagers (12-18 years) of whom a parent recently underwent a transition. Sociological research on trans people is scarce and mostly dominated by theoretical considerations on gender or how gender identity and gender transition are constructed socially (Hines, 2006). The social and family environment where a transition takes places is often neglected in research. Especially the presence of children and the issue of parenthood has scarcely been subject to in-depth research. No sociological study yet interviewed minor children with a trans parent. Trans parenthood challenges multiple assumptions about parenting and gender roles and is relatively common among trans people: according to different survey data around 1 out of 3 trans people has children (FRA, 2014; Motmans, Ponnet, & De Cuypere, 2014). It is striking that despite the lack of research on trans parenthood, assumptions on the well-being and identity development of these children are widespread (Weiner & Zinner, 2014). This paper aims to describe the experiences of (minor) children with a trans parent and the influence of the transition of the parent on the well-being and the identity development of the child. We use a quantitative, multi-actor design in our study. During the first half of 2015, in-depth interviews with children, parents, and their significant others will be performed. The multi-actor methodology will provide insights in the children’s experiences. We aim to interview 10 families. With this research that will interview for the first time minor children who experienced recently the transition of their parent, we hope to gain insights in the often neglected experiences and needs
of those children. The outcomes can lead to better support in the future for those children and their families. The first results will be expected in the summer of 2015.

Measuring and modelling the transition to solo parenthood: perspectives from a qualitative study
Laura BERNARDI (Swiss National Centre of Competence in Research LIVES - University of Lausanne, Switzerland) | laura.bernardi@unil.ch
Ornella LARENZA (Swiss National Centre of Competence in Research LIVES - University of Lausanne, Switzerland) | ornella.larenza@unil.ch

Understanding what solo parent experiences are like is a challenging task in an era of multiplication of family forms and related legislations regulating the care and responsibilities of children. Official statistics on lone parent households hardly reflect a composite reality of households between which children circulate and in which co-residence with biological and non-biological parents change during the life course. On the basis of an ongoing explorative qualitative study in Switzerland, we focus on the transition to solo parenthood as reported by 40 individuals perceiving themselves as raising their children as solo parents. We analyze the way in which individuals who became parents in a couple context talk about the onset of their solo parenthood (by separation, divorce, or widowhood). We also analyze the narratives of the transition to solo parenthood by individuals who experienced parenthood alone from the early months of pregnancy (parenthood by contraceptive failure, because of the other parent’s denial of parenthood, fecundation by anonymous donor). We pay attention to the perceived markers of the transition to solo parenthood. We conclude that objective markers are not sufficient to define the experience of raising children alone and that a number of subjective markers are necessary to understand the process underlying the transition. All the more so since the entry into solo parenthood involves an array of dimensions and is often characterized by a considerable amount of ambivalence. Though our findings are preliminary, they have important implications for measuring and understanding solo parenthood and family diversity.

Lone but not alone? Lone mothers’ need of social support networks in order to attain work-family balance.
Jenny Maria ALSARVE (Örebro University, Sweden) | jenny.alsarve@oru.se

In this paper I explore the meaning of social support networks for lone mothers in Sweden. Drawing on 39 in-depth interviews with Swedish lone mothers from different social backgrounds the paper discusses questions like: How does family and friends support lone mothers in their everyday lives? In what ways does access to social support networks facilitate or constrain lone mothers ability to reconcile paid work and caring responsibilities? Inspired by theories on reciprocity the paper also discusses the underlying premises for different kinds of support. The results show the support from kin, family and friends were vital in mediating work-family conflict among the mothers. Not least the mothers own mothers were the most important helpers. In
addition the middle class mothers got more regular help than working class mothers. This is in line with previous research indicating that higher educated people get and receive more support. The findings are striking since family policies in Sweden has aimed at facilitating parent’s combination of work and family not least by offering a low cost and high quality childcare. Working long hours and/or unsocial hours as well as a high workload however meant that informal support was extremely important. For the ones lacking access to social support networks everyday life as a working single mother was very difficult.

Petr FUČÍK (Masaryk University, Czech Republic) | fucik@fss.muni.cz

Most sociological researches as well as popular discourse link the socialization in single parent families with various negative outcomes. Within the theoretical and empirical studies, there are two dominant explanations: causal explanation (also known as stress-adaptation perspective) and selection model (highlighting the spurious correlation between the family structure and negative outcomes). Our perspective adds the institutionalization aspect, which seems to add explanation power in the specific context: we decided to explore, whether the nature of this relationship can be different in a society characterized by rapid rise of non-marital fertility and high divorce rate. The situation of progressive de-institutionalization of marriage and splitting of institutional unity of marriage and parenthood presents a specific environment: The normative forces and strains connected with the situation of single parent families can diminish rapidly and decrease the costs for the non-institutionalized forms of the social action. Using the dataset from Czech version of EU-SILC panel survey, we test the hypotheses concerning the differences between adult offspring socialized in single parent or intact families. The impact of family structure was researched in three dimensions: the educational level of the offspring, their current partner situation and current income level of their households. The aim is to indicate the effects of family structure on the level of cultural capital, intimacy and labour market. The results of regression models suggest that the differences between people socialized in single parent family compared to intact families are very small in case of education, rather weak in the dimension of current partner situation and completely absent in case of household income. These results challenge the causal explanations and make the selection model of the family structure effects doubtful, thus the space is open for deepening the interpretation through de-institutionalization mechanisms.

The mediating effect of family functioning on the relationship between parenting styles and social functioning among Finnish adolescents

Sirpa Maarit KANNASOJA (University of Jyväskyla, Finland) | sirpa.kannasoja@jyu.fi

This study examines the effects between family functioning and parenting styles on social functioning in a sample of 359 adolescents aged 13–16 years from three elementary schools in a small Finnish city in Central Finland in spring 2009. Equally male (49.5%) and female (50.5%) adolescents participated in the research. The used research setting was the Process-Person-Context-Time model, which is based on Urie Bronfenbrenner’s bioecological system theory. An exploratory factor analysis was used to clarify the structure of parenting styles, family functioning and social functioning. The linear regression was used for discovering the explanatory model of social functioning. The bootstrapping, a non-parametric resampling procedure, was used to test and to confirm the
indirect effects: Is family functioning a mediator between parenting styles and social functioning?
Family background, e.g. family structure, parents' education and job situation, was not associated with social functioning, whereas parenting styles and family functioning were strongly associated with social functioning. An important result of the multiple mediation analysis was that the well-functioning of families is a significant precondition for the positive development of social functioning among adolescents. The results were slightly different for boys and girls. In addition, gender differences were found in which individual characteristics explained the social functioning, and how. As a conclusion the study showed the importance of the context where adolescents live and of supporting families to better functioning for improved social functioning among adolescents.

RN13S06c - Parenting: Mothers, Fathers and Others III

Educational Fields and Fertility in Western Germany – An Analysis of Women born 1955-59 with the Mikrozensus 2008
Anja OPPERMANN (iFQ - Institute for Research Information and Quality Assurance, Germany) | oppermann@forschungsinfo.de

In recent years, research on education and fertility has been enriched by studies that take the educational field into account in addition the educational level. The aim of the present paper is to add Western Germany, a country with outstandingly high levels of childlessness, to the list of countries on which comparable research has been carried out. Using data from the German Mikrozensus 2008 the association between educational attainment, childlessness, and ultimate fertility among Western German women born between 1955 and 1959 is examined.

The overall finding of the present analysis is that, despite the strong impact of the level of education, there is also a relationship between the educational field and childlessness in Western Germany. Consistent with previous findings from other countries, women educated in teaching and health-care are the group with the lowest rates of childlessness at each educational level, while those educated in administration, economics or social science are the groups with the highest levels of childlessness. Educational field and level account equally for variation in ultimate fertility. In further analysis the differences between Eastern and Western Germany with regard to childlessness is confirmed. At the same time similarities are observed in comparison with other European countries.

Becoming a parent: from individualization to family formation.
Lidia Patricia TOME (CIDEHUS.UE, Portugal) | lidiatome@uevora.pt
Maria Filomena MENDES (CIDEHUS.UE, Portugal) | mmendes@uevora.pt

The individualization theory had as main characteristic the emancipation of individuals from traditional social forms result from the industrial society. Links between early experiences in the family and transition behaviours are today well established. Societies continuously change and evolve over time, and with them the individual's attitudes, norms and values orientations. Over the past years and across several cohorts, the links between educational level and occupational status have been weakened, the labour market and expertise has decreased substantially, at the same time family has reached new levels of instability, and cultural representations of love and work emphasize flexibility, choice and impermanence.
Individualization is a process of modernization in which individuals’ behaviour is no longer conditioned by variables given by birth (sex, family, origin, age, etc.) and in which variables that correspond to personal choice (personal effort, education, etc.) start to have more predictive capability. While some countries, such the Scandinavian ones, are well ahead in embracing individualization attitudes, other such as the Mediterranean ones, appear to be having a hard time in leaving them behind.

The objective of this study is to investigate and explain the transitions to individualized societies using for that the segmented regression method. We aim to identify when and how such transition happened. And also will use the recent results from Portuguese Family and Fertility Survey (2013) to describe how individualization is influencing the parenthood transition.

Childlessness in later ages in Portugal and in the Southern European Countries
Andreia Barroso Figueiredo MACIEL (Évora University/ CIDEHUS/FCT, Portugal) | delabarroso@hotmail.com
Rita Brazão FREITAS (Évora University/ CIDEHUS, Portugal) | ritabf8@gmail.com
Maria Filomena MENDES (Évora University/ CIDEHUS, Portugal) | mmendes@uevora.pt
Paulo INFANTE (Évora University/ CIMA, Portugal) | pinfante@uevora.pt

It is argued that parenthood is no longer a basic condition for achieving self-realization and that the choice of a life without children (childfree) has become an increasingly common choice and free of stereotypes, transforming the desired and ideal family size in one of the most important determinants of future fertility. It is also important to recognize the importance of education level and employment status in the choice of a childfree life.

Whereas the current fertility decline is, in large part, the result of the postponement of parenthood (a phenomenon that has been growing over the last decades), we look at those individuals who have reached 30 or more years old without children and try to define the profile of those who are more likely to remain childlessness. In order to examine and quantify the effect of the characteristics that makes the residents in the Southern European countries remain childlessness, we adjusted two logistic regression models, using data from the 2011 Eurobarometer data and the Fertility Survey in Portugal, 2013. To adjust these models, we considered the response variable defined as: 0- Temporary childlessness; 1- Definitive childlessness.

We conclude that the increase in age, the lack of a suitable partner and a low ideal family size are the most important determinants in the decision to remain childlessness. Additionally, we find that those who live in large cities are also more likely to not experience parenthood. Because individuals with lower levels of education tend to make earlier transition to parenthood, when they reach the age of 30 without children they become more likely to remain childless. At the country level, the Greeks show lower possibilities of remain childlessness relatively to the Portuguese, Spanish and Italians. In Portugal, those who think that parenthood is not a basic condition for achieving self-realization and men that don't have a full time job are also more likely to remain childlessness.

Transitions to first parenthood in Spain during a changing socioeconomic context from 1999 to 2013
Elena VIDAL-COSO (University of Geneva, Switzerland) | Elena.Vidal@unige.ch
Pau MIRET-GAMUNDI (Centre for Demographic Studies, Spain) | pau.miret@uab.cat

This paper analyses the transition to first parenthood in Spain from 1999 to 2013. It explores, particularly, the timing and the intensity of first child dynamics in the country, as well as the influence of the changing socio-economic context. The convergence of the postponed
parenthood of the baby-boom generations, those born in the 1960s and early 1970s, with the early entrance to parenthood of younger generations, and with the contribution of immigration on childbearing patterns, explains the shiny fertility recovery during the years of the economic recovery. Using the panel version of the Spanish Labour Force Survey, a first child’s birth is identified from one wave to the following: from not having any baby aged 0 to having 1 or more. Transitions to motherhood and fatherhood will be longitudinally analysed considering the parents’ age, country of birth, educational attainment, labour status, and year of observation of the event. The hypothesis is that the economic crisis, the educational level, and the labour status, are factors influencing differently on childbearing, depending on the age of the transition to parenthood. Higher probability to motherhood for less educated women and inactive women are only expected for younger mothers, whereas higher educational level and strong labour attachment is related to a delayed motherhood. Moreover, the adverse economic context only lowered the probability of having the first child at young ages. Finally, a gendered pattern is also expected, with an inverse relation between the timing of fatherhood and the educational attainment and labour market status than this for mothers.

Pathways to external care: the role of family resources
Francesco GIUDICI (Ufficio di Statistica del Canton Ticino, Switzerland) | francesco.giudici2@gmail.com
Loredana ADDIMANDO (Scuola universitaria professionale della Svizzera italiana Dipartimento formazione e apprendimento, Switzerland) | loredana.addimando@supsi.ch

In Switzerland, the transition that children experience from the family to the external care takes place at different ages. External care can be formal (i.e. childcare) or informal (i.e. grandparents) and the frequency and length of the care can also vary. Some children stay only with their parents up to 4 years old until he or she will enter the public childcare, while some others enter the nursery school (childcare for children from 0 to 3 years old) during the first months of their lives, and some others spend half of full days with their grandparents. The transition from the family to the external care is thus qualitatively different from child to child. In our paper we want to analyze the age at which children first experience the external care, as well as the type and frequency of care, in relation with parent’s social, cultural and economical resources.

The data that we will use come from a study that took place in the Italian speaking part of Switzerland (Ticino). The questionnaire was commissioned by the Department of the Social and Health Services of the Canton Ticino and was sent to all the families in the region with at least once child under 4 years old; the sample is composed by more than 5000 families who completed the questionnaire. Our analyses aim to elaborate a typology of educational strategies that parents adopt for the care of their children, with the age at the first transition, the type, and the frequency of the external care. In a second step, we will study the association between types of educational strategy and parents’ resources, such as job characteristics, occupational rates, educational level, household income, etc.

RN13S06d - Parenting: Mothers, Fathers and Others IV

Unnatural Deaths: Infant Mortality as Social Crisis in Western Canada after the Great War
Amy Kathleen KALER (University of Alberta, Canada) | akaler@ualberta.ca
In the years following the "Great War" of 1914-1918, white settler communities on the frontier of western Canada grappled with the spectre of high infant mortality rates. In defining infant mortality as an urgent social and political problem, political and social elites drew on discourses of economic wastage and the fear of military weakness. Western Canadian families were identified as the sites of national survival or its opposite, national decay. Drawing on archival sources from the province of Alberta between 1905 and 1939, I focus on the interwar years, I engage with the politicization of vital statistics and of the events which the statistics record, the deaths of infants. I demonstrate how these intimate processes of childbearing and family formation were interpreted as matters of national survival in the unsettled and turbulent interwar years.

**Conceptualising Breastfeeding: Responsibility and Shame**

Lisa SMYTH (Queen's University Belfast, United Kingdom) | L.Smyth@qub.ac.uk

Why does breastfeeding generate intense emotional responses, both from mothers and wider publics? This paper argues that breastfeeding has been placed at the centre of struggles to secure recognition for the quality of gendered role performance in the early stages of motherhood. Public health campaigns tend to rely on moral norms which equate good mothering with the maximization of infant health through breastfeeding. However, the practice is framed by gender inequalities, as it is caught up in more general forms of recognition, not least for the competence of one’s embodied self-presentation. The tension this generates is experienced by new mothers through relations with healthcare professionals, family and friends, as well as other mothers. This paper argues that experiences of inequality and normative tensions around infant feeding can provoke guilt and shame in new mothers, as women struggle to demonstrate their competence as mothers in a complex and contested normative environment.

**Potential circumstances and emotional repercussions of abortion**

Kristin HAJEK (Ludwig-Maximilians-University Munich, Germany) | Kristin.Hajek@soziologie.uni-muenchen.de

Abortion is an important topic for family research, but there is still plenty of room for further research. There have only been few studies investigating the circumstances under which women have an abortion and how abortion influences their well-being. The German Family Panel (pairfam) is a multidisciplinary survey focusing on partnership and family dynamics. In addition to the panel approach, it follows a multi-cohort and multi-actor approach. This means that so-called anchor persons from birth cohorts 1991-93, 1981-83 and 1971-73 are surveyed annually. Furthermore, the anchors’ partners, parents and children are interviewed as well. Using data from waves 1-6 of the German Family Panel (pairfam) I will analyze if partnership status, employment situation, health problems and further important contextual factors have an influence on the decision to have an abortion. Furthermore, it is alleged that women suffer emotionally from having an abortion. By using fixed effects panel regression models I can shed light on the question if life satisfaction decreases after an abortion or if women abort because they are not satisfied with their life.

**RN13S07a - Changes and Continuities in Fatherhood and Fathering Practices I: Work and Family Balance**
The Flexibility Stigma and Active Fatherhood in Germany
Johanna POSSINGER (German Youth Institute, Germany) | possinger@dji.de

More and more fathers have the desire to extend their traditional role as family breadwinner and become actively involved in the upbringing of their children. Attitudes towards fatherhood are changing – a change that is reflected in the increasing number of German fathers who take parental leave (nearly 30%). Nevertheless, in many families the division of paid labour and unpaid care often remains traditional. Even in welfare states like Germany that set incentives for fathers’ caregiving through policies such as the “daddy months”, the workplace continues to be a major obstacle to active fatherhood. Based on the hypothesis of the “flexibility stigma” (Coltrane et al. 2013; Williams et al. 2013) the paper aims at taking a closer look at informal practices within companies that stigmatize the use of the “daddy months”. Therefore, a qualitative study with 23 biographic interviews was conducted with fathers in Germany. All interviewees worked at the same energy company. The company had been given an award for its family-friendliness. However, the company demanded a lot of “face time”, total availability and overtime hours that undermined the family-friendly working time arrangements. Additionally, a concept of traditional masculinity dominated the firm expecting fathers to comply with a male work-devotion schema. Climbing the career ladder was considered masculine, while taking time for children was associated with femininity and a lack of ambition to succeed. Thus, the fathers found themselves in a serious work-family conflict.

Combining work and family in contemporary Sweden. Views of highly educated young men.
Livia OLAH (Stockholms University, Sweden) | livia.olah@sociology.su.se
Merete HELLUM (Gothenburg University; Sweden) | merete.hellum@gu.se

Until now, research on the interconnection of work and family has predominantly focused on women. In this paper, we seek to reduce the knowledge gap and “bring men back in” to the work-family debate. More specifically, we aim to deepen our understanding of the relationship between work and family life by analyzing the expectations and experiences of highly educated young men on combining work and family in contemporary Sweden. Our research is part of a larger international project on gender equity and low fertility in postindustrial societies. The theoretical framework is designed to capture the ways in which family- and gender-role norms, institutions and economic context intertwine with work and family formation intentions and behaviors of young adults. In our analysis, we rely on mixed-methods approach. We combine quantitative data about work and family issues with a qualitative analysis of in-depth interviews (N=40), carried out with men aged 24-35 years, with postsecondary education, in two metropolitan areas in Sweden in 2012. The interviews were roughly divided between single individuals, married/cohabiting without children and married/cohabiting with one child. In this paper we explore our interviewees’ reasoning about and experiences of working conditions, division of household work as well as perceived tensions on the work-family relationship. For parents, we even look at the division of childcare. Our preliminary findings show that young Swedish men generally position themselves as pro gender equality, emphasizing the importance of men and women engaging in gainful employment and equally sharing family responsibilities. A deeper analysis of their reasoning and experiences, however, enabled us to identify three main patterns in the interview material. First, men who express views that family is more important than work. Second, men who view their working conditions, such as specific career demands, long working hours, commuting time and employers’ attitudes on combining work and family, as an obstacle for family life, including the transition to parenthood or having a
second child. Third, men who express ambivalence when it comes to combining work and family. Also, we assess the similarities and differences regarding the ways in which highly educated young men in Sweden perceive, negotiate and modify work and family relationships. We conclude the paper with a discussion on the implications of our results for work and family research and policy development.

Innovative fatherhood in masculine professions: Spanish Rural Police using a leave alone in Spain

Gerardo MEIL (Universidad Autónoma de Madrid, Spain) | gerardo.meil@uam.es
Pedro ROMERO-BALSAS (Universidad Autónoma de Madrid, Spain) | pedro.romero@uam.es
Jesús ROGERO-GARCÍA (Universidad Autónoma de Madrid, Spain) | jesus.rogero@uam.es

Parental leaves policies have increasingly aimed fathers to use leave to childcare in several European countries. Among other elements, the design of leave schemes is a way to promote fathers to get more involved in reproductive activities. In this study we have researched Spanish rural police since this profession is mainly developed by men and it is linked to macho stereotypes. We have dug into fathers’ discourse about their experience, motivations, reactions and consequences of taking a leave alone. This paper is framed in a wider project about fathers on leave alone funded by the Spanish Ministry of Economy and Competitiveness (CSO2013-44097-R). We have performed fifteen in-depth interviews to fathers who work as rural police which have been on leave at least during a month while their partners were on a paid work. Sample method has been snow ball sampling and, the fieldwork has been carried out in 2014. We have analyzed the interviews using codes and families with the software Atlas.ti. Our preliminary findings show rural police fathers did not considered taking a leave alone as a form to change roles but as a tool to balance the familiar strategy. When advantages are perceived in taking a leave alone, the traditional father role is not a key to decide.

Juggling career and parenthood: Latest empirical data from German fathers

Claudia ZERLE-ELSÄßER (German Youth Institute, Munich, Germany) | zerle@dji.de
Xuan LI (German Youth Institute, Munich, Germany) | li@dji.de

The arrival of the first child often leads to a re-traditionalisation of gender roles: the mothers step back from their career, at least temporarily, to devote to childcare, while the fathers focus on breadwinning. Despite the long-standing discussions on “new, ‘active’ fathers” and the introduction of parental leave benefits in Germany since 2007, which seems to indicate changes in gendered parental roles, mothers still suspend their career for a longer time, and tend to take on part-time employment when they return to work, whereas fathers take shorter breaks, if at all, and tend to return to work full-time. Most of the fathers must perform “active fatherhood” while maintaining full-time employment. How should we define “active fatherhood” in this context? The present study is based on the AID:A II dataset, a large survey conducted by the German Youth Institute, Munich. Featuring a “Doing Family” section and a multi-actor design (with both father and mother responses), this survey was conducted with 3023 fathers and mothers with a child under 9 years of age, and could help further refine the definition of active fatherhood and identify important predictors of father involvement.

Preliminary findings suggest that the father’s engagement in childcare is closely related to parental employment constellations, and in particular, to parents’ actual working hours: fathers who work overtime are much less likely to be actively involved. The results will also shed light on fathers’ ideal working time, work-to-family and family-to-work conflicts as well as fathers’ satisfaction with their own engagement with children.
Transitions into Teenage Fatherhood: Changing identities, practices and choices
Bren NEALE (University of Leeds, United Kingdom) | b.neale@leeds.ac.uk

The entry of young people into early parenthood is an issue for social policy and professional practice in the UK and internationally. The UK has one of the highest rates of teen pregnancy in Europe, concentrated in the most socially disadvantaged areas of the country. Young fathers have been neglected in research and in professional practice, and are still regarded in popular discourse as feckless, disinterested in their children, or, at worst, as a potential risk to their children.

This paper presented findings from an ESRC funded Qualitative longitudinal study that charts transitions into early fatherhood for a varied sample of young men from a northern industrial city in the UK. It explores what it means to enter into fatherhood at an early age, the extent to which this is planned or anticipated, 'serial' fatherhood with one or more young mothers, and how young men reconcile their youthful identities with their emerging adult status. The study revealed variations in the extent to which young fathers are supported to engage with their children, with implications for policy and professional practice.

Following Young Fathers: Shared Parenting and the ‘Package Deal’
Carmen LAU CLAYTON (University of Leeds, United Kingdom) | c.lau@leeds.ac.uk

Our understanding of young fatherhood is limited. Teenage parenthood research typically focuses on the accounts of adolescent mothers’ and their perspective of young fathering. Available literature on young fatherhood primarily stems from America and is heavily quantitatively based, but this is slowly changing. The voices of young fathers’ are becoming increasingly central within a range of research, including the ESRC funded Following Young Fathers Study (2012-15), which intensively tracks the lives of 35 young fathers, defined as under the age of 25, from different socio-economic backgrounds and age groups, through qualitative longitudinal methods.

Within political and popular discourses, teenage parenthood is regarded as a social problem. Young fathers are often considered as being absent, violent, criminal, and socially excluded. Furthermore, young fathers are seen as irresponsible sexual youths who are feckless-uncommitted to the mother and child. The feckless father notion is further exacerbated when young men form new relationships and have further children.

Much of the current literature focuses on maternal gate-keeping attitudes and little is known about the complex and nuanced nature of young fathers’ relationships with the mother of the child. Drawing on new empirical evidence, this presentation discusses the way in which personal relationships with the mother of the child are framed by young men. The fluidity of such relationships; the level of commitment, negotiation and difficulties between the parental dyad; and their day to day practices, whether romantically involved or separated, provide a new understanding of the so called ‘package deal’ – described as the contingent nature of the father-child bond upon the father-mother relationship. The reflections by young fathers demonstrate a myriad of factors that can encourage or impede upon the paternal role, fatherhood engagement levels and fathering identity, when interacting with the child’s mother.

Such findings will be valuable for service practitioners who work with young families, particularly if there are difficulties present between the mother and father. A focus upon healthier relationships and effective strategies for shared parenting, regardless of parents’ relationship
status, could help encourage long term paternal involvement, and material or other forms of support for the mother and child also.

**Transition to Fatherhood: Plans versus Reality; the Czech Case.**

Olga NESPOROVA (Research Institute for Labour and Social Affairs, Czech Republic) | olga.nesporova@vupsv.cz

The paper focuses on differences between the plans of first-time fathers and the subsequent reality. By means of the constructivist approach, stemming from the work of Berger and Luckmann, and involving the conducting of qualitative longitudinal sociological research between 2011 and 2014 as part of the international TransPARENT research project, the paper attempts to identify the notions and experiences of Czech fathers concerning the first 18 months of fatherhood. Two waves of semi-structured interviews were conducted with 16 Czech heterosexual working parental couples; each partner was interviewed separately. The first interview took place when the woman was pregnant and the second once the child reached the age of 18 months. Sixty-four interviews were conducted and analysed. Fathers’ parental expectations and plans were markedly vague - all of them planned to continue to work full time; however, they varied significantly in terms of plans concerning increasing or decreasing their working hours in order either to earn more money for the family or devote more time to childcare respectively. Perceptions of the principal life changes brought about by fatherhood were then analysed and compared with the men’s original expectations. The results revealed that the father-breadwinner role remains strong. Interestingly, however, it is not exceptional for the father to be actively involved in childcare and housework; nevertheless, this appears to be linked more with notions of the “involved father” and the practical problems of parenting than the employment preferences of the mother.

**Changing Modes of Father Practices at the Transition to Parenthood**

Irene RIEDER (University of Vienna, Austria) | irene.rieder@univie.ac.at
Eva-Maria SCHMIDT (University of Vienna, Austria) | eva-maria.schmidt@univie.ac.at
Ulrike ZARTLER (University of Vienna, Austria) | ulrike.zartler@univie.ac.at
Rudolf RICHTER (University of Vienna, Austria) | rudolf.richter@univie.ac.at

Although research revealed an increase in fathers’ involvement in childcare, the transition to parenthood still comes along with a gendered division of labour. In order to understand this ambivalence, we aim to define and understand fathers’ involvement at the transition to parenthood.

Relying on qualitative longitudinal data (pre- and postnatal interviews with first-time parents in Austria, 44 in total), reflections on practice theory and the life course perspective as well as existing research, we developed a theoretical concept of paternal involvement at the transition to parenthood. This concept captures nine ideal-typical modes of father practices, i.e. ways of involvement, – helping, conducting, managing, shared deciding, exclusive caring, key caring, main caring, providing, and equal caring – and a variety of turning points, which cause changes in the modes of father practices. Turning points, for example the entry into maternity protection, represent particular points in time within the transition process where specific gender differentiations or more gender equality may be induced.

Our results extend previous research on paternal involvement by revealing that a father’s transition to parenthood is characterised by various evolving modes of father practices and several turning points that change his way of involvement. Existing theoretical conceptualisations are expanded and enhanced by providing a concept that (1) captures pre-
and postnatal involvement; (2) adopts a processual perspective by including change in terms of turning points; and (3) incorporates maternal involvement as a reciprocal part of paternal involvement, thus being appropriate for examining the gendered division of care work.

RN13S07c - Changes and Continuities in Fatherhood and Fathering Practices III: Cultural Aspects

Responsible fatherhood by Finnish fathers: A narrative approach
Petteri EEROLA (University of Jyväskylä, Finland) | petteri.eerola@jyu.fi

Over the last three decades in Finland, as elsewhere in the other Nordic countries, men’s share in child care has broadened notably. At the same, the cultural expectations of fathers and understanding of men as parents have also changed and become more care and nurture-oriented. This presentation draws on the results of my recent doctoral thesis (Eerola 2015) in which I analyze in what terms responsible fatherhood is conceptualized, and what gendering of responsibility men’s narratives reveal. In total, the empirical data comprises 60 interviews conducted with 44 fathers during the first three years of their fatherhood.

In the men’s narratives, the comprehensive engagement of fathers in caregiving from the very beginning of parenthood was highlighted as a major feature of responsible fatherhood. That is, nurture and hands-on care by fathers were seen as self-evident and performed on the father’s initiative. In many ways, differences between fathering and mothering were not emphasized, as the narratives were close to or parallel with the cultural portrayals of “good” motherhood. Also, traditional paternal responsibilities such as breadwinning were narrated as shared parental duties in principle, though the fathers’ accounts highlighted how these ideals were not always realized in everyday life. However, it seems that fathers have moved closer towards the intimate and emotional core of the family, and fatherhood has become a life domain in which men are allowed and actually required to show their emotions and act in many ways that run counter to what has traditionally been understood as masculine.

The identity of the father's role in the situation of having a child with autism.
Ewa Anna KACZMAREK (University of Lower Silesia, Poland) | ewa.a.kaczmarek@gmail.com

Fathers of children with autism are a underrepresented group in the world of scientific research. In Polish sociological discourse they are completely invisible. I conducted a qualitative research using method of less structured in-depth interviews. The narratives were interpreted by using the theory of social roles by Ralph H. Turner and relations in public by Erving Goffman. The aim is to show the concept of father's role identity - how fathers define their fatherhood and in what knowledge about fatherhood they were equipped. The study shows the dilemma between the expectations resulting from socialization to the men's roles in Polish cultural sphere and the received new reality. Having a child with autism is a specific social situation. This specificity consists of disappointed expectations towards the child and the confrontation with the expectations of the social role that is impossible to fulfill. There also appears a lack of a sense of competence in the "new" role of the father. Men are aware that fatherhood they experience differs from the role scheme they knew before becoming a father. They apply the mechanisms to restore the family picture they know: they escape into work and focus on the securing the family welfare and future. Fathers experience loneliness as a result of the lack of support within the family. They believe that the male roles are deprived of the possibility to confess their
problems. The loneliness also follows from the lack of external support and the loss of social bonds.

**Clues of Social Polarization: Middle Class Fatherhood Experiences in Secular and Conservative Groups in Turkey**

Fatma Umut BESPINAR (Department of Sociology, Middle East Technical University, Turkey) | bespinar@metu.edu.tr
Zeynep L. BESPINAR (Department of Sociology, Marmara University, Turkey) | zeynep.bespinar@marmara.edu.tr

Our study is a comparison of secular and conservative segments of middle class fatherhood in Turkey to understand their fatherhood experiences and transmission of values to the following generation. This is significant within a socio-political context where the gap between radical religious versus secular lifestyles, ideational and practical organizations of individual and social life are widening. We aim to examine the rising tensions between secular and conservative groups in the Turkish society by focusing on their “distinctive” family life styles and perceptions about the “other’s” values and practices of fatherhood. In this sense, Turkish case represents a good example with the rise of pro-religious conservative political parties since the 1990's, which are promoting “appropriate” social and everyday life practices whereas the secular groups are “defending” their ways of life. These two social fragments of the Turkish society both experience commonalities of middle class lifestyles but also diverse perceptions, values, gender roles, family and class dynamics. Based on a fieldwork conducted in Istanbul and Ankara with 40 fathers, we examine and discuss the changes and continuities in the secular and conservative middle class professional men’s fatherhood experiences by considering both the transformation of social norms/values of middle classes around cosmopolitanism and globalism, and at the same time the search for authentic local cultural sources. This study provides significant clues in understanding the values children from each subgroup receive, while it also is aimed at comprehending the risks of social polarization based on the perception of “difference” from the “other” group.

**Fathering in Russia: the influence of cultural factors**

Alexandra LIPASOVA (National Research University Higher School of Economics, Russian Federation) | alexandra.lipasova@gmail.com

The problematics of gender studies takes a prominent place in the field of modern social research in Russia. However, the discussion of gender problems is mainly focused on the understanding of a new role and place of women in the society and on the topic of work-life balance for women. The problematics of fathers/fatherhood and fathering practices is less popular among researchers, which deepens traditional gender inequality in family relations and makes the role of father seem secondary compared to that of mother.

In the Soviet past, according to many authors, fatherhood was a set of practices and concepts which pushed fathers to the providing and bread-winning sphere but underestimated them as fathers. According to some Russian data, financial support of the family is still considered as one of the most important functions of a father. That is why many researchers connect the diminishing significance of father in the family with his falling social status of an economically successful man. At the same time we can face a tendency of increasing father involvement in the process of up-bringing children in the family. Here we can speak about a new emerging type of fathering – responsible and “involved” fathering.

The model of “involved” fathering faces active institutional, state and public support in a number of foreign countries, namely, in Scandinavia. However, the situation in Russia is controversial.
Modern Russian society can be characterized by both egalitarian and traditionalistic tendencies in gender relations: on one hand, we can face the emergence of new interpretations and practices, on the other hand – the strengthening of traditional patterns of masculinity and fatherhood.

This paper focuses on the fertility decisions of Russian men. The falling number of children being born is a concern throughout Europe. Demographic analyses argue that the low fertility rate is not due to less desire to have children, but rather the postponement of having them from early to later adulthood, which result in lower overall fertility. This tendency is a main trait of the so called “second demographic transition”. The main literature on this topic has also focused mainly on women and their reproductive decisions while it is equally important to investigate this problem from the male perspective.

A cultural approach to fertility decisions emphasizes the importance of individual attitudes and societal norms present in a certain society. These so called ideational factors affect the decision on occurrence (whether or not to have children), timing of childbirth (when to have children) and male fertility rate (number of children). This paper is aimed to estimate the importance of men’s individual attitudes as well as social norms of entering into and timing of fatherhood in relation to the fertility decisions of individual fathers, contrasting Russia to other European countries. The aim of this paper is to understand at what age men enter into fatherhood if at all, and whether the number of children they have fathered by the age of forty and older (40+) is affected by individual attitudes and social norms regarding male fertility, also taking into account socio-economic variables and attitudes to gender equality.

The analysis is built on the data from the third round of the European Social Survey (2006). The sample for Russia consisted of 983 men. The ESS includes individual attitudinal questions concerning the ideal age of becoming a father, the age which is regarded as the “dead-line” for fathering and the importance of fatherhood for being considered an adult, as well as the individual’s and societal attitudes towards childless men. The background characteristics include education, age, relationship and employment history and the respondent’s attitudes to gender roles.

The results of the research have shown that in Russia ideational factors are strongly associated with actual fertility behavior. Russian men are significantly younger compared to Europeans when having their first child, but generally have fewer children. The ideal age of becoming a father and social age deadline for fathering are generally lower. Russian men have a much higher disapproval rate for voluntary childlessness. It proves that postponement of fatherhood is more likely if one does not think that fatherhood is important for being considered an adult, and also if one has a high ideal age and social age deadline for fathering.

Obviously, the occurrence of fatherhood is related to whether a man has had a stable partner relationship, as well as his economic position – men who have experienced long periods of unemployment are more likely to remain childless.

The main conclusion is that there is strong correlation between attitudes and behavior regarding male fertility. Russian society is much less tolerant to childlessness compared to other European countries. Being a father is considered an important part of male identity – a childless man can not be taken seriously. Thus, the decision to become a father is strongly correlated to the ideals of fatherhood in Russian society. There exists a wide range of ways of “doing masculinity”, still the notions of what it really means to be a man are deeply embedded in Russian men’s consciousness. Men are held responsible for acting according to the cultural ideals of masculinity and behaving in gender-appropriate ways.

Fatherhood and migration: the Irish and the Polish
Julia BRANNEN (UCL Institute of Education London, United Kingdom) | j.brannen@ioe.ac.uk
The paper is based on a study of three white ethnic groups including two groups that represent different waves of migration to the UK, the Irish and the Polish. It focuses upon the family experiences of first generation migrant men in Britain, aspects of their lives that have been little studied. Taking a comparative biographical perspective it outlines the different resources that the men brought with them to Britain and the consequences for bringing up their children. Experiences of migration are also compared through the kinds of stories the fathers tell that in turn relate to the life course phases when they were interviewed. In the case of the Irish they take a long view as they reflect back upon their childhood in Ireland and on the whole of their working lives in Britain from the mid 1950s/1960s when they came as young single men. By contrast the Polish in the study arrived in Britain as fathers in the 2000s in a very different context in which they did not see themselves as permanent residents. The paper considers some of the methodological issues in this comparison, for example, how migration is viewed with much greater finality the more distant it becomes.

RN13S07d - Changes and Continuities in Fatherhood and Fathering Practices IV: Childcare Involvement

From the authoritarian breadwinner to caring father? Reflections on the paradigm change in contemporary Poland
Marta BIERCA (University of Social Sciences and Humanities, Poland) | marta.bierca@gmail.com

The family roles in Poland are undergoing changes, with recently strong focus on alterations in the father's role. The model based on undisputable authority of male breadwinner becomes questioned and shifts into more egalitarian one. In the new model, the father is supposed to willingly engage in childcare, be present at all stages of child upbringing by sharing duties with female partner, and also to express emotions openly. The ‘new father’ rhetoric becomes more and more observed in contemporary Poland both among men and also promoted by the media. The author analyses the dynamics of the above paradigmatic change. Is there a smooth transition from the ‘old’ model to ‘new’ one? Or are these narratives contradictory and competitive? On individual level, what does a ‘modern’ or ‘new’ father mean for men? Are there any inspirations or benchmarks as regards the ‘new’ role? On political level, is there any ‘norm’ men refer to or are confronted with? Is the ‘new’ model within the ‘norm’ or still out? And finally, what is the political context (legal, officially promoted by social policy etc.) of such fatherhood change?

The aim of the paper is to capture the above development of the concept of fatherhood in contemporary Poland. The empirical material will be provided by qualitative interviews inspired by biographical method conducted with young fathers representing the ‘new’ paradigm. The paper will focus on exploration of model change rather than its quantification or predicting further changes in family roles in Poland.

Father involvement in the care of children in Spain: Short-term shifts or structural changes?
Lluís FLAQUER (Universitat Autònoma de Barcelona, Spain) | lluis.flaquer@uab.cat
Lara NAVARRO-VARAS (Institut d'Estudis Regionals i Metropolitans de Barcelona) | Lara.Navarro@uab.cat

The remarkable presence of Western women in the public sphere has led many researchers to surmise a more egalitarian sharing of childcare responsibilities in terms of gender. However,
The research literature in the field has found that despite a slow and unequal trend in that direction, women still take on nowadays disproportionately a role of carers. The analytic importance of childcare not only lies in that it is a most time-consuming activity but also in that it lays the foundation for the allocation of role expectations in couples.

The purpose of this paper is to analyse underlying factors of father involvement in the care of children and their effects in terms of gender balance in the Spanish context. The paper distinguishes different types of care; it makes an analysis of the differential impact of main predictors and it provides an evolutionary diagnosis of father involvement in relation to mother involvement.

We draw on data from the Spanish 2002-03 and 2009-10 time use surveys and our analysis focuses on fathers and mothers with children up to 12 years. Different lineal and logistic regression models have been estimated for various factors. Results show an increase in fathers’ participation in all activities, which in terms of mean duration accounts for an increased time devoted to physical childcare. This might reflect the prevalence of heavy male unemployment rates but also confirm a growing paternal assumption of physical and routine tasks. These developments, nevertheless, can cast a shadow on the structural character of changes.

How to “measure” fathering practices and perceptions in international surveys?
Judit TAKÁCS (HAS Centre for Social Sciences Institute for Sociology) | takacs.judit@tk.mta.hu
Ivett SZALMA (FORS, Switzerland) | ivettszalma@unil.ch

The purpose of this paper is to examine fathering practices in Europe. This topic has attracted increasing interest from scholars in the past decades. This attention is motivated by important social changes that have occurred in many countries, such as the increasing number of women and mothers entering the labour market and the growing number of working single parents and dual-income families. However, fathering practices are not homogeneous in Europe because several country level social constructions can influence them, such as parental policies that make it possible for fathers to stay at home with their children or evolving gender related norms, beliefs and attitudes. Furthermore the changes over time are also important because in some countries fathers’ involvement in childbearing started earlier and was more intensive than in other countries.

In order to assess the changes over time and across countries we can use the freely available international survey datasets such as European Social Survey (ESS), European Value Studies (EVS), International Social survey Programme (ISSP) and Eurobarometer. These surveys allow us to map the changes over time due to their repeating items regarding fathering practices and they also make it possible to make comparisons in Europe. In spite of the fact that there are many international surveys that have items related to this issue they are not harmonized yet and some important features are missing that would be required in order to gain an overall view of fathering practices.

Caring Fathers: Ambivalences of Involved Fatherhood
Michael MEUSER (Technical University of Dortmund, Germany) | michael.meuser@tu-dortmund.de
Diana LENGERSDORF (University of Cologne, Germany) | diana.lengersdorf@uni-koeln.de

Notwithstanding the growing discourse on involved fatherhood and the increasing rates of fathers in parental leave there is still a huge gap between this discourse and fathers’ engagement in family work. This paper focuses on fathers who bridge the gap: fathers who take parental leave for a longer time or reduce their working time in favor of participating in child care
and family work. Although being a minority, looking at these fathers helps to understand the complex dynamics of changing gender relations in the private sphere. Based on a completed qualitative study on involved fatherhood and an ongoing project on fathers taking parental leave we discuss how involved fatherhood affects the gendered order of the family and fathers' perceptions of their own masculinity. Involved fatherhood does not only reduce or even pacify conflicts between wife and husband about father's participation in domestic work and child care; potentially, it is also a source of new conflicts about who is entitled to define the criteria of 'good' domestic work and childcare. Further, fathers who care for their children have to struggle with cultural images of masculinity that are still oriented to occupational career. The paper discusses whether and to which extent paternal engagement in the family (instead for the family by earning the family’s income) could become an arena of new constructions of masculinity and how this way, by increasing the significance of the private sphere as a site for constructing masculinity, new gender conflicts emerge.

Social and Family Assumptions of Fathers’ Practice in Serbia
Dragan STANOJEVIC (Faculty of Philosophy, Serbia) | draganstanojevich@gmail.com

The subject of the article is fathering in Serbia today depicted on the basis on data from the representative survey of family life of parents with minor children (N = 1217). Although parenting in Serbia is placed in the structural and cultural context that favors the traditional division of parental responsibilities and although the practices still function to a large extent on this line, the transformation processes have also brought changes in the family domain that move in the direction of gradual reduction of asymmetry. The aim of this paper is to examine the factors that influence the level of fathers’ assuming obligations to small children in Serbia, bearing in mind the social context as well as family dynamics. This paper will present and test the significance of three complementary approaches to the explanation of the father's level of involvement in child care: 1) theory of resources; 2) theory of patriarchy; 3) dynamics within the family (intimacy and flexibility). Having summarized the findings of the regression models, all theoretical assumptions showed significant predictive power in explaining the level of assuming parental obligation by father. Mother’s resources (primarily income from employment), spousal / partner and family dynamics and value orientations of father showed independent effects in the prediction of father’s involvement in responsibilities for children. The involvement of father will depend both on the employment and his wife’s income regardless of the source. Also, fathers with less traditional value orientations in terms of gender relations will be present in the lives of their children more. In the families in which the relations between spouses are at a higher level of intimacy and flexibility fathers will show more willingness to take on responsibilities for children.

RN13S08a - Gender Differences in Family Life, Care and Work I: Work and Occupation

Unemployment, domestic labour and fairness
Ingólfur V. GÍSLASON (University of Iceland, Iceland) | ivg@hi.is

Most of the research that has been done on the connection between male unemployment and their participation in household chores has shown that their participation does not increase, in some instances even declines. The main explanation has been that unemployment is such a threat to the masculine self-image that increased participation in what has traditionally been seen as the domain of women is an unbearable thought. In the study presented here I
interviewed 8 couples (the partners separately) where the man had been unemployed for at least three months while his partner held a full-time job. The main finding is that these men just took over the domestic sphere and felt that it was the only fair thing to do. Even though the unemployment takes its toll, has a bad effect on their self-image and their confidence in themselves in some instances, none experienced it as a humiliation or un-masculine to shoulder the domestic duties. On the whole their partners confirm what the men say though some of them feel that the unemployment has damaged the men more than they themselves claim. There are also examples where the women think the men might do a bit more but on the whole they agree with the description provided by the men.

Which fathers are involved in looking after their children? Investigating the relationship between paid work, attitudes and childcare
Helen Louise NORMAN (University of Manchester, United Kingdom) | helen.norman@manchester.ac.uk

Although fathers’ roles have been adapting over the last three decades, financial provisioning remains the essence of ‘good’ fathering and the work schedules associated with fathers’ employment is a key factor that shapes their involvement in childcare and domestic work. However, the relative importance of fathers’ and mothers’ employment in shaping paternal involvement in childcare remains unclear, and little is known about the longer term impact. This paper presents new analysis about fathers’ involvement in looking after their pre-school children in the UK and evaluates recent policy interventions which are intended to support such involvement. Using the UK’s Millennium Cohort study (MCS), I analyse father’s involvement in looking after their child at nine months after the birth and when the child is aged three years. The influence of gender role attitudes vis-à-vis employment hours is also examined by drawing on previous research on the determinants of men’s capabilities to be involved fathers (Norman et al 2014, Norman and Elliot 2015).

Results show that both fathers’ and mothers’ employment hours are associated with fathers’ caregiver roles, but, contrary to expectation, the hours that the mothers’ works has the strongest effect. Fathers are most likely to share childcare when the mother works full-time hours both nine months and three years after childbirth, regardless of what hours the father works. There is only a very weak association between father’s gender role attitudes and their involvement in looking after their three year old child, which suggests fathers may purport to support egalitarian gender roles but this may not necessarily be carried out in practice.

Informal Elder Care and Unemployment. Accumulation or Compensation of Risks of Social Exclusion?
Michael GRÜTTLER (Institute for Employment Research, Germany) | michael.gruettner@iab.de

Unemployment has long been known as a risk of social exclusion in contemporary European societies. Today the growing percentage of elder people in Europe combines with socially unequal opportunities for making elder care arrangements, which consist either of informal care work done by family members or of formal care work by professionals and elder care institutions. This combination gives rise to the issue of informal elder care as a new risk of social exclusion. The Panel Study “Labour Market and Social Security” (PASS) in Germany creates an opportunity to analyse the following questions: Is informal elder care a risk of social exclusion? If so, are informal elder care and unemployment accumulating or mutually compensating risks of social exclusion? The paper presents empirical evidence as well as theoretical reflection indicating both negative and positive effects as well as interaction effects of care work and unemployment. It tests its conflicting hypothesis by means of panel analysis and shows
differences by gender and the amount of hours spent in informal care work. It shows differing findings of effects of informal elder care on subjective measures of social exclusion, for instance an inverted u-shaped relationship between care work hours and subjective social exclusion.

**Working mothers, Housewives, and Life satisfaction**
Dana HAMPLOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | dana.hamplova@soc.cas.cz

Using the EU-SILC data from 2013 on quality of life, the paper explores the link between the maternal employment and life satisfaction in comparative perspective. So far, the empirical studies provide a mixed picture of the association between the maternal employment and life satisfaction. Some studies suggest that combining more roles increases life satisfaction whereas others indicate that the full-time employment might be detrimental to mothers’ well-being. This paper looks at the issue in more detail and compares mothers with children in specific age groups. It argues that the link between the maternal employment and well-being is moderated by the age of children and the prevalent values in the society.

**Childlessness, gender and social inequality: European developments**
Anna ROTKIRCH (Population Research Institute, Vaestoliitto, Finland) | anna.rotkirch@vaestoliitto.fi
Anneli MIETTINEN (Population Research Institute, Vaestoliitto, Finland) | anneli.miettinen@vaestoliitto.fi
Szalma IVETTE (Swiss Centre of Expertise in the Social Sciences (FORS); Lausanne, Switzerland) | ivett.szalma@unil.ch
Tanturri MARIA LETIZIA (Department of Statistical Sciences, Padua University, Italy) | tanturri@stat.unipd.it

Childlessness is increasingly common in Europe but little studied, especially among men. We investigate whether childlessness is associated with social inequality among both men and women, using a large data set compiled from available national statistics and surveys and the Gender and Generations Survey and study associations on the individual and country level. Female childlessness at age 40-44 varies from less than 10 % in some Central and Eastern European countries to around 20% in Austria, Italy, Finland, the Netherlands and the UK. Male lifetime childlessness is highest (above 23% among men aged 45–49) in Finland, Italy, Germany, the UK and the Czech Republic.
Results show that childlessness is more common among men with little education, and among women with either very high or very low education. The prevalence of childlessness does not seem to be associated with gender equity on a country level (measured as proportions of women with high education, women’s employment rates and with divorce rates at country level), although higher childlessness is found in countries with widespread individualist values.
Educational differences in childlessness rates indicate that unwanted childlessness may now be concentrating among those who lack socioeconomic resources. There are also clear gender differences. Men’s childbearing patters are typically more polarized than women’s are, so that a higher proportion of men compared to women remain childless while also a higher share of men have larger families compared to women. Among women, childlessness is common among the highly educated but also, increasingly, also among the low educated women. Among men, childlessness continues to be concentrated in the less-educated groups.
We conclude that childlessness in contemporary Europe should no longer be associated with the stereotypical image of a highly-educated and career-oriented woman. Neither is childlessness in any clear way associated with higher gender equity or the proportion of women in the labour market. The rapidly increasing proportions of childless Europeans, who mostly
would have wished to become parents, pose a challenge for policy makers. In the long run, the growing proportions of childless persons will also bring extra challenges for future ageing generations through the older people who will have no adult children or grandchildren to assist and take care of them.

**RN13S08b - Gender Differences in Family Life, Care and Work II: Gender and Couple's Life**

**Conflicting family norms and elite life course. Gender inequalities and couple coordination between elite spouses**

Bernadett CSURGÓ (Centre od Social Sciences of the Hungarian Academy of Sciences, Hungary) | csurgo.bernadett@tk.mta.hu

Luca KRISTOF (Centre od Social Sciences of the Hungarian Academy of Sciences, Hungary) | kristof.luca@tk.mta.hu

There is considerable evidence that women are underrepresented in elite positions. In addition gender topics have been neglected in the mainstream literature on elite. Elite literature - if does it - mainly focuses on the work and leadership positions of man and women (see f. ex. glass ceiling effects) and has lower emphasis on family roles and couple coordination. This paper aims to understand how elite couples perceive their work-life balance, how they discuss their couple coordination and their family roles and norms. We focus on the narratives of elite spouses. Our findings build on and extend an existing literature on work-life balance that focuses on topics related to balancing work and family and on role conflicts and also on subjective feelings about managing work and family. Our contribution of this paper is to highlight that there is ‘elite position’ based pattern of couples’ aspiration to career and domestic egalitarianism. However the meanings and feelings of work-life balance are gendered.

We aim to provide a new kind of explanations on the exclusion of women from elite position through the analysis of elite’s family life. We contribute to answering the question on women position in elite by a qualitative content analysis (Atlas.ti) of 34 individual interviews (17 couples) among Hungary’s political, economic and cultural elite.

The paper show that egalitarian couple coordination is discussed in every narratives and appears in most cases as a norm but attitudes and actual behaviour are different. We argue that elite membership is characterised by both helping and blocking factors for egalitarian partnership. Elite lifestyle (financial safety, domestic helps, independency etc.) contributes to egalitarian partnership. While elite career challenges (very high work commitment, external and internal expectations) contradict it. We conclude with some comment on why egalitarian coordination is realized only in rare cases and how the elite life style and the challenges of work-life balance strengthen gender inequalities resulting the underrepresentation of women in elite positions.

**Women and men: self-identity after engagement and marriage**

Iwona Ewa PRZYBYŁ (Adam Mickiewicz University Poznań, Poland) | przybyl@amu.edu.pl

Betrothal or marriage may be treated as a kind of social institution and described in the categories of patterns associated with performing the role of fiancé, wife or husband, created in a given culture. Secondly, engagement and marriage that determine new periods in life can be viewed through a prism of individual experiences of individuals. According to Giddens (1991), identities are no longer received automatically through the rituals and social practices of the
traditional social order. The self has become a reflective project. Based on the Personal In-Depth Interviews the paper examines how young spouses in Poland perceive themselves and how their "significant others" perceive them after the betrothal and after marriage. This paper is based mainly on the results of the author’s study carried out in 2014 using the IDI (25 husbands and other 25 wives; different social status; duration of the marriage from 1 to 24 months) and the cross-sectional population study conducted on a sample of 630 married women and men using a PAPI. The research is located within a family life course theory (interactional perspective) emphasizing the dimensions of time and change and using more qualitative assessments of interaction (Barry, 1970; Turner, 1970; Giele, Elder 1998; White, Klein 2002). The main focus of this paper is on the individual experience of transitions between stages. Irrespective of the quality of emotions experienced, in the majority of respondents only marriage forces reorganization the self-image. The range of the changes differs among men and women, most often, being connected with the changes in the sense of adult, responsibility and in the self-esteem. In addition, locating analyses in the context of a postmodern society shows a certain tension between modernity orientation declared and the "fetters" post traditional society, which is still the Polish society.

Pathways of engendering work-care balance in dual-earner couples with young children
Vanessa CUNHA (University of Lisbon, Portugal) | vanessa.cunha@ics.ulisboa.pt
Sofia MARINHO (University of Lisbon, Portugal) | sofia.marinho@ics.ulisboa.pt
David CRUZ (University of Lisbon, Portugal) | david.cruz@ulisboa.pt

In Portuguese society, dual-earner couples with young children are a widespread reality, since women record a high rate of employment in full-time work, especially throughout childbearing years. Despite persistent gender inequalities in paid and unpaid work – wage gap, women's overload in household tasks and childcare – couples’ lives are, in fact, shifting towards more balanced ways of engendering conciliation, and nowadays most fathers of young children portray themselves as caring and daily-involved as well as sharing partners. In this presentation we will depict, from several in-depth interviews with both partners of dual-earner heterosexual couples with children in different social settings, how more egalitarian conjugal functioning is being negotiated, engendered and achieved. Initial findings support the fact that work-care balance is attained in different degrees and by different paths. In fact, norms on gender equality tend to generate more equal sharing couples, with men receptive to reduce their career investment or rewards in order to carry out more childcare and chores, and women receptive to give up some maternal prerogatives and pass on some childcare responsibilities and privileges to fathers. But there are alternative pathways, even though couples sustain a more traditional perception on gender roles. Men’s early socialization into housework or strong family projects, but also women’s demand for more male participation in household tasks right from the beginning of conjugal life, are also key-drivers for engendering work-care conciliation in a more balanced way.

Towards a democratization of domestic and care work? A longitudinal look through time use patterns
Matxalen LEGARRETA (University of the Basque Country UPV/EHU, Spain) | matxalen.legarreta@ehu.es
Cristina GARCÍA-SAINZ (University of the Basque Country UPV/EHU, Spain) | cristina.garcia@uam.es
Time use studies are useful tools for analyzing family life’s dynamics. They have shown gender inequalities’ persistence into the distribution of domestic and care work. At this paper we study the evolution of time involved into domestic domain by women and men. We use data obtained through Time Use Surveys carried out by the Basque Statistics Institute-Eustat at the Basque Country region in Spain (1993-2013). A first general analysis suggests a tendency towards "a democratization of domestic and family work". The growth of the percentage of people who uses its daily time’s part to carry out this work is accompanied by the reduction of the dedication of those who are actually involved on it. However, a closer look calls into question this tendency’s strength. Women maintain their participation high for the entire period, confirming a constant and decisive reduction of time spent on household. Men’s greater involvement does not respond entirely to women’s decrease and it is not regular, but presents ups and downs. Furthermore, women still do most of the domestic and care work, regardless their social position. Moreover, comparing to other activities (paid work or leisure time) the greatest gender inequalities remain taking place at the distribution of domestic and care work. The longitudinal study we present enables us to understand the evolution of the gender distribution of domestic and care work, offering clues to comprehend also what is occurring in other European regions.

**RN13S08c - Gender Differences in Family Life, Care and Work III: Gender Roles**

**Work and family cultures: dynamics of family change in Southern Europe**
Isabella CRESPI (Dept. Education, University of Macerata, Italy) | isabella.crespi@unimc.it
Almudena MORENO (Dept. Sociologia, Universidad de Valladolid, Spain) | almudena@soc.uva.es

The wider context of the trade-off between work and family is not just a matter of changing preferences. For individuals and couples, questions concerning work and family always involve either–or choices, but these choices are likely to be more or less difficult depending on the policy environment in which they are made. Under this heading fall a wide range of the nostrums of contemporary family policy, although the focus of the literature in this area has, until recently, been more concerned with the identification of factors promoting high levels of female employment than with the location of policy determinants of cross-national fertility variation. The Mediterranean countries model (Portugal, Spain, Italy, and Greece) take a conservative/corporatist-family-oriented approach to work-family reconciliation. They are conservative in that their dominant culture invests the family with a greater role as a social institution that in other countries. They are corporatist in that they design welfare measures according to the occupational status of family members. Finally, they are family-oriented in that they entrust the family with more responsibilities that in other countries. In the last decades major changes have occurred in work and family life in Italy and Spain. The incorporation of women into the labour market, the increase of dual-earner families and the increase of the work-family conflicts have addressed the family changes. However these transformations have not had a substantive impact in gender roles and the division of family labour in these countries. In fact, the gender division of labour in households with children has become pronounced. Numerous studies have examined this issue for the Southern European countries from the perspective of welfare regime; however, few studies analysed this apparent contradiction in terms of gender and culture norms. The purpose of our paper is to present the current state of work-family dilemmas in Italy and Spain, focusing the analysis on three points: changes in family models, family policies developed by welfare states and attitudes and values towards the
gender norms and family-work balance, using data from European Social Survey, Eurobaromterers and OCDE Family Database

**Work-life balance and subjective well-being for families with children in Romania**

Cosmina Elena POP (Romanian Academy, Romania) | cosminapop@gmail.com

An essential element for children’s quality of life is represented by the time spent together with their family, especially with their parents. However, for most of the families, the time spent together is quite limited by the work obligations on one side and on the other hand by the household living arrangements. In this paper, I will approach the relationship between work-life balance and subjective well-being for families with children. The paper will focus on families with children from Romania in a comparative perspective with the families from other countries of European Union. For this propose, I will appeal to secondary analysis using data for the research European Quality of Life Survey (2011/2012) made by European Foundation for The Improvement of Living and Working Conditions. In the analysis, there will be included indicators referring to family status of subjects, indicators referring to relationship between work and family life, also indicators of subjective well-being, like life satisfaction, happiness and other evaluation indicators. I will emphasize the important role of having children for life satisfaction, but also the problems which are confronting families with children. I will focus on gender differences and inequalities in harmonizing family life and work and the level of well-being. People have to manifest imagination for facing the plurality of social roles in everyday life, as sociologists have to handle with sociological imagination their instruments and tools for investigating people lives.

**Transformations of intimate communicative and care-taking relations and the impact on the balance between family- and work-life**

Hans H. K SØNDERSTRUP-ANDERSEN (Roskilde University, Denmark) | hsan@ruc.dk
Lars Tomas DENCIK (Roskilde University, Denmark) | lasse@dencik.se
Allan WESTERLING (Roskilde University, Denmark) | allanw@ruc.dk

Currently the social boundaries between work and non-work are beginning to dissolve. Compared to the 19th and 20th centuries, working life increasingly intertwines with other areas of our social life. Especially this is the case with respect to our family- and everyday life. The concept of boundlessness has been much debated in the context of work. Boundlessness can be described as a movement towards dissolution of familiar boundaries in our society and in our work- and everyday life. On the one hand boundlessness could lead better possibilities for individual self-realization and a higher degree of social responsibility. On the other hand there is a risk the economic rational thinking corporations will have the opportunity to embrace every single aspect of our individual and social lives. This paper seeks to explore the balance between our everyday social life and our working life. The paper draws on a longitudinal study of everyday family- and work-life. The survey was first administrated in 2003 and again data was collected in the cohort in 2014. The paper will present the initial results from the study looking at relations between presence and absence in family and work life along a series of dimensions including time and energy. Moreover the paper will present the results of looking at changes, including technology based, changes in the configurations of intimate communicative and care-taking relations and the impact on the balance between family- and work-life.

**Childcare role distribution in adoptive families. An unfinished revolution? The case of Spanish families adopting in China.**

María Isabel CÁCERES (UNIVERSITY OF SALAMANCA, Spain) | mifc1988@gmail.com
Theoretical underpinnings: Maternity involves high opportunity cost, especially for women, and they suffer its consequences in the following ways: limitations on their professional career, unpaid wages, an extra burden in their daily lives, a loss of freedom, and a considerable reduction in their free time (Alberdi et al., 2000; Beck-Gernsheim, 2003). It is not therefore surprising that many women have decided to delay motherhood (Becker, 1987; Bernardi and Requena, 2003; Delgado et al., 2006; Cea D’Ancona, 2007; Davia and Legazpe, 2013). Although fathers are now gradually but slowly becoming involved in childcare, the concept of "maternal instinct" is still firmly embedded in society. Related to this, institutional approaches in countries also implicitly favor a low birthrate by reinforcing certain attitudes and behaviors toward parenting. A clear example of this is the way conciliation policies favor women, being reinforced by the persistence of the myth of "intensive mothering" (Aguinaga, 2004; Solé and Parella, 2004), or the limited nature of public services available in childcare (Baizán, 2009; Baizán, et.al, 2013).

On the one hand, women are portrayed as the engine of change that will bring about an "egalitarian revolution" within the family, which means a democratization of family relationships and an improvement in their own status (Alberdi, 2000, 2004; Alberdi et al., 2000; Del Campo Urbano and Rodríguez-Brioso, 2002; Meil and Ayuso, 2007). On the other hand, however, this revolution is hampered by various circumstances. While there are already many men who prefer the egalitarian or syncretic family model propounded by Meil (1999), the proportion of those that assume their fair share of overall domestic responsibilities still remains very low. Therefore, this new "interchangeable" parenthood is still tentative and weak (Alberdi, 2003; Iglesias-Ussel et al., 2009; Marí-Klose et al., 2010). As far as childcare is concerned, some authors suggest that the involvement of fathers in this area is higher than in other household duties (Alberdi and Escario, 2007; Brullet and Rocas, 2008). In contrast, research such as that by González et al. (2013) is skeptical about this "new fatherhood". Moreover, although there is empirical evidence for a positive relationship between the request for paternity leave and the greater involvement of men in childcare (Meil, 2011; Escot and Fernandez, 2013), its use is still very limited.

Therefore, although times have changed, there is still a persistence of certain so-called traditional values that hold back social adjustment to women’s new roles, whereby they remain the ones mainly responsible for childcare (Brullet and Gomez, 2008). In this sense, we are dealing with an "unfinished revolution" (Esping-Andersen, 2009). Yet what happens in the case of adoptive families? Generally speaking, scant attention has been paid to the distribution of tasks and care in adopting families, limiting the analysis to a single pioneering study that is still in progress (Jareño and Rodríguez, 2010). The results obtained by these researchers point to a collaborative and quasi-egalitarian trend in the distribution of roles.

The aim of this paper is to analyze this distribution of roles, paying particular attention to those duties related to childcare, on the initial understanding that as there is no biological filiation in adoption, the social discourse of "maternal instinct" and "maternal responsibility" is rendered meaningless. This means, in this case, that the degree of involvement of both partners should be the same, tending to an equal distribution model of roles and tasks. Secondly, considering that adoptive families usually have high levels of education, one may also expect them to reflect a more egalitarian model of childcare. Thirdly, any male initiative in the decision-making process related to adoption or the use of paternity leave would be expected to lead to greater male involvement in care duties. Only the use of sociological imagination will lay the foundations for the true circumstances of these families, framing it within the context of current family dynamics and responding to the following research question: Have Spanish adoptive families achieved this Egalitarian Revolution?

Methodology and sources
The methodological approach used in this research is largely qualitative, with a semi-structured interview being the main instrument of inquiry. The use of this tool allows developing a particularist approach, focusing on the heterogeneity of the profiles, and their relationship to different strategies and dynamics of family behavior. Through the development of a non-probability "snowball" sampling, a cohort is used of thirty-five families adopting in China (for some time now, one of the main countries of provenance of children adopted abroad). The analytical strategy used consists of a discourse analysis of respondents based on successive readings of in-depth interviews.

Findings and conclusions

This study’s findings confirm that although an adoptive family tends toward egalitarianism, it does not yet seem to have reached the model of "interchangeable" parenthood. In fact, far from what one would expect, it involves families that still have certain traditional values that support common gender roles regarding the care of offspring.

Fathers in parental leave – negotiations and decision-making within couples

Stefanie AUNKOFER (Ruhr-University Bochum, Germany) | stefanie.aunkofer@rub.de
Benjamin NEUMANN (TU Dortmund University, Germany) | benjamin.neumann@tu-dortmund.de

The amendment of the German Parental Leave legislation in 2007 can be seen as a further step in establishing new forms of fatherhood in Germany. By introducing two ‘partner months’, fathers are encouraged to raise their commitment in household- and child-caring activities. Recent data from the federal office of statistics show that between 2003 and 2012 the percentage of fathers, who took parental leave, increased from 2,6% to 29,3% – a historical peak. Nevertheless, related to differences and inequality in terms of education, income, ethnic affiliation or region, fathers make demands on parental leave in very different ways, which influences e.g. the length of the leave or the amount of money they’ll get during that time. With a qualitative-reconstructive approach, we focus on these (and further) differences in Interviews with couples and reconstruct – based on a comparative and sequential analysis – their negotiations and decision-making concerning the leave of the fathers. First findings reveal that the couples’ arrangement concerning the fathers parental leave are influenced by anticipated problems within the workplace, as well as attitudes and cultural images about mothering, fathering and parenting. Further new conflicts potentially emerge about the entitlement who defines the standards and quality of family work.

Suggested for e.g.:
6. Parenting: mothers, fathers and others
7. Changes and continuities in fatherhood and fathering practices
8. Gender differences in family life, care and work
9. New developments in parental leave

The children's father's quota – time with dad
Brita BUNGUM (Norwegian university of science and technology, NTNU, Norway) | brita.bungum@plu.ntnu.no

Norway was the first country to reserve part of paid parental leave for fathers in 1993. The father's quota is based on the premise that fathers' time and caregiving are important for young children (White Paper 8 2008 – 2009, Proposition to Parliament 4, 1988-89, 32). In this paper, however, I want to show how the relationships between the children and the fathers are developed during the time of leave. I will use interview conversations with fathers who reflect upon experiences and perceptions of their time on leave with their children.

Research on the father's quota has primarily focused on masculinity and the father's role in relation to equality between women and men (Bekkengen 2002, Brandth & Kvande, 2003, 2013, Leira, 2003, Jensen, 2004) and what the scheme means for children remains unexplored territory (Brandt & Gislason,2010, Bungum, 2013). Therefore my aim for this paper has been to focus on the father's quota as a welfare scheme for children.

The paper explores how children can be understood as active participants in relation to their fathers. By examining how the understanding of the importance of children in the relationships emerges in the fathers' reflections. In the fathers' narratives the children emerge as participants in this situation. My findings suggest that the key in the relationship is a "wordless language", and to learn, the fathers must take a rationality-of-care approach caregiving (Wærnes, 1987) becomes a goal and the ability to have empathy is trained.

The analysis is based on qualitative data material collected from 16 fathers who were interviewed from the autumn of 2012 to January 2013. Fourteen of the fathers who were part of the sample were either on leave with a child or had had experience of the father's quota relatively recently. Since I am specifically interested in illuminating the father's quota as the child's time with the father, I have chosen to concentrate on the fathers who actually have experience of having the main caregiving responsibility for the children while the mother has been at work. It is the "home-alone fathers" (Brandth and Kvande, 2003) thus comprises my key informants here.

The exclusionary politics of paid parental leave in Romania
Borbála KOVÁCS (Central European University, Hungary) | kovacsb@ceu.hu
This paper elaborates on the gendered and classed outcomes of the Romanian paid parental leave policy in the context of the economic recession, analysing the 2006-2014 period. It reviews and critically analyses policy changes in Romanian paid parental leave legislation between 2006 and 2014, with a focus on eligibility criteria, benefit levels, leave duration and rules around the sharing of the leave between the parents, in an attempt to highlight the range of mechanisms through which close to half of Romanian parents are excluded from accessing this time-plus-cash benefit during their children’s early years. Through the analysis of aggregate data regarding the take-up of paid parental leave and of in-depth interview data with over sixty Romanian mothers and fathers discussing their use of paid parental leave, this paper shows that this policy instrument, far from guaranteeing Romanian parents’ right to care for their young children and facilitating employment after childbirth, functions as a reliable social assistance scheme for half of Romanian parents eligible to use it. Given that the most vulnerable parents are excluded from what remains a comparatively generous cash-plus-time benefit, the Romanian paid parental leave is best understood as a policy instrument reinforcing and perpetuating economic inequalities among Romanian families with young children rather than as a labour market activation intervention.

Parental leave and the division of care between parents – The case of Iceland
Asdis Adalbjorg ARNALDS (University of Iceland, Iceland) | aaa1@hi.is
Gudny Björk EYDAL (University of Iceland, Iceland) | ge@hi.is

In 2000 the Icelandic parliament adopted a new law that provided both parents an equal right to take paid parental leave. The aim of this study is to investigate whether the law has had the intended effect to increase both parents’ participation in caring for their children. The findings are based on three surveys on childcare and labor market participation, conducted in 2003, 2007 and 2013 among parents who had their first child in 1997, 2003 and 2009. The data provides a picture of how parents divided care before and after the law was enacted. As well as analyzing the change in the division of childcare over the past years, linear regression analysis will be applied to assess the association between the length of fathers’ leave and their involvement in childcare four years after birth. The results indicate that the division of care between parents has changed in the intended direction, as the division is more equal after the law was put into practice. Furthermore, there is an association between the length of leave taken by fathers and their involvement in childcare four years after the birth of the child when controlling for background variables such as age, education and occupation. Even though one cannot come to the conclusion that fathers’ uptake of parental leave has a causal effect on their involvement in childcare, it is of great relevance for policy makers to identify an association between these two factors.

Paternity leave in Hungary - Inequalities and progress
Julia GALANTAI (ELTE Social Sciences Department, Hungary) | juliagalantai@gmail.com

The traditional type of family model is often said to be in connection with the traditional women and men roles within families. The division of housework in Hungary is very weak comparing with European data. Although if we compare data regarding the hours that fathers spend with childbearing in Hungary is in the midfield. Analysing the data of the Hungarian Statistical Office’s time scale survey, there is a proportion of male who decide to stay at home with their child and take parental leave, although there is still a great discrepancy between the female and male stay-at-home parents: Those women, who stay at home with their child spend more time with housework and childcare while male
stay-at-home parents spend less. This can also show that although the male partner chose to be the stay-at-home parent it is still the female partner’s task to do a huge percent of housework and childcare tasks. Data showed that those men whose labour market position is uncertain, have lower level of education or earn lower wages are more prone to stay at home with their child. The imbalance of level of education, wages and housework can cause the disharmony of the relationship, or cause the dislike of the community or relatives or even the frustration of the male parent.

According to the above aspects I conducted interviews with fathers who stayed at home with their child and analysed the data of the Hungarian census of fathers who applied for paternity leave.

**RN13S10 - Family Life and Children Arrangements**

**Doubled homes – doubled social ties? Children’s social networks in post-divorce dual residence models**

Ulrike ZARTLER (University of Vienna, Austria) | ulrike.zartler@univie.ac.at
Kathrin GRILLENBERGER (University of Vienna, Austria) | a0802756@unet.univie.ac.at

Rising divorce rates, modified post-divorce roles of fathers, legal amendments and changes in the construction of parental rights have led to an increasing number of children who live in dual residence models. This means that children have two places of residence and their time is shared ‘equally’ between both parents. Research on children’s perceptions of their everyday lives in such models is still scarce, and scholarly studies on children’s social networks are nearly inexistent. We address this research gap and ask how children’s social networks are affected when their places of residence are doubled. Our data basis consists of qualitative interviews with fourteen children who live in dual residence models. Theoretically, we rely on a social networks approach and explore social networks of children who live in dual residence models. We particularly ask in what way strong ties and weak ties are affected. Results indicate that children do not create completely new networks and that an enlargement of the social network is exclusively based on new weak ties. Regarding emotional aspects, strong ties remain relatively stable, while weak ties are more dynamic. Both types of relations provide different resources for children. Diverse aspects, like housing area and family type, influence the composition of the network members and the types of social capital that is provided. While the accessibility of social capital rises in the analysed networks, this does not necessarily apply for the use of these resources.

**Fetter and Chain: Czech Buddhist Converts Experience of Parenting in Detraditionalized Society**

Zdeňka PÍTRUNOVÁ (Faculty of Arts of Masaryk University Brno, Czech Republic) | ZPitrunova@seznam.cz

The religious minorities have undergone important demographic changes during last decade. Arrival of the second generation triggered a new issues and debates as religion can be considered a core dimension of personhood, an important source of values, life purpose, communal belonging. The contribution is based on a qualitative research intending to shed light on emic perspective that forms attitudes of Buddhist parents (who themselves converted to religion on the base of personal decision in the adulthood) towards socialization of their children. The socialization is a process into which different actors intervene: members of broader family, school, media, religious authorities, peer group etc. In qualitative interviews parents clearly
expressed feelings of unease and doubts about their way of parenting and worries connected with influence of “majority society” (emic term) on their children. They perceive parenting as new spiritual goal and they seek the way how to become authority for their children. They attempt to create a local Buddhist community which would make sharing of the practise with children possible and also help them to bring up children in convenient environment. Community would help them maintain a living collective chain of memory (Daniele Hervié -Léger) as a source of meaning for their children. We can observe that due to the lack of sources (authority, background, members) the creation of local community must be fostered by different forms of relationship with global community.

So you are staying at home? The everyday practices of Polish teleworkers.
Jacek GADECKI (University of Science and Technology AGH, Poland) | jgadecki@agh.edu.pl
Magdalena ZADKOWSKA (University of Gdansk) | magdalena.zadkowska@ug.edu.pl
Marcin JEWDOKIMOW (Cardinal Stefan Wyszynski University in Warsaw) | info@uksw.edu.pl

The aim of the paper is to present the results of a 30 months’ intensive ethnographic research on a group of contemporary Polish teleworkers and their families. Recent media representations of home-located working activities show that the fusion of work and home in the same space may be a near future, but it is a still a new and challenging situation for many households Working at home on the basis of telecommuting isn’t really a chance, but rather one of the major challenges leading to serious problems and limitations both in family and work life. The ethnography we offer discovers newly established practices of everyday life occurring in the different structures - “the daily puzzles of real people who live their work and households lives” (Devault 1999: 52).
By using mix of qualitative methods (in pair interviews, photography, dairies) We develop the research methodology to investigate the household as an socio-spatial situation, also.

Cohesive or not? Polish families from adolescents’ perspective in over a decade of research
Magdalena ROSOCHACKA-GMITRZAK (University of Warsaw, Poland) | m.rosochacka-gmitrzak@uw.edu.pl

The presented material is part of a broader research project of mine, carried out in the years 2002/3 and 2013/14 in Poland. The gathered data was a panel research. The paper depicts family bonds “captured” via a notion of social cohesion. With quantitative research (survey questionnaire administered), I examined family cohesion of adolescents living in different environments: urban and rural one. The entire sample, covering both turns of scrutiny, accounted for 1489 of secondary school students.
The purpose of the research was to investigate family cohesion from adolescents’ perspective. The family itself, as a social institution, is undergoing broad changes. Yet how do the changes influence family life of adolescents? Are there any transformations observed between the years when the scrutiny was carried out?
On the theoretical level, major findings of the research introduced in the paper, were to:
- exploit the notion of family bonds (as kind of social bonds) and develop their understanding via a notion of social cohesion
- expound the above further, in the search for more “European” synonyms portraying social bonds through sociological concepts of i.e. social solidarity, collective consciousness (as in Dürkheim’s works) or social identification.
On the practical one:
- offer a perspective supplying sociological imagination with “hints” to handle differences, here –
on the level of urban and rural families of adolescents
- provide reflective material for various family/adolescents researches and practitioners: teachers, social workers, social and culture services providers such as public administration and/or NGOs.

RN13S11 - Mixed/Interrmarriage Partnerships and Families

Patterns of Intermarriage in Switzerland: The importance of linguistic homogamy
Jörg RÖSSEL (University of Zurich, Switzerland) | roessel@soziologie.uzh.ch
Julia H. SCHROEDTER (University of Zurich, Switzerland) | schroedter@soziologie.uzh.ch

Factors that hinder intermarriage between individuals of different ethnicities or nationalities can
often be subsumed under the header of culture. Differences in cultural norms, religious beliefs
and more general values, for instance, are among those factors known to impede partnerships
between members of different ethnic or national groups. Language is also one of the key
cultural factors influencing partner choice and marriage behavior. Contrary to many other
cultural features, the effect of the language, or more precisely that of the mother tongue, can
hardly be separated from the effect of nationality alone. In this article, we aim to disentangle
partially the influence of the “culture” on bi-national marriages as we disjointedly analyze the
effect of linguistic and national homogamy. We use the multilingual country of Switzerland as a
test case as it allows differentiating marital unions to co-nationals and non-nationals, each with
the same or a different mother tongue. Our results suggest that, in addition to spatial barriers,
linguistic differences are the largest obstacles to ethnic or national intermarriage. Accordingly,
linguistic homogamy plays a major role in bi-national partner choice which is only then followed
by religious homogamy, age similarity and educational homogamy.

Ethnic differences in poor parents’ educational expectations and parental
practices in Hungary
Ildiko HUSZ (Hungarian Academy of Sciences, Research Centre for Social Studies, Hungary) |
husz.ildiko@tk.mta.hu

Several studies have demonstrated the profound influence of family background on children's
educational attainment. In addition to financial resources, many other factors, including parents'
educational ambitions and expectations play important roles in supporting the education of their
offsprings, especially when these are associated with cognitively stimulating parental practices.
The effects of family background on children's educational attainment are particularly large in
Hungary. Children of poor families are less likely to study in secondary and higher education.
This is particularly true for Roma pupils, whose participation in post-elementary education is
even lower than that of their poor, non-Roma peers. Most of the discussion about the Roma's
low academic attainment deals with the role of the education system, while studies examining
the impacts of home environment and parents' educational expectations are relatively few. The
aim of the presentation is to highlight some ethnic- and gender-specific features of parents'
expectations for their children's educational attainment. The analysis is based on a
questionnaire survey carried out in 2013. In order to minimise the effect of school performance
to educational expectations, a subsample of pre-school children (0 to 5 years) was selected
(N=2070). Statistical methods (bivariate analysis and logistic regression) were used to explore
the social and cultural background of expectations. The results show that when all other
variables are controlled, Roma parents have less ambitious dreams than their non-Roma
counterparts. Not only the goals, but the means are somewhat different: parental practices
advantageous for later school success are less widespread among the Roma than the non-Roma.

**Dynamics of mixed unions. The case of Hungarian ethnics in Transylvania**

Mihaela HARAGUS (Babes-Bolyai University, Romania) | mihaela.haragus@ubbcluj.ro

Ethnically mixed unions act as a connecting element in a society. The spread and stability of mixed partnerships are considered indicators of social cohesion and well-being of ethnic minorities. Regarding partnership formation, similarity of traits has been found as the dominant pattern; nevertheless, there are trade-offs among partners’ characteristics: similarity on some dimensions may be more important than on others. This is the case of inter-ethnic unions: even if cultural differences are fostered from the beginning, (similarity on) other characteristics linked with socioeconomic and cultural resources may be more important determinants of union formation. The aim of our work is to have a deeper insight on union formation and dissolution, from the ethnic minority’s perspective.

We focus our investigation on Transylvania, the western Romanian region with an important Hungarian minority (19% of the population in the region). We work on a representative sample of Hungarians from Transylvania - Turning Points of the Life Course – Transylvania (2006) – that includes 2,492 persons (1,306 women and 1,186 men), aged 18-45. We investigate characteristics that favor inter-ethnic unions, examine whether the mixed union is in the form of long term commitment as marriage or rather in the more unstable form of consensual union, and whether the mixed union is their first or subsequent partnership. We also investigate stability of mixed unions, compared with endogamous partnerships.

Preliminary results show that endogamous unions start earlier in life than exogamous ones, and differences by sex, birth cohort or education level are less visible for exogamous unions than for endogamous ones. Ethnically mixed unions are more fragile than endogamous unions and persons who entered a first mixed union are more likely to enter a second exogamous one.

**"Diversi ma non troppo". International Mixed Couples and Cross-Border Marriages in Italy**

Claudia ZILLI (Università degli Studi di Milano / University of Milan, Italy, Italy) | claudiazilli1980@gmail.com

Traditionally, intermarriage has been conceived and analyzed as the output of migrants’ process of assimilation and intermingling with local populations. Nowadays, nevertheless, it is presumed that a good portion of contemporary international mixed couples and cross-border marriages are not necessarily the result of an assimilation process, not even of a previous migratory experience. Today many more different and complex motivations merge together around the conformation of a mixed union. Some of them may comprehend the output of more complexes processes of marriage’s and family life’s transformations such as the internationalization of modern and postmodern marriage/family forms; the opening of new (voluntary and/or forced) heterogamy and exogamy channels; or the formation of transnational communities.

In this study particular attention is paid to the couple’s formation process and the partners’ internal/external adjustments through different adaptation strategies and concrete negotiation practices, mainly but not exclusively of gender and cultural differences. It is further emphasized the instrumental and symbolic meaning of the marriage institution within an international context, and the instrumental role of the partners’ human capital in relation to the couple’s settlement and the foreign spouse’ integration process in the host country.

The terms Mixed Couples, Intermarriage or Cross-border Marriage -which have been used interchangeably although the different legal implications of the marriage itself- refer to the social
institution by which two people (traditionally identified as heterosexual but lately not only) from a different race, ethnicity, religion, cultural background, nationality, etc., unite to each other by an affective bond (although not necessarily) that is socially and ritually recognized and that it usually involves (according to the conditions of the union itself) legal effects. However, and most importantly, a constructivist analysis of the intermarriage concept makes evident that what it has continuously changed is the kind of social category at stake for a couple to be socially and legally considered "mixed"; the rules and instruments by which the host society, and the State in particular, have dealt with and regulated mixed relationships; and the many different grades of "mixity" that are usually drawn within a very complex and dynamic power relation system that varies from one society to another, from one historical period to another, and from one group to another. Furthermore, parallel changes have been observed in relation to the available resources that individuals have in order to cope with the internal and external potential difficulties that may be faced within a context of "mixedness".

The relevance of this topic goes far beyond its conceptual relative novelty, especially because relational encounters with different "others" have been observed all along human history; but it lies on the analysis of contemporary overall diversity and the way in which this is perceived and managed in a particular national context, which is internally very much heterogeneous, and furthermore it is currently experiencing both labor market and migration pressures, such as Italy. If the institution of family, with marriage as its main legitimating ritual, has experienced deep transformations during the last century through increasing marital instability to favor instead a biographic de-standardization process (systemic individualization), and thus an acknowledgment of an increasing amount of family typologies such as unions outside of the marital bond, second-marriage unions, gay unions, mono-parental families, etc.; such biographic de-standardization gets much more diversified and complex if we also consider the increasing possibilities and/or constraints in terms of spatial and virtual mobility that certain individuals have experienced especially during the last decades.

In order to deeply understand the complex processes underlying the incidence of this social phenomenon, this study proposes to analyze it moving from a contextual macro sociological perspective to a micro socio-psychological one; employing analytical resources from two study areas, Sociology of Family and Sociology of Migration. Thus, theoretical macro-analysis is developed through the lens of economic and social theories related to the transformation of the institutions of marriage and family. Such analysis will move from the functional perspective of extended and nuclear family's transformations, to the notions of "companionate, romantic and confluent love" (Gidden's reflexive nature of modern love and intimacy), and "world families" (Beck's reflection of individualistic values in the conception of world-family).

And afterwards a micro-analysis of the mixed couple's formation process; its social and cultural dimensions will be performed according to the insights offered by previous empirical research and the contribution of analytical frames developed under the multidisciplinary study area of migration studies (integration frame and acculturation strategies; Berry, 1980; Kalmijn, 1998; Schiller et. al. 2006).

Finally, a description of the empirical research developed with international mixed couples/marriages from Italian/Mexican origin will be presented. This research employed mainly qualitative methods; biographical narrative and semi-structured interviews with 30 couples applied in the Italian region of Lombardy, that hosts one of the largest number of overall immigrants (11.3% of the immigrant population), and one of the highest intermarriage rates. Such sample was constructed after observing that most Mexicans living in Italy (women in particular) do stay in the country precisely because of being part of a long term mixed relationship or intermarriage with an Italian citizen. Thus, the analysis of this particular “marriage combination” sheds light on the gendered character of the marriage migration phenomenon, as well as on the raise of a new kind of "emergent" marriage migrant categorization that does not correspond to none of the two larger migrant categorizations that are usually involved in
international intermarriage, thus, 1) Non qualified citizens (traditional migrants: guest workers, low qualified/educational attainment migrants, refugees or asylum seekers) and 2) Highly qualified citizens (new migrants, free mover or “Eurostars”: mobile students, transnational workers and expats) (Favell, 2003).

Insightfull results were found about the couples’ formation and negotiation’s processes, the “mixity” experience of each particular couple; the multiple characteristics of the foreign partner’s integration process in the host society; and the main practices that the partners do implement - depending on their available human capital and structural restrictions- in order to deal with the multiple challenges and potential cultural shock experienced both inside and outside the couple.

RN13S12 - Migrant and Transnational Families Across Europe

Proving Love? The Governance of Migrants' Privacy, Marriage and Sexuality
Lisa Marie BORRELLI (University of Bern, Switzerland) | lisa.borrelli@soz.unibe.ch
Tobias Georg EULE (University of Bern, Switzerland) | tobias.eule@oefre.unibe.ch

This paper analyses current developments and research outcomes at the intersection of two important paradigms: migration management and sexuality. Recent high court decisions and legal changes in Europe have stressed that non-citizens have a right to freely act out their sexual orientation, be it within the context of “traditional”, often religiously defined marriage and family life or in other forms of sexuality, without stigma or harassment. In both cases discussed, the state is tasked to respect the right of migrants to partnerships, and to protect them from potential persecution in other nations. In both cases, relationships and sexual practices can lead to the attainment of legal residence, even trumping other considerations such as employment or qualification. However, this extension of migrant rights is always accompanied with the fear of abuse.

Based on original ethnographic research as well as an analysis of recent court cases and grey documents, we examine how immigration authorities decide on these cases. We argue that in order to prevent abuse, officials often go far beyond an acceptable infringement of privacy. However, this is due to a lack of supervision and guidelines, as well as the stark vulnerability of applicants, who in order to appear cooperative see themselves forced to comply with these infringements. Instead of seeing them as acts of pure humiliation, the practices should rather be seen as misguided practices of immigrant selection, often formed by traditional religious expectations of social life, which can be managed and curtailed.

Doing Baltic families in Ireland
Inga SABANOVA (Trinity College Dublin, Ireland) | sabanovi@tcd.ie

Since the EU enlargement of 2004, most of the migration studies emphasised economic aspects of labour migration. By ignoring dynamics of families, the agency of migrant parents remained out of focus. Hence, this paper looks at family migration though the lens of normality in terms of trajectories and paths, and diversity in terms of age, gender, ethnicity, life cycle, familial relationship, occupation, purpose of migration and its length. Family migration represents one type of many migrant trajectories, which may be influenced by a combination of different economic and non-economic factors.

This paper is based on a qualitative case study of 35 Baltic parents (mainly mothers) in Ireland. Migration from Estonia, Latvia and Lithuania became a permanent rather temporary phenomenon in Ireland, considering the fact that many migrants decided to settle down, have families or bring their children with them to Ireland.
The paper deals with the dilemmas of choice migrant parents have about their children's education and leisure in Ireland. The findings demonstrate that migration experiences are closely intertwined with the experiences of parenthood. There are different migration trajectories and family formations of Baltic families. The research also explores gender dynamics and motherhood, in particular, how mothers negotiate a balance between work and family life or explain their decisions to stay at home.

An exploration of family influences on perceptions of maternal competence among UK-born South Asian mothers in Britain
Shuby PUTHUSSERY (University of Bedfordshire, United Kingdom) | shuby.puthussery@beds.ac.uk
Katherine TWAMLEY (University College London, United Kingdom) | K.Twamley@ioe.ac.uk
Seeromanie HARDING (University of Glasgow, United Kingdom) | Seeromanie.Harding@glasgow.ac.uk
Alison MACFARLANE (City University London, United Kingdom) | A.J.Macfarlane@city.ac.uk

Background: Perceptions of maternal competence - the belief in mothers’ ability to perform parenting tasks successfully - is a key factor in facilitating women’s adaptation to motherhood and in enhancing the quality of mother-child interactions. Existing literature on maternal competence and efficacy has provided a rich understanding of women’s personal experiences of becoming ‘a mother’ and their achievement of competence; but the discourses have mainly been focused on the perspectives of White women. Women from minority ethnic groups constitute a significant proportion of the child bearing population in many European countries, such as the UK, with a growing proportion of second and third generations. Previous research has shown that mothers from some ethnic minority groups experience significant inequalities in health outcomes and social wellbeing around birth. This paper explores the impact of family influences on perceptions of maternal role competence based on the experiences of UK-born South Asian mothers in Britain.

Methods: Qualitative individual in-depth interviews were conducted with 17 UK-born South Asian first time mothers from Indian (11), Pakistani (5), and Bangladeshi (2) backgrounds as part of larger study of the maternity care experiences of UK-born ethnic minority mothers. Mothers were recruited mainly from six National Health Service (NHS) maternity units in England. The main inclusion criteria were that women were born in the UK and their parents were born abroad. The recorded interviews were transcribed verbatim and were analysed using the software Nvivo based on a ground theory approach.

Results: The closeness of the extended families and the powerful influence exerted by some family members, such as the mother-in-law, on motherhood experiences was clearly explicit in all the interviews. Family influences were perceived to be protective as well as challenging in developing a sense of competence as mothers had to navigate between their own constructions of motherhood with those of significant family members. The key themes emerged in mothers’ accounts included: ‘valuing support’; ‘recognising authority and taking charge’; ‘perceptions of competence and failure’; ‘establishing and maintaining identity as a good mother’; ‘managing discrepancies between own and family expectations’. Whilst all the mothers accrued great importance to the help and support they received from extended family, some mothers suffered from a strong sense of failure in their competence due to difficulties in initiating and maintaining breastfeeding and performing child care tasks arising from ‘excessive family involvement’. The conflicting advice received from different sources of ‘authoritative knowledge’ also proved to be creating tensions in their family lives.

Conclusion: Our findings add credence to the view that family make a powerful impact on maternal competence development among women of some ethnic groups such as the South Asian mothers. While there are (potential) protective characteristics of extended families,
managing discrepancies between own expectations and those of family members around the maternal role along with differing pace of cultural assimilation between oneself and significant others, can be a source of significant stress for second generation ethnic minority mothers living in western countries. In addition to contributing to the evidence on the role of family in supporting and inhibiting maternal competence development in different cultural contexts, the findings carry implications for policy and practice towards enhancing the health and social well-being of ethnic minority mothers and their families who are at risk of experiencing inequalities.

Language's Pivotal Role for Family Climate. Profiling Family Language Practices of Multilingual Families.

Graziela DEKEYSER (KU Leuven, Belgium) | graziela.dekeyser@soc.kuleuven.be
Sofie VANASSCHE (KU Leuven, Belgium) | sofie.vanassche@soc.kuleuven.be
Gray SWICEGOOD (KU Leuven, Belgium; University of Illinois at Urbana-Champaign) | gray.swicegood@soc.kuleuven.be

In this paper we will document the profiles of multilingual families’ language practices in Antwerp, Belgium. While previous research has predominantly focused on dichotomous measures of family language (e.g. only the heritage language is spoken versus multiple languages are spoken), our detailed data allows us to investigate per family dyad which language is used by various actors. For example, the language used by parents to a child may not be the same as the language used by the child to the parent. Such parent-child “language dissonances” can be negatively associated with family climate and with multilingual children’s well-being. However, we argue that language practices include more than language use alone. Up until now, differences in the normative climate (e.g. language use rules) surrounding language have seldom been investigated. In contrast, language brokering has been examined with some frequency but without consideration of other language practices in the home. Research questions are: 1) Which types of family language profiles can we distinguish? 2) To what extent are different profiles associated with family cohesion and family conflict? Survey data from 859 multilingual children from the “Multilingualism in Antwerp”-project will be analyzed by means of cluster analysis (RQ1) and SEM (RQ2). Key variables included are language (dis)sonance between child and mother/father/older/younger siblings, number of languages used in the household, language rules and sanctioning, language brokering, family cohesion and family conflict. Control variables include ethnicity, migration generation and SES. The data was only collected during the winter of 2014-2015. Detailed results are therefore not yet available.

Relational Partnering Practices Across Cultural Differences: The case of Persians in the UK

Ali AMIRMOAYED (University of Birmingham, United Kingdom) | axa013@bham.ac.uk

This paper investigates ‘relational partnering practices’ across cultural differences engaged in by individuals from the Persian diaspora in the United Kingdom. Adopting a critical approach, the driving theory of this research is the predominant theory of reflexive modernization, which shapes the current discussions of the sociology of family life and relationships in the UK. I interviewed 36 Persians who had had the experience of being in relationship(s) with one or more members of non-Persian social groups in the UK. Drawing on my qualitative data, this paper addresses the ways in which Persians construct ‘relational partnering practices’, which focus on practices related to personal connections with immediate and extended family members as well as members of other social networks such as friends, acquaintances and neighbours. Managing these relationships in conjunction with an intercultural union often
requires constant negotiations between members of a couple and influences their life together. For example, relational interactions often come together during culturally significant celebrations and ceremonies such as Christmas, Nowruz (Persian New Year), Islamic Eid holidays, Shia festivals and other traditional occasions. Negotiations about these cultural sessions, which are often about relationships with wider social networks, are vital in order to sustain a partnering relationship across cultural boundaries. In light of empirical evidence, this paper argues that partnering practices and intimate relationships within this study's particular social context may not fit in with the claims of individualization and de-traditionalization theses, and thus that further theoretical refinement and reconceptualization in the field are required.

RN13S13a - Economic Crisis and Family Lives I

“Here to Stay?” Intergenerational Coresidence in Time of Economic Crisis
Ronny KÖNIG (University of Zurich, Switzerland) | koenig@soziologie.uzh.ch
Bettina ISENGARD (University of Zurich, Switzerland) | isengard@soziologie.uzh.ch

Intergenerational transfers of space are an important part of solidarity in contemporary societies and a reaction to social inequality on different levels. This is particularly of interest in times of economic crisis accompanied by a withdrawal of welfare state solidarity, when intergenerational support becomes an important characteristic of parent-child relationships. Previous research reveals substantial country-specific differences in coresidence, raising the question of causes and reasons for European divergences. Apart from inequality on the micro level, meso (family) as well as macro level characteristics are important to understand different levels of providing living space within and between countries.

Against this background the proposed presentation will address intergenerational coresidence in an international perspective using the fourth wave (2010/12) of Survey of Health, Ageing and Retirement in Europe (SHARE) including 16 European countries (Austria, Belgium, Czechia, Denmark, Estonia, France, Germany, Hungary, Italy, Netherlands, Poland, Portugal, Slovenia, Spain, Sweden, and Switzerland). Multilevel analyses indicate that primarily individual needs and opportunities of the children affect an extended stay at the parental home. Furthermore, welfare state arrangements have a substantial effect in the distribution of using or providing living space in European families. Thus, intergenerational coresidence appears to be a response to economic insecurities at both, individual and societal levels. These findings support the presumption that coresidence of adult family generations can be understood less in terms of a chosen way of life, but rather of a greater influence of economic pressure and uncertainties.

The intergenerational solidarity in Romanian family. An analysis from qualitative perspective on households living in economic precarity.
Ana Maria PREOTEASA (Research Institute for Quality of Life, Romania) | anita@iccv.ro
A. Laura TUFA (Research Institute for Quality of Life, Romania) | laura.tufa@gmail.com

The paper has the objective to analyse the pattern of inter generational transfers in or outside household. Over the last 25 years, Romania has undergone a very long and difficult transition period, with several social and economic recessions. The recent economic crises contributed to a decline in the country’s social and economic situation, especially for vulnerable groups (youth, aged employees, disabled or ethnic minorities) that are less protected in the face of economic challenges. The data analysed in this presentation are coming from a qualitative research designed to depict the main strategies of the households living above poverty line, but severely deprived. The inter-generational transfers are very important among their economic strategies (as atypical employment, family farming). One very important finding is related to the change in
inter-generational transfers’ direction. In many multigenerational households the pensions are important stability factors, the older members (parents or event grandparents supporting the younger generation). In the same time, an important pattern is the transfer of agriculture products from the rural area to urban area. The research is part of a larger project build around the Precarious Prosperity concept, designed with the aim to depict a socio-structural category situated in between poverty and secure material prosperity. Stemming from a German line of research (Hubinger) and being refined by the Swiss research, the concept comprises the multidimensional poverty/prosperity (incomes and deprivation). This work was supported by the Swiss Enlargement Contribution in the framework of the Romanian-Swiss Research Programme, grant no. IZERZO_141975

Practices of young families and their networks under conditions of social economic inequality
Vida CESNUITYTE (Mykolas Romeris University, Lithuania) | v.cesnuityte@mruni.eu

The research aim is to explore relations between family practices and family networks in formation of objective (material) and subjective quality of life of young families. Everyday routine involve members of personal community (Pahl, Spencer, 2004), i.e. not only family members, but also, friends and other persons beyond kinship. Personal community is created through family practices and are doing familial relationships (Morgan, 1996; Smart, 2007).

The main research questions relate to situation of young families that just begin to form their personal communities. Issue is of particular importance under economic crisis. So, who help to ensure objective (material) and subjective life quality of young families? How family practices relate to creation of life quality of members of these families? How personal communities of various sizes and structures relate to life quality of them?

The analysis is based on data of the national representative quantitative survey carried out in Lithuania in end of 2011 – beginning of 2012. Additionally, data of ESS6 survey analyzed. Data of international study and comparative dimension in research are used in order to extend findings of the national level to an international level.

RN13S13b - Economic Crisis and Family Lives II

Economic crisis and inequalities in family lives: evidence from a large population survey in Italy
Sara MAZZUCHELLEI (Catholic University of Milan, Italy) | sara.mazzucchelli@unicatt.it
Miriam PARISE (Catholic University of Milan, Italy) | miriam.parise@unicatt.it

The present study is aimed to gain better insights into how families are affected by the crisis and which factors are likely to have the greatest impact in helping families to cope with these challenges. The data used for this study were derived from a recent large population-survey on family relations in Italy (3.527 individuals interviewed with CATI system).
A cluster analysis by the economic condition was carried out and two groups of subjects were identified: those who, in the current crisis, are forced to fall into debt and those who manage to make savings. The two groups are clearly differentiated. Those who have a low level of education, unemployed, redundant and atypical workers, divorced people and people with children live in a situation of greater difficulty (make debts). The analysis of this group, comparatively, highlights how the economic difficulties not only affects the daily lives of people from a material point of view, but have consequences also on relational functioning: there are negative effects on couple satisfaction, parental alliance, parental self-efficacy, and perceived parental stress. Moreover, these negative effects are extended also to the perception of the social context, undermining the sense of trust, the cooperative attitude and social capital. So, whilst financial and social difficulties are affecting a growing number of households, what is the role of the family? Is the family the ultimate bulwark against the crisis as highlighted by many studies? Results will be discussed trying to answer to these questions.

**Families and Food in Hard Times: Household Food Insecurity in Portugal, the UK and Norway**  
Rebecca O’CONNELL (Thomas Coram Research Unit, UCL, IOE, United Kingdom) | r.oconnell@ioe.ac.uk

With widening income disparity in Austerity Europe, ‘food poverty’ is increasingly recognised as a central issue in the field of health inequalities. However, little is known about the extent of household food insecurity or how different social contexts and social positionings mediate the experience. Focusing on young people (aged 11-15 years) and their families in Portugal, the UK and Norway, Families and Food in Hard Times seeks to address these issues through a multi-method embedded case study design.  
The paper draws on some early findings from Phase 1 of the ERC funded study, that includes analysis of large scale national and international data including the European Survey of Income and Living Conditions and the Health Behaviour in School-aged Children Study. It describes the extent of food insecurity for families with children in Portugal, the UK and Norway and identifies which children and households are at greatest risk of food insecurity in each country. The paper also discusses some methodological issues in particular relating to operationalising the concept of household food insecurity and its multidimensional and dynamic aspects. It will do so both in relation to conducting secondary analysis of different UK and international datasets and in constructing a screening method to be used to find households experiencing food insecurity in the qualitative phase. As the paper discusses, both endeavours involve the issue of concept equivalence with respect to economic, policy and cultural contexts. There is the further issue of equivalence between measures.

**The Impact of the Crisis on Children and their Families: lived experiences, perceptions, diversity**  
Karin WALL (University of Lisbon, Institute of Social Sciences, Portugal) | karin.wall@ics.ul.pt  
Leonor RODRIGUES (University of Lisbon, Institute of Social Sciences, Portugal) | leonor.rodrigues@ics.ul.pt  
Mafalda LEITÃO (University of Lisbon, Institute of Social Sciences, Portugal) | mafalda.leitao@ics.ul.pt

The economic crisis and austerity are impacting strongly on Southern European societies, with much attention given by sociology and comparative social policy to growing inequalities, poverty and weak welfare state support. In contrast, the experiences of individuals and families, in particular those of vulnerable groups such as children, have received little attention. Drawing on
a qualitative study of the crisis and children in Portugal in 2013, the aim of this paper is to explore the lived experiences and subjective perceptions of children from a diversity of social classes, age groups, regions and types of families. Based on a purposive sample of 77 children, in-depth interviews show that children perceive adults, rather than themselves, as suffering the most severe consequences of changing living and work conditions. Children from all social classes reflect on the problems of family life and schooling in times of crisis, on the need to reduce living standards, on the vulnerability of those who fall into poverty or have to emigrate. They would like to know more about the crisis itself and to participate actively in the solutions set up at local levels to support vulnerable individuals. They are critical of the lack of “hope” for the future and have doubts about their own future as students and active workers in society.

**Self-surveillance and sacrifice: Mothers’ perspectives on feeding the family in hard times**

Vicki HARMAN (Royal Holloway University of London, United Kingdom) | v.harman@rhul.ac.uk
Benedetta CAPPELLINI (Royal Holloway University of London, United Kingdom) | benedetta.cappellini@rhul.ac.uk

This paper seeks to understand how a group of British mothers on low incomes feed their family in difficult economic circumstances. Drawing on semi-structured interviews and observations of everyday food shopping, this paper explores mothers’ everyday coping strategies in the supermarket and the home and how these relate to the identity of motherhood. We apply the Foucauldian concept of surveillance to understand the everyday mothering work of feeding the family. Following Foucault (1975), contemporary power relations are characterised by a constant surveillance directed at producing docile bodies and minds, as individuals are aware of their “conscious and permanent visibility” (Foucault 1977:201). More recently Douglas and Micheals (2004: 6) speak of intensive mothering as constant state of mind characterised by self-sacrifice and “psychological police state” wherein mothers are constantly “surveil” and judge themselves.

The findings indicate that the current financial crisis has deepened the everyday intensive mothering and mothers’ self-surveillance. In fact, the reduced family income has intensified practices of self-abnegation and self-sacrifice as coping strategies of redirecting family resources to children and partners. These strategies are framed as a matter of ‘doing good mothering’, by enacting practices of self-control and disciplining the self. When deviations from such as a self-sacrifice regime occur, these are framed as a way of “putting the children first” (Chaudry 2004) and doing family. As such we observe that recessionary times stimulate a reinstatement of more traditional gender inequalities in the home and an intensification of mothering as a matter of self-policing.

**RN13S13c - Economic Crisis and Family Lives III**

**The Well-being of Italian Families with Children Aged 0-13: A Relational Approach**

Elisabetta CARRA’ (Family Studies and Research University Centre, Catholic University of Milan, Italy) | elisabetta.carra@unicatt.it

Foreword: At a time of economic crisis a morphogenetic process is likely to take place in the well-being-oriented choices made by families with young children on work-family reconciliation and parental care.
Hypothesis: Depending on different cultural and structural factors (financial resources, family type, location), families can be expected to adopt specific ways of life and base their overall satisfaction on different elements.

Methods: The present contribution is aimed at verifying this hypothesis through data from the ‘Multipurpose Survey on Households: Aspects of Daily Life’, carried out by ISTAT (Italian National Institute of Statistics) throughout 2012. For the purpose of this research, a special section dedicated to 3,745 families with children aged 0-13 was included in the ISTAT survey. The research hypothesis is argued in light of two categories: a) relational well-being, a key concept in Relational Sociology by Pierpaolo Donati, and b) a sustainable modus vivendi, central to the Morphogenetic Theory by Margaret Archer.

Findings: Results show that the ways of life (modi vivendi) of families with children aged 0-13 vary significantly, as families’ priority agendas are strongly connected to the continual interaction between family agency and structural conditions. Furthermore, satisfaction with work and with family relationships plays a key role in predicting overall satisfaction, thus overshadowing the importance of the financial situation.

Women’s Post-Divorce Household Income: the Contribution of Alimony and Child-Support. An Analysis of Belgian Fiscal Data
Elke Irène Ludovic CLAESSENS (University of Antwerp, Belgium) | elke.claessens@uantwerpen.be
Dimitri MORTELAMS (University of Antwerp, Belgium) | dimitri.mortelmans@uantwerpen.be

Gender inequality in post-divorce economic decline takes a prominent place among studies on the negative consequences of union dissolution (Aassve, Betti, Mazzuco, & Mencarini, 2007; de Regt, Mortelmans, & Marynissen, 2013). While e.g. custody arrangements and loss of partner’s income more often put strain on women’s, rather than men’s, post-divorce finances, the role of alimony and child support in alleviating their financial status remains unclear. Some authors doubt the potential of alimony payments for poverty reduction (Duncan & Hoffman, 1985; Skinner & Davidson, 2009), while others consider post-divorce monetary transfers an important source of income (Bonnet, Solaz, & Garbinti, 2013; Cancian, Meyer, & Han, 2011). If this last stance holds true, it provides us with a nuanced perspective on the economic consequences of marital dissolution and the post-divorce monetary decline for women.

Since detailed information on alimony and child support is rather scarce, little is known about their importance as components of women’s post-divorce household income. While most studies are restricted to survey data, we use large scale Belgian register data to delve deeper into the relatively undiscovered domain of these private transfers. As the Federal Public Service of finance has only recently granted access to this data source, our study provides the first analyses on detailed information concerning Belgian alimony and child support payments. In this paper, we focus on the magnitude of post-divorce transfers and clarify their importance in women’s post-divorce household income. As such we shed light on the actual financial transfers that exist between two former spouses and the possible potential of alimony payments in alleviating poverty risks among divorced women.

Economic crisis, precarious work, and unstable couple histories: A typology of uncertainties to explain first and second birth behavior in Germany
Annina T. AßMANN (Max Planck Institute for the Study of Societies, Germany) | assmann@mpifg.de

Especially in the context of the economic crisis, a vast literature addresses the impact of economic insecurity on the timing of childbearing in Germany. But little is known about the joint
and alternating influence of uncertainties in partnerships and working lives on first and second births in Germany. Synthesizing and extending economic theory (Becker 1960, 1981), preference theory (Hakim 2003) and an uncertainty of life approach (Friedman/Hechter/Kanazawa 1994), I argue, that this joint and alternated influence of uncertainties on childbearing need to be differentiated by preferences. I developed a theoretical typology of uncertainties that captures uncertainties in partnerships on one dimension and uncertainties in working lives on a second dimension. Assuming that a certain degree of stability is required to start or extend a family, fertility behavior should vary depending on the types and combinations of uncertainty a person encounters. The differentiation between work-centered women, family-centered women and women, who want to balance the two parts of life, helps to understand how uncertainties are perceived and finally coped with. In further analysis this theoretical approach need to be applied to empirical data. Using event-history analysis and data from the German Socio-Economic Panel, I will compare first and second births between 1990 and 2012. I am innovative in using new retrospective couple data to measure the characteristics of partnerships and drawing on approaches from sociology of family and work to measure uncertainties and precarious work.

The Effect of Employment Insecurity on First Childbirth from a Couple Perspective – A Comparison of Germany and Australia

Inga LASS (Bielefeld University, Germany) | inga.lass@uni-bielefeld.de

For some decades, fertility behaviour in Germany has been characterised by a growing number of people remaining childless as well as an increasing age at first birth. Parallel, a rising number of young adults face difficulties getting established in the labour market. Combining these developments, the paper explores how insecure employment conditions affect first childbirth. Following Becker’s New Home Economics, employment insecurity should lead to a postponement of first childbirth since a sufficient and secure income is seen as a necessary precondition. In contrast, Friedman et al.’s Uncertainty Reduction Theory suggests that employment insecurity causes people to speed up family formation to reduce uncertainty. Adding a gender role perspective, postponement should primarily be found among men, as the main earners in the family, and speeding up among women, mainly being responsible for family work. What has been neglected in many prior studies, however, is the fact that childbirth decisions are usually not made by single individuals. Rather, it is couples making a joint decision on the basis of both partners’ employment situations. Therefore, the paper investigates the effect of different employment constellations among couples on first childbirth, applying event history analyses to the German Socio-Economic Panel (2001-2013). Furthermore, in order to investigate the role of the welfare state context, the results for Germany will be compared to results from the Australian HILDA survey. The effect of employment constellations on childbirth is expected to vary between the two countries due to differences in labour market conditions as well as family policies.

RN13S14 - Theorising Contemporary Families and Personal Life

What is a family? Differing Cultural Conceptions and their Interaction with Family Lives

Detlev LUECK (Federal Institute for Population Research, Germany) | detlev.lueck@bib.bund.de
Throughout Europe there are significant differences in the predominant patterns of family lives, for example in the spread of births out of wedlock, in fertility rates, and in gender arrangements regarding paid and unpaid work. These differences can be found in cross-national comparison, but also within societies, e.g. comparing different educational strata. This paper studies Germany as a country with an intermediate position within Europe and a large heterogeneity within the society, especially comparing East and West. It examines to what degree these differences go along with differing cultural conceptions of how a family “usually” looks like and should look like, assuming that such conceptions are on the one hand shaped by specific experiences and on the other hand reproduce and stabilise the specific ways in which family lives are organised. The paper builds on the theoretical concept of “leitbilder” (Diabaté & Lück 2014; presented during the RN13 IM in Vilnius), meaning sets of collectively shared and pictured conceptions of “normal" states or processes, in the sense that they are personally desired, socially expected and/or presumably widely spread and self-evident (“This is how it is done”). And it builds on multivariate analyses, using the survey “Familienleitbilder” (FLB) conducted by the Federal Institute for Population Research in Germany in 2012 with n=5000, representative for the population, aged 20 to 39 (Lück et al. 2013).

Distances and family ties: a dialectical relationship between geographic and affective distances/proximities
Aurore FRANÇOIS (UCL, Belgium & ULG, Belgium) | aurore.francois@uclouvain.be
Laura MERLA (UCL, Belgium & UWA, Australia) | laura.merla@uclouvain.be

Contemporary family life is increasingly characterized by the experience of mobility, distance and physical absence. This paper explores the inter-relations between family ties, and two forms of distances/proximities in particular: geographic and affective. Our discussion is based on the hypothesis that there is a complex and dialectical relationship between geographic and affective distances, as well as between the various dimensions that compose each one of them. We propose a framework for the analysis of distances and family ties that identifies three inter-connected dimensions in geographic distance (‘objective’, ‘subjective’ and ‘(re)appropriated’) and two dimensions in affective distance (‘felt’ and ‘reappropriated’). The framework also identifies four contextual elements that influence the interconnections between these various dimensions in family relations: the political-institutional context, which refers to the ways in which institutions such as the State, companies, the Church etc. regulate family relations; the cultural-normative context, which provides norms and models that influence individual and family practices as well as the philosophies that underlie the institutional regulation of family relations; the technological context, that is, on the one hand, the technical aspects related to mobility and communication that can lead to space-time compression and, on the other hand, the intervention of science and technology in human reproduction; and finally, the relational context that refers both to individual psychological contexts, and relational systems that is, conjugal and family dynamics and significant others. We illustrate this framework with examples drawn from studies of various family relations, including intergenerational and couple relations in geographically proximate and transnational families.

Theorizing about families in the 21st century: is there a need for social institution as a sensitizing concept?
Liv Johanne SYLTEVIK (University of Bergen, Norway) | Liv.Syltevik@sos.uib.no
At the end of the 20th century, the study of family and intimate relationships was revitalized in sociology by scholars introducing the individualization thesis and the both empirical and theoretical critical responses that followed. Undoubtedly, this renewed interest was prompted in part by the rapid changes in family relations and practices. In addition, changes in sociology (an increased focus on culture and action) made family issues more relevant to and important for the sociological enterprise. This has led to what by critics has been termed, a new orthodoxy in which we highlight the open-endedness of intimate relationships and use concepts such as intimacy, personal life, relationships to avoid narrowing our understanding to the nuclear family and family practices to cover different ways family is “done”. The focus is also on interactive processes and the agency of individuals/family members in relations to social constraints as class, gender and migration. Possible constraining dimensions related to family as such are often left undiscussed. In this paper, I present some recent Norwegian research about families and intimate relationships and use institution as a sensitizing concept for addressing also institutional aspects of family life. I argue that the opposition between seeing the family as an institution or as practice is unfruitful. Instead, I argue that a concept of the family as institution as well as practice is necessary tools for the sociological imagination in understanding family today.

Loneliness and Urbanization in Europe: A Multi-level Approach
Christopher Scott SWADER (Lund University) | cswader@gmail.com

Despite its rich theoretical and empirical potential as a distinctly sociological phenomenon, contemporary analyses of loneliness in the context of city life are scarce. The present study aims to determine the roles of urbanism and individualism-collectivism in predicting loneliness across a wide range of European societies. Are individualists less lonely because they value primary ties less, or do objective features of social isolation matter nonetheless? The analyzed data come from the 2012 wave of the European Social Survey. I employ a multi-level logistic regression model in order to test the effects of urbanization and individualism in yielding dichotomous individual loneliness outcomes. I hypothesized that urbanization (at both levels) will predict greater loneliness, but that these effects will be usurped by the mechanism of individualism (alone and as an interaction with social isolation) when it is inserted into the model. Contrary to this, findings illustrate that individualism can reduce subjective loneliness perceptions, but this does not cancel out the impact of objective features of social isolation. Among these, the unemployed and those with low income have higher perceived loneliness even when taking into account if they are individualists.

The Palestinian-Israeli Family - Simultaneous and Contradictory Trends of Change and Preservation
Tal MELER (Zefat Academic College, Israel) | talmeler12@gmail.com

Most Western theories focusing on the emergence of an autonomous and separate self claim that the nuclear family is the central site for the construction of a mature individualized self. In the Arab family the notions of self do not conform to the individualist, separative, and autonomous self subscribed to in many Western theories. Speaking on ‘intimate-selving’ in Arab families Joseph (1999) conceptualizes the concept of ‘connectivity’. In the last three decades, Palestinian society in Israel has undergone various changes. Trends of change and preservation have evolved simultaneously. These includes Contradictory processes of secularism and religious reinforcement, rising education and employment rates, and at the same time rising unemployment and poverty rates and an encounter with the secular
parts of Jewish society in Israel. Therefore, I seek to offer a structural mapping of the familial contexts currently extant in Palestinian-Israeli society.

This paper will be based on a study I conducted holding semi-constructed in-depth interviews with Palestinian-Israeli single and married mothers. The data was analyzed, based on a feminist perspective and using intersectional-analysis, making it possible to relate to the studied category – the Palestinian-Israeli family – separate from society, and also reveal sub-groups in this social category. Unlike previous studies that addressed this society en bloc, I will argue that deciphering the diverse contexts in the life of women in this society mandates “deconstruction” of this social category. The differences must be addressed, and an understanding formulated regarding the implications inherent in being a single social category. This study can contribute to ethnographic thinking on Muslim women experience living as a minority in western societies.

**RN13S15 - Domestic and Gender Violence in Families**

**Why does he stay? - accounts from men that use violence in close relationships**

Susanne BOETHIUS (Lund University, Sweden) | susanne.boethius@soc.lu.se

Violence is not an accepted part of intimate relationships in Sweden today. Research has shown that men’s violence against women in close relationships is more severe and recurrent than women’s violence against men. Studies have focused on trying to explain why women stay in these relationships by analyzing the process women go through while staying or leaving a violent spouse. This study has its starting point in these questions but has its focus on a less explored group, the men. How do men that use violence in close relationships account for staying in the relationship? A total of 16 men that came to crises centers in Sweden, which are working with men using violence in close relationships, participated in semi-structured interviews. The results show that these men use accounts such as being a dedicated husband, being emotional attached to his partner and disconnecting the woman from the violence, as ways of justifying their relationship status. In the analysis the men’s accounts for staying or leaving the relationship is interpreted as ways to present a self that is morally acceptable.

**Turkish Women in Divorce: Violence in the Family & the Need for Women Friendly Policies**

Aylin AKPINAR (Marmara University, Turkey) | aakpinar@marmara.edu.tr

The ruling conservative Justice & Development Party in Turkish society is trying to promote marriage by emphasizing on "the protection of the family". The government has been alarmed by increasing divorce rates & decreasing fertility rates. Feminists on the contrary, hold on to the "women's human rights" perspective & point to the fact that, Turkish women's and especially divorcees’ lives are under threat because of violence directed against them by partners or ex-husbands. Especially when women of low income classes get divorced, they may be threatened to death, injured or are killed by their ex-husbands. I have conducted a theme-based qualitative research using in-depth interviews with 40 divorcees of different ages & social backgrounds living in three metropolitan cities in Turkey. Relying on the preliminary analysis of the data of my ongoing research I argue that, the patriarchal family exacerbates the situations of women of low income classes. These women are subjected to perpetuating violence in their lives starting from their upbringing sometimes including incest & rape. When they marry, they are battered by their husbands. When they manage to divorce they don't seek alimony from their ex-husbands even
if they have the custody of their children. Their sole aim is to escape from physical violence. As such, they live very vulnerable lives given the fact that divorcees are not supported financially by the Turkish state as against those women whose husbands have died.

**Economic violence against women in Croatia: testing the socioecological model**

Ksenija KLASNIĆ (Faculty of Humanities and Social Sciences, University of Zagreb, Croatia) | kklasnic@ffzg.hr

The view that violence against women (VAW) in intimate relationships is not only a private individual or family problem, but rather social problem which is still present in most modern societies has long been accepted in sociology. In this study violence is defined as patterns of behaviors that are aimed at demonstration of power, intimidation, coerced control and oppression of women, while economic violence is defined as behaviors that limit, control and exploit women’s economic resources and potentials. Economic violence is closely related to gender economic inequality. From a feminist perspective violence against women is considered to be a consequence of unequal gender power relations, but it is also the foundation for further deepening of gender economic inequality. There are numerous theories from different scientific disciplines that try to identify the causes of violence and the so-called risk factors associated with an increased risk of violence. In this study we applied one of the most frequently used multidimensional models for explanation of VAW: the socioecological model (Bronfenbrenner, 1979; Dutton, 1985; Heise, 1998; Dahlberg and Krug, 2002; Heise, 2011). This model classifies factors of violence into four levels: individual level, relationship level, community level and society level.

In our paper we will try to answer two main research questions:
1) What is the prevalence of economic violence in Croatia among women who live with their intimate partners and which are its most common forms?
2) Which factors from different levels of the socioecological model are associated with women's experiences of economic violence?

In the first national study on economic violence in Croatia we used mixed methodology approach to construct and evaluate new scales for measurement of this phenomenon. The study showed that there are four interrelated forms of economic violence, each being manifested by a variety of different behaviors. Survey research conducted on a representative sample of Croatian women with a minimum of one year of cohabitation with intimate partner (N = 601) showed that the most common form of economic violence against women is general economic violence, which was experienced by 25.4% of women. It is followed by economic violence after the termination of an intimate relationships (experienced by 23.6% of women from their ex partners), then by behaviors that men use to prevent the economic independence of employed women (20.1% of employed women), and finally the economic violence related to child support (8.1% of women with children).

Using Poisson log-linear regression models we tested the hypothesis of simultaneous relations of various factors from four levels of socioecological model with the experiences of individual forms of economic violence. The results showed that statistically significant predictors indicate factors from all four levels of the socioecological model (individual, relationship, community, and society level). Our attempt to explain these relations showed that it is necessary to simultaneously take into account a number of different theoretical explanations of the causes of VAW at different levels of analysis: micro (psychological), meso (social psychology), and macro level (sociological and feminist).

It is concluded that economic violence, like other forms of VAW in intimate relationships, can not be explained using absolute causal statements, but rather the results suggest that it is - similarly to physical or psychological violence (Carlson, 1984) - multidetermined.
Gender violence and struggle for recognition in family life: an insight from narratives of Latin American women in Italy

Angela M. TOFFANIN (University of Padova, Italy) | angela.toffanin@gmail.com

This contribution focuses on social representations of gender violence and its main phenomenologies, as described in 36 biographic interviews of Latin-American women currently living in Northeast of Italy.

We take into consideration two aspects: 1) gender violence against women, as it is recognized by interviewees, and 2) the struggle for recognition (Honneth, 2002) in the everyday life, especially with the partner and within the family context. Both aspects are linked to the migration experience and the organization of everyday life in Italy.

Studies on violence and migration (Menjavar, Salcido, 2002, Bimbi, Basaglia, 2010, et al.) highlight the specific vulnerabilities that women can suffer as women and migrants. Here, we consider that international mobility might represent a factor of change in gender relations: in some of the cases under scrutiny, asymmetry between men and women actually decrease after the interviewees’ arrival in Italy, whereas in other cases gender roles get “re-traditionalized”.

By focusing on patterns of femininity which the interviewees refer to and perform in everyday life, we look into the conditions for women’s agency and empowerment, and for the ones that allow women to experience a violence-free life. These conditions seem to be based on the construction of a mutual autonomy (material, socially symbolic and cultural as well), which set both partners free either to redefine or end their relationships.

Symbolic violence (Bourdieu, 1998) is adopted here as interpretive approach while intersectionality – among gender, class, race, etc. - (Crenshaw, 1991, Mason, 2002) as analytic perspective.

Power and control in female same-sex intimate partner violence

Alzbeta MOZISOVA (Masaryk University, Czech Republic) | amozisova@gmail.com

The presentation explores the role of power and control in intimate partner violence among women through the experiences and attitudes of lesbian, bisexual, trans* and queer women.

Preliminary results of a pioneering study in the Czech Republic with over 200 questionnaires with LBTQ women and several in-depth interviews with women who have experienced relationship violence in a same-sex relationship are interpreted with a particular focus on the role of power and control in intimate partner violence among women, addressing the specific context of heteronormativity and gendered expectations.

RN13S16 - The Role of Government: Social Policies and Interventions

The ‘problem’ of family in Irish drug policy

Eva C DEVANEY (University of Limerick, Ireland) | eva.devaney@ul.ie

Introduction

The domain of the family is evolving and expanding in drug policy. While the inclusion of family in drug policy may seem self-evident, this development has received limited critical examination with respect to the evidence and presuppositions underpinning its rationale. Recent scholarship has examined how ‘problems’ related to drugs are constructed and represented in policy, but a focus on family as a ‘problem’ has received limited attention. In this paper I trace how the family
has been constructed and represented as a ‘problem’ in Irish drug policy documents during the 1971 – 2009 period.

Theoretical Framework
My research is framed by theories of governmentality, introduced by Foucault (e.g. 1991, 2000, 2007), and developed by Dean (e.g. 2010), Miller and Rose (e.g. 2008). Governmentality refers to ways of governing populations and individuals through regulation of behaviour and individualisation of responsibility, often taking place through a network of sites and agents ‘at a distance’ from the State. This perspective identifies the rationalities for, and the technologies of governing, and aims to critically interrogate ideas that seem ‘taken-for-granted’. Through an assumption that all programmes have unintended consequences, this form of study can shed light on these effects using different lenses, such as gender, family structure or social class. It enquires into the processes of how humans are made into subjects, and subjects into objects of knowledge. It analyses the processes of how people are shaped into self-governing subjects, becoming active, autonomous, resourceful and responsible citizens in the name of freedom and the best interest of society. The questioning of how a certain conduct, or a group of people, becomes a ‘problem’ is central to governmentality. The process of problematising is closely linked to the process of devising responses to remedy the ‘problem’. Hence, problem representations serve to justify responses that may seem self-evident and make certain forms of governing possible.

Methodology
The data include the entire body of Irish governmental drug policy documents, seven texts, published between 1971 and 2009. I draw on Foucauldian discourse analysis theory, using the ‘What’s the Problem Represented to Be?’ approach, developed by Bacchi (2009). Underpinned by governmentality theory, this approach is specific to social policy analysis, and functions as an analytical tool to operationalise my theoretical framework. A realist perspective understands public policy as a government proposal to solve presumed problems that exist ‘out there’. Instead, this approach suggests that problems and solutions are constituted within policy, the role of expertise and knowledge being central to this process. The analytic process comprises six questions. The starting point is a policy recommendation, which identifies how a ‘problem’ is represented, which is then analysed for its underlying assumptions. The history of how the problem representation ‘came to be’ and ‘took hold’ is examined. Silences in the policy are elucidated. The consequences of the problem representation - discursive, subjectification and lived effects - are analysed. The process of how and where the representation was disseminated and defended is examined, and possibilities for how the problematisation could be disrupted and reframed are considered.

Findings
My analysis indicates that ‘family’ is increasingly persistent in discourses as policy has evolved. Discourses relating to family are gender neutral across all policies, even though activities like using drugs, caring for drug users and parenting are highly gendered. This precludes problem representations and proposed solutions relating to family having a gendered dimension.
I have identified two main contemporary problematisations: the resourceful/responsible family, and the problematic/risky family. The resourceful/responsible family is seen as having either inherent or potential abilities. While it is assumed that the first group possesses all the required resources, the latter group is seen as needing intervention to develop certain capacities, or to improve their own wellbeing and functioning. Ultimately, the resourceful/responsible family is seen as using these strengths in a supportive capacity to positively affect change in a family member in the context of treatment, and to manage potential risks in the context of prevention. As such, they are a co-opted as a support for service provision in meeting governmental objectives. This problematisation assumes families to be active, responsible and rational subjects that engage with their family member and other agents, and that work to improve themselves in order to attain normalised ideals of family, in the best interest of society.
However, it ignores family circumstances that may make active participation difficult, such as cultural, material and structural factors.

In contrast, the problematic/risky family refers to a specific subject category, parents who use drugs, whose children are perceived to be at risk. It is assumed that these families have deficits in relation to parenting, and individual parents are attributed responsibility for the life chances of their children. Framing this through a discourse of risk and child protection/welfare legitimises surveillance of family practices and targeted professional interventions that aim to ‘break the cycle’ and ‘safeguard the next generation’. It is presumed that such programmes can prevent more extensive interventions in the future. In this instance, individual families are not trusted to self-regulate and manage risk. While these can provide opportunities for transformative change, they also have the potential of further stigmatising and marginalising those families. They also do not consider the constraints and challenges – material, structural and attitudinal - that can make parenting difficult for families.

Conclusions
Family is persistent in drug policy as it is seen as an important instrument for biopolitical governing of populations. Contemporary problematisations are individualised and assume that some of the ‘problem’ and the ‘solution’ lies with families, and that families share responsibility for delivering governmental objectives. My intention is not to criticise family programmes per se, as they can contribute to positive changes for individuals and families; however, they are limited in their capacity to address complex issues such as drug use. They also close off alternative constructions of ‘problems’ and ‘solutions’, such as those that lie with gender, and political and socioeconomic inequalities.

New techniques of parenting support: the relation between early intervention and support from peer groups
Ella Tuulia SIHVONEN (University of Helsinki, Finland) | ella.sihvonen@helsinki.fi

Discussion on strengthening of parenting is a common issue in many European countries for the last 15 years. At the same time with increasing political and public attention on parenting numbers of family related programmes have been developed all over the Europe, for example, Sure Star in UK, REAAP in France, Centri per le famiglie in Italy, and Family Centres in Finland. The primary purpose of parenting support programmes was to prevent children’s behavioral and emotional problems, and parenting was expected to have a crucial role in this affair. This paper represents findings from research studying parenting support projects conducted in Finland between 2000 and 2010. The aim of the study was to examine the new techniques of parenting support and clarify, what is supported when ‘parenting’ is supported? Textual analysis was carried out on the project documents from 330 projects in order to identify the key themes of the data. As a result, early intervention, a particular parenting support method, was established in the projects. Further analysis revealed that early intervention emphasized responsibility of individual parents’, parents’ inner capabilities and own expertise. However, another parenting support technique was identified from the data, and it was ascertained as a technique of peer grouping in order to reinforce community. The peer grouping highlighted togetherness and social relations between the parents in the community. The results were interpreted from a viewpoint of changing welfare state, and how parenting is defined in neoliberal discussion about family and parenting support.

Family Friendly Working Culture in the context of Globalization: The Nordic Model in US working life
Hege Eggen BØRVE (Nord-Trøndelag University College) | hege.borve@hint.no
This paper explores the impact that working ideas related to the ‘Nordic model’ transformed across national borders has on working culture and family life. Using a case study of a Norwegian global knowledge organization located in US, I explore how employees practices ideas originating in a different welfare state model and a different cultural context. In contrast to US, Norway is a social democratic welfare regime (Esping-Andersen, 1990), has a regulated working life with high gender equality ambitions and well-developed work-family policies. The Nordic model encompasses institutional arrangements, which include employment regulations and welfare state services geared toward the inclusion of both male and female employees in working life. The transformation processes implies that ideas and practices developed in a regulated working context, so-called ‘The Nordic model’, crosses national borders and culture to a company located in a deregulated working context. The findings indicate that transformation of ‘The Nordic model’ has contributed to construct a family friendly work culture, which emphasized equality, regulations of working time arrangement, providing parental leave schemes and extended vacation arrangements. The findings indicate the significant of work policy on the organization level in the construction of working culture in the context of globalization. This may imply that national legislation and regulations have less importance on the construction of family friendly working culture.

Mothers’ re-entry into the labour market after a family related absence – the role of public childcare offers in Germany

Katharina DIENER (Institute for Employment Research (IAB), Germany) | katharina.diener@iab.de
Dr. Anne BERNGRUBER (German Youth Institute (DJI), Germany) | berngruber@dji.de

After 25 years of German reunification, the employment rate of women in West Germany increased during the last years but is driven by male breadwinner families and mothers working part-time. To reconcile work and family, public childcare was intensively extended in Germany. Since August 2013, there is a general legal right for childcare places for children older than age one.

We examine how mothers differ in their wish to return into the labour market in the first fourteen months of the child’s life. Subsequently, we show analyses regarding those mothers who plan a re-entry: What is their preferred extent of working hours after parental leave? We assume that general attitudes toward public childcare and their availability play a crucial role when planning and starting a re-entry into the labour market after parental leave. From a longitudinal perspective, our analyses aim to answer the question if mothers actually realize a re-entry and to what extent.

We use the first three waves of the KiföG (Kinderförderungsgesetz) panel study from 2012-2014 of the German Youth Institute. The study offers information about the current care situation of children under age three and mothers’ attitudes on public childcare. The sample consists of over 1,400 mothers with a partner. We estimate panel analyses for controlling individual characteristics of the mothers, attitudes and macro structural data. Preliminary results show that attitudes toward public childcare opportunities and their extension influence mothers’ wish to return. Further correlation can be found between used public childcare and the actually realized re-entry.

RN13S17 - Contemporary Challenges in the Legal Regulation of Family Life
Relational Subjects: Law, Gender and Family Relations in the European Court of Human Rights
Linda HART (Sociology, Dept of Social Research, University of Helsinki) | linda.hart@helsinki.fi

This PhD dissertation argues that a certain understanding of autonomous, contextual and relational subjects has shaped the way family relations are viewed in the case law of the European Court of Human Rights today. The notion of “relational subjects” developed in this thesis comes from Nicola Lacey and draws e.g. on the thinking of Robert Leckey and Pierpaolo Donati. It tackles the paradox of protecting family life, a bundle of criss-crossing human relations of affection, authority, care, dependency and possession from the perspective of an individual rights holder, the traditional subject of international human rights law. It is also attempts to understand how the boundaries of who is entitled state-acknowledged family relations have been drawn in recent decades in the European Court of Human Rights. What is included in the “family rights” of a person in the age of supranational European human rights law is explored and analysed in order to present a way to look at legally relevant family relations from the point of view of ‘relational subjects’ instead of status (e.g. male/female, married/unmarried) or identity (e.g. sexual or gender identity). Relevant ECHR cases (circa 100 texts between 1970-2010) present an authoritative and intriguing timeline of social and legal change in the field of European human rights norms concerning family life and have been analysed with the help of a conceptual framework resting on the biological, legal, social and gendered dimensions of family relations as well as a shift from status and identity to relations.

Modern reproductive technology and family ties: „Never mind that I am a complete orphan. The main thing is that I know the truth!“
Hana KONECNA (University of South Bohemia, Czech Republic) | hana@adamcr.cz
Magdalena PETRJANOSOVA (Slovak Academy of Sciences, Slovak Republic) | magda.petrjanosova@savba.sk
Marek ZEMAN (University of South Bohemia, Czech Republic) | marek-zeman@seznam.cz
Marketa SUDOVÁ (University of South Bohemia, Czech Republic) | canis.ludens@seznam.cz

In gamete donation the rights associated with the genetic link include the parents’ right to autonomy and privacy, the donor’s right to privacy, and the child’s right to know his/her origins. Each society must decide how to legislate in order to best reflect these rights within the context of that society. Sweden was first to abolish anonymity in 1984 and there is now a trend towards allowing children access to information about their gamete donor and to meet him/her. Other countries follow (AU, NZ, UK, NL, D, …). In our home country, Czech Republic, the anonymity is mandatory by law, but a proposal towards abolishing anonymity repeatedly appears. Identity of the child, as we have seen, seems to be the deciding factor in the debate in favour of open identity systems.
We will discuss these arguments in the light of current theories of identity, recent research in area of adoption and foster care and in the light of potential difficulties arising from an open-identity system. In democratic societies, one of the current synonyms for “best” is “transparent”; but transparency is here only a small element in an enormously complex issue.
Title of the paper is a quote from the drama "The Hour of the Truth" written and played by Czech absurd theater “Divadlo Járy Cimrmana” - but absolutely without any connection to assisted reproduction and “open identity” discussions.

Struggles for respectability and self-respect: parents’ statements in out-of-home placement proceedings of their children
Paula Johanna HIITOLA (University of Jyväskylä / Kokkola University Consortium Chydenius, Finland) | johanna.hiitola@chydenius.fi

This presentation is about the struggles of parents, who oppose the out-of-home placement of their children in the Finnish administrative courts. The presentation is based on my recently published dissertation, where the definitions of parenthood by family experts were analyzed in situations, where administrative courts deliberated whether children should be placed out-of-home. The data is comprised of court documents from administrative courts containing descriptions and evaluations of the parents’ life situations and perceived qualities as well as statements by the parents themselves.

Social positioning of families was analyzed by using a framework of different social capitals and distinctions which guide the processes of evaluating the families and organizing the ways by which parents position themselves. The concept of respectability was used to analyze the gendered, ethnicized and classed processes through which value was appropriated.

The analysis revealed that respectability was the focal point in the parents’ definitions of their own parenthood. In their statements, the parents often resisted and opposed the definitions of their parenthood offered by social work. The experience of injustice was sometimes expressed as anger and “ugly-feelings”. This was a way for the parents to gain self-respect and in many cases it was the only way for the parents to be heard. However, the parents also recognized the need to confess their weaknesses as parents. This meant that they adopted the definitions of themselves as poor, violent, ignorant or as alcohol abusers and thus positioned themselves in need of help and guidance.

JS_RN13+RN33a - Family Dynamics, Differences/Convergences in Gender Roles; New Inequalities and New Opportunities I

Work Arrangements and Gender Roles among Family-Farmers in Austria
Franz HÖLLINGER (Universität Graz, Austria) | franz.hoellinger@uni-graz.at
Sabine HARING (Universität Graz, Austria) | sabine.haring@uni-graz.at

Since some decades, agricultural economy in Austria is characterized by a significant increase in pluriactivity and part-time farming. This trend, in particular outside-farm employment of male farmers, goes together with a shift from male to female farm management and toward shared management. In this paper we investigate whether different work arrangements (combinations of farming and outside farm employment) as well as different farm-management arrangements are linked to differences in regard to gender role attitudes and the division of work-tasks between the farming couple. Our findings from a questionnaire-survey of 250 Austrian farmers indicate that the division of agricultural work-tasks and the balance of power between the farming couple is more egalitarian in the case of female or shared farm management than in the case of male farm management. Different work and farm management arrangements, however, have little effect on the gender division of household tasks and childcare. A comparison of the farmer survey with a representative Austrian population survey shows that all types of farming families maintain significantly more traditional gender-role patterns than other groups of the Austrian population.

Occupational Choice and Earnings Mobility in the Work-Life-Cycle - Empirical Evidence from Europe and the United States
Veronika V. EBERHARTER (University of Innsbruck, Austria) | veronika.eberharter@uibk.ac.at
Since the mid 1990ies, the structural shifts of the labor markets in many industrialized countries are accompanied by job polarization, and heterogeneous earnings dynamics (Acemoglu 2003, Autor et al. 2006, Atkinson and Piketty 2010). Empirical evidence shows that the earnings level is determined early in the career, and earnings mobility varies with the initial position in the earnings distribution, resulting to gender differentials of earnings mobility (England et al. 2007, Joshi et al. 2007, Manning and Swaffield 2008, Lalive and Stutzer 2010, Grönlund and Magnusson 2013).

Based on longitudinal nationally representative data (CNEF 1980-2012) the paper tests the cohort replacement theory with respect to gender differentials in earnings mobility. The paper analyzes earnings profiles of different cohorts of employees in selected European countries and the United States. Due to increasing labor market participation (OECD 2014) we suppose that younger cohorts of women will acquire more work experience so that human capital characteristics are fading out as determinants of earnings mobility differentials. We employ mobility measures, and panel regression techniques to quantify the level and the determinants of earnings dynamics in the work-life course (Fields and Ok 1999, van Kerm 2003, Jenkins 2011, Shin and Solon 2011, Pavlopoulos et al. 2014). The paper is organized as follows.

Section 2 provides the theoretical background and the related literature. Section 3 presents the data and the methodology used. Section 4 discusses the empirical results, and section 5 concludes with a summary of findings and future prospects for economic and social policy.

Intra-couple income distribution and subjective well-being: the moderating effect of gender norms
Gábor HAJDU (Institute for Sociology, Centre for Social Sciences of the Hungarian Academy of Sciences; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary) | hajdu.gabor@tk.mta.hu
Tamás HAJDU (Institute of Economics, Centre for Economic and Regional Studies of the Hungarian Academy of Sciences) | hajdu.tamas@krtk.mta.hu

In this research we examine the relationship between intra-couple income distribution and subjective well-being, using nationally representative data from Hungary (n=8012). We show that the association between the woman’s relative income (the woman’s share of the couple’s total earnings) and life satisfaction is negative not only among men, but among women. Since we control for financial disadvantages on individual and household level, socio-economic and job characteristics of the respondent and his/her partner, the result can be interpreted as the impact of traditional gender roles and the persistence of the traditional male breadwinner mentality: the higher the woman’s economic contribution the more the man’s breadwinning role is questioned, which leads to lower life satisfaction. Moreover, we show that gender norms moderate significantly this negative association: among those who prefer equal gender roles the woman’s relative income has no effect on life satisfaction, whereas among those who prefer traditional gender roles the negative association is stronger.

The practical implication of our research is that the conflict between the gender norms and economic reality reduces life satisfaction. Since in Hungary the gap between employment rates of women and men is decreasing, and education level of women have exceed recently those of men, if social values do not change, satisfaction will be lower. Thus, espousing egalitarian attitudes regarding gender roles and breaking down gender stereotypes might be important to increase subjective well-being.

Her family, his family: Married couples’ conceptions of family belonging
Aino LUOTONEN (University of Helsinki, Finland) | aino.luotonen@helsinki.fi
Anna-Maija CASTREN (University of Helsinki, Finland; University of Eastern Finland, Finland) | anna-maija.castren@helsinki.fi

The paper explores marital partners’ conceptions of family belonging and investigates the extent to which husbands and wives living in an in-tact family include same people in their family. The study draws from the configurational approach to family relationships and discusses the gendered nature of contemporary kin relations. We ask whether personal understandings of men and women, collected in individual interviews, confine to the immediate nuclear family, and if not, who are those included: members of woman’s or man’s extended family, her or his friends, or someone else? The data includes qualitative interviews of 34 individuals, women and men from 17 married couples, aged 25–41, living in Finland. The information on research participants’ views on their family was collected with a Family Network Method (FNM) questionnaire completed in the end of each interview. Convergence / divergence in husbands’ and wives’ views on family composition informs us on the extent to which different conceptions can co-exist in a first-time family and whether there is a gendered bias in the inclusion of outside-household members. The analysis allows us to discuss the gendered characteristics of familial bonding and to see, for example, if there are differences in the ways in which transitivity shapes configurations of significant family ties. The paper presents first results of a research in progress and contributes to the understanding of contemporary family as a set of individually and/or collectively lived relationships.
Do 'good' jobs and gender roles matter for childbearing decisions? Evidence from the low fertility/equality context Switzerland

Doris HANAPPI (UC Berkeley, United States of America) | dorish@demog.berkeley.edu
Valérie-Anne RYSER (FORS, c/o University of Lausanne) | valerie-anne.ryser@fors.unil.ch
Laura BERNARDI (University of Lausanne) | laura.bernardi@unil.ch

BACKGROUND: Where changes in fertility timing and sequencing do not suffice in explaining family planning, scholars typically think of socioeconomic conditions in terms of income, employment status or work hours as determinants for the formation of childbearing intentions. Yet, few studies have focused on the importance of perceived job quality and gender role attitude.

OBJECTIVE: We examine in what way perceived job quality in terms of job stability and occupational prestige is associated with the intention to have a child for men and women in the stable low fertility but high inequality context Switzerland, whether job quality matters equally for first and subsequent child intentions, and whether a gender-unequal attitude changes the effects of job quality on the childbearing intentions of men and women.

METHODS: Using data from the Swiss Household Panel (2002-2011) the authors estimate separate logit models of the childbearing intentions of men and women without children and those with at least one child.

RESULTS: We find that the intention of having a first child for women is negatively related to job instability. Our analysis suggests that the link between occupational prestige and childbearing intentions is more complex and depends on people’s gender attitude, which we argue renders job quality differentially salient for men and women.

CONCLUSIONS: Our findings provide empirical support for economic and cultural factors behind recent stable low fertility as found in many European countries and highlight the need for future research on these intervening mechanisms between the formation and realization of people’s childbearing plans.

Involved parenting and the reprioritization of mothering activities in contemporary Singapore

Kristina GÖRANSSON (Lund University, Sweden) | kristina.goransson@soch.lu.se

The rapid societal and demographic transformations across Asia have had a profound effect on family life and intergenerational relations. In this context, it is important to ask in what ways parenting strategies and the meaning of (having) children are reinterpreted and renegotiated, and how norms and ideals about parenthood are changing. In contemporary Singapore, the competitive education system is a major concern for families with young children. The anxieties around preparing one’s children for the future, coupled with widely shared expectations as to what constitutes responsible and involved parenting, falls heavily on mothers. As educational success is perceived as the primary route to upward social mobility, mothering practices tend to move away from basic caregiving and nurturing (tasks that are increasingly delegated to domestic helpers) and instead center on supporting and coaching children in their academic activities. Based on ethnographic data, I will discuss the ways in which such material and emotional investments in childrearing are rendered culturally meaningful in middle-class families in Singapore and its consequences for family life and gender roles. Particular attention will be given to the phenomenon of ‘mumpreneurs’, which refers to (generally well educated) women...
who leave the traditional labor market to become entrepreneurs, as they seek more flexibility to look after their children.

**Maternal imprisonment; the social inequalities on family life**  
Natalie BOOTH (University of Bath, United Kingdom) | n.booth@bath.ac.uk

Prison is a family experience. Currently, little research has explored the familial lives of female prisoners and their families in England and Wales. Despite this, the majority of women in prison are mothers, and many provided primary care to their children before incarceration (Caddle and Crisp, 1997). Most research attention to date has focussed on imprisoned fathers; as men constitute the majority of the prison population (Ministry of Justice, 2013). However, it is widely recognised that maternal imprisonment is different; more disruptive and distressing for families owing to the dominant, gendered roles women play in the family (see Corston, 2007; Hardwick, 2012).

This qualitative research addresses this gap by adopting a family-centred approach which privileges the perspectives of family members' who have experienced maternal imprisonment. Theoretically drawing on Morgan’s (1999) “family practices” and Goffman's (1961) depiction of prison as a “total institution”; the research explores how family members renegotiate ‘doing’ family during maternal imprisonment, whilst considering how processes within the penal context shape and interfere with family life. Using this sociological imagination, the research questions how these familial circumstances generates multiple, complex social inequalities for family members (both inside and outside prison) in the quality, availability and access to family life.

Three groups of family members are being recruited through a purposive sampling strategy; imprisoned mothers, caregivers of female prisoners’ children, and young people (aged 15-18) with mothers in prison. Preliminary results from in-depth, semi-structured interviews with family members will reveal the most prevalent developments from the ongoing fieldwork.

**Childcare, gender roles and family attitudes in six European countries**  
Lívia MURINKÓ (Hungarian Demographic Research Institute) | murinko@demografia.hu

Certain gender role and family attitudes may be seen as barriers to increasing the participation of men in domestic and childcare tasks and easing the burden of women, especially working mothers. Moreover, attitudes and the fit of attitudes and behaviour have important implications for relationship quality, fertility decisions, family cohesion and children's outcomes.

We look at attitudes towards gender roles and family and their relationship with the gendered distribution of child care in six European countries (Germany, France, Norway, Poland, Romania and Hungary), using data from the Generations and Gender Survey (2005/2007/2011). Countries with different welfare regimes, family policies, and employment and fertility patterns are compared.

Instead of using a simple traditional vs. egalitarian dichotomy, factor analysis is performed on ten items. Three sets of attitudes are identified: the importance of children and the two-parent nuclear family, the acceptance of gender inequalities, and the preference of domestic labour and child-rearing over paid work. The examined countries are characterized by different combinations of the three factors. Gender inequality is most accepted in the post-communist countries. The ideal of the nuclear family is important in France, Hungary and Romania. The interests of children over paid work are least emphasized in Norway and Romania. The childcare burden of Norwegian women is the lowest, followed by France, Hungary, Poland, Germany and Romania. There is a positive relationship between the acceptance of gender inequalities and the uneven distribution of child care in all the examined countries and for both sexes.
In this research project I want to analyze the central theme of time in the postmodern age. Essentially what I want to examine are the reasons of unhappiness and happiness, in the context of postfordist “society of services”, based on mass consumption. The objects of this study are the workers, men and women, in the service industry and, at one side, the satisfaction demand from customers, for example in the context of the shop in which they are working, and, on the other side, the satisfaction demand from the workers’ relatives and friends, in the familiar and friendship context. But workers are also themselves consumers: the problem of the immediate, instant, satisfaction of desires concerns the perception of social rhythms of all the classes in the Italian society. Time is a problem of power, and power is a problem of time: if you have or have not time to do something you want to do, and time to reason about the social reality you live in.

Relationships need routines, time and cyclical rhythms to be created and recreated everyday on a long-term line, but in the postmodern age all the stakeholders want to be satisfied immediately. I think that there are two dichotomous processes: people, including workers, want everything, not only objects to buy and consume but also affections and feelings, immediately; and simultaneously they need time and tranquility, because human beings couldn't live without routines, which are necessaries to create social life itself.

We can presume that people try to use their resilience and flexibility to engage this process of “deroutinization”, to live their life and search their happiness, in primis women, who are forced in their role of mothers and wives, even in our postmodern age, especially in the Italian catholic society. And so, the research questions are firstly (1) if and how do social actors perceive and can explain to themselves this phenomenon, and if and how do they rebuild new routine to face up to this process; and then (2) if and how especially women perceive and can explain to themselves this phenomenon, and how they rebuild new routines to face up to this process.

Methodology: qualitative methods
Step 1- participant observation and sociologic discourse analysis
Step 2 - interviews and inquiries, focus groups.

In Italy and above all in Milan there are many groups of workers that want to bring the problem of shift work, and especially holiday's and Sunday's work, to the Parliament: they raised thousands of signatures to request a national referendum. This is the paradigmatic example of the process of “deroutinization” and “immediatelyzation” that I want to analyze, in the perspective of the instant satisfaction in the age of postmodern capitalism.

The object of this study is linked to the theory of consumerism society and of the "society of services", with the ambition to be useful to get better the picture of the postmodern capitalist society, put into a perspective of connection among different areas of interest of Sociology: Time, Labour, Everyday life, and above all Gender Relations in the Labour Market and the Welfare State.
Women on the Romanian labor market: limitations and possibilities
Andrea MÜLLER-FABIAN (Babes-Bolyai University, Romania) | andrea_fabian_ubb@yahoo.com
Cristina BACIU (Babes-Bolyai University, Romania) | cribac2011@gmail.com

In accordance with the Social Europe (2012) Report of the European Commission, 40.3% of the Romanian population is exposed to the risk of poverty and social exclusion. This is a double percent, compared to the European average (24%). According to Romanian data, such risk is even more pregnant in the case of women: in 2010, the employment rate of the Romanian women (aged between 20-64 years old) was one of the lowest in Europe: 55.9% compared to 62,1% in Europe. The economical crisis made such problems even more dramatic. Framed in such data, the objective of my research is to analyze women’s access to labour market in Romania based on a survey which comprised 1200 vulnerable persons (people with Roma ethnicity, disabilities, youngsters from shelters, people without shelter, single parent families, families with more than 2 children, etc.). This study showed that those factors which explain women’s limited access to the labour market are: value orientation (i.e. traditional values according to which men are responsible for earning money, while women should remain at home and caring for their family and households), educational level, limitations from the part of the employers (i.e. the lack of flexible working hours), social stereotypes. Based on these findings, our investigation shows also some possible ways about how women can combat their limitations and extend their possibilities on the labour market.

RN14S01 - Migration

Marginalized or normalized? Working time patterns among immigrant women in Norway
Hanne Cecilie KAVLI (Fafo, Norway) | hanne.kavli@fafo.no
Heidi NICOLAISEN (Fafo, Norway) | hen@fafo.no

The Nordic countries are celebrated as “world champions” and “forerunners” with regard to gender equality. A high level of female labour market participation is identified as crucial to achieve gender equality, and in Norway more than 80 percent of women between the age of 25 and 59 engage in paid work. A substantial share, currently about 40 percent, work part-time, but their part-time work has for several decades been regarded as a “normalized” labour marked phenomenon with working conditions of part-timers equal to those of full-timers. Immigrants in Norway are met with great expectations concerning their adaptation to the dual earner family model. Consequently, the fact that immigrant women in general has far lower employment rates than Norwegian women, has received a lot of attention. Less is known about immigrant women who have entered the Norwegian labour market. In this paper we examine the working time patterns of immigrant women. Do they work part time to the same degree as ethnic Norwegian women? Is their part-time employment a stepping stone towards full-time work or an end station? And for those who remain in part-time positions - can their part-time work be understood as marginalized or normalized compared to that of ethnic Norwegian women?

The multivariate analyses are based on a panel register where women who were employed in 2009 are traced in public registers until the end of 2012. The data includes information on a wide range of variables, including employment status, education, public benefits, time of residence in Norway, country of origin as well as a variety of family related variables and
information related to the work place. Norwegian women without immigrant origins are compared with immigrant women from Iran, Iraq, Pakistan, Somalia and Vietnam.

We find that employed immigrant women work part time more or less to the same degree as ethnic Norwegian women. However, working time mobility is more common among immigrant women than among ethnic Norwegian women, as immigrant women are more inclined both to increase their hours and to leave the labour market entirely.

**Accounting for differences in women’s labour force transitions by ethnic origin in the UK**

Yassine KHoudja (Utrecht University, Netherlands) | y.khoudja@uu.nl

Lucinda Platt (London School of Economics and Political Science, United Kingdom) | l.platt@lse.ac.uk

Despite increasing female labour force participation (LFP) across Western countries, there remain large differences in LFP for women of different ethnic origins. While existing research has demonstrated that part of these differences can be attributed to compositional differences (age, qualifications, family context etc.) and to differences in gender role attitudes and religiosity, residual ‘ethnic effects’ typically remain. Moreover, dependence on cross-sectional data impedes understanding of when and how these differences emerge. Exploiting the longitudinal potential and large, nationally representative sample sizes of Understanding Society: the UK Household Longitudinal Study, we make an original contribution to the literature by investigating ethnic differences in women’s probabilities of labour market entry and exit. In addition, we explore how far these can be accounted for by a) human capital and demographic characteristics, b) the impact of relevant events (partnership and children), and c) gender role attitudes and religiosity. Focusing on the UK’s main immigrant origin groups and White majority women, we find that, adjusting for all these factors, Indian and Caribbean women do not differ from White majority women in their labour force entry and exit probabilities but that Pakistani and Bangladeshi women are still less likely to enter and more likely to exit the labour market, while Black African women have higher entry rates. We also find that Pakistani and Bangladeshi women’s labour market entries and exits are less sensitive to partnership and child-bearing events than other women’s. We reflect on the implications of our findings for both policy and future research.

**De-familialization of whom? Re-defining defamilialization in the light of migration flows and the transnational circulation of care**

Florence Degavre (UCL, Belgium) | florence.degavre@uclouvain.be

Laura Merla (UCL, Belgium & UWA, Australia) | laura.merla@uclouvain.be

The defamilialization concept has been abundantly mobilized for the study of the gendered character of welfare States and, in particular, their action to diminish the burden of child and elder care that heavily rests on women’s shoulders. But this theory needs to be revisited in the light of the growing importance of transnational mobilities of care, including the migration of care workers and the transnational « circulation of care » (Baldassar & Merla 2014) between these migrants and their geographically distant relatives. This paper aims at revisiting the defamilialization theory in order to better acknowledge the profound transformations within contemporary welfare states in relation with these transnational mobilities of care. This is done through the identification of the points of intersection between the circulation of care and the defamilialization theory. Based on two case studies of domestic migrant workers in Belgium, the paper highlights the importance of migration within European care regimes and questions the defamilialization of migrant care workers themselves. These women are indeed considered by
policy makers and employers as ‘defamilialized’ through the migration process, an illusion that partly justifies their exclusion from defamilialization schemes. This is particularly problematic in particular for migrant women who continue to care and provide for relatives living in highly familialistic states. These women are indeed located at the intersection between the care regimes of their home and host societies. This leads us to interrogate the conditions of exercise of their participation in the transnational circulation of care with their distant relatives, and ask in particular if transnational family solidarity necessarily involves the hyper-familialization of female migrants. We conclude with an exploration of possible directions for the transformation of care regimes ans migratory policies.

Out of The Country While in the Family: The Incomplete Liberation Under Patriarchy - Work-and-Family linkage of migrant women workers in a construction site
Lin CHEN (National Taiwan University, China, People's Republic of) | r03325014@ntu.edu.tw

By a study of four cases based on the fieldwork in a construction site in Beijing, the article breaks through the traditional conception on the controversy between the Patriarchy and women's liberation. Among previous studies on women leaving the rural villages and working in the cities, women's following their husbands into big cities as workers is a neglected group. The study discovers that the action of migrant peasant women workers does not equal the resistance opposite the Patriarchy, neither does it be classified as a regression of the Patriarchy. From the perspective of gender and domestic division of labor, the article proposes that these women respond to their own roles in the family in a more positive and initiative way, which is catering for their responsibilities. Firstly, the research is intended to make this group voice out; secondly, it helps to understand women's individualization in the new-form conjugal relationship resulting from employment. The research views the group in three theoretical perspectives: the production regime, dormitory system and the pure relationship between each couple.

The study discovers that the action of migrant peasant women workers does not equal the resistance opposite the Patriarchy, neither does it be classified as a regression of the Patriarchy. From the perspective of gender and domestic division of labor, the article proposes that these women respond to their own roles in the family in a more positive and initiative way, which is catering for their responsibilities.

Under the sub-contracting system, there was a hierarchy within workers in that construction site, including labor contractors (Bao Gong Tou), vice labor contractors, skilled and unskilled workers. Women workers at the age of 40s to 50s in this construction site were almost those who followed their husbands to the site to do some assistant jobs. Therefore these migrant women workers were engaged in different kinds of work. I describes four cases in my paper. And I focus on the individualization of current China.

RN14S02 - Self Employment

Next generation family business leaders: role-models for flexible working practices or caught in traditional role-definitions?
Isabell Kathrin STAMM (University of California Berkeley, United States of America) | mail@isabellstamm.de
Nicole HAMEISTER (Deutsches Zentrum für Altersfragen, Berlin, Germany) | Nicole.Hameister@dza.de
Fabian BERNHARD (INSEEC, Paris, France) | fabian.ber
Families who own and manage businesses offer an opportunity to study the coordination of everyday life and biographies under flexible working conditions and in extended families. Families in business are particularly interesting as they employ more than half of the German workforce and set important impulse for current and future work practices. With regard to the discourse on family-friendly-working policies, we analyze the actual work practices of this next generation in terms of flexible boundaries between life and work as well as the gendered division of labor at work and at home. Based on the German Panel Analysis of Intimate Relationships and Family Dynamics (PAIRFAM), our analyses focus on next generation family business members. Each family business member in our sample is allocated to a similar but nonfamily-business individual using propensity score matching (N=674). Findings from comparing the two groups revealed not only a higher work load and more income, but also a higher degree of flexibility in working conditions for family business members. We did not find significant differences between both groups in their attitudes and values in regard to gender roles. Interestingly, we found gendered differences in the way family business members use their flexibility: Working in a family business setting allows mothers to combine working in the business with taking care for the family, while fathers adhere to traditional role-definitions.

The alternative career woman: The rural home-based business, enterprising women and female empowerment

Tracey FORBES (University Of Aberdeen, United Kingdom) | r01tf12@abdn.ac.uk

At the heart of this research is the rise of the home-based business (HBB) as an alternative to the more familiar high street venture. HBB’s represent a numerically significant proportion of total business (Breen and Karanasios 2010) and are evidence of a vibrant and growing trend worldwide (Tandrayen-Ragoobur and Kasseeah 2012). Self-employment statistics released in August 2014 (ONS 2014) reaffirms earlier claims of a consistent upward trend in self-employment, observable in the UK since the late 1990’s. Although men still dominate the self-employment population (ONS 2014), women represent two thirds (64%) of the ‘homepreneurs’ in the UK (Enterprise Nation 2014). Dismal economic conditions, high rates of unemployment and the perpetual discrimination against women in the mainstream labour market are all said to be driving women to look for alternative employment opportunities (Tandrayen-Raggoobur and Kasseeah 2012).

Women’s frustration at discriminatory behaviour is said to be mounting (Weiler and Bernasek 2001). The association between high job satisfaction and low valuation, evident among women, now appears to be in decline (Rose 2005). This has led some researchers to identify female labour market dissatisfaction as an explanatory factor for a change in attitudes. Young women are said to favour a return to a traditional gender role; a role whereby they once again, operate predominately in the private sphere of the home, as housewives and primary care givers to children (Fortin 2005; Dench 2010; Johnston et al 2012). This research seeks to ascertain the extent to which these business examples challenge any claim of a ‘retraditionalisation’ of gender roles emergent in contemporary society. Whilst these business examples may not fully discredit these claims, they do suggest an oversimplification of the female response to labour market discrimination.

The growth of the HBB within the rural location adds further interest. Home-business ownership appears to be high among rural return-migrants and in-migrants (Bosworth 2006). These individuals appear to take the capital they acquire, within the urban setting, and apply it to develop a business venture within the home (Newbery and Bosworth 2010). Whilst we have some understanding of the value the labour market places upon female employees, via wage differentials between men and women and returns to skills, we have little understanding of the
value women place on their own worth and how they come to identify their career potential. We have little understanding of how women experience discrimination and how they respond to it. These business examples may well provide us with valuable insight into these experiences. The female-owned rural HBB might provide evidence that women are not passive victims of discriminatory labour market practices, nor are they content to reassume a traditional gender role, but instead they recognise their employment potential and actively seek to deploy their capital within the context of business activity centred upon the home.

The findings of the research are based upon analysis of data, derived from in-depth interviews with 44 female HBB owners, living in remote rural and accessible rural locations in Scotland. Prior to the interview participants were asked to complete a questionnaire, designed to collect biographical information, including levels of education, employment experience and current business interests. The information provided enabled participants to be assigned to one of three groups - rural ‘remainers’, ‘in-migrants’ and ‘rural returners’ and gave an indication of their access to various ‘forms of capital’ (Bourdieu 1990). The interview explored a number of areas of interest, including the factors that led women to start up and develop a business from home, the challenges they had faced, the advantages of working from home, the pros and cons of working for self as opposed to working for an employer and how they viewed the future, both in terms of their business and in future employment prospects.

The findings confirm an association with rural migrants and home-business development; 75% of interviewees identified as return or in-migrants. Returners had the highest levels of capital in the form of educational qualifications - educated to degree level or above. Those with the highest levels of education had established successful careers, which they later abandoned in favour of self-employment. The majority of women gave some account of the failure of the labour market to provide satisfactory and/or sufficiently rewarding paid employment. The positive experience of working for oneself was a recurrent theme in the majority of interviews, with women stating they could not work for an employer after running their own business.

What appears to happen is the emergence of a second career. Many of the return migrant women started a business based around an awareness of a gap in the market, and awareness that they possessed the skills to fill that gap. Others developed a business around an activity or interest they had in adolescence; activities that they had abandoned in favour of those which would form the basis for their early careers. The emphasis now is on the quality of their working life, rather than on quantity. They sought to acquire a regular income but also to gain intrinsic rewards, including a sense of self-worth, a sense of achievement, the ability to develop their full potential, whilst taking ownership of their own labour. The home becomes a space where women can more fully nurture their career potential and personal growth, alongside the responsibilities of home and family life.

Whereas access to some forms of capital varied between groups, low levels of social capital in the forms of networks, deemed necessary for business development, was universal. The women overcame this restriction through the extensive use of social media and cooperative business practices between female HBB owners, resulting in the formation of communities of support. The research findings provide some understanding of entrepreneurialism in relation to women, where the emphasis is on ethical trading and concern with customer satisfaction and quality control, rather than simply making money and expanding the business. However, this does appear to impact on their ability to maximise earnings and subsequently the value the customers and the women themselves place on certain skills.

**Corporate-led feminism? Coca Cola’s initiatives for the empowerment of women in the Global South**

**Sofie TORNHILL (Stockholm University, Sweden) | sofie.tornhill@statsvet.su.se**

This paper examines corporate solutions to gender inequality in the global South. In ongoing debates, a number of authors have argued that notions of female empowerment have come to justify contemporary economic relations, simultaneously making it difficult to address existing inequalities within global divisions of labor (Fraser 2009; Eisenstein 2009; Roberts 2014). Others have argued that corporate attention to empowerment have multiple, also potentially beneficial, effects on gender equality and civil society influence (Grosser & Moon 2005; Ferguson 2009; Prügl & True 2014). In order to engage with feminist understandings of the apparent support from business for some of its concerns, focus is placed on the Coca-Cola Company’s campaign “5by20” that aims to empower 5 million women in their role as small-scale entrepreneurs around the world by 2020. Important partners are the UN Women, governments, private businesses and NGOs. Based on interviews with company representatives, partner organizations, participants and participatory observations carried out in Mexico and South Africa, the paper discusses the meanings attached gender equality, the strategies employed to enhance female empowerment and what kind of societal transformations these initiatives open up for. The aim is to examine how the campaign is being elaborated in conjuncture with civil society organization, enforcing particular ideas about gender and labour. Thus, the paper explores gender equality promotion initiatives against the backdrop of conflicting tenants;
market solutions on the one hand and formations of collectivity around work on the other hand. The paper contributes to the understanding of how TNCs frame the organization of production and work, thus shaping the possibilities for gender and class-based collective demands for economic justice in the wake of corporate competitiveness interests.

**Women Farmers Whose Life Change in a Contest**

Bulent GULCUBUK (Ankara University, Faculty of Agriculture, Dept. Of Agr.Econ.-Turkey) | bgulcubuk@gmail.com

The Republic of Turkey Ministry of Food, Agriculture and Livestock has been organising a competition, whose title is “Women Farmers Contest” and which aims to promote social status of women who live in rural areas and are engaged in farming, to provide efficient knowledge, in Turkey since 2004. The aim of the competition; is to evaluate the knowledge and performance of women farmers, to assess the outcomes of training-publications for these women, to raise self-confidence of these women, to raise consciousness of healthy nutrition and producing high quality crop and to create, increase entrepreneurship. The Competition awards prizes, which are cash money, loan support, tractor and other equipment support, livestock and agricultural insurance, to women, come in city, regional and national levels competition. The competition takes places among women farmers based in the rural areas of 81 cities in Turkey. In the final phase of the city, region and Turkey Competition, there are questions about plant production, animal breeding, agricultural mechanisation, nutrition, child development, agricultural enterprise, agricultural organisation, the management of family ownership and handcrafts. “Women Farmers Contest”, which is knowledge competition and has been organised among women based in rural areas since 2004, generates huge excitement and creates competition environment among women and families.

In order to reveal the economic, social and cultural effects of the “Women Farmers Contest”, a survey was conducted in 24 cities in Turkey and among 61 women who participated in the final of Turkey Competition. The survey shows that there is an increase in the self-confidence of women and these women deal with agricultural technological activities more than the past, have much more structural questions in their minds and strengthen their position in family and social environment. In addition to these points, some basic facts from research on the effect of the competition can be summarised as follows; women want to appear and participate in all fields much more than they do now. The competition can serve as a source of respect, knowledge and a tool of social transformation among women in rural areas. There is a high level interest in the competition among young women (21-30 years old). After the competition, 67.7% of women started to drive tractor. Labour force participation rate has increased after the competition. 70.5 % women started to contribute to the family income at small or high level. Women, who work in agriculture sector, are usually from informal labour. The Competition increased the sensitivity among women and families to this issue or informal labour. The rate of social security system among women increased more than 50%. High level of women, 91.8 %, has mobile phones. Computer usage and access to internet increased among women who are under 40 years old. The Competition has important results also for “married” women. 36 out of 49 married women stated that “they can live without support from anyone else or depending on someone else” and 24 out of 49 women state that “there is an “increase” in the level of contribution to life and education of their children”. While there were 36 women participated in decision making process of family expenditure, this figured became 52 after the Competition. There were 30 women, who said “I can apply to agricultural institutions and organisations when I need” and this figure became 45 after the Competition. 67.2 % women considered the Competition as “informative-instructive”. This paper will present qualitative and quantitative data about women farmers, who
participate in the Competition, and the research on “effect evaluation” will present qualitative and quantitative data as well as analyse change observed among women after the Competition.

**Womentrepreneurship. A gender sensitive perspective on women’s construction of entrepreneurial biography**

Andrea SMIOSKI (University of Vienna, Austria) | andrea.smioski@univie.ac.at

Business start-ups and entrepreneurship are of great importance for economic prosperity. Despite the increasing number of women entrepreneurs, they have received little attention in scientific work so far. Women's entrepreneurship research is still only at the brink of adolescence – existing studies focus on gender differences in entrepreneurial behaviour (e.g. motives for starting a business, leadership styles, the readiness to assume risks, etc.) as well as on the multiple responsibilities of women managing business, family and household chores alike. However, this perspective, which is focused on aspects of deprivation, contributes to a maintenance of the dichotomy between male- and female-run companies and a dualistic thinking about gender. It obstructs both the view of successful female business owners and of the subjective accounts of women about how they establish and experience themselves as entrepreneurs. In women's entrepreneurship research there have been calls to address more profoundly the remarkable heterogeneity and diversity of female entrepreneurship and to pay greater attention to the various contexts in which women entrepreneurs are embedded. Against this background, this paper presents and discusses the study design of qualitative biographical research project at the University of Vienna, which aims at taking account of the specific ways in which women entrepreneurs construct their biographies in a gender-sensitive manner and shedding light on the biographical contexts in which narrations about business start-ups are embedded. It is argued that the ‘individual stories’ generated by the biographical approach transcend the binary ‘male-female’ classification and contribute to elaborate on a more differentiated picture of business start-ups by women.

**RN14S03 - Pay/Benefit**

**Made in Dagenham in context: the politics and industrial relations of equal pay 1964-1970**

Hazel CONLEY (University of the West of England, Bristol, United Kingdom) | h.conley@qmul.ac.uk
Kay GILBERT (University of Strathclyde, Scotland) | k.gilbert@strath.ac.uk

The fight for equal pay in the UK has been popularised by the film ‘Made in Dagenham’, in which women sewing machinists working at The Ford Motor Company at Dagenham in 1968 engaged in strike action for equal pay with men who, they argued, were doing equivalent work. The strongest point made by the film is just how entrenched sexism was in workplaces and wage structures prior to the equality legislation passed in the 1970s, and how brave the Ford women were to challenge such hegemonic discrimination. Further the film and previous researchers point to the pivotal role that the industrial dispute played in stimulating legislation for equal pay. What is less clear is the wider complex political, economic and industrial climate that fostered and supported institutional sex discrimination manifesting in a gender pay gap that has yet to be eradicated. Drawing on government Cabinet papers and trade union papers, this paper provides
a detailed historical account of the positioning of equal pay in centralised, multi-level collective bargaining structures in the engineering sector in the years leading up to the Ford dispute and the first Equal Pay Act passed in 1970. The paper highlights the influence of political strategies of pay restraint and productivity bargaining on collective bargaining and equal pay. Our analysis of the data examines how despite discriminatory attitudes to women’s work and pay that infused trade union and government pay policy, strong women activists within and outside Ford turned the tide for those that followed.

‘Equal pay for work of equal value’ – The impact of women’s movements and unions for institutionalizing equal pay laws in OECD countries
Thomas LAUX (Chemnitz University of Technology, Germany) | tholaux@web.de

Equal pay for women is one of the main issues for ensuring gender equality in modern societies. Nonetheless, gender pay gaps still exist in all OECD countries. Equal pay laws are an important measure for promoting gender equality within the labour market and for ensuring equal pay. Furthermore, equal pay laws are part of the economic citizenship of women. Equal pay laws are institutionalized in all OECD countries, but there are significant differences in their strength and scope. For example, one has to distinguish between ‘equal pay for equal work’ and ‘equal pay for work of equal value’. Based on this, the study inquires the relevant conditions for strong equal pay laws. The focus is on the impact of the civil sphere (Jeffrey Alexander) and world-polity (John Meyer) for institutionalizing equal pay laws. The analysis is conducted by applying a Qualitative Comparative Analysis (QCA), which combines a comparative and a case-oriented approach. It shows that two solution terms are sufficient for the institutionalization of strong equal pay laws: a strong women’s movement in combination with weak unions and strong unions in combination with an overall support for gender equality within society. The solutions of the comparative analysis are exemplified by two case studies (UK and Denmark).

Precarious Employment and Pension Reforms: A New Pensions Agenda?
Nata DUVVURY (NUIG, Ireland) | nata.duvvury@nuigalway.ie
Aine NI LEIME (NUIG, Ireland) | aine.nileime@nuigalway.ie
Aoife CALLAN (Novartis) | aoife.callan@novartis.com

Pension reforms have gained pace in the context of the economic recession in Europe. Regardless of the welfare state regime, a common policy reform is the shift to increasing individual responsibility for pension provision. This policy shift has occurred in the context of intensification of precarious employment and/or non standard employment, which has fundamentally altered the structure of the labour market. Thus a dissonance has amplified between the pension policy framework and the ability of workers to adhere to the new demands of pension provision. This disjuncture is a serious issue to address and requires a new structure that would ensure basic pension rights for all citizens.

In this paper we will identify the implications of the changing trends in pension provision and informalisation of employment in Ireland, particularly in the context of the economic crisis. We will then turn to a discussion of what changes are required in the pension system to facilitate access to an adequate pension for workers with insecure employment. We will draw on the recommendations made by Irish older women workers in earlier research by the authors exploring their access to pensions.

A Study on Russian Gender Trends in Home and Market Work
Sergey KAPELYUK (Novosibirsk State University, Russian Federation; Siberian University of Consumer Cooperation, Novosibirsk, Russian Federation) | skapelyuk@bk.ru

There is strong evidence of substantial gender inequality in market work and housework in Russia. The gender differences in Russia are well-studied. However, the previous studies cover relatively short period. For this reason, it is difficult to reveal the long-term trends. In addition, the majority of studies use data from the 1990s and the beginning of 2000s. This study offers recent evidence on gender differences and tries to explain their trends. The main source of data is the Russia Longitudinal Monitoring Survey (RLMS-HSE). This survey is a nationally representative panel household survey conducted every year. The present study uses rounds 5 to 22 covering the years 1994 to 2013.

To estimate the gender wage gap, the study uses Oaxaca-Blinder decomposition with separate estimation of the Mincer-type wage equation for females and males. I take into account sample selection bias and use Heckman procedure. I also explore gender differences in different parts of the wage distribution using quantile regression.

I calculate that adjusted female-male ratio was about 0.85 in 1990s than it declined to 0.80 in 2000s. In 2009 after the crisis, it increased to 0.85 but then it again declined to 0.80–0.81 in 2011–2013.

I also investigate the determinants of hours dedicated to housework by married individuals using fixed effects methodology. I reveal a slight decline of the average number of hours of housework in 2000s both for women and men, but the gender differences remain very large. I estimate the determinants of the gender differences in housework using a probit model.

RN14S04 - Working Time

Work-family conflict of Hungarian male managers
Nikolett GESZLER (Corvinus University of Budapest, Hungary) | kolettina@gmail.com

The work-life balance literature starts to acknowledge the importance of analyzing the challenges in work and family harmonization, although first of all as a woman issue, even if the discourse about it is formulated in a gender neutral way. The reason behind this is that the uninterrupted full time model of men is still often taken for granted. However masculinity is not something one dimensional and stable. There are more and more expectations towards men as well to take part in home and care duties, especially in child rearing. Men are not considered only as the economic supporter of the family anymore. Therefore it is not rare if a man faces similar difficulties in harmonizing his life as working women, especially when they diverge from traditional gender roles. Although there is still a huge gap in investigating men’s work-life balance.

Besides empirical results show that men in managerial positions often face high level of conflict. Job demands are growing, the competition-driven pressure to be responsive and flexible has forced organizations to downsize and reduce hierarchical levels, adding complexity to managers’ jobs, while family responsibilities are also rising. This might create tension between work and family life. In addition leaders are important in organizational change, especially in new fields and types of change like helping work-life balance in companies. Managers are in a position to help or hinder the development of a family supportive organizational culture, and they can be role models for other employees.

However even organizational initiatives supporting employees’ work-life balance (for example flexible arrangements) are not completely effective. In the globalized world there is a growing importance of information-based economy and shift from fordist to postfordist time regime. The
high performance organizations are increasing their expectations towards employees regarding time, energy and commitment. The constant and fast paced change of organizations, the more demanding intensified working practices and environments result in feelings of pressure, lack of time and general busyness. Employees are provided with smart phones and laptops in order to be available and be able to work from home as well. The new kind of information technology, the spread of networks and the increasing number of transnational companies have changed the use of working time and the question of flexibility dramatically. All of these have resulted in the new, flexible time regime promising greater autonomy, which is in sharp contrast to the traditional, industrial fordist time management with its standardized working hours and fix time schedule which draws a clear boundary between work and free time. Formal contracts regulating working time are often replaced by time norms built on moral expectations and total commitment. The expectations and requirements of the so-called greedy corporations are increasing towards employees. In this sense the hegemonic forms of masculinity is still associated with work that entails long hours and behaviors to demonstrate prioritization of the work. Those men constructing masculinity through flexible working might be construed as men rejecting the constraints of hegemonic masculinity. There are no regulations or restrictions to prevent him from working long hours. Long hours culture can demand that employees interested in career mobility work hard and demonstrate commitment and loyalty through being always visible. It seems as his individual responsibility to say ’stop’ but this does not happen because the pressure is too great on one hand and this kind of knowledge work is a major source of status and identity on the other hand. Therefore the question of harmonizing work and family seems to be a personal responsibility, an own “choice”, while the role of the organizational system is not emphasized. In the boundless time culture work is internalized, being always in the mind of employees without a need for employer to control them. The disciplining processes of empowerment and individualization make the employees themselves the driving force behind the long-hours work culture not noticing this invisible trap.

Therefore the aim of my case study is to map how male managers of a multinational telecommunication company in Hungary can harmonize the contradictory expectations of work and home when they are fathers. Although gender roles and the division of labor within the households are still quite traditional in Hungary (which suits the masculine norms of ideal employee), the need to spend quality time with one’s children and the role of relations and private life in general gets more and more attention among young Hungarian fathers as well. Therefore there is a relevance to investigate the topic in regard of male managers. Besides choosing a company with foreign background can help to see how a different organizational frame can influence Hungarian managers’ perception of work-life balance and to what extent is it supporting their needs.

The research questions focus on how they perceive and experience the conflicts between their work and family life, how is the organizational frame influencing this perception of work-family conflicts, how do the ideals of involved fathering and managerial identity affect work-family conflict and finally how manager’s partner are supporting their work-life balance.

In this conference I would present the preliminary results of 20 qualitative interviews made with male managers of the mentioned company.

Women managers’ mobile phone use to find work-life balance
Beáta NAGY (Corvinus University of Budapest, Hungary) | beata.nagy@uni-corvinus.hu

Women in leading positions are under continuous pressure of juggling between career and private obligations. They intensively face the problem, how to reach and keep the balance. The present paper will give a fresh overview on the issue, how women managers make use of ICT in general, and mobile phones in particular during their everyday activities. A huge amount of
articles have been published on the different theoretical approaches, like the spillover or the border theory, and also the number of articles dealing with women managers’ work-life balance has increased considerably. However, the use of ICT devices in this particular group remained almost unexplored.

Based on the results of a survey among working age population to be carried out in May 2014, twenty semi-structured interviews with highly positioned female managers were carried out in 2014. The questions focussed mainly on time constraints; however both to issue of stress and strain was taken into consideration as well.

The results intends to contribute to the debate, whether ICT devices support or hinder the opportunities for fulfilling a balanced life in this particular group in Hungary, where the gender order can be characterised by traditional expectations towards women.

The Influence of Relative Childcare Subsidy on Families with Young Children
Pei-Yuen TSAI (National Chengchi University, Taiwan, Republic of China) | pytsai@nccu.edu.tw

In accordance with the discourse of parents’ ‘free choice’, some governments have provided various policy options for parents to choose and make childcare arrangements. Nevertheless, there are still debates on whether governments should subsidise informal childcare, such as children cared for by their relatives. As subsidy policies for relative childcare are comparatively scarce, studies on this issue are also relatively limited. In order to fill in this gap and understand how these policies affect families with young children, this paper draws on the experience of relative childcare subsidy in Taiwan and explores the issues related to this policy. The Taiwanese government expanded the provision of childcare subsidy from childminder childcare to relative childcare in 2012. This paper reviews the policy making process to analyse the backgrounds, discourses and rationales behind this policy. Moreover, it investigates the implementation of this policy to demonstrate the policy effects and problems in implementation.

The aims of this paper are to address the following research questions: How does the relative childcare subsidy policy restructure the childcare responsibilities between the state, the family, and the market in Taiwan? How could relative childcare subsidy policy affect the gender relations, employment and childcare patterns of families with young children? What are the potential problems when the state regulates family childcare? This paper adopts documentary analysis and semi-structured interviews to investigate these questions. The findings of this research can provide empirical experience and contribute to the understanding of informal childcare subsidy policies.

RN14S05 - State Policy I

Why are some countries more successful in integrating women into the labour market? Evidence from multi-level analysis
Angelika KÜMMERLING (University of Duisburg-Essen, Institute for Work Skills and Training, Germany) | Angelika.Kuemmerling@uni-due.de
Dominik POSTELS (University of Duisburg-Essen, Institute for Work Skills and Training, Germany) | Dominik.Postels@uni-due.de

Increasing women’s employment rate has been on the agenda of the European Union for a long time now. With certain success: Women’s employment rate in the European Union is currently on an all-time high. However, the focus on employment rates ignores that employment is only one dimension when assessing women’s labour market integration, and that the extent of this involvement, namely the amount of hours worked is also key. We will show that countries in the
EU still differ tremendously as regards women’s, especially mothers, working time over the life course. Women’s average working time is especially low in countries such as Germany, the Netherlands and the UK while the life phase (single, partnership, motherhood, “empty-nest”) has much less influence in France, Sweden and Eastern European countries on working time decisions of women and mothers. As working time is a decisive determinant of income, career development and pension entitlements it is important to understand how institutional arrangements interact with women’s working time decisions. Using multi-level analysis we will demonstrate how prevailing gender norms, the availability of child care services as well as flexible working time arrangements impact on women’s working time patterns. Policy implications will be discussed.

**Historical perspective on the work of social workers and their workload**

Jussi TURTIAINEN (Finnish Institute of Occupational Health, Finland) | jussi.turtiainen@ttl.fi

My presentation discusses on the social workers’ problems of work and work load in the years 1958-2014 in Finland. Research material I use consists of Finnish social workers’ trade magazines. I analyse the themes that social workers considered demanding and stressful in their work. Secondly, my purpose is to explore the changing conceptions distress and the burden of work and locate them in the history of the welfare state. In the 1970s and 1980s circa 90 percent of social workers were female. However, the question of gender and its impact on the work and occupation was ambiguous in the trade journals. The gender issue was ignored in the majority of articles although the other writers considered that the gender had a crucial effect on the profession and working conditions. The issue of gender was attached to the low pay, diffuse unionization and weak professional prestige among the labour force and society in general. The central theme in the magazine articles was to improve the position social workers, and to help identify the sources of distress. The vocation and highly personalised labour was recognized challenging elements at work. Social workers also think that they have to serve two emperors; the client in need and society’s social cohesion and security. The presentation is based on my post-doc project funded by the Academy of Finland (267172).

**Female Employment Policy in Turkey: Empowering or Subordinating?**

Canet Tuba SARITAŞ-ELDEM (Hacettepe University, Turkey) | canet.eldem@gmail.com

Since 1980s, a restructuring process has been experienced by means of Structural Adjustment Policies, known as 24th January Decisions, in Turkey. Despite restructuring has generated similar tendencies, different from the experiences of other countries, the structural adjustment process has not been experienced as feminization of labor force in Turkey. Even in service sector, female labour force participation and employment rates have been very low and gender based segregated appearance of labour market has been a persistent tendency especially in urban areas. On the other side, it can be argued that since the second half of 2000s, there has been an intent to increase female labour force participation and employment rates on political level. The critical point in here is that this period has also been characterized by extended conservatism and deepened neoliberalism in Turkey. In this context, this study questions the rationale behind this intent to increase women’s labour force participation and employment rates and problematizes the constituted relationship between women and labour market within gender regime in Turkey. Study is based on the analysis of main policy documents and formal regulations on female employment in the last 10 years and aims to provide a comprehensive and critical framework on the main components of female employment policy in Turkey by
considering the patriarchal-capitalist articulation mechanisms among state, labour market and family.

**Gender Relations in Japan’s Labour Market: Can Abenomics Close the Gender Gap?**

Melanie CZARNECKI (Rikkyo University, Japan) | melanie@rikkyo.ac.jp
Nerys REES (Rikkyo University, Japan) | nerysrees@rikkyo.ac.jp

According to the World Economic Forum, Japan is ranked 105th in terms of global gender parity (World Economic Forum, 2013). Particularly, in the area of economics, Japanese women in senior management positions comprise a paltry 7% (Grant Thornton International Business Report, 2013). Despite the implementation of the Equal Employment Opportunity Law (EEOL) in 1986 and its subsequent revisions, gender inequality continues to manifest in discriminatory promotional practices and wage disparity. In fact, a government survey of the wage gap shows that Japanese women can expect to earn 70% of a man’s wage for equal work (Ministry of Health, Labour, and Welfare, 2011). This longitudinal research study aims to highlight the experiences of a group of management-track female business students through their career trajectory by analyzing their experiences during the interview, hiring, training, and promotion process. In particular, the researchers hope to determine what, if any, impact Abenomics has on changing the corporate culture to eradicate gender discrimination and better utilize educated and talented women in the workforce. Data collection will include surveys, interviews, journal writing, and focus groups.

**RN14S06 - State Policy II**

**The slow progress of gender equality in economic decision-making in the EU: the situation in Portugal**

Sara Falcao CASACA (ISEG - University of Lisbon, Portugal) | sarafc@iseg.ulisboa.pt

Despite the investment in education and human capital in general made by the European women, their representation in economic decision-making bodies is still very low. Firstly, the paper aims to provide an overview of the progress made by different European countries, both in terms of the normative / policy framework and of the numbers of women on managerial boards. It compares the different approaches as far as state regulation in Europe is concerned, and critically assesses the ambivalent and slow progress of the normative process at the EU level. Secondly, the situation of Portugal is observed in particularly and compared to the other EU countries. Since 2007, the National Action Plans for Gender Equality have incorporated concrete measures, including financial incentives, to encourage the promotion of gender equality in the business sector and in all organizations in general. A recent 2012 Government Order made it mandatory for state-owned companies to implement gender equality plans, and the publicly listed companies were also strongly recommended to put in place policies and practices to tackle gender imbalances, including top management. Public policies have been far ahead of social representations and practices. Studies have also shown that women in particular have been the most penalized group in terms of job opportunities and career prospects, due to the prevalence of discriminatory practices, unfriendly organizational cultures and traditional managerial approaches.
Why should I study? Reading the crisis gender impact on occupational path of young graduates in Italy
Domenico CARBONE (DIGSPES University of East Piedmont, Italy) | domenico.carbone@unipmn.it
Fatima FARINA (DESP University of Urbino, Italy) | fatima.farina@uniurb.it

In Italy, more than in the other European countries, gender differences still are a strong predictor of differentiated an unequal working and career opportunity. In the last decade female educational level have been increasing more than male one, but gender gap does not appear to be reduced. A new phenomenon is emerging of marked “gendered mismatch” between female education and (qualitative and quantitative) working opportunity. In the 80’ the increased level of education allowed women a massive and more stable access to labour market. Gender pattern of social and working participation are quickly and deeply changing, with significant consequences on gender system, poverty risk and on the entire national welfare system (mostly on women shoulders).
Nowadays gender discrimination (segregation, under occupation, pay gap..) strongly affects young women paths from educational system to labour market. Current literature shows that better university curricula of young women rarely become a comparative advantage by competing in labour market with male colleagues: young graduates women earn on average 116 Euros per month less than their male colleagues, with an unemployment rate of 26% compared to the 22% of young males. The aim of this paper is to analyze, through a diachronic perspective, the impact of current socio-economic crisis on all these structural inequalities.
Analysis will be conducted on Alma Laurea (a consortium of 72 Italian universities) Annual Survey data (2008-2014), in order to reconstruct and describe continuity and discontinuity in gender occupational structure, focusing on the highest and more qualified segment of young labour force.

Making reflexive legislation work: stakeholder engagement and public procurement in the PSED
Tessa WRIGHT (Queen Mary University of London, United Kingdom) | t.wright@qmul.ac.uk
Hazel CONLEY (Queen Mary University of London, United Kingdom) | h.conley@qmul.ac.uk

Perhaps the most innovative development in equality and diversity in the past 15 years is the move to introduce responsive or reflexive legislation. The public sector equality duty (PSED) is an example of responsive legislation enacted in the UK, representing a move away from top down, reactive law that depends on discrimination having already taken place to a form where those who have a direct stake in the PSED’s outcomes have a role in ensuring its success. Powers to hold public authorities to account through the PSED are particularly important in relation to the procurement function, given the increasing out-sourcing of public services, which reduces workers terms and conditions and has been shown to adversely affect women and ethnic minority workers and reduce the quality and reliability of public service provision. Although early duties provided public service users and workers, or their collective organisations with a regulatory right to be consulted, the role of stakeholders is absent from the EqA 2010 and the specific duties in England. Nevertheless, this paper uses illustrative evidence to argue that equality objectives can be pursued in the procurement of public services by building equality for workers and for service users into tendering processes and contracts. For these to be effective, though, there is a need for involvement of stakeholders, including trade unions and civil society, in scrutinising contract terms and monitoring outcomes. The paper provides a theoretical and empirical argument for the re-introduction and strengthening of statutory consultative rights for stakeholders in the PSED.
Regulating Gender Equality in Public Procurement.
Eva Katharina SARTER (University Bielefeld, Germany) | sarter@gmx.de

One of the most important changes Western European Welfare States underwent during the last decades was what Heinrich/ Lynn/ Milward (2009: i3) called “a steady, longer term transformation away from direct provision of goods and services through traditional structures of public administration toward more devolved authority and decentralized public services delivery [...]”. In this context, contracting out of (social) services has become quite common. This leads to a detachment from the public sector whereby public sector regulations do not apply to those employed in the services contracted out. As regulations on gender equality regarding public sector employment are oftentimes more favourable than private sector provisions, this imposes new challenges for upholding working conditions as well as regulations on gender equality.

At the same time, another development tackles the regulation of measures to foster gender equality in contracted services. Thus, while first regulations on public procurement were imposed with the Treaty of Rome, European regulations on public tendering successively gained in reach and in depth since the 1970s. As European legislation of public procurement is firmly embedded in market-building and the non-discriminatory logic of the internal market, it imposes strong constraints on the stipulation of social criteria such as measures to foster gender equality in national regulations of public procurement.

Against this background, the question arises which impact these developments have on gender equality in the workplace. Legal regulations of public tendering set the framework that determines whether and to which extent concerns about gender equality can be part of public tendering. They are thus of major importance when it comes to determining the impact of tendering practices on gender equality as well as the importance (that can be) attached to measures fostering gender equality in tendering. Focusing on legal regulations of public procurement, it has to be asked whether and how gender equality is included in public procurement regulations. Core points of concern are thereby not only the existence but also the scope of gender equality regulations. Do they go beyond the rather narrow focus of universally binding non-discrimination policies? Last but not least, it has to be asked in how far and where public procurement related regulations differ from public sector stipulations on gender equality.

Based on ongoing research on public procurement laws and practices, the presentation undertakes an in-depth analysis of a specific case. It focuses on Germany, whose federal structure allows economic regulations regarding public procurement to be passed at national as well as at subnational level. While the general framework of public procurement is set by the Anti-trust Act (GWB), it only include vague provision regarding social considerations in public procurement. Therefore, subnational regulation gains major importance; regulations of social criteria (among which gender equality) are thus, most importantly set out in 15 federal states' subnational public procurement laws and four statutory decrees on social criteria respectively gender equality in public contracting. A systematic analysis of gender equality regulations in these subnational laws and statutory decrees is given. The presentation thereby follows a twofold aim: First, it aims to foster knowledge on one specific case. Second, based on the comparative analysis of 15 subnational laws and four statutory degrees it suggests conclusions which may serve to guide further research on gender equality in public procurement. The presentation consists of three main parts whose main findings will be summarized in the end of the presentation.

The first part gives an overview of all subnational regulations on public procurement in Germany. Highlighting the divergence of the stipulations, it will be shown that gender equality is one point of concern for at least part of the public procurement laws. A number of gender related criteria are included in different federal states’ public procurement regulations. However,
each of these gender related criteria is thereby less prevalent than a number of other social criteria such as for instance compliance with ILO Core Labour Standards in the supply chain. Albeit important differences of the specific regulations, another characteristic of most gender related criteria in public procurement regulations is the fact that these are – with few exceptions – neither specified nor mandatory. Drawing on an ongoing study of public procurement practices in Germany, it will be argued that this may impose hindrances to the use of criteria relating to gender equality in public tendering as it leads to a situation in which attention to gender equality means increased administrative challenges, requiring additional monetary and personal resources and personnel capacities.

Based on the overview of gender related criteria in Germany, the second part of the presentation is dedicated to the comparison of those federal states’ regulations which do specify gender related criteria further. Thereby it will be shown that two distinct modes of specification can be distinguished: on the one hand specifications of measures promoting gender equality that are laid down in public procurement regulations themselves and on the other hand specifications on measures to be taken to foster gender equality that are laid down in the realm of gender equality policies or by cross-references to gender related regulations. Drawing on a comparative analysis of the measures specified in these regulations, it will be suggested that the mode of regulation – which determines the political field it is negotiated in – seems to relate to the scope of measures defined.

Based on the preceding parts, the third part of the presentation compares gender equality regulations in public procurement with those in public sector regulations. Two main findings will be presented: First, it will be shown that general differences among the public sector regulations can also be found in the respective public procurement regulations. Second, while public procurement related regulations include a set of regulations that do not exist in public sector regulations and strengthen measures to reconcile work and family life, regulations on gender equality in public procurement – be it in the realm of public procurement or gender policies – seem to shift the focus of gender equality regulations.

**RN14S07 - State Policy III**

**Comparative analysis of gender and extended working life in Ireland and the USA**

Aine NI LEIME (National University of Ireland, Galway, Ireland; Case Western Reserve University, Cleveland, Ohio, USA) | aine.nileime@nuigalway.ie

Policies designed to extend working life have become increasingly prevalent in European state and beyond. These policies include increasing state pension age, removing inducements to early retirement and requiring more years of contributions to build up an adequate pension. Such policies have emerged partly as a response to demographic ageing, the global financial crisis and, some would argue partly as an adoption of a neo-liberal agenda (Kalleberg, 2012). It is associated with the broader tendency to dismantle the Welfare State. There has been relatively little research on the gender implications of the introduction of extended working life policies. The EU and the OECD draw on a rhetoric of ‘Active Ageing’ to recommend the introduction of longer working life and it is largely assumed that this is beneficial for older workers (OECD, 2006). This paper draws on a comparative study of the USA and Ireland, being conducted as part of a Marie Curie project, analysing the employment and pension policies that have been introduced, and the economic and social context in each country and in the EU. It will use a feminist political economy of ageing and a lifecourse approach and will draw on broad trends in the employment data to analyse the likely impact of such policies for women and men and for the Welfare State. The increasing precarity of
employment in both countries and the likely health impacts for men and women in different types of employment – secure and precarious -will be considered (Standing, 2011).

**Gender mainstreaming in working organizations: A fruitful strategy or a passive administration?**

*Sara Marianne JOHANSSON (Karlstads University, Sweden) | sarajoha@kau.se
Clary KREKULA (Karlstads University, Sweden) | clary.krekula@kau.se*

At the United Nation’s women’s conference in Beijing in 1995, gender mainstreaming was adopted as a strategy for equality when governments from 189 countries formally committed themselves to implementing the strategy and to “remove all obstacles to gender equality”. Thereafter many countries have also implemented versions of it in national documents. This applies, for example, to the Nordic countries and to Sweden where the strategy has been described as successful. There is still however, lack in the knowledge about how the strategy can be used to promote women's and men's equal participation in defined labor organizations. In this paper I will provide such a discussion by scrutinizing the governmental incentives to increase the amount of women as fire fighters, a profession where the proportion of full-time female fire-fighters is still only 3.6 percent. By analyzing the government appropriations directions and budgetary bills addressed to the Rescue Services during the years 1997─2014, I will illustrate how the strategy has been used as a tool to implement national equality goals, and I show that this approach has a simplified definition of gender equality as starting point. In doing so, theoretical tensions, contradictions in public policy and socio-cultural discourses may be reconsidered.

**Transforming or transferring gender inequalities: family policy reforms in Poland**

*Ania PLOMIEN (London School of Economics, United Kingdom) | a.plomien@lse.ac.uk*

Contemporary Poland is regarded as a success story of transition from centrally planned to capitalist liberal democracy. It has developed a sound electoral process, including a Gender Quota Bill, and despite the post-2008 EU recession its economy has grown and its GDP per capita increased from 48% to 67% of EU average over the last decade. At 6.4% its gender pay gap is among the lowest in Europe and state-owned companies are obliged to consider a male-female balance on management boards. Life expectancy, educational attainment, and at-risk-of-poverty rates show remarkable progress, while policies to address gender based violence and reconciliation of work and family imply serious state effort towards social justice and well-being for all. However, the government has been grappling with a low fertility/low employment crisis characteristic of the Polish post-socialist gender regime. Recent family policy reforms aimed to address this double crisis suggest a thorough reconfiguration of the welfare state. In this paper I conduct a critical gender analysis of the family policy reform package within two wider analytical frames. The first uses the policy system lens, highlighting the interdependencies among policy areas to achieve specific outcomes. The second employs a transnational perspective, emphasizing the relationship between the national and the supranational—Poland’s EU integration. My analysis demonstrates that the family reform package has a limited potential to resolve the fertility/employment crisis in Poland, which, in part, is due to the framing of gender equality in the EU employment and demographic agendas. I argue that the implications for gender and other forms of inequality are ambiguous and uneven, acting to transfer rather than transform existing inequalities.
**RN14S08 - Care**

**Women, Care and Precarious Work in the Context of Economic Crisis**
Radka DUDOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | radka.dudova@soc.cas.cz
Hana HAŠKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | hana.haskova@soc.cas.cz

In the paper, we examine forms and experience of insecure and precarious work by Czech women caring for a child or dependent family member. The results of a quantitative survey indicate that the share of caring women performing precarious work has increased during the economic crisis. A secondary analysis of interviews conducted in 2006-2013 with women caring for a child or family member offered insight into the kind of forms precarious work can take, how women feel about this kind of work and why, and in what way, based on the capability approach, do their explanations provide a better understanding of the nature and spread of precarious work among women with care responsibilities. We have found that caring women fit along a continuum, ranging at one end from viewing ad hoc work as an optimal strategy for them for a temporary period, to seeing it as a temporary solution to a situation when no other option is available, and finally to feelings that they are caught in a precarious work trap. This continuum can be extrapolated into a kind of ‘collective story’ of women finding themselves in the trap of precarious work: a woman first ‘chooses’ ad hoc work as a temporary strategy in order to get a job; if her life conditions are difficult she must continue to perform such work against her preferences; after a long period of economic inactivity or of performing just temporary work the woman is ultimately unable to find any solid form of employment, even once she reaches a situation where she is not as restricted by care responsibilities.

**Long-term care and labour market performance of male and female welfare recipients in Germany**
Katrin HOHMEYER (Institute for Employment Research, Germany) | katrin.hohmeyer@iab.de
Eva KOPF (Institute for Employment Research, Germany) | eva.kopf@iab.de

Due to the demographic development, the demand for long-term care is increasing in the near future in many developed countries. Furthermore in response to these demographic changes, the OECD advised member countries to take measures to increase employment to ensure the sustainability of the welfare state. Since the welfare reforms in Germany, welfare recipients were supposed to be ready to work and help themselves to decrease or end the neediness of their household. However, almost 6% of male and more than 8% of female members of these households who receive welfare benefits are engaged in long-term care of relatives or friends in need of assistance. Their care tasks may interfere with their job search. Our paper studies the relationship between care tasks of welfare recipients and their labour market performance. The direction of this relationship is not clear: on the one hand, taking care of relatives can worsen labour market opportunities. On the other hand, taking care of relatives can be the result of bad labour market opportunities (see Heitmüller, 2007; Meng, 2013). To shed light on this relationship, we study the labour market performance of male and female welfare recipients taking care of relatives. Our analyses are based on survey data from the Panel Study Labour Market and Social Security and on panel methods.

**Care more, earn less? The association between care leave for sick children and wage among Swedish parents**
A number of studies have shown that women’s and men’s wages relate to parenthood in general and parental leave in particular, but we know little about the possible wage impact of leave to care for sick children, which is a part of the Swedish parental leave system. On one hand, care leave may influence human capital and real or perceived work capacity similarly to parental leave and send the employer the same signals about work commitment and responsibilities outside of work. On the other hand, important differences, including timing, frequency and predictability, between care leave and parental leave influence paid work. This study uses Swedish register data to analyse the association between care leave and wage growth among mothers and fathers who had their first child in 1994. The results show that care leave is associated with a weaker wage growth among both women and men but that the association is stronger among men. One reason for the gender difference in the association may be that men’s care leave has a stronger signalling effect compared with women’s care leave.

Grandmothers’ care-work reconciliation: A comparison of 12 European and East Asian cities
Yueh-Ching CHOU (National Yang-Ming University, Taiwan) | choucyc@ym.edu.tw
Per H. JENSEN (Aalborg University, Denmark) | perh@dps.aau.dk
Teppo KRÖGER (University of Jyväskylä, Finland) | teppo.kroger@jyu.fi

Aim. Very few empirical studies have yet focused on care and work reconciliation among grandmothers, particularly on the comparison between different welfare states. This study aims to explore the relations between paid work and regular care responsibility for young children among grandmothers in working age and conduct a comparison between European and East Asian countries.

Methods. The study is based on a sample of 1791 grandmothers who participated in a comparative survey (out of in total 9957 women participants aged 25-64), gathered in 12 cities representative 12 countries. Cross tabulations and ANOVA were used to compare whether there are significant differences between those grandmothers who have a regular care responsibility for grandchildren and those grandmothers who do not have such a responsibility. A multiple regression analysis was used to determine whether labor force involvement and different welfare states are associated with these grandmothers’ care responsibility for grandchildren.

Results. ANOVA and Chi-Square analyses showed that the grandmothers having care responsibilities for grandchildren had lower involvement in full-time work and were more often married, poorer and older, and had a lower level of education than the grandmothers without such care responsibility. The cities/countries of grandmothers also showed a significant difference; the grandmothers from Nordic countries showed the lowest proportion of having such care responsibility compared to other area EU countries and East Asia. Logistic regressions revealed that the country, marital status and having full-time work were strong factors determining whether grandmothers had such a care responsibility.

Conclusion. Care and work reconciliation policies should take working-age grandmothers into account in particular in non-Nordic EU and East Asian countries.

RN14S09 - Parents I

Lone mothers and partnered mothers in EU member states. Why the difference?
Mary P MURPHY (Maynooth University, Ireland, Ireland) | mary.p.murphy@nuim.ie

This paper examines contemporary trends in restructuring labour markets and welfare states for gender equality and focuses on issues of gender and intersectionality as well as state regulation of equality. Using a comparative approach and analysis of four EU member states, it explores differences in the restructuring of welfare regimes across two different groups of low income women, lone parents and ‘partners’. In a context of the post crisis focus on low work intensity and the phenomena of jobless households in the EU, the paper examines the variegated approach to policy for working class mothers across Europe. Utilising Daly’s (2011) ‘dual earner gender specialised family’ regime and a typology based on push factors; patterns of individualisation and activation, and pull factors; childcare and family care, the paper attempts to examine whether or how member states differentiate policy for lone parents and partnered social welfare dependant women. While policy direction is ambiguous, we find policy is differentiated as much by the family status as by the class of these low income mothers. The analysis raises fundamental questions about intersectionality and the paper explores whether different life experiences might justify such intersectional differences in approaches to labour market, welfare and family policy. It examines the implications for equality between mothers and suggests children will experience different outcomes depending on the maternal family status. The paper concludes by asking, from a feminist sociologist perspective, whether there is an optimal policy option to better promote gender equality and improve the lives of both lone parents and partnered mothers.

In and out of the labor market: A longitudinal analysis of the motherhood penalty and job interruptions
Zbigniew KARPINSKI (Polish Academy of Sciences, Poland) | zkarpinski@ifispan.waw.pl
Kinga Anna WYSIENSKA-DI CARLO (Polish Academy of Sciences, Poland) | kingaw228@gmail.com

Using longitudinal data from six waves of the Polish Panel Survey between 1988-2013, we test hypotheses derived from human capital and status theories to explain the effect of gender and parenthood on labor market situation and income. Specifically, we assume that if human capital differences, measured in our analysis by length of employment and number of job interruptions, explain employment risks and income, we should expect to observe little variation in the effect of job-related experience and job interruptions between males and females, as well as between parents and non-parents of the same gender. We apply event history analysis with time varying variables to model the survival in employment and unemployment for respondents with children of different ages. As parenthood and income are nested within individual respondents, we apply panel data regression models to estimate the effect of parental status on income. We find that, regardless of experience and job interruptions, having children up to 12 years of age has a beneficial effect for men and an adverse effect for women when it comes to their chances of finding a job after an episode of unemployment. This is consistent with status but not human capital theories. The effect of parenthood on income is less straightforward, and depends on the age of females and type of employment. We also show how changes in relevant labor laws correlate with observed effects, and use qualitative interviews of a subsample of unemployed respondents, conducted in 2012, to illustrate the patterns emerging from our analysis.

Care Poverty among Mothers in 12 Cities of 12 Nations: Associated Factors and Implications for Work-Care Reconciliation
Teppo KRÖGER (University of Jyvaskyla, Finland) | teppo.kroger@jyu.fi
Yueh-Ching CHOU (National Yang-Ming University, Taiwan) | choucyc@ym.edu.tw
This paper addresses the situation of mothers of young children in 12 cities in 12 nations (the Czech Republic, Denmark, Estonia, Finland, France, Hungary, Germany, Ireland, Italy, Spain, the UK and Taiwan). This is done through the concept of “care poverty” (Kröger 2010), which is defined as lack of necessary care. Care poverty implies that there is an imbalance concerning the needs and resources related to childcare at the level of individual families. Access to necessary care can be seen as a citizenship right and care poverty is here seen as a breach of that right, reflecting weakness of social citizenship of mothers.

Data for this paper comes from the WP5 survey of the FLOWS project that was in 2012 conducted in 12 cities (Brno, Aalborg, Tartu, Jyväskylä, Nantes, Székesfehérvár, Hamburg, Dublin, Bologna, Terrassa, Leeds and Hsinchu). The FLOWS project was funded by FP7 and led by prof. Per Jensen. The analysis starts by outlining the prevalence of care poverty among families in the 12 cities. The main focus of the paper is on analyzing the connections between care poverty and socio-economic and other factors that are potential predictors of care poverty (e.g. age of children and age of the mother as well as family type). Which factors are most strongly associated with care poverty and are these variables the same in all cities or do national and local childcare policy models affect the situation? Furthermore, the paper also asks what kind of implications for work-care reconciliation does the presence or absence of care poverty bring to European (and Taiwanese) mothers? Does care poverty threaten the employment of mothers or are mothers, despite deficiencies in their childcare arrangements, still able to compose everyday life strategies that make it possible for them to take up paid work?

Based on the analysis, the paper identifies factors that need to be addressed by policies, in order to reduce the prevalence and negative implications of care poverty among mothers of young children.

**Intersectional perspective in the analysis of the impact of crisis on life courses in the CR: gender, class, age (and parenthood).**

Alena KŇŽKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | alena.krizkova@soc.cas.cz

Lenka FORMÁNKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | lenka.formankova@soc.cas.cz

We analyse impacts of the economic crisis on labour market relations in the Czech Republic. We use the “intra-categorical” approach as part of the intersectional perspective, which enables us to examine gender impacts of the economic crisis as wider patterns, in quantitative analysis of structural inequalities in the labour market between 2008 and 2012 at the intersection of gender, class, age and parenthood using statistical indicators. We show how the impacts of the crisis on the increase in unemployment intersect based on gender, class and age, e.g. how the crisis impacted various groups of population at the intersection of selected dimensions of these characteristics. Moreover we capture the risk of losing job in the first phase of the crisis (2008 - 2010) by event-history analysis.

Our analysis shows, that the economic crisis has deepened already existing inequalities in the labour market and has brought greater differentiation of the female labour market prospects by educational attainment, especially in interaction with parenthood and also rapidly deteriorated labour market situation of men with low education including fathers of small children. The population of young people until 24 years of age found itself in the “buffer” role in the contemporary crisis and “absorbed” great part of the total increase of precarious types of jobs and bad working conditions in the Czech labour market. The risk of unemployment increased especially for young people until 30 years of age and for groups with low education and in low qualified jobs.
Impact of the Introduction of Parental Leave Policy on Labour Market Attachment of Mothers in Luxembourg - Causal Effect Evaluation

Marie VALENTOVA (LISER LUXEMBOURG, Luxembourg) | marie.valentova@ceps.lu
Michela BIA (LISER LUXEMBOURG, Luxembourg) | michela.bia@ceps.lu

The main aim of the paper is to examine the impact of the introduction of parental leave policy on the labor market engagement of mothers of a single child in Luxembourg. The impact of the policy is analyzed in the course of first three years following childbirth. The labor market engagement is measured by two outcome variables: being active or inactive in the labor market and the number of hours worked per month. The analysis are conducted on the social security longitudinal individual records (the IGSS data) from 1996-2007. A difference-in-differences (DID) method is applied to evaluate the causal effect of the introduction of the policy in 1999 on the outcomes by accounting for impact of other possible intervening factors such as the changing economic context etc. The results of analysis reveal that, among mothers who were employed full-time at childbirth, the introduction of the parental leave policy had a strong and positive effect in terms of working hours per month. After the introduction of the policy mothers worked more hours per month compared to the situation before the introduction of the policy. This effect of the introduction of the policy was observed only the first two years after the childbirth. With respect to labor market activity, a notable effect of the introduction of the parental leave policy was observed only one year after childbirth. Among mothers who worked part-time at childbirth, the impact of the parental leave policy both in terms of hours worked per month as well as labour market activity was negligible. The paper contributes to the existing literature in several ways. Firstly, it analyzes a unique data set, which covers the whole population of women in the country before, during and after the introduction of the policy and which includes enough of variables to construct meaningful treated and control groups and to run the DID analysis. Secondly, it is the first causal effect evaluation study focusing on the parental leave policy in Luxembourg. Thirdly, on the contrary to the most existing studies conducted in other countries, this paper provides information about two most frequently used outcome variables regarding labour market engagement (labour market activity and the number of working hours) at the same time.

The effects of reconciliation strategies in different cities on mothers' working lives

Evelyn MAHON (Trinity College Dublin, Ireland) | emahon@tcd.ie

Comparative data on welfare systems reveal considerable differences between between gender regimes with attendant opportunities or barriers for women's participation in the labour force. Liberal regimes are reluctant to provide adequate public childcare for mothers yet mothers enter and try and remain in the labour market. They do so by drawing on kinship networks or familial childcare. This paper based on data from the FLowSeu project will examine focus group data from a number of cities and indicate the conflict and stress that reconciling work and family lives presents for many mothers within the European Union. Mothers live in a competitive European Labour Market and their different access to childcare generates different forms of citizenship for working and nonworking mothers. Yet employment targets -post Lisbon- ignore childcare as an issue, and leaves it off the political and EU agenda which in turn increases class polarisation within the member states. A focus on the investment
state and full employment policies has removed gendered differences by failing to recognise the persistence of the impact of reproduction and motherhood on women's working lives.

**Work/family reconciliation in the legal profession and the police**
*Tanja Haraldsdottir NORDBERG (Oslo and Akershus University College of Applied Sciences, Norway) | tanja-haraldsdottir.nordberg@hioa.no*

My PhD-project examines the views of managers in the Norwegian legal profession and police on how employees utilise work/family reconciliation policies. In order to gain a better understanding of the implications of employees exercising their rights, it is important to understand the organisational context within which these rights are exercised.

**Research questions:**
The main research questions in my PhD project are: “How do managers in the Norwegian legal profession and the police view employees’ rights to work part-time, leave due to children’s illness and parental leave? What are the consequences – for the organisation and the employee's position – when employees exercise their rights?” At the ESA conference, I will present some findings from both professions. But my main focus will be on the views of managers in the Norwegian legal profession on flexibility and employees’ working time arrangements. I will discuss the relationship between work/family reconciliation policies and gender segregation in the Norwegian legal profession. And analyse what meaning the nature of the work tasks has for the managers’ expectations of the employees’ commitment.

**Background:**
Even though men and women lawyers are equally ambitious when it comes to career, status, income, etc., senior positions are dominated by men and their income is higher. Studies also show that women tend to leave the private sector in favour of working in the public sector when they become mothers. My project draws on these studies, as well as previous research on the Nordic welfare model.

In Norway, employees have the right to work part-time when they have children under the age of 10. Studies show that mothers take most of the dividable part of the parental leave, and they more often than fathers work part-time. Ellingsæter (2006) has described this gendered way of combining paid work and care for children as ‘double-tracked parenthood’, one for mothers and one for fathers. This pattern is also found among lawyers. In a profession where commitment, excellence and the number of hours logged are viewed as closely related, examining the consequences of different working time arrangements is important. The legal profession being a competitive elite profession makes it an interesting context for exploring possible tensions between work/family reconciliation policies and work life.

Previous research on flexible working time arrangements and other work/family reconciliation policies have been dominated by the employee’s perspective. This study takes an employer perspective by interviewing managers.

**Theoretical framework:**
The paper analyses and discusses norms for the ideal worker within the law profession. Joan Acker’s concept of the ideal worker is central to this discussion. Lawyers have a great deal of freedom and flexibility, and are at the same time themselves expected to be flexible. Theories on changes in modern work life are important in the analysis. Goldthorpe’s theory about different employment contracts and Sennet’s theory on flexibility are important in the comparison between different organisations.

The legal profession has traditionally been male dominated, but in the last few decades the proportion of women has increased. Women now account for around 64% of all law students in Norway. Meanwhile, studies show that combining a law career with family is challenging. A gender perspective is central to the analysis, because patterns of work/family reconciliation are
gendered. This is also reflected in how the managers in the study view men versus women working part-time or not being able to work overtime because of family responsibilities.

Methodology:
The paper examines the views of managers in the Norwegian legal profession on how employees reconcile work with family life. The data comprises 21 semi-structured qualitative interviews with men and women managers in private law firms and in public sector. The interviews lasted for around one hour. In the first half of the interview, I asked descriptive questions directed at practices in the organization. In the second half, I asked more confronting questions directed at managers’ attitudes as well as possible negative consequences of utilising work/family reconciliation policies.

Five themes were covered in the interviews: 1) Daily life in the organisation: what does the work consist of, how is the workplace organised, how are tasks allocated, how much time do the employees spend at work etc. 2) Employees’ work-family balance: managers’ experiences with employees utilising work/family reconciliation policies. 3) Challenges related to work/family reconciliation policies, both for organisation and the employee. 4) Career and advancement: what qualifications and qualities are valued in the organisation. And what is required – formally or informally - in order to advance or succeed in the organisation. 5) Career, gender and work/family reconciliation policies: What are the challenges related to combining a career in law with family life? Why do women leave private law firms when they have children?

Preliminary findings:
There are several inconsistent findings in my material: employees’ rights are important when managers consider their employees’ reconciliation between work and family life. Managers express respect for their employees having a life outside of work. But they also describe practical implications of employees’ exercising their rights. It looks like employees exercising their rights may have several costs. The findings vary by sector, but also from organisation to organisation. It is no surprise that working part-time has greater consequences in private law firms than in public, bureaucratic organisations. But across sectors, the consequences of work/family reconciliation are influenced by how the work is organised. The consequences of part-time work depend on the nature of the work and the employee’s position. Some duties cannot easily be combined with part-time work because they demand a constant presence. For example, a big trial. According to the managers, these are often the same types of case that result in status and valued experience. Therefore, working part-time might have consequences for the employee’s future career. The study also finds that public and private sector is more nuanced when it comes to family-friendliness and career prospects than is often portrayed.

**Women's employment exits around the birth of their first child in Spain**

Irene LAPUERTA (Universidad Pública de Navarra, Spain) | irene.lapuerta@unavarra.es
Daniel GUINEA-MARTÍN (Universidad Nacional de Educación a Distancia, Spain) | daniel.guinea@poli.uned.es

In terms of women's employment rates the literature usually describes Spain as an "early peak" country: the percentage of young women in paid work is relatively high, but after family formation women's employment rate drops off. Our goal is (i) to update this picture with recent longitudinal data and (ii) to narrow the attention down to different phases around women's pregnancy and birth of their first child. In particular, we identify the first and second part of the pregnancy and the post-delivery period during which the mother's employment is protected by law.

We analyze data drawn from the “Muestra Continua de Vidas Laborales”, a unique data set that links the individuals’ employment history with administrative and income tax data. The subsample includes 7,750 women between 25 and 45 years of age who were in paid employment 10 months prior to giving birth to their first child sometime in the period between
2005 and 2012. Hence, the observation window comprises 10 months before delivery and a maximum of 85 months afterwards. We test logit-based event history models. Our preliminary results show that the likelihood of exiting is higher in the second stage of the pregnancy (months 5 to 9) than either in the first part of the pregnancy or in the period after confinement during which women's employment is protected by law. Moreover, in the second stage of pregnancy the risk of exiting the labour market comes closer among women with various levels of educational attainment. However, when the protection period expires women's exit rate from paid work increases drastically. This finding suggests that the existing anti-discriminatory policies to protect the employment of pregnant women are limited in scope. Overall, the advent of the economic crisis does not modify these patterns.

RN14S11 - Leadership

Gender (In-) Equality in Leading Positions and Works Councils in Germany
Susanne KOHAUT (Institute for Employment Research, Germany) | susanne.kohaut@iab.de
Peter ELLGUTH (Institute for Employment Research, Germany) | peter.ellguth@iab.de
Iris MÖLLER (Institute for Employment Research, Germany) | iris.moeller@iab.de

In this contribution we take a closer look at gender inequality in the labour market namely the participation of women in leading positions throughout the privat sector. We pay special attention to the role played by (the existence of) work councils in filling these positions with a man or a woman.

The legal basis of works councils, the Works Constitution Act, provides works councils with various substantial rights (regarding information, consultation, objection and even codetermination). However the hiring process is an area where the rights of works councils are not very pronounced. Moreover, employees in leading positions (“leitende Angestelle”) are officially beyond the realm of works councils. Nevertheless as works councils often exceed their rights e.g. via so called package-deals they might influence the recruiting process at large and especially in this segment.

Questions we ask are: Do establishments differ in the share of women in leading positions (top and middle/lower management) depending on the existence of a works council and in which respect? Is there a difference between top and middle/lower management positions? With data of the IAB-Establishment Panel the share of women in leading positions can be monitored in Germany since 2004. This survey covers almost 16,000 firms every year and is designed as a longitudinal survey in which the same establishments are contacted every year. The survey contains – besides works council status - a huge number of explaining variables, enabling an in depth analysis of gender bias in management positions with the focus on works councils.

Feminist Coalitions and Solidarity in The rebuilding of dialogical professionalization in social services
Orly BENJAMIN (Bar Ilan University, Israel) | orly.benjamin@gmail.com

Several recent studies have traced processes of de-professionalization in the social services. Some have argued that the de-professionalization that occurs through the practices of employing assistant nurses, assistant social workers and assistant teachers has opened new opportunities for women from lower strata social categories who enter the labor market with few or no qualifications. These employment opportunities, however, were conceptualized by feminist authors as reflecting deteriorating quality of jobs in the public sector. Moreover, it was reported
that when the resulting job got to be negotiated by employees’ representatives it had little influence. To understand the relative weakness of this resistance I interviewed administrators in the Israeli health, education and welfare ministries, involved in the tendering of services set for procurement. My data analysis suggests that women in charge of occupational standard whose historical role has been protecting occupational standard lose their voice and their authority in negotiating occupational standards with budgeting administrators. In this way employees’ representatives are left alone without their allies in the ministries. These findings suggest that solidarity with these administrators and with women whose employment conditions are negotiated in the tendering process, requires a feminist coalition working in co-operation in all OECD countries. The paper discusses the various social forces who could take part in such a coalition supporting the women movement in reclaiming a dialogical professionalization in the social services. A dialogical professionalization would restore skill recognition, payment scales, team work, standards of workloads and appropriate training for all care and service employees.

Leading Change: women’s activism in the UK aviation and aerospace industry
Susan DURBIN (University of the West of England, United Kingdom) | sue.durbin@uwe.ac.uk
Ana LOPES (University of the West of England, United Kingdom) | Ana2.Lopes@uwe.ac.uk
Stella WARREN (University of the West of England, United Kingdom) | Stella.Warren@uwe.ac.uk
John NEUGEBAUER (University of the West of England, United Kingdom) | John.Neugebauer@uwe.ac.uk

Women comprise just 6.9% of engineers in the UK, are much less likely to graduate with a degree in aerospace engineering and make up just 4% of commercial and Royal Air Force pilots (RAeS 2009; WISE 2012; EngineeringUK 2013). This situation is set to continue unless steps are taken by organisations within the industry to end this gender imbalance and work towards gender equality. Evidence suggests that mentoring can be an important source of support for women at all stages in their careers in relation to both career advancement and social support (Ehrich, 2008; Durbin and Tomlinson, 2014; Kram 1985).

This paper reports on the work of a group of women activists (academics and individuals from UK public and private sector organisations) who have joined together to create positive change for female professionals through a knowledge exchange project that is funded by the ESRC and the partner organisations. The aim is to build an industry-wide mentoring scheme, the first of its kind in the industry, to provide mentoring ‘for women, by women’ which involves working closely with female professionals within the industry. Drawing upon survey, interview and focus group data, the paper critically considers the rationale for the scheme, how it may meet the needs of a diverse group of women and the role of women activists in seeking to change the masculine culture in their own industry and to bring about positive change in terms of gender equality.

A Tough Job But Someone Has to Do It: Exploring the Experiences of Gender Equality Experts in European Higher Education
Helen PETERSON (University of Gothenburg, Sweden) | helen.peterson@gu.se

This paper draws on experiences reported by gender equality experts active in European Higher Education Institutions. The intent of the paper is to identify hindering and facilitating factors for these experts in their attempts to exercise efficient change agency aimed at changing organizations and institutions towards increased gender equality. The data was collected within the GenderTime project, funded by the European Commission 2013-2016. The project aims at identifying and implementing the best systemic approach to increase the participation and career advancement of women researchers. The findings reported on in this paper illustrate the multifaceted character of gender equality change agency. Change agency can be direct or
indirect, long-term or short-term, formal or informal, symbolic or practical. The results also show that awareness of gendering processes in organizations, developed through day-to-day experiences of being marginalised and discriminated, is an important prerequisite for change agents for gender equality. Many women with the awareness and will to act as change agents, however, are in practice restricted by a precarious work position, which leaves them with a lack of power, influence and resources necessary to initiate change. The influence of a change agent is also dependent on his or her age, gender, network, disciplinary context and national context. The results from this study can be useful when developing gender equality strategies, policies and practices and can also be used to empower gender equality change agents that face challenges while trying to implement change in any kind of institution.

**RN14S12 - Careers I**

‘You’re on show and you can’t fail in this unforgiving profession’: the challenges for women working as freelance musicians

Victoria ARMSTRONG (St. Mary's University, United Kingdom) | victoria.armstrong@stmarys.ac.uk

This paper aims to contribute to on-going debates about the gendered nature of creative work as it relates to classical music. Women’s involvement in professional music-making has a long and complex history. They currently occupy only around 32% of all music-industry related jobs in the UK and they earn less, have shorter careers and face more obstacles in their careers than men (Creative and Cultural Skills, 2010). Although the gendered nature of work in the cultural industries is receiving greater critical attention, the experiences of women in the classical musical profession are still an under-researched field.

Data are presented from the first phase of this on-going research which included nine female classical musicians based in the UK, ranging in age from their mid-twenties to mid-50s, and working as composers, conductors and performers. The methodology drew together approaches from visual sociology and digital ethnography whereby each participant compiled a personal ‘digital diary’ comprising information about their musical and non-musical lives over a five week period. The content of the diaries was not analysed but, using a form of photo elicitation, the women wove narratives around their data which allowed for themes around the nature of work to emerge and be explored.

The paper outlines some of the emerging themes regarding the gendered nature of this work as it relates to motherhood and family life, the challenge of maintaining a professional identity when work is largely unpaid, the construction of femininity and professional image, and the role of emotional labour in developing professional networks.

**On Different Tracks? Work-Family Strategies and Early Career Attainments among Male and Female Professionals in Sweden**

Anne GRÖNLUND (Umeå university, Sweden) | Anne.gronlund@umu.se

The paper is based on a new survey directed to Swedish men and women that graduated from five higher educational programmes a few years ago (n≈2 200). Two research questions are investigated:

1. Do men and women with the same education have different work-family strategies, i.e., are men more career-oriented and women more family-oriented in their motivation for occupational and job choices and in their willingness to adapt work to family demands (e.g., by working part-time).
2. Do men and women with the same education differ in their early labour market attainments and if so, can such differences be explained by differences in work-family strategies? The study puts to test the assumption made in human capital theory (Becker 1985, 1991) that women make long-term strategies with future family responsibilities and work interruptions in mind and generally aim for "family-friendly" work conditions. This assumption is commonly invoked to explain gender differences in e.g. wages and training. A sample comprising men and women with the same education in a context strongly promoting gender equality (Sweden) provides a strong test to the assumptions made in human capital theory. If gender differences in work-family strategies are found even in this sample, and if they explain labour market inequalities, Becker's hypothesis can still be regarded as a valid mechanism.

Undone: Women's Career Ambitions and the "Doing" of Professional Work.
Suzanne CARTHY (University College Dublin Smurfit Business School, Ireland) | suzannecarthy@gmail.com

This paper seeks to bring into sharper focus an enduring work ritual, namely long hours, to illustrate and develop the connection between gender discrimination and a firm's economic model. Commencing from a position that long hours are a form of "currency", and the gold standard underpinning the business model of many professions, this paper queries whether it is possible to contest systemic (if rationalizable) discrimination without challenging long hours and their importance in the reward structure of organisational life (Stiller Rikleen, 2013). In short, this paper seeks to develop a conceptual framework within which to imagine how work, and gender, might be "done" differently. This interpretation proposes that gender inequality in the workplace is reproduced as a logical and predictable consequence of decisions about the performance of work. Long hours are acknowledged to be a crucial component of "what it takes" to succeed (Donnelly, 2006) and accordingly, are implicated in sustaining "inequality regimes" (Acker, 2006). Viewed thus, long hours are not merely a smokescreen for slippery concepts such as cultural bias, or in-group favouritism (Gorman, 2005). Rather, as a unit of analysis, long hours are perhaps the "smoking gun", the instrument by which the injury of discrimination is inflicted; the means by which women are excluded, even when such end is unintentional.

The research further develops the proposition that long hours are an artefact of unchallenged organizational culture, an expression of socially, structurally and institutionally reinforced assumptions about how work is done and whether it is in the "doing" of work that women's career ambitions are undone.

How to Achieve “Total Success”: Being a ‘Woman’ and a New Middle Class Member in Urban Turkey
Hasan Kürşat AKCAN (Ankara University, Turkey) | akcanhasan@gmail.com

Success is an integral, if not a central, part of being a member of the new middle class. This is not only related to educational and professional success but also requires the individual to meet the expectations of the society in terms of stereotypical gender role performances. The aim of this study is to investigate how women of the new middle class manifest and accommodate their femininities at work environment in urban Turkey. We performed in-depth interviews with 17 women who live in the two biggest metropolises of Turkey and work in private service sector in professional and managerial positions. Their narratives suggested that their ideas of being a woman at work is contested or negotiated in line with discourses of the “super-woman myth”. Our participants generally assumed a connection between being a good mother, a good wife, at times using their feminine charms and their professional advancement which one participant
defined as “total success”. Accordingly, on the one hand, gendered aspects of women’s success necessitates a certain form of patriarchal restriction and on the other hand, seemingly yield a performative field in the service sector for their emphasized femininity. This ambiguous position ultimately shows the fragility of class and gender identity and how they depend on myth building. This is one of the few studies in literature from Turkey that investigates the labor process associated with female gender roles and the new middle class.

Women’s Overeducation: Why it is Necessary to Account for Additional Individual Characteristics
Nancy KRACKE (Institute for Employment Research (IAB), Germany) | Nancy.Kracke@iab.de

Women’s labor market participation has been rising in the last years, the proportion of female university graduates increases constantly and ever more women are in executive positions. However, there is also evidence that women are more likely to be overeducated then men. If a person is overeducated, in the sense that an employee’s level of training exceeds the job requirements, parts of the human capital lie idle. This could not only have negative consequences on the individual level, but also be costly on the social level. Current research on overeducation focuses on individual explanatory factors, which are limited to only one determinant - such as gender or migration status. But in light of economical, political and cultural globalization that increases societal heterogeneity, it is obvious that the emergence and reproduction of social inequalities cannot be reduced to only one dimension. In the study of social inequalities it is important to consider that people are always part of several social groups at the same time.

In the presentation I will focus on this research gap. Based on the concept of intersectionality I will discuss the mechanisms of interaction of gender, migration status and social background in the context of overeducation theoretically. Using data from the National Educational Panel Study (NEPS) I show the effect of gender on the risk of being overeducated as itself and in interaction with the other individual characteristics. I will respond to the question how gender inequality on overeducation varies with other social categories.

The Impact of Women’s Birth Spacing Behavior on their Long-Term Career - an International Comparison
Uta BREHM (BAGSS, University of Bamberg, Germany) | uta.brehm@uni-bamberg.de

The contribution presents a proposed edited volume which collects and compares studies across Western countries. Its aim is to examine women’s birth spacing behavior, their employment history between births and these decisions’ effect on their long-term career. A particular focus is set on differences by education.
In a first, initiating step, Brehm and Buchholz (2014) elaborated on the West German case by using data from the National Educational Panel Study. Findings show that the employment behavior of mothers of two children during their specific birth spacing has strong and complex effects on their peak occupational prestige at age 45. Specifically, results suggest that mothers’ full-time employment between births does not affect the career much differently from staying in unpaid caregiving altogether. However, any part-time employment during the spacing proved to impose a strong and significant negative effect on occupational prestige at age 45. This effect evinced to be considerably stronger the sooner first-time mothers decided to return to the labor
market. While highly educated mothers could influence their career chances very positively by spacing both births shortly, the careers of mothers with low and intermediate education were greatly affected by their employment behavior between births. The authors argue that the severe impact of part-time employment between births is driven by mothers who cut back on their working hours in order to attain flexibility and time to care for their children. This behavior impedes their return into promising employments in the long run by getting mothers stuck on an occupationally detrimental ‘mommy track’.

All across countries in Europe and North America, there has been extensive research and public debate on the reconciliation of work and family as well as the underlying policies and social norms in the last years. Predominantly, their focus is set on mothers’ behavior in terms of returning to the labor market and its (financial) outcomes. Part-time employment is often politically praised to balance countries’ pursuit of a gender-equal labor market against traditional family norms. However, the questions remain as to how any return and employment behavior between births affects women’s chances on a career in the very long run - and how they compare across countries with different norms and policies. Evidence from Germany passes a rather detrimental first verdict regarding part-time employment and highly educated mothers’ long birth spacing. The proposed volume aims to address these issues on an international scale.

“Don’t use the ‘weak’ word”: Barriers to entry and coping strategies of female brewers resisting stereotypes

Agnieszka RYDZIK (University of Lincoln, United Kingdom) | arydzik@lincoln.ac.uk
Victoria ELLIS (University of Lincoln, United Kingdom) | vellis@lincoln.ac.uk

Despite increasing numbers of women entering the UK microbrewing industry, female brewers remain marginalised in this traditionally male dominated sector. This is due to the barriers women face when entering this industry and is often attributed to the physical nature of the role as well as deeply rooted stereotyped assumptions. To date, there has been no sustained examination of women brewers’ experiences and research into how the microbrewing sector is gendered remains limited.

This paper explores the barriers female brewers face in this male dominated industry and identifies the coping strategies they adopt to challenge the status quo, confront stereotyped assumptions and contest inequalities. In doing so, the study gives voice and visibility to female brewers. It also highlights the significant role of support networks by providing an in-depth insight into an emergent network of female brewers, namely Project Venus. The Project Venus network brings together female brewers from the United Kingdom and Ireland, and engages them in collaborative action, co-creation and community building. This study examines the value women brewers attach to the network and the benefits they draw from belonging to this community.

This qualitative study is based on sixteen in-depth interviews with female brewers in the Project Venus network as well as participant observation at Project Venus networking events. The data was analysed using thematic and narrative data analysis methods to uncover barriers to entry and coping strategies, with a particular focus on the impact of belonging to the network on personal and collective empowerment.

Whose Closure? Gender Inequality and Access to Skill Training

Christian HUNKLER (Max-Planck-Institut, Germany) | Hunkler@mea.mpisoc.mpg.de
Job sex segregation is well-documented, and has been shown to be an important contributor to gender wage inequality. Some scholars argue that exclusionary processes by employers and/or workers which limit females’ access to training opportunities are important contributing factors to the sex segregation of employment. However, extant research falls short of documenting the alleged mechanisms of exclusion. We examine the allocation process for training opportunities for new labor market entrants. We study gender patterns in the pipeline of candidates for these opportunities from initial application to final placement, and identify which actions by which actors produce gendered outcomes in access to training. We find that gendered outcomes are evident at each step of the allocation process. A simple model of opportunity hoarding on the part of employers cannot explain our findings.

High-income women’s reasons to postpone maternity
Barbora BERANOVÁ (Faculty of Social Sciences, Czech Republic) | beranova.barbora@gmail.com
Alexandra IRIKOVSKÁ (Faculty of Social Sciences, Czech Republic) | irikovska@gmail.com
Hana PACÁKOVÁ (Faculty of Social Sciences, Czech Republic) | hpacakova@gmail

The thesis goal is to introduce results of qualitative research aimed at so called “aging primiparas”, that is women who decided to have a child after they reached age of 35. A phenomenon to postpone maternity became one of the most discussed topics in recent years, a result of various demographical changes in the Czech Republic. One of the popular theories explaining why women have a child in later stage (above 35) is a theory of rational choice during maternity postponement, which was then more specifically defined as microeconomic theory of fertility by Gary S. Becker in 1970s. Rational choice in this theory means that the desire to have children is limited by external barriers, which increase the costs of parenthood. However, the situation can be improved by government through social-political measures. A qualitative research in a form of in-depth interviews was conducted with high-income women, who had their first child after age of 35; in order to understand their declared rational arguments of why to postpone the first child’s birth as well as to discover external factors that they perceive to be limiting their decisions (social-political government measures, social pressures, pressure of an employer etc.)
Filipino Labour Migrants drawing Boundaries of Belonging beyond the Finnish Context
Sanna SAKSELA-BERGHOLM (University of Helsinki, Finland) | sanna.saksela@helsinki.fi

This paper discusses how temporality, geographical distance and cultural differences can influence Filipino labour migrants’ decisions to become part of the permanent population or continue to work as temporal migrants. The starting point is that different kinds of time conceptions can guide and influence the stream of thought of labour migrants and their motives to become part of the Finnish labour. A more profound image of immigrants’ integration to the Finnish labour market is obtained by analysing the role of time in the lives of temporary labour migrants. First, the paper explores the economic, sociocultural and religious push and pull factors, which influence the migrants’ opportunities and interest to remain in Finland. Second, this paper explains how both local and transnational daily practices guide the Filipino migrants to create social spaces, which connect them with their friends and family members beyond Finland. The final part demonstrates a need to take into consideration more fluid and symbolic boundaries connecting migrants with their country of origin and settlement. The data consists of twenty semi-structured interviews conducted among Filipino health-care workers, cooks and cleaners.

Community, Communication, and Participation: The Role of Regional Japanese Language Classes in Japan for Non-Japanese Nationals
Kumi SATO (Kinjo Gakuin University, Japan) | avenues@sato.email.ne.jp
Kohei OKAMOTO (Nagoya University, Japan) | h44540a@cc.nagoya-u.ac.jp

Previous ethnicity studies in Japan have mainly been focused on the non-Japanese residents in the foreigner-concentrated areas within big cities and industrial regions. However, even in rural Japan areas, there lives a quite number of non-Japanese women, immigrated from China, Korea, Philippines and Thailand to marry Japanese men who are bound to their homes to inherit their family estate. Since they cannot easily find their wives from among Japanese young women who do not want to live in rural areas, they welcome women from Asian countries as their wives through international marriage brokers. Those wives live with their husbands' parents and have not been visible in Japanese society so far.

One of the ways to help those wives who live dispersedly not getting isolated is the formation of a network for themselves and also of a network to connect them with local Japanese residents. The authors have researched how local Japanese language classes throughout Japan are functioning for non-Japanese nationals to find that those classes have been working not only as the places for them to learn Japanese language, but as the places where they can consult with their Japanese teachers regarding any concerns from their daily lives to personal issues.

The authors discuss the possibilities of regional language classes to be the hubs for multicultural coexistence promotion in future when Japan decides to open its door wider to non-
Japanese nationals in order to solve its aging and declining population and to revitalize its economy.

RN15S01 - General Theme

Glocalization & social theory: three interpretations
Victor ROUDOMETOF (University of Cyprus, Cyprus) | roudomet@ucy.ac.cy

This paper presents three interpretations of the concept of glocalization in the literature. To date, there is no attempt at a distinct theorizing of glocalization on its own terms. But there are two key interpretations of glocalization in the context of the theories developed by Roland Robertson and George Ritzer. This paper offers a critical assessment of advances and weaknesses of each of their perspectives with regard to their treatment of the concept of the glocal. Both theorists demonstrate an awareness regarding the differences between globalization and glocalization, but this awareness is far from self-reflexive or explicit. As a result their interpretations fail to draw a consistent analytical distinction between the two concepts, thereby leading to different forms of reductionism: either glocalization is subsumed under globalization or globalization is transformed into glocalization. Building on these past efforts on theorizing glocalization, the paper proposes a third interpretation that offers a means for rectifying the problem of insufficient analytical autonomy. Accordingly, it advocates that glocalization should be seen as an analytically autonomous concept from globalization. The paper develops working definitions of glocalization and of glocality as analytically autonomous from globalization and globality. It also addresses the key themes of power and temporality in conceptualizations of the glocal and argues that the notion of analytical autonomy offers the means of adequately addressing these themes.

The Spatial Structure of Transnational Human Activity
Emanuel DEUTSCHMANN (Jacobs University Bremen, Germany; Bremen International Graduate School of Social Sciences, Germany) | e.deutschman@jacobs-university.de

How does physical distance influence the mobility and communication of people across nation-state borders? For a long time, social scientists have argued that as globalization proceeds, geography becomes less powerful in structuring human activity, resulting in the “annihilation of space by time” (Marx), a “global village” (McLuhan), the “demise of geography” (Toffler), a “shrinking world” (Allen and Hamnett) and ultimately the “death of distance” (Cairncross) and a “flat world” (Friedman). In contrast to these popular accounts, studies in the natural and complexity sciences have shown that the movements of many species, from sharks and penguin to spider monkeys and plankton, as well as human motion at the local and national scale follow specific mathematical patterns, known as Lévy flights, in which the frequency of moves heavily decreases with distance (in the form of a power-law relation). Which of the two conflictive positions actually holds for human activity at the global scale has however not been thoroughly studied as yet.

The persistence of this research gap is astonishing given that many problems humanity is facing today, from health epidemics like H5N1 and Ebola to climate change and terrorism, are heavily intertwined with transnational human mobility and communication. Driven by the hope that a better understanding of how people move around the world can contribute to solving such pressing social problems, a group of researchers has recently challenged the scientific community to get active and “to collect large-scale human mobility traces” (Hui et al. 2010). The
The aim of this article is to respond to this call and to fill in some missing pieces, namely to add the global-scale analysis to the natural-scientific Lévy-flight debate, and the Lévy-flight analysis to the social-scientific globalization debate. In specific, we search for answers to the following research questions:

1. Does the planet-wide spatial structure of transnational human activity follow a Lévy-flight?
2. Does the spatial structure differ by type of activity, and if yes – why?
3. Has the spatial structure of transnational human activity changed over time?

To answer these questions, we examine the spatial structure of eight types of mobility and communication (asylum- and refuge-seeking, migration, student exchange, tourism, Facebook friendships, phone calls, and remittances) worldwide for ties between 196 sending and receiving countries (38,220 country pairs) for time periods as long as 1960 to 2010. In addition to analyzing these eight activity types individually, we also examine the spatial structure of transnational human activity as a whole via three aggregate indices of transnational mobility, communication and activity. The underlying data was collected from a wide range of sources (e.g., UN, WTO, UNHCR, Facebook).

The usual strategy to detect Lévy flight patterns in empirical data is to test the power-law fit of the empirical probability density distribution. A simple model is developed that allows to propose type-specific predictions concerning the power-law fit based on two factors: the availability of opportunities for attainment of the goals associated with a specific type of activity and the resources available on average to the individuals engaging in it. Next, we compare the empirically observed probability density distributions to the ideal pattern of a power-law function of the form $P(r) \propto r^{-\beta}$, where $P(r)$ is the probability of a displacement length $r$ to occur and $\beta$ is the scaling exponent. To do so, we use the curvefit module in Stata, which provides a goodness-of-fit measure ($R^2$) and other relevant parameters like the scaling exponent $\beta$. As a robustness check, we partially repeat the analysis with Kernel-weighted local polynomial smoothing using an Epanechnikov-kernel function and the ROT-bandwidth estimator. This procedure leads to similarly outcomes.

The results indicate that

(a) Contrary to popular social scientific accounts, geography is not “dead”. The large majority of THA still occurs at short distances and truly global mobility and communication continues to be scarce. The spatial structure of transnational human activity is similar to that of animal displacements and local-scale human motion in that it can be approximated by Lévy flights with heavy tails that obey power laws.

(b) Scaling exponent and power-law fit differ by type of mobility, being highest in refuge-seeking and tourism and lowest in student exchange. This pattern suggests that the availability of opportunities for attaining type-specific goals as well as the resource stock disposable on average to the individuals engaging in a specific mobility type play a role in determining the precise shape of the spatial structure.

(c) For communication, we observe that distance is stronger in determining online friendships in the late 2000s than analogous phone calls more than a decade earlier. This finding is completely at odds with Cairncross’s popular argument that declining costs of communication lead to a “death of distance”.

(d) Despite dramatic increases in the absolute amount of transnational mobility and communication over the years, the Lévy-flight pattern remains intact and remarkably stable over time. Longitudinal change occurs only for some types of transnational human activity and predominantly at short distances, indicating shifts at the regional level rather than globalization. Overall, our findings fit the Lévy-flight model well, whereas the death-of-distance arguments turn out not to hold under closer scrutiny for transnational mobility and communication. Geography still shapes the patterns of planet-scale human activity. Where humans interact across nation-state borders, they are very likely to do so with neighboring countries and within the world regions they live in. The discrepancy between this finding and popular accounts of globalization
– from McLuhan’s “global village” to Friedman’s “flat world” – may indicate that we as humans tend to overestimate our capability to transcend nature. Despite the profound technological, socio-economic and infrastructural revolutions that took place during the last half century – from the end of the bipolar world system after the fall of the iron curtain to the rise of mass tourism and the dawn of the internet age – the overall patterns of human mobility remain largely unchanged, bound to the same natural laws as the motion of all kinds of species, from plankton to penguin.

**Cosmopolitan Bodies**
Motti REGEV (The Open University of Israel, Israel) | mottire@openu.ac.il

One of the most overwhelming consequences of cultural globalization consists of its impact on bodily practices. In this paper I want to offer a certain analytical framework for understanding this impact, by suggesting that cultural globalization has led to the emergence and consolidation of cultural bodies best described as cosmopolitan bodies. Moreover, I want to suggest that cosmopolitan bodies come into being through interaction and engagement of individuals with objects and things in the material world. The paper brings together inspiration and insights from areas of research and theory in cultural globalization, sociology and anthropology of the body and so-called “thing-theory” (material culture studies, ANT, etc.) in order to propose possible empirical foci for investigating how cosmopolitan bodies come into being and function as cultural entities. Cosmopolitan bodies are bodies whose very corporeality is inscribed with cultural dispositions and sensibilities, skills, schemes of perception and evaluative criteria shared by many other bodies across the world, in national and ethnic realms other than their own. Once the bodies of modern individuals adapt their senses and bodily practices to globally circulating cultural elements, and knowingly incorporate the experiential repertoires associated with such practices for articulating cultural locality and a sense of indigenousness, their bodies become cosmopolitan bodies. Such adaptations may pertain to various sensual practices (gustatory, auditory, haptic/tactile), may be invoked by things such as food, clothing, music, machines and gadgets, and result in cultural practices such as eating, appearance, artistic taste and everyday behavior in modern urban settings.

**RN15S01 - General Theme**

**Imageries of the social world in epistemic governance**
Ali QADIR (University of Tampere, Finland) | ali.qadir@uta.fi
Pertti ALASUUTARI (University of Tampere, Finland) | pertti.alasuutari@uta.fi

To explain why neoinstitutionalist theories have been so successful in explaining global isomorphism and to discuss how they can be extended to describe otherwise inexplicable similarities in the world, the article approaches policy-making from an epistemic governance perspective. Utilizing a constructionist view, the paper argues that popular and political rhetoric are inextricably bound to social scientific conceptions of reality through the use of root metaphors that are, in turn, woven into convincing imageries of social reality. In addition to the well-known culturally constructed imagery of social change as driven by functional requirements of modernization, two other imageries are identified: society as a hierarchy and the social world as comprising competing blocs. These three imageries are then discussed as key discursive ingredients for both social scientific and political actors seeking to understand and change the world. Finally, the implications of the article for future research are discussed.
Values as the core of culture. How the recognition of universal values and the emergence of world society cause and require each other
Max HALLER (University of Graz, Austria) | max.haller@uni-graz.at

Starting from the Weberian concept of sociology as a science of social reality (Wirklichkeitswissenschaft) I will argue in this paper that it is the central task of sociology to relate human action, social processes and social institutions to the underlying basic values. Following G.H. Mead, I argue that the essence of social values is that they reconcile individual interests with the needs of the social groups and societies in which a person lives. This shows itself also in the close relation between values and emotions. We can enumerate a restricted number of basic values (e.g., individual autonomy, freedom, justice, altruism, security). Three basic theses will be proposed: First, these values lie at the core of all large world religions as well as of most social philosophies since ancient times, thus they are really universal; second, there exists, in spite of ever recurring fallbacks, a secular trend toward the realization of these values in human history (this is a position different from Weber who had a rather pessimistic view in this regard); third, the range of values becomes the larger the more extended the social relations, networks and societies of individuals are becoming; it is only in modern times when something like a world society is emerging, the existence and relevance of universal human values becomes fully aware. Thus, this view offers a fruitful new approach to the concept of a cosmopolitan sociology transcending normative arguing which is prevalent in this area.

RN15S02 - Ethical Cosmopolitanism

Gender performance and cosmopolitan practice. Gender, the cosmopolitan imagination and everyday schemas of hospitality.
Ian WOODWARD (Griffith University, Australia, University of Southern Denmark) | i.woodward@griffith.edu.au
Nina HØY-PETERSEN (Independent researcher) | nina.hoey@gmail.com
Zlatko SKRBIS (Monash University, Australia) | zlatko.skrbis@monash.edu

Although empirically grounded accounts of cosmopolitanism have explored the impact of class, education, and ethnicity on cosmopolitan practices, no direct attention has yet been given to whether and how men and women might differently understand and frame cultural diversity. Indeed, as critical accounts of cosmopolitanism argue, research in the field commonly assumes the question of cosmopolitan citizenship to be gender neutral. Addressing this gap, the current paper analyses the gendered sociological features of everyday conceptions of hospitality - keeping in mind that the capacity to give and receive hospitality is often held to be a defining feature of the reflexive cosmopolitan outlook as well as the signature performative component of ethical cosmopolitanism. By applying the methodological concept of cognitive schema to a large set of qualitative data, we inductively assemble evidence that men and women have differently articulated ‘cosmopolitan imaginations’. Our findings show men’s conceptions of hospitality typically centre around ideals of rationality, power and control. Men are more inclined than women to draw stronger boundaries between the other and self, and to express allegiance to conditional forms of hospitality centred around nation-state based power hierarchies. Women, in contrast, generally express an inclination towards reciprocal, embodied forms of hospitality that foster inter-human bonds. We consider what explicit research attention to these gendered
frames of cosmopolitan hospitality might mean for how we conceptualise, develop and advance critical theories of cosmopolitanism.

Exploring contradictions and challenges in performances of openness in tense cosmopolitan encounters
Indigo WILLING (Griffith University, Australia) | i.willing@griffith.edu.au
Stefanie PLAGE (Griffith University, Australia) | stefanie.plage@gmail.com
Ian WOODWARD (Griffith University, Australia) | i.woodward@griffith.edu.au
Zlatko SKRBIS (Monash University, Australia) | zlatko.skrbis@monash.edu

This paper explores cosmopolitanism in encounters between individuals from different cultural backgrounds. Encounters with difference are increasingly a feature of everyday life and a deeper understanding of the cultural, ethical and identity work people engage in to negotiate diversity is required. This is particularly pertinent in situations beyond voluntary cosmopolitan pursuits, such as sampling diverse cuisines and ‘staged’ experiences of diversity. Employing the concept of ‘cosmopolitan encounters’, we examine the strategies people use to work through situations where socially constructed forms of diversity, such as racial to religious differences, cause friction rather than easy pleasures. We argue that cosmopolitan dispositions and practices assist individuals in diffusing potential escalations. Drawing on a qualitative dataset, we reveal the contradictions in what individuals profess and how they act to examine cosmopolitan practices in the context of everyday settings against the background of their attitudes, actions and self-perceptions towards diversity. Our findings show that the moral dimensions and ethical dispositions people draw upon in encounters are foundational to their achieving more reflexive forms of openness. However, we also illustrate how the moral and ethical dimensions of cosmopolitanism are far from neutral and are shaped by factors including people’s reflexivity and various social hierarchies. In doing so, we add to studies where actually existing cosmopolitanism is observed as being grounded in the messiness of social life, and as an ethical and reflexive process that allows for forms of social rapport to be achieved.

Social Remembering and Moral Learning: ‘Comfort Women’ and the cosmopolitanisation of memory
Gyunghee PARK (University College Cork, Ireland) | g.aprilpark@gmail.com

In an examination of ‘comfort women’ memories and their transformations across time and space, the present paper underscores the broader normative and empirical aspects of how social remembering facilitates and contributes to processes of moral reflection and deliberation. Corollary to what some have termed the ‘cosmopolitan turn’, a dominant trend has been the aim of a ‘cosmopolitan memory culture’ upon which post-nationalist political alliances and a more democratic and just global polity could be made possible. Diverging from the notion that ‘cosmopolitanism’ is purely ‘connective’ or that globalization is the primary mechanism, this paper argues for a methodologically grounded approach which identifies new or emergent social realities. Through an interrogation of the conscious and unconscious (re-)production of ‘comfort women’ memories through multiple mediums, the author aims to elucidate how our memories implicate conflicting representations of the past infused with competing moral frameworks, ideological perspectives, and vested interests. Supplementary to this theoretical analysis, using the author’s empirical examination of how narratives have resonated with individual understandings of moral identity and international commitments to human rights and justice, it will be argued that varying representations of the ‘comfort women’ demonstrate transformations and differences in recollection and register of said remembrances as memories of injustice
amongst multiple publics. Thus, the individual and institutional competences – making and stabilizing the connections necessary for any measure of solidarity that would deem the dominant normative political and moral account of cosmopolitanism even viable – will reveal the very concrete field of contestation within which they do so.

Cosmopolitan spheres of local environmental action
Hande PAKER (Bahcesehir University, Turkey) | hande.paker@eas.bahcesehir.edu.tr

Cosmopolitanism has emphasized the importance of transnational spaces of extraterritorial interactions, and norms and values that shape them; however, has mostly assumed away the actual dynamics that shape such interactions and frames. As such, it has drawn criticisms of discounting local/national contexts where political action actually transpires. The paper analyzes two local environmental struggles in Turkey to understand the process of integration into transnational public spheres. The analysis shows that the movement against the construction of the Ilısu dam in Southeast Turkey formed transnational solidarities, while in the case of the opposition against the construction of a third bridge on the Bosporus in Istanbul, cosmopolitan frames were established, albeit no substantial transnational links. I argue that the local dynamics out of which transnational action and cosmopolitan frames emerge have to be carefully expounded to identify the conditions under which such actions and frames are made, thereby grounding cosmopolitanism in concrete relations of solidarity and conflict.

RN15S03 - The Mobilities of Elites

Everyday Cosmopolitanisms of Mobile Elites. Ambivalences and Fragmentations in the Everyday Life of German and American Expatriate Managers in China
Anna SPIEGEL (Bielefeld University, Germany) | anna.spiegel@uni-bielefeld.de

The question whether today’s mobile elites have to be described as interculturally open and competent cosmopolitans or, on the contrary, as pronounced anti-cosmopolitans and ‘parochial jet-setters’ is still unanswered. With this paper we want to contribute to the further development of the concept of everyday cosmopolitanism by researching the global elite from an everyday perspective. The concept of everyday cosmopolitanism was initially introduced to counter the view of cosmopolitanism as a unique feature of the globally mobile elites. A variety of ethnographic studies of non-elite groups showed instead that in contexts characterized by the lack of economic and other privileges cosmopolitanism emerged precisely in order to enlarge the limited room for manoeuvre. The everyday life of the globally mobile elite, however, has not been empirically grounded in a similar way. Based on ethnographic case studies of German and American expatriate managers in China we highlight the ambivalences, partialities and contradictions within practiced elite cosmopolitanism. We analyse how mobile professionals ‘immerse’ in the material and spatial arrangements of the locality of their assignment, how they deal with the perceived differences and what specific ways of managing the ‘Other’ they develop. We explore three distinct social spaces which are relevant for the expatriate managers’ relation to the ‘Other’—urban space, dwelling spaces and working spaces. Our findings clearly contradict both the image of mobile elites as cosmopolitan ‘global managers’ as well as their image as ‘parochial anti-cosmopolitans’ living in hermetically sealed ‘bubbles’. On the contrary, we argue for a ‘compartmentalized cosmopolitanism’ that emerges from the fragmented quality of the managers’ everyday life and from the contradictory ways in which they deal with cultural difference in different realms of everyday life.
Acculturation and mundane cosmopolitanism in international students’ life experiences
Weyi WU (Shanghai Jiao Tong University, China, People's Republic of) | wwy2014@sjtu.edu.cn

This research investigates the acculturation of international students in host countries from an interdisciplinary perspective by defining the acculturation process as individuals’ overall aesthetic experience and everyday performance. Based on the notion that international students are both agents of cosmopolitanism and are profoundly affected by various materialization of that idea, the research seeks to shed light on the discussion of mundane cosmopolitanism in the context of complicated and controversial globalization.

International students’ life experiences enable an empirical approach to conceptual dichotomies such as cultural pluralism and essential otherness, cosmopolitanism as a humanitarian ideal and cosmopolitanism as an ideology as well as daily confrontation of alterity and performative multicultural identity. Accordingly, ethnographic methods including participant observation and in-depth interview are chosen to collect qualitative data for the analysis of acculturation and mundane cosmopolitanism.

The research sample population is divided into three groups: before, during and after sojourn, to constitute a longitudinal view of the acculturation process and its long-term effects. In terms of data analysis, Victor Turner’s anthropology of performance and Erving Goffman's dramaturgical theory of interaction are used in combine with Pierre Bourdieu’s critical thoughts on habitus, cultural capital and higher education. Instead of raising and testing any hypotheses, this research aims to explore possibilities of cosmopolitanism as embodied in and by international students’ lives and interpreting the permanent “conflict” between belongingness and otherness in individuals’ understanding and practice of their cultural identities.

'Parochial Cosmopolitanism' and other Paradoxes of Aid Work
Silke ROTH (University of Southampton, United Kingdom) | sroth@soton.ac.uk

The expatriate community of aid personnel, people working for international aid organisations including non-governmental organisations and UN agencies, represents a ‘very parochial form of cosmopolitanism’ (Rajak and Stirrat 2011). Based on biographical interviews with national and international staff of aid organisations, this paper explores paradoxes of aidwork while focusing on the interaction between international and national staff. The interviews reveal contradictions between seeking authentic ‘non-tourist’ experiences and the retreat of (white) international staff into ‘white spaces’ (Leonard 2010). Hotels or villas of expatriates become ‘Club Med under bombs’ (Yala 2005; Muenz 2007; Pandolfini 2011) and Western expatriates explained that after a stressful day, they preferred to socialize with other expats rather than with their national colleagues, especially if the encounters with national staff at work were experienced as stressful. Some expressed guilt for lacking desire to spend time and cultivate friendships with national colleagues outside of work. The analysis of interactions and relationships between international and national staff and their encounters with local populations and beneficiaries reveals paradoxes of aidwork that are related to differences in power and privilege. Furthermore, Aidland can be characterized as ‘racial project’ (White 2006). Even though aidwork addresses the symptoms of global inequality, these are re-enacted in the interactions between national and international staff. My analysis of the reproduction of global inequalities within aid organisations is a contribution to ‘connected sociologies’ (Bhambra 2014) and highlights how processes in the Global North and the Global South are inextricably intertwined.
On the Reluctant Cosmopolitanism of Kinetic Élites
Karin Eva FAST (Karlstad University, Sweden) | karin.fast@kau.se
Johan Eric LINDELL (Karlstad University, Sweden) | johan.lindell@kau.se

This paper draws upon interview data, collected between August 2014 and March 2015, with members of the internationally mobile economic elite of Sweden. The purpose is to illuminate the experience of pursuing a career in potentially cosmopolitan spaces, and the using of various media for sustaining a sense of ontological security and relational stability with home and family. Results indicate that the members of this group view their mobility and potential cosmopolitan capital as a necessary evil in order to maintain a position of economic privilege at home. Cosmopolitanism is here actualized only in relation to the career, involving a “feel for the game” and relevant skills in the transnational business field rather than the immersing of the self in the culture of the other. The instrumental, and in some cases reluctant, cosmopolitanism of the kinetic élite is sustained by regular mediated connectivity with the families back in Sweden. Rather than viewing media as gateways to the wider world and potential spaces of cosmopolitan cultivation, they are invoked, above all, under the regime of what Tomlinson called “technologies of the hearth”. As such, the paper contributes to contemporary discussions of the status of cosmopolitanism and the ambiguities pertaining to life on the move as it unravels the tensions between “home” and “away” and the complex relationship between physical and symbolic connectivity experienced by the kinetic élite.

Comparison of French teachers in Casablanca and London. Fuzzy identities and spreading "home" stressing cultural diversity.
Sylvain BECK (GEMASS, France) | sylvain_beck@yahoo.fr

This proposition proposes the results of a comparative perspective between situations of French teachers in Casablanca and London. An a priori nationalist considers the presence French abroad as post- or neocolonialist, a teaching with a universalistic spirit, spreading French culture and language. Cultural and economic influence of France across Francophonie are emphasized by political discourses particularly viewable in Morocco. But comparison with London show us a more complex reality, that cannot be only connected with colonial memory. I interviewed sixty teachers in both cases, and stayed observe for six months each. Different grades of blend have seldom highlighted nationalist feeling, but rather binational or fuzzy identities. At first, the feeling of belonging is structured by the professional status, type of school (national or local), family situation, time spent in the host country, the life courses and origins. Then, the local context induces different possibilities of immersion according to the social pressure on the stranger. Morocco is particularly interesting because social boundaries are sharp. Very well hosted the stranger is kept at his specific place. Finally, comparison show us that this nationalist view failed because French teachers have to be adapted in a certain measure to the local context. Even if they keep to be carriers of certain republican values, there are grades of adaptation with pupils who live in local environment. As said one interviewee who experimented both examples, stressing also cultural diversity in France: “It is the same curriculum and the same job but with cultural differences”.

RN15S04 - Mobilities and Belongings
A social constructivist approach to non-Western perceptions of international volunteers.
Loes VERHAEGHE (UGent, Belgium) | loes.verhaeghe@ugent.be

Despite the unseen expansion of volunteers participating in international voluntary service, there has been a one-sided Western research focus on the volunteers. Adopting a social-constructivist approach, this paper aims to present a non-Western interpretation by including the view of the host community. Fieldwork conducted between January and April 2014 in a small village in Mexico provided us with new insights. We acknowledge different notions of volunteering, which we discuss by assessing multiple perceptions the host community has of the international volunteers. The typology of perceptions consists of volunteers as resources, missionaries, wiseacres and world citizens. We understand the perception of a volunteer that an inhabitant has by his exposure to the outside world and the dimensions of the volunteering program. We conclude by using these findings to question and reflect on the concept of (international) volunteering in a non-Western context.

Moral Cosmopolitanism and the everyday life.
Robin VANDEVOORDT (University of Antwerp, Belgium) | robin.vandevoordt@uantwerpen.be

As moral cosmopolitanism has been at the heart of many sociological debates, scholars have developed a wide range of theories and methods. Individuals’ sensibilities towards distant others have been conceived of as a series of affective effects (Boltanski; Cohen), as a discourse (Chouliaraki; Wodak), as a collective identity competing with local or national variants (Lamont), and as the logical terminus of late-modern reflexivity (Giddens; Beck; Habermas). These conceptual frameworks, however, have drawn scholars’ attention primarily to the particular ‘forms’ of engagement in which moral cosmopolitanism may appear. In this presentation I argue that focussing on the socio-cultural mechanisms enabling or constraining these moral forms, requires altogether different types of theory and method. More concretely, mediated morality should be approached through everyday life, that is, as something that is negotiated from within the complex life-world in which individuals engage with a variety of social spheres (e.g. family, friends, passions, neighbourhood, education).
Building on recent developments in media ethnography and pragmatic sociology, this presentation draws on empirical data obtained through 10-day media diaries and in-depth interviews with 20 Belgian students who spent part of their higher education abroad. These data serve to explore how students’ confrontation with the well-being of distant others is embedded in their everyday life-world, and mediated by the social spheres dominating that life-world. It is argued that focussing on this everyday context deepens our understanding of the mechanisms determining the forms through which individuals’ engage with distant others (e.g. reflexivity, collective identities, emotional experience).

Using visual Q methodology to study difference across and within countries: A transnational comparative study of beauty standards
Giselinde KUIPERS (University of Amsterdam, Netherlands) | g.m.m.kuipers@uva.nl
Michael DEINEMA (University of Amsterdam, Netherlands) | m.n.deinema@uva.nl
Sylvia HOLLA (University of Amsterdam, Netherlands) | s.m.holla@uva.nl

How can we study differences in beauty standards within and across countries? It is commonplace to assume that people in different countries have greatly divergent standards for male and female beauty. This (supposedly) leads to greatly different appreciations of specific physical traits (e.g. body size, hair color), as well as different styles in grooming and styling.
This study aims to empirically investigate these assumptions, by systematically studying social differences in the evaluation of male and female appearance in France, Italy, the Netherlands, Poland, and the UK. In order to do this, we developed a novel method, using Q methodology (Brown 1996) with images of male and female bodies and faces. Combining Q-methodology and open interviews (N=133), we present a quantifiable comparative measurement of ‘repertoires of evaluation’, and a qualitative analysis of the underlying logics of ‘beauty tastes’. We find, first, considerable variation across informants, suggesting that there is no single ‘hegemonic beauty standard’. Second, we find marked differences for the evaluation of (male and female) faces versus (male and female) bodies. The evaluation of the beauty of faces is mainly linked with age, educational level, and urbanity, but not with country. The evaluation of bodies, in contrast, is more country-specific. These findings have considerable implications for comparative research. First, they highlight the value of novel research methods, in particular the use of visual (i.e. language-independent methods) and in-depth comparison of standardized qualitative interview data. Second, in an era of increasing globalization, nationality is increasingly unlikely to be the main source of variation (or the central variable). Third, even within a delineated domain like beauty, some styles and standards may be more national than others. We argue, therefore, that it makes more sense to speak of ‘transnational comparative research’.

**Freirean cosmopolitanism: teachers and international volunteering**

*Mags Liddy (University of Limerick, Ireland) | mags.liddy@ul.ie*

International volunteering currently is a popular activity (Comhlámh 2013; Simpson 2004) and often seen as a way of increasing teachers adoption of a global perspective in their teaching (Martin 2008). My PhD research is a case study of an Irish NGO who annually send volunteer teachers to facilitate a teacher education programme in North East India. It examines the Irish teachers learning about global development and their engagement with development education (or global education as it is termed in Europe). Qualitative work was deemed most appropriate for my research as I aimed to gain insight into the complexity of international volunteering and into teachers’ lifeworlds. I utilised three methods of data collection; ethnographical fieldnotes when I accompanied two groups to India; semi-structured interviews on return to Ireland; and reflection sheets completed approx. one year after their overseas experience. I employ two theoretical lens to interpret their words and actions, notably cosmopolitanism and postcolonial theory. For this presentation I will begin by outlining these two theoretical approaches; present data from my research with my theoretical interpretations, and conclude by questioning these two theoretical lenses.

The physical move from ‘first world’ Ireland to ‘third world’ India engages teachers with the reality of global development and cultural differences, including clothing, food, weather, religion. Arguably these changes could work to challenge dispositions and disrupt taken-for-granted beliefs (Bourdieu 1977). Yet there is also a familiarity to their experience; the school settings are familiar with timetables, staffrooms full of colleagues, and religious management of schools. Thus their habitus is different while simultaneously familiar. This strange mix of difference and familiarity could be interpreted positively by cosmopolitans as conjuring similarity of professional experience, or negatively by postcolonials as glossing over differences especially material resources. This mix echoes through the ambiguity of volunteering experience understood as an in-betweenness and liminal space (Bhabha 1994) where a volunteer is visiting and being a tourist but also working and being professional.

The data I will present demonstrates how my research participants words can be read through two theoretical frameworks, with some participants are evoking multiple frames of interpretation and symbolic frames. Postcolonial theory is often utilised to analyse developed world views on
the developing world (Martin 2008; Jefferess 2012), while Andreotti (2011) describes the process of unlearning and relearning of place in the world as actionable postcolonialism. However this theoretical approach can emphasise a deficit of understanding on the developing world in Western participants which could work to disempower teachers from teaching on global development. Within my research I see where some participants are working towards relearning while others remain in the liminal space (Bhabha 1994). This liminality highlights the translation dynamic from direct experience into changed beliefs or practices. Remaining in the liminal works to undermine the positive impact of overseas experience as new knowledges or ways of seeing are not integrated into practices and critiquing their non-learning further disempowers learning.

Cosmopolitanism may be a more fruitful approach to interpretation of volunteers’ experiences, as it celebrates the professional connection between teachers as a cosmopolitan consciousness (Bamber 2010). Developing from its origins in Greek and Roman times, cosmopolitans believe that all human ethnic groups share a common morality and support global moral obligations (Pogge 2002; Brock 2009). The ethical values base of development education centres on social justice according to Bourn (2014) has much in keeping with the ethics of cosmopolitanism. However this global moral ethic is not always enough; a benevolent global moral ethic could motivate volunteering but also encourage charitable responses to the developing world and lead to soft forms of global development education in teaching a global perspective (Andreotti 2006). The absence of power emphasises the human side in global development which can prevent activism for global change from being implemented (Liddy 2015). I suggest cosmopolitanism needs to differentiate between the diverse layers within global ethic. My research participants work in a participatory and facilitatory manner, in a sustainable long-term programme jointly designed by Irish and India participants and are conscious of the material and resource differences. As such they could be described as bottom-up approaches or as I suggest, Freirean cosmopolitanism, connecting the volunteering experience, pedagogy and global development education.

Cosmopolitan Cultural and Aesthetic Experiences: the Grand Tour Narrative in the 21st century
Pierluca BIRINDELLI (Gonzaga University, Italy) | pierluca.birindelli@gmail.com

People all over the world cling fondly to the Florentine myth that spells Renaissance and all its legacy. Visitors’ expectations and their encounter with the edifying reality appear to be guided largely by the aesthetic appreciation of art. This leaves out of count many other cultural, social, political and philosophical aspects, and their contemporary ramifications, which could transform the epithet of “Cradle of the Renaissance” into “Museum of the Renaissance”. In this paper I wish to explore various current myths that lead foreigners to choose to visit/live in Florence for a while or forever. Is it possible to discern any shared, collective representations of Florence (and Tuscany)? Do they differ from other typical “Made in Italy” images? If so, how do such myths fit into the contemporary everyday life of the city? Can we arrive at a set of typical (or archetypical) biographical motives leading foreigners to Florence and distinguish certain identity traits? Is it possible to observe signs of a Cosmopolitan Spirit? And if so, can we identify a pathway from the aesthetic quest for the “authentic” Italian life to cultural encounters with Italians in the flesh? I hypothesize that one of the leading motifs of foreigners’ experiences is a romantic, and to a lesser degree, intellectual approach towards “Florence without Florentines”. The outlanders’ romantic coup d’oeil may induce a deceptive vision of Italian life and social reality. If so, there is nothing new "Under the Tuscan Sun": the Grand Tour archetype and narrative is alive and kicking.

RN15S05 - Transnational Cosmopolitan Communities

Neither surrender nor mastery: Spatial detachment and ethical ambiguity among elite cosmopolitans in Geneva
André JANSSON (Karlstad University, Sweden) | andre.jansson@kau.se

Ulf Hannerz once outlined cosmopolitans as people who are willing to immerse themselves in other cultures, while at the same time displaying their skills in handling them – a peculiar interplay between surrender and mastery. Following Hannerz’s characteristic, skilled professionals within the UN sector come close to the cosmopolitan ideal type embodying a cosmopolitan ethic while at the same time building their careers on global mobility and obedience to institutionalized rotation policies. How are these orientations played out in cultural settings that are not obviously understood as “other”? This paper presents an analysis of social trajectories and senses of belonging among Scandinavian expatriates employed by UN organizations in Geneva. The interview material (gathered during two periods of fieldwork in 2014) shows how the cosmopolitan outlook is to a large extent set aside when confronted with the local culture of Geneva. The city is typified as a non-place without cultural specificity and sarcastically described as “good for those who are inclined to suffer from homesickness” (because of its relative proximity to Scandinavia, culturally and geographically). The analysis thus underscores the situated character of cosmopolitanism and the culturally objectifying hierarchies that govern the accumulation of cosmopolitan capital. The outspoken detachment from Geneva is interpreted as an ambiguous ethical statement that celebrates broader
cosmopolitan ambitions while at the same time revealing aspects of ontological insecurity among cosmopolitan subjects.

**First trip abroad: expectations, experiences and stories of transnational Romanians**

Alin CROITORU (Lucian Blaga University of Sibiu and University of Bucharest (CESMIG)) | alin.croitoru@ulbsibiu.ro

The presentation analyzes transnational Romanians’ stories about their first trip abroad. The concept of physical mobility is seen in a broader framework for understanding transnational and cosmopolitan behaviours as well as international migration. In order to distinguish between different types of travelling for the first trip abroad the paper is constructed keeping in mind the structural changes and constraints regarding physical mobility for Romanian citizens. During the process of transition from a communist country to the status of EU member, Romanian citizens’ stories about travelling abroad for the first time fundamentally changed. Labour migrants, asylum seekers, business travelers, students or tourists left the countries with different expectations and faced different problems at destination. Their attitudes toward origin and destination framed their images about the first trip abroad and about other cultures. Using a qualitative approach and EUCROSS research project's samples of Romanians who live in Denmark, Germany, Italy, Romania, Spain and the United Kingdom, the analysis emphasizes certain differences between different types of travelling for the first time abroad and reconstructs how Romanians started their transnational careers.

**Food, consumption, and socio-material proximity in the making of cosmopolitan city**

Jakub GRYGAR (The Institute of Ethnology of the Academy of Sciences of the Czech Republic, v.v.i., Czech Republic) | grygar@eu.cas.cz
Karel ČADA (The Institute of Ethnology of the Academy of Sciences of the Czech Republic, v.v.i., Czech Republic) | kcada1@gmail.com

Aim of our paper is to investigate ways in which eating as an everyday praxis can be use as a medium of understanding for changes in contemporary cosmopolitan urban space. We are interested to explore conditions under which ethnic food consumption might be considered as a vehicle of cultural exchange and under which might be seen as a middle class project of pursuing status distinctions.

The paper is based upon our ethnographical case study of the spread and consumption of Vietnamese food in Prague. With approximately 65,000 inhabitants, Vietnamese are the biggest non-European minority in the Czech Republic. When one looks at the share of Vietnamese compared to total population the Czech Republic ranks fourth in the world. Through mapping histories of Vietnamese restaurants and their geographical environment we focus on translations of objects (food, interior and urban space) and subjects (consumers, restaurant owners, bloggers or journalists) in the trajectories of diffusion of Vietnamese cuisine.

In the context of cosmopolitan cities, we consider ethnic food as a materialization of diasporic experience which can be characterized by its fluidity and in-between-ness. Through series of translations, diasporic food refers not only to the country of origin but also to the hosting country and to the diaspora as a transnational phenomenon. As such, it creates conditions for construction of a new form of authenticity referring to its global context. New forms of authenticity contrast to old forms referring predominantly to shared local memory and local meanings.
Nicolas ARENS (University Saint-Louis Brussels, Belgium) | nicolas.arens@usaintlouis.be

Abstract
This paper provides reflections on a renewed cosmopolitan perspective by contributing to the debate on how integrate the notion of plurality in a globalized society at European Union (EU) level. From a theoretical point of view this paper aims to ask the possibility to complete the juridical cosmopolitism and to explore the positive integration by the integration of social interaction. This question could be addressed in two steps. First, the paper explores the contribution of Jean-Marc Ferry and presents its republican cosmopolitanism asking how this approach gives opportunities to understand the emergence of a European consciousness in the EU. The horizontal “cosmopolitization of mentality” could be seen as an integration of a global otherness into interpersonal relations. This opening to transnational links between individuals, people and states is formalized at a EU level by a set of common rights; shrinking similarly difference of treatment between Europeans. Leading to a possible political action at EU level, but still limited, this perspective could support and be completed by a sociological point of view.

In that context, the paper intends to consider Tocqueville’s approach of democracy, since social interplay and pluralism constitute and vivify necessarily the identity of a society for this author. Focusing on tocquevillian idea of democracy brings the opportunity to explore cosmopolitism as being integrated directly into social link, since “social link” is understood as the completeness of individual decentring. The paper will therefore consider this perspective as a base to revive some aspects of current cosmopolitan sociology.

RN15S06 - European Identities and Citizenship Within European Societies

Imperial worldmaking. Innovation and security in the EU in comparison to the US and China.
Risto HEISKALA (University of Tampere, Finland) | risto.heiskala@uta.fi
Jari ARO (University of Tampere, Finland) | jari.aro@uta.fi

Political actors construct in their policy documents the world partly based on what they believe to be the facts and partly on how they want to frame the facts. The current paper studies the specific nature of the European Union as an empire in the making by comparing its policy documents on innovation and security to those of two other current empires, i.e., the United States and China. In case of the EU we analyse the Europe 2020 Strategy (2010) and European Security Strategy (2003) and compare the world implied by these documents to A Strategy of American Innovation (2011) and National Security Stategy (2010) of the US as well as the Twelfth 5 Year Plan of China (2011). Tools of cultural sociology such as word frequencies, categorical analysis and analysis of narrative structures are used. The analyses show that the EU speaks the language of the economy of about everything it touches as is understandable based on its ordoliberal historical origin while the US puts more ideological emphasis on the tradition of the US nation promoted by the current presidency and China focuses on development brought to the society by the subject of the plan (Communist Party of China and China's National People's Congress). The speaker position in the documents of the US and China present the identity of the nation and the subject of development as unified and
firm while the documents of the EU are characterized by an internal negotiation between the member states and interest groups.

**Bargains With the State and the Neighbours: The Story of Two Villages on the Georgia-Turkey Border**

Mehmet BOZOK (Maltepe University, Turkey) | mehmetbozok@yahoo.co.uk  
Nihan BOZOK (Middle East Technical University, Turkey) | nihanmortas@hotmail.com

In this presentation, we are going to discuss the two ethnic groups’ experiences with border, the state, the “other side” and with each other, on the Georgia-Turkey border, by focusing on Lazis of Sarp Village and Hemshins of Kazımýe Village, based on the results of a qualitative field research we conducted in 2012. The Georgia-Turkey border that was opened in 1988 with the dissolution of USSR brought new experiences to borderland peoples. After the opening of the Turkey-Georgia border, the lives of the borderlanders significantly changed, with the flow of languages, religions, cultures, prostitutes, gamblers, commercial goods, occupations, the abolition of the former prohibitions and establishment of new prohibitions. Since the border is not a fixed entity, its traps, prohibitions, restrictions, opportunities and interests have not been same for every ethnic group.

In our case, Lazis and Hemshins have had historically different relations with the Turkish state, while the Lazis had closer ties and alliances with the state, the Hemshins had conflictual relations with the state and the Lazis. Therefore their economic practices, recognition by the state, migration histories, patterns of protecting their mother tongues, identity construction strategies, cultures and also relations with the border differentiate. As we shall present, the different experiences of these two ethnic groups at the neighbouring villages on the Turkey-Georgia border manifest the contextual, contingent, polysemous and unsettled character of the border and being at the border.

**Re-constructing Citizenship from below in a Cosmopolitan Europe**

Laura LEONARDI (University of Florence, Italy) | laura.leonardi@unifi.it  
Gemma SCALISE (University of Florence, Italy) | gemma.scalise@unifi.it

This paper focuses on the issue of citizenship in the European context. It draws on the debate about the challenges to social citizenship in modern societies, deriving from Europeanisation, globalisation and transformations of both the welfare state and capitalism. It puts forward the concept of “cosmopolitan citizenship” as a useful approach for understanding citizenship transformations beyond the parameters of the nation states. The latter are no longer the exclusive reference point of sovereignty, recognition and identification. By presenting an empirical research conducted on participants to social movements and civil society organisations involved in the European social forum of 2012, the paper identifies transnational patterns of actions and cross-borders networks of people that are engaged together in common activities, share values, interests and experiences, elaborating new meanings and practices of citizenship. The outcome is a new ground for solidarity across national borders encompassing diversity. The results of our study allow us to identify some signals of an emerging “post-national” and cosmopolitan citizenship: an hybrid and processual notion of citizenship linked to different territorial levels and symbolic borders.

**Back to the poorhouse? Social protection and social control of unauthorized immigrants in the shadow of the welfare state**

Arjen LEERKES (Erasmus University Rotterdam, Netherlands, The) | leerkes@fsw.eur.nl
In the late 1980s and early 1990s, De Swaan, a historical sociologist, speculated that heightened global interconnectedness, and the resulting increased potential for international migration, would lead to transnational social policies. In this view, states of richer countries would increasingly perceive an interest in financing social policies in poorer countries in an effort to reduce the need for the distant poor to migrate. By and large, such transnational social policies have not materialized. In this paper, which focuses on ‘the Dutch case’, it is argued that international migration, and the desire by states to selectively limit international migration, is nonetheless leading to new forms of poor relief and poverty control, not in countries of origin, but in countries of destination. In the shadow of the Western welfare states we now find elementary and, in many cases, rather archaic practices of poor relief and anti-pauperism measures for certain categories of unauthorized immigrants. Paradoxically, the local (municipal) level contributes significantly to this rise of ‘secondary poor relief’ in globalized times. Scholarship on migration and citizenship indicates that the rights of immigrants increasingly resemble the rights of citizens, especially in comprehensive welfare states. This trend seems to be complemented, however, by a growing differentiation of social citizenship between those formally admitted (both citizens and residence permit holders) and those officially considered ‘illegal’ non-members.

Another Tale of Nationhood: Black Citizens’ Struggle for a Different France
Abdoulaye GUEYE (University of Ottawa, Canada) | agueye@uottawa.ca

The hegemonic premise of the abstract citizen that has long marked the French nation is facing a significant challenge. To the great displeasure of lawmakers and intellectuals, black French organizations are promoting the idea of a plural citizen rooted in the French nation yet retaining a racial/ethnic identity: hence, their claim for a national census including race and ethnicity as variables.

This paper’s main goal is to assay the extent of the contribution of black French organizations to the emergence of an alternative tale of nationhood, and pinpoint the endogenous factors and political developments feeding their tale. The paper’s theoretical framework binds two key propositions: the degeneration of French nationality, and the transformation within the black French citizenry. It argues that:

a) The French Revolution’s premise of an abstract citizen is being superseded by the organic conception of nationality championed by a (far) right-wing ideology pervading both policies and intellectual narratives, and weakening the jus soli principle. However, a liberal ideal is also being ushered in as the European Union expands and promotes its race directive and minority languages charter via a conceptualization of the national as phenotypically embodied and culturally multi-positioned.

b) The intellectualization of black French readies them to decipher, and build upon, the assault on the Revolution’s tale of nationhood and its foundational premise of an abstract citizen, seen by blacks as concealing the racial specificity of their own disadvantages in an ailing society.

RN15S07 - Policies in a Globalizing World

Globalization of Education Policies? The Effect of PISA
Pertti ALASUUTARI (University of Tampere, Finland) | pertti.alasuutari@uta.fi
Marjaana RAUTALIN (University of Tampere, Finland) | marjaana.rautalin@uta.fi
Leena TERVONEN-GONCALVES (University of Tampere, Finland) | leena.tervonen-goncalves@thl.fi
The OECD Programme for International Student Assessment (PISA) has attracted a lot of attention to education in a comparative perspective. It has been argued that it has created a transnational field of education policy. The paper examines the effects of PISA on the ways in which education policy reforms are debated in national parliaments during 1994 and 2013. The countries compared are Australia, Canada, Finland, Germany, Portugal, Trinidad and Tobago, Uganda, United Kingdom, and USA. The main question asked is whether PISA seems to have affected the ways in which new laws are motivated and justified in national contexts, e.g. has the number of references to the international community increased in the education policy debates? The study shows that PISA indeed seems to have had an effect in that there are more references to international rankings than before. However, references to other countries and international comparisons have not changed. In that respect education policy is no different from other policy areas.

International statistics as an intermediary institution between the local and global
Gert VERSCHRAEGEN (University of Antwerp, Belgium) | gert.verschraegen@uantwerpen.be

This paper discusses the role of numerical and statistical governance instruments (such as cross-national comparisons and benchmarking) in the synchronization of European and global policies. Looking at cases in the field of pensions and employment policy, it argues that cross-nationally standardised data, indicators and comparisons are crucial devices in re-ordering the relation between the national and the global, and in constructing autonomous transnational or European governance fields. Comparative statistics might be interpreted as an intermediary institution between the national and the international; they enable the meaning of national data to be translated into policy terms in the European or global arena, and, conversely, can locate European or global developments in the national space. At the same time, they reshape the role and meaning of ‘the state’ in contemporary policies. Within transnational or European policy spaces, the state still plays a crucial role, albeit mainly in the form of a commensurated epistemic category. By this, we mean that the emergence of a European policy sphere has been constructed around particular data sets (such as the European Community Household Panel (ECHP), the European Union Labour Force Survey (EU LFS) or the European Union Statistics on Income and Living Conditions (EU-SILC)) in which Member States necessarily appear as equivilised or commensurated categories. This is not a neutral process, but often leads to a forced commensurability of incommensurables.

On Not Being Treasonous
Valtteri Johannes VÄHÄ-SAVO (University of Tampere, Finland) | valtteri.vaha-savo@uta.fi

As world society theory has shown, we can see a surprising amount of uniformity between contemporary nation-states concerning both their administrative and political institutions and the policies they seek to implement. This isomorphism can be explained by the diffusion of world cultural models among nation-states. Then again, one central world cultural idea is that the world is composed of number of clearly defined nation-states with unique national cultures
which guide the decision making processes within these nations. These two ideas seem to be at odds with each other. How can you copy exogenous models while keeping up the appearance of a unique nation-state and national culture? How can you avoid accusations of treason or mindless copying?

One explanation for the peaceful equation between ideals of unique nation-states and international isomorphism is the role of experts in introducing policy models into national debates. Another explanation is that while transnational models are introduced into the national field, they are merged with national political issues, which helps to evaporate any traces of exogenous influences. If the reforms are implemented, they gradually form into mundane tasks which eventually cut any visible ties to exogenous origins.

My presentation will show that the question is not so clear cut. We can find several rhetorical techniques which help to overcome this conflict at the outset. Experts are neither sufficient nor necessary condition for overcoming this contradiction. We should look at the rhetorical instruments that are used in domesticating transnational models while validating the idea of unique nation-states.

**Local struggles of transnational philanthropy in Central Europe:**

**Institutionalization and de-institutionalization of the Prague Central European University Foundation in the 1990s**

Tereza POSPÍŠILOVÁ (Faculty of Humanities, Charles University in Prague, Czech Republic) | tereza.pospisilova@fhs.cuni.cz

The aim of the paper is to contribute to our knowledge of the effects of American-style transnational philanthropy in Central Europe. Global private philanthropy develops and supports professional and elite transnational networks as well as specific organizational models and values, which has lead some authors to hypothesise that philanthropy may be one of the key agents in the spreading of globalized capitalism (Vogel, 2006). The focus of the paper is on the local struggle to institutionalize (and de-institutionalize) the organizational structures and values of a private transnational foundation. The paper is based on a case study of the Prague Central European University Foundation, established in the Czech Republic by George Soros in the early 1990s and closed down after the Czech state discontinued its support of the project. The paper traces the transnational actors connected to the university and the groups of local elites which opposed the transnational philanthropic project. Discourse analysis of the newspapers and key documents shows that the main categories which defined the struggle of embedding the transnational project locally were: elitism vs egalitarianism, cosmopolitanism vs nationalism, and reciprocal obligations of philanthropy vs government control. Since domestic elites shared the goal of market (capitalist) economy and pro-US attitudes at that time, the main line of the symbolic struggle was over the control of national politics in the face of transnational actors and agendas.

**RN15S08 - Epistemic Governance and Global Knowledge**

**Intersectionality and categories of inequalities in the EU's Europe 2020 strategy**

Tuija VIRKKI (University of Tampere, Finland) | tuija.virkki@jyu.fi

Intersectionality is a theoretical approach that aims to deal with the complexity of social life in the era of globalization, diversity, and multidimensional forms of inequalities. Launched during the European Year for Combating Poverty and Social Exclusion (2010), the EU’s 10 year
strategy Europe 2020 provides an interesting case study about the construction of socially relevant categories of inequalities in contemporary EU policies. This paper addresses the ways in which Europe 2020 takes into account multiple and intersecting inequalities such as gender, ethnicity, class, and age. It begins with a content analysis of (1) the visibility, articulation and contextualization of the socially relevant categories of inequalities, and (2) the intersections of these categories in Europe 2020. Based on the results of this analysis, the paper considers the reasons to the invisibility of some central categories of inequalities in Europe 2020. Furthermore, the paper addresses the tendency, evident in Europe 2020, to "shrink" the meaning of intersectionality and limit the areas in which it is applied. It is concluded, then, that getting a better grasp of the complexity of social life requires an approach presupposing that the categories of inequalities intersect in multiple ways and through socio-cultural hierarchies and power dimensions that produce complex relations of inclusion and exclusion.

Globalization, knowledge and neo-liberal consensus: a history of management knowledge in Brazil
Maria Caramez CARLOTTO (Universidade Federal do ABC, Brazil) | mariacarlotto@yahoo.com.br

Globalization is a social process based on the strengthening of global flows of capital, goods, people and, important to note, knowledge. The circulation of knowledge, especially of the so-called State knowledge (Savoirs d’état), is a key element of social construction of the neo-liberal consensus that guided the reforms and dismantling of the welfare state. Assuming that a sociology of globalization should consider the global process of knowledge circulation, with a special attention to inequalities and hierarchies that separate producers and receivers of knowledge and expertises, the present contribution aims to analyzes the expansion of management knowledge in Brazil from the 1950s, when cooperation agreements between Brazil and the United States led to the creation of the first Brazilian management schools, until the 1990s, when we faced the consolidation of a neo-liberal consensus for the State Reform in the country. The aim of this contribution is to show how the international circulation of the so-called "State knowledge", particularly in the field of management and emphasizing US-Brazil relations, is essential to understand how the social conditions necessary for implementing called neo-liberal reforms of the state are produced. From this point of view, we can consider the role of knowledge and inequalities to the international process of Statebuilding that has been intensified in the last years.

Outsourcing the Nation-State: Analyzing Professional Networks of Destination Marketing in India and the USA
Tim ROSENKRANZ (The New School for Social Research, United States of America) | roset997@newschool.edu

Through the case study of destination marketing practices, this paper analyzes how the nation-state itself becomes an object of outsourcing into global, professional networks of expertise. Today, nation-states invest billions of US$ to actively manage and produce positive images of themselves to attract tourists. Professional destination marketing and branding therefore have become central activities of the globally competing nation-state. This paper explores these efforts of the nation-state in two main sources of the global tourism economy: the USA and India. “Sources” (or “source-markets”) in this study, and in the professional vocabulary of destination marketing, are the places where tourists come from, where marketing turns potential travelers into actual tourists, who visit a specific destination. This paper draws on qualitative data collected through ethnographic research in India and the USA. I focus on the interactions at the interface between the nation-states’ destination marketing agencies, the National Tourist
Offices (NTOs), and the local, professional actors who translate the nation-state into a tourist destination. I show how the nation-state as tourist destination becomes a local resource of production and consumption for all these professional actors. I argue that this ‘out-sourcing’ process is based on professional claims to expertise and knowledge, which shift away from the destination towards the local source. By focusing on professional networks of interaction, I therefore expand the theorization of global outsourcing-processes, which the current literature mainly understands as a process of organizational change and movement of capital, production and expertise that removes these from national control. In contrast, the out-sourcing process this paper explores, expands the nation-state beyond its organizational boundaries into the sources of global tourism.

The disguise of national interests in European cooperation - the case of international research funding and creating a common European call
Laura Kristina VALKEASUO (University of Tampere, Finland) | Valkeasuo.Laura.K@student.uta.fi

In this presentation I discuss how common European research calls are designed by national research funders working jointly on the international level in order to fund European research. Curiously simple call practices, such as picking a theme and forming an evaluation procedure, have proven to be unexpectedly hard to form in such cooperation leading to lengthy negotiations and unsuccessful outcomes. In fact, general values and common objectives of science policy are much easier to agree on than seemingly simple practices based on which common European research calls are carried out. My explanation is that due to different representative identities and attached national and organizational interests, the process is full of power struggle. The actors struggle to get their national interests through, yet in a way that is not in conflict with common assignments. The institutional framework of European research policy cooperation means that actors need to take into account common European interests and values, which acquire putting national interests in the background. As a consequence the actors need to find new kinds of strategies in order to further national interests in ways that disguise the fact that their objective is to protect such interests. Those strategies are discussed in this presentation based on an empirical study on European research funding negotiations in ERA-NETS. In the study policy practices are considered as a dimension of politics, not just a mechanical execution of objectives formulated elsewhere.

RN15S09 - Beyond Borders: The Global and the Local in an Everyday Imaginary I

The Political Economy of Globally Mobile Workforce. The Creative Edge of Difference in Local Communities
Mei-Ling LIN (National Open University, Taiwan, Taiwan, Republic of China) | paulina@kcg.gov.tw

The global demands have changed the work, resulting a shift in the highly educated, globally mobile workforce. The demands for immigrant labor today is the emphasis on highly skilled labor and global efforts to attract this scarce resource. While cross-border movements of people are growing, international migration is important on states’ policy agendas. Different experiences, the dynamics of global/local relations, yield many creative solutions to life challenges and opportunities at work. Diversity and change are a fact of life for global cosmopolitans. Global Cosmopolitans develop a multifaceted view forged by their experiences with conflict. Migrants become part of the restructuring of the social fabric of the localities to
which they may be agents of the reshaping of localities, so that we need to address the rescaling processes. The paper explains how global cosmopolitans develop the skills and knowledge that make them so effective.

A country’s development is related to its human capital resources, including highly skilled intellectuals. Local communities as diverse as Taiwan, welcomes global talent in the form of professional and highly skilled immigrants, tends to favour the way of life of mobile and well-educated people, develops cosmopolitan outlook, and enters the competition for the best brains. Taiwan’s ability to attract highly skilled migrants is a measure of its international strength, but may become concerned that it remains too local to take advantage of global opportunities. Globalization depicts migration as inevitable; Taiwan must endorse, both in theory and practice, the viability of alternative processes of development and do so on different levels.

The socioeconomic context of careers has changed because of the process of globalization. This paper outlines an alternative methodological and theoretical approach based on a critique of the perspectives regarding the migration–development nexus: the political economy of migration. From this perspective special attention is placed on: (1) the structural changes make international labor necessary and the alternatives to neoliberal globalization; (2) the implications for the changing meaning of what it is to be employable in the context of the changing world of work; (3) the global and domestic constraints that affect states’ responses to international migrants and highly skilled economic migrants; (4) the factors influencing states’ decisions to alter their immigration policies and to target specifically high-skilled migrants; (5) feature of the new careers (boundaryless) for workers to transit among different kinds of organizations and jobs; (6) new labour market policies that encourage flexibilization and deregulation so as to enhance job creation; and (7) changes borne a crucial impact upon the quality of work and life.

The author combines qualitative and quantitative methods to investigate the immigration policymaking in the global era, the pursuit of global talent of the local communities, Taiwan.

Beyond borders: cosmopolitan dreams and national nightmares
Pierluigi MUSARO (Bologna University, Italy) | pierluigi.musaro@unibo.it

In order to shed light on the different ways in which a universalist cosmopolitan ethics is cross-cut by a logic of liberal government, the paper will move from a number of recent conflicts, concerning “illegal” migration, which are ongoing in the European public sphere. Although we usually intend humanitarianism as a moral imperative that transcends the walled space of the inter-national system, operating in response to fundamental values and urgent needs, the recent events and the media attention to the migrant tragedies at sea have intensified humanitarian discourses in context of borders and migration.

Since the early 1990s, the relative stability that had characterized Europe’s post-war asylum regime has given way to radical and widespread restrictive policy change, provoking one of the worst contemporary migration crisis (according to recent reports, more than 20,000 people died during their high-risk journeys to Europe in the last two decades). Migration and asylum have been high on Europe’s agenda and a main cause of concern for European citizens, alarmed by the levels of “illegal” migration as well as by the humanitarian duty of safeguarding the rights of people who are attempting to cross the borders.

While scholars and activists have widely denounced the securitization and militarization of borders today, there is far less consideration of the border as a space of humanitarian government. Focusing on the mediated performances that contribute to create the “spectacle of border” and specifically what has been recently called the “birth of the humanitarian border”, the paper aims to explore the symbolic, affective and emotional dimensions of the humanitarian narratives that contribute to legitimize the European management of migration.
Network society. How as social relations are redesigning global and local space.
Roberta IANNONE (University Sapienza of Rome, Italy) | roberta.iannone@uniroma1.it

The space is an expression of society and, like time, is a constitutive dimension of human and social experience. It is now internationally accredited hypothesis that the transformation of contemporary societies passes through the birth of new forms and spatial processes of a reticular type. Social relation imposes over every other dimension of experience by connecting and creating bridges between global and local space through an intelligence which is not much “collective” but rather “connective”. Network society arises through “space of flows” and "intermediate space", not only in the online experience, but, if not more, in that of offline. The proposed reflection stems from a research project funded by the University of Sapienza Rome and intends to combine the studies of dynamic spatial and the studies of relational dynamics, also in terms of social capital. The aim is to capture network society, not in a generic and abstract sense, but in its specific areas of fulfillment and in its "spaces" (global and local, in fact) of enucleation. Methodologically the attempt is to describe and to explain this emerging reticular social configurations starting from the political, economic, migratory and territorial changes, and from transformations of communication, language and communities. The results of which are far from predetermined and in the process of transformation. In this way an attempt is made to give an original contribution to the existing literature on these topics. Special attention will be given to the potential of the network society, but also its vulnerabilities and contradictions. There emerges above all else a key question: network society is clearly an expression of a society increasingly connected at a global scale, but is it also increasingly united? It is increasingly obvious that it is interdependent and interactive, but is it also increasingly integrated and cohesive?

Strategic Cosmopolitans: The Role of Cosmopolitanism in Protecting White Settler Hegemony in Aotearoa/New Zealand
Jessica TERRUHN (The University of Auckland, New Zealand) | jter023@aucklanduni.ac.nz

Settler societies such as Aotearoa/New Zealand are characterised by triangular relationships between settlers, indigenous peoples, and migrants which involve contestations over indigenous
rights, the place of ethnic minorities, and the position of the white settler majority. In Aotearoa/New Zealand these tensions are encapsulated in the governance frameworks of biculturalism and multiculturalism. While biculturalism with its rhetoric of partnership between Pakeha (European New Zealanders) and the indigenous Maori and its focus on redress for colonial injustices forms the national framework, a rapid increase in immigration has called attention to multiculturalism as an alternative paradigm. In this presentation, I focus on the role the rhetoric of liberal multiculturalism and cosmopolitanism plays in Pakeha identity politics. Based on data from thirty-eight life story interviews, I argue that participants' constructions of cosmopolitan identities often serve to dismiss indigenous rights claims which represent a constant reminder of the moral dilemma of settler descendants. A number of specific discursive themes will be discussed as contemporary expressions of the settler colonial need to neutralise the threat of indigenous politics, and as examples of the perpetuation of colonial control over indigenous aspirations. I use these findings to proffer a critical examination of cosmopolitanism as contingent, drawing special attention to the strategic deployment of cosmopolitan ideals as a way of protecting white settler hegemony.

RN15S10 - Beyond Borders: The Global and the Local in an Everyday Imaginary II

A Big House as a Tool on the Way out of Marginalisation: The Villas of the Rich Poor and Global-Local Tensions in the Western Balkans
Radan HALUZIK (Charles University/ Czech Academy of Sciences, Czech Republic) | haluzik@hotmail.com

In the last 2-3 decades there has been a literal urban-architectural revolution in the Western Balkans. The local vernacular architecture has been supplanted by a chaotic sprawl of huge new several-storey modern villas, presenting the new aspirations and dreams of their owners and attracting respect and envy.
Paradoxically this change has been most striking in the most marginalised and poor rural and mountain areas of the region (Kosovo, Albania, parts of Macedonia and Montenegro), which are furthermore inhabited by ethnic minorities (Albanians, Slavic Muslims, Turks, Roma). Geographical and ethnic marginalisation, as well as the ethnic wars following the break-up of Yugoslavia, has led to the departure of the great majority of the local labour force to work in the cities of Western Europe. The local (mostly Muslim) communities have therefore become a kind of distant suburbia of major European cities. The newly erected villas aspire to the status of villas of the European rich but at the same time draw syncretically on traditions of local folklore and ideas of castles and chateau of the dream-fairyland national past... Their owners themselves speak of them as a way out of social and ethnic marginalisation. These are buildings that are truly “glocal”: inside them the western technology of bathrooms, kitchens and garages – outside traditional oriental ornament; an imitation of the comfort of the west – but invested with a local traditional feeling; using modern global materials – exploited by local construction technologies. Above all, the funds to build them come from global economic flows, which are nevertheless obtained and mainly spent in accordance with very local (traditional) models.
Despite all the efforts and sacrifices, these fiercely elemental (and illegal) buildings, in which their owners have invested almost all the money they earn, are in most cases long-term incomplete, and many are entirely empty (their owners being abroad). The chaotic urban sprawl lacks a territorial plan, roads and public drainage...
I study the material culture (Gell, Miller, Buchli) of these houses through the prism of the social life of things (Appadurai) and pose questions such as – what do people on the periphery hope for and expect from global modernity/change? What dream does it awaken in them and what are they not afraid to sacrifice for this dream (and how far will they go for it)? In what ways does their understanding of modernity differ from ours?

Reconfiguring Icelandic identity in a globalised world – the tourist gaze.
Mary Louise HAWKINS (University of Western Sydney, Australia) | m.hawkins@uws.edu.au
Helena ONNUDOTTIR (University of Western Sydney, Australia) | h.onnudottir@uws.edu.au

The Global Financial Crisis of late 2008 hit Iceland particularly hard. The impact was not confined to the economy: Icelandic national pride was rocked, and the hitherto commonly accepted belief that Iceland’s political system was transparent and trustworthy was all but shattered. Icelanders sense of themselves as an exceptional people, custodians of a uniquely beautiful land, but equally citizens of a global world, was severely disrupted. The welfare state struggled, and inequality deepened. At the same time, the collapse of the Icelandic krona and the emergence of new low cost airlines in Europe, transformed Iceland from one of the world’s most expensive travel destinations to a country that, if not cheap, was newly affordable to many. The increase in tourist numbers was immediate, and massive: in 2005, according to the Icelandic Tourist Board, there were 374,100 arrivals; by 2014 the number of tourists had reached 807,300, about half of whom arrived in the summer months. The Icelandic response to this tourist onslaught is complex, but can be characterised as attempts to link the local – that which is uniquely Icelandic – to the global – provision of the unique, accompanied by standards expected by global tourists. This has prompted a number of intense debates among Icelanders, for example, should visitors and locals alike now pay fees to visit Iceland’s great waterfalls, geysers, and hot springs, or should Icelanders, as ‘owners’ of the land, be exempt? This paper provides a sociological analysis of these debates, with particular emphasis on processes of glocalisation.

The cosmopolitan class: case study on Egypt
Liina MUSTONEN (The European University Institute, Italy) | liina.mustonen@eui.eu

In my paper I discuss the discursive practicies of of the "cosmopolitan class" in a majority Muslim country, Egypt. The term "Cosmopolitan class" signifies a loose group of people whose lives and lifestyles fall in the criteria defined by Ulrich Beck (2006) as “the cosmopolitan” (including among others by consumption patterns and borderless traveling). Against the backdrop of the Egyptian society, the cosmopolitan class under scrutinity in my work is in a privileged position. Since elites (and other privileged groups) only exist vis-a-vis other social groups the discursive practices of the cosmopolitan class have to be analyzed in relation to other groups of people residing in the country. The specificities of a Muslim-majority context constitute a challenge for the analysis of elite distinction strategies as does what sociologists call the post-modern condition (or liquid modernity or second modernity) (Lytard, Bauman, Daloz, Beck) and the departure from metanarratives. While engaging in discussion on Beck's (2003) methodological cosmopolitanism, the paper emphasizes the importance of the analysis of the interplay of the national (local) and the global (cosmopolitan). Hence I analyze how the cosmopolitan discourses relate to the global and the local by, as Mills would have it (1959), delving into the relationship of the personal troubles of the cosmopolitan milieu and "the public issues". The attractive positionality of being a representative of " the Global South" – a poor underdeveloped Muslim country, but possessing the habitus (Bourdieu), if needed, of (the imaginary) Westerner, creates opportunities for the cosmopolitan. In this light, I am primarily
interested in how the discursive practices of the cosmopolitan, despite the rhetoric to the contrary, may actually re-produce existing inequalities. The research is based on fieldwork conducted in Egypt between the revolution 2011 and the military coup d’etat in 2013 (and its aftermath up to January 2014).

Competing Cosmopolitanisms: Migrancy, otherness and the (re)construction of group boundaries
Peter HOLLEY (University of Helsinki, Finland) | peter.holley@helsinki.fi

Whilst one might argue that the human story is one of migration, the overwhelming interconnectedness of the world today has resulted in increased flows of people, products, and information on a hitherto unforeseen scale. As a result of these changes, in their daily lives individuals frequently encounter alterity. Far from being exceptional, difference is now regarded as a central feature of our increasingly diverse ‘multicultural’ societies. But how is difference dealt with as individuals go about their daily lives? The following paper addresses the various ways in which difference and alterity are understood and managed by contemporary migrants in Finland. In particular, it focuses upon the construction collective identifications that can be broadly defined as ‘cosmopolitan’. That is, identifications that seek to distance individuals from particularistic ethno-national groups or those that seek to rework group boundaries to be more inclusive of ‘others’. Through the analysis of empirical materials presented herein, I point to the emergence of competing cosmopolitan identifications. I highlight the tensions between the privileged ‘world citizen’ and an ordinary cosmopolitanism that seeks to reconfigure existing categories to include multiple forms of difference, and the limitations of ‘cosmopolitanism’ as a catchall concept for understanding the complexity of identifications that arise in the context of international migration.

Conceptualizing Transnational Spontaneity: Displacement and Diaspora in a Stateless Global Context
Abdi M. KUSOW (Iowa State University, United States of America) | kusow@iastate.edu

Based on the experience of Somali immigrants to North America, the first post-cold war nation to fall into the simultaneous vacuum created by the sudden disappearance of the geopolitics of bimodal super power arrangements; and the appearance of a spatially and temporally compressed world as a case study, my aim in this paper s to extend the conceptual parameters of transnational migration theories by bracketing the structuring capacity of the state, and examine an instance of transnational migration in a Stateless global context in the country of origin and how that affects the nature of transnational incorporation in host communities. Spontaneity, or the formation and consequences of the unexpected and active ways in which immigrants and refugees appear at the door steps of border immigration officers or at metropolitan airports as a result of social order without the state is a theoretical possibility that needs to be articulated. Such a theory can advance our understanding of the entire trajectory of transnational activities from the moment of exit to the enactment of transnational social space. I specifically argue spontaneity, or the formation and consequences of the unexpected and active ways in which immigrants and refugees from a condition of failed state in the country or origin subvert global state structures and immigration policy regimes by actively devising their own migration routes through globalized social networks in order to reach a desirable final destination is theoretical possibility than can fully capture the formation and consequences of transnational social space.
RN15S11 - Comparative Methods in the Globalizing World

Methodological problems in comparison of poverty: Empirical evidence from upper-middle income countries
Aysegul Tugce BEYCAN (Department of Sociology, University of Neuchâtel, Switzerland) | tugce.beycan@unine.ch

Poverty is one of the global concerns both for developed and developing countries. Despite this, currently, there is no consensus on the definition of poverty and there are several methodological problems for poverty measurement and comparison through countries, regions, or societies. This paper focuses on actual problems in poverty comparison and gives an empirical evidence from upper-middle income countries. The goal of this paper is to show poverty comparison problems emerging from these following methodological limitations: i) different existing poverty concepts, their gaps and their relationship with the reality of poverty; ii) inconsistency between operational definitions of poverty and measurement techniques, iii) different dimensions and indicators used in different multi-dimensional poverty studies; and iv) the loss of information during the aggregation process for obtaining a global poverty rate, with an empirical evidence from upper-middle income countries. This paper proposes solutions to these methodological limitations and comparison problems with a new poverty measurement technique based on a novel poverty framework. This framework concerns a mixed approach including absolute and relative aspects of poverty and aims to measure poverty separately for child, man, and woman with a consistent operational definition of poverty.

Toward Eventful Transnational Sociology
Jaeyoun WON (Yonsei University, Korea, Republic of (South Korea)) | jywon@yonsei.ac.kr
Hyukjin CHO (Yonsei University, Korea, Republic of (South Korea)) | loveforest@yonsei.ac.kr
Eunhye YOO (Soongsil University, Korea) | eunhye.yoo@gmail.com

Our research project is tentatively titled, “Toward Eventful Transnational Sociology,” which explores a new, alternative way of conceptualizing the issue of nation, nation-state, and citizenship. We will also come up with a new sociological methodology to capture the newly emerging transnational aspects, based upon the recent developments in comparative sociology by George Steinmetz and William Sewell Jr., who emphasize a more fluid and nuanced type of time-space contingent comparison that extends beyond the limits of the old conventional method. By doing so, we hope to provide the new, innovative approach to conduct the researches in transnational sociology. Our transnational research include conducting “Eventful sociology,” with the two cases – 1) the micro-level transnational subjectivity research: the transnational citizenship of overseas Chinese in South Korea, and 2) the macro-level institutional linkage study: the Minnesota-Seoul National University Educational Cooperation Project. These two researches will provide the balance to understand the transnationalism in East Asia, one mainly focusing on the micro-level subjectivity, the other on macro-level institutional connection.

Understanding the Relations Between Types of Power in the Global Context: Statistical and Fuzzy Sets Perspective
Igor KOVAČ (University of Cincinnati) | kovacir@mail.uc.edu
Matej MAKAROVIČ (School of Advanced Social Studies, Slovenia) | matej.makarovic@fuds.si
Power remains one of the crucial and most studied notions of the contemporary globalized world. It is often described in quantitative terms only, while there are quite a few recent definitions that take into consideration both qualitative and quantitative aspects of power. However, the debate about an epistemological approach, which would encompass both and adequately analyze such a holistic concept, needs to be stirred as well. The focus of our paper is to apply and compare two methodologies in analyzing power: statistical correlation and regression, and, on the other hand, determining sufficient and necessary conditions in terms of fuzzy sets analysis. Our assumption is that both types of methods will provide complementary insights into the relations and conditioning among different types of power. Taking all the UN member states as our units of analysis, we apply Michael Mann’s ‘types of power’ (military, economic, political, ideological), and test whether and how different types of power have developed and preconditioned each during the recent decades. Each type of power is operationalized for each country by a combination of indicators from the selected databases (World Bank, IMF, SIPRI, IISS, UNESCO).

**JS_RN09+RN15 - Europe and the Globalizing Economy**

**New patterns of consumption among Portuguese-speaking African countries**

Raquel Barbosa RIBEIRO (School of Social and Political Sciences, Portugal) | rribeiro@iscsp.ulisboa.pt
Isabel SOARES (School of Social and Political Sciences, Portugal) | isoares@iscsp.ulisboa.pt

Because of globalization, many developing countries have adopted increasingly westernized consumption patterns. In this article, we address the cases of three African Portuguese-speaking countries: Cape Verde, Angola and Sao Tome & Principe. Although consumption patterns in these countries are largely inspired by the media-conveyed American consumption society model, specific cultural particularities can also be found. In fact, despite their differing rates of economic growth and their various social structures, these three countries share an important relationship with Portugal (at economic, commercial and social levels), which contributes to their connection to the consumer society. By the use of in-depth interviews with consumers and observation of commercial spaces in major cities, this article seeks to explore how westernized consumption patterns are appropriated by the local cultures of these African countries.

**Diaspora, female immigration streams and self presentation: cariocas in São Paulo city, and brazilian women in Paris**

Laura Graziela GOMES (Universidade Federal Fluminense, Brazil) | lauragraziela@gmail.com
Solange MEZABARBA (École des Hautes Etudes en Sciences Sociales, Paris) | solange_riva@hotmail.com

This text presents an analysis of two different cases of female migration at the present time, investing in « self presentation » (Erving Goffman) as an issue of adaptation to specific situations where the professional objectives and, in one of the cases, also religious, are definitive for a successful project of life in the chosen city. In order to get this aim, we investigated the lives of a group of brazilian religious women in Paris, and in another scope, women from Rio de Janeiro that moved to São Paulo for increase their professional level. We worked using ethnography method. The main idea is to show how those women undertake their strategies of self presentation, pursuing through « tacit deals » observation of personal presentation in the public space (enphasising the world of work) of the « townies », the patterns that will help them to build a personal face that, to their expectations, will be the most
convenient. So, in the end we discovered how those two groups of women interpret the « new place » and their rules of sociability. Cariocas that moved to São Paulo had to deal with the formal x informal uses of apparel; and braziliam women in Paris persued, in their terms, a « liberty » to move all around the city through the effort of keeping their appearence as much as possible close to what they think is a french women appearence.

The significance of ethnic social capital in case of Polish migrant entrepreneurs in the UK and its enhancement by the incremental transnationalization of the European Union
Sakura YAMAMURA (University of Hamburg/Maastricht University) | syamamura@hotmail.com
Paul LASSALLE (Sheffield Hallam University, Sheffield) | p.lassalle@shu.ac.uk

The EU aims to transnationalize its territory and allow free flows of capital, goods and people on a common market. However, the enlargement to the East has been approached only cautiously, especially regarding labor migrants.
Polish migration to the UK experienced a strong increase through EU-accession. However, rather than enabling smooth economic integrations of migrants into the local market, the reserved stance and the incremental implementation of the- what was supposed to become-transnational migration contributed to the strong attachment of the Polish entrepreneurs to enter the EU-market by ethnic channels, mobilizing and using social capital of the Polish community.
Ethnic niche market remains the most lucrative and accessible market for Polish entrepreneurs. Despite the formally free access to the EU-internal market, barriers to access appropriate employment in the labor market still exist for migrants. The society also remained reluctant towards opening doors to their new EU-co-citizens, thus, enhancing the re-/production of ethnic niche markets in a “host” country.
Based on empirical evidence on Polish entrepreneurs in Glasgow, this paper discusses their market integration after the EU-enlargement and questions the notion of an overenthusiastic transnationalization of the EU economic market. It gives a valuable insight into the circumstances and the significance of the ethnic social capital for the market entrance of Poles.
By analyzing the impact factors for entrepreneurs in a particular city and region within an EU country and its embeddedness in EU-wide policies, it contributes to a multi-leveled discussion of the 'transnationalizing' economy of Europe.

In time of glocalisation: the end of "Made in", and the new scenery of "Made by".
Riccardo GIUMELLI (University of Verona, Italy) | riccardo.giumelli@univr.it

We are experiencing a deeply change of age. As many important sociologists said we are facing a change of our identity and our social relations in everyday life. Time and space are changing, proximity is our local dimension, but we are immersed in the global flows.
Deterritorialization is a widespread characteristic of this new postmodern era, deeply different from the modern one, where the territory was so linked to sovereignty and citizenship.
Nowadays the crisis of the idea of modern state nation is reflected by the difficulty to keeping the same meanings to the same expressions.
We use to say "Made in" China, or Italy, or France to express the idea that some products are manufactured in a particular country. Is this a real and appropriated meaning respect to the global flows of goods, expertise, knowledge? Delocalization and new processes of "back-reshoring" (part of the production comes back in the original country) cut the relations between, for exemple, products and territory. The problem is understanding the belonging and, on the other face, the identity of goods, services, intellectual propriety, and so on.
For better understanding what I mean I will present different cases of analysis.
Our reflection wants to move from these premises to identify a new paradigm where the preposition "in" could be substituted with "by". The implicit idea is to move from a paradigm of the modern era with the state nations as protagonists to a new one more and more with cultural and glocal social actors.
Translating research evidence into social work practice in Romania: cancer care
Denalee O'MALLEY (Rutgers University) | omalledm@rwjms.rutgers.edu
Csaba Laszlo DEGI (Babes Bolyai University, Romania) | csabadegi@gmail.com
Brittany GILBERT (Rutgers University) | blg93@scarletmail.rutgers.edu
Shari MUNCH (Rutgers University) | munch@ssw.rutgers.edu

The lack of a cohesive approach to Romanian cancer control has resulted in increased incidence and mortality for many cancers (e.g., cervical, lung) that can be prevented or successfully treated. Insufficient attention to psychosocial aspects throughout the phases of cancer control—from prevention and detection through treatment, rehabilitation and palliative care—magnifies Romania's cancer burden. Implementing cancer control nationally is a complex, multidisciplinary undertaking. Recently, Romania’s new National Cancer Program was initiated and cancer control efforts are receiving increased attention. To date, uneven engagement of professionals who address the behavioral aspects of cancer control, such as social workers, raises implementation concerns. This article describes social work specialization in health care situated within the context of the parallel evolution of Romanian cancer control initiatives. A brief history of oncological social work illustrates the forces driving the need for increased cancer care specialization internationally, which can be adapted and applied to inform Romanian approaches as culturally appropriate. The recent momentum in cancer control efforts and magnitude of the cancer burden indicate that the time for social works’ engagement in these efforts is now; for example, meeting patients psychosocial needs and implementing cancer screening programs. Equipped with the necessary expertise in psychosocial assessment and intervention, across micro- and macro-level arenas, professional social workers are an untapped resource that could address the unmet needs of Romanian citizens and improve the effectiveness of Romania’s overall cancer control efforts.

Social sustainability, health and well-being according to degree of rurality in Finland
Sakari KARVONEN (THL - National Institute for Health and Welfare, Finland) | sakari.karvonen@thl.fi
Timo M. KAUPPINEN (THL - National Institute for Health and Welfare, Finland) | timo.kauppinen@thl.fi

Health and well-being are important aspects of social sustainability. Yet, social sustainability remains a poorly understood concept and accordingly there are few attempts to measure it. The aim of this study was to apply the SOLA theory (‘Sustainable Social Quality’, Pieper et al. 2014) to an analysis of patterns of health and well-being by rurality among adult population in Finland. Data for the study comprise a nationally representative sample of 18 to 79 year-olds (N=4226, response rate 72.3%). Rurality was measured with grid data (250 m x 250 m) that was classified into seven groups representing different rural and urban area types. Health and well-being were measured with 16 indicators to cover all four dimensions of SOLA: socio-economic security, empowerment, social inclusion and social cohesion. The data were analysed by means of cross-tabulations and logistic regression analysis. The study showed health and well-being to vary according to degree of rurality, broadly so that more rural areas witness poorer well-being.
than more urban areas. However, in some aspects of well-being, more rural areas had higher levels of well-being, and some aspects were not associated with rurality. Yet, all dimensions of social sustainability associated with the degree of rurality. The study underlines the importance of broad understanding of social sustainability when assessing regional development and policy changes.

Pharmaceutical care in Poland. Necessity or chance for medical care system under reform?
Anita MAJCHROWSKA (Medical University of Lublin, Poland) | anita.majchrowska@umlub.pl
Małgorzata SYNOWIEC-PILAT (Wroclaw Medical University, Poland) | m.synowiecpilat@gmail.com
Anna PAŁEGA (College of Management "Edukacja" in Wroclaw, Poland) | drpalega@gmail.com

Dysfunctional medical institutions in Poland generate various medical conditions which deepen already existing discrepancies in health. Drop in trust for physicians and increasing level of health competencies among Polish patients even strengthen the tendency to exclude physicians from the therapeutic process and seek help directly in pharmacies. Patients expect from pharmacists not only information on medicines but also help in self-treatment and resolving medical problems. Pharmaceutical care allows this and has been successful in western European countries for years. Despite some unquestionable benefits of pharmaceutical care (pharmacotherapy rationalization, polipragmazy limitation, and above all economy both for an individual patient and for the whole system) Polish pharmacists are not interested in implementing it in their pharmacies.

The aim of the research was to learn about the attitude of Polish pharmacists to pharmaceutical care. The survey was conducted with a questionnaire done by 186 pharmacists working in pharmacies in the south-east of Poland. Additionally, 30 interviews were conducted. Majority of surveyed pharmacists approve of introducing pharmaceutical care to Polish pharmacies (77.5%). The benefits include an increase of professional prestige, growth in professional satisfaction of pharmacists – (44.9%), growth of pharmacotherapy effectiveness (54.6%) and treatment effectiveness (44.3%). The barriers of pharmaceutical care implementation include lack of knowledge among pharmacists (33.7%) and lack of cooperation with physicians (32.6%).

Pharmacists are aware of the importance of pharmaceutical care, however they identify various barriers that hinder its implementation.

Maintaining Inequality through Informed Consent
Michaela MAYRHOFER (IFZ, Austria) | michaela.th.mayrhofer@gmail.com
Bernhard WIESER (IFZ, Austria) | wieser@ifz.tugraz.at

Informed Consent (IC) has become a necessary prerequisite for medical research. This applies to both clinical reach as well as for the social study of health and illness. When patients become involved in research processes it is mandatory to explain the nature of the research at hand and to offer the possibility to withdraw a given consent at any time. Without doubt IC has contributed to safeguard patients’ rights. However, a closer look into medical practice shows some important difficulties. With our paper we will look into two intertwined fundamental inequalities: an inequality of power and an inequality of knowledge.

We argue that IC procedures maintain traditional power relations between patients and physicians. Most of all this is achieved in a performative way through the process of knowledge transfer. The consent procedure requires comprehensive explanation, but it is precisely that how authority becomes established. Moreover we argue that in the context of cancer research patients are rather vulnerable and hardly in the position to comprehend the wider implications of
technological innovations related to their illness. Only recently the field of cancer diagnostics has radically changed through the introduction of whole genome sequencing. We propose to take this current development as an opportunity to revisit IC practices as a means to safeguard patient’s interest under circumstances when their lives are threatened by a carcinosis.

The influence of socio-demographic and psychosocial characteristics of people with disabilities in Poland on their involvement in the Internet community

Tomasz MASŁYK (AGH University of Science and Technology, Poland) | tomaslyk@agh.edu.pl
Ewa MIGACZEWSKA (AGH University of Science and Technology, Poland) | ewamig@agh.edu.pl

Disabled people in Poland are numerous social category. Every tenth Pole struggles with constraints of perceptual-physical skills which hinder their function in everyday life. Internet may be an effective remedy for overcoming these barriers. Building and maintaining social relations is one of the key spheres where this medium may play a particularly important role. The authors will attempt to answer two questions. First one: do people with disabilities in Poland take advantage of the social potential of the Internet to compensate their limitations in direct contact with others? Second: what socio-demographic and psychosocial characteristics determine the use of the Internet for this purpose? Verification of answers for these questions will be carried out in relation to the two alternative assumptions.

On the one hand, social potential of the Internet will be increasingly used by disabled users, who eliminate their deficits in direct relationships with others by that means. In contrast, people without disabilities have easier access - in spatial and physical terms - to interactions face to face with others.

On the other hand, the Internet provides not only the ability to construct, but first of all to reproduce, social relationships. Capital available for the individual, especially in the human, social and symbolic aspect, is put into the Internet wire. This capital is the basis for generating other values and achieving different goals. Therefore, it can be assumed that disabled Internet users will participate in narrow and homogeneous social networks, mostly because of their professional status (higher degree inactivity) and education (lower level of education). It will be reflected in the scale of the use of a social networking tools.

Putting together services to meet everyday health needs: diversity and bricolage in Sweden, UK, Portugal and Germany.

Hannah BRADBY (Uppsala University, Sweden) | hannah.bradby@soc.uu.se
Amina Jama MAHMOUD (Uppsala University, Sweden; Somali Information and Business Centre, Skåne) | aminajama0@gmail.com

The inequitable distribution of both healthcare resources and minority ethnic populations in European cities has put particular pressures on health service delivery. Multi-cultural models of society have tended to try to educate migrants and newly formed minorities in how to use services ‘appropriately’, rather than to reconfigure services. As neighbourhoods have been getting more diverse, existing models of healthcare delivery do not work so well, despite the rhetoric of ‘patient-centred care’.

This study maps how people in two highly diverse neighbourhoods, with residents differentiated by faith, income, age, gender and legal status, put together the everyday support and healthcare they need. To build up a picture of the range of what people do to support their own wellbeing, we map people’s use of official health services, voluntary group support, informal help, including online and social media sources. This information, gathered by interviews and observations in neighbourhoods, is turned into an app that can be viewed and updated and
which is used to further investigate the health care services that are valued and contrast these with the gaps where support is lacking. This paper draws on initial mapping data from Swedish neighbourhoods to critique ethnicity as a concept to investigate inequalities and diversity in respect of individuals’ relationship with healthcare, different modes of provision, and responsibilities for welfare allocation. Superdiversity (Vertovec 2007) is tested as a concept suitable for reconfiguring health services to respond to the ongoing diversification of diversity.

**Shame and resistance- women's lives in an unequal society.**
Marian PEACOCK (University of Sheffield, United Kingdom) | m.peacock@sheffield.ac.uk
Paul BISSELL (University of Sheffield, United Kingdom) | p.bissell@sheffield.ac.uk

The UK is now experiencing levels of social and economic inequality not seen since the 1930s (Hills 2014). Contemporary disparities in income (and wealth) have been shown, most notably by Wilkinson and Pickett (2009), to be socially corrosive and damaging to health and well-being. A number of mechanisms have been proposed by these authors (and others) for the ways in which inequality may operate to cause damage; stress in early life, lack of friends or social engagement, and invidious or shaming comparisons resulting from the experience of low status. In relation to the latter, Wilkinson and Pickett (2009) argue that unequal societies increase anxieties around status, and thus avoiding the shaming comparisons that come with low status, becomes increasingly important. Those at the bottom of society suffer most as they are least well-equipped to defend themselves materially, discursively and emotionally against shaming comparisons and it is this that (at least partially) accounts for the social gradient in health seen in most epidemiological studies.

However, there are methodological, theoretical and philosophical issues raised by theorising such as this, which has its basis in neo-positivist social epidemiology. Furthermore, there are relatively few sociologically informed studies exploring the processes which TSL argue are the ways that inequality gets "under the skin". One of the basic sociological problems that confronts Wilkinson and Pickett's argument is that it fails to acknowledge that actors routinely deploy discursive (and other) resources to resist health damaging discourses and fails to locate the contexts that might make resistance to toxic discourses possible.

In this presentation, we draw on data from a qualitative study which employed narrative-biographic interviews to explore women's experiences of inequality, focusing on the place of shame and social comparison in their accounts, and in particular, how they orientated themselves or resisted potentially shaming social comparisons. We found that it was in the realm of women's bodies and homes and, in particular the need to protect their children from the shame of the lack of socially salient goods that emerged as significant. At the same time, we noted that the women were not passive consumers of goods, they consciously resisted some of the social practices concerning consumption, often using humour to do so, and they constructed narratives that allowed them to position themselves partially outside dominant discourses of conspicuous consumption. "Othering" was also used as a means to protect the self. But there was also considerable emotional strain and distress and the narratives that they drew on protected them only in part. We propose that understanding sources and practices of resistance is necessary to make sense of the impacts of contemporary inequality and its impacts on health.

**Making markets: allergy online**
Catherine M. WILL (University of Sussex, United Kingdom) | c.will@sussex.ac.uk
Piera MORLACCHI (University of Sussex, United Kingdom) | p.morlacchi@sussex.ac.uk
Helen SMITH (Brighton and Sussex Medical School, United Kingdom) | h.e.smith@bsms.ac.uk
In this paper we explore the field of allergy as it appears on the Internet. Starting from a simple search, we draw attention to the ways in which allergy is created as both clinical condition and series of market opportunities. Where medical sociology has often been critical of commercial, especially pharmaceutical, involvement in health, and tended to celebrate the activities of patient organisations, we use discourse analysis to examine the similar strategies and messages from commercial and voluntary actors, and the ways in which sufferers are encouraged both to defer to medical expertise and also to take responsibility for finding their own ways to live with allergy in daily life. We suggest this creates difficulties for readers who are positioned as both patients and consumers through more or less awkward juxtapositions of advice and product placement in health markets that go well beyond pharmaceuticals, and suggest that these markets deserve more attention from medical sociologists among others.

Social and cultural obstacles of health promotion in Lithuania
Ramuné MAKŠUTYTĖ (Vytautas Magnus university, Lithuania) | r.makstutyte@smf.vdu.lt

The health care system in Lithuania has been going through numerous of challenges since the Soviet union collapsed. Today it is still facing issues of struggling to overcome some social and cultural obstacles in becoming not only the section for compulsory treatment but also the main field for health promotion as well as the strong indicator for the public health, especially within the primary health care.

The report aims to consider the conceptions of health and health care and how they have been changing during the last decades to come in forming the socially and culturally reflected field of health care implementations within Lithuania. It also claims the very specific micro transactions between the doctor and patient to display the behavioral connections in the primary health care system and how they interrelate with the health care outcomes for specific groups of patients either the whole population. As a hypothesis those are the presumptions for the mistreatments and neglect of the primary health care patients as well as the circumstances for the primary health care to become or keep staying the unfulfilled sector in health promotion processes.

Holistic rehabilitation policy, translation of ideas and wicked problems
Bente Vibecke LUNDE (University of Nordland, Norway) | bente.lunde@uin.no

Joined-up Government (JUG) points out “wicked problems” which are resistant to traditional sector-based organization of services. Norwegian rehabilitation policy can be studied as a JUG-reform. Rehabilitation is an intersectoral and interdisciplinary field affecting many people with functional impairment and chronic illness. Norwegian municipalities are obliged to offer rehabilitation to all the inhabitants in their respective municipalities with such needs. The Norwegian Government has imposed the municipalities to adopt specific coordination technologies called “Individual Planning” and “Personal Coordinator”. This technology is used to coordinate the welfare-services at an individual level. Individual planning is a key technology for user involvement and individually adapted, holistic and coordinated services. Users that are granted individual planning are also granted a personal coordinator to be responsible for the planning process and follow-up. The Government is the sender of the policy, and the municipalities are the receivers. My study is a collective case study (Silverman 2005). I have studied rehabilitation policy as “ideas that travel” (Czarniawska og Sevón, 1996), and how ideas are translated (Latour 1986) when they are implemented in four Norwegian municipalities. The translation of the technologies in the municipalities showed that both individual planning and personal coordinator where conceptualized as resource-incentive, and the implementation of the technologies is met with resistance. I also found that rehabilitation as an intersectional
service does not fit into the management system of the municipality, and rehabilitation is experienced as both diluted and invisible inside the system.

The influence of socio-demographic and psychosocial characteristics of people with disabilities in Poland on their involvement in the Internet community
Ewa Migaczewska (AGH University of Science and Technology, Poland) | ewamig@agh.edu.pl
Tomasz Masłyk (AGH University of Science and Technology, Poland) | tomaslyk@agh.edu.pl

Disabled people in Poland are numerous social category. Every tenth Pole struggles with constraints of perceptual-physical skills which hinder their function in everyday life. Internet may be an effective remedy for overcoming these barriers. Building and maintaining social relations is one of the key spheres where this medium may play a particularly important role. The authors will attempt to answer two questions. First one: do people with disabilities in Poland take advantage of the social potential of the Internet to compensate their limitations in direct contact with others? Second: what socio-demographic and psychosocial characteristics determine the use of the Internet for this purpose? Verification of answers for these questions will be carried out in relation to the two alternative assumptions. On the one hand, social potential of the Internet will be increasingly used by disabled users, who eliminate their deficits in direct relationships with others by that means. In contrast, people without disabilities have easier access - in spatial and physical terms - to interactions face to face with others. On the other hand, the Internet provides not only the ability to construct, but first of all to reproduce, social relationships. Capital available for the individual, especially in the human, social and symbolic aspect, is put into the Internet wire. This capital is the basis for generating other values and achieving different goals. Therefore, it can be assumed that disabled Internet users will participate in narrow and homogeneous social networks, mostly because of their professional status (higher degree inactivity) and education (lower level of education). It will be reflected in the scale of the use of a social networking tools.

Cultural Representations of Good Death: Example of Turkey
Ece Erbug Sanli (Eskişehir Osmangazi University, Turkey) | ecee@hacettepe.edu.tr

In sociology of death literature, a good death is accepted to be both the medicalized death (in a hospital or hospice environment) and as the death of elderly. Additionally, the researches show that it is preferable that the terminally ill people are told that they are dying. However, these seem to reflect Western values and perspectives. In Turkey, sociology of death is a very rarely studied area and there are very few studies on the subject. As a researcher, my aim is to find out if these acceptations are also valid for Turkish culture. By the help of semi structured interviews, I will be able to understand the cultural specific point of view to the above situations. Do Turkish people think it is better to die at home or in the hospital? Is it better to tell a person that s/he is dying? Is a sudden death at a young age is better than a medicalized death at an old age? These are kind of questions that I will be looking answers for. To see the both sides of the medallion I will conduct my study to both Medical Doctors and patient relatives.

Anxiety in changing societies
Tetyana V. Ivanova (Sumy State University, Ukraine) | sociol_tanya@mail.ru

The purpose of the study: a comparative study of the correlation between the level of social anxiety, and some of the economic characteristics of the countries.
Anxiety is defined as an emotional condition of acute inner agitation, connected with danger forecasting in human consciousness. It is like experience arising by threat to person as a social object, when his position in society is exposed to danger: his values, self-perception, needs affecting personality core. Anxiety is always connected with misfortune expectation in social interaction.

Social anxiety is usually studied in sociology through the structure of social fears. In this research social anxiety was considered as a generalized social disquiet.

Indicators: the level of anxiety (Q83-Q84 – EVS), the level of happiness (Q3 – EVS), the level of social activity (Q5aA-N – EVS), human development index and human development rates.

High growth rates of human development level positively correlate with increased level of anxiety (0.76) and negatively correlate with the level of happiness (-0.51) and the level of social activity (-0.57).

Low growth human development index are accompanied by reduced anxiety (-0.88), high level of social activity (0.81) and feeling of happiness (0.71).

Negative emotions can be an important regulator of social activity. It is necessary to distinguish between the qualities of negative emotions. For example, the decrease in activity occurs in depression. Anxiety is accompanied by disappearing of emotions, interest loss, and energy reduction.

Results of factor analysis.

Societies with low social anxiety level are described with two factors.

The first factor - “Democratic values” as condition of comfortable existence. It includes such factors as safety, liberty of speech, democratic political system.

The second factor - “Individual hedonism”. Parameters with negative correlation make the basis of this factor.

Factor structure of societies with high social anxiety level is a few complicated. Particularly, the first factor (State capitalism) has pronounced dichotomous structure, including parameters both with positive and negative correlation. Values of statehood (strong state, economic growth, orientation on personal enrichment) as the conditions of economic prosperity are situated on the one pole. On the other hand there is the negation of liberal values range. An attention should be paid to the fact that this factor includes parameter “Not at all happy”. This factor probably reflects existence of quite numerous social group in society striving to adjust to fast social and economic changes, using insufficiently effective ways for it.

The second factor also reflects orientation on state, which is like a space for personal self-fulfillment in this case to a greater extent.

Anxiety stimulates social activity, makes people more susceptible towards, first, to social innovation, and secondly, to social dysfunction. High innovative activity leads to a more rapid pace of economic and social development of the country.

A Healthy Life Style in the Czech Republic

Jitka BURIÁNKOVÁ (Faculty of Physical Education and Sport, Faculty of Arts, Czech Republic) | bjitkab@seznam.cz

The paper focuses on the topic of lifestyle with respect to health and health-related such as smoking, drinking alcohol, abusing illicit substances. Its main goal is to analyze the relationship between the social-psychological factors and one's health with the focus on the lifestyle. In our analyzes, we will mainly focus on how these explanatory mechanisms act differently in different strata of society. Our approach is informed by two theoretical sources: the compensation theory and the cognitive dissonance perspective. Both these approaches offer a possible explanation of why many individuals do not engage in a consistently healthy life style. The compensation theory proposes that some individuals see unhealthy behavior as less harmful if it is compensated by healthy activities in other life domain. The cognitive dissonance is often
produced by the confrontation of personal resolutions to lead a healthy lifestyle with the everyday reality of work stress, unhealthy nutrition and other negative phenomena. Typical excuses people make to justify unhealthy behavior are also demonstrated. The plausibility of these theories is tested using two data sources. First, the data from the International Social Survey Program (ISSP) 2011 on health are employed. These data allows testing the consistency of lifestyle measure. However, the Czech data (Participant 2011, 2013) are used as the principal sources to test the compensation and cognitive dissonance theories. These surveys incorporate a complex set of questions that were designed to test these theories. The preliminary results seems to support the compensation theory and the cognitive dissonance perspective.

RN16S01 - The Politics of Healthcare and Illness Management

Doctor-patient relationship – the specificities of inflammatory rheumatisms and renal insufficiency
Carla RIBEIRO (University of Neuchâtel, Switzerland) | carla.ribeiro@unine.ch

In the 50s, Parsons (1951) analysed the doctor-patient relationship as a social system. Since then, researches in this area flourished, and his work has been widely criticized, especially regarding the excessive normative determinism, the fact that his theory can be applied to a limited number of diseases, his partiality by the medical model and exacerbated power that was assigned to the medical institution. Gerhart’s work (1977; 1979) allows us to interpret doctor-patient relationship as elements that are part of the same gear: the social system of medical practice (Gerhart, 1987). The aim of this paper is to analyse, compare and describe the doctor-patient relationship on two specific chronic diseases – inflammatory rheumatisms and renal insufficiency. We argue that nowadays, doctor-patient relationship tends to be less imbalanced, given that patients participate actively in illness management, they accede more easily to information, empowering them and illness is managed mostly at home. Nevertheless, the relationship depends on the way patients experience their illnesses and thus react to symptoms, to treatments and to the context of care practice. Data comes from 41 biographical interviews (longitudinal biographical approach) with 30-60-years-old patients diagnosed either with inflammatory rheumatisms or renal insufficiency. The results show that inequalities of doctor-patient relationship depends on: 1) healthcare specificities; 2) patients’ characteristics (psychological, socio-economic and cultural); 3) the diseases’ characteristics (illness’ trajectory phase, illness severity and response to treatments). The findings aim to contribute to better identify the factors that imbalance doctor-patient relationship.

The importance of the doctor-patient relationship in a period of economic crisis
Stefania FUCCI (University of Eastern Piedmont, Italy) | stefania.fucci@sp.unipmn.it

Contemporary society is characterized, on the one hand, by the medicalization of increasingly wider areas of life, and on the other, by the continuous decline in welfare spending as a result of the economic crisis. Understanding how the therapeutic relationship is built can be very important because of the centrality of patients considered both “objects” of the care treatments, and “subjects” who are able to participate in health decisions with doctors. The paper intends to present some results of a qualitative research aiming to reconstruct the moral career of patients suffering from diseases such as colorectal cancer and cardiac decompensation, combining subjective and institutional aspects of illness experience. A total of 80 in-depth interviews with patients and 7 focus groups with medical and paramedical staff were carry out. From the
analysis of the research material emerge an active role of the patient, a relationship characterized by different levels of co-participation to the therapeutic choices and negotiation in the different stages of the disease according to gender, age, education, social and economic status of the respondents. Doctor-patient relationship is structured in some cases as a dyadic relation, in other as a triadic relation with the intervention of patient’s family, which plays an important role in supporting care in a situation of almost total absence of local health service. Moreover, as a result of this situation, hospitals and professionals adopt a taking in charge of the patient that going beyond what is provided by the national and international protocols of care.

When differences become inequalities: personalisation, familiarisation, and normalisation in diagnosis, treatment and management of disease
Anna Rosa FAVRETTO (University of Eastern Piedmont, Italy) | favretto@asie.it
Francesca ZALTRON (University of Eastern Piedmont, Italy) | francesca.zaltron@asie.it

A qualitative study was carried out on the building of the “patient career” in the interaction with health services. Based upon 80 disease histories (heart failure and cancer) and seven focus groups with doctors and nurses, we identified three processes which structured and differentiated patients’ careers in health services: 1) personalisation, which includes patients’ activities aimed to the reduction of fragmentation of pathways in diagnosis, treatment, management, and to limit the disorientation due to the patient’s status; 2) familiarisation, which is the patient’s adaptive effort to make familiar and more acceptable the disease, and places, people, activities associated with it; 3) normalisation, which corresponds to the different ways in which normality is disrupted and, possibly, rebuilt, and to the extent in which the disease is accepted as part of daily life, and to different processes in the restructuring of the Self. In each of the above processes, certain variables made patients’ careers as very different. Type of disease, gender, age, education, social and economical status of patients and their families affected patients’ access to health services and therapeutic relationships. Consequently, biographic disruption and the negative effects of the disease on patients’ identity were enhanced or limited by these factors. The same variables also affected power relationships with doctors and with other caregivers, by making possible, or limiting resistance and adaptation by the patients, and their efforts to be entitled to speech and to be recognised as “competent patients” with a role in therapeutic choices.

From knowledge to practice in self-monitoring: beyond narratives of responsibilisation and democratisation.
Kate WEINER (University of Sheffield, United Kingdom) | k.weiner@sheffield.ac.uk
Catherine M. WILL (University of Sussex, United Kingdom) | c.will@sussex.ac.uk
Flis HENWOOD (University of Brighton, United Kingdom) | f.henwood@brighton.ac.uk

In the context of the increasing commercialisation of health care, there is a growing market in consumer health devices for recording and monitoring ever more aspects of bodily status. One strand of scholarship has seen this through the lens of governmentality or responsibilisation, suggesting that self-tracking requires and produces certain types of self-regulating subjects. Another strand has seen these developments through the lens of expertise and implied a more creative potential for tracking to engender new forms of patient participation, and the democratisation of knowledge production. In both perspectives, knowledge creation is a key outcome of self-monitoring. We start from some doubts about whether this fully explains people’s self-monitoring practices. We question whether such monitoring necessarily leads to
data, let alone to knowledge. Drawing on our research on the domestication of consumer health technologies, in particular blood pressure monitoring, we would like to supplement current perspectives through exploring how self-monitoring contributes on a very local and domestic level to negotiations about care and to identity. In undertaking this analysis we are attentive to inequalities in access to and resources for care. We also consider the potential for monitoring to feature in what we understand as mundane or quiet forms of resistance to contemporary health surveillance.

**Misunderstandings between healthcare workers, physicians and homeless people**

Laureline COULOMB (Laboratoire Dynamiques Européennes, France) | laureline.coulomb@misha.fr

Despite several specific schemes set up in France to help the care and cure of people living in the streets, the prevalence of both chronic and acute diseases is higher amongst homeless people than in the general population. They are regularly described by social workers, politics, physicians or healthcare workers as refusing medical care, and this is often the main argument raised to explain their poor health.

Based on participant observation and semi-structured interviews conducted in Strasbourg, I suggest that interactions between physicians, healthcare workers and people who live down-and-out are crossed by several misunderstandings. I identify three main misunderstandings: the first one deals with their relationship to the body, the second one with their relationship to health and illness, and the third one to their relationship to time. After living a while in the streets, homeless people develop peculiar representations and practices that are linked to their precarious living conditions. In the same time, physicians and healthcare workers also show specific ways of conceptualising health, illness, body and time, that have been developed over the span of their career.

The analysis of these misunderstandings' consequences on the care of people living down-and-out may shed light of what is at stake in their interactions and can help to explain homeless people's health status. Those specific patients seem to gather all the structural and individual difficulties encountered by physicians and healthcare workers. Providing a better awareness of their misunderstandings, we can thus ask if it's really acurate to talk about homeless people care refusal.

**RN16S02 - The Impact of Gender, Class and Ethnicity on end of Life Experiences**

**Ill and Ageing Bodies from a Gender Perspective**

Rita BIANCHERI (Pisa University, Italy) | rita.biancheri@sp.unipi.it
Silvia CERVIA (Pisa University, Italy) | silviacervia@tin.it

Epidemiological data show an apparent paradox of increased longevity in women combined with a greater rate of morbility in their lifetimes. Scientific research in this area has focused on what has been defined as feminine “resilience”, the absence of risk and preventive lifestyles, which translate into increased longevity and a postponement of ageing, without considering the interaction between working conditions and home life (Hunt & Macintyre 2000; Fan & Frisbee 2009).
From this point of view, the increasing presence of women in the workplace, the raising of the retirement age, together with current social transformations and a drop in past forms of reciprocity and solidarity will affect welfare models, and lead to important consequences for the well-being of the elderly.

By adopting the life course approach to studying “health trajectories” in the ageing process, the research takes into account the paradigm of gender and the ensuing differences. These may be seen as crucial elements of those dynamics linking several multidimensional factors that play a relevant role in health outcomes. In our paper, we have considered gender role construction as having a double significance that could explain the ambivalence of the epidemiological data. By analysing the life story and medical history of certain witnesses – females and males over the age of 75 – the research results show a possible connection between the worst health outcomes (ill bodies) and overburdening deriving from a “double presence”, and the positive effect on the “re-establishment” of identities (Beck 2008) in the continuity of care.

Men’s and women’s experiences of loss of bodily autonomy at end of life
Ana Patricia HILÁRIO (Center for Research and Studies in Sociology, University Institute of Lisbon, Portugal) | patriciahilario@gmail.com

While sociological research has been successful in elucidating the role of gender in terms of how men and women experience their ageing and chronically ill bodies, it has not paid sufficient attention to the embodied character of gender at end of life. The dying process and its bodily realities have indeed been described as being undifferentiated in the sense that there is the belief that men and women who are very ill and at the end of life do not experience this process and associated bodily changes in dissimilar ways. Through a series of interviews with terminally ill patients, family members and members of hospice staff we aim to offer insights on how gender might shape the experience of loss of bodily autonomy at end of life. Within this context bodily autonomy is defined as the corporeal capacity for self-containment and the ability to act as the agent of one’s embodied actions and intentions (Lawton, 2000). The findings suggested that the loss of bodily autonomy is a much more dramatic experience for men than for women as it contravenes masculine norms of autonomy, invulnerability and control. Women, in contrast to the men in this study, showed a less negative reaction and tried to integrate the best as they could their condition. The study contradicted theories that have suggested a potential ‘degendarisation’ of terminally ill patients.

‘He’s used his ashes in the ink. He’s in with him, isn't he?’: Working-class experience of death, dying and bereavement
Stephanie MULRINE (Teesside University, United Kingdom) | s.mulrine@tees.ac.uk
Janet SHUCKSMITH (Teesside University, United Kingdom) | j.shucksmith@tees.ac.uk
Paul CRAWSHAW (Teesside University, United Kingdom) | p.crawshaw@tees.ac.uk
Catherine EXLEY (Newcastle University, United Kingdom) | catherine.exley@ncl.ac.uk

Epidemiological evidence suggests that death, dying and bereavement affect groups in society in highly variable ways. Those from working-class or disadvantaged communities are more likely to experience acute health inequalities and a higher mortality rate. However there has been little qualitative research to understand the lived experience at end-of-life. Howarth (2007) warned against making assumptions about the experiences, norms and practices of working-class people faced with end-of-life and grief. Following the theoretical work of Bourdieu, this research aims to further knowledge about the cultural practices and social resources available
to people living in disadvantage and to examine how these impact when managing the dying and during the bereavement process.

The research uses in-depth qualitative serial interviews carried out with bereaved carers in an area of deprivation in North East England. Participants (n=12) have been recruited through support organisations, charities and community groups working with or supporting unpaid and informal carers of a spouse or family member. Findings from these respondents suggest that the bereavement process was aided for some by what they felt others may regard as, ‘non-traditional’ funeral or memorial practices, such as taking videos of the funeral, having dedicated tattoos or keeping the ashes at home. However participants’ narrative accounts indicate that they felt these choices are often perceived to be taboo and require justification or explanation. This narrative work is necessary to counter the symbolic violence of class-based distinctions which devalue these practices and deem them ‘tasteless’.

Caring for Dying ‘Others’: Palliative Care Workers Talk about Cross-Cultural Interactions
Pernilla ÅGÅRD (Uppsala University, Sweden) | pernilla.agard@soc.uu.se
Sandra TORRES (Uppsala University, Sweden) | sandra.torres@soc.uu.se

The social-constructionist perspective argues that language sets the framework for how we perceive the world around us. In interacting with others we can sometimes come to negotiate the way in which we think about different categories. Through focus group interviews with palliative care workers in Sweden (n=60), this project explores, how palliative care workers’ understandings of cross-cultural interaction are constructed in relation to the specific context that is end-of-life-care. Departing from a Membership Categorization Analysis (MCA) of the focus group data collected, the analysis highlights how palliative care workers negotiate, refute and adapt – through talk - the understandings of cross-cultural interaction that they claim to uphold. The findings show that one of the reasons why cross-cultural end-of-life care interaction seems to be regarded as challenging is that palliative care workers seem to take for granted that patients from ethnic minority groups have needs that are different from the needs that ‘ordinary patients’ have. The interviewed workers talked also about the fact that cross-cultural care requires that care workers bridge the boundaries that exist between themselves and those they regard as ethnic ‘Others’. The presentation aims, therefore, to problematize the way in which understandings of ethnic ‘Others’ were verbalized in the focus group interviews. The analysis shows, after all, that these understandings are far more fluid than what meets the eye at first glance.

RN16S03a - Sociological Perspectives on Obesities: Understandings, Interventions and Practices
From the setting-up of a Bariatric Surgery Support Group to the emergence of the “expert-patient”: Reflections on the role and the place of the “patients” in hospital health care services for obesity
Kàtia LURBE I PUERTO (AP-HP, Public hospital Network of the Parisian Region, GT Education Santé, Ifé ENS-Lyon, France) | katia.lurbe.puerto@gmail.com

This paper will present preliminary results of a broader research on bariatric surgery, the SociOb study, currently taking place at two University Public Hospitals in France. This study seeks to explain the ways obesity is constructed in lay and expert knowledge and how different
ontologies of obesity are enacted in clinical settings. It also aims to understand how people whose body is not only out-of-bounds but also sources of physical and social suffering link in their daily life nutritional norms and eating practices as well as physical activity norms and exercises. It finally intends to understand the place of education in hospital clinical practice, in particular as regards a health condition recognized as a chronic illness as well as a disease of late modernity civilization (i.e. “obesogenic environment”) for which no pharmaceutical treatment is efficient and the focus is put on changing individual’s life-styles. Drawing from the ethnographical data produced from June 2013 on the patients’ support group meetings on bariatric surgery and on a series of interviews with professionals and patients, I will approach the following questions: which ontologies of obesity are enacted in the meetings? What themes emerge? How do people become an “expert patient” and how do they define their role? How are they perceived by “lay-patients” and professionals. To what extend a complementary work, a therapeutic alliance set up with professionals? To what extent this official recognition of patients overcomes the lay versus expert knowledge divide and strengthen individuals’ autonomy in the management of obesity?

Caretaking of Obesity: A Matter of Medicalization and Self-medication Practices
Cristina CALVI (Indipendent Researcher, Italy) | cristinacalvi27@gmail.com

The World Health Organization acknowledges that obesity is currently one of the major health problems: in Italy the percentage of obese people has increased from 8.6% in 2000 to 10.4% in 2012 (Ocse 2014). Obesity can be considered among the deviant behaviors, such as eating disorders, alcoholism, mental or sexual abuse that are the subject of the process of medicalization in place in modern societies (Conrad, Schneider 1980). In the case of obesity, we have seen both the spread of bariatric surgery, and the prescription of ad hoc diets and physical activity.

This paper intends to present the results of an empirical research that involved people suffering from Class I obesity and that they had begun a medical course of treatment. The research, referring to the theoretical paradigm of the life course, adopted a qualitative research perspective.

In particular, 22 biographical interviews with patients are realized in order to analyze their medical history. The research reconstructs the representations of health and illness by analyzing the behaviors and routines adopted by patients in everyday lives with particular reference to how to manage treatment and post-treatment stages. On the one hand the analysis of the empirical material identifies some ways of managing obesity implemented by patients ranging from the full acceptance of the treatments offered by doctors (“a path formally medicalized”) to an “own path” of self-medication (Fainzang, 2013). On the other hand, the interviews are able to reconstruct subjects’ identities with particular reference to the changes of the self perception.

Socio-economic inequality and narrative accounts of living with obesity
Paul BISSELL (University of Sheffield, United Kingdom) | p.bissell@sheffield.ac.uk
Marian PEACOCK (University of Sheffield, United Kingdom) | m.peacock@sheffield.ac.uk
Jo BLACKBURN (Barnsley Hospital NHS Foundation Trust, Barnsley, United Kingdom) | j.blackburn1@nhs.net
Christine SMITH (Barnsley Hospital NHS Foundation Trust, Barnsley, United Kingdom) | christinesmith@nhs.net

Despite the now well-documented social gradient in obesity, there are relatively few qualitative studies which locate the experiences of living with obesity in the context of social inequality. This paper addresses this omission, drawing on data which used biographical interviews with 15
obese adults living in socio-economically disadvantaged parts of northern England. All participants were interviewed twice, with the first interview being relatively unstructured and the second utilising a semi-structured approach. We found that participants sought to position themselves as responsible, autonomous agents when accounting for their weight. We highlight the often painful, biographical work undertaken by participants where food practices and life histories were positioned in opposition to mainstream discourses of personal failure. We suggest these accounts can be viewed as weak forms of protective resistance, against ‘hostile’ anti-obesity discourses. We also report on participants sometimes visceral but often muted and shaming accounts of the pleasures associated with consuming food. We suggest that whilst these practices can be understood as providing sources of comfort and to regulate mood, they also appeared to have another purpose which was to establish spaces for agency and control in lives shaped by disadvantage. In situating these findings, we refer back to Hilary Graham’s earlier work on smoking and disadvantage. We argue that living with obesity in an unequal world not only constructs embodied identities but also shapes capacities for discursive resistance and protection.

Insecurity, family dynamic and health behavior
Kia DITLEVSEN (University of Copenhagen, Denmark) | kmd@ifro.ku.dk

Increasing attention is being paid to the link between insecurity and obesity. The link is, however, still mainly described on national level as causal connections between social security and prevalence of obesity. It remains abstract: why and how this connection works are unanswered questions. In the cross disciplinary field of obesity research, where biomedical world views and large scale quantitative analyzes are dominating, the sociology of health and illness have an important role to play in attempts to understand how structural conditions affect individual and family-level health behavior. Insecurity is becoming a widespread prerequisite in an increasing number of people’s lives under the current economic crisis, all the while European governments make cuts on welfare and health budgets. Thus, there is an urgent need to understand the connection between insecurity and obesity at the social level where health behavior is enacted, in order to know how to counter health problems that will assumingly grow as social security levels decrease. Based on qualitative interviews with a sample of Danish adults with low SES-status and diverse ethnic backgrounds, this paper explores insecurity as a recurrent pattern in their life conditions and how it affects family health behavior in relation to weight management. Further, it will theoretically conceptualize the empirical examples of insecurity, using Bauman’s exploration of security, and discuss ways to sociologically grasp why insecurity facilitates obesity at family level.

RN16S03b - Sociological Perspectives on Obesities: Life-style Drift

Coping With Obesity: Some Sociological Insights Coming from Turkish Experience
Hülya YÜKSEL (Dumlupınar University, Turkey) | hulya.yuksel@gmail.com

Linkages between structure and agency do not abound in sociology, despite the need for such an analysis in the sociology of health. I aim to elucidate these linkages by examining obesity in Turkey. In recent years, obesity and overweight have become leading preventable causes of
death worldwide. Obesity is a multifaceted problem whose prevention requires the involvement of every level of society. Multilevel integration across sectors is crucial in the struggle to achieve healthy lifestyle changes. This demands a holistic approach that focuses on process rather than outcomes and recognizes the interactions and interdependencies among individuals, organizations and systems.

The obesity problem results from the interplay of the social and the built environment, food policies and individual behavior. The Turkish Statistical Institute’s Health Statistics (2012) indicate that 17.2% of adults aged 15 and above are obese (men 13.7%, women 20.9%), and that 34.8% are overweight. The Turkish Government has launched programs to deal with obesity. One started in 2010 as a media campaign using public service announcements to encourage people to exercise more and eat less.

In 2012, the Ministry of Health conducted a nationwide study (N=2223) to measure the campaign’s effectiveness. I will evaluate and discuss the results of this study to see how this nationwide campaign influenced individual attitudes and behaviors. In the process, I will critique the program’s focus on individual behavior without taking into account the obesogenic food environment and the lack of opportunities for physical activity in urban areas.

“Maybe I should just forget about calorie counting?” Problematisations of the script of slimming in an online weight loss service

Johanna M MÄKELÄ (Department of Teacher Education, University of Helsinki, Finland) | johanna.m.makela@helsinki.fi
Mari NIVA (Department of Political and Economic Studies, University of Helsinki, Finland) | mari.niva@helsinki.fi

The increasing concern for overweight and obesity has led to a proliferation of individual body projects that aim at losing and managing weight. New tools for weight loss have been produced by Internet technologies, such as online services providing detailed calorie counting in food diaries, peer support in discussion forums, and expert advice. Our earlier paper based on interviews with users of two Finnish online slimming services suggested that the food and exercise diaries provided by the services produced a script for a calculative practice of slimming, and that for the users, the diaries necessitated slimming in which both calories, nutrition and bodies were treated as quantified objects.

In this paper, we turn to examining the relationship between the calculative script produced by the services and the discourses of slimming that are brought about in a discussion forum related to one of the services. Among the postings from users in the period 2008–2014, we have chosen those that specifically problematize the script of slimming produced by the service. We examine the interpretative repertoires that either comply or challenge the calculative script of the service, and analyse how users ‘re-script’ and negotiate the meanings of slimming when providing and receiving peer support. Our preliminary findings suggest that discourses drawing on subjective experiences may either support or contradict with the slimming script of the service. Therefore, the user forum produces a discursive space with multiple and competing versions of online slimming that voice dieters’ everyday understandings and interpretations of the script.

The relationship between Obesity and social capital

Johanna MUCKENHUBER (University Graz, Austria) | johanna.muckenhuber@uni-graz.at

Often obesity is treated as an indivual health problem. In consequence public health programms are developed with the aim to change individuals’ health behaviour.
But research has shown that obesity is highly related to a low socioeconomic status and to low education. This shows that obesity shouldn't be seen as an individual health problem and as a result of individual misbehaviour.

Environmental factors like a lack of social support and social resources are known to be risk factors for obesity but this relationship should be analysed more in detail. In this study we investigated the relationship between social capital and obesity. We analysed a subsample of the Austrian Health Interview Survey 2006/07 by means of an adjusted binary logistic regression model.

Our results show that low social capital is associated with a high risk of being obese, even after adjustment for the socio-economic status and lifestyle factors. This result supports the argument, that obesity is not just an individual phenomenon but a social one. Public health programmes focusing on lifestyle factors and health behaviour follow an ideology of individual responsibility. The knowledge about low socio-economic status and low social capital as risk factors for obesity show that public health programmes should be changed. Their focus should shift from prevention on the level of behaviour to prevention on the level of social conditions and environmental factors.

**RN16S03c - Sociological Perspectives on Obesities: Special Session on Childhood**

**The Red Thin Line of Pediatric Obesity**

Arianna RADIN (University of Turin, Italy) | arianna.radin@unito.it

In the field of pediatric obesity, it appears to be a scientific backwater in which the idea that prevention is better than cure seems to be the big news of the last 30 years: in this sort of black box labelled “prevention of pediatric obesity” there are unhealthy food practices, sedentary habits and an incorrect lifestyle (for children and families). To swim into this backwater, it's appropriate not to adopt the approach of the sociology "in" or "of" obesity but to adopt the approach of the sociology “for” the obesity, proposed by Poulain, then analyze public policies to counteract obesity and the various narratives and dramatizations of these. This story is made of words similar but not identical - Health Promotion, Prevention, Health Protection (Tannahill's model), Health Literacy and Physical Literacy- and numbers - that define the normal weight or not; that compose the diffusion rates of pediatric obesity; that correspond to the amount of vegetables or hours of TV a day to consume.

In the complexity of obesity pediatric, health professionals have the task to draw a thin red line between normal weight and the excess, between scientific discoveries and common sense in the prevention of pediatric obesity, among the professional interests and individual (or parent's) responsibilities. Therefore it seems to have been created a system of medicalization, which involves the medicalization of food, the medicalization of physical activity but also a sort of (bio)medicalization of parenthood, from nutritional programming to family habits. The creation of this system by the medicalization of health professionals has had two effects. On the one hand, the so-called obesity skeptics showed some critical aspects about medicalization(s) of obesity relatively on medical imperialism (or, as Illich would say, on imperialism of homogenized) and responsibilities of the establishment of the obesity in lobbies activity for put the obesogenic condition as priorities in the Global Health Agenda. On the other hand, by adopting the idea of a Global Health Agenda medicalization as proposed Clarke, also the Pediatric Obesity Agenda was medicalized from the WHO European Ministerial Conference on Counteracting Obesity, Diet and Physical Activity for Health (2006) to Vienna Declaration on Nutrition and
Noncommunicable Diseases in the Context of Health 2020 (2013). During these eight years, health professionals have created Corporate NGO pediatric obesity - Obesity World Federation (International Association of the Study of Obesity - International Obesity Task Force merger), European Association for the Study of Obesity and European Childhood Obesity Group- so the issue of responsibility of the professional has become as important as the responsibilities of the obese person. The issue is particularly sensitive in the case of pediatric obesity , as highlighted by Fulponi, because especially children are not always aware of the ready meals consumed at home or what they eat for example at school. The information and health education implemented by health professionals therefore play a key role: on one hand, the guidelines and clinical recommendations produced by the Corporate NGOs provide practical training to colleagues who deal daily with children, obese or not, starting by pediatricians; on the other hand, studies and prevention programs educate schools, families, parents and, of course, children on healthy behaviors to do and habits to avoid.

So I use a stakeholders analysis to analyse Pediatric Obesity Guidelines and Recommendations and the ten European Researches and Programs made by health professionals networks from 2006 to 2013.

The construction of the system medicalization seems to be more than functional: not only the Guidelines and Recommendations provide medical indications about life style of the family (e.g.1h/day of physical activities or eat fruits and vegetables daily) , but also about parenting style (e.g. suggest to parents to valorize self-image of their child). If the role of Big Pharma and pediatric bariatric surgeons still seems to be marginal, at the moment, Guidelines and Recommendations identified Pediatricians as primary stakeholders, but they admit that these health professionals must have more training on prevention and treatment of pediatric obesity and be more aware not only of the importance of their daily activities with families but also of the crucial task of setting a healthy lifestyle, even if the results seem slow to arrive. The European studies and prevention projects analyzed, even though they are made in countries with different cultures, especially on food, have similar goals. This similarity, probably due to the creation of a network more or less formalized, appears to have reduced over the years the innovative drive on the level of contents, e.g. propose short healthy and physical break during school lessons or while children (and family) are watching tv. However some studies and projects are innovative in the form: applying social marketing to prevention, creating telematics platforms for healthcare professionals or for the boys/girls and their families, or, finally, turning the nutritional programming in a primordial form of prevention.

In addition to health care professionals who design and manage these studies and projects, there are other stakeholders: teachers, who give part of their professionalism in applying the new rules during lessons or lunchtime at school; parents, who give some of their authority in the management of parenting in terms of nutrition and physical activity; and companies that subsidize these projects. A wellness management shared between public and private, a sort of wellness mix, can be defined at local or national level, with small or large companies. If the economic participation of the small supermarket is definitely viewed as positive, the Public-Public Partnership (PPP) with Big Food, the food industry, is definitely an issue of considerable controversy, even within the community of health professionals who deal with obesity children. Furthermore, despite the banality of the prevention solutions proposed in the majority of the cases, the professional jurisdiction on pediatric obesity seems to be safeguarded through the use of the concept of double risk (to be overweight and obese in childhood, then in adulthood), development of the nutrional programming and the creation of a real own brand of prevention predictable, evidence-based and efficient. In other words, pediatric obesity has been mcdonaldizated.
Becoming a healthy child: an exploration of the Growing up in Ireland study as a technology of moral governance.
Eluska FERNANDEZ (University College Cork, Ireland) | e.fernandez@ucc.ie

This paper interrogates findings from the Growing up in Ireland study, the biggest and most comprehensive Irish research of childhood ever undertaken. More specifically, this paper develops a critical governmental analysis of what growing up as a healthy child means in this study. Drawing upon both quantitative and qualitative data generated by Growing up in Ireland, I argue that the knowledge produced and presented in relation to what being a ‘healthy child’ is in this study is prone to ideological capture and reflects wider processes that are shaping contemporary class relations. These processes are here explored through analysing what roles various conceptualizations of selfhood – namely the rational self, the responsible self and the civilized self - play in the discussions of health behaviour which dominate the Growing up in Ireland’s section on health and well-being. The focus on levels of crisps and soft drinks consumption, exercise and self-esteem, amongst other behaviours, and how notions of shame, guilt and embarrassment are implicated in the study’s interpretations, is an example of how this study is analysed as a technology of moral governance. My paper argues that Growing up in Ireland, which aims to inform future policy in relation to children's lives, has failed to engage with a sociological imagination. Instead, I will argue that it has allowed the psychological to be brought as an explanation for the experience of structural inequality, and that once again some (classed) social groups are produced as irrational, irresponsible and uncivilized.

Governing childhood obesity in Switzerland (2000-2010)
Andrea LUTZ (University of Geneva, Switzerland) | andrea.lutz@unige.ch

The main objective of this article is to analyze the emergence of the issue of childhood obesity in the health policies of the Swiss federal state between the 2000s and 2010s. We try to understand how this topic was put into the public policy agenda and how it was translated in the concrete practices of health-care professionals in various contexts (hospitals, private medicine, school health services). Our interest focuses both on the prevention and the treatment of childhood obesity.

Our analysis of the childhood obesity policies relies on a critical discourse analysis approach, inspired by the work of the French philosopher and historian Michel Foucault. In this perspective, we explain how power relationships are expressed through discourses, language and practices. Health policies are considered as a form of biopolitics, which main purpose is to govern bodies and manage life. We will reflect on the dialectic between power and knowledge that characterizes the management of children’s health. We try to understand how the discourses of the designers of these policies (politicians, health professionals, teachers) define and conceptualize the issue of childhood obesity. What are the explanations and causes that these actors advance? What are the means and strategies that they preconize? Moreover, we reflect on the consequences that these discourses have on the everyday life of children, once they are translated into real practices and concrete activities. This means that we analyze the performative dimension of health policies discourses.

The results that we discuss in this article were collected in the framework of a sociological research conducted in the French-speaking part of Switzerland between 2013 and 2015. This research relies on different types of sources: grey literature produced by various institutions involved in the development of obesity policies (campaigns material, reports, web sites); legislation (laws, directives, regulations); Swiss and international medical literature on childhood obesity; fifteen interviews conducted with political actors, teachers, doctors and other health professionals (nurses, nutritionists, psychologists and health promoters).
Exchange, control and conflict: navigating mother-grandmother relations within the childhood obesity debate.
Gillian Mary MARTIN (University of Malta, Malta) | gillian.martin@um.edu.mt

Childhood obesity is a current issue of concern in Malta where normative and corrective discourse on escalating bio-medically defined statistics of body fat set the agenda in public health campaigns. This paper looks beyond the social construction / social determinants of obesity and focuses on the lived experience of mothers of fat children. This is done by exploring relational dynamics at the core of grandmother-mother mentoring, and subsequent negotiated childcare arrangements, and how these may impact on the quality of the young child’s eating habits. Carried out as part of a larger ethnographic study, qualitative in-depth interviews were conducted with mothers and grandmothers (n=38) of children in a purposive sample framed within two primary schools in Malta. Cross sectional thematic analysis was used with the data where power, exchange and control were the driving conceptual categories, and ‘cooking-as-loving’ and ‘mother knows best’ emerged as key descriptive themes.

The significant influence of the grandmother is a key finding in two key areas. Her close collaboration with the mother as main mentor when caring for very young children is shown to have an empowering effect within medical consultations. Their collective ‘lay epidemiology’ offers strong resistance to nutritional advice offered by the medical professionals and the idea that ‘mother knows best’ dominates. The grandmothers’ powerful position as main and preferred source of childcare is clear and the mothers’ loss of control over the child’s consumption of high calorie sweet treats is an accepted negative consequence in child care negotiations.

RN16S04a - Ethnic Minorities in Europe: Health Inequalities and Policy Challenges

Ethnic differences in the use of mental health services: what is the role of social networks?
Dharmi KAPADIA (The University of Manchester, United Kingdom) | dharmi.kapadia@manchester.ac.uk

The ways in which people seek help and access mental health services are complex and varied. Usage of services may occur through individual efforts, referral by doctors, the influence of informal contacts, and some combination of these. However, mental health service use has typically been researched within an individualistic paradigm, with Dixon-Woods’ candidacy model gaining popularity and with less consideration of the social processes involved in help-seeking. More specifically, the way in which the resources available in social networks influence service use (as theorised by Pescosolido in the Network Episode Model) has not been widely explored and not at all in relation to ethnic differences. Pakistani women in England have lower rates of attendance at outpatient mental health services compared with women from White ethnic groups. Although there is an indication that social networks may play a role in the usage of services, there is little robust evidence. This paper addresses questions around how and why social networks are associated with the use of mental health services, and how these associations might vary amongst women from different ethnic groups. Using quantitative data from an English community survey (Ethnic Minority Psychiatric Illness Rates in the Community) this paper presents a structural equation model of the effects of social networks on usage of services, and discusses how these vary between
Pakistan women and women from other ethnic groups. The findings are discussed in relation to mental health policies to address ethnic inequalities in service use in the UK and beyond.

The impact of recession on children's health in deprived communities, including ethnic minority and migrant communities, in a northern English city.
Neil SMALL (University of Bradford, United Kingdom) | N.A.Small@bradford.ac.uk

Born in Bradford is an ongoing prospective pregnancy and birth cohort study in the UK's 6th largest city. Between 2007 and 2011 12453 women (13776 pregnancies), 3448 of their partners and 13818 babies were recruited. Half of families are in the poorest fifth for deprivation in England and Wales and 45% are Muslims of Pakistani origin (of these half of mothers were born in Pakistan and migrated to the UK). A longitudinal study in one city allows close consideration of the impact of local circumstances including service provision and policy choices and it allows engagement with the community to implement evidence based responses to study findings. The health impact of economic recession has been greatest in the poorest cities and, within these, it has been greatest in the most deprived groups in these cities. Infant and child morbidity correlates with deprivation and even within the same deprivation categories minority ethnic communities do relatively badly. This paper considers inequality in infant health by examining deprivation, ethnicity and migration. It focuses on infant growth, obesity and diabetes risk. Diabetes in twice as high in poorest groups compared to national averages and is four times higher in people of Pakistani origin in the UK. This presentation considers the mechanisms through which recession might add to these inequalities and considers responses that can be implemented to ameliorate the impact of recession.

Embedding racialised differences into prescribing: the case of UK hypertension guidelines.
Andrew SMART (Bath Spa University, United Kingdom) | a.smart@bathspa.ac.uk
Kate WEINER (Sheffield University, United Kingdom) | k.weiner@sheffield.ac.uk

In 2002, US psychiatrist Dr Sally Satel courted controversy by arguing in a New York Times magazine article that physicians should take into account a patient’s race when they prescribed medicine. For many observers, her viewpoint contradicted the long-standing consensus that race was a biologically meaningless form of categorisation, and ignored concerns about the socially sensitive nature of making racialised judgements in healthcare. However, in 2006, the UK's foremost authority on prescribing practices, the National Institute for Health and Care Excellence (NICE), issued a set of treatment guidelines for hypertension that stipulated a treatment pathway for 'black patients of African or Caribbean decent'. In 2014, the US Joint Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure (JNC) followed suit, over-turning its 2003 race-blind policy. These developments raise difficult questions, not least for health care systems, policymakers and practitioners. This paper reports on research investigating the development of the NICE hypertension prescribing guideline, based on documentary analysis and interviews with key UK experts. We consider the discussions that surrounded its development, the types of evidence used to support the guideline, and ideas about its implementation. We analyse the intersections between different knowledge claims (about pharmacological evidence, tacit clinical experience and underlying assumptions about difference) to reflect on how racial categories are ascribed and how uncertainties about ‘mixedness’ are addressed. We will also discuss the implications of such guidance for evidence-based clinical practice and for policy debates about inclusion and equality.
The impact of health on unemployment patterns in Scandinavia: Are immigrants and descendants more prone to health selection?
Kristian HEGGEBØ (Oslo and Akershus University College, Norway) | kristian.heggebo@hioa.no

Previous research has established the presence of both ethnic discrimination and health selection on the labor market. Considerably less is known about ethnic minorities with ill health, and whether this sub-group is especially prone to unemployment. The present paper investigates the unemployment probabilities of immigrants and descendants reporting ill health in Scandinavia. The analysis consists of linear probability models estimated on the cross-sectional part of the EU-SILC data material. Observational year is set to 2011, because this module includes information that enables us to localize descendants of immigrants. The Scandinavian countries (Denmark, Norway and Sweden) represents an interesting case, because the countries are similar in many respects, but are different on important labor market dimensions. Firstly, Denmark and Sweden experienced low demand for labor during the period in question, while Norway did not. Secondly, the employment protection legislation is much more lenient in the Danish ‘flexicurity’ labor market model, compared with the neighboring countries. The results indicate that healthy immigrants are more prone to unemployment than the majority population in Norway and Sweden, while immigrants with ill health are particularly likely to be unemployed in Denmark. Descendants reporting good health status does not have a higher likelihood of unemployment in either of the Scandinavian countries. Descendants with ill health, however, have a high unemployment probability in Denmark. There are signs of similar tendencies in Norway and Sweden as well, but only among descendants reporting more serious health problems (limiting longstanding illness).

Towards Realizing Right to Health: The Case of Undocumented Filipino Migrants in Utrecht Netherlands
Annabelle Benedicto BONJE (De La Salle University, Philippines) | annabelle.bonje@dlsu.edu.ph

In the Netherlands the existing legislation regarding access to health care among undocumented migrants is generally favourable, however, this provisioning becomes problematic in practice. The conflicting policy objectives of the states create a condition of liminality, which hinders the undocumented migrants in accessing health care services. In the dominant discourses, the liminal bodies of undocumented Filipino migrants are seen as docile bodies and passive victims of health injustices. I contend that there is a need to re-examine the homogenization implied by these dominant discourses among undocumented migrants. This paper argues that the liminal bodies of undocumented Filipino migrants emerge as self-governing individuals capable of navigating within the grey zone of liminality prevailing within the Dutch health care system. The condition of liminality widens their agentive capacity and enables them to contribute in the knowledge production in light of the epistemology of meaning-making and place-making. Analyzing the narratives of undocumented Filipino migrants, I critically explore how these crafting of meanings related to their embodied lived experiences thus, influenced their health seeking behaviour. I utilized the ethnographies of experience and Filipino Psychology to examine how these liminal bodies address their health needs within their immediate horizon.

RN16S04b - Ethnic Minorities in Europe: Health Inequalities and Policy Challenges

Identifying Vulnerable Groups: Categorization and Biopolitics in Public Health
Penelope Anne SCOTT (Ludwig Maximilians University, Munich, Germany) | penelope.scott@wzb.eu
Hella VON UNGER (Ludwig Maximilians University, Munich, Germany) | unger@lmu.de
Dennis Quincy ODUKOYA (Ludwig Maximilians University, Munich, Germany) | odukoya@soziologie.uni-muenchen.de

Health statistics show high rates of infectious diseases such as TB and HIV/AIDS among ethnic minority and migrant communities within many European countries. The provision of services and public health interventions to address their specific needs is dependent on effective epidemiological surveillance practices, which serve to identify vulnerable groups. The development of ethnicity and migration-related categories in public health classifications is one such practice employed in epidemiological surveillance. However, the construction of these categories is bound up with the ascription of identities and is rooted in unique social and historical factors configuring inter-ethnic relations and influencing approaches to diversity in various institutional contexts such as public health. We report on a discourse analysis of the categories used in TB and HIV/AIDS health reporting in both the UK and Germany. We critically examine the theoretical and methodological principles underpinning the construction of ethnicity and migration-related categories in public health classifications and demonstrate their biopolitical function. The examples presented highlight the differing constructions of these categories, their instability and the possibilities for rendering certain groups invisible in processes of categorization. We argue that these categories constitute a specific discourse on ethnic minorities, migrants and infectious disease, which serves to construct them both as a vulnerable group in need of policy and service interventions as well as a risk to the nation’s health. This discursive position warrants critical investigation in terms of the biopolitical outcomes and power effects generated.

Health targets as a tool for policy making in public health: the example of migration and health
Patrick BRZOSKA (Chemnitz Technical University, Chemnitz, Germany) | patrick.brzoska@soziologie.tu-chemnitz.de
Ute ELLERT (Robert Koch Institute, Berlin, Germany) | EllertU@rki.de
Ahmet KIMIL (Ethnomedizinisches Zentrum Hannover e.V., Hannover, Germany) | ethno@onlinehome.de
Oliver RAZUM (Bielefeld University, Bielefeld, Germany) | oliver.razum@uni-bielefeld.de
Anne-Christine SASS (Robert Koch Institute, Berlin, Germany) | SassA@rki.de
Ramazan SALMAN (Ethnomedizinisches Zentrum Hannover e.V., Hannover, Germany) | ethno@salman.info
Hajo ZEEB (University of Bremen, Bremen, Germany) | zeeb@bips.uni-bremen.de

Introduction: Health targets are a common tool of health systems to develop health policies and to coordinate activities of its stakeholders. Setting health targets requires a standardized procedure to evaluate and prioritize competing topics. In Germany, this procedure involves the evaluation of potential health targets by selected expert groups based on standardized criteria preset by the Health Targets Network. As an expert group, we were asked to review migration and health as a potential new health target for Germany. The present paper provides an overview of our evaluation and can serve as a blueprint for other European countries.

Methods: Thirteen standardized criteria served as a basis for our evaluation. For each of the criteria, extensive reviews of literature and project documentation were conducted. Results were narratively summarized.

Results: Although migrants have some health advantages, their health status, on average, is poorer than that of the majority population in Germany. In part, this is attributable to various barriers that migrants experience in health care. Different strategies exist aiming to improve the
health situation of this population group. Yet, their current scope and implementation in the health care system are limited in several ways. Present data on the health of migrants is inadequate and limits migrant-sensitive health reporting.

Conclusion: Health targets are useful for health policy formulation. A standardized evaluation facilitates the process of target setting. Prioritizing population-based targets such as migration and health against competing disease-oriented targets, which, e.g., focus on reducing the prevalence of chronic diseases, however, provides for some additional challenges.

Facilitating access, promoting integration? Organizational discretion of healthcare providers as a vector of social inclusion of immigrants

Paolo ROSSI (University of Milano Bicocca, Italy) | paolo.rossi@unimib.it
Mara TOGNETTI BORDOGNA (University of Milano Bicocca, Italy) | mara.tognetti@unimib.it

The aim of this paper is to study the implications of organizational discretion in the provision of healthcare services to immigrants. The underlying assumption is that the provision of healthcare services represents a significant step in the process of social inclusion of immigrants in hosting countries. The analysis is here focused on services provided to immigrants by hospitals and community health centers. Because of the peculiar nature of healthcare services [Arrow, 1963], these organizations are typically provided a considerable degree of discretion in the arrangement of their activities. Discretion affects both professional practices and managerial decisions and it is likely to bring about a substantial differentiation of the outcome of organizational activities. Immigrants represent a particular category of patients, with peculiar needs, expectations and possibilities of access to healthcare services [Derose et al 2009]. From this point of view, organizational discretion is fundamental for shaping the opportunities of access and the forms of delivery of healthcare services to immigrants.

The paper presents the findings of six case studies conducted in healthcare organizations in Milan, examining the analogies and the differences of the practices developed in order to interact with immigrant patients. The findings emphasize the thesis that healthcare organizations act locally as de-facto policy makers [Brodkin, 2010], influencing the opportunities of access and inclusion of immigrants. However, the analysis of the endeavors promoted by organizations for facilitating the access of immigrants to healthcare services reveal the fragmentation and heterogeneity of solutions, as well as a controversial acceptance of organizational logics. The access of immigrant patients becomes the driver for organizational innovation, although this process does not take a disruptive but a fragile and fragmented form.

Abortion and reproductive rights of migrant women in Italy and Europe. Social conditions, policies, current debates

Lia LOMBARDI (University of Milan; ISMU Foundation, Italy) | rosalia.lombardi@unimi.it

Research shows that migrant women in EU countries (about 17 million) have fertility and abortion rates significantly higher than the native women, but their access to the reproductive health services and abortion is not always guaranteed. Notwithstanding the provisions of EU that recommends the member countries to legislate in favour of abortion and to make it accessible, very often the laws on migration and health policies of EU countries are discriminating towards migrant women on this issue. In Italy, for instance, the higher abortion rate of migrant women (three time higher than italians) has highlighted the controversy both from the part of conservative and catholic movements and from the part of public policies that complain about high health care costs. The elective abortion of migrant women raises an important debate also in other European countries: the topics most discussed concern the high rate of abortions (as in Norway, Spain and Italy); the access to abortion for foreign women non-
residents or undocumented (in Czech Republic, France) and sex-selective abortion (in Sweden and Netherlands).
Starting from these assumptions, the paper analyses and develops three aspects of elective abortion, in Italy and in Europe:
1. abortion rates of migrant women and the related social conditions;
2. the policies which ensure reproductive rights of migrant women and the access to abortion (in terms of law, healthcare services, free access);
3. the current debates on abortion raised by women’s movements, international organisations (as IPPF, European network of migrant women, etc.) and conservative and religious organisations.

Barriers in accessing health services for migrant women: inappropriate access to emergency services and lack of intercultural competences. An Italian case study.
Angela GENOVA (University of Urbino Carlo Bo / Fondazione Giacomo Brodolini, Italy) | angela.genova@uniurb.it

In most of the European countries, the health conditions of migrant women are characterized by inequalities with respect to the same women and men in their native population. Their socio-economic conditions strongly affect such inequality, fostered by barriers in accessing health services. What are the main barriers in accessing health services? Focusing on an Italian case study, Marche Region, this paper investigates the main barriers migrant women face in accessing health services by analyzing the points of view of health professionals working in primary and secondary health services. The analysis of 32 in-depth interviews brings to light the high rate of migrant women accessing emergency services instead of GP or community services, as well as the lack of intercultural mediators and intercultural competences for health care professionals both in primary and secondary health services. Adequate access to primary care would reduce cost of secondary care as well as the inequalities in the health conditions of migrant women. Moreover, intercultural mediators would represent a crucial tool in improving the relationship between migrant women and the professionals working in the health services. Both initiatives are discussed within the framework of welfare reforms, between a reduction in the investments and a welfare reform approach towards universalistic welfare services or services specifically targeted to migrant populations or migrant women.

RN16S05 - The Role of Civil Society in Central and Eastern European Health Care Systems

“Kruzhok of independent artists”: midwifery networks
Anna A. TEMKINA (European University at St.Petersburg, Russian Federation) | atemkina@gmail.com

“Civil society” generally is a contested term concerning the impact in healthcare (Giarelli, Annandale, Ruzza, 2014). In 2000-2010 in Russia different kinds of civic activities constitute independent space and voices concerning healthcare, however actions (strikes, meeting, etc) are sporadic, their influence on politics is low. Generally civil society as opposed to the state ideology and politics in healthcare, as a sphere of independent public is problematic in Russia both as a social practice and as a concept. However numerous professional and cultural communities without special status or with a vague status construct their own rules and meanings, inside and outside official institutions in different
spheres. I will show how such meanings are constructed within network of midwives in course of their gathering, informal communication, training courses, conferences, routine practices of work, mentoring and teaching etc. The informal meetings of midwives are considered by some of them as a “protest against the (medical) system”. Activities and communities within official institution, simultaneously inside and outside them (Yurchak 2005), producing meanings and practices, are in the focus of my attention.

Midwives in their networks discuss and promote some ideas, which are different in comparison to “classical” obstetric approach. Midwives identify themselves as the “circle” (kruzhok) of “independent artists”, as “independent activity” (samodeyatelnost), and “sedition” (kramola), though they are “not ready to break to foundation of the institutions”. They look for the space of influence within official institutions adapting and to the existing rules and changing them. Identity and community construction, solidarity and cleavages, consciousness raising and status competition are emergent within this space.

The role of civil society in health care system in Poland

Beata TOBIASZ-ADAMCZYK (Jagiellonian University Medical College, Poland) | mytobias@cyf-kr.edu.pl
Barbara WOZNIAK (Jagiellonian University Medical College, Poland) | barbara.wozniak@uj.edu.pl
Monika BRZYSKA (Jagiellonian University Medical College, Poland) | monika.brzyska@uj.edu.pl

Over 68% of adult Poles do not participate in civic activities. This relatively low engagement is due to a lack of experience in such activities in previous political system, but, 25 years after political and economic transformation, the number of those engaged is still increasing. It should be noted that Polish citizens are eligible to donate 1% of income tax to a public benefit organization.

According to the database ngo.pl among all foundations and associations working in the field of healthcare in Poland 11591 is aimed at protection and promotion of health and 8120 work for the people with different kinds of illnesses and disabilities. As an example may serve Anna Dymna’s (famous Polish actress) "Against the Odds" Foundation, the aim of which is maintaining and managing Therapeutic and Rehabilitation Center for Persons with Intellectual Disabilities as well as subsidizing medical treatment and rehabilitation camps, etc.

Most significant nationwide initiative is The Great Orchestra of Christmas Charity. The aim of it is the effective support of the health care system in Poland through establishing new methods of diagnosis and treatment, by improving the standard of care for the youngest and oldest patients. They achieve this goal by public money raising and purchasing equipment for hospitals, medical offices throughout the country. The foundation is a great phenomenon in Poland as it’s activity is based on voluntary work of many people and vast majority of Polish citizens support it financially contributing each year to its success and improvement of health care system.

The civil society, gender, and childbirth activism in the Czech Republic: (re)establishing the alternatives

Ema HRESANOVA (University of West Bohemia, Czech Republic) | ehresano@kss.zcu.cz

Since the fall of the communist regime, Czechs have been involved in the process of re-establishing the civil society. Many scholars point out that this process has been deeply gendered; the gender composition of the highly feminised NGO sector stands in sharp contrast to the men-dominated high level party politics. Such a genderedness is even more apparent in the field of birthcare, which recently became a subject of numerous public debates. Childbirth turned to be a crucial driving force of a dynamic health-related social movement criticising allegedly paternalistic and patriarchal birth care system.
This paper discusses attempts of childbirth activists to establish alternatives in the Czech birthcare system and the Czech civil society in general. In particular, it focuses on the gendered dimension of this process. It builds on a long-term ethnography of the Czech childbirth movement employing a wide range of qualitative research methods, especially qualitative in-depth and narrative interviews and the so-called 'netnography' - studying childbirth activists' online activities.

The developing civil society for the growth of mental health: A case-study of the civil society organizations in Poland
Anna PROKOP (Jagiellonian University Medical College, Poland) | a.e.prokop@gmail.com

The presented study addresses the question of the role of the development of civil society in Poland after the political turn in 1989 for the situation of individuals with mental disorders and their families. To explore this issue qualitative methodology was applied. Firstly, the analysis of organizational discourse of local and national civil society organizations (CSOs) of three categories of social actors from the field of mental health (professionals, individuals with mental disorders as well as their families) was performed. Secondly, the expert interviews with leaders of the CSOs were conducted. The gathered material allowed an exploration of the major factors that facilitated the process of establishing CSOs in the field of mental health in Poland and the scope of activities undertaken by them in the last 25 years. Moreover, the analysis enabled a description of the dynamics of the growth of CSOs in the context of the process of socio-economic transformation as well as the perceived impact on concerned individuals, common health-care practices and regulations in the health system as well as attitudes within the general society in Poland. Finally, the results of the study provide the understanding of the forthcoming challenges of the CSOs and conditions that limit their chances of success.

RN16S06 - Technologies of Health : CAM and Medical Pluralism

An alternative from above: Bringing TCM as innovation to the Czech health care system
Tereza STOCKELOVA (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | tereza.stockelova@soc.cas.cz
Jaroslav KLEPAL (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | jaroslav.klepal@soc.cas.cz

In 2013 the Czech Republic revived its pre-1989, state socialist cooperation with China in the field of health care. This time the cooperation has encapsulated interests not only of the states and their citizens’ bodies but also corporate actors on both sides to introduce medical technologies, goods and services into their respective markets (EU and China). It was agreed, among other things, that a clinic of traditional Chinese medicine (TCM) would be established within a regional university hospital in the Czech Republic and in this way TCM would enter the public health care system in the country. While still in the stage of an unaccomplished project whose realization is conditioned by solving various setbacks, the TMC clinic has already been reordering the domestic professional and policy realities as well as public debates. Following the project of the TCM clinic as a complex “innovation” to the health services in the Czech Republic (and more broadly in post-socialist Central and Eastern Europe) we trace different (geo)political, economic, regulatory and medical logics that are negotiated with the introduction and translation of an alternative medicine “from above”. We will argue that the top-down process needs to be
studied as concerning and transforming the very nature of the introduced medicine. Empirically we draw upon interviews with involved actors, policy and other available documents and media analysis.

**Striving for Self-Maximization: Alternative Medicine Considered as Medical Enhancement Technologies**  
Inge Kryger PEDERSEN (University of Copenhagen, Denmark) | ikp@soc.ku.dk

Alternative medicine has in research mostly been addressed as a kind of therapy, treatment, healing practice, healthcare, or well-being. Drawing on 138 in-depth interviews with 46 Danish users of session-based alternative medicine and observations of 92 of their treatment sessions, this paper demonstrates that users do not only seek treatment of a given illness or well-being, but go on a voyage of discovery in the body to optimizing the body's own resources. This is precisely the phenomenon that Nikolas Rose has drawn attention to with the concept of medical enhancement technologies (2007). More options than ever are available now to improve and modify the body, when private providers enter healthcare in increasing numbers and new health technologies, for example computer-based biofeedback programs or self-screening equipment, become available. This paper argues that alternative medicine is also an overall designation for individual bodily projects aimed at body maintenance and a constant alertness to the state of the body and, ideally, identifying the various optimizing techniques that will issue in the perfect body. Alternative medicine can be regarded as just one more option for the privileged, paying out of their own pockets and as an expression of a privatized effort to ensure one’s own good health and to prevent the diseases one fears developing.

**The Construction and Composition of Medical Pluralistic Personal Networks in Kathmandu/Nepal**  
Lydia RÖSSL (Donau Universität Krems, Austria) | lydia.roessl@donau-uni.ac.at

Medical Pluralism is not new phenomena, but the worldwide dissemination of Biomedicine unveiled medical pluralism as linked with governmental authority and power and “modern” western medical practice was constructed oppositional to “traditional” medicine and healers(1). Nepal is defined as Least Developed Country and objective of various health projects and programs, 2010 – 2011 international aid represented 26% of national budget(2). Kathmandu, the chosen research field, has a diverse population. Contrary to rural areas - governmental accepted and not-accepted - healing professions coexist close to each other and have various opportunities to exchange. This research focused on the construction and composition of personal networks of doctors of Allopathy, informal and formal trained Vaidhya, Tibetan medicine physicians and shamans in this unique setting. The methodical approach was based on the “ Concurrent Embedded Strategy” by Creswell et al. (2014)(3). Questionnaires and qualitative interviews were used complementary to collect information about attributes and relations of healers, focusing on the referral of patients and the exchange of resources. Explications of the construction and composition of the personal networks were supplemented by including the given societal, economic and political context and implications for the network-actors.  

Changing Patterns of Vitality in the Postmodern Times: Discussing “the Organs without Bodies” through Nikolas Rose’s Theory of Molecular Biopolitics

Nihan BOZOK (Middle East Technical University, Turkey) | nihanmortas@hotmail.com

Medical knowledge is being reshaped in the postmodern times; so, the body, life and death are being reconstructed. Contemporary medicine is the specialist of replacements. People can give to each other blood, kidney, a piece of lung and tissues. Via these exchanges the borders between bodies become permeable and current medicine interknits the bodies, deaths and lives of humans. Artificial limbs placed in the body multiply wildly, so the distinctions between mechanics, synthetic and organic disappear. A part of vitality can be printed, similar to printing a text, via bio-printing technology. Thus, the distinctions between born and made, between natural and artifactual vanish.

In order to read these changing patterns of vitality peculiar to postmodern times, one of the leading post-Foucauldian theoreticians Nikolas Rose offers the concepts of “molecular biopolitics” and “molecular body”. Through his theory, in this presentation, I will discuss new arts of governments unique to molecular body, whose components are storable, movable, replaceable and demountable. Especially concentrating on organ transplantation therapy, I will argue that there are four prominent ruptures in the field of medicine in the postmodern times. Firstly, postmodern medicine does not imagine the body as something biologically given, contrarily it sees the body as something remouldable. Secondly, postmodern medicine transforms death into an event that is able to be experienced by individuals piece by piece. Thirdly, through operating in the conditions of current global capitalism, postmodern medicine transforms vitality parts into commodities. Fourthly, postmodern medicine gives new lives to the organs circulating without bodies.

Biobanks and human bio-objects: challenges in the healthcare sector

Brígida RISO (Centre for Research and Studies in Sociology - University Institute of Lisbon, Portugal) | brigida.riso@gmail.com

The systematic storing of human biological samples in biobanks has increased in Portugal and worldwide. The creation of the UK Biobank and the phenomenon of deCode Genetics in Iceland are paradigmatic cases which have led to a widespread discussion in Europe about ethical, legal and social issues concerning banks of biological samples and genetic databases. In Portugal biobanks are mainly focused on forensic, medical diagnosis and therapeutic purposes. Biobanks specifically dedicated to clinical research and health innovation are residual, and the lack of a legal framework makes it difficult to map and identify these banks. These kinds of units, usually closely connected with high level medical training, research and development, have human biological samples as their study and work object. Even though the participation of other health and non-health professionals in laboratories is demanded, the medical profession still dominates – leading and coordinating all clinical research in this domain. Biological samples are collected in a voluntary basis, from ill and healthy donors. A great belief in science and in the future possibility of eradicating many of the existing diseases are some of the reasons for the increasing expression of research-focused biobanks. If, on the one hand, the
possibility of donation a sample demonstrates one’s power over its own body, on the other, donating defies the concept of property and the ways of managing the individual biological heritage.

These biological products gain an autonomous existence and identity, different from those of the human individual who has given the sample. The sample identity is particularly given by codification and organization systems, obeying to clinical research criteria, which are conditioned by social, moral and political norms. The laboratory procedures scrutinize samples under advanced technologies, to remove the impurity and danger of sample’s manipulation, promoting tumours and surgical waste into objects of science and health innovation.

The equation of time-space of corporeal viability is challenged. Medical diagnosis could be as premature as the first cells of a new individual are generated in the mother’s womb, while the conservation and replication of human living samples could occur long after the individual’s death. Moreover, medical procedures are reaching deeper than ever before, the diagnosis moves from the body surface to the inner body, surpassing the precision of advanced imaging exams. The medical gaze is now focused in a profound analysis of the body – genes, cells and nano entities are enough to produce a medical diagnostic, in certain cases.

Attachment and detachment logics between the sample and the original individual body can coexist. The self and the body can exist simultaneously in distinct times and places. In this sense, the vision over the body is fragmented: the body is likely to be a source of object-samples, which are not sufficient to reconstruct or rescue the integral body or the integral individuality. The borders and the boundaries of the body are likely to be more unclear and indefinite, and the frontiers between public and private are also blurred.

All of these procedures are part of a broader process of bio-objectification of the human biological samples. From samples collecting to storing, to the existent legal and political structures that regulate the clinical research, each of these procedures contributes to the complex transformation of a simple sample into a human bio-object.

In these contexts, how is the relationship between body, health and illness reconfigured? Based on the hypothesis upon which the constitution of human bio-objects is a process mediated by social relationship, promotes novel configurations of health and illness, this research is focused on the analysis of social relations and dynamics surrounding human bio-objects in the Portuguese health context. The aim is to understand how the bio-objectification process of human biological products is contributing to produce and reproduce biomedicalized notions of health, based in individual bodies but mostly outside of the human body. This study also aims to deepen the reflection on fundamental issues about human and social consequences of the uses of biological samples.

The exploratory nature of this research and the limited range of clinical research biobanks in Portugal demand an intensive approach in order to better understand the phenomenon, allowing the observation of interactions and moving processes, and also the observation of the symbolic organization of spaces. One biobank was considered as a base for this research. In a biobank, there is a set of professionals who interact and develop their practices, which structures complex representations of science and technology, medicine, body, health and illness. It was assumed these relationships might be more relevant where clinical research is the main goal, because the structures and practices are organized in a collective sense, to benefit a wider community and maybe all humankind.

Grounded in a health sociology perspective, this research explores how the collection and storage of these human biological samples in specific places for clinical research is generating novel ways to interpret and define body boundaries, new configurations of health and illness, and the design of sophisticated politics of life. The dimensions of health are connected in social, political and cultural structures and its biological dimension cannot be thought without the recognition of this complex and multidimensional scope.
Life in Plastic – It’s Fantastic? Milieu-specific Perspectives on Aesthetic-plastic Surgery between Health and Illness
Julia WUSTMANN (Ludwig-Maximilians-University Munich, Germany) |
Julia.Wustmann@soziologie.uni-muenchen.de

According to an annual study published by the International Society of Aesthetic Plastic Surgery more than 11 million aesthetic-plastic surgical procedures were performed worldwide in 2013. This marks a current climax of a development which has been constantly rising for years. Furthermore this development coincides with an increasing visibility of the phenomenon aesthetic-plastic surgery. Whether through the attention of the media that these kinds of operations gain or through the advertisement of franchised clinic-companies for aesthetic-plastic surgery in everyday life. These considerations lead to the question why people, especially people who do not get operated, are caring and discussing aesthetic-plastic surgery? This question is currently being investigated in a qualitative research project about attitudes of nonsurgicals towards aesthetic surgery. Therefore focus groups with everyday actors sampled by milieu were conducted. This paper wants to discuss first results and is therefore presenting the thesis that all group interpretations are unified in the problematization of common dichotomies between healthy and ill and, in connection to that, between physically and mentally as well as between necessary and possibly. Subsequently another remarkable result beyond this problematization is that there are several milieu-specific differences in the framing of aesthetic-plastic surgery which lead to several understandings of health and illness. Regarding this, different framings will be outlined, e.g. aesthetic-plastic surgery as a phenomenon of the evolutionary process or as an effect of capitalism. In view of this results the presentation wants to make a contribution towards the social construction of health and illness.

Othering Bodies: The relationship between obesity and stigmatization in media texts.
Gönül DEMEZ (Akdeniz University, Turkey) | gonuldemez@gmail.com
Meral TIMURTURKAN (Akdeniz University, Turkey) | meralgulkaya@gmail.com

The body, along with its physical and biological features of individuals, as a site through which socialization appears, is being turned into a practical space in where social power relations would appear as well. The presentation of the body and the meanings attributed to the body cannot be considered apart from social structure and power relations. Fat bodies, in that context, those have a significant market value within consumer culture are going beyond simply the expression of a physical condition and it is also under the influence of social, political and economic codes. Announcement of fatness as an illness in medical practice leads that it is being seen as physical defects and also as an illness needs to be cured. It brings about that fat bodies are subjected to othering and stigmatization in both medical and social practice. This study tries to interrelate between fatness and social exclusion with reference to Goffman’s definition of stigma. Goffman (1963) considers stigma as a critical factor in social interactions and suggests that it is determinative upon the attitudes and behaviors of individuals in the moments of interaction among individuals. Declaring stigmatized “fat” individual as an ill causes to positioning of that person into a different status group. Thus, predefined and stigmatized individual is being turned into a customer, by means of assurance of “curing” and “normalization”, of centers and specialists who work in that field, in short of market. In that study, the relationship between stigmatization and obesity will be scrutinized. In doing so, this study is based on analyzing of relevant texts of a daily mainstream newspaper.
Mothers’ empowerment and mothers’ burden – gendered aspects of parental vaccine refusal
Jaroslava HASMANOVA MARHANKOVA (University of West Bohemia, Czech Republic) | jmarhan@kss.zcu.cz

This paper focuses on the Czech parents who decided not to have their children vaccinated, despite the general acceptance of vaccination on the part of biomedical authorities and the formal sanctions leveled by the state. Twenty-three parents whose children were not vaccinated were interviewed and several participant observations were conducted at public lectures concerning immunization and on meetings of parent who actively take part in the debates against compulsory vaccination. This paper studies parental vaccine refusal as a process that is strongly gendered. It analyzes different roles mothers and fathers play in the process of decision-making concerning vaccination and subsequent negotiation with health authorities and how the gendered notion of the role of women and men in family is (re)constructed during this process. It shows vaccine refusal as a site of a new form of women’s agency. The health of themselves and their children have become in the descriptions of mothers a project on which each of them must individually work. This kind of discourse strongly empowers mothers in the process of evaluating risk, as it puts them in the position of the most important and capable actors while evaluation the information concerning vaccination. Those mothers challenge the authority of state and the system of medical expertise and actively (re)interpret expert information, creating their own "scientific credibility". Simultaneously, it extends the gendered work of mothering and place new demands on the mothers to became “guards” of their children’s health (who are superior to the authority of medical professionals).

Prenatal testing, social inequality and the apparatus of choice
Catherine MILLS (Monash University, Australia) | catherine.mills@monash.edu

At least in liberal democracies, the moral principle of reproductive autonomy has an unprecedented ascendency in the social, medical and political management of reproduction, especially in regards to prenatal testing and related decisions about selective termination. Focusing on the context of obstetric ultrasound, I show that notions of choice are deployed in various ways, to differentially cast women as responsible moral agents – who are capable of informed decision-making and bear primary moral culpability – or as fundamentally irresponsible, that is, incapable of informed decision-making but nevertheless culpable for their perceived (moral) failure. Furthermore, the apparatus of choice intersects with processes of medical normalization in prenatal care in complex ways, evidenced in discussions of termination of pregnancy on the basis of foetal abnormalities. The apparatus of choice operates as a means of retreat from ethical complexity, and obfuscates the ways that social norms and other socio-economic conditions shape which decisions appear as possible and which do not. In this way, the apparatus of choice operates differentially to reinforce social inequalities and differences in social capital in regards to both pregnancy and the medical institutions that strive to manage it. It can also reinforce discriminatory attitudes and norms that restrict the range of bodies that appear as livable in the social field. The arguments made in this paper draw on qualitative data collected in Australia in a project on the effects of obstetric ultrasound on the experience of pregnancy and moral conceptions of the foetus.
Unbearable responsibility for bearing: the health professionals’ perspective
Anastasiya NOVKUNSKAYA (European University in Saint-Petersburg, Russian Federation) |
a.novkunskaya@gmail.com

Current neo-liberal reforms in Russia, catalyzed by the economic and political crisis, are modifying not only organizational and material arrangements of the public health. Rules and practices of interactions between patients, doctors and state are being transformed on the both, institutional and interpersonal levels. As a consequence, responsibility between main actors in this field is being redistributed. In particular, while Russian state cuts down financing of the public health services, patients and medical institutions are expected to be more involved into health promotion and provision both, materially, technically and morally. Enhancement of possibility of choice for patients and growth of economic and organizational autonomy for medical institutions both have contradictory consequences. The issue appears, do they possess enough resources to accept and bear such responsibility?

The purpose of this article is to examine how representatives of the reproductive health services problematize responsibility for it, to what agents they attribute it and how they enact their accountability obligations within their professional practice. According to this aim, the qualitative methodology, as the most sensible for individual perspectives, rather than formal evaluations, was applied to collect and analyze empirical data. Given research was conducted with application of case study strategy. As a case was treated a system of three governmental antenatal clinics, one gynecology department and maternity home, which aim to promote women’s reproductive health, in one Russian district center (Central Federal Okrug).

Focusing on specific case of medical attendance for child bearing and reproductive health in Russia, this paper will provide the investigation of how health professionals in Russian maternity homes and antenatal clinics evaluate current social changes. Basing on the data, collected from in-depth interviews with obstetrician-gynecologists and participant observation in antenatal clinic, conducted in 2011-2012 and in 2015 years in one of the Russian small towns, the problem of responsibility for the reproductive health will be examined. In particular, the main agents of responsibility for the individual reproductive health (and successful childbirth as a result) will be described from the health professionals’ point of view. Furthermore, The purpose of this article is to examine how representatives of reproductive health services define responsibility for it, to what agents they attribute it, and how they enact their accountability obligations within their professional practice.

The analyzed material shows that obstetrician-gynecologists expect multiple agents to be responsible for successful child bearing. Among them the primary accountability for health perpetuation and amelioration is ascribed to the patients. Nevertheless, not all patients of reproductive health services are ready to take responsibility for their childbearing (from the doctors’ point of view). Most of them appear to be oriented on paternalistic model of interaction, expecting substantial governmental support and medical monitoring in the health provision. At the same time, in description of their own clients, doctors speak mostly about “irresponsibility”, denoting that patients’ practices do not correspond with professionals’ normative beliefs and expectations.

From the other side, government, and other state institutions are expected to bear considerable amount of responsibility for the citizens’ health as well. The main mission of state from the obstetrician-gynecologists’ perspective, is to provide structural conditions for interaction and bearing responsibility of all the other important actors. Moreover, the field of reproductive health, in particular, is defined as more problematic than any other, since the current state social policy in this sphere has become explicitly paternalistic. As Russian social researchers claim, the modern gender order in Russia especially problematize reproductive sphere as the one, which provides nation’s reproduction and is of symbolical importance (Здравомыслова, Темкина, 2011: 25). Consequently, reproductive health appears to be especially moralized and
medicalized (Lock, 2004; Martin, 2001; Михель, 2010). Nevertheless, actual political measures, taken by state in the social and medical sphere are assessed by health professionals as insufficient and inadequate to the mission claimed. Eventually, from the doctors’ perspective, currently no one from the main social actors in the field of care for pregnancy and birth are capable to bear responsibility sufficiently.

At the same time, doctors and other medical personnel are believed to be the main experts in this field and share a significant extent of authority and, therefore, responsibility, which is treated as imputed or assumed obligations to care for maintenance, promotion and treatment of reproductive functions. However, since ambiguity of institutional rules in Russian public health is exacerbated by the current liberal reforms, medical institutions and health professionals become vulnerable to the both, economic and administrative deprivation. Health professionals appear to be charged not only with compliance with determinate medical algorithms of observation and treatment but with complicated bureaucratic order as well. This impedes bearing their own responsibility for the reproductive health, as managerial and administrative operations take most of the time and energy obstetrician-gynecologists possess.

As a result the doctors consider their patients to be the main agents of responsibility for reproductive health. Besides, they also mentioned the government, pharmaceutical companies and the patient’s social environments as such. Obstetrician-gynecologists admitted that they are responsible for the reproductive health too, although the management and arrangement of the public health services prohibit them from performing their professional responsibility in full. Thus, the paper suggests, that the sphere of reproductive health from the medical professionals’ point of view is characterized by the lack of other social agents’ responsibility and multiplicity of impediments to performing their own obligations and commitment.

Risk perceptions, professional powers and emerging actors in planned home births in Portugal
Mário J. D. S. SANTOS (CIES - University Institute of Lisbon, Portugal) | mariojdssantos@gmail.com

The contemporary option of an out-of-the-hospital birth confronts different risk perceptions, plays with powers and knowledge with different levels of legitimacy, and questions formalised professional and organisational dynamics. In a previous research conducted in 2012 on the experiences of home birth in Portugal, planned home births revealed to be part of a wider reflexive search for a sense of identity coherence, where medicine loses its centrality and part of its power. Home birth can be seen as an anti-obstetrics manifesto, as it symbolises the rejection of the context and the technology which are in the origin of this medical specialty. In fact, each hospital ward illustrates typical forms of exercising medical knowledge and medical power. Following Foucault, hospitals can be seen as a medical and medicalising panoptic, with a
structure that allows a permanent and conscious visibility status which assures an automatic exercise of power. Home birth, however, escapes this medical panoptic and demands a wider sociological look into the social mechanisms of power relations and knowledge circulation. At home there is an unstable background of informalities where, nevertheless, there are persisting elements of medical rationality. Despite the relevance of the literature published around pregnancy, childbirth and motherhood within the social sciences, there is little literature dedicated to a critical theory of maternity and even less specifically addressing home births. Regarded as a social phenomenon, home birth has enough empirical relevance to sociology and, in particular, to the sociology of health: (1) it is a paradigmatic case of reaction to medicalisation and to institutionalised obstetric practices; (2) framed by the theories of modernity, it emerges as a reflexive rejection of the medical hegemony, through a personalised mobilisation of medical and non-medical resources; (3) it can be viewed as a process of gender re-appropriation for pregnant women, midwives and emerging actors, like doulas, throughout the pregnancy experience and the dynamics of professional assistance before, during and after birth; and (4) it can be regarded as a particular field of professional interaction, where different actors define their own regions of knowledge and power, mostly without a formal organisational or institutional support. The previous research brought new insights regarding the first two points. This new research, recently started, is focusing on these last two, concerning the professional dynamics surrounding home birth in Portugal, where, like many other South and East European countries, informal networks and a lack of regulation are characteristic of home birth assistance. The relationships established between pregnant women and their families, midwives, obstetricians and doulas are dynamic relations shaped by risk perceptions and trust. If, in ancient times, birth happened within the feminine circle of care, the transition to modernity was marked by professional tensions that have been shaping childbirth care. Nowadays, in Portugal and in several European contexts, midwives and nurse-midwives share with the obstetrician a set of formal competences regarding the assistance of normal or physiological birth, framed mainly by scientific knowledge. Nevertheless, there are permanent tensions suggesting active dynamics of professionalisation and closure. How do all these actors interact, communicate and work? How do doulas and midwives define their boundaries? Do these actors search for the legitimation of their practice through scientific objectivity? Is home birth promoting the professional closure of nurse-midwives and midwives, with the definition of technocracies? Which trajectories shape the professional socialisation of nurse-midwives who are trained in the hospital and biomedical model but decide to assist home births? And knowing that obstetricians are relevant actors, in some settings, during antenatal care and even at birth, how is the doctor-patient relationship configured, and which elements can be found in the medical discourse on home birth? This research aims to analyse home birth as the front-stage of professional interactions, in order to identify which actors, professional and non-professional, are part of the set of resources mobilised during pregnancy and birth; to observe the features and dynamics of the informal networks of support and assistance; and describe and characterise the strategies of power-knowledge of these different social actors. The diffuse distribution of this phenomenon called for the use of multi-sited ethnography, in order to catch the continuities and connections within the informality, the privacy and the lack of regulation. Beyond the academic and sociological relevance of this research, it is expected that recognising this social dynamics can have a wider social impact at the national level, by informing the definition of maternal health public policies which are sensitive to the invisible but relevant reality of home birth.

RN16S09 - Medical Technologies & Reproductive Health Services
Does social policy work (and how)? An examination of European social policy influences on breastfeeding initiation and duration among European mothers.
Karen VANDERLINDEN (Department of Sociology, Ghent University, Belgium) | karen.vanderlinden@Ugent.be
Bart VAN DE PUTTE (Department of Sociology, Ghent University, Belgium) | bart.vandeputte@Ugent.be

BACKGROUND Breastfeeding is typically considered the preferred feeding method for newborns worldwide. However, the topic remains understudied in social sciences, especially with regard to its determinants at the macro level. To our knowledge, this is the first paper to attempt health comparative research regarding different infant feeding decisions in Europe, and even worldwide. Several distinct social policy types are examined: welfare state regimes, maternal leave regulations, breastfeeding friendly hospital initiatives (BFHI) and adherence to the Code (of marketing of breast milk substitutes).

OBJECTIVES We first assess the relation between each social policy type regarding inequalities in breastfeeding initiation and duration separately, then disentangle its different effects combined. This allows us to determine the most dominant policy influences, and possibly detect different patterns, for breastfeeding initiation and duration respectively.

METHODS Based on Eurobarometer data, we perform several linear and logistic multilevel analyses. To conceptualize these different social policies, we use indicators provided by both UNICEF and the World Health Organization (WHO).

RESULTS Initial results show significant differences of the distinguished European social policy types between breastfeeding initiation and duration. A substantial proportion of variance is situated at the country-level. Furthermore, policy directly related to breastfeeding culture, such as BFHI and the Code, shows strong positive association with breastfeeding initiation and duration.

DISCUSSION We suggest possible explanations and set a direction for the inclusion of social (care) policies in further research on breastfeeding. We also emphasize the importance of conducting comparative health research when examining infant feeding decisions and practices.

“Nobody wants a public debate about abortion”: Can fetal futures be imagined as anything other than an individual undertaking?
Niamh STEPHENSON (University of New South Wales, Australia) | n.stephenson@unsw.edu.au

Ideally, the new use of health technologies involves collective decision-making about their implications and regulation. However, as the routinisation of obstetric ultrasound unfolds it is marked by the absence of public discussion, in Australia at least. New and expanded uses of obstetric ultrasound are led by practitioners and industry, and government regulation has a limited role in enabling, shaping or curtailing developments in the field.

This paper explores how the absence of public discussion relates to a key tension that arises in the practice of obstetric ultrasound (drawing on interviews with pregnant women, sonographers, specialist obstetricians, counselors, researchers and policy makers about obstetric ultrasound). Health professionals repeatedly demarcate their role (of information and service provision) from the parental responsibility to make informed decisions about fetal futures; a demarcation typically underpinned by health professionals’ insistence on “a woman’s right to choose”. At the same time, there is a common lament about how ill-prepared prospective parents are for prenatal testing. However, professionals rarely describe the way to address this as a matter of increasing collective discussion; rather they identify a need for improved clinical communication. There is a ready explanation for keeping the discussion about fetal futures anchored to the clinic, voiced at times by our participants: “nobody wants a public debate about abortion”. Given
the background of political controversy over abortion law, this paper will examine the ways in which professionals involved in obstetric ultrasound navigate, avoid, or try to stimulate and participate in public discussion about abortion.

“Women on the countdown”: experiencing Assisted Reproductive Techniques (ART) in the Spanish public healthcare system
Beatriz MAÑAS (UNED (National Distance Education University), Spain) | bmanas@poli.uned.es

The aim of this paper is to improve our understanding of the experiences and perceptions of women undergoing ART treatment. This research involved the study of patients from the Spanish region of Castilla-La Mancha’s public healthcare system. We have applied a qualitative methodology based on discussion groups and discourse analyses. The analysis has made it possible to discover multiple dimensions in which these women’s lives are affected, not only by the treatment they are undergoing, but also by the decision to start it.

One of the most important elements is the influence of time and age perceptions on these women’s plans for their lives, as this deeply modulates their gender self-concept. Undergoing treatment confronts women with a whole universe of popular knowledge about reproduction and fertility and, at the same time, it transforms the way they live their sexuality, which from this moment on follows guidelines set down by doctors, which affects the relationship with their partner. Finally, the opportunity to carry out this research at a public healthcare institution has let us observe these women’s experiences as public healthcare users, not only in comparison with the private system, but also revealing functional problems which, in the end, could have consequences for the success of the treatment.

In short, this research can contribute relevant information, not only for the sociological field, but also to enrich the knowledge of those healthcare professionals who work with this group of patients on a daily basis.

The role of NGOs in field of reproductive health care in Poland
Krystyna DZWONKOWSKA-GODULA (University of Lodz, Poland) | krystyna.dzwonkowska@gmail.com

Reproductive health care should provide among others access to safe, effective, affordable and acceptable methods of fertility regulation and safe motherhood (antenatal care, delivery care, and postpartum care). Unfortunately reproductive health care system in Poland doesn’t respect the needs of women. There is no sexuality education, no universal access to contraception, very restrictive abortion law and limited access to legal abortion (because of conscience clause). Women giving birth are not provided with sufficient level of medical care (e.g. lack of free anesthetization during childbirth), they suffer and feel humiliated (medicalisation of pregnancy and childbirth). The problem is an inequality in realization of reproductive rights among Polish women from different socio-economic groups.

Above mentioned problems are a challenge for NGOs in Poland. The aim of paper, based on analyzing existing data, is to study an activity of two of them: Federation for Women and Family Planning and Childbirth with Dignity Foundation. It focuses on objectives of both organizations, forms of action and effects. Their activity covers different areas of reproductive health care in Poland such as: law-making, monitoring of observance of patients’ rights (right to dignity, information, privacy, informed consent), interventions in the cases of denial of access to reproductive health services, control of public institutions: ministry, hospitals (a role of watchdog), sexuality education, education of healthcare professionals, raising awareness and disseminating information about issues related to reproduction, conducting media campaigns.
Both NGOs are a good example of collective social actors that can contribute to positive change in health care system.

**RN16S10 - Health and Illness in Mediterranean Countries: Present Challenges and Future Developments**

**Ethnicity, gender and health professions: the Arab minority in Israel**

Ariela POPPER-GIVEON (David Yellin Academic College, Israel) | arielapo@netvision.net.il
Yael KESHET (Western Galilee Academic College) | yaelk@wgalil.ac.il
Ido LIBERMAN (Western Galilee Academic College) | idol@wgalil.ac.il

An intersectionality approach that addresses the non-additive influences of social categories and power structures, such as gender and ethnicity, is used to further understand the complexity of health inequities. While most researchers adopt an intersectionality approach to study patients' health, in this lecture we exemplify its usefulness in studying underrepresentation in the health care workforce. Our research objectives were to examine gender patterns of underrepresentation in the medical profession among the Arab minority in Israel. We used both quantitative and qualitative methodologies. The quantitative data were obtained from the Labor Force Survey conducted by the Israeli Central Bureau of Statistics. The qualitative data were obtained through ten in-depth interviews with Arab physicians working in Israeli hospitals. We found that health professions are a sought-after and popular education and employment pathway among the Arab minority in Israel. Nevertheless, with respect to physicians, the Arab minority in Israel is underrepresented, and this is due to Arab women’s underrepresentation, particularly in medicine. Few possible explanations for these findings will be presented, including Arab women’s particular employment and educational patterns. Arab women are also expected to fulfill traditional gender roles and conform to patriarchal and collectivist values, which makes it difficult for them to study medicine. The small number of Arab women physician adversely affects the medical treatment given to Arab women in Israel. Using an intersectionality approach to study Arab women underrepresentation in medicine provides, therefore, a foundation for action aimed at increasing the number of Arab women physicians and reducing health disparities.

**Social determinants of health in the European periphery: A cross-sectional time-series analysis**

Sabine ISRAEL (University of Oldenburg, Germany) | sabine.israel@uni-oldenburg.de

Due to similar economic trends, individuals and households in the European periphery, that is the Central European countries (CEECs) and the Mediterranean Member States, are exposed to a comparable situation of lower wages and less expenditures on health and social protection (however on different levels). Reports from these countries suggest that unmet medical needs, deprivation, arrears and mortgage payment difficulties are health risks which increased in particular in the crisis period. These European issues are likely to have an impact on health as they put individuals with low resources in a situation of physical and psychological discomfort. The purpose of the presentation is to set out in how far Mediterranean and Eastern European countries show similar or divergent trends in health and their social determinants. This is done on the basis of cross-sectional time-series analyses of EU-SILC data comparing health status and social determinants of health from before (2005-2008) to the within crisis (2009-2012) period.
The study observes that more than the Mediterranean countries, impacted by the Eurozone crisis, the Baltic countries show an increase in the degree of bad health. In particular the take-up of healthcare services has declined for poor individuals due to monetary reasons, bringing about unmet medical needs. Material hardship (difficulties to adequately warm one’s home, afford a substantial meal and other usual expenses) and psychological burdens on health from arrears are however a more important determinant of health in the Mediterranean countries.

“Like penguins in the desert”: families with intellectually disabled children dealing with the economic crisis.
Alice SCAVARDA (University of Torino, Italy) | alice.scavarda@unito.it

The recent economic crisis in Italy has had a major impact on health services, which have been consistently cut back, in order to limit public expenditure. The mixture of a decreasing provision in public sector and a rapid development of private services, often expensive, produced social inequalities in the access to healthcare. This has recently affected disabled people, compounding families’ quality of life and diminishing the life opportunities of people with physical and mental impairments. However, for people with intellectual disabilities, barriers to therapeutic interventions may have consequences in terms of a limited improvement of their abilities, with the enduring presence of cognitive and behavioural problems that can prevent their social participation. Therefore, the current reduction of economic resources may undermine the equality between able and disabled people, jeopardizing the acquirements and the rights obtained in the past.

The paper produces the findings of a qualitative study, based on about 60 in-depth interviews to families with Down and autistic children, underlining both the efforts to make the most of the potential of their children, in spite of the lack of public aid, and the strategies of resistance to this situation, in terms of collective action. These families seem to be responding to the welfare shortening by providing the services themselves, through associations, and by trying to find private solutions to the problem of independent living. This commitment to families’ resources, however, keeps producing social inequalities.

Sociology in studies on accessibility: A case study on the accessibility of persons with motor disabilities to eGovernment in Spain
Marta AGUILAR GIL (University of Sevilla, Spain) | maguilar6@us.es
José María BLEDA GARCÍA (University of Castilla-La Mancha, Spain) | jose.bleda@uclm.es
Rafael CONDE MELGUizo (ESNE - Centre of Design, Innovation and Technology, (University of Rey Juan Carlos)) | rafael.conde@esne.es

Spanish law 11/2007, on Electronic Access of Citizens to Public Services -LAECSP- (BOE, 2007), establishes the obligation to guarantee that all Spanish citizens have the means to carry out all transactions with public administration electronically under conditions of equal access. In this work, we identify the barriers to persons with spinal cord injury and cerebral paralysis. We provide evidence on how accessibility solutions and/or universal design are not enough to permit their access to eGovernment on an equal footing with other citizens. Public policies designed to implement Act 11/2007 on Electronic Access to Public Services by citizens, LAECSP (BOE 2007) must include social interventions with these groups, in addition to work on technology.

RN16S11a - Health Inequalities: Miscellanea
The meritocratisation of mental health disparities: fact or myth.
Pieter DUDAL (University of Ghent, Belgium) | pieter.dudal@ugent.be
Piet BRACKE (University of Ghent, Belgium) | piet.bracke@ugent.be

Educational differences in mental health are among the most consistent findings in the sociology of health and illness. By consequence, scholars paid considerably attention to educational inequalities in the prevalence of depression. Despite earlier recommendations to investigate absolute and relative inequalities at the same time, this has not been conducted for depressive symptoms in a cross-national setting. This paper tries to fill this gap by examining both measures of educational mental health inequality using data on depressive symptoms from the 3th and 6th round of the European Social Survey. Analysis are based on respondents aged between 25 and 90 in 21 European countries. Results indicate that there are substantial educational inequalities in the frequency and severity of depressive symptoms. Moreover these inequalities vary between countries: cross-national variation is observed for both inequality measures. Additionally, we investigate whether these inequalities are influenced by income-related factors. Results show cross-national variation in the direct and indirect effect of education on the prevalence of depression.

In conclusion, comparative research needs to uncover the institutional context that renders schooling relevant for mental health. It seems that, as concerns the mental health outcomes, meritocratic society is a fact in some, but a myth in other contemporary European countries.

Social capital and mortality in Finland: a prospective study
Timo ANTTILA (University of Jyväskylä, Finland) | timo.e.e.anttila@jyu.fi
Tomi OINAS (University of Jyväskylä, Finland) | tomi.oinas@jyu.fi
Jussi TANSKANEN (University of Jyväskylä, Finland) | jussi.o.tanskanen@student.jyu.fi
Tomi KANKAINEN (University of Jyväskylä, Finland) | tomi.k.kankainen@jyu.fi
Petri RUUSKANEN (University of Jyväskylä, Finland) | petri.ruuskanen@yfi.jyu.fi
Jouko NÄTTI (University of Tampere, Finland) | Jouko.Natti@uta.fi

Social capital refers to various levels of social relationships formed through social networks. Previous studies have shown that social capital reduces mortality. Social capital scholars have begun to distinguish different functions of social capital according to their context. Typically researchers separate bonding and bridging social capital. Bonding social capital refers to trusting and cooperative relationships such as relations with family and close friends, and respectively bridging social capital refers to relationships of respect and mutuality, such as associational memberships.

The data consists of a representative Finnish Living Conditions Survey (FLCS) conducted in 1994, which has been combined with register-based follow-up data on mortality from Statistics Finland covering the years 1994–2011.

The relative risk of death was examined by conducting Cox proportional hazards analyses. The results were adjusted for background (health, gender, level of education and family situation). According to preliminary results various measures both of bridging and bonding network capital were associated with decreased risk of mortality.

Health Inequalities in Romania. The Key Role of Access to Health Services in Self-rated Health
Iuliana PRECUPETU (Research Institute for Quality of Life, Romanian Academy, Romania) | iuliana@iccv.ro
Cosmina Elena POP (Research Institute for Quality of Life, Romanian Academy, Romania) | cosminapop@gmail.com

Romanian population has a poor health status in comparison to population in other European Union countries. Indicators like life expectancy at birth, general mortality rates, infant mortality rate or morbidity rates place Romania among the lowest rankings in the European Union. When looking at subjective indicators, like self-rated health status, the same pattern is highlighted. Moreover, the country is confronted with high inequalities in the health status and previous research showed that the model of these inequalities is different in comparison with other European Union countries. The paper explores health inequalities in Romania by adopting a quality of life approach. The main goal is to understand the types of inequalities that are to be found between people in poverty (under the threshold of 60% of median income), those living in the immediate vicinity of poverty line and those having a high standard of living. The paper adopts a comparative perspective and thus compares Romania with other European Union countries in regard to the pattern of inequalities revealed by the data. The analysis is based on data coming from European Quality of Life Survey 2011-2012 (developed by European Foundation for the Improvement of Living and Working Conditions) and uses indicators like health status, satisfaction with health, long term disability and access to health. The data is analysed with the help of bivariate and multivariate statistical analysis. Descriptive and explanatory analysis includes individual and contextual factors contributing to inequalities. Results reveal systematic inequalities in Romania and a mixed picture of health inequalities in the other European Union countries.

A Sociological Investigation of Income inequality and Disparity in Infant Health Outcomes
Ahmad KHALILI (Slippery Rock University of Pennsylvania, United States of America) | ahmad.khalili@sru.edu

Exploring the relationship between socioeconomic conditions of the family and maternal-child health indicators provide an insight into pathways linking social inequality to the family health outcomes. Infant mortality rate (IMR) and low birth weight (LBW) are two important indicators of the health outcomes of family and community. Meanwhile, they can be interpreted as a sociological factor measuring socioeconomic status of a population. High IMR reflects unaffordability and inaccessibility of families to raise their infants. Despite a remarkable decline in infant mortality and low birth rate in the U.S. during the past decades, the inverse relationship between socioeconomic indicators and child health continues and is getting stronger. Furthermore, changes in health indicators have varied across geographic areas, socioeconomic groups, and racial groups. This study uses aggregate data to test the hypotheses that increasing income inequality has contributed to increasing health inequality between states, within states, and across social groups. In this study, the relationship between major components of infant mortality, low birth weight, and social indicators are examined within an ecological framework in which the primary analytical unit is the state and subareas within the states. This study is an updated of my previous study in which I have identified subareas within the states and divided the population by high-, low-, and medium-income areas within each state. I choose state as a unit of analysis to identify changes in resource allocation including education, primary care, and related indicators. Dependent and independent variables have been identified. A factor analysis is performed to examine the relationships between variables. It is hypothesized that the intensity of the decline of child health indicators varies by place, time, and among social groups. The data from 50 states has been updated and were obtained from census and Vital Statistics between 1995-2012.
RN16S11b - Health Inequalities: On the Effects of Educational Disparities

Do cohort patterns matter? A hierarchical age, period, cohort analysis of the educational gradient in self-rated health
Katrijn DELARUELLE (Ugent, Belgium) | katrijn.delaruelle@ugent.be
Veerle BUFFEL (Ugent, Belgium) | veerle.buffel@ugent.be
Piet BRACKE (Ugent, Belgium) | piet.bracke@ugent.be

Recently, researchers have been illustrating the necessity of taking cohort effects into account when examining age trajectories in the education-health relationship. With regard to age differences, two hypotheses are put forward: the cumulative advantage hypothesis predicts that educational disparities in health grow with age; and the age-as-leveler hypothesis that expects a decline in the education gap throughout life. An even more recent addition to the health-education field is the assumption of widening educational disparities in health across cohorts (rising importance hypothesis). Despite the importance of these theoretical perspectives, empirical studies taking both insights into consideration are scarce. The present study aims to contribute to this field in two important ways: (1) methodologically, by using a hierarchical age-period-cohort analysis (H-APC), under the assumption of certain period effect restrictions and (2) theoretically, by questioning the rising importance hypothesis. We use a subsample of individuals aged between 25 to 85 years old (N = 233045) from 32 countries in the European Social Survey (2002 – 2012). The analyses lead to two important conclusions. First, we find support for the cumulative advantage hypothesis. Second, we find contra-evidence for the rising importance hypothesis. The latter finding is particularly interesting. The diminishing relevance of education for health raises concerns about potential barriers to education as a vehicle for empowerment and the promotion of health.

Trend in the educational gap in birth outcomes in the Czech Republic
Martina STIPKOVA (University of West Bohemia, Czech Republic) | marsti@kss.zcu.cz

There is a large and persistent gap in birth weight between newborns of women with low and high education in the Czech Republic. However, its size varies by time. The proposed paper aims to explain the variability in the educational gap in birth weight. Two factors are hypothesized to influence it, the variation in life conditions and health care. The first explanation supposes that economic uncertainty elevates stress and worsens life conditions of mothers and thus influences birth weight negatively. The effect should be larger for children born to mothers with less education, because they are more vulnerable at the labour market. The second explanation reflects the fact that the number of births temporarily elevated because large cohorts of women reached childbearing age. It expects that when more mothers crowd for health care, its quality may suffer and lead to a worse birth outcome. I suppose the impact to be stronger among the less educated women who have fewer resources (of various kinds) to compensate for the crowding effect. The analysed data come from the national birth register and cover period between 1990 and 2014. Preliminary results support the hypotheses only partially. As expected, the effect of life conditions, approximated by unemployment rate, is stronger for children born to less educated mothers. Contrary to the expectation, the effect of the quality of health care, measured by the number of mothers per beds in maternity hospitals, is only present among children of mothers with secondary and tertiary education.
Capital interplays and the self-rated health of young men: Results from a cross-sectional study in Switzerland

Gerry VEENSTRA (University of British Columbia, Canada) | gerry.veenstra@ubc.ca
Thomas ABEL (University of Bern, Switzerland) | abel@ispm.unibe.ch

We apply capital interplay theory to health inequalities in Switzerland by investigating the interconnected effects of parental cultural, economic and social capitals on the educational trajectories and health of young Swiss men who live with their parents. Specifically, we apply logistic regression modelling to self-rated health in original cross-sectional survey data collected during mandatory conscription of Swiss male citizens in 2010 and 2011 (n=23,975). In comparison with sons whose parents completed mandatory schooling only, sons with parents who completed technical college or university were significantly more likely to report better self-rated health scores. Parental economic capital was an important mediating factor in this regard. Number of books in the home (parental cultural capital), family economic circumstances (parental economic capital) and parental ties to influential people (parental social capital) were also independently associated with the self-rated health of the sons. Although sons in the highest educational stream tended to report better health than those in the lowest, we found little evidence for a health-producing intergenerational transmission of capitals via the education stream of the sons. Finally, the positive association between personal education and self-rated health was stronger among sons with relatively poorly educated parents. Specifically, among respondents whose parents had completed mandatory schooling only, the odds of sons reporting very good/excellent health were 2.25 times as high for sons in the grammar school stream compared to sons in the mandatory schooling stream. The same odds ratios were much smaller among respondents whose parents completed university. Our study provides empirical support for the idea that capital interplays play an important role in the intergenerational production of health in Switzerland.

Health-related returns to education of migrants in Germany

Johann CARSTENSEN (Friedrich-Alexander-University Erlangen-Nuremberg, Germany) | johann.carstensen@fau.de

A substantial amount of research has explored the differences in mortality (the healthy migrant paradox) and morbidity of migrants and the autochthonous population. Former studies addressing this point find different results according to the outcome measure (morbidity vs. mortality). This work tries to shed some light on the mechanisms, leading to differences in health outcomes.

Education is one important determinant of one’s health. However, it is still unclear if this is due to the effects of educational certificates and their effect on resources such as the socioeconomic position or if higher education leads to better health behavior through competencies and knowledge. Earlier research for Germany shows that migrants have problems to fully capitalize their education on the labor market. Foreign certificates of education and academic degrees are often not acknowledged, leading to a discrepancy between competencies and employment. In this paper the question is addressed, whether migrant’s morbidity differs from those of the autochthonous population, and especially if there is a different effect of education on health status. The focus lies on the question whether devalued education from the country of origin can be transferred into better health, or if the devaluation affects the usability of education for health purposes. The answer to this question could illustrate if the mechanism of the effect of education on health functions due to certificates and thus better resources, or competencies and their beneficial effect on health behavior.
Which care means inclusion? A sociological discussion on care and social inclusion in mental illness

Joana ZÓZIMO (Centro de Estudos Sociais - Universidade de Coimbra, Portugal) | joana.zozimo@gmail.com

Historically, treatments of mental illness have been associated to ways of controlling both the symptoms and the individuals suffering from them, frequently leading people with mental illnesses to a state of little responsibility for their actions, whether in their everyday lives or in crucial moments of managing the disease (Goffman, 1991; Porter, 2002). Yet, there have also been several attempts to return individuality, agency and self-determination to these people, for example the anti-psychiatric (in Europe) and mental hygiene (in the USA) movements in the twentieth century, but with some hard consequences for many of the deinstitutionalised people who came into communities almost deprived of material or symbolical infrastructures to welcome them. Also, the psychopharmaceuticals revolution in the 1950’s has pledged the opportunity of treating mentally ill people outside the hospitals or other similar institutions and, as the chemical vest would turn the material one into an obsolete practice, it would guarantee a more independent and inclusive life. However, persistent problems in the social inclusion of people with experience of mental illness (Hespanha, et al. 2012; Fontes e Portugal, 2013), in our contemporary societies, expose a persistent deficit of self-determination and citizenship opportunities available to them, with great individual, economic, and social consequences. Recent studies have stressed the burden of mental conditions namely in western societies, as unipolar depression is expected to be among the three leading causes of burden of disease by 2030 (WHO, 2008). Portugal, unlike the other European southern countries, has the highest prevalence of psychiatric illnesses in Europe, alongside with Northern Ireland (Caldas de Almeida e Xavier; 2013), and an incomplete mental health reform that placed the responsibility for deinstitutionalization mainly on the shoulders of the families. Therefore, added to the goal of decreasing the treatment gap, it is also urgent to aim at the usefulness gap – i.e. the proportion of mentally ill people who are not able to conduct a useful and meaningful life in their communities - and rethink the types of care provided, also according to their potential of emancipation and autonomy.

Medically, mental illness is construed, at least to some extent, as a neurological condition, i.e. situated in the brain, and socially, this perspective on mental illness has disseminated in contemporary western societies through the medicalization process (Zola, 1975; Conrad, 2007), which has a great impact in the social and individual identity of people diagnosed with these conditions. As Rose (2007) poses, contemporary individuals are envisioned as neurochemical selves – their personalities and selves seen as a product of their neurological, neurochemical reality. Since mental illnesses compromise the ‘brain’, culturally represented as the organ governing a person’s self and individual behaviour, they imply, as chronic diseases, a profound work of identity reconstruction (Bazsanger, 1986; Bury, 2000). Social representations of personhood, social usefulness and reliability, in contemporary western societies, are bonded to the mental abilities of memory, concentration, rationality, and stability and thus somewhat denied to people diagnosed with mental illness, especially in advanced stages. As frequently noted in sociological literature, mental illness has profound social and individual impacts as it produces ‘spoiled identities’ (Goffman, 1990): their symptoms are seen as categories of a neurological malfunction that causes unreliable behaviour and personalities. Acknowledging the crucial importance that the psychiatric and pharmaceutical models assume in explaining and treating mental illness in the western world, I wish to contribute to the
understanding of how people suffering from these types of illnesses, their families, and their therapeutic agents, see the mediating effect of medication on the biographical trajectory of people with mental illness - both in their daily life and their social and personal identities. However, as other types of care are also important in managing mental illness, I thus intend to discuss the relation between the pharmaceutical strategy of care and other strategies of care, and their influence in self-image and social inclusion.

This paper is an output of my PhD research project “Trajectories of care and inclusion: a sociological study on the meanings and senses of different therapeutic strategies for dealing with mental health”, which aims to make sense of the narratives of the central actors involved in care networks - people with mental illness and their therapeutic agents (whether professional – official or alternative, or personal – family and significant others) – as for how the strategies of care in mental illness can be accounted for in a more inclusive life trajectory. Drawing from in-depth interviews conducted with people diagnosed with severe mental illnesses – schizophrenia and major depression, carried out in Lisbon, Portugal, in 2015, this paper focuses on their experience with mental illness and different care strategies. My approach stands from the perspective that, primarily, one must recover the social discourses of people diagnosed with a mental illness since they are the experts in their own experiences and should be the advocates of their therapeutic trajectories. It corresponds to a crucial stage of the research, as the typology of care/inclusion resulting from these interviews will guide the subsequent interviews with the care network.

Hence, based on the available literature and the in-depth interviews, I will discuss the impact of different types of care in the processes of identity reconstruction and in social inclusion, after being diagnosed with mental illness, paying special attention to (i) the sense and meaning of the diagnose; (ii) the meaning of different types of care and the resources and actors carrying it out; (iii) how diversified are the trajectories of care including alternative or unexpected therapeutic activities; (iv) what is seen as social inclusion; (v) the identified effects of care in managing the illness and easing social inclusion.

The purpose is therefore to discuss what care means, for which people are designed the different types of care, and which care is a mean for social inclusion? Socially, as mental illness prevalence becomes more and more evident it is crucial to problematize what kind of care is made available; sociologically, this paper furthers our understanding on the complex relation between mental illness, care and social inclusion, which have been seldom investigated in sociological tradition.

Mental handicap as disability and as a way of being human
Elzbieta ZAKRZEWSKA-MANTERYS (University of Warsaw, Poland) | ezakrzewska@isns.uw.edu.pl

The paper deals with questions of names which characterize some kinds of persons. These persons are named: mentally retarded, mentally handicapped or intellectually disabled. Just recently there occurred a new name: a person with intellectual disability. The use of each name has a special axiological and philosophical background. Political correctness causes that names which are stigmas are replaced with more neutral ones. The question is: what from came to use discriminative descriptions?

In the paper there are portrayed examples of segregative policy, which has been present in European countries and in the USA till seventieths of XX century. The consequence of this policy for intellectually disabled “patients” was that they were locked in big total institutions and were totally separated from the mainstream of social life. This situation caused that words describing these “patients” sanctioned their worse position in the society. Things have started to change after introduction in Western countries the policy of integration and social inclusion.

In the second part of the paper, the author undertakes considerations about meaning of words “disability” and “intelligence” and shows two contradictory understandings of the term intelligence. Then the author shows the consequences of these two understandings for a human being living in a contemporary social world.

In the conclusion the author shows that mental handicap doesn’t have to be treated as “lack” or dysfunction, but it can be – in accordance with the policy of diversity – treated as equal way of being human, different from humanity of statistical majority of citizens, but having its own specificity and beauty.

Using Health Capability approach to explore primary care for people with severe mental illness
Maya LAVIE-AJAYI (Ben-Gurion University of the Negev, Israel) | laviema@bgu.ac.il
Gilad GAL (Tel Aviv yaffo Academic College) | giladgal@mta.ac.il

Health capability approach (HCA) is based on Sen's theory that distinguishes between realized and realizable choices. According to this model, the gap between realized and realizable is derived from personal, social and environmental factors and determine services' and resources' use. While, the relevance of HCA to poverty-related inequalities has been increasingly acknowledged, the theory was not implicated with regard to health inequality associated with severe mental illness (SMI).

The shift from hospital- to community-based psychiatric services has increased the role of general practitioners (GPs) in the health care of persons with SMI. This paper is based on a qualitative research of in-depth, semi-structured interviews with 15 persons with SMI and 10
GPs, who discussed their health care experiences and the factors that may enable better interaction between both parties.

Personal and social factors affecting health capabilities of patients with SMI were revealed using HCA, among them were 1. Patient's level of functioning; 2. Social network and social capital; 3. Discrimination and SMI stigma; 4. Extent to which GP and health system interacts with individual to overcome barriers to access and utilization of services.

We therefore suggest Sen's capability approach as a useful analytic tool to understand health services inequalities in mental health. This approach allows for the consideration of structural conditions as well as people's capabilities to be active for their health.

**Rehabilitation as a boundary-field - between changing public, political and professional practices**

Marte FEIRING (Oslo and Akershus University College, Norway) | marte.feiring@hioa.no
Søren Gytz OLESEN (VIA University College, Denmark) | sgo@via.dk

Rehabilitation of disabled and chronic sick people is today attracting a significant professional as well as political interest: As a concept, it is linked to the rise of the modern welfare state and its policies. As a multi-professional practice, rehabilitation is regarded as a field under reconstruction - as well as a practice on the boundaries of the medical, social, educational, and political fields (Feiring, 2012). A number of agents have in their own way and with their own agendas contributed to the development of multi-professional rehabilitation practices in the Scandinavian welfare state. However, there are few studies of how rehabilitation, as what we will term a boundary-field, has been established as a multi-professional practice and as a policy discourse produced by the many agents in the field. The aim of this paper is theorizing on the changing relationship between the professional, the public and the political due to health and welfare reforms. Historically, it traces back to the early works of classical sociologists. The main ambition is to examine the contributions of sociologists of professions from the Chicago interactionist tradition including E. C. Hughes, E. Freidson and A. Abbott to the French ‘Theory of Practice’ as outlined by P. Bourdieu.

**Poaching to do the job: French mental health workers and financial uncertainty in psychiatric units**

Frédéric MOUGEOT (Centre Max Weber, France) | freric.mougeot@gmail.com

Since the early eighties, the implementation of financial management tools in French public hospitals has tended toward transforming the healthcare professionals’ mandate. Researches in this area suggest that these workers’ professionalism is directly impacted by the changes in management policies in a context of financial uncertainty.

Because they fear becoming “emptying beds workers”, psychiatric nurses try to protect what matters in their daily work. To succeed in maintaining their role, they poach (De Certeau, 1980) resources and subvert protocols. This ordinary life in the margins of organizational work generates knowledge and practices that questions the identity of mental health workers.
Based on a one year immersion in the daily work of nurses in psychiatric units as well as several interviews with mental health workers, this paper aims at contributing to a comprehensive approach of the appropriation of work in a context of uncertainty.

The transition from hospital to home based hospital cares and its consequences for the understanding of caregiving

Herve Alfred CAZENEUVE (IFROSS - Université Lyon 3, France; Centre Max Weber - CNRS, France) | herve.cazeneuve@univ-lyon3.fr
Yannick FOUQUET (TASDA, France) | yannick.fouquet@tasda.fr
Véronique CHIRIE (TASDA, France) | veronique.chirie@tasda.fr

The increasing pressure to reduce patient stays in European hospitals as well as the increase in chronic diseases has had numerous consequences, among which, the development of homecare. While its use for the care of elderlies and chronic diseases is well known, States are now pushing for its diversification toward patients suffering from more acute diseases and undergoing complex treatments. The development of home based hospital cares which are aimed at coordinating care happening at the patient home is a direct consequence of this trend, thus blurring the meaning behind being discharged for a number of patients.

This paper will focus on how the transition from hospital to home-based hospital care impacts the relationships between home care professionals, patients and their families. First, it will describe what happens behind the scene when the patient is released from hospital, and into the hand of home based hospital care professionals. Second, it will rely on the understanding of these events to give an interpretation of their impact on the relationships between patient, carers and health professionals.

Our research is based on two qualitative studies of French home based hospital care organizations which were funded respectively by the French health ministry (PREPS program) and the French League Against Cancer and in collaboration respectively with members of TASDA and the Hygée centre. They includes interviews with patients, family members and healthcare professionals involved both in the coordination of care and caregiving.

Tenacious assumptions of person-centred care

Öncel NALDEMIRCI (University of Gothenburg, Sweden) | oncel.naldemirci@gu.se
Doris LYDAHL (University of Gothenburg, Sweden) | doris.lydahl@gu.se
Nicky BRITTEN (University of Exeter, UK) | n.britten@exeter.ac.uk
Mark ELAM (University of Gothenburg, Sweden) | mark.elam@gri.gu.se
Lucy MOORE (University of Exeter, UK) | L.E.Moore@exeter.ac.uk
Axel WOLF (University of Gothenburg, Sweden) | axel.wolf@gu.se

Person-centred care (PCC) seeks to treat and care for patients as persons. Within this approach, persons who seek expertise or professional care are expected and encouraged to share their stories, provide an account of their symptoms and goals, and participate in decision-making processes and care plans. This approach envisions a shift from the paternalistic biomedical tradition where the healthcare experts are omniscient, competent and ultimate decision-makers to a more humanistic, dialogic and collaborative relationship with lay people seeking expertise and care for particular medical conditions but also having resources and capabilities. However, even though PCC challenges the tenacious assumptions of the biomedical approach, it also requires questioning of how the person is defined and seen by healthcare experts. Drawing upon in-depth interviews with researchers in three research projects within the University of Gothenburg Centre of Person-centred Care (GPCC), one strong
lead in developing PCC research, we will shed light on how the person is conceived as unique and capable differs from one medical and/or care setting to another. Based on these projects where persons are not able and/or willing to participate in PCC, we will argue that even though PCC targets the problems and inequalities in the provision of care, a monolithic and standardized definition of the person glosses over the complexity of situations where both caregivers and persons engage differently in creating narrative, partnership and documentation.

Tea LALLUKKA (Department of Public Health, University of Helsinki, Helsinki, Finland; Finnish Institute of Occupational Health, Helsinki, Finland) | tea.lallukka@ttl.fi

Background: Smoking is shaped by norms, values and behaviours embedded in social structures and cultures. Social class inequalities in smoking exist in many European countries, but less is known about non-European countries and changes over time. We followed up relative and absolute inequalities in smoking among cohorts from Britain, Finland and Japan.

Methods: British Whitehall II study (n=4092), Finnish Helsinki Health Study (n=7239), and Japanese Civil Servants Study (n=2637) included employed men and women aged 35-63 at baseline (1997-2002), with 5-7 year follow-ups. Social classes were managers, professionals and clericals. Current smoking was examined. Covariates were age, marital status, body mass index and self-rated health. Relative and absolute inequalities and 95% confidence intervals (CI) were calculated using Relative Index of Inequality (RII) and Slope Index of Inequality (SII).

Results: Inequalities in smoking were only found in Britain and Finland. Relative inequalities in smoking among cohorts from Britain, Finland and Japan.

816
inequalities varied from SII 0.11 (CI=0.04-0.18) among British women to 0.31 (CI=0.18-0.43) among Finnish men and remained stable. Covariates had only minor effects. Conclusions: Large relative and absolute social class inequalities in smoking persisted in Britain and Finland. Relative inequalities widened among British women and Finnish women and men. An east-west divide was suggested as no inequalities were observed in Japan. Smoking continues to be an unequal risk factor in Britain and Finland. Measures against smoking should be targeted to lower social classes.

Understanding Alcoholism in Russia - The case of the Russian Alcoholics
Anonymous
Laura LYYTIKÄINEN (University of Turku, Finland) | laura.lyytikainen@helsinki.fi

According to the WHO, Russia is one of the world’s top countries in alcohol consumption and alcohol has been estimated to cause even up to 50%, of premature deaths in the country. In Russia alcoholism is not seen as a disease, but as a personal weakness and the paradigm of alcoholism as a disease is not widespread. Even if drinking alcohol is seen as a norm in the Russian society, being an alcoholic is seen as shameful and kept as a secret inside the family. One of the globally known organizations struggling with alcoholism is the Alcoholics Anonymous movement, which stands out in its worldwide diffusion. The first Russian AA groups were established in 1986, but AA has struggled for acceptance as a legitimate treatment method and has largely failed to establish its status in Russia. Russian treatment methods for alcoholism are based on medicalization and detoxification. This stands in contrast to AA’s philosophy, which is based on treating alcoholism as an illness and pays attention to the emotional and spiritual roots of alcoholism.

This paper analyses Russian AA’s Internet forum as a forum of mutual support and scrutinizes how AA’s philosophy is understood and adopted by the Russian forum members. I analyse the forum participants’ understanding of alcoholism and recovery, and how these relate to the general understanding of alcoholism in Russia. Based on the discussion data, I analyse the AA participants’ struggle to create a new identity of a non-drinking alcoholic in the Russian context.

Are children and youth unhealthy habits learned in family environment?
Emanuela BOLOGNA (ISTAT, Italy) | bologna@istat.it
Laura IANNUCCI (ISTAT, Italy) | iannucci@istat.it

It is well known how parents teach children values and habits that can last for the rest of their life. The aim of this work is to investigate how family environment influence unhealthy behaviours of children and youth such as physical inactivity, tobacco smoking, alcohol consumption and obesity.

Data analysed in this work come from the multipurpose Survey ”Aspects of daily living”, carried out by ISTAT from 1993 to 2013. Preliminary results show that higher rates of physical inactivity, no moderate alcohol consumption, obesity and smoking habit can be observed when at least one parent has the same unhealthy behaviour. In addition unhealthy habits are more spread when both father and mother have a low level of socioeconomic status (SES).

In the last part of this study logistic regression models have been applied with the aim to estimate among children and youth the risk to have unhealthy habits (physical inactivity, no moderate alcohol consumption, obesity and smoking habits) according to parents unhealthy behaviours controlled by parents socioeconomic status and youth individual and geographic characteristics. The results show that especially family factors such as parents unhealthy habits and low level of socioeconomic status play an important role.
Physical inactivity as well as obesity, smoking habits and alcohol consumption represent serious health risk factors that must be controlled and reduced. Political strategies should be adopted to improve healthy habits among children and youth.

**Smoking and socioeconomic inequalities in smoking among young people during the current economic recession: a multilevel study across 24 European countries**

Katharina RATHMANN (Institute of Medical Sociology (IMS), Medical Faculty, Martin Luther University Halle, Halle (Saale), Germany) | katharina.rathmann@medizin.uni-halle.de

Timo-Kolja PFOERTNER (Institute for Medical Sociology, Health Services Research, and Rehabilitation Science (IMVR) at the Faculty of Human Sciences and the Faculty of Medicine of the University of Cologne, Cologne, Germany) | timo-kolja.pfoertner@uk-koeln.de

Klaus HURRELMANN (Hertie School of Governance, Berlin, Germany) | hurrelmann@hertie-school.org

Matthias RICHTER (Institute of Medical Sociology (IMS), Medical Faculty, Martin Luther University Halle, Halle (Saale), Germany) | m.richter@medizin.uni-halle.de

**Background:** Controversial findings are available on smoking behavior among adults during times of economic downturn. So far, no study has investigated the impact of the economic crisis on young people’s smoking prevalence and inequalities in smoking. This study examines the role of country-level youth unemployment as a consequence of the current economic crisis for adolescent smoking and smoking inequalities across Europe.

**Methods:** Database is the WHO-collaborative ‘Health Behaviour in School-aged Children’ study in 2005/2006 and 2009/2010, which included 11- to 15-year old adolescents from 24 European countries (HBSC 2005/2006: N=43,554, HBSC 2009/2010: N=43,093). Social position was measured by the Family Affluence Scale (FAS). Logistic multilevel models were conducted for the absolute rate of youth unemployment in 2010 (enduring crisis) as well as the relative change rate in youth unemployment (between 2005/2006 and 2009/2010) in relation to adolescent smoking and inequalities in smoking in 2010, respectively, controlling for tobacco control policies in 2010.

**Results:** The absolute rate of youth unemployment rates in 2010 was significantly related to lower likelihoods of smoking among medium and low affluent adolescents (OR for FAS(medium): 0.988, OR for FAS(low): 0.973) compared to high affluent adolescents. In contrast, an increase in youth unemployment (2005/2006-2009/2010) was not associated with smoking and inequalities in smoking.

**Conclusion:** This study highlights the beneficial impact of increasing unemployment rates on smoking among less affluent adolescents compared to better-off counterparts, a finding that is clearly linked to the insecure circumstances and the affordability of cigarettes for less affluent adolescents during the current economic crisis.

**The effect of work-life conflict on mental and general Heath**

Sara ZELLA (University of Lausanne (Switzerland), Switzerland) | sara.zella@unil.ch

Ivett SZALMA (University of Lausanne (Switzerland), Switzerland) | ivett.szalma@unil.ch

The purpose of this paper is to analyse the association between two types of work-life conflict (time-based and strain-based) and two dimensions of health: mental and physical. We rely on the Swiss Household Panel (SHP) from 2002 till 2013. Our dependent variables are: the self-assessed health’ (“How do you feel right now?”), which ranges from 1 (very well) to 5 (not well at
What predicts changes in mental health? Findings from middle-aged German working women
Silke TOPHOVEN (Institute for Employment Research, Germany) | silke.tophoven@iab.de

Working women are often embedded in multiple roles. Thus, when examining changes in mental health for female workers different spheres of life have to be considered. In addition to working conditions (mental and physical demands of work, commuting) also the private life circumstances (child care, elder care, domestic work, partnership status) have to be taken into account. Furthermore, the interplay of professional and personal tasks can result in a perceived work-family conflict. For Germany, a focus particular on the situation of older female workers is missing so far. With increasing age, work demands as well as domestic and family tasks might be experienced differently. Furthermore, informal caregiving to older relatives becomes more important for female workers in higher working age. Against this background, I examine how the requirement constellations of different spheres of life are related to mental health. To investigate the assumed associations, I use the first two waves of the “lidA study. German Cohort Study on Work, Age and Health” which were conducted in 2011 and 2014. Thus I can describe the mental health status at baseline and predict changes in mental health three years later for more than 2,000 women. The results show that most women have a lower mental health score three years after baseline. I employ different methods to explain the changes in mental health status.

Suboptimal work and rest patterns and potential health hazards in international maritime industry: cases from European and Chinese shipping companies
Zhiwei ZHAO (University of Southern Denmark, Denmark; Dalian Maritime University) | zhaozhiwei2006@hotmail.com
Jorgen Riis JEPSEN (University of Southern Denmark, Denmark) | jriis@health.sdu.dk

Shipping is one of the most globalised industries, characterized by the highly deregulated international business atmosphere due to the rapid growth of Open Register system and the establishment of a global seafarers labour market which facilitates shipping companies seek cheap labour internationally. This paper explores the implications to seafarers health of organizational practices under international regulatory framework on hours of work and rest at sea. It systematically examines differences of European and Chinese seafarers in work and sleep patterns, sleep quality and feeling of sleepiness/tiredness and stress. 454 and 483 seafarers in two European and two Chinese shipping companies, respectively, answered a questionnaire and 17 managers and 52 seafarers were interviewed. Strata were
compared by application of a T-test and indexes were constructed to represent feelings related to sleepiness/tiredness at work, sleep quality and stress at work. Compared to contract work time, both European and Chinese seafarers had higher actual daily/weekly working hours, respectively. Their actual sleep was less than their ideal amount of sleep. Discrepancies were the most obvious for officers. Officers and deck and engine crew from all strata experienced particularly lower sleep quality and more stress at work. Seafarers from all companies felt sleepy/tired at work. Chinese seafarers experienced lower quality of sleep and more stress at work than the European seafarers, and their subjective optimal need of sleep exceeded that of Europeans. The Chinese seafarers’ experiences could largely be explained by the long working time at sea. This study indicates suboptimal work and sleep patterns in global seafaring. There are significant differences in between strata of seafarers (rank, department, nationality). Seafarers’ health is likely to be impaired in the long run.

Cancer patients returning to work in Romania
Adela Elena POPA (Lucian Blaga University of Sibiu, Romania) | adela.popa@ulbsibiu.ro

The presentation discusses the implications a cancer diagnostic has on work in Romania and what types of support is available for cancer employees. The cancer incidence is currently growing in all European countries, including Romania. In the same time, the cancer survival significantly increased in the last years. More and more cancer patients can consider returning to work after treatment. Studies show that returning to work following a cancer diagnostic has beneficial effects on patient, his/her family, on employer and ultimately on society. Even so, employees diagnosed with cancer can face considerable barriers (physical, psychological, social) regarding return to work (RTW) and work retention. For many of them unemployment and early retirement are the only options available. Several countries have put up policies and interventions for supporting these patients. Romania is at the beginning of the road in this matter.

The legal framework and government types of support relevant for RTW of cancer patients in Romania will be briefly presented and discussed. The support provided by the non-government organizations will be also analyzed by examining the associations and foundations (available in the National Registry of NGOs) addressing cancer (how many of them approach this issue, what types of cancer do they target, whether RTW of the patients is one of their goals, etc.). Finally, an exploration will be made on the motivation for RTW, barriers encountered and needs of cancer patients that returned to work after treatment, based on narrative interviews with such patients.

RN16S16 - The Impact of Global Crisis on People's Health

Poverty and health expenditures in Italian households during the recent crisis
Simone SARTI (University of Milan, Italy) | simone.sarti@unimi.it
Marco TERRANEO (University of Milan-Bicocca, Italy) | marco.terraneo@unimib.it
Mara TOGNETTI BORDOGNA (University of Milan-Bicocca, Italy) | mara.tognetti@unimib.it

In recent years health expenditure in Italian households has decreased. Meanwhile the citizen has increasingly been asked to share health costs. Cost-sharing policies have to be assessed in terms not just of limitation of moral hazard and revenue to the State, but of equal opportunities for citizen users accessing health services (Drummond & Towse 2012). However, the decrease in familial health expenditure may hide some consequences if we look at the socio-economic
condition of the households (Nandakumar & Farag 2008). Obviously this decrease does not affect those who are fully exempt, but even excluding this segment of the population, many other households may be under pressure. The suspicion is that poorer households may have reduced health expenditure more than others.

Poverty is a term that has many dimensions and affects various ambiots of individuals’ and their families’ lives (material privation, social vulnerability, psycho-physical suffering). However, the analyses of specialist studies tend to emphasise the economic side to poverty, their definitions of relative and absolute poverty being based on monetary income or consumption (Ranci 2010). ISTAT estimates relative and absolute poverty in Italy from sampling surveys on family consumption. Every year it fixes (and updates) a spending quota below which families are reckoned to be poor. Many items of family consumption resulting from such surveys are to do with health expenditure (expenses over and above free health care on the health system, i.e. what families have to pay out).

The literature confirms that health expenditure ought to be inelastic, i.e. independent of economic recession (Terraneo et al. 2014). In other words, families in need of healthcare products or services will not reduce their consumption if their overall budget contracts (unnecessary forms of consumption will be cut first).

We may thus conjecture that when there is an economic crisis and poor families reduce their consumption, we ought to witness a more or less stable outlay on health in absolute terms (purchasing power being equal) and an increase in the ratio of health expenditure to overall consumption. Moreover, if we were in a phase of absolute, and not just relative, stability of health expenditure among poor families, where socio-demographic factors were equal we could expect the public system to have a diminished ability to control the health demand.

The aim of this paper is to analyse the relation between poverty conditions and pharmaceutical and diagnostic costs borne by Italian households, considering regional and social group variations.

The data used stem from the Family Expenditure Survey (Indagine sui Consumi delle Famiglie) collected by the Italian Statistical Institute (ISTAT). We used data from 1997 to 2013 enabling us to reckon with changes brought on by the economic crisis that began in 2008. The analysis employed a hierarchical regression model so as to gauge the changing relationship between state of poverty and health outlay over time, net of socio-demographic confounding factors and bearing in mind structural macro-contextual variations (by period or by healthcare area – in Italy public health being on a regional basis France et al. 2005).

The health spending items analysed refer to: overall private health expenditure borne by families, outlay on diagnostic tests and outlay on medicines.

The results show that families’ private health spending has broadly kept the same, though if we distinguish between poor and not poor families, the former have significantly cut down on health spending. This cut mainly concerns diagnostic expenditure, and less so the purchasing of medicines.

Regarding diagnostic tests, we found that poor families tend to decrease their expenditure, even when taking into account the differences in regional Italian health systems.

To summarize, our analysis suggests that in the last few years private health expenditure seems to have squeezed the more vulnerable families, on top of the economic crisis.

One may expect their members’ health to be at greater risk, which is likely to increase the burden on health systems in future.

The Mental Health Burden of the Economic Crisis in Europe: the Role of Job Insecurity and Displaced Workers
Veerle BUFFEL (Ghent University, Belgium) | Veerle.Buffel@Ugent.be

Background: The recent economic crisis is characterized by rising unemployment. Especially the group of displaced workers has increased, as many Europeans have lost their job due to plant or business closures. Additionally, long-term employment in the same job has already become relatively rare, while temporary or contract-based job opportunities and more flexible use of labor are increasing. The latter changes, combined with rising unemployment rates, have led to a heightened sense of job insecurity. Concerns have been raised about mental health problems and care use, as research has related job insecurity and unemployment to worse mental health and a greater use of health care services and psychotropic drugs. The impact of this economic crisis differs from country to country. With the exception of Ireland and Iceland, the biggest tremors in Europe have been felt in the Southern countries. Differences in the strength of the crisis have also been observed within countries, as reflected in the large variance in regional unemployment rates.

Most research to date has focused on the comparison process of being unemployed in the context of a high or low level of unemployment, while rarely on the cause of unemployment. However, based on the social norm theory, being unemployed because of a workplace closure can also be experienced in a different way to being unemployed under other circumstances, such as being laid off due to personal reasons. The former—the displaced workers—are characterized by a structural cause for the displacement. This kind of unemployment can be considered as exogenous to the individual. It can be perceived as a structural and social problem rather than an individual issue, given that the unemployed person will not be the only one in that situation and they might compare themselves with colleagues who also lost their job. As a result, their unemployment may be perceived less as a personal failure and affect the worker less in terms of self-blame and self-esteem, which may have consequences for their mental health, as well as for their mental health care, and medication use. Moreover, these differences in experience of unemployment also enable us to test the medicalisation hypothesis empirically. Medicalisation describes a process in which problems that are not self-evidently medical—such as unemployment and job insecurity—are defined and treated as medical problems. Researchers have warned that unemployment could be isolated from its social roots by considering it as a personal characteristic rather than a social process that influences the risk factors for illness. Based on the social norm theory, unemployment due to a non-structural cause will possibly trigger medicalisation more than unemployment with a structural cause, as the latter will be less individualized and perceived less as deviant or a personal problem that needs medical treatment.

Objective: This study aims to investigate the relationships between employment status and mental health, mental health care, and medication use, paying attention to the regional unemployment level, and using the social norm and medicalisation perspective as theoretical framework. With regard to unemployment, we investigate whether the relationships differ for the ‘displaced workers’. For those still in the labour force, we scrutinize the impact of job insecurity. In addition, attention will be paid to possible gender-related differences in these relations.
We focus on the group of aged 50 plus who are still included in the labour force. They are an interesting research population in the European context of an aging population together with active aging policies, which envisage the enhancement of health as well as social and labour-market participation. During economic instability, young people and older people are especially vulnerable to marginalisation in the labour-market. When people aged over 50 become unemployed, the chances of them finding a new job are low. In addition, research indicates that the middle and older aged unemployed are more depressed than those who are younger.

Data and methods: Data is used from the fourth wave of the Health Ageing and Retirement (SHARE) survey, which includes information on individuals aged 50 years or above, after the onset of the global financial crisis (2010-2012). A subpopulation of individuals between 50 and 65 years old (men N=11,789 and women N=15,118) is selected. Our hypotheses are tested by means of 3-level multilevel analyses -(1) individuals, (2) regions (NUTS) and (3) countries - with psychiatrist consultations, number of consultations with a general practitioner (GP) and medication use for anxiety and depression, as main dependent variables.

Gender-specific indicators of mental health are used to take the extent of distress by gender into account, as women suffer more from anxiety and depressive disorders, while men suffer more from impulsive and addictive problems, such as alcohol consumption. Anxiety and depressive symptoms is measured by the EURO-D 12-item scale and Heavy episodic drinking (HED) is defined as drinking at least 60 grams (alcoholic drinks) or more of pure alcohol on at least one occasion in the seven days prior to the survey.

Results and discussion: In line with the social norm theory, the results show that–only for men–the displaced workers are less depressed and use less medication compared with the non-displaced unemployed. However, they report more depressive symptoms than the employed, which supports the causation effect of unemployment. We find evidence for the medicalisation of unemployment, but not of job insecurity, among men and women in terms of respectively psychiatrist and general practitioner consultations. Only the non-displaced unemployed men seem to be triggered to medicalise their unemployment by consuming medication.

Few associations are found between the regional level of unemployment and health care use by the unemployed. Only unemployed men in a region with a higher unemployment rate have a lower number of GP consultations compared with the unemployed in a region with a low level of unemployment. This is also irrespective of their mental and general health. This finding can be considered as an indication of the social norm effect of unemployment among men, but on the regional level.

Mental distress and economic crisis in Greece: An empirical community study

Anastasia ZISSI (University of the Aegean, Greece,) | a.zissi@soc.aegean.gr
Michalis POULIMAS (University of the Aegean, Greece,) | poulimas@yahoo.fr
George STALIDIS (Alexander Technological Educational Institute, Greece) | stalidgi@mkt.teithe.gr

This talk presents the results of a comparative study of socio-economically contrasting local communities that was undertaken during the period of economic and financial crisis that Greece is facing over the last five years. The study examines the socio-economic inequalities produced by unequal presence of undesirable events, long term adversities, unequal access to resources and socially differentiated everyday practices. Three hundred people were randomly selected from three different localities to conduct face to face interviews. Localities were selected on the basis of the built environment, services, employment structures, socio-demographic characteristics. Interviews were designed to examine levels and types of stressors, coping strategies, living and working conditions, material environment, employment, health, economic and social life. The country’s economic crisis affected all social groups, but mostly those on the lower end of the socioeconomic position. Psychological distress was also greater for self-
employed and unemployed people. The study demonstrates the role of social class as this operationalized by Erik Olin Wright in determining respondents' mental health status.

**Deprivation and health before and after the Icelandic economic crisis**  
Stefan Hrafn JONSSON (University of Iceland, Iceland) | shj@hi.is

In the wake of the collapse of the Icelandic banks in 2008, considerable changes were observed in Icelandic society. The national income distribution changed as purchasing power diminished with the collapse of the national currency. At the same time less income inequality is observed, due to compression at the upper tail of the income distribution. In this article, the potential impact of these changes on people’s health is estimated. Based on theories of social comparison, the relationship between deprivation and health is analyzed with 2007, 2009 and 2012 data from the national health study, Heilsa og líðan Íslendinga (Health and Wellbeing of Icelanders). In all three years, statistically significant interactive relationship is observed between absolute and relative deprivation and self-assessed physical health. These interaction effects do not change significantly over time. While both absolute and relative deprivation have increased after the 2008 collapse, people’s self-assessed physical health has not changed nor has the crisis had a direct effect on people’s physical health. However, it is important to note that a significant relationship is observed between deprivation and health, both during economic growth, and after the collapse of the Icelandic banks.

**RN16S17 - The Effects of Neoliberal Policies on Healthcare Systems and Illness Experiences**

The political and economic embedding of chronic illness management experiences: a comparison of lay accounts of people with diabetes in United Kingdom and Bulgaria  
Ivaylo VASSILEV (University of Southampton, United Kingdom) | I.I.Vassilev@soton.ac.uk  
Anne ROGERS (University of Southampton, United Kingdom) | A.E.Rogers@soton.ac.uk  
Anne KENNEDY (University of Southampton, United Kingdom) | A.Kennedy@soton.ac.uk  
Elka TODOROVA (University of National and World Economy, Bulgaria) | elka.todorova@me.com  
Poli ROUKOVA (University of National and World Economy, Bulgaria) | proukova@bas.bg

Macro level environmental factors such as deprivation inequalities, economic and social policies that have an impact on food production, distribution and consumption, and the governance and delivery of health care systems, are recognised as distal influences on the personal management of long term conditions. Whilst this implies the need to negotiate the entrenched interests of powerful groups current long term management policy remains focussed on individually focussed solutions to improving individual knowledge, motivation and “responsibility”.

There is currently little understanding of the contrasting experiences of chronic illness management in different national contexts and the macro level processes that shape these experiences. Such a perspective on chronic illness management is particularly pertinent at a time when healthcare service across Europe are experiencing increasing financial pressures, while healthcare reforms are shaped within an environment where neo-liberal policies of austerity are the dominant response to the collapse of the financial sector.  
This paper builds on work conducted by the Framework 7 EU-WISE project, which seeks to understand the environmental influences on chronic illness management in order to inform and
develop future initiatives relevant in peoples’ everyday life across selective settings in Europe.

We compare narratives of people with chronic illness in Bulgaria and UK. These are countries that are at different stages of implementing neo-liberal reforms, and also differ in terms of the depth and longevity of austerity policies and the extent to which they have been directly applied to their healthcare systems. While Greece and Spain are the countries that are most often used as show cases of the impact of austerity policies on people’s health, it is Eastern European countries where wide ranging neo-liberal reforms were first introduced.

We draw on findings from 60 semi-structured interviews conducted in Bulgaria and United Kingdom. Mapping of whole networks of support was undertaken using a network diagram and by exploring the nature of relationships, narratives of responsibility, and the availability and acceptability of support. Interviews were conducted face-to-face, recorded and transcribed verbatim in English and Bulgarian. The transcripts were analysed using thematic analysis.

We identified relational practices and experiences which differed in the reported experiences of respondents in the two countries. These were organised in four themes: negotiating self-discipline and coping with the cost of living; how to navigate the food market; who to trust when accessing healthcare; and medicalization and stigma.

This paper offers evidence that reforms of privatisation, marketization, and de-regulation when applied to healthcare, are neither unavoidable nor superior to state-centred approaches to healthcare delivery, but constitute a specific normative choice. The experiences of people with diabetes and the current state of healthcare provision in Bulgaria can usefully project some of the possible futures for the UK and can inform debates about the direction of change of the NHS.

Health Inequalities, New Public Health and Area-Based Initiatives: Redressing Ecological Disparities or Placing Blame?

Oli WILLIAMS (University of Leicester, United Kingdom) | osw1@le.ac.uk

Historically, public health has looked towards social and environmental explanations for the occurrence of illness and disease but increasingly new public health shifts attention to how individuals ‘choose’ to behave. Despite the current trend towards moral individualism, area-based initiatives (ABIs) have been popularly used by neoliberal governments to address social and ecological inequalities. In market-driven societies there is a longstanding ‘inverse care law’: health resources tend to be less readily available to those most in need. By highlighting the significance of structural inequalities, ABIs appear to acknowledge the problematic nature of approaching social issues as matters of individual moral responsibility alone. However, they also continue to draw heavily on the discourse of individualism which readily blames the victim. ABIs are particularly susceptible to the wider health policy trend known as ‘lifestyle drift’: whereby policies aimed at addressing structural inequalities tend, over time, to adopt a behavioural approach. This paper draws from data collected during sixteen months of ethnography, involving observation, interviews with staff and participants and analysis of documents, in a deprived English neighbourhood where ABIs have promoted active-lifestyles and significantly increased local physical activity opportunities. The analysis shows that over time the relevance of initially identified barriers to participation experienced by local residents was largely ignored and institutional responsibility became contested. These findings inform an evaluation of the strategy of delivering ABIs in a market-driven, neoliberal society. Conclusions are drawn as to how research-based interventions could increase the robustness of future policies aiming to address health inequalities.

Health Inequalities and Neoliberalism: Corrupting the Gift and Breaking the Social Contract.
Ireland’s health care system is a deeply inequitable two-tiered arrangement in which the privately insured receive swifter access to care than those without insurance. Health forms a core part of any welfare state and is key to what is known as the social contract. This paper presents original research that offers a unique perspective on the Irish health care system using a historical genealogical approach. Through a number of key case studies the origins of the current status of Irish health care are traced; a method that is informed by the work of Michel Foucault. This novel approach enables an interrogation of surrounding discourse and contributes to an understanding of contemporary neoliberal circumstances. While this research paper presents Irish case studies, there is a universal application of the approach taken to many other social systems and countries.

The core concepts of the social contract, the gift relationship, and solidarity are used to construct a unique theoretical framework upon which the case studies are positioned. An examination of the cases through the lenses of this significant body of literature opens up new ground in terms of health policy analysis. The case studies examined are effective as they serve as exemplary demonstrations of the subtle, yet significant, impact on society when the social contract is broken and when solidarity is eroded.

Czech Mental Health Care Policy in the European context: What is the Problem Represented to Be?
Miroslava JANOUSKOVA (Masaryk university, Czech Republic) | m.janouskova@mail.muni.cz

Policy documents can be regarded as rhetorical however if we look from a perspective of critical discourse analysis we see how such documents generate discourse and produce policy problems, that subsequently influence solutions. The aim of this paper is to explore how mental health policy issues are constructed and represented because such problematizations have implications for how we are used to think and justify possible policy responses. The first official governmental document Strategy of psychiatric care reform has been introduced only recently in the Czech Republic (2013) after one year of negotiations and discussions. This policy document is studied in the international and European context, especially that one represented in the Green Paper: Improving the Mental Health of the Population: Towards a Strategy on Mental Health for the European Union (2005) and WHO’s Comprehensive Mental Health Action Plan 2013–2020 (2013). Czech strategy has not been implemented yet, that is why it is important to reflect its possible consequences on future solutions and changes in mental health care. The paper uses Bacchi’s analytical approach “What’s the problem represented to be?” (2009) that sees policy not as a logical response to empirically known problems, rather as constructed and represented or "problematized". Qualitative research strategy with the use of critical discourse analysis. Sources of data are Czech and international policy documents. The paper also discusses post-communist historical and political context of mental health policy and possible consequences on people with mental illness.

RN16S18 - Gender Perspectives on Health and the Body

Depressive symptoms and the accumulation of women’s disadvantage across countries and cohorts in Europe
Piet BRACKE (Ghent University, Belgium) | Piet.Bracke@UGent.be
Rozemarijn DERUDDRE (Ghent University, Belgium) | Rozemarijn.Dereuddre@UGent.be
Sarah VAN DE VELDE (Ghent University, Belgium) | Sarah.VandeVelde@UGent.be

Depression is more common among women. Macro-sociological theories stress the contribution of gender inequality to this gender gap, but their findings are not totally equivocal. Life course theory, and more specifically cumulative disadvantage theory (CAD), on the other hand, remind us that mental health inequalities accumulate over the life course. To explore their complementarity, we contrast several hypotheses concerning age differences in depression—a hormonal theory, a status composition theory, CAD theory, and a maturity theory—and test them in a variety of more to less gender unequal European countries (European Social Survey, 2006 and 2012, N of countries = 31; N of men= 40,322 and N of women = 48,832).

The results of the hierarchical linear models confirm the relevance of gender stratification for the mental health of women and men in Europe. In addition, in accordance with CAD theory, the gender gap in depression accumulates across age categories, substantially in countries with a high level of gender inequality. As a result, the mental health of older adult women in women unfriendly countries is worse of, while the gender gap in depression is nearly absent among young adults in more women friendly countries. No evidence is found for a more firm gender gap in depression during the reproductive years.

In sum, especially when studying the impact of macro-sociological conditions that undergo rapid social change, is seems fruitful to systematically explore their age differential impact.

Macro-level gender inequality and the “East-West” divide in contraceptive use
Rozemarijn DEREUDDRE (Ghent University, Belgium) | Rozemarijn.Dereuddre@ugent.be

Background
Although contraceptive use patterns vary in a great extent across Europe, one dichotomy is particularly relevant: Western Europe (WE) versus Central and Eastern Europe (CEE). This divide emerged well before the collapse of the communist system and remains to this day. Whereas WE is characterized by widespread reliance on “modern” contraceptive methods (i.e. barrier methods, hormonal contraception and sterilization) since the 1960s-1970s (Frejka, 2008), the prevalence of “traditional” contraceptives (i.e. withdrawal and the rhythm method) remains high in the CEE region and the abortion rates are among the highest in the world (Serbanescu et al., 2004). During the Soviet period, CEE witnessed limited access to modern contraception and high costs because of importation from the West, poor quality of domestically produced methods and skeptical health care professionals (Westoff, 2005). Moreover, because of the ingrained “abortion culture”, induced abortion was well embedded and socially accepted as a method of birth control (Frejka, 2008; Serbanescu et al., 2004).

Particularly relevant in this matter is the 1994 International Conference on Population and Development held in Cairo (UNFPA, 2000). Scholars that investigate contraceptive use often refer to it because it is considered as the start of a new way of thinking about population and, among others, family planning. It was recommended to approach reproductive health within its broad social and environmental context (Serbanescu et al., 2004), and to further develop policies that address individual’s and couple’s needs rather than macro-level population control (as was for instance the case in the Soviet Union) (UNFPA, 2000). Specific attention was paid to the role of gender relations and the empowerment of women. On the one hand, reproductive health has been identified as an essential component to narrow the gender gap in individual, social and professional areas as women should be able to plan if and when they want to have a child in order to realize their personal and professional aspirations (IPPF, 2013). On the other hand, reproductive health, and more specifically contraceptive use, is highly dependent on women’s ability to make decisions about their own fertility. Accordingly, limited access to modern contraceptive methods may be interpreted as a manifestation of inequity in women’s
status (CDC & ORC Macro, 2003) and an inability to negotiate otherwise (Bentley & Kavanagh, 2008).
Nevertheless, the vast majority of studies in more advanced economies has been ignoring this
gender aspect and the social embeddedness of contraceptive use (Grady et al., 1993). This
study is the first to make a cross-national comparison on how macro-level gender equality is
associated with contraceptive method choice in a European context. We focus on eighteen WE
and CEE countries to examine whether the “East-West” divide is still relevant and can be partly
explained by differentials in gender equality.
Methods
Sample - We combine data from the Generations and Gender Surveys (2004-2010) and the
Demographic Health Surveys (2005-2008), covering eighteen WE and CEE countries. Both
survey programs provide detailed information on contraceptive use and method choice, and rely
on similar measures for socioeconomic indicators which enables reliable between-country
comparisons. We select a subsample of 35,477 women of reproductive age (18-49) with a male
partner, who were not pregnant, were physically able to have children and had a fertile partner,
and had no desire for children at the time of the survey.
Variables - Contraceptive use, the dependent variable, is classified in four categories: not using
contraception, using traditional contraception, using modern male contraception and using
modern female contraception (reference category). Macro-level gender inequality is assessed
with two indicators: the Gender Inequality Index (GII) and the Global Gender Gap Index (GGGI).
A higher score reflects higher levels of gender inequality. Our analyses are controlled for
the macro-level GINI coefficient, and several micro-level socioeconomic and family-related
variables.
Analysis - We use multinomial multilevel models to examine our research question because of
the hierarchical structure of the sample: individuals are nested in countries. Separate analyses
are performed for both gender inequality indicators and for all subscales.
Results and conclusion
The results show that a significant part of the variance in women’s contraceptive use can be
explained by the country in which they live. This variance is partly due to differences in gender
inequality rates. Higher scores on both the GII and the GGGI seem to relate to a higher
likelihood of not using contraception or of using traditional methods instead of modern female
methods. Looking at the subscales, this can be explained by gender gaps in health and political
participation. Only according to the models including the GII, women living in countries with
higher levels of gender inequality are also more likely to practice modern male rather than
modern female methods.
As the WE countries generally rank lower on gender inequality as compared to the CEE
countries, our findings suggest that differences in inequality rates are part of the explanation of
the “East-West” divide. However, although we argue that this divide remains relevant to this
day, it should not distract our attention from the enormous heterogamy in both regions.

‘Gender-specific medicine’ and the pharmacological body
Ellen ANNANDALE (York University) | ellen.annandale@york.ac.uk
Anne HAMMARSTROM (Umea University) | anne.hammarstrom@umu.se

This paper develops the argument that the development of ‘gender-specific medicine’ heralded a new biopolitics of health which drew gender and medicalization closer together. It explores the problems that arise from the division and stratification of bodies though the gendered customization of pharmaceuticals drawing on the concept of ‘stratified biomedicalization’ (Clarke et al., 2010). In particular it reflects on how the ‘gender-specific body’ and a ‘gender-specific ethos’ in medical practice are constructed through an erroneous emphasis on difference and the dominion of sex, and a fragmented conception of the body. While recent developments in biomedicine which emphasise customisation and personalisation such as the recent push to ‘precision medicine’ might seem to support and advance the ‘gender specific’ ethos’, they also threaten to render ‘gender specific’ medicine with its emphasis on binary sex difference obsolete as part of intense individualisation that this development entails. The paper reflects the consequences of these developments for the politics of gender and health and the treatment and experience of illness.

RN16S19 - Health Promotion

Improving Lifestyle Choices? Behavioral Economics, Happiness Research and Health Promotion
Stefan IMMERFALL (University of Education at Schwäbisch Gmünd, Germany) | Stefan.Immerfall@ph-gmuend.de

Individual decisions in general are greatly, and perhaps increasingly, affecting health and illness. Lifestyle choices and sedentary lifestyle in particular are known to have an arguably significant impact on health, healthy ageing and disease. As a consequence, ideas of behavioral change as a remedy to rein in health costs are flourishing. Politicians are eagerly listening to the claims of “libertarian paternalists” to improve decisions about health through “choice architecture”.
This focus on the importance of people’s behavior for their health has met with criticism as well. Critical social scientists dismiss it as a new way of blaming the victim and individualizing health care.
The proposed presentation reviews different ways approaching the challenge of affecting individuals’ lifestyle choices. Reviewing empirical evidence, it finds that claims about the effects of choice architecture are overblown. Nevertheless, the contribution of recent research on self-reported preferences and cognitive biases need to be incorporated in health promotion programs. Not trying to affect individual behavior is simply not choice for public health.
Boundary work: Organizational tensions in health promotion programs aimed at reducing health inequalities
Pia Vivian PEDERSEN (University of Southern Denmark, Denmark) | pvp@niph.dk
Morten HULVEJ ROD (University of Southern Denmark, Denmark) | mhj@niph.dk

Strategies to reduce health inequalities can be placed on a continuum from the gradient perspective, targeting the association between health and socioeconomic position at a population level (e.g. through legislation or taxation) to the vulnerable population perspective, aiming to improve the health of the worst off. It is, however, increasingly acknowledged that the task of reducing health inequalities is a complex task which demands employing several complementary strategies rather than either-or approaches.

In this paper, we aim to explore the organizational tensions that arise in vulnerable population approaches to health promotion. Despite the often diverse structure, contents, and target populations of such approaches, they typically share a strong focus on intersectoral collaboration and in particular on integrating health promotion with social work. In practice, however, this has proved difficult.

The paper draws on ethnographic fieldwork among municipal public health officers and qualitative interviews from an evaluation of municipal health promotion programs targeting homeless citizens. Analytically, we focus on different types of ‘boundary work’, i.e. ways in which organizational boundaries are established, maintained, transgressed and negotiated through these programs. We discuss four types of boundary work and their implications for health promotion in practice: (1) The friction between different professional identities; (2) Legislative/administrative boundaries for improving the health of the marginalized; (3) The boundary-setting between mainstream and specialized health care; and (4) The tensions between different types of knowledge related to the effects and methods of specific interventions.

Corruption of the social determinants of health: the role of ‘articulation’ in processes of turning health in all policies into practice
Ditte Heering HOLT (University of Southern Denmark, Denmark) | dihh@niph.dk
Morten Hulvej ROD (University of Southern Denmark, Denmark) | mohj@niph.dk
Tine TJØRNHØJ-THOMSEN (University of Southern Denmark, Denmark) | titt@niph.dk

Notions of Health in All Policies (HiAP) and intersectoral action for health (ISA) are often suggested to promote health equity by addressing social determinants of health (SDH). This paper investigates how assumptions about health are articulated in relation to HiAP and ISA, and the relation between these assumptions and the legitimization of certain practices in the setting of Danish municipal health promotion.

Based on document analysis and qualitative interviews with health and non-health civil servants, this paper argues that health fluctuates from a broad, social concept of health based on foundational ideas of SDH to favouring risk-based interventions with emphasis on physical health. The role of non-health sectors hereby changes simultaneously from being important sectors by themselves in providing their core task e.g. ‘good schools’, to becoming arenas for health interventions focusing on e.g. ‘healthy schools’.

The analysis shows that municipal public health professionals face a dilemma. On a general level they endorse a broad conceptualisation of health, but to engage in productive collaboration with other sectors they often resort to what is ‘accepted’ as their legitimate area of expertise – that is, what is explicitly articulated as health. The push to do HiAP hereby seems to favour interventions articulated and framed explicitly as ‘health’ in intersectoral policy processes. This
leaves out existing welfare policies and services, as they are not articulated in terms of health. As a result, despite HiAP's foundational ideas of SDH, the great emphasis on promoting these ideas serves to introduce health into non-health sectors as health interventions.

RN16S20 - Medicalisation and the Social Construction of Illness

The field of elderly-related health issues in Belgium: A stakeholder analysis
Sarah VAN DEN BOGAERT (Ghent University, Belgium) | Sarah.VandenBogaert@UGent.be
Sarah VAN LEUVEN (Ghent University, Belgium) | Sarah.VanLeuven@UGent.be
Thierry CHRISTIAENS (Ghent University, Belgium) | Thierry.Christiaens@UGent.be
Daniel BILTEREYST (Ghent University, Belgium) | Daniel.Biltereyst@UGent.be
Piet BRACKE (Ghent University, Belgium) | Piet.Bracke@UGent.be

This study is situated within current discussions of ‘medicalization’ (Conrad, 2005, 2007). Relations within the medical field have evolved from linear doctor-patient-relations towards a complex network involving many different stakeholders. As a consequence, laypeople are overwhelmed with health-related information from many different organizations and through different channels, including new digital media, and they often have difficulties processing it all (Andreassen et al., 2010). Besides this, the field of health and health care has become a medical market in which health is increasingly seen as a commodity. Moreover, the aging of the population drastically changes the demographic landscape and increases the attention devoted by these different stakeholders to the elderly as consumers of medical information and products.

It is within this changed, and still changing, landscape that this study aims to examine the societal background of the production and construction of health information about pharmaceuticals. Using qualitative interviews and a stakeholder mapping technique this study studies the political-institutional and economic relations between stakeholders, and the interests and discourses of the different stakeholders that communicate health information about pharmaceuticals. Our stakeholder mapping revealed eight relevant stakeholder categories in our field of research; the media, the pharmaceutical industry, government institutions, health insurance companies, patient organizations, consumer organizations, academic medical experts and organizations of health professionals. To further analyze the relations, interests and discourses of these different stakeholders, interviews were conducted in the Spring of 2015 with key persons at management level within the organizations. Preliminary results will be available in August 2015.

The Social Construction and Professional Defence of Categories of Mental Illness in Ireland 1800-2000
Damien BRENNAN (Trinity College, Dublin, Ireland) | dbrennan@tcd.ie

Ireland has a historical legacy of prolific mental hospital utilisation. A key aspect of this practice is the act of diagnosis. This paper explores shifting diagnostic categories of mental illness in Ireland from 1800-2000. It is demonstrated that social forces, rather than the individual mental state, influences the conceptualisation of mental illness which continuously reshapes in response to the social context of any particular point in time. The contemporary political/economic context in Ireland is also considered as a backdrop to emerging understandings of ‘mental health’ as a normative human emotional state.

A second and parallel observation concerns the high level of confidence or ontological security that underpins the various diagnostic systems, with each new era or system of re-categorisation of mental illness being endorsed as factual truth by professional groups. While a retrospective
critique of diagnostic criteria is engaged in by professionals, contemporary criteria are firmly defended at each point of time.
The key sources of data informing this paper are the reports of the Inspector of Lunatic Asylums in Ireland, later the Inspector for Mental Hospitals, for each year from 1846 to 2000 which are available in the Parliamentary Papers at the National Library of Ireland. Methodology this data is considered through a fusion of the interpretive and critical traditions within historical sociology, particularly drawing from the approaches associated with both Foucault and Weber.

Sadness and clinical depression: the medicalization and de-medicalization and everyday life
Christian BRÖER (University of Amsterdam, Netherlands, The) | c.broer@uva.nl
Broos BESSELINK (University of Amsterdam, Netherlands, The) | broos_italia@hotmail.com

This research addresses the impact of medicalization on social situations outside the clinical realm and among non-patients. It transcends biological and social determinism to recast medicalization as an outcome of the dialectical relationship between everyday life concerns and clinical practice. This paper analyses everyday social interactions concerning sadness and interrogates the hypothesis that the expansion of medical diagnosis and treatment has transformed common sadness into clinical depression.
The analysis is based on 293 observations of everyday life in the Netherlands, gathered with a purpose-built observational log. We observed and recorded interactions and situations in which sadness or depression were spontaneously expressed or referred to. The analysis shows that a psycho-medical approach to low mood is common in everyday life. But sadness is not fully medicalized: sadness is partly reclaimed against medicalization, clinical definitions and treatment become normalized and sadness can be unrelated to clinical definitions and treatments. This happens while people are dealing with specific problems of everyday life. Peoples most pressing concern seems to be how to make sense of sadness in the first place. This means that the availability of medical categories and treatment has not solved pragmatic concerns. We interpret this as part of the ongoing societal and clinical debates about the validity of depression. Across medicalized and non-medicalized contexts, a norm of happiness and active citizenship seems prominent.

Psychopharmaceuticalization of old age: practices and conceptions of seniors living alone and institutionalized, a case study in Portugal
Noémia Mendes LOPES (Egas Moniz _ Instituto Superior de Ciências da Saúde I, Portugal; CIES-IUL/ISCTE, Portugal) | nlopes@egasmoniz.edu.pt
Joana ZÓZIMO (Egas Moniz _ Instituto Superior de Ciências da Saúde I, Portugal; CES / UC, Portugal) | joana.zozimo@gmail.com
Ricardo ANTUNES (Egas Moniz _ Instituto Superior de Ciências da Saúde I, Portugal) | riantunes2003@sapo.pt
Elsa PEGADO (Egas Moniz _ Instituto Superior de Ciências da Saúde I, Portugal; CIES-IUL/ISCTE, Portugal) | els.pegado@iscte.pt

The growing consumption of psychopharmacs among the elderly points to an also growing medicalization and psychopharmaceuticalization of old age. This may be a cultural and social response to a representation of the elderly as vulnerable and disabled, or it may also express new and emergent ageing cultures of well-being. The relation of senior people to these consumptions assumes various cultural patterns, which are correlated with different ways of life and perceptions of well-being. This paper analyses the role of psychopharmaceuticals in the management of older people’s everyday lives, by drawing a comparison between seniors living
alone and seniors living in Old Peoples’ Homes. The analytical focus is on categories of psychopharmacs - or similar natural psychoactive products - for four purposes: sleep, anxiety, sadness and memory. Empirical data was collected in 2014, in the city of Almada, as a case study using mixed methods. Questionnaires were administered to a sample (n=414) of people aged 65 years old and over, with cognitive and functional autonomy, living alone or in Old People’s Homes. The choice of studying institutionalised people has proven crucial to understanding different patterns (specifically, on psychopharmacs consumption and perceived well-being) among people living in different arrangements. With life histories’ interviews to some of the questionnaires’ respondents (n=30), we have reassembled the different patterns of life and different rationales behind the relationship with psychopharmacs. This material allowed us to explore social plurality in the senior universe and the distinct shapes of its psychopharmaceuticalization, which represent specific dimensions of contemporary modernity.

Towards a history of depression and the neoliberal man
Claudio MAINO (University Paris Descartes (Paris 5) Cermes3 Laboratory, France) | claudiomaino@gmail.com

After the return to democracy a WHO study revealed that the prevalence of depression among primary care patients in Chile, was the second highest in the world. This led to several epidemiological evaluations and they showed that this disease ranked second among the top 15 Disability-Adjusted Life Year (DALY) among women, accounts for over 70% of sick leaves and located Chile, between OECD countries, as the second region with the highest increase in its suicide rate, surpassed only by South Korea. This data contrasts with the unquestionable success in the implementation of the neoliberal model, where it appears that Chile has the highest GDP per capita in South America with $18,419, being registered as one of the top ten economies in the liberalized world according to the "Heritage Foundation". How is that being the material and economic development best than ever, Chileans declare themselves as less happy, commit more suicide and are more depressed? I propose here, from a comparative perspective, some notes of the social history of depression in Chile in the light of what was known as the laboratory of the neoliberal model that differs from what Kitanaka, Ehrenberg and others have exposed about Japan, Europe and the United States with regard to this disease. The relationship between pathological expressions and economic transformation of a country like Chile, can bring up a truth contrast about this crossroads in northern countries, particularly in Europe.

JS_RN05+RN16a - Cross-national Perspective on the Normative Discourses of 'Food Health'

Toward a proper diet and a healthy body in France and in the United States : a comparison of normative discourses
Faustine RÉGNIER (INRA, France) | Faustine.Regnier@ivry.inra.fr

This contribution will analyse a wide corpus of normative discourse regarding a healthy diet and the measure of the ideal corpulence, coming from French and American women's magazines, between 1930 and 2010. A “proper” diet has to be defined, in its relation to the measure of the feminine healthy ideal body. I will determine national models of recommendatations related to healthy diet and ideal body and I will underline the main evolutions through time. Can the French tendencies be considered as the reflect of European ones, opposed to the American norms?
I will first examine the definition of a “healthy diet” and the measures of the “ideal body”: what are the main differences between the 2 countries? What are the evolutions in terms of weight control? I will then discuss the specificities of two different national models: a French model, where culinary art, health and beauty are intimately connected; an American one, where nutrition, self-control and moral are the dominant factors. Finally, I will underline a transnational convergence: the discourse seem less and less normative, but their claim of hedonism and liberty is never expressed without a reminder of the new duties (in terms of health, nutrition or body weight control), in a context where explicit contraints have been transformed into internalized self-restraint and are thus, maybe, all the more powerful.

**Nutrition recommendations, health citizenship and lazy gluttons**

Piia Tuuli JALLINOJA (University of Helsinki, Finland) | piia.jallinoja@helsinki.fi
Salla SAVOLAINEN (University of Helsinki, Finland) | salla.m.savolainen@helsinki.fi

In October 2013, the 5th edition of the Nordic Nutrition Recommendations was published, followed by the national version in Finland in January 2014. Both were widely reported and debated in the Finnish media. The data of the study consist of this debate in printed media, social media, online forums and blogs, one month after Nordic and one month after the national recommendations (n=430). We analysed who takes part in the debate, what are the arguments for and against recommendations and how consumers were positioned as regards expert advice, responsibility for one’s health and proper food consumption. Critical stances included claims that the recommendation do not take into account individual dietary needs and that they aim to control people’s lives. A common argument defending the recommendations stressed their scientific basis. Consumers were positioned e.g. by estimating their ability to control themselves: ”The new nutrition recommendations are not for gluttons but for those who are able to control themselves in dinner table” (online discussion forum). Another type of argument referred to the lack of understanding, e.g. by leading nutrition scientists in a newspaper “Based on the lively discussions [since the publication of the recommendations], it seems that many parts of the recommendations have been misunderstood”. The study applies theories on new public health and health citizenship, Beverley Skeggs’ analysis of moderation as a consumption ideal among middle class and “letting-go” and gluttony as its opposite, and studies suggesting that “tamed hedonism” or “negotiated pleasures” are currently desired patterns for food consumption.

**Do consumers reduce meat consumption? Background factors and opinions related to healthy and sustainable eating in four Nordic countries**

Gun Mikaela ROOS (National Institute for Consumer Research - SIFO, Norway) | gun.roos@sifo.no
Mari NIVA (University of Helsinki, Finland) | mari.niva@helsinki.fi
Nina KAHMA (University of Helsinki, Finland) | nina.kahma@gmail.com
Unni KJÆRNES (National Institute for Consumer Research - SIFO, Norway) | unni.kjarnes@sifo.no
Thomas Bøker LUND (University of Copenhagen, Denmark) | tblu@ifro.ku.dk
Johanna M MÄKELÄ (University of Helsinki, Finland) | johanna.m.makela@helsinki.fi

Meat is a significant and valued food all over the world, but in addition meat is also today associated with problems related to health, environment and animal welfare. Citizens in the Western world are increasingly reflecting on the health and sustainability of meat, but there are few signs of policies actually aiming at reducing meat production and consumption. This paper examines consumer agency regarding meat eating in the Nordic countries. The analysis is based on data collected by a web-based survey in 2012 as part of the ‘Food in Nordic Everyday Life’ study carried out in Denmark, Finland, Norway and Sweden (N = 8 248). By using
multivariate methods we investigate how reducing meat eating is related to socioeconomic and life phase variables, and to opinions, practices and policies of healthy and sustainable eating. The paper discusses whether citizens in the Nordic countries can be expected to take a leading role in reducing the environmental impacts of meat eating, whether they have the agency and power to do so, and how they see the role of political interventions in advancing sustainable food production and consumption. Theoretically, the article will contribute to the discussion on ‘new modes of green governance’ (Klintman 2009), especially by debating the key role attributed to people as buyers and eaters. We examine how assumptions of consumer agency and political consumerism encounter the practicalities of people’s everyday life and values related to societal responsibility of various actors.

You Are What You Eat - On Perception Of Linkages Between Food Consumption And Health In Poland
Agnieszka MAJ (Warsaw University of Life Sciences, Poland) | agnieszka_maj@sggw.pl

The paper will present results of a quantitative research based on an opinion poll of a group of research participants from Poland. The research will investigate the participants’ opinions concerning chosen aspects of relations between food consumption and maintaining health and a good look, especially their beliefs about the kinds of food considered as “healthy” or “unhealthy” and the possible reasons standing behind such a classification of certain food products. The study will also investigate the importance of a “healthy diet” in the lifestyles of the research participants: whether they consider it important at all, do they feel determined to follow any patterns of dieting or not, are they open to exploring any new trends in nutrition, for example following new dieting fashions. The proposed research study will also attempt to investigate the role of the slim body ideal in shaping participants’ attitudes towards healthy eating: whether they find it important to maintain a slim body silhouette or not and whether it influences their everyday choices of food products in any way, for example by the fact of avoidance of any specific kinds of food. Where possible, the findings of the research study will be presented in a broader context of lifestyle choices made by specific social groups.

JS_RN05+RN16b - Feeding Peoples’ Health: Dietary Health and the Medicalization of Eating

Feeding health. The role of functional foods.
Paulo Jorge MONTEIRO (ISCTE-IUL (University Institute of Lisbon), Portugal) | pjemonteiro@gmail.com

The relationship of man with food testifies, at any time, the crossover between culture, technology and marketing. Regardless the apparent paradox between a sophisticated food science and the expansion of diseases related with food ingestion, in modern societies, food has, progressively, played a dual role: instrumental as a supplier of nutrients as well as therapeutic resource managed both in isolated and combined way. Functional foods, developed in Japan in mid-1980s, are a product of food science and the marketing of the agro-food sector, that are supposed to improve health and well-being and prevent future disease, fuelling a consumerist ethos leveraged by a growing reflexivity, knowledge and activism by the healthcare consumers.

In Portugal, fortified yogurts with bifidus bacteria, the most representative segment of functional foods, are ranked in the 24th position among the top 50 most purchased products in hyper and
supermarkets in 2014, and my current research as a PhD student will cross the results of the first national food and nutrition survey, with 1200 respondents, performed since mid-1980s, with the analysis of half a million transactions, integrating any sort of functional food from a hypermarket chain’s loyalty cardholder database, to produce the portrait of profiles and consumer habits of functional foods by the Portuguese population. Further qualitative research through Focus Groups (n= 32 ) will try to uncover the logics of consumer’s adhesion to such “natural” tools and explore the hypothesis that special food’s therapeutically usage is a contemporary expression of medicalization.

Scottish policy initiatives to improve dietary health in secondary schools: food and drink purchasing practices of young people
Giada DANESI (University of Hertfordshire, United Kingdom) | danesi.giada@gmail.com
Wendy WILLS (University of Hertfordshire, United Kingdom) | w.j.wills@herts.ac.uk
Ariadne KAPETANAKI (University of Hertfordshire, United Kingdom) | a.b.kapetanaki@herts.ac.uk

Public authorities in Scotland have implemented several initiatives regarding food and drink sold in schools in order to improve the diet and health of children and young people. Some foods and drinks are not available in schools and the sale of others is restricted. Kitchen supervisors have to develop menus respecting the Statutory Nutrient Standards for Schools. Nonetheless, regulation does not prevent food retailers around schools selling whatever they wish, and public authorities are now concerned with this issue.

Through a mixed-methods approach and a case study methodology, this study explored food and drink purchasing practices of pupils aged 13-15 years across Scotland. Seven schools took part with 535 pupils completing an online purchasing recall questionnaire and 651 pupils involved in one or more qualitative methods of the study (individual and collective interviews, writing exercises, go along tours, focus groups and participant observation). Moreover, 13 head teachers and kitchen supervisors as well as 25 food retailers took part in informal or semi-structured interviews. The schools were varied in terms of social deprivation and food environment.

This paper reveals the impacts of public policies regulating food and drink on offer in school and the reasons why many pupils venture beyond the school gate at lunchtime. Furthermore, perceptions of pupils on food and drink sold in school and strategies they adopt to avoid school rules are discussed in order to highlight views of young people on public policies concerned with their health.

Incorporating considerations on equity-oriented implementation and ethics in WHO normative work on nutrition actions
Gerardo ZAMORA (World Health Organization) | zamorag@who.int
Juan Pablo PEÑA-ROSAS (World Health Organization) | penarosasj@who.int
María Nieves GARCÍA-CASAL (World Health Organization) | garciacasalm@who.int

Setting norms and standards is one of the core functions of the World Health Organization (WHO). WHO follows an evidence-informed, policy-oriented process for its normative work on nutrition and provides programme guidance to its Member States and partners in emergency and stable settings. Guidelines are developed for nutrition-specific and nutrition-sensitive interventions and include, for instance, food fortification, supplementation with vitamins and minerals, protection, promotion and support to breastfeeding, complementary feeding, prevention of childhood obesity, or clinical practices for improved nutrition (e.g. delayed umbilical cord clamping or care of patients with Tuberculosis). Starting in 2014, the Evidence and Programme Guidance Unit, in the Department of Nutrition for Health and Development of
WHO, started a progressive and systematic approach to incorporate policy-relevant considerations on health equity and ethics into its normative work. By approaching eating as a social act and adopting a social determinants of health perspective, guideline development has been enhanced and recommendations are furnished with guidance on equity-oriented implementation. This paper examines the conceptual and methodological steps followed in this progression and suggests considering equity in access as an implementation outcome grounded on ethical principles. It takes the examples of four WHO guidelines related to micronutrient deficiencies and one theoretical work on exclusive breastfeeding to illustrate how social determinants, equity in access and ethics are considered in guideline development and programme guidance. It highlights the limits of such work and the challenges to programme implementation and finalises with a brief discussion on the applicability of sociological inquiry to nutrition sciences.

**JS_RN16+RN19 - Citizens and Professionals: Unequal and Diversified Healthcare Societies**

**Changing Landscapes of Patient and Public Involvement in UK National Health Service Research**

Mary MADDEN (University of Leeds, United Kingdom) | m.t.madden@leeds.ac.uk

The UK National Health Service (NHS) is a system of socialised medicine, into which, over the last thirty years, neoliberal economic policies have been introducing marketization. The Health and Social Care Act 2012 passed by Parliament in England effectively ended the NHS by abolishing the 60-year duty on the government to secure and provide healthcare for all while potentially laying the ground for wholesale privatisation. This change, which NHS England Chief Executive David Nicholson famously described as so big “you could probably see it from space”, is in the process of creating a new architecture of power in the NHS. Replacing publics with markets, including the creation of a de-socialised healthcare market which gives expression to the liberties of individuals and within which they are free to pursue their own self-defined ends, has been seen negatively by some as part of the deconstruction of democracy; a hollowing out of civil society which poses a challenge to traditional notions of professionalism and public service ethos. At the same time patient and public involvement (PPI) in NHS services and research has become an imperative, yet the empirical evidence-base underpinning the worth and impact of PPI remains poor and there is contestation between professional and ‘lay’ power/knowledge. PPI remains conceptually unclear and this paper will discuss ways in which this ongoing lack of conceptual clarity impinges on patients and the public working inclusively and meaningfully with health professionals in health research within the context of neoliberal reorganisations of the UK NHS and University sectors.

**The changing nature of professionalisation in a global and unequal world:**

**Comparing medicine in Britain, the United States and Russia**

Mike SAKS (University Campus Suffolk, United Kingdom) | m.saks@ucs.ac.uk

This paper asks whether the nature of professionalism is changing in a global and unequal world. It was once projected that an elite knowledge class was fast developing with increasing professionalisation in a converging modern world, primarily driven by developments in technology. However, recent trends such as growing corporatisation, the new public management and increasing citizen engagement suggest that we may be witnessing rising
deprofessionalisation, as opposed to increased professionalisation. Using medicine as a case study, the impact of these trends on doctors specifically is discussed from a neo-Weberian perspective in three societies with very different socio-political philosophies – namely, Britain, the United States and Russia. With due regard to methodological issues arising from comparative evaluation, it is argued that the pattern of professionalisation in the societies concerned is more divergent than convergent. An overview is provided of the patterns that have emerged as a result of the complex interplay between the professions, state and the market in each country. It is claimed that there is no necessary logic of industrialism as far as professionalisation is concerned or even any straightforward relationship between the form of professionalism and private and public sector settings. The implications for the public, including in relation to inequalities, of the different patterns in each of the models characterising the countries considered are also explored. These raise questions about best practice for the future in relation to medicine, as well as professions and citizens more generally.

**Medical and nursing professional culture after thirty years of corporatization in the Italian healthcare system.**

Roberto LUSARDI (University of Bergamo, Italy) | rob.lusardi@gmail.com
Stefano TOMELLERI (University of Bergamo, Italy) | stefano.tomelleri@unibg.it

In the last decades, the Italian healthcare system (as the majority of the European countries’ healthcare systems) has been interested by processes of rationalization of governance structures, of administrative procedures and of professional practice. Effects and impacts of these innovations are mainly measured in terms of services effectiveness/efficiency. Nevertheless, it has been reported how these structural changes have been accompanied by a vertical segmentation within the medical profession, including: clinical-physician (the professional), manager-physician (the administrator) and researcher-physician (the academic). These peculiar roles within the same professional profile diverge for power and influence on others, formal knowledge and professional duties. Analogue but less articulated differentiation can be identified within the nursing profession, where some people perform managerial tasks aimed at managing working activities and information spreading.

This paper discusses the results of a qualitative study carried out in an Italian healthcare organization, and aimed at investigating the impacts of these changes on the professional cultures (medical and nursing in particular). The empirical dataset is composed by thirty-three interviews with physicians and nurses in charge of managerial and academic responsibilities. Three main cultural frames emerge from the content analysis of data: the corporate-managerial culture, the clinical-professional culture and the academic-technological culture.

In this paper, we will discuss these cultural profiles in detail, identifying for each of them professional identity changes, social expectations and styles of leadership in both medical and nursing staff.

**Constructing meanings of experience by health care professionals and patients**

Tiina Maria TIILIKKA (University of Tampere, Finland) | tiina.tiilikka@uta.fi

The presentation discusses how co-operation between health care professionals and experts by experience is part of changing Finnish health care and the third sector. The aim is to analyse how the need for experience of citizens using health services is constructed between health care professionals and patients who act as experts by experience. This presentation gives examples of how health care professionals and experts by experience give meanings to the mental health and alcohol use. The aim is also to find out how experience of citizens was
presented before and how the need for individual experiences of citizens is emphasized in current Finnish health care.

The presentation is based on a research which is focused on social and health care and the third sector and how they operate. This project takes a broad view on the processes of societal change. The research project is designed as a third sector view of how Finnish society has changed from the early 1970s to the present day. The context of the study is Finnish alcohol and mental health policy.

The research data consist of writings about Finnish alcohol policy and mental health care published between 1970-2014. The data also include the interviews of health care professionals and experts by experience. The content analysis and discourse analysis offer the methodological tools for the research.

**Working through? Labor in the perspective of psychotherapists**
Sabine FLICK (Goethe University Frankfurt, Germany) | s.flick@em.uni-frankfurt.de

The paper focuses on therapist's knowledge of labor in the frame of psychotherapeutic treatment. Medical as well as psychological psychotherapists are more and more confronted with a problem: patients search their treatment with the descriptions of stressful working conditions. The question is, to what field of knowledge the interpretations of the psychotherapists of the patient's suffering is related. Do they locate the patient's status despite their narrations in inner processes or do they relate to knowledge of pathogen structures of today's working conditions? Do they reflect the debates on precarity or the blurring of boundaries of work and life? What results from this reflection for their therapeutic practice? The paper presents results of an empirical study in two psychosomatic clinics in Germany that work with psychodynamic approaches. On the basis of protocols of supervisions as well as interviews with these therapists three scenarios can be anticipated: a small group of the therapists discuss the stressful working conditions and try to overcome their own professional means with empowering the patients to either change or leave the working situation. A second scenario questions the patient's narratives about their work and already interprets these as part of the patient's pathology which sometimes is based on a lack of knowledge of today's working conditions. The majority of the therapists focus on the family biographies and the inner conflicts of the patients and even try to softly direct the content of the patient's narrative in the direction of family-biographic experience.

**JS_RN16+RN23a - Sexual Health and the Medicalisation of Sexuality I**

**The Localization of Sexual and Reproductive Health**
Thorsten BONACKER (University of Marburg, Germany) | thorsten.bonacker@uni-marburg.de
Judith VON HEUSINGER (University of Marburg, Germany) | heusing4@Staff.Uni-Marburg.de

From the 1990s on reproductive and sexual health has emerged as a global concept developed by institutional entrepreneurs like international organizations and non-governmental organizations. As a concept it is distributed for example through development aid programs and agencies which try to change government policies as well as collective and individual sexual and reproductive practices of the general public or certain population groups in a society. The global concept of sexual and reproductive health contains normative, regulative and cognitive notions of appropriate sexual behavior, legal frameworks for the implementation of reproductive rights in national health systems and conceptions about the functionality of human sexuality or delivery.
This global concept is contested even on the global level and is localized in a social and cultural context with local understandings and constructions of sexuality, femininity and gender which therefore often leads to frictions, negotiations and conflicts when for example reproductive rights are introduced through international development programs.

Based on our work on the emergence of a global institutional field of sexual and reproductive health and on field research on development practices in this paper we want to discuss why in some cases these conflicts do not occur on the local level. Our argument is that development polices in the field of sexual and reproductive health to a certain extent fits quite well into local gender norms and constructions of sexuality because they treat women as responsible for sexual and reproductive rights even for men, e.g. by caring about sexual enlightenment and contraception.

Beyond or within medicalisation? Discussing Viagra and its discontents
Raffaella FERRERO CAMOLETTO (Dept. Cultures, Politics and Society, University of Turín, Italy) | raffaella.ferrerocamoletto@unito.it

In the last decade, a lively debate on medicalisation has developed, with scholars discussing its heuristic value and the need for new conceptual tools (such as biomedicalisation and pharmaceuticalisation) to grasp the complexity of emerging social processes (Abraham 2010; Clarke, Shim 2011; Williams et al. 2011; Bell, Figert 2012). Among these processes, the advent of Viagra and other pharmaceuticals treating erectile dysfuction (ED) has triggered a rich strand of theoretical analysis and empirical research.

Drawing on qualitative data from interviews with medical experts and on-line forums among experts and lay people dealing with male sexual health issues, the paper aims at discussing how the Viagra phenomenon works as a fruitful case-study to assess the actual heuristic potential of the medicalisation framework.

The paper will investigate the way medical professionals and consumers account for uses of ED pharmaceuticals, unveiling plural and ambivalent meanings. On the one hand, medical experts, while complaining a general decline of their professional dominance and the emergence of patients’consumerism, express controversial positions questioning the definition of the disease, its legitimate treatment and its target. On the other hand, male consumers, while claiming for an active role in defining their sexual discontents, show also compliance with a quick-fix pill culture challenging the boundaries between cure and enhancement.

The complexity of these accounts will be analysed by recalling Conrad and Schneider’s (1980) three-dimensional articulation of medicalisation (conceptual, institutional, relational), showing how the construction of male sexual health in the Viagra culture entails a multidimensional and bidirectional medicalising process.

Medicalizing masturbation: Danish sperm donors, biomedicine, and affective masculinities
Sebastian MOHR (Aarhus University, Denmark) | semo@edu.au.dk

The public figure of the sperm donor is one of masturbatory mystique: young virile men enjoy moments of sexual ecstasy and receive cash in return. However, nearly nothing is known about sperm donors’ experience of masturbation. Despite its central role in contemporary reproductive biomedicine, masturbation is not of importance for most researchers interested in biomedical regulation. Based on interviews with Danish sperm donors and ethnographic fieldwork at Danish sperm banks, I want to provide insights into what it means to produce semen samples as part of reproductive donation. Instead of making assumptions about how easy it is to donate semen, since it ‘only’ involves masturbation, and rather than dismissing masturbation as a central
A critical look at the medicalisation of women’s sexuality at menopause and midlife
Sharron HINCHLIFF (University of Sheffield, United Kingdom) | s.hinchliff@sheffield.ac.uk

"Without oestrogen, the quality of being female gradually disappears. The vagina begins to shrivel, the uterus gets smaller, the breasts atrophy, sexual desire often disappears, and the women becomes completely desexualized. Actually, it is a little worse than that." (Reuben, 1970: 288)

Menopause has long been medicalised: from the Victorian era where clinicians advised women to rest and avoid ‘over-exciting’ the mind, to the mid 20th century where hormone therapy (HT) was widely promoted to ‘restore’ the femininity that accompanied a decline in the hormone oestrogen. At this time, medical discourses positioned women’s sexuality during the menopausal transition in terms of decline (‘vaginal atrophy’) and loss (of sexual desire).

In this paper I explore the medicalisation of sex at menopause, drawing on literature from sociology, (critical) psychology and social gerontology as well as qualitative research carried out with women. Focusing on women’s own perspectives is important because the bulk of research on sex and menopause has been conducted within a biomedical framework, which often obscures other factors that can influence women’s sexual well-being at this time. I also examine competing discourses around midlife women’s sexuality. In particular, how this representation of the sexually ‘void’ menopausal woman fits with the ‘new’ representation of midlife women as sexually agentic, desiring and desirable: the ‘sexy midlifer’.

Listening to young people as a strategy to improve sexual education in Poland
Maria Monika WOŹNIAK (University of Warsaw, Poland) | marysia.wozniak@gmail.com

The debate concerning youth sexuality in Poland is focused mostly around issues of sexual education. Particularly, on trying to answer questions about the ‘most appropriate’ form which “family life education” should take. The discourse is dominated by the voices of adults belonging to political and symbolic elites (i.e. politicians, teachers, clergy). Hence being a public issue it expresses a great diversity of norms, beliefs and attitudes towards sex. Yet, the actual opinions of young people, which often reflect authentic, personal troubles and generational needs are largely being ignored.

The presentation will be focused on discussing my PhD research project based on qualitative interviews which seeks to uncover feelings, experiences and visions of young people in Poland that are being overlooked in political discourses and are not being studied extensively in scientific discourses. This is especially important when discussing the voices of LGBTQ youth in the discourse concerning sexuality education.
It is hence designed to highlight the essence of the research carried out with Polish youth in order to understand the ways in which young people perceive everyday aspects of sexuality in which they engage, what are the cultural scenarios that are available to them, what is the impact of current sexual education school program, how do the system and the mentioned scenarios effect young people current and future behaviour, beliefs and values. Especially in relation to LGBTQ youth.

All these points are designed to facilitate the construction of a tailor made sexual education program, which will meet young people’s expectations.

**Italian university students: sexual behavior and health risk**

Michaela LIUCCIO (University La Sapienza, Italy) | michaela.liuccio@uniroma1.it
Chiara BORGIA (University La Sapienza, Italy) | kiaraborgia@gmail.com
Benedetta MARTINO (University La Sapienza, Italy) | bene_m@hotmail.it

Sexually transmitted diseases (STDs) account for some of the most serious public health problems worldwide. The WHO (2013) has estimated that STDs have an annual incidence of 333 million cases without including AIDS. Out of those 333 million new cases estimated annually, at least 111 affect young people under the age of 25. The aim of this survey is to identify risky sexual behaviors in young people and to describe the perception / awareness that young people have of the risks they are exposed to.

In line with the aim of our survey, an "Anonymous Questionnaire" was designed in compliance with confidentiality rules which was inspired by Fishbein’s Integrative Model as a reference model (2000). For the selection of the items and the Likert type scale to be adopted, Ajzen was chosen as a reference (2011). For evaluating the perception of the risk associated with sexual behavior, instead, Donizzetti was selected as a reference source(2009). Finally, for the preparation of the items to be investigated in relation to risky sexual behaviors, the use of psychoactive substances and earlier screening, the Behavioral Risk Factor Surveillance System (BRFSS) of the Center for Disease Control and Prevention was selected as a reference model.

The research sample consists of young university students from Rome La Sapienza. A preliminary investigation took place with the involvement of 20 university students from Rome La Sapienza. In its final version, the questionnaire has been turned into a Web Survey and forwarded via email to all La Sapienza University students through INFOSTUD (an electronic answering system in place at La Sapienza University). At present 3469 students responded to the questionnaire and the survey is still in progress. The questionnaire aims at investigating risky sexual behaviors both qualitatively and quantitatively, the use of psychoactive substances in association with sexual behaviors, the intention to adopt healthy sexual behaviors, the perception young people have of rules, the attitudes and preconceived ideas about sexual behaviors, self-efficacy, and the perception of the risk to our own health and to that of our peers falling under the same sexual sphere. Data analysis will also take place by cross-checking the above mentioned variables with other relevant variables including: gender and age differences, the university faculty of origin, off-site or on-site student status, the source used to extract information about sexual and reproductive health, the age of sexual initiation, any history of STDs communication, presence or absence of a stable partner.

Sexual orientation and health in England: evidence of health inequalities, and challenges in the method, practice and policy of recording and interpreting data: a multimillion case dataset
Alex POLLARD (Brighton & Sussex Medical School, United Kingdom) | a.pollard@bsms.ac.uk
Tom NADARZYNSKI (Brighton & Sussex Medical School, United Kingdom) | T.Nadarzynski@bsms.ac.uk

Systematic reviews show consistent inequalities in the physical, mental and behavioural health of Lesbian, Gay and Bisexual (LGB) people, but the legacy of stigma and marginalisation has limited investigation into sexual orientation as a social determinant of health.
We present statistical analysis of one year’s data (1 Million GP patients) from the ‘GP Patient Survey’ (UK Department of Health). This data includes self-report of respondents’ sexual orientation (14,142 LGB), which is unique in the world for its extent and diversity.
The ‘GP Patient Survey’ is an annual, anonymous, proportionally stratified, postal survey of 1 million adult GP patients in England each year. Its primary purpose is to evaluate patient experience of General Practitioners (GPs), but including sexual orientation alongside health conditions and European standardised measures of health (EQ-5D) enables internal comparison of health across sexual orientations.
The scale, proportional sampling and diversity of this sample also enable exploration of the use of reductionist categories of sexual orientation (Heterosexual, Lesbian/Gay, Bisexual, Other, Prefer Not to Say); patterns in the disclosure of sexual orientation; and the geographical distribution of respondents.
We present data on:
* bias in the willingness/ability of patients to disclose non-heterosexual identities
* patterns in patients’ response to the available categories of sexual orientation
* evidence of health inequalities between sexual orientations
* the potential application and effectiveness of data on sexual orientation.
We also touch on differences between data from anonymous surveys and data from health services, which could usefully be linked to the health experience and needs of individual patients.

Large system of sexual education in Russia: why do women want to know more about sex?
Alexander B. ROSLYAKOV (Znautvse.ru Sociological Research Service, Russian Federation) | karsuh@gmail.com

My report is possible after a long case study of educational centre "Sex.rf" – the largest system of commercial sex-courses in Russia and monthly interviews with its customers on different aspects of their sexual behaviour, predominantly in Moscow. We’ve got a full picture of social regulators of female sexual behaviour: norms, including tabu, goals, values, etc.
These are the main characteristics of my report:
Firstly, this picture was mainly done from women's point of view and secondly, my object was a specific group of women: most of them were at their fertile age and highly educated. As a result I will answer some questions about their motivation: why they choose a sexual education, what they like and dislike about it, how they see their own sexuality, men and other women.
Adolescent Girls’ Menstruation Management and Meaning in Rural Kenya

Molly SECOR-TURNER (North Dakota State University, United States of America) | molly.secor-turner@ndsu.edu
Kaitlin SCHMITZ (North Dakota State University, United States of America) | schmitz.kait@gmail.com
Kristen E BENSON (North Dakota State University, United States of America) | Kristen.Benson@ndsu.edu

Rural Kenyan girls miss up to 8 weeks of school annually due to limited access to reliable hygienic sanitation and sanitary products. This study describes the menstruation experiences of adolescent girls living in rural Kenya with consideration of the context of gender, poverty, and education. Twenty-nine adolescent girls, ages 13-21 years were interviewed in the Kaare Subarea of Tharaka-Nithi County, Kenya. Four primary themes emerged: 1.) Receiving Information about Menstruation, 2.) Experiences of Menstruation, 3.) Menstrual Hygiene Practices, and 4.) Social Norms and the Meaning of Menstruation. One participant stated, “When I have menstruation, I cannot… come to school. When I don’t have the pads, I stay at home.” We found that challenges related to menstruation were directly linked to experiences of education and socialization. Global priorities to address gender inequality, especially related to education, need to consider the impact of poverty and gendered experiences, such as menstruation.

‘Football Fitness’: Constraining and enabling possibilities for the management of leisure time for middle aged women

Lone Friis THING (Copenhagen University, Denmark) | lfthing@nexs.ku.dk
Maria Gliemann HYBHOLT (Copenhagen University, Denmark) | maria.hybholt@nexs.ku.dk
Laila Susanne OTTESEN (Copenhagen University, Denmark) | lottesen@nexs.ku.dk

The aim of the paper is to generate empirically based sociological knowledge about a ‘Football Fitness’ intervention carried out in associative sport clubs. There is an increased pressure on the voluntary sector, e.g. the sport clubs, to embrace new segments of users and to meet social and health-related societal challenges related to the welfare state. The empirical material is based on six focus group interviews with female participants (aged between 24 and 53) from different clubs all over Denmark. Approximately 32 people have participated in these focus group interviews. The manner in which recreational football activities and the ‘Football Fitness’ concept are experienced from a participant perspective is examined. We investigate how the implementation is actually carried out in the local football clubs and identify constraining and enabling possibilities for the management of leisure time. We also examine how Football Fitness as an activity and concept can ‘work’ for the participants in their everyday life. Even though it is a few decades since Elias and Dunning wrote (1986: 93) that leisure remains relatively neglected as an area of sociological research, their statement is still relevant, and inspired by them, we have chosen to analyse Football Fitness as part of a spare-time spectrum. How do grown up women make sense of their new ‘football lives’?

Joint associations of smoking and physical activity with disability retirement and mortality
Ossi RAHKONEN (Department of Public Health, University of Helsinki, Finland) | ossi.rahkonen@helsinki.fi
Jouni LAHTI (Department of Public Health, University of Helsinki, Finland) | jouni.mm.lahti@helsinki.fi
Eero LAHELMA (Department of Public Health, University of Helsinki, Finland) | eero.lahelma@helsinki.fi
Tea LALLUKKA (Department of Public Health, University of Helsinki, Finland; Finnish Institute of Occupational Health, Helsinki, Finland) | tea.lallukka@helsinki.fi

Background: We examined the joint associations of smoking and physical activity with disability retirement and mortality.

Methods: Survey data on smoking and leisure-time physical activity collected among 40-60-year-old employees of the City of Helsinki, were linked with register data on disability retirement from the Finnish Centre of Pensions and mortality from Statistics Finland (n = 6390 67%). Cox regression models were fitted, and the follow-up continued until the end of 2012. No gender interactions were found.

Results: No excess risk of disability retirement was observed among ex-smokers and moderate smokers with vigorous physical activity, while ex-smokers and moderate smokers who were inactive had an equally increased risk of disability retirement. All heavy smokers had an increased risk of disability retirement irrespective of their level of physical activity. Smokers also had an increased risk of mortality, but the risk was highest among inactive and moderately active smokers. Vigorously active had no excess risk of mortality. Among non-smokers patterns of the associations suggested that inactive non-smokers might have a higher risk of mortality. Risks were, however, lower than among smokers.

Conclusions: Level of physical activity affects the risks of disability retirement and mortality both among smokers and non-smokers. However, among heavy smokers physical activity is likely not sufficient to counteract the adverse effects of intense smoking on work ability. Amount of physical activity affects the risk of mortality among smokers. Vigorous physical activity is associated with survival, while the highest mortality risk is found among physically inactive or only moderately active smokers.

Physical Activity Interventions to Promote Health in a Highly Vulnerable Group? – the Case of Residential Aged Care

Viktoria QUEHENBERGER (Ludwig Boltzmann Institute Health Promotion Research, Austria) | viktoria.quehenberger@lbihpr.lbg.ac.at
Martin CICHOCKI (Ludwig Boltzmann Institute Health Promotion Research, Austria) | martin.cichocki@lbihpr.lbg.ac.at
Karl KRAJIC (Department of Sociology, University of Vienna, Austria; FORBA- Working Life Research Centre, Vienna, Austria) | karl.krajic@lbihpr.lbg.ac.at

Introduction: Users of residential aged care (RAC) have a high prevalence of physical and cognitive functional impairments. There is evidence that even such a vulnerable group can benefit from (predominantly) high frequent/intense PA interventions but it is questionable if such a vulnerable group will/can regularly attend intense programs; in addition documentation on sustainability of effects is scarce. The objective of this study was to examine health effects of a low-threshold (i.e. low demands on health status and discipline) PA intervention in RAC and their sustainability.

Methods: The intervention took place in three RAC homes in Vienna, Austria, using an evidence-based curriculum. The study was conducted as an RCT with an additional assessment in the intervention group one year after completion of the trial.
Results: Program components like variety of content, individualization and exercises’ relatedness to everyday life were found relevant; pro-active recruitment and personalized support were reported to foster participation. The intervention was successful in improving residents’ subjective health status ($p=.002$). In a one year follow-up mainly those participants initially less functionally and cognitively impaired could be reached. Participants’ subjective health status was still significantly increased, equalling a small sustainable intervention effect ($p=0.02$, Cohen’s $d=0.38$). In comparison to baseline, a significant decline of reported pain/discomfort ($p=0.047$) was found.

Conclusion: Users of RAC can benefit of a low-threshold PA intervention and health effects can be sustainable. Yet there is need for research on mechanisms which enhance participation, for research on effects and their sustainability.

Time to become physical active? The complexity of everyday life in middle-aged women
Maria Gliemann HYBHOLT (University of Copenhagen, Denmark) | maria.hybholt@nexs.ku.dk
Laila Susanne OTTESEN (University of Copenhagen, Denmark) | lottesen@nexs.ku.dk
Lone Friis THING (University of Copenhagen, Denmark) | lfthing@nexs.ku.dk

Even though it is by now well documented that physical activity has preventive and health-promoting effects recent studies show that a continued significant proportion of the Danish middle-aged women among others are not living their life in accordance to the health advices from governmental institutions based on scientific research. Additionally, international studies have shown difficulties with adherence to health intervention, which underpin the complexity of lifestyle changes not only to be a individual informative matter but rather a highly societal complex concern.

The present study examine how the relations between family, work and leisure activities can influence the everyday life of middle-aged women with focus on time management.

The empirical material built upon a physical intervention, which included former inactive middle-aged women participating in spinning lessons three times a week during a three months period. Nine focus groups and further 23 qualitative individual interviews six months later were conducted with selected women through maximum variation. Additionally, observation of the training sessions and in the dressing room is part of the empirical material.

Therefore, from a participant perspective this paper will bring into focus how time management and the relations between family, work and leisure can be experiences as enabling as well as constraining for a lifestyle change concerning physical activity for women in middle age. These reciprocal relations seem decidedly important as regards the everyday life of these women. Furthermore, the study elucidates how the existing sociocultural norms relating to health are influencing these women’s everyday life but this paper will not elaborate further on the comprehensive health discourse present in the Danish society of today.

JS_RN16+RN28b - Physical Activity, Health & Inequalities II

Physical Activity Counselling by French General Practitioners: Does it Tend to Reduce or to Widen Inequalities?
Geraldine BLOY (LEDi UMR CNRS 6307, University of Burgundy, France) | gbloy@u-bourgogne.fr
Laurent RIGAL (CESP INSERM U1018, France) | laurent.rigal@inserm.fr
Physical activity (PA) is considered by medical guidelines a lever to improve health and well-being. Social gradients exist both in health and in PA, which is less common at the bottom of the social hierarchy. PA counselling could contribute to reducing inequalities in health... But, if counselling is more delivered to (or better received by) advantaged people, it may have the opposite effect.

We will focus on French General Practitioner (GP) attitudes and practices toward this type of counselling. GPs are consulted by the entire population and supposed to become involved in PA (for preventive purposes or for people with chronic illnesses) but their practices in this matter remain unknown in France. When and how do they promote PA? To every kind of patient? In a manner likely to reduce social inequalities or not? We conducted two studies: PrevQuanti examined how main preventive cares (including PA counselling) were offered by 52 GPs to 3640 patients. It showed GPs’ heterogeneous, but globally weak, involvement in this type of counselling and a social gradient among male patients, with less counselling at the bottom of the social hierarchy, where less physical activity was also declared by patients.

Based on interviews with 99 GPs on the same topics, PrevQuali explored the construction of one’s practice style for PA counselling. It stressed a common difficulty in considering PA as a valuable medical care, an implicit and social selection of the patients “worth trying” to counsel, and the strong influence of the GP own sport trajectory.

**Physical job-intensiveness, time use and health**

**Jef DEYAERT** (Vrije Universiteit Brussel, Belgium) | jef.deyaert@vub.ac.be
**Djiwo WEENAS** (Vrije Universiteit Brussel, Belgium) | djiwo.weenas@vub.ac.be

There is a wide medical consensus regarding the effects of physical activity on the promotion of general health and well-being. In this paper, the following research question will be addressed: ‘what is the relationship between levels of physical job-intensiveness with patterns of physical activity in free time and health outcomes in the Belgian population?’ Do full-time workers with a heavy physical job have more or less physically intensive patterns of behaviour in their free time? Can we see a sort of trade-off where people with heavier patterns of activity during work compensate with more sedentary or less intense activities in their free time? Furthermore, we will investigate whether these patterns of active behaviour are mediated by other aspects than job-intensiveness and how these are related with general health and mental health.

To answer these questions, Belgian Time-Use data of 2013 are used. All respondents within the household were asked to complete a questionnaire (including health, BMI and detailed job information) and to keep record of their daily behaviour in a diary during two days. Levels of ‘intensiveness’ are studied by linking detailed job information and the registered activities in the diaries with an internationally validated typology of MET scores.

A crucial advantage in using diary data to study time use lies in the fact that respondents usually underestimate the amount of time spent watching television and overestimate the amount of time spent on sports activities, when compared to their own diary registration.

**(Un)fitness, moral commitment and unequal reputations: insights from the experience of wounded, injured and sick soldiers**

**Davide STERCHELE** (Leeds Beckett University, United Kingdom) | d.sterchele@leedsbeckett.ac.uk

In a similar way to professional athletes, soldiers’ identity and reputation are highly dependent on physical fitness. Being fully fit-for-duty is a fundamental requirement especially for those armed forces personnel, whose daily routine is based around hard physical training that prepares them to keep up with the pace of the group on the battlefield while carrying heavy equipment and under extremely hard environmental conditions.
Besides this clearly functional value, military drills are also paramount in building and sustaining group cohesion through repeated durkheimian rituals based on shared attentive/emotional focus and mutual rhythmic coordination. As the existence and survival of the group relies on these rituals, the moral status of its members depends on their ability to meet the physical standards which enable their efficient participation. Since the moral status and professional reputation of these military personnel are so hugely influenced by their fitness, it is not surprising that injuries and illnesses have a massive impact on both the way the soldiers are treated and the way they perceive themselves. Being “medically downgraded” can be a career-threatening situation that often generates uncertainty, frustration, depression and self-stigmatisation. The fear of this occurrence frequently leads to unhealthy behaviours such as concealing physical and psychological pain and pathologies for as long as possible, which aggravate such conditions and eventually impair recovery. The paper explores these issues, drawing on ethnographic fieldwork and qualitative interviews undertaken during the Battle Back Multi-Activity Course, an adaptive sport and adventurous training programme for wounded, injured and sick British soldiers.

The influences of temporal structures on health

Djiwo WEENAS (Vrije Universiteit Brussel, Belgium) | djiwo.weenas@vub.ac.be
Jef DEYAERT (Vrije Universiteit Brussel, Belgium) | jef.deyaert@vub.ac.be

In this paper, the following research question will be addressed: what is the relationship between time spent on physical or non-physical activities and health outcomes in the Flemish population? Differences in health outcomes have been closely linked to lifestyles, and in response to this, a public debate started in Flanders on whether or not people with unhealthy lifestyles should pay more to receive medical coverage. In this public debate, certain academics replied that lifestyles, and their consequences on health outcomes are related to social inequalities, and that individuals should therefore not be charged with the costs of their unhealthy lifestyles. The societal relevance of this research is therefore twofold: how do lifestyles or activity patterns affect health, and to what extent do social inequalities play a role in this relationship? Data from the 2013 Flemish and Belgian time-use surveys will be used. Before recording their time-use in a 2 or 7 day diary, respondents also filled in a questionnaire, allowing us to investigate whether (un)healthy lifestyles are correlated with sociodemographic background variables. A crucial advantage in using time-use data to study this relationship lies in the fact that respondents provide very exact information on the types of activity, their duration and their embeddedness in the structure of daily life. These activities can be linked to an internationally validated typology of MET scores, which enables us to differentiate between different levels of physical and non-physical activities, thus taking it further than a division between sedentary and non-sedentary behaviour.
FLEXLIFE-project: Temporal flexibility of work and its effect on later work and family life
Jouko NÄTTI (University of Tampere, Finland) | jouko.natti@uta.fi
Satu OJALA (University of Tampere, Finland) | satu.ojala@uta.fi
Tiina SAARI (University of Tampere, Finland) | tiina.p.saari@uta.fi
Pasi Juhani PYÖRIÄ (University of Jyväskylä, Finland) | pasi.pyoria@uta.fi
Timo ANTTILA (University of Jyväskylä, Finland) | timo.e.e.anttila@uta.fi
Mia SALIN (University of Jyväskylä, Finland) | mia.salin@uta.fi
Tomi OINAS (University of Jyväskylä, Finland) | tomi.oinas@uta.fi

Work is moving beyond its traditional borders of time. Instead of a standard industrial working time model (eight-hour day, five-day week, work in the daytime, free evenings, weekends, annual holidays and retirement with old-age pension), a new temporal flexibility called a ‘post-industrial working time’ regime is becoming more common. FLEXLIFE-project is funded by Academy of Finland (2014-2018). The project examines long-term social consequences of temporal flexibility on later work and family life, by follow-up data up to 35 years at individual level and 13 years at family level (respondent, spouse, children). In this study we conceptualize temporal flexibility to have four dimensions: the number of hours worked (duration), the timing of the work, working time autonomy, and work-time intensity (tempo). Furthermore, we will emphasize the nature of time as socially constructed and gendered, and thus also the importance of subjective experiences. Our focus is on the long-term social consequences of short and long working hours, the unsocial timing of work, and the high tempo and degree of autonomy of working time for employees and their families (spouses and children).

The main research questions in this project are: 1) What is the prevalence of temporal flexibility of work and what are its characteristics at individual and household levels and in Finland and in EU countries? 2) What are the long-term social consequences of temporal flexibility for employees and their families and for later work career, later family life and children’s later life?

Our data is a combination of thematic interviews and surveys on working conditions and household-based time use, merged with long register-based follow-up data, including Finnish Quality of Work Life Surveys, European Working Conditions Surveys, Finnish Time Use Survey and Follow-up Finnish data.

Masters as Servants – Organisational agility as source of dissatisfaction
Jussi OKKONEN (University of Tampere, Finland) | jussi.okkonen@sis.uta.fi

Many professional groups are facing new challenges in work as duality in work rises its head. Traditional forms of organising tasks have been changed by ubiquitous computing, say virtue of constant connectivity and attention to work. Moreover, several routine tasks are allocated to people who are not hired to perform them, and their resources are wasted while conducting secondary chores instead of the primary ones.

The issue of job satisfaction is relevant when (under)performance and motivation of professionals is discussed. Performance and motivation are related to persons work identity and
how it manifests itself in daily operations or participation in longer term. The key proposition for this paper is that people are risk averse in work (too) and they are better off if they have sense of control in their work, thus they avoid random tasks and keep with familiar ones.

The paper is based on series of studies conducted among professionals in finance and insurance, accounting, law, public services, and medicine. The data utilised was gathered for user experience (UX) studies in general human computer interaction (HCI) research, yet certain themes started to saturate as people filled surveys and they were interviewed.

Key findings relate to professional identity, motivational factors in work, performance and procrastination, and information ergonomics. The paper opens new vistas on the issues of changing and restructuring work organisations and how those affect different employee groups.

RN17S01 - Social Dialogue in Europe

Representativeness of social partners in three European sector social dialogue committees
Peter KERCKHOFS (Eurofound, Ireland) | Peter.Kerckhofs@eurofound.europa.eu
Pablo SANZ (Notus, Spain) | pablo.sanz@notus-asr.org

The EU has been developing a framework for European Sectoral Social Dialogue (ESSD) since 1998, creating more than 40 European social dialogue committees covering about 145 million workers throughout the Member States. Since there, research has shown great interest on understanding processes and dynamics on this new form of multi-level sectoral social dialogue. Some research suggests the existence of a link between European sectoral social dialogue (ESSD) developments and sectoral industrial relations structures in the EU Member States. They argue that because the sector is a prominent level between the European, national and company levels, its organisation and cross-border similarity affects the capacity to develop and implement ESSD. Accordingly, features such as low actor fragmentation, high organisation density and high levels of collective bargaining are generally found in the sectors where ESSD appears, at least formally, to have been most productive.

Bearing this in mind, the paper will analyse link between European sectoral social dialogue (ESSD) developments and sectoral industrial relations structures in the EU Member States in three sectors: electricity, chemical and furniture. Besides, it will analyse similarities/differences between organisational features of industrial relations regarding representativeness on the one hand and ESSD developments and results on the other.

This paper will build further upon the data collected within the Eurofound representative studies conducted for the three sectors.

Employers’ organizations in post-communist countries: strategies for surviving in the market economy of Romania
Claudia PETRESCU (The Research Institute for Quality of Life, Romania) | claucaraiman@yahoo.com
Gabriel STANILA (The Research Institute for Quality of Life, Romania) | gabriel.stanila@gmail.com
Mihaela LAMBRU (The Research Institute for Quality of Life, Romania) | lmb_ro@yahoo.com

As in all Central and Eastern European countries that shifted away from a planned economy towards a market economy after 1989, worker cooperatives in Romania are faced with a series of difficulties due to their distorted functioning during communism: a public image influenced by the former socialist cooperative system in which cooperatives were established top-down, without genuine member participation; lack of management skills adapted to the new economic
context; deficient knowledge of the right to associate; and problems related to the legal status of cooperatives (in particular to property) that still await solving. Moreover, there are issues concerning political recognition and support through innovative policies.

The collapse of communism and the period of transition that marked Romania in the 1990s brought about a structural change in the system of worker cooperatives that redefined their societal role, reorganized their production of goods and services, redefined the supply of goods and services, changed product marketing and identified new markets for their goods. As economic agents, cooperatives in Romania have managed to survive and even make a profit in areas where they had serious competition from other SMEs. Their competitive edge comes from the fact they own production facilities and machinery.

Our paper, based on a quantitative and qualitative research, explores the various types of crisis that have taken a toll on worker cooperatives in Romania, both those with lasting structural consequences and those that are context-related. Also, we critically examine the conditions that cause Romanian worker cooperatives to fail or succeed.

The role of shared beliefs in the scope and legitimacy of European policy making - implications on the structure and efficiency of social dialogue
Barbara BECHTER (University Durham, United Kingdom) | b.b.bechter@gmail.com

The objective of this paper is to identify and analyse barriers to the effective involvement of trade unions and employer organisations in European Sectoral Social Dialogue (ESSD). Social partners’ participation in transnational social dialogue and policy making varies significantly across the European member states and also across sectors. Barriers to effective involvement identified in previous research are: the structure of industrial relations systems, decreasing union density and coverage of collective bargaining, the lack of interest of employer organisations in participating in dialogue at the European level, or social partners’ general lack of interest in the issues addressed in ESSD committees. Little, however is known about the conditions associated with these causes and if and how they interact with each other in different contextual settings. The paper will discuss the role of shared beliefs on the scope and legitimacy of ESSD policy and the structure of social dialogue. This research seeks to analyse and model real-life interactions to improve European social governance and enhance the reflexivity of European institutions at both the national and supra-national level. A multi-level analytic approach is used to identify and analyse the interactions and communication between social partners at national, transnational and the ESSD level. Hence, the analysis encompasses both vertical and horizontal dimensions of dialogue between and within trade unions and employer organisations. The aim is to advance our understanding of the motivations of trade unions and employers organisations and their ability to participate in ESSD.

Is Europeanised Board-level Employee Representation Specific? The Case of European Companies [SEs]
Aline CONCHON (European Trade Union Institute, Belgium) |aconchon@etui.org
Jeremy WADDINGTON (University of Manchester, United Kingdom; European Trade Union Institute, Belgium) | jeremy.waddington@mbs.ac.uk

Workers are granted the right to be represented on corporate boards with the same rights and duties as other board members in no less than 19 European countries. In addition to these national legislations, board-level employee representation stands as a European-level feature insofar as it is anchored in European law. The 2001 statute for a European Company (known as ‘SE’ after its Latin name Societas Europaea), which is a Europe-wide legal status of public
limited-liability company, was the first piece of European company law to include provisions on genuinely European board-level employee representation. Its enactment paved the way for the adoption of two further components of European company law, the 2003 Statute for a European Cooperative Society and the 2005 Cross-Border Mergers Directive, which both include provisions on board-level employee representation, based to a large extent on the SE Directive. Each case, therefore, led to the emergence of Europeanised boards on which sit not only employee representatives from the ‘home country’ of the company headquarters but also from the ‘participating countries’ in the establishment of an SE, a European Cooperative Society or a merged company. Because of the low number of established European Cooperative Societies (25 throughout Europe as of July 2012) and the lack of data with regard to the use of the Cross-Border Mergers Directive compared to the 2,285 SEs which were registered as of 15 February 2015, this paper exclusively focuses on the SE case as a point of departure for investigating Europeanised board-level employee representation.

In particular, the point under investigation in this conference paper is whether Europeanised board-level employee representation in SEs is specific. Is it truly ‘Europeanised’ in the sense that board-level employee representation on SE boards would act in a way which is not similar to that of its equivalent in the headquarters ‘home country’? Or, as it was initially feared with regard to EWCs, is it ‘coloured by the national system of their company’s country of origin’ (Streeck 1997: 331) in the sense that board-level employee representation in SEs would only be an ‘international extension of national systems of workplace [here, board-level] representation’ (ibid.)? Alternatively, is an intermediary position possible which, as was argued with regard to EWCs, represent an ‘intersection of country-specific and transnational influences’ (Marginson 2000:27)?

Analyses will be drawn from the comparison of responses provided by two set of actors to a questionnaire-based survey conducted from 2009 to 2013. The first set of actors is that of employee representatives who sit on the board of an SE (n=38). Since board-level employee representation in SEs is mainly to be found in German-based SEs, comparative analyses will be elaborated on the basis of responses provided by the second set of actors which is that of employee representatives who sit on the board of a German company. In addition, our analyses will benefit from the fact that comparisons can not only be made with responses from all 'German' respondents (n=1,213), but also, at a disaggregated level, to 'German' respondents who sit on a corporate board within the framework of the one-third codetermination system (according to which 1/3 of the board is composed of employee representatives, n=305) as well as within the framework of the parity codetermination system (in which 1/2 of the board is composed of employee representatives, n=870).

On the basis of these survey data, answers to the two following questions will be proposed: 1/ Do employee representatives from different countries act as a single and united collective actor on the board of an SE? The aggregation of employee representatives appointed from different countries does not automatically lead to the emergence of a collective actor with a single transnational identity as each individual may retain his/her domestic perspective. It has been argued, however, that employee representatives on SE boards ‘should take account of the interests of all SE employees’ (Kluge 2008:129) and not only those of their fellow countrymen. 2/ Are employee representatives on the board of SEs more, less or as influential on strategic decision-making as their domestic counterparts? Europeanisation of boards and, in particular, the acceptance of employee representatives from countries where employee representation at board level is unknown might lead to an increase of board-level employee representatives' influence insofar as ‘foreign’ representatives gain access to information that otherwise would have been unavailable to them. In contrast, the diversification of board-level employee representatives might lead to a juxtaposition of diverging perspectives and practices and a loss of unity in collective action as mentioned by some employee representatives on SE boards: ‘Representatives from countries with high standards […] argue a loose influence on corporate
decision-making due to a certain "dilution" of well-institutionalized and practiced rights' (Keller and Werner 2012:636).

RN17S02 - Social Dialogue and Employment Relations in Multinational Context

The Choice of the Employee in the Multinational Enterprise : Similarity of High Skill Professionals and the Factory Workers
Masayo FUJIMOTO (Doshisha University, Japan) | mfujimot@mail.doshisha.ac.jp

This study conducted a qualitative survey into the human resource management and education of the local employee at Japanese-multinational companies which expanded to Asian countries. Many of the companies in developed countries have their manufacturing factories in developing countries to minimize their personnel expenses. Many companies have shifted their factories to Asian countries such as Vietnam, Malaysia, etc. for cheaper labor cost. In manufacturing industries, the structure of exploiting from labors by capitalists has been studied, but, today, the situation is different. For example, Chinese labors easily change their job with communicating better employment conditions gathered by communications with friends through mobile phones which can be purchased with their one month salary. In high mobility area, there are both losing job possibility by lay-off or stop contract renewal, and well grown labor market for selective job changes. Thus, labors’ behavior is decided by their possibility of job acceptance and corporate welfare programs. About leaving ratio, there are many cases in Silicon Valley to keep skilled engineers with masters or doctors degree. Even for the labors of factory line, well trained and skilled labors left at same timing is a big problem for the managers. To keep them remained in company, it is very much important to propose interesting or skill growing jobs, or good work environment. At multinational companies in high mobility area, it is observed even among the factory workers that well trained and skilled labors have their options of selective job change by their possibilities of job acceptance.

RN17S02 - Social Dialogue and Employment Relations in Multinational Context

The Foxconn Employment System
Jan DRAHOKOUPIL (European Trade Union Institute, Belgium) | jdrahokoupil@etui.org

This paper examines the employment systems across the world operations of Foxconn and relates it to the business strategy of the firm. Headquartered in Taiwan, Foxconn is the largest
electronic manufacturing firm in the world with a major presence in China. Its business strategy is indicative of the shifts in the structure of global production networks in the sector, with MNCs from ‘emerging countries’ acquiring new roles. Foxconn has entered Europe as an employer, with production sites established in Czechia, Hungary and Slovakia. The analysis takes a holistic perspective on the firm and relates the outcomes in the affiliates to the global business strategy of the MNC. Particular attention is given to the degree to which the labour management regimes developed in the Chinese context are attempted to be replicated in Europe, the degree to which local conditions allow that, and the role of European plants in the wider business strategy of Foxconn. The analysis draws on secondary resources and primary data collected through case studies on employment relations and labour conditions in Foxconn plants in Czechia, Hungary, Slovakia, and China. These were analysed in the context of an edited-volume project on the topic organized by the European Trade Union Institute.

RN17S02 - Social Dialogue and Employment Relations in Multinational Context

Because they can. Collective bargaining in multinational corporations (MNCs) in Poland
Jan CZARZASTY (Warsaw School of Economics (SGH), Poland) | jczarz@sgh.waw.pl

The position of multinational corporations (MNCs) in Poland is so significant that the country is often employed as an example of Dependent Market Economy (DME) in Europe. As far as work and employment relations are considered, there are two opposing viewpoints on the role of MNCs: on the one hand, they are perceived as a channel for dissemination of ‘good practices’ in the field of work and employment relations stemming from their places of origin (‘Europeanisation’), on the other, there is a claim that MNCs simply take advantage of what host country has to offer, and if they can adjust to local labour standards (lower than those in their home countries), they likely will.

The paper is empirically based on the study “Collective bargaining in multinational corporations”, conducted in 2013 in 81 subsidiaries of multinationals operating in Poland with trade unions and collective agreements present. The study comprised quantitative and qualitative methods: a survey study based on standardized interviews with trade unions leaders (supplemented with interviews with HR managers) and content analysis of single-employer collective agreements in the subsidiaries in focus. The picture is mixed: while the standards of work and employment relations in the companies in focus are better than average (trade unions and collective agreements are in place), they are still flawed, mostly due to strong autocratic inclinations on the part of management. What is noteworthy, is that the results in many aspects contradict national stereotypes of industrial relations: in Scandinavian and German companies the state of collective bargaining is worse than expected, while in Francophone ones – better than one might presume.

Corporate Social Responsibility (CSR): A new lifeline for trade unions and collective bargaining?
Michael MULLER-CAMEN (WU Vienna, Austria) | Michael.Muller-Camen@wu.ac.at
Iris MAURER (WU Vienna, Austria) | Iris.Maurer@wu.ac.at
Ian ROPER (Middlesex University London, UK) | I.Roper@mdx.ac.uk
Sepideh PARSA (Middlesex University London, UK) | S.parsa@mdx.ac.uk
Over the last decades, most large corporations publicly committed themselves to be responsible organisations. In addition to a focus on profits, corporations these days propose to pursue a triple bottom line of financial, ecological and social goals. The achievement of these is documented in CSR and sustainability reports. The aim of the research reported here is to examine whether industrial relations (IR) are discussed in these reports and if so how corporations describe their relationship with organized labour. In particular we are interested to find out whether corporations propose to follow the ideologically dominant union avoidance strategy or present the picture of a harmonious and supportive relationship with trade unions. The sample of this study is based on the 250 world’s largest corporations that issue sustainability reports according to the guidelines of the Global Reporting Initiative (GRI). GRI contains two performance standards requiring organisations to report about the percentage of employees covered by collective bargaining and the extent to which they guarantee freedom of association.

First results indicate that there is considerable over-reporting in that corporations claim to report, but do not provide the information required by GRI. Whereas this part of the analysis did not show differences between corporations headquartered in different varieties of capitalism, the content analysis indicates that companies from CMEs such as many Continental European ones present IR as an important part of their CSR strategy. However, the CSR discourse does not provide a strong incentive for corporations from LMEs to revise their union-avoidance strategies.

RN17S03 - Human Capital, Human Resources and HRM

What is the Point of Globalization of Human Resource Management? From the Swedes point of view

Ylva ULFSDOTTER ERIKSSON (University of Gothenburg, Sweden) | Ylva.Ulfsdotter_Eriksson@sociology.gu.se

In 2011, the International Organization for Standardization (ISO) formed the technical committee ISO/TC 260 for Human Resource Management (HRM) in order to develop international standards for the field (ISO 2011). According to Society for Human Resource Management (SHRM), the need for global standards within the field is warranted (SHRM 2012). The need to regulate and homogenize HRM activities and practices has emerged from MNC operating all over the world but nevertheless strive for harmonized personnel management and synchronized HRM practices and processes. A global harmonization of HRM is also considered a means of preventing and remedying excessive local HR-solutions, practices and processes.

However, in comparison with others of ISOs TCs, there are rather few participating countries in the project. Sweden is one of them, and it has been tremendously hard for the local project leader to recruit participating organizations and HR-practitioners to the Swedish technical committee. This paper builds on interviews with participants who still remain and those who have dropped out, as well as field notes from committee meetings. The main purpose is to explain the lacking engagement for Global HRM standards from a Swedish point of view. The paper answers questions such as how the HR professional who participates in the work perceives global standards and what advantages or disadvantages global standards are perceived to have for employment relations and the HR-profession itself.
Social Networks in firms’ recruitment processes – Finding more and better candidates?
Gerhard KRUG (Institute for Employment Research, Germany, University Erlangen-Nuremberg, Germany) | gerhard.krug@iab.de
Martina REBIEN (Institute for Employment Research, Germany) | martina.rebien@iab.de

Social networks on the labour market are recognised to ease the matching between employers and job searchers, but research on their operational use in recruitment processes is scarce and mostly limited to case studies.

This way, Fernandez et al. (2000) identified mechanisms describing the benefits of social networks over other search channels. The “richer-pool”-mechanism states that social networks increase the pool of applicants quantitatively and qualitatively, while the “better-match”-mechanism suggests that the appropriate candidate is found faster through social networks.

Up to now, there is no study that prospects these mechanisms using quantitative data from a random sample of firms. We test the two mechanism using data from the German Job Vacancy Survey 2010 to 2014, which is a representative survey of (personnel) managers that provides detailed information on current labour requirements and recruitment processes from about 9,000 firms each year. It contains information on firms search channels, the duration of search, the number of (appropriate) candidates and requirements of the vacancy.

First results show that searching through social networks does not create a larger pool of candidates, but firms will find every second candidate to be appropriate, otherwise this rate is three out of twelve candidates. Therefore, the “richer-pool”-mechanism is proofed partly: there is no evidence for a larger pool of candidates, but social networks cause a qualitative improvement of it. Concerning the “better-match”-mechanism we find that if using social networks, the appropriate candidate is usually found latest within two month, otherwise this search process takes much longer.

Challenging human capital orthodoxy: the role of Labour Market Intermediaries in disorganized capitalism
Tony DOBBINS (Bangor University, United Kingdom) | a.dobbins@bangor.ac.uk

Contemporary academic and policy prescriptions based on orthodox supply-side human capital theory assumptions are inadequate for understanding and adjusting to deindustrialization and associated labour market unpredictability in regional economies like Wales, in the UK. This paper discusses alternative more integrated institutional approaches that match supply and demand in regional labour markets. The role of regional Labour Market Intermediaries (LMIs) in facilitating labour market adjustment, performing this matching function and brokering employment relationships is an important research issue (Benner, 2003, Benner et al., 2007; Autor, 2008; Goldstein et al., 2012). LMIs have been defined by Autor (2008:1) as ‘entities or institutions that interpose themselves between workers and firms to facilitate, inform, or regulate how workers are matched to firms, how work is accomplished, and how conflicts are resolved’. The paper addresses the research question: do LMIs address the challenges of matching supply and demand in regional labour markets? The contribution is to advance theoretical and empirical understanding of the operation of regional labour markets, especially the role of LMIs. Here, one specific LMI in North Wales called Shaping the Future (StF) with a remit to assist nuclear power workers facing into redundancy is explored empirically using qualitative ethnographic methods. The results suggest that StF primarily followed human capital theory orthodoxy in terms of retraining/reskilling workers made redundant but paid less attention to the demand-side of the labour market, in terms of matching re-skilled workers with actual (quality) job opportunities. StF was evidently in the business of helping workers adjust to disorganized
and uncertain labour markets associated with deindustrialization and trying to mitigate the effects of redundancy. But StF did not, and was not equipped to, play a broader role in regional re(development). Small-scale labour market interventions like StF (and LMIs generally) do not resolve the ongoing structural demand-side problem of paucity of quality jobs in deindustrialized regions like Wales. This would require coordinated state intervention on a much grander scale, notably a long-term industrial strategy involving multiple stakeholders as ‘social partners’. But policy-makers from all sides have consistently failed to address the massive socio-economic problem of creating new (decent) jobs in the aftermath of deindustrialization.

Ensuring the health and wellbeing of older workers
Andrea BROUGHTON (Institute for Employment Studies, United Kingdom) | andrea.broughton@ies.ac.uk
Rachel SUFF (Chartered Institute of Personnel and Development) | R.Suff@cipd.co.uk

The increasing age of Europe’s workforce has become a major policy focus at European level over the past few years. The fact that an ever greater proportion of Europe’s workers are classified as older workers (50+), creates a number of challenges in the area of employment and social policy. One of the main issues is how to retain older workers in order to maximise productive output to employers and to the economy as a whole, but also to enable them to carry on leading fulfilling lives, which include an element of work if they wish. Workers in particularly difficult or dangerous jobs tend to retire earlier than their counterparts in other types of work, but the majority of workers work in jobs that could be continued well beyond 60, with a little thought and some adjustments to tasks and work environment. Our research focuses on the challenges of employing an increasingly older workforce, concentrating on relevant health and wellbeing aspects and how the care responsibilities of older workers (such as caring for elderly relatives) can best be managed by employers. We examine the following issues: the types of workplace and working environment adjustments that need to be made to accommodate older workers; changes to work organisation in order to make it less strenuous for older workers; support with caring responsibilities; and countering prejudice against older workers. The research examines five countries: the Czech Republic, Denmark, France, Germany and the UK. The methodology comprises a literature review and up to three company case studies in each country, carried out during the first nine months of 2015.

RN17S04 - Old and New Actors and Processes in Industrial Relations

The Strange Non-Death of Employer and Business Associations: The Development and Transformation of Employer and Business Associations in Europe
Bernd BRANDL (University of Durham, United Kingdom) | bernd.j.brandl@gmail.com
Alex LEHR (University of Durham, United Kingdom) | a.lehr@fm.ru.nl

The representativeness of employer and business associations is challenged by the long-term socio-economic development and by short-term economic setbacks even though it is of central importance to enforce the needs of companies. Using a cross-national approach, the authors investigate how employer and business associations faced these challenges. The authors argue that these socio-economic changes have also offered opportunities. The results show that by adapting the organizational structure as well as their activities to the changing needs of companies, representativeness can be secured. This is done in particular, by shifting activities
away from engaging in binding collective wage-agreements and more towards non-wage agreements and involvement in training and active labor market programs.

Yellow unions and non-organized workers – what does it mean to the workers collectivity?

Jonas FELBO-KOLDING (University of Copenhagen, Denmark) | jf@faos.dk
Steen Erik NAVRBJERG (University of Copenhagen, Denmark) | sen@faos.dk

While the Nordic countries in general still have comparably high union densities, the union density in Denmark has eroded slightly over the last decade, from 73.1 per cent in 1995, dropping to 69.6 per cent in 2013 (Ibsen et al, 2013). However, the numbers are deceiving: while 2.1 per cent of all union members in 1995 were members of a so-called ‘yellow union’, in 2013 that number had increased to 8.7 per cent (‘yellow’ colleagues). Hence, while 71.0 per cent were members of a traditional union in 1995 that number had dropped to 60.9 in 2013.

At workplace level, the presence of non-organised colleagues or ‘yellow’ union members potentially undermines the worker collectivity vis-à-vis management. Using labour sociologist Sverre Lysgaard’s concepts of worker collectivity we analyze if and how the worker collectivity at the workplace has been influenced by the infiltration of ‘yellow’ colleagues; if the mandate of employee representatives is eroding; and how the representatives are coping with this (possible) infiltration of the worker collectivity. The theory is used to analyze data from an extensive shop steward survey conducted in 2010; a quantitative and qualitative project on cooperation in manufacturing in 2012; and qualitative interviews from 2014.

In conclusion, the paper discusses how the changes in the composition of the workforce – i.e. the deteriorating support of the worker collectivity at company level - affects the balance in the institutionalized labour market relations, that is the relationship between unions and employers organisations at central level.

Organizing the New Self-Employed: Varieties of Self-Employment, Membership and Attitudes Towards Interest Organizations

Giedo JANSEN (University of Twente, Netherlands) | giedo.jansen@utwente.nl

This study examines differences among self-employed in their membership of and attitudes towards interest organizations. With its recent rise, self-employment in advanced economies has developed into a heterogeneous employment type, with growing numbers of dependent/precarious self-employed who are exposed to high labor market risks, but generally enjoy low social protection. It is often suggested that these “new” self-employed are weakly organized. Both traditional organizations representing the interests of small and medium-sized enterprises (e.g. branch, business or employers’ associations) as well as trade unions struggle to recruit people in solo-self-employment.

This study aims to provide theoretical and empirical clarity on whether people in “new” (precarious) self-employment support the same organizations as those in traditional forms of self-employment. Theoretical clarity is needed as the sociological literature predominantly perceives self-employment in terms of classic class-based theories, i.e.: as a relatively monolithic social class with shared interests as entrepreneurs and (potential) employers. Alternative perspectives, putting self-employment under the umbrella of precarious or atypical work, have received far less attention. Empirically, quantitative data on the organizational alignments among self-employed workers is needed: To date, there is virtually no survey data available that allows to examine who is organized how – and why (or why not). Focusing on the empirical context of the Netherlands, this study addresses these shortcomings by collecting and analyzing unique and novel survey data among over 800 self-employed
workers, based on the Dutch ZZP Panel. This tailor-made survey was specifically designed to disentangle the organizational patterns of self-employed workers in various socio-economic positions.

The union organising turn in Ireland?

John GEARY (University College Dublin, Ireland) | john.geary@ucd.ie
Sophie GAMWELL (University of Middlesex, UK) | sgamwell@gmail.com

This paper explores the shift to an “organising” agenda in trade unions in the Republic of Ireland. Drawing on extensive case study research that included 69 interviews with union officials in five trade unions across various sectors, the paper charts the trajectories taken by the unions in their moves to develop an organising agenda. The paper situates the unions' engagement with organising within the broader social and political context, including the demise of social partnership, the deregulation of the labour market and the halting and hesitant attempts of the peak trade union confederation to engage with the “organising model”. The paper demonstrates and seeks to account for the fragmented and piecemeal manner in which the organising agenda has been adopted among Irish unions.

Substantive content
From 1987 to 2009 Irish unions operated under relatively benign conditions. The economy was buoyant; unemployment was low; wages and living standards rose appreciably; state supports for wage settlement arrangements (in the form of a National Minimum Wage, Employment Regulation Orders and Registered Employment Agreements) were well-established and supported union influence; and union leaders played a key role in national economic and social policy-making under the auspices of social partnership. However, these favourable conditions were suddenly and abruptly challenged with the onset of the global economic crisis in 2008. Social partnership collapsed in 2009 and employers and elements with the government and state agencies became increasingly hostile to the legal framework supporting wage regulation. These changes, along with the absence of statutory procedures for union recognition or collective bargaining, have made the Irish context an increasingly challenging one for trade unions.

Outside of Ireland, many unions have given increased attention to their membership levels, and have in recent years been drawn to looking at “union organising models. Such models gained increased prominence in the US in the 1980’s and in the UK in the late 1990’s (Simms et al, 2013). It is only comparatively recently in 2005-8 that Irish unions sought to incorporate union organising into their agenda. In contrast to the TUC in the UK, which established an organising academy, the Irish Congress of Trade Unions has played a relatively peripheral role in supporting unions in adopting an organising model. Rather Ireland’s largest union, SIPTU, has sought to champion the move to union organising, and has shared its expertise and training - provided to it by US partner unions - with other Irish trade unions.

In the late 2000s, two unions in Ireland sought to make ambitious changes to their structure and operations to incorporate an organising model. They were the general union, Siptu, and the retail sector union, Mandate. Both embarked on radical changes with the intention of reallocating significant resources from traditional membership servicing function to the adoption of an organising approach. In both cases the intention was to organise greenfield sites as well as to build density and organisation on sites with existing members. Two other case study unions, electrical and specialist union TEEU, and the communications industry union, the CWU, created specialist organising departments focused on greenfield recruitment. In contrast, the public sector union Impact, sought to build membership by recruiting specified staff groups and providing specialist servicing officials for these new members rather than building activism and capacity within the workplace or sector.
Methodology: The research was designed as case studies of 5 Irish trade unions. It included interviews with 69 trade union officials including the general secretaries of the 5 case study unions, servicing officials and union organisers. In addition interviews were conducted with officials at the Irish Congress of Trade Union. Preliminary findings were reported to 4 distinct groups of participants, the general secretaries of the 5 unions, senior organisers, junior organisers and to the ICTU directly. At each session, which lasted ½ to a full day, participants were asked to feed back their views on the research in a focus group setting which offered greater scope to compare, contrast and investigate the interconnections between unions, and the variations in their approach to organising.

Conclusion: In recent years, a number of Irish trade unions have sought to incorporate an organising model into their operations against the backdrop of an inhospitable economic climate. This paper appraises these efforts and seeks to account for the varying trajectories followed by the various unions and the variable success they have had in adopting an organising approach. Critical factors identified include:

• A lack of central support and a consequent difficulty in sharing practice and experience across union and among union organisers.
• Resistance within unions, which was exacerbated in a context of diminishing resources
• Inter-union rivalry
• Employer postures
• The 'status' of organisers. Most organisers were relatively young, recent recruits with few, if any, well-established links into the wider trade union movement. This resulted in them, in many cases, operating as experimenting islands lacking critical supports from within and outside their unions. This further reduced the capacity for inter-organisational learning.

Trade union cooperation and networking in Europe – viewed from the perspective of Nordic trade unions

Bengt LARSSON (University of Gothenburg, Sweden) | bengt.larsson@socav.gu.se
Kristina LOVÉN SELDÉN (University of Gothenburg, Sweden) | kristina.loven@socav.gu.se

The role of trade unions is of great importance in the European integration process. A crucial prerequisite for unions to take an active role is that they are able to cooperate across borders. Historically, most importance was given cooperation through the ETUC and the social dialogue. In the 2000s, more emphasis is put on the sectorial social dialogue. But it is important also to acknowledge ‘bottom up’ cooperation at bilateral, regional and European level, encompassing exchange of information; training programs; coproduction of statements; participation in trade union action; and coordination of collective bargaining. This paper is part of a comparative study of trade union cooperation and network-building at the sectoral level in Europe, aiming to explain what factors enable or hinder cooperation. Empirically, the focus is on the Nordic parts of the data sets; encompassing interviews and a survey with union representatives in six sectors, selected to maximize variation in terms of competitive pressure, production processes and risk for relocation (Mining, Metal, Construction, Transport, Banking/finance, and Health Care). The main research questions are: How are the cooperative networks structured within
different sectors? What similarities and differences in cooperation exist between different sectors? To what degree can these be explained by differences in industrial relations between sectors and countries? The study focuses on the following aspects of cooperation: a) joint statements in the sectoral dialogue, b) training/education, c) exchange of information and coordination of collective bargaining; d) cooperation on member enrolment; e) trade union action, and f) lobbying towards the EU.

The influence of international factors on employment and work: the case of the TTIP
Alessia Vatta (University of Trieste, Italy) | VattaA@sp.units.it

In recent years, the effects of globalization and internationalization on industrial relations have been recorded and widely discussed by social scientists. In some cases, crucial actors have assumed a very dynamic role (e.g. the multinationals). In other cases, specific events and long-term processes have proved relevant (e.g. some sentences by the European Court of Justice and the resort to flexible labour contracts). The TTIP (Transatlantic Trade and Investment Partnership) is a treaty currently being negotiated between the European Union and the United States. Though the talks started in 2013, the first details were made public only more than a year later, mainly because of protests and public pressure. Apart from the strictly trade and economic aspects, the agreement could exert influence on several work-related matters, first of all the employment levels (supposedly due to rise after the implementation of liberalisation provisions). However, a rather intense and controversial debate has risen about the clauses of the agreement and their consequences. Worries mainly regard the possible downgrading of working and welfare standards, the decrease of minimum wage levels, the political influence of big firms. The paper intends to investigate the potential implications of the TTIP on work and employment issues, and consider the role of European business and trade union organizations in the negotiation of the treaty.

Labour Control and the Workers’ Attitudes under the Factory Regime: Some Evidences of Two Joint Venture Auto Assemble Plants in China
Wei Zhao (Beijing Normal University, China, People’s Republic of) | zhaowei@bnu.edu.cn

China is the world’s largest and fastest-growing automobile manufacturing nation. There have been a certain number studies on worker’s working conditions in European and the North American countries. In contrast, there has been little written on the Chinese autoworkers. This article aims to contribute to the understanding of the impact on the workers, as well as the unions of the change in factory regimes in the Chinese automobile industry. Utilizing qualitative and quantitative research methods, but mainly uses qualitative methods. Case studies were conducted in two joint venture auto assemble plants in China in 2012. The main findings of this article are that, first, in spite of the implementation of foreign management methods from their parent companies, such as lean production, some old behaviors in the period of state owned have not been given up, a full range of economic, political, ideological control presents a trend of “collectivization”. Thus, labor control in these two factories has two characteristics, namely the "market-oriented" and "traditionalists". Second, China’s trade unions have retained their traditional concept in the context of the market economy. They play a role in helping the managers to control the workers for the purpose of social stable which is the required of the Party. Third, under this kind of factory regime, the workers have various choices, obeying, leaving, and a few small-scale resistances. The so called “collective action gradually” always erodes in the workshop level.
Discourses on work in modern Greece; a critical view from “below”.
Aikaterini NIKOLOPOULOU (Autonomous University of Barcelona, Spain) | aikaterini.nikolopoulou@e-campus.uab.cat
Leonor Maria CANTERA ESPINOSA (Autonomous University of Barcelona, Spain) | aikaterini.nikolopoulou@e-campus.uab.cat

Paid work has been forged as one of the main pillars of modern societies, thanks to various social practices that normalize it so as to seem part of the natural state of affairs. In contemporary Greece, among other settings, public discourse transforms “working power” to “human capital”, strategically intending to depoliticize work; “competitiveness” is preached as a virtue, while “employability” becomes a pivotal signifier of the discourses articulated by national and international governmental centers.

The proposed paper focuses on the creative reproduction of those discourses by Greek employees, at the dawn of the change of the political scenery. It discusses how individuals talk about paid work, upon which discourses they base their narrations, and how they articulate them in order to fashion their labour identities. At the same time, it traces alternative labour imaginaries as well as the discourses upon which individuals draw in order to construct them; tracking the rhetoric strategies followed, it illuminates the shadows of the modern metademocratic condition.

In this direction, interviews with people aged 25-45 that find themselves in a paid labour relationship were qualitatively analyzed, using as a theoretical basis discourse theory and applying the research tools provided by critical discourse analysis and discursive psychology. The research forms part of Aikaterini Nikolopoulou’s doctoral dissertation, supervised by Prof. Cantera Espinosa.

RN17S06 - Theoretical and Methodological Challenges in the Field of Work, Employment and Industrial Relations

East Meets West: the theoretical and methodological challenges of the critical labour studies in the UK, Poland and Hungary
Paul STEWART (University of Strathclyde, Glasgow, UK) | paul.stewart.100@strath.ac.uk
Adam MROZOWICKI (University of Wroclaw, Poland) | mrozowicki@gmail.com
Violetta ZENTAI (Central European University, Budapest, Hungary) | viola.zentai@opensocietyfoundations.org

This paper explores both crisis and revitalisation of critical labour studies in three countries, Hungary, Poland and the UK. Regardless of different historical trajectories and political contexts, the British, Hungarian and Polish critical labour studies were affected by similar challenges, such as (1) the marginalisation of the sociology of work in the academia; (2) the disappearance of the sociology of work from the teaching programmes; (3) loosening the vital links between sociologists of work and workers' movements; (4) relatedly, the relationship between these and the role of neo-liberal ideologies more broadly. There are, critically, a number of reasons for these trends including, inter alia, the neglect of certain areas of work; shifts in the academic division of labour; and the transformation of the world economy along with the challenges to trade union power. Simultaneously, albeit with different intensity, we can observe some indicators of the renewal of critical traditions beyond the boundaries of institutionalised sociology and the formation of a new, interdisciplinary research fields in all three
countries studied. This also involves new ways of critical engagement between researches and new categories of workers and a related search for a new research agenda and methodologies, such as Participatory Action Research. The paper concludes that the development of a CLS in Poland, the UK and Hungary can be linked to national trajectories of the respective labour movements, their relations with academic and other milieus, the legitimacy of critical (neo-Marxist, socialist feminist and other) intellectual traditions and specific conjunctures in critical social sciences (e.g. disciplinary encounters, cross-border intellectual effects and joint projects and programmes).

It takes more than one measure. Capturing the multidimensionality of job quality with job types and multiple job quality outcomes
Lise SZEKÉR (HIVA KU Leuven, Belgium) | lise.szeker@kuleuven.be
Sem VANDEKERCKHOVE (HIVA KU Leuven, Belgium) | sem.vandekerckhove@kuleuven.be
Stan DE SPIEGELAERE (HIVA KU Leuven, Belgium) | stan.despiegelaere@kuleuven.be
Monique RAMIOUL (HIVA KU Leuven, Belgium) | monique.ramioul@kuleuven.be

Many people spend a large part of their life at work and the retirement age is increasing, making job quality a key issue. However, it is a concept which cannot easily be assessed with one measure. This paper uses the job types methodology of Holman (2012) to capture and better understand the complex and multidimensional nature of job quality. This configurational approach allows to look at specific combinations of job characteristics and trade-offs between good and bad job characteristics. Using the data from the fifth European Working Conditions Survey we first made a typology of eight job types starting from a broad set of job characteristics. Next some consistency is identified with and across the typologies of Holman (2012) and Vandenbrande et al. (2012). In the second part, the relation between the job types and job quality (evaluated by job quality outcomes such as job satisfaction, health, job insecurity, etc.) is examined and trade-offs between the job characteristics impacting job quality are discussed. This paper concludes with a discussion of the main limitations and conclusions of this study.

Intervening in workplace harassment: Envisioning and enacting new, non-hierarchical social orders through participatory theatre
Elizabeth QUINLAN (University of Saskatchewan, Canada) | elizabeth.quinlan@usask.ca
Ann-Marie URBAN (University of Regina, Canada) | ann-marie.urban@uregina.ca
Beth BILSON (University of Saskatchewan, Canada) | beth.bilson@usask.ca
Isobel FINDLAY (University of Saskatchewan, Canada) | isobel.findlay@usask.ca

Psychological harassment among workers is a pressing occupational health and safety concern. No industrial sector is immune of harassment. However, in health care workplaces have especially high prevalence rates of repeated, sustained aggressive behaviour toward another within an interpersonal relationship characterized by a differential in power. The purpose of this paper is to report on a study of workplace harassment among caregivers working in the anemic workplaces of Canada’s restructured health care system. The study uses participatory theatre, a popular art form, to expand caregivers’ communicative, creative, and ethical problem solving capacities and provides a model of ‘bottom-up’ workplace cultural change. Participatory theatre is located in the established tradition, largely located outside the academy, of enlisting the popular, non-institutional arts as a medium of social integration and an arena for envisioning and enacting new, non-hierarchical social orders. A realist evaluation methodology is used to test and refine mid-range theory that explains how, under what circumstances, and for whom,
do participatory theatre interventions reduce workplace harassment. The results make explicit how harassment interventions interact with workplace contexts to activate the mechanisms that empower workers’ to become protagonists in their own lives by recognizing that social problems, such as workplace harassment, can be experienced individually but have structural antecedents. A key insight of a realist evaluation is any type of training intervention may work well in one type of workplace, but poorly or not at all in another type of workplace.

**Actors, Structure, and Mechanisms: Promises and Challenges of an analytical approach to Employment Relations Studies**

Alex LEHR (Radboud University Nijmegen, Netherlands, The) | a.lehr@fm.ru.nl

The paper discusses how the analytical approach to the social sciences might fruitfully be applied to typical to ER problems. It advocates structural-individualism as a basis for such an approach. The paper demonstrates how this can help unpack, clarify, and rigorously test causal processes, by reviewing existing examples and potential further applications in ER. At the same time, the paper also highlights the challenges associated with such methodological choices in ER research. In particular, the paper deals with the implication of an analytical approach to ER research for the scope of research questions; as well as the problems associated with 1) choosing and defining appropriate (natural and/or corporate) actors, 2) selecting and defining appropriate levels of analysis, and 3) the systematic study of embeddedness and emergence. The paper highlights the possibilities and challenges of an analytical approach with currently available data and methods and concludes by reviewing the advantages and promises of so-far sparsely used data and methods.

**RN17S07 - Changing Collective Bargaining**

Changing employment and working conditions in East-Central European healthcare sectors: from collective bargaining to state and market regulation

Monika Ewa KAMINSKA-VISSER (Universität Bremen, Germany) | m.e.kaminska@uni-bremen.de

Marta KAHANCOVA (Central European Labour Studies Institute, Slovak Republic) | marta.kahancova@celsi.sk

The paper studies the impact of post-1989 reforms in East-Central Europe’s healthcare on unions in the sector. It focuses on Czech Republic, Hungary, Poland and Slovakia. Although in the literature these countries are located in a single cluster of embedded neoliberal economies, their healthcare sectors are characterized by different sectoral regulatory and institutional frameworks.

The paper qualitatively documents and analyses how post-1989 reforms, including liberalization of labour markets and privatisation of healthcare provision, and changing national and sectoral regulation affect healthcare unions’ strategic capacities. It observes varying effects in terms of union density, bargaining capacity, legitimacy and union action.

In Poland, the combined effect of the provisions of the Trade Unions Act, the privatization of primary and hospital care, the fragmented structure of employers, and the conditions of service contracting for hospitals, has led to a disappearance of collective bargaining at all levels, a decline in membership among doctors (while membership among nurses remains high), and a demise of union external legitimacy. In contrast, Slovakia has observed the persistence of permanent employment contracts and coordinated bargaining in healthcare despite reforms in the new public management style. However, recent trade union dissatisfaction with legislative
changes on doctors’ and nurses’ wages fueled union fragmentation and a shift away from traditional bargaining structures to state regulation through union-driven legislative pressures, political lobbying, protests and strikes. Similarly, state regulation of hospital working conditions is gaining prominence over collective bargaining in the Czech Republic. In Hungary, collective bargaining never dominated healthcare industrial relations, but hospital reforms in the past decade produced further fragmentation of interests and more reliance on market regulation than collective bargaining as a method of governance.

Trade Union Renewal in East Germany
Stefan SCHMALZ (Friedrich Schiller-University Jena, Germany) | s.schmalz@uni-jena.de
Thomas Eilt GOES (Friedrich Schiller-University Jena, Germany) | thomas.goes@uni-jena.de
Marcel THIEL (Friedrich Schiller-University Jena, Germany) | marcel.thiel@uni-jena.de

In recent years, East Germany was considered a special case of German industrial relations: Trade unions were weak, and works councils existed only in few companies. Since then, employees changed their attitude towards unions and co-determination. Several unions such as the IG Metall (Metal Workers’ Union) gained new members continuously. Also, in Thuringia, Saxony and other East German federal states new works councils were established. In this paper, we analyze this ongoing trend of trade union renewal in East Germany. We focus on two cases, the Metal Workers’ Union (IG Metall) and the Food, Beverages and Catering Union (NGG). For our study, we draw on more than 50 in-depth interviews in 20 companies and on quantitative data on trade union membership and works council coverage. Our results show that a new generation of young activists pushes the organization process with low payment and poor working conditions being the main reasons for their activity. Also, trade union officials supported these grassroots activities with new organizing methods such as “condition-based trade union work” (bedingungsgebundene Gewerkschaftsarbeit).

Collective bargaining and new labour categories based on language autonomy of workers.
Amado ALARCÓN (Rovira and Virgili University, Spain) | amado.alarcon@urv.cat
Maria MARTINEZ-IGLESIAS (Rovira and Virgili University, Spain) | maria.martinezi@urv.cat

Collective bargaining and new labour categories based on language autonomy of workers. One notable aspect of informational capitalism is the increasing importance of worker’s language skills and abilities. Language becomes a commodity and a raw material in the production process, potentially objectified through scripts and protocols. This paper analyzes language rationalization in the workplace as an element of negotiation between trade unions and business organizations within contact centers in Spain. While business organizations try to homogenize and deskill the contact centers jobs, unions try to build a professional career by introducing industrial-related arguments based on work autonomy as source of productivity. Our research aims: 1) to identify the different processes of linguistic rationalization aimed at increasing the efficiency of communication, 2) to analyze the position and bargaining arguments used by trade unions and business organizations to achieve collective agreements regarding regulation of linguistic profiles and performance of workers. In the Spanish case, as we show in our paper, the outcome has been the creation of new job categories based on the linguistic autonomy criteria. The field work has been conducted through eight case studies in Galicia, Catalonia and Madrid. The project is founded by the Ministry of Education and Competitiveness (FFI2012-33316).
Path Dependency, Cross-class coalitions, and the Slow Road of the French Further Training System towards Segmentalism
Etienne COGNARD (Catholic University of Louvain, Belgium) | etienne.cognard@uclouvain.be

Based on 12 interviews with top representatives of the French union and employer confederations, our communication will analyse the strategies of these organisations during the last cross-sectoral collective bargaining on further training in France. The 2013 collective bargaining was a historical moment in the history of the French industrial relation system. Indeed, for the first time, employers were unable to propose a common draft and at the end of negotiation, the main SME confederation – CGPME – refused to sign. The principal bone of contentions was the strong willingness the general and employer confederation dominated by large firms – Medef – to put an end to the training levy.

We analyse the achievement of the 2013 collective bargaining and the following 2014 law on further training through the lens of employer collective action (Thelen and Busemeyer 2012). The suppression of the training levy constitutes a step from collectivism towards segmentalism in the French training system. It will indeed result in decreasing fund-raising for the bipartite training funds and thus a lower ability of social partners to implement sectoral training policies. Conversely, the reform introduces more leeway for firm-specific skill provision by (large) firms. My communication contributes to the emerging literature that points out the significance of cross-class coalitions in complex contemporary industrialised countries (Thelen 2003; Palier and Thelen 2010, Busemeyer 2012). This set of researches sees institutional change in the field of labour market regulation as the consequence of alliance between actors and socio-groups from both sides of the labour market, instead of mere class-struggle between capital and organised labour. For organisational motives, the CGPME and the building sector employer association entered into a ‘conservative’ alliance with the radical trade union CGT. They however were unsuccessful to oppose the ‘segmentalist’ cross-class coalitions between Medef, the craft SMEs association UPA, and the four remaining French union confederations.

Furthermore, in a historical neo-institutionalist perspective, we show that the rather limited institutional change introduced by the 2003 collective agreement is not only due to the necessity of setting up a winning ‘segmentalist’ cross-class coalition, but also to path dependency mechanism. Owing to their strong involvement in block release training, the main sectoral federations of Medef – bank/insurance and metalworking sectors – had no interest to lower even more the degree of collectivism of the further training system. Consequently, employers did try to lay into the training levy for ‘professionalisation’, which continues to be ruled under bipartite governance.

Craft unions and wage policy: High wage increases, perceived justice and organizational consequences
Matthias DÜTSCH (Otto-Friedrich-University Bamberg, Germany) | matthias.duetsch@uni-bamberg.de
Olaf STRUCK (Otto-Friedrich-University Bamberg, Germany) | olaf.struck@uni-bamberg.de

In recent years, several German craft unions have negotiated to an increasing degree independently from classical trade unions. Due to their homogeneous membership and their assertiveness they were able to achieve high salary increases for specific professional groups they organize. In reaction to this development, employers’ associations and trade unions predicted societal problems and negative organizational consequences. Referring to organizational justice theory, this paper examines empirically whether and under what circumstances high salary increases for specific professional groups, which are represented by craft unions, are perceived as unfair and if they have negative consequences. Estimates are based on a telephone survey of workers aged 18–65 years. The survey was conducted in the second half of 2012 in Germany. Descriptively and by using probit regression, this paper analyzes the responses from about 550 employees who worked in companies where high salary increases for specific professional groups occurred. The study shows that approximately 31% of the respondents from these branches assess the salary increases as unfair. About a quarter of the respondents, who are not trade union members, report that these salary increases have reduced work related motivation and that internal social relations have deteriorated. Although the perceptions of justice as well as the organizational consequences can be influenced through several aspects of distributive and procedural justice, an overall trend towards diminishing solidarity between employee groups can be identified.

Strategies to reduce inequity in the Romanian cultural context
Carmen BUZEA (Transilvania University of Brasov, Romania) | carmen.buzea@unitbv.ro

The study makes use of the equity theory framework to explore the dominant strategy used by Romanian employees to reduce inequity in working environment. We conducted 87 semi-structured interviews with employees having a minimum of three years work experience. Results showed that when facing inequity, Romanian employees prefer to cognitively distort either their inputs (contributions) or their outputs (rewards). Thus, respondents prefer to minimize the input, mainly the work effort, and to maximize the output, mainly the fact that they have a job in times of economic crisis. Regarding the employee-employer exchange, it was found that most of respondents perceived it as inequitable, but the degree of the inequity has been evaluated as “tolerable”. The results are discussed in conjunction with the equity sensitivity construct that argued that employees might perceive situations of inequity in different ways, within a continuum of three states: Benevolents (individuals who prefer their input to exceed their outcomes), Equity Sensitives (individuals who react according to equity theory model) and Entitleds (individuals who prefer that their outcomes to exceed their input). Implications for Romanian organizations along with the study limits and directions for future research are presented.

From Financial In(ex)clusion to Social Exclusion: a Study on Construction Workers
Elife KART (Akdeniz University, Turkey) | elifekart@hotmail.com

Market conditions around the world created by global capital bring forward more irregular, and precarious employment politics and informal working conditions together with the impacts of
neoliberal market conditions on the one hand while changing the functions of social state in favor of the capital, on the other. Vulnerable informal working conditions with changing working hours and a structure of different wages influence the processes of workers’ exposure to financial in(ex)clusion. While financial inclusion occurs within terms of indebtedness for the construction workers, over-indebtedness and the conditions of staying in informal working conditions cause them to be exposed to financial exclusion. From this point of view, this study deals with the conditions exposing the workers to financial in(ex)clusion. Within terms of the structural changes new economy and neoliberal practices on working conditions and labor, the reasons why the workers are exposed to financial exclusion are questioned besides financial tools the workers use and the way how they use them. Both financial inclusion and the conditions which cause the workers to be exposed to financial exclusion are discussed with economic, social, territorial and discursive dimensions of social exclusion. Only the construction workers are in the scope of the study. Data gathered from in-depth interviews are used.

**Working conditions and subsequent drinking habits**

Aino SALONSAALMI (University of Helsinki, Finland) | aino.salonsalmi@helsinki.fi
Ossi RAHKONEN (University of Helsinki, Finland) | ossi.rahkonen@helsinki.fi
Eero LAHELMA (University of Helsinki, Finland) | eero.lahelma@helsinki.fi
Mikko LAAKSONEN (Finnish Centre for Pensions) | mikko.laaksonen@etk.fi

Background: Alcohol drinking is a major threat to work ability having. Work environment might play a role in shaping drinking habits. We lack, however, studies on the contribution of working conditions to drinking habits.

Methods: The baseline data were collected in 2000-02 and the follow-up data in 2007 by postal surveys among middle-aged employees of Helsinki City. Logistic regression was used to analyse associations between baseline working conditions and drinking habits five to seven years later. Drinking habits included weekly average drinking, binge drinking and problem drinking. The results are presented as odds ratios (OR) and their 95% confidence intervals (CI). The study included 6468 women and 1651 men.

Results: Work fatigue, workplace bullying, mental workload, work content and work-family interface were associated with drinking habits among women. Among men associations were found concerning work fatigue, workplace bullying, mental workload and work content. Physical workload was not associated with adverse drinking habits. Baseline drinking habits often explained the associations but the associations between work content and heavy average drinking remained after all adjustments among both women (OR 2.12, CI 1.08-4.15) and men (2.33, 1.07-5.07). Among women also work fatigue (1.49, 1.10-2.02) and workplace bullying (1.86, 1.18-2.95) were associated with heavy average drinking after all adjustments.

Conclusions: Poor working conditions were associated with subsequent drinking habits. Baseline drinking habits often explained the associations. Work content and workplace bullying showed strongest associations with drinking habits. Paying attention to working conditions might promote moderate drinking habits.

**RN17S09 - The Transformation of Work and Employment: Causes and Implications**

**Reconsidering work and employment: through the case of French artisanship**

Samia AIT TKASSIT (Centre Max Weber Université Lyon 2, France) | samia_ait_tkassit@hotmail.com
The current economic crisis reveals some uncertainty in financial and industrial fields of economies, disturbing the relationship between the labour and the capital and increasing inequalities. Artisanship in France is an economical sector that includes a majority of small businesses with fewer than 10 employees in nearly 500 different trades which appears like an analytic key of the present situation. In these organisations where work is essentially related to manual skills, the capital is maintained at its lower level – for legal reasons – and its power is not supposed to increase. This maybe what makes crafts a possible solution against the rise of unemployment and provides its units a relative capacity to resist to crisis effects and economic pressures.

Artisanship as a locally rooted manual productions made for a locally rooted markets leads to ask many questions about work and labour market’s functioning in today’s globalization context. What does work mean when it comes to artisanship in France? What about the individual and the collective patterns of artisan work? Who are French manual trades’ owners and workers? What are the labour market specificities? What are the meaning and the relevance of solidarity in artisanship organisations and labour market?

The theoretical challenge here is to answer these questions knowing that the prism of crafts remains minor in the long research’s tradition on the field of work. This means that the first question is about the possible use of conceptual tools produced within the industrial field to apprehend work in artisanship.

The dual nature of work Transformation of Employment Policy in East Central Europe
Judit CSOBA (University of Debrecen, Hungary) | csoba.judit@arts.unideb.hu

‘Decent work’ as a key category of social integration has undergone significant changes with respect to its concept and its content during the past centuries. The dual nature of work (punishment and reward) can be traced throughout all eras of universal history, but it depends mainly on the economic, social and ideological context whether it is one or the other of these two aspects that becomes dominant for most members of the society.

In recent years, most European countries have turned away from the ‘welfare’ model, which emphasizes welfare payments and services, toward ‘workfare’ models focusing on work. ‘Workfare’ programs are based on direct reciprocity and assume that citizens possess primary responsibilities in addition to their social rights: in return for welfare benefits, they are expected to provide compensation within a relatively short period of time.

The regulation of labor belong to the “gray zone” of legislation, and has progressed in an unplanned, spontaneous fashion for several decades in Hungary. The colorful system of employment-related and non-employment-related forms of labor exclusively characteristic of Hungary evolved in the context of the short-term regulatory framework, as the result of a spontaneous development that could be traced back to various economic and political reasons.

In our paper we will examine the changes of employment policy in East Central Europe in order to find answers to the question: what are the consequences of the deconstruction of the welfare state on the impoverished social groups today

The value of work-focused social enterprises in facilitating transitions to regular work
Timothy BAYL (Universiteit van Amsterdam, Netherlands, The) | timbayl@gmail.com

What is the value of work-focused social enterprises in facilitating transitions to regular work? Social enterprises are becoming increasingly important for the social policy goals of governments around the world. The maturity of the social enterprise sector varies in different
developed countries, as does support to social enterprises from public and private funders. Many social enterprises have been set up with the specific aim of employing people judged to be experiencing some type of ‘distance’ to the labour market.

A number of these work integration social enterprises (WISEs) go beyond simply providing employment (the labour policy concept of ‘occupation’) and provide some form of training or other classical ‘human capital’ investment as part of their social goal. Additionally, they may offer ‘labour supply advancement’ that is not directly work focused (e.g. social skill development, help with practical barriers) but helps to build future employability.

The financing and accountability expected of WISEs not only guide their activities but are also critical to the viability and sustainability of their business models, and hence to the successful transitions of their employees into regular work. Effective and value-adding WISEs take a holistic ‘case management’ approach to their workers whereby they engage a range of tools tailored to the needs of each employee to increase individual employability. Effective WISEs are also well connected to the bodies that provide finance and those that determine their requirements. Do these characteristics enable WISEs to be a highly value-adding investment for modern labour market reintegration policy in different countries?

Patterns of social exclusion: the effects of socio-economic changes
Claudia PETRESCU (The Research Institute for Quality of Life, Romania) | claucaraiman@yahoo.com
Adriana NEGUT (The Research Institute for Quality of Life, Romania) | adri.negut@gmail.com
Gabriel STANILA (ADPSE Catalactica, Romania) | gabriel.stanila@gmail.com

One of the major topics in official European documents and policy debates, social exclusion is driven by a plurality of demographic, social, spatial, economic and behavioural factors that interact and influence each other. Many of these factors are related to the lack of access to different resources during the life course or to the socialization factors leading to different social inclusion problems. Other contextual effects like changing nature of labour market, technological change or political regime’s changes must be taken into analysis also. A comprehensive analysis of social exclusion factors should involve longitudinal research in order to collect data from the person’s birth to the adult life.

The paper intends to bring structured information about the contextual effects over social exclusion on the labour market based on quantitative data from a regional survey (1100 questionnaires for adult population in South-East and South Muntenia regions) and on secondary data analysis. We’ve used a retrospective questionnaire, focused on life trajectories of respondents, in order to analyze the impact of different factors (political, social, economic changes etc.) on the risk of social exclusion faced by the respondents and their families, especially the exclusion from the labour market. In terms of employment, the research followed occupational trajectories of both the respondent and of family members. This household-centred perspective together with the retrospective approach are aimed at providing a better understanding of the factors influencing social exclusion risk which could help us refine the intervention in this area.

RN17S10 - Quality of Working Life

Why the Long Hours? Work Demands and Social Exchange Dynamics
Émilie GENIN (University of Montreal, Canada) | emilie.genin@umontreal.ca
Victor HAINES (University of Montreal, Canada) | victor.haines@umontreal.ca
Marchand ALAIN (University of Montreal, Canada) | alain.marchand@umontreal.ca
This study investigates the determinants of long working hours from the perspectives of the demand-control model (Karasek, 1979) and social exchange theory (Blau, 1964; Goulder, 1960). The results from a population-based sample of Canadian workers support that high job demands are positively associated with longer work hours. The predicted positive association between skill discretion and work hours was only supported for employees with a university degree. Finally, the results support a positive association between active jobs and longer work hours. Our research thus suggests that job demands and social exchange dynamics need to be considered in the explanation of longer (or shorter) work hours.

Contradictory Awareness of Precariat? Between Individual and Structural Responsibility
Jacek ZYCH (University of Warsaw, Poland) | zychjacek1@wp.pl
Justyna Kinga ZIELIŃSKA (University of Warsaw, Poland) | justynakingaz@gmail.com

The aim of this paper is to present outcomes of qualitative research conducted among the most unprivileged workers in two post-industrial cities in Poland (2013-2014). These workers are: long term unemployed who take part in low-paid trainings, internships (organised by local Public Employment Services and social assistance) and who are forced to take up odd jobs and jobs on the black market. Next, seasonal workers and women that are full time mothers and housewives. We call them all precariat (Standing, 2011) due to uncertainty and lack of sense of security they experience. They all also suffer from poverty. Capital often violates employment code in this the most marginalized segment on the labour market, thus one can say about unfairness, but also about lack of solidarity (individualisation and fragmentarization of post-industrial workforce). It results in inability to fight for better working conditions among precariat and broader working class as well. The main thesis of the paper is that institutions of social policy (i.e. Public Employment Services and social assistance) contribute to individualisation of social phenomena such as unemployment and poverty. These institutions operate within the framework of austere social and labour market policies (“emergency regime” and paradigm of workfare). However, individualisation of social phenomena is not fully achieved and the precariat, the object of these practises, is aware of social causes of these problems. Therefore, precariat is potentially a partner in action for social change.

Work-life balance in relation to workplace diversity
Hana MAŘÍKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | hana.marikova@soc.cas.cz
Lenka FORMÁNKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | lenka.formankova@soc.cas.cz

The objective of the study on diversity management (DM) is the analysis of organisational measures in work-life balance (WLB) in two employers’ organisations, regarding the extent to which the design and practice of utilising these measures meets the concept of DM that represents an innovative approach to the issue of equal opportunities. DM means equality in the conditions for accessing the labour market and management positions together with eliminating social inequalities in terms of gender, age and nationality. Some studies show that diversity has a positive impact if accompanied by support for the reconciliation of employees’ work and private life (e.g. McKinsey & Co., 2012). Our study compares case studies from a private company and a public authority. In each organisation we
compiled 16 individual interviews and seven focus groups, and made analyses of the documents and the workforce on the statistical data provided. When analysing the data, we focused on the questions: How does the current form of WLB measures in the given organisation support workforce diversity? To what extent are certain groups of workers at a disadvantage? The analysis confirmed that there prevails a reductionist approach to WLB in both organisations. WLB is understood and conceived there primarily as measures for mothers with children. The issue of the private lives of single people as well as the involvement of fathers in care and the issue of caring for other family members are ignored. The analysis shows that universally conceived measures, as with partial ones, can have a varied and thus unfavourable impact on certain groups of workers.

Working but poor: who they are and what lives do they live?
Terezie LOKSOVA (Faculty of Social Sciences, Masaryk University, Czech Republic) | lyn@mail.muni.cz
Tomas BEK (Faculty of Social Sciences, Masaryk University, Czech Republic) | 273213@mail.muni.cz

Our paper aims to contribute to the discussion on social inequality in the Czech republic. Minimal income presents a noteworthy research object as it is both a well-defined institution and a question of dispute between economists, politicians and social scientists. Contemporary discussion on minimal income revolves around its perceived effects in terms of macro-economic relations that vary between reducing poverty and increasing unemployment. Notably, these disputes are based on probability models that usually presuppose homogenous workforce and other ideal conditions and the concern is an effective functioning of the market while the actual life situation of the workers is widely ignored. Sociology also has a tendency to overlook this issue as these workers do not explicitly belong among the most palpable examples of social exclusion. Despite these people practically being ever-present in public space as shop assistants or waiters, they remain invisible, lacking distinctive features that would make them recognizable as a group.

We aim to contribute to this predominantly economical discussion by exploring the living conditions of employees with minimal income from both the objective perspective of concepts of poverty and from the position of subjects. Research analyzes official documents for objective definitions of poverty. These are accompanied by semi-structured interviews exploring the subjective conception of needs and their fulfillment. We focus on how the working poor relate to and cope with subjective and objective aspects of poverty. This exploration provides an insightful contribution to both social inequality research and rendering the invisible actors present in a public discussion.

RN17S11 - Differences and Inequalities Between Different Groups

Dualisation and Workplace Change in Europe
Amy Erbe HEALY (Maynooth University, Ireland) | Amy.Healy@nuim.ie
Seán Ó RIAIN (Maynooth University, Ireland) | Sean.ORiaen@nuim.ie

John Goldthorpe argued that liberalisation was likely to produce a dualism in labour markets, between those still strong enough to protect their employment and the benefits attached to it and those condemned to a more precarious existence. Recent research has argued that such dualisation has proceeded apace in the subsequent decades, as the counterweight of
corporatism has weakened and as dualisation has extended into welfare and production regimes. However, these analyses have moved ever further from the original roots of studies of labour market dualism in employers’ workplace strategies and production regimes. While much emphasis has been placed on the ability of ‘insiders’ to exclude ‘outsiders’, classic studies of labour market dualism linked such exclusions to the mobilisation of labour into certain kinds of employment and the control of that labour while at work. Revisiting the classic origins of the question, our paper explores how workplace change and dualisation have been linked together in Western Europe between 1995 and 2010.

We analyse data from the European Working Conditions Survey for the EU15 from 1995 to 2010. We use latent class analysis to identify a range of ‘workplace regimes’, formed through the interaction of working time, worker autonomy and control, forms of compensation and learning and training at work. In particular, we examine how the ‘de-standardisation’ of ‘core employment’ reduces or promotes dualisation by gender, citizenship and age in different worlds of European capitalism.

Opening the black box: Can segregated job placement processes explain economic inequality between secular and ultraorthodox Jews in Israel?
Ronit NADIV (sapir academic college, Israel) | ronitnadiv@gmail.com
Shani KUNA (sapir academic college, Israel) | shanik@mail.sapir.ac.il

The ultraorthodox Jewish community in Israel is highly segregated from the Israeli society as a whole, in terms of various social and economic factors. In particular, the employment rate of the ultraorthodox Jews is significantly lower in comparison to the majority of the Israeli society. As a result, the poverty rate among ultraorthodox families is high and has grown significantly in the last decade. Consequently, "welfare to work" programs have been implemented by the government to assist this special community. In the present study we explore the role and consequences of labor market intermediates such as segregated job placement processes designed for the ultraorthodox community. Prior research on the assimilation process of the ultraorthodox community into the labor market found contradicting results. On the one hand, ultraorthodox men are better paid in the general labor market, but on other hand, in terms of job quality they are better treated in the segregated ultraorthodox labor market. The present study opens the black box of the placement process itself to explore its role in explaining these contradictive findings. Based on interviews with job placement consultants the study reveals unique methods of job placement designed for the Ultraorthodox community that rely mainly on informal networks in this special community. Paradoxically, we find that the very job placement process which is supposed to be a tool of solving poverty, itself exacerbates inequality in the ultraorthodox community.

Labour force fragmentation: empirical evidence from case studies in Cyprus
Gregoris IOANNOU (University of Cyprus, Cyprus) | gregoris.ioannou@gmail.com

The concept of segmentation is usually used to describe division in the labour market and the formation of primary and secondary markets, or division within the firm into a core and a peripheral labour force. This theoretical formulation that focuses on employment terms and conditions, although valid at a general level, becomes inadequate once the researcher observes closely actual workplace conditions. The actually existing divisions in the labour force which are many and varying in form and intensity and can only be grasped through extensive empirical research which can illustrate the lines of segmentation at workplace level and the patterns of labour force fragmentation. The gendering and ethnicisation of occupations, age and years of
service at work and the cultural and social capital in one’s possession in the form of technical knowledge and membership in social network reflect and sustain power differentials, construct formal and informal hierarchies and produce social cleavages. Employment as well as social and societal based divisions often interact and combine and as such may reinforce or undermine existing segmentation lines. The result of these processes is a complex segmentation that enhances the fragmentation of the workforce and rearranges the dynamics of the workplace. Based on data from case studies in the hospitality, banking and construction industries in Cyprus I illuminate the plurality of processes and dimensions that shape workplace dynamics and discuss the particular means through which institutional, economic, cultural and social factors fragment the labour force.

Organization of work in Nordic countries: analyzing change in public and private sector 1990-2010

Tomi OINAS (University of Jyväskylä, Finland) | tomi.oinas@jyu.fi
Timo ANTTILA (University of Jyväskylä, Finland) | timo.e.e.anttila@jyu.fi
Armi MUSTOMAKI (University of Jyväskylä, Finland) | armi.mustomaki@jyu.fi
Mia TAMMELIN (University of Jyväskylä, Finland) | mia.tammelin@jyu.fi

According to European comparative studies, organizational change and restructuration have been especially prevalent in Nordic countries. Especially public sector organizations have been under turbulence due to pressures for cost reduction and increasing efficiency. Yet, not much is known about how these changes have affected the organization of everyday work and employee experiences. Based on the four waves of European Working Conditions surveys (1995, 2000, 2005 & 2010) this paper analyses the change in the organization of work in Nordic countries. Applying the typology introduced by Lorenz & Valeyre (2005; 2009) the aim is to look into types of organizing work in public and private sector organizations in Sweden, Finland and Denmark. Are new forms of work organization (so called learning organizations) becoming more prevalent or are the new pressures increasing more traditional management techniques?

Ethnic diversity in the workplace and social trust

Frederik THUESEN (SFI - The Danish National Centre for Social Research, Denmark) | frt@sfi.dk
Peter DINESEN (Department of Political Science, University of Copenhagen) | ptd@ifs.ku.dk
Kim SØNDERSKOV (Department of Political Science, University of Aarhus) | ks@ps.au.dk

The ever-expanding literature on the effect of contextual ethnic diversity on generalized social trust has overwhelmingly focused on the neighborhood. In doings so, the literature has largely overlooked other social contexts in which individuals are exposed to people of other ethnic background on a regular basis. In this paper we focus on one of these neglected contexts, namely the workplace. In the workplace, individuals are consistently and, compared to many other social settings, less voluntarily exposed to people of different ethnic background, which makes it a highly fruitful setting for examining various theories of the role of contextual exposure to ethnic diversity on social trust. We analyze the effect of workplace diversity on trust by merging the five first rounds of the European Social Rounds to elaborate register-data on workplaces (specific branches) in Denmark. Preliminary results point toward a negative effect. However, this effect appears to be moderated by characteristics of the individual and the workplace. Subsequent analyses are going to explore potentially interacting effects from (rising) economic inequality, gender differences, and differences relating to age and education.
RN17S12 - Insecure Employment and Unemployment

Employment changes, strategies and resources in times of austerity: results from narrative biographies in Spain and the UK.

Marti LÓPEZ-ANDREU (Manchester Business School, United Kingdom) | marti.lopezandreu@mbs.ac.uk

The paper presents results of a research that has the aim to analyse how individuals cope with the employment changes that recession has provoked in the UK and Spain, two of the countries at the forefront of the austerity turn. The recession and its aftermath (austerity policies) imply the reinforcement of previous existing trends towards more instability and insecurity in the labour market. This increase of insecure employment and employment transitions interact with changes in social and employment policies that deepen trends already existing since the 1980s towards a greater fragmentation of society. The research is focused in the effects of the crisis as a turning point; that is it is interested in individuals who experienced a downward move in their employment situation. The research uses narrative biographies to investigate how these individuals cope with these employment changes in terms of the supports and resources they use and have access to reach their employment, personal and social objectives. The research question that emerges is how individuals with different social profiles and resources cope with these changes? And how are the changes affecting their living and working conditions? Such a perspective requires an interaction between labour market trajectories and life course as options, choices and projects in the labour market are closely linked to household and family situation, the institutional context, community networks and personal and social orientations. We will present main findings of the biographies and we will discuss the role of institutional changes in shaping life course and in eroding the material basis of citizenship (capacity of being and doing).

Different patterns for different sub-populations: heterogeneity in post-unemployment work trajectories

Matteo ANTONINI (University of Lausanne, Switzerland) | matteo.antonini@unil.ch

Many studies compare employed and unemployed workers to highlight the effect of unemployment. While employed workers are differentiated in categories, unemployed workers are often introduced as a homogeneous population. The main target of our paper is to give a more detailed description of the unemployed population and to link each subgroup of this population to specific risks and opportunities.

We describe 512 careers touched by a period of unemployment relying on the data from the 1999-2011 waves of the Swiss Household Panel. This main sample is compared to a control sample without any period of unemployment. In both samples, we examine employment careers by a combination of sequence analysis and regression analysis. We seek to relate sex, age, nationality, education, social origin and socio-professional categories to different patterns caused by a period of unemployment.

Our findings show that risks related to unemployment can take three forms: (a) Persistent unemployment affects workers considered to be “problematic” due to supposed shared characteristics (as for seniors and foreigners) or personal work performance (as for highly educated workers). (b) Occupational downgrading consists in the transition to a less prestigious job position and affects groups traditionally used as buffers in times of crisis (women and foreigners). (c) Reorientation patterns imply unstable sequences and affect low-skilled workers who can neither downgrade their job position nor afford a long period of unemployment.
These differences appear linked to the specific characteristics of each sub-group that hinder some patterns and facilitate others.

The “good employee” and the “bad unemployed”: Explaining boundaries of employment in the construction sector in Switzerland
Laura AMARO GALHANO (University of Lausanne, Faculty of Social and Political Sciences, Switzerland) | laura.galhano@unil.ch

In Switzerland, construction is one of the sectors statistically most concerned by unemployment. However, when interviewed most of actors in the construction sector speak and act as if full employment would reign in their sector. On the other hand, they clearly differentiate in their discourse between “unemployed” and “people waiting for a job”. Part of the explanation for this phenomenon is the massive use of temporary workers and the structural organization of work, which forces people to deal with periods of unemployment during their work activity. In this particular situation, work relations change: when the short-term employment contract is over, maintaining boundaries with the firm and employers is a critical issue in order to find work again. In this context, reputation appears to be a key resource mobilized by workers who succeed in this rehiring process. My empirical work, based on qualitative interviews with workers, project managers, temporary agencies and union representatives, focuses on the construction sector in western Switzerland. I will show how reputation functions as as symbolic capital (Bourdieu, 1994) in the world of construction and what repercussions it has for the perception of employees, unemployed people and qualification of workers. More generally, I will analyze which kind of inequalities this classification of workers can produce in the field of work and employment and what is the impact for social and work relations.

The Economic Inactivity of Muslim Women in Britain: Measuring the Impact of Religiosity and Social Capital
Asma Shahin KHAN (Cardiff University, United Kingdom) | AsmaKhan@cardiff.ac.uk

This paper presents the empirical findings of an original analysis of the 2010 Ethnic Minority British Election Survey (EMBES) dataset. The EMBES is an authoritative dataset which contains a nationally representative, clustered, stratified random sample of the largest ethnic groups in Britain. The survey includes an exciting range of questions for researchers of minority ethnic and religious groups. The findings presented result from the first phase of a mixed methods project that aims to understand and explain the economic inactivity of Muslim women in Britain. Muslim women are more than twice as likely as women from other religious groups in Britain to be economically inactive and the existing literature suggests that this is the result of religious, rather than ethnic, penalties. Variables within the EMBES enable analysis of the impact that both religiosity and social capital might have on the economic inactivity of Muslim women. As well as presentation of the empirical findings, the paper will include some critical reflections on the limitations of the EMBES in studying Muslims in Britain which are likely to be widely applicable to other large datasets.

RN17S13 - Gender at Work

Working Conditions and Inequalities in Social Movement Organizations
Mor KANDLIK ELTANANI (University of Edinburgh, United Kingdom) | mor.kandlik@gmail.com

In the last decades Social Movement Organizations (SMOs) went through processes of professionalization, which are reflected in their transition from being based primarily on volunteers, to employing on a wide scale. As part of this transition, the boundary between volunteers and workers has become blurred, marking a forming frontier in the definition of the labour market. This presentation will investigate the working conditions workers in Israeli peace SMOs experience, particularly emphasising gender- and nationality-based inequalities. The results presented are based on a randomly sampled survey of 200 workers from 32 organizations, two workshops with organizations’ representatives, and five in-depth interviews with key figures in the researched organizations. Working conditions, including salary and weekly hours, will be discussed in the context of the conditions provided in the Israeli labour market. The effect of gender and nationality, in both the personal and the organizational level, on working conditions will be presented and compared to those relationships in the wider labour market in Israel. I will argue that while inequalities between Jews and Palestinians are reversed in SMOs – Palestinians receive better working conditions than Jews in these organizations – this is not the case for gender. Results reveal that women have worse working conditions than men in SMOs. Furthermore, in organizations with a higher percentage of women, conditions are worse off, even while controlling for the individual effect of gender. Findings reflect working conditions and relations within civil society, as well as mark a path for new definitions and outlooks of work and workers.

Gender perspective on the occupational prestige in a modern global labour market
Olga Anna CZERANOWSKA (University of Warsaw, Poland) | o.czeranowska@gmail.com

Hierarchy of occupational prestige is a valuable source of information on society’s structure and normative system. Occupational groups can be seen as the most basic groups of reference and professional biography has a significant bearing on identity. This is why the research on the occupational prestige has such a long traditions. What is worth noticing, is that comparative studies seem to show similarities between prestige hierarchies form different countries. Generally, key factors correlating with prestige are competences required and functional importance.

It is interesting however, to look on the feminization/masculinisation of the most prestigious occupations. It is also an important methodological dilemma which gender form to use in the questionnaire (especially since in some languages there are no feminine forms of many occupation’s names).

In my research I wanted to look at the occupational prestige form personal-biographical point of view, taking into consideration gender perspective. I have conducted research on media discourse in which I have analyzed how successful men and women are presented. In my quantitative study I have chosen to focus on firefighters - the most prestigious profession in Poland (according to nationally representative study). This group is also interesting because of high masculinisation and the controversies around mixed-sex teams. My research covered meaning of occupational prestige and professional group in the individual’s lives as well as the motivation behind career choice. I also investigated my respondents attitudes toward women in The State Fire Service.

Gendered Precariousness?: Social Prospects of Home-Based Work in Turkey
Şafak TARTANOĞLU (Uludag University, Turkey) | safaktartan@gmail.com
Burak Faik EMIRGIL (Uludag University, Turkey) | burakfaikemirgil@gmail.com
Şenol BAŞTÜRK (Uludag University, Turkey) | senolbasturk@gmail.com

Insecurity and informality become the basic trends about employment relations in modern working life. Atypical employment practices are increasing especially in developing countries which are part of the global value chains. In Turkey, garment industry has become one of the top exporting sector, based on female labour through small and middle size enterprises, family owned small firms or home-based piecwork, as a result of export-oriented economic policies in the beginning of 1980s. Such home-based and outsourced work is generally related with precarious employment practices including specific characteristics like non-standard working conditions, restricted social protection and low income. Women’s work contribute to global economy but are invisible to local labour market regulations, in some cases they may not identify as workers.

The debates about the participation of women to the labour markets mostly underline the low percentages of female labour in official statistics. One reason of this situation is the invisibility of informal employment. This study aims to discover the insecure working conditions of the women, whose work can be defined as home-based, in the lens of precariousness with semi-structured interviews which will be conducted in Bursa and Tekirdağ. These cities constitute good examples for kinship structure which is the main dynamic of the relations of home-based production. The contribution of the proposed paper will be its unique character of an overview about precariousness and gendered working relations from a developing country, Turkey.

The Analysis on Sex Differences in Determinants of Job Mismatches for the Youth in Korea : Sex Segregation in Occupations and Industries
Soo gyoung BAEK (Korea University, Korea, Republic of (South Korea)) | bbsoogg@gmail.com

This study analyzed determinants of job mismatches that have been experienced by the youth in Korea where high school entrance rate is over 70 percent. Job mismatches were examined under three criteria of education, skill and major. This paper especially focused on sex differences in determinants of job mismatches. As the structural context that has caused sex differences in labor market, industrial and occupational sex segregation can explain more about job mismatches than human capital can.

According to the result of the analysis, determinants of three types of job mismatches have different influences. Although today’s higher education level makes education level no longer significant, qualitative aspects of education still have strong influence. Although factors of human capital can reduce job mismatches, job mismatches of the youth increases under the structure of industrial and occupational sex segregation, and men and women experience different job mismatches. The likelihood of women experiencing job mismatches in male-dominant sectors is higher than in female-dominant sectors. Furthermore, the type of mismatches women are mostly facing on is ‘overeducation’ or ‘overskilled’, which is level mismatches. Eventually employment of the youth woman has a different type of barrier unlike the youth as a whole. This result is the part of the ‘comparative worth’ discussion, implying the necessity of a political structure that guarantees the youth woman can be equally evaluated for employment and promotion as the youth man is evaluated and advance according to her level.

RN17S14 - Atypical Work: Meaning and Strategies
Same same but different? Working conditions of highly-skilled solo-self-employed workers – The role of staffing agencies and traditional actors of industrial relations in negotiation processes
Birgit APITZSCH (University of Duisburg-Essen, Germany) | birgit.apitzsch@uni-due.de
Caroline RUINER (TU Dortmund, Germany) | caroline.ruiner@tu-dortmund.de
Maximiliane WILKESMANN (TU Dortmund, Germany) | maximiliane.wilkesmann@tu-dortmund.de

The rising share of solo-self-employed in Germany poses a major challenge for industrial relations. While the combination of industry-level collective bargaining and works councils has been considered as effectively reducing inequality between workers and securing voice at the workplace level, the spread of atypical employment and the blurring boundaries between dependent and independent employment confront established actors in industrial relations with more heterogeneous interests and difficulties in reaching workers at their company-based workplaces. A rising group of solo-self-employed workers are mainly depicted as privileged group of highly qualified workers who prefer individualized negotiations of working conditions based on their market power. However, a closer look at the working conditions (e.g. income) of solo-self-employed in different industries reveals striking inequalities which so far have not been addressed sufficiently in industrial relations research. Therefore, this paper explores the complex configurations of new and traditional actors which represent interests of a growing individualized workforce in media, IT and medicine. Specifically, it explores the roles of unions, professional associations, and staffing agencies in the negotiation of employment conditions and new possibilities of collective interest organization. The empirical findings stem from a qualitative interview study of solo-self-employed and representatives of intermediate actors in Germany. We focus on experts in media, IT and medicine since these industries differ decisively regarding the employment conditions of solo-self-employed and, consequently, the function of different intermediate actors. Eventually, the comparison of the industries selected will provide a better understanding of the flexible labor markets’ structure.

Job quality characteristics and part-time employed women’s perceptions of time pressure
Judy Patricia ROSE (School of Social Science, University of Queensland, Australia) | j.rose@uq.edu.au
Belinda Anne HEWITT (School of Social Science, University of Queensland, Australia) | b.hewitt@uq.edu.au
Janeen Helen BAXTER (ARC Centre of Excellence for Children and Families over the Life Course, Institute for Social Science Research, University of Queensland, Australia) | j.baxter@uq.edu.au

Part-time employment has continued to expand across the OECD over the past few decades, particularly for women (OECD, 2013). The deregulation of labour markets, increasing participation of women in the workforce, and entrenched breadwinner ideologies combine to channel women with children into part-time employment in much greater numbers than men or fathers (Fagan & Walthery, 2007). Australia is amongst a select group of OECD countries including the United Kingdom, Switzerland and the Netherlands that adopt the one-and-a-half earner model for families with dependent children (OECD, 2013). Yet, in Australia, mothers’ part-time employment tends to be clustered in poorer quality part-time jobs, while fathers predominately work in better quality, full time positions (Charlesworth et al., 2011). Concerns about the declining quality in part-time employment has been associated with an increased trend towards temporary (casual) part-time jobs since the Global Financial Crises in 2008 (ILO, 2014). Of further concern is that part-time employed women in Australia do not have the same job protections as part-time employees in European countries such as the
Netherlands, where women employed part-time are guaranteed equivalent benefits to full time employees (McDonald et al., 2009). Australian part-time jobs tend to be characterized by insecurity, inflexibility, and low autonomy and these factors have been found to exacerbate work-life conflict and negatively impact individual and familial well-being (Strazdins et. al, 2006; Hosking & Western, 2008).

While part-time employment enables women with children to maintain an attachment to the workforce, there is conflicting evidence about how well it facilitates the reconciliation of time demands associated with paid work and family life. Previous research has found that not all part-time work is associated with less time pressure for employed women (Rose et al., 2013). These investigations showed that compared to women working full time hours, women who worked longer part-time hours (15 to 34 hours per week), did not gain the same overall time pressure relief as women who worked shorter part-time hours (1-14 hours per week) (Rose et al., 2013). However, this prior study did not examine the importance of job quality characteristics other than hours of work on women’s time pressure. This paper extends our knowledge by investigating whether women in good or bad part-time employment, as measured by various job characteristics, experience different levels of time pressure. We use data from the 2006 ‘Negotiating the Life Course’ survey. More broadly, this survey was designed to understand how Australian women and men negotiate their paid and unpaid work over the life course. For this study we focus on a sub sample of 1,142 employed women and examine how employment hours, job security, occupation and work-time characteristics including sociability, flexibility and regularity of employment hours affect women’s perceptions of time pressure perceptions at work, at home, and overall. Examining three kinds of time pressure provides a broader understanding of time pressure experience that extends earlier studies based on a single measure (Craig & Mullan, 2009).

We find that irregular work schedules (not having a regular weekly work pattern) and lack of access to job flexibility are the main factors that negatively impact on women’s time pressure perceptions (overall and at work). These job characteristics potentially make it difficult for women to plan and meet their time demands or fit their paid work around other life commitments, including family care. Surprisingly, results showed that working in a casual (non-permanent or temporary) jobs is associated with reduced time pressure for women at work. In addition, women employed in trade occupations have lower levels of time pressure at home and at work than women in managerial positions. This suggests that occupations with management responsibilities incur higher time pressure costs. In summary, this study provides empirical evidence to suggest that there are time pressure benefits and detriments for women in part-time employment, but that job characteristics may intervene to vary time pressure experiences. Further, the relationship between work hours and job quality characteristics is complex, with short part-time work associated with lower time pressure in some contexts, but likely to be characterized by poor quality conditions such as lack of flexibility and lack of regular work schedules. We conclude that job quality characteristics, in addition to hours of work, affect time pressure outcomes for women and may counteract some of the work-family balance benefits sought by women in part time employment.

**Fragmented staff: temporary agency work and its meaning for staff relations and industrial relations**

Saskja SCHINDLER (University of vienna, Austria) | saskja.schindler@univie.ac.at

Temporary agency work is one of the most rapidly growing forms of atypical employment in Austria (Stichtagserhebung 2013, Specht 2010). It is an interesting case because it is the only male-dominated form of atypical employment (Geisberger/Knittler 2010) and it is frequent in the industrial sector (Stichtagserhebung 2013) that has traditionally been characterised by powerful trade unions, stable labour relations and hardly any precarious employment. Thus the increasing use of temporary agency work with its highly precarious potential (Specht 2010) causes important changes within this sector.

My paper is concerned with differences and inequalities between temporary and permanent workers and with the effects of this dynamic on industrial relations at the workplace level. It particularly focuses on the fact that a low secured group of workers has to perform the same tasks but under worse conditions. What does this mean for the staff relations in user companies and how does it influence the balance of power between employers and employees and their capability to enforce their interests? Methodologically the paper is based on qualitative interviews with workers representatives (N=7), works councilors (N=9), industry representatives (N=5) as well as company staff from two user companies (metal industry in lower Austria; temporary workers and permanent staff; N=18).

**Over-education - a strategy of employment for young graduates?**

Dana Ioana EREMIA (Research Institute for Quality of Life, Romania) | dana.eremia@iccv.ro

This paper presents the employment situation faced by young people in terms of opportunities and risks caused by the mismatch between education and labor market. It seeks to provide an overview analysis between the differences of youth employment associated within the fields of study and with credentials competences (Kucel, 2008, Voicu, 2010). The analysis is based on
an exploratory qualitative research regarding youth perceptions of risks and opportunities in Romanian labor market integration. It was carried out a number of in-depth interviews with young people aged between 18-35 years with no other selection criteria, during the period 2012-2014. The heterogeneity of the group allowed a greater diversity of types of young people included in the analysis, without claiming to extrapolate the results to the entire population. The general purpose of the research was to improve the potential of knowledge over the difficulties faced by young people in transition from school to work. The initial objective was to segment the investigated population according to different types of problems that have to faced in employment, on the grounds of the level of education, field of study, residence, labor market experience, family background, etc. First results showed that regardless of youth socio-demographic characteristics, the differences between them are not determined by the type of problem, but depends on how they tackled these issues, which vary by employment strategies adopted by young people in order to improve their chances of employability. The most common reasons invoked by youth are the lack of experience, job vacancies and the mismatches between their specializations and labor market requirements. This could lead to a certain configuration of employment models based on support received in the stage of education / training and on the effort made by the young person in searching for a job. Another notable difference is given by the variation of intensity within a particular type of problem encountered in finding a job, which is determined by the level of education. Studying the employability patterns by educational mismatch through the model of Kucel (2010) can offer a better understanding especially of highly educated youth: an individual can be horizontally mismatched which means that his field of study is inadequate for the job requirements; or he can be vertical mismatched which means that his lower/higher level of education leads to an over/under education situation. The strategies used by young people can play a decisive role in adoption of a particular model of employment. They may vary depending on the individual characteristics. According to the human capital theory (Becker), the analysis takes into account the individual characteristics determined by the level of investment in education (support received) and the extent to which every individual valorizes this investment (effort made). The employment model configuration, which can be adopted by a young man, consists in level of education, field of study and skills acquired. The variation of these variables can determine employment differences in terms of adequacy or inadequacy of skills acquired through education to those required in the labor market. The analysis will focus on explaining the youth employment variations between specializations / fields of study. The major hypothesis is that in order to compensate the inadequate employment situations, every young person, on the basis of his dominant characteristics, will adopt different strategies to make the best option for filling a job. We expect that highly educated young people to use over-education as a strategy for a better employability. Moreover it is expected that graduates of soft disciplines (social sciences and humanities) to be found more often in inadequate situations as a result of over-education strategy. During the last decades the relationship between over education and field of study drew attention to both economists and sociologists, dedicating it several studies (Sloane, 1999; Mc Guiness, 2003; Teichler 2007; Ortiz and Kucel, 2008; Byrne and Kucel, 2008), but the link between the study and its equivalent in the labor market was less exploited. Furthermore, reasons of being overeducated occur from a diffuse situation between skills that soft disciplines form and requirements of the job for which they form. For example, the tertiary sector promotes an increased access to labor with a high potential of workplaces. In this context, labor productivity growth is both an advantage through diversifying the offer of work and a disadvantage by increasing competitiveness within the labor force. According to the job competition theory (Throw, 1975), the probability of occupying higher quality jobs, belongs to those who have the highest level of education, but in the context that work demand exceeds supply young people are in the increased risk to place themselves in inadequate situations, even in atypical forms of employment. As an opposite effect of Sattinger job matching theory
(1993), which explains whether an individual is inadequately employed in a position which involves partial or non-use of skills acquired through education, in this case we are dealing with "underutilization of workforce" which affects the work productivity and wage income (Allen and van der Venden, 2001). Especially in times of economic crisis employers will seek to make the best choice (rational action theory) in recruiting the most skilled candidates, involving the lowest costs (MacDonald, 2011). Atypical employment situations among youth, such as underemployment, temporary or marginal employment can be interpreted as steps towards adequate employment according to stepping stone theory (Korpi and Levin, 2001). Graduates enter the labor market in lower positions against their level of education, caused by lack of work experience, but as they evolve the level of correlation with work increases. In this context, a new hypothesis can be launched: if at some point, after about 3 years of working experience, the correlation between level of education, knowledge and required skills is not performed, there is reason to doubt about the mismatch over skills required and acquired specialization. All this key concepts describe a wider perspective over quality employment among youth, particularly those with higher education.

RN17S15 - Migration and Industrial Relations

Migrants in academia in Poland. How to identify the foreign academic workers?
Janusz MUCHA (AGH University, Poland) | jmucha@post.pl

Poland has been and continues to be a country of emigration rather than immigration. However, since 1989, it faces both low-skilled and high-skilled foreign labor inflow. Scientists belong to the second category. We will focus on their immigration to Polish research laboratories and university classrooms. Although this group is not large, it is worth examining, because inflowing academics are employed in one of the most prestigious sectors of public life and presumably contribute to its modernization.

The aim of this presentation is to discuss some methodological problems related to the identification of ‘academic immigrants’ to Poland which we have met while preparing our own research project on multicultural scientific work settings. The basic and general question is “who is a foreign scholar”. Does one have to be born abroad to be considered foreign? Is it sufficient to have a foreign passport? To be educated abroad? Do foreign scholars bear “foreign” names? Which name should be considered “foreign” in the recent European context? The second problem is how to “find them” within the science sector. They are employed legally and in relatively large institutions but the individualized databases are unavailable in Poland, university HR sections would not provide information on nationality of employees, university websites are often outdated and rarely publish CVs of academics.

To sum the presentation, we propose some methodological solutions employed in our own research project on foreign academics who currently work in Poland.

British union renewal: Does salvation really lie beyond the workplace?
Phil JAMES (Middlesex University, United Kingdom) | p.w.james@mdx.ac.uk
Joanna KARMOWSKA (Oxford Brookes University, United Kingdom) | jkarmowska@brookes.ac.uk

The paper provides an in-depth, longitudinal case study of a union initiative to recruit and organise among Polish migrant workers outside of the workplace. It does so against the background of calls for unions in North America and Britain to focus more on engaging with potential members beyond the level of the workplace and a lack of British evidence as to the capacity of such an approach to support expansion.
From both academic and policy perspectives, there would seem a clear need to address this evidential weakness. The paper sets out to make a contribution to this task. It seeks to do so in two inter-related ways. First, through a conceptual exploration of the potential for this category of activity to support British unions in expanding their membership and what we currently know about its impact in reality. Secondly, through the provision of an in-depth, longitudinal analysis of an already widely reported British union initiative to recruit and organise among Polish migrant workers that sheds new empirical light on this potential capacity. The study’s findings indicate that the initiative did serve as a source of new members. However, they also raise questions about the sustainability of such approaches in the absence of the mutually supportive access to workplace representation and, more widely, viable strategies to generate collective forms of instrumental and normative commitment.

**Workplaces, careers and conjunctures: Migrant professionals in the construction industry moving through time and space**

James WICKHAM (Trinity College Dublin, Ireland) | jwickham@tcd.ie
Alicja BOBEK (Trinity College Dublin, Ireland) | bobeka@tcd.ie

Sociological research on work and careers pays little attention to short-term changes in the business cycle and thus to differences over time. We use the concept of employment conjuncture to understand the specific economic, social and political context of work as it shapes the careers of migrants as they move through time and space. We study young migrant graduate professionals (architects and engineers) in the construction industry in different employment conjunctures. Firstly, we studied Poles who entered Ireland during the boom of the ‘Celtic Tiger’: using a Qualitative Panel Study (QPS) we carried out repeat interviews between 2008 and 2010 and again during 2013. These careers thus traverse an initial goldrush labour market and a subsequent disaster labour market. Secondly during 2012-13 we studied recent Irish graduate construction industry professionals who are now working in the UK or Australia. Comparative analysis shows how goldrush labour markets shape the workplace, casualising even professional recruitment; predictably the subsequent collapse leads to a tightening of control. Like the locals, migrants develop strategies of survival but are also disproportionately likely to simply escape by moving on to another country. Their subsequent careers suggest that just as starting the working life in a slump has long term scarring effects, starting in a boom can bring long-term benefits. There are also significant and continuing differences between Polish and Irish emigrants in their long-term career strategies and opportunities.

**When the ‘Unorganisable’ Organise: An Analysis of Migrant Domestic Workers’ Journey from an Individual Labour of Love to a Collective Labour with Rights**

Joyce JIANG (Roehampton University, United Kingdom) | joyce.jiang@roehampton.ac.uk

The collective mobilisation of migrant workers is an important issue for analysis. Two key barriers to the emergence of mobilisation have been identified – employment conditions that tend to prevent migrant workers coming together, and the framings held by migrant workers that marginalise an understanding of their position as that of exploited workers. There is also a barrier to long-term mobilisation relating to the issue of sustainability. The paper examines migrant domestic workers as a case in which collective mobilisation appears highly unlikely. The paper uses the social movement approach as a meta-theoretical framing to explore the bottom-up mobilisation among migrant domestic workers in London. We show that mobilisation changed the framing of migrant domestic workers from ‘labourers of love’ to workers with rights. It was able to do this because it addressed the three barriers to the development and sustainability of mobilisation: by creating a space for the development of communities of coping...
among migrant workers; by using politicised learning; and by using participative democracy and collective leadership development, tied to links with formal organisations. The paper argues for the importance of social scientists examining the creative processes by which migrant workers move towards collective mobilisation, and for the utility of a social movement approach in this process.

RN17S16 - Migrants on the Labour Markets

Social recognition in the informal work in Barcelona: the case of sub-Saharan waste pickers
Julian Arturo PORRAS BULLA (University of Barcelona, Spain) | japbulla@hotmail.com

The informal work is one the most studied items inside of sociology of work in economies called “developing”, but in Europe is not a central subject of studies. In a crisis moment as the actual, where the rates of unemployment rise and the conditions of work goes worst every day, is inevitably that the shadow of informal work is growing up. If we consider that informal work is a kind of work that goes out of the standard that socially we built, we have to studied and re-think this standard and realities that holds. The activity of the waste pickers is global, almost in all big cities around the world they collect, select, transport and sale recycling materials and objects of reuse form the waste. Almost in all the contexts is an activity for the population most excluded, and one the aspects that configure their activity is how they see they work, how the others see his work and how the government consider his job. I explore how the sub-saharan waste pickers in Barcelona have shaped a different way to work with a particular social recognition, it is necessary know how works that goes out of the predominan models reproduce our societies, our cities, and our daily lifes. I studied two groups of waste pickers in Barcelona, one organized around a occupied warehouse and other decentralized. Also I analized the discourse about their job from the newspaper, ONG´s and policies that affect them.

Work immigration, employee-driven innovation and “The Norwegian Model”
Kristiane LINDLAND (International Research Institute of Stavanger, Norway) | kristiane.m.lindland@iris.no

While other European countries have experienced an economic recession the last number of years, the Norwegian labor market has been dependent on work immigration to handle its labor demand. This paper will theoretically explore the idea that for immigrant workers in Norway to be fully integrated in the work processes they take part in, they need to internalize “the Norwegian model”. Through a newly started research project on employee-driven innovation (EDI) and work-migration, I explore the hypothesis that work immigrants in Norway need to internalize “The Norwegian Model” where leaders and labor union representatives cooperate closely in order to contribute to EDI. I discuss this argument through Mead’s (1932, 1934) understanding of how meaning and identity co-constitutes one another, and where expectations towards the future direct what one sees as possible to do. The paper contributes to a deeper understanding of how the cooperation between The Confederation of Norwegian Enterprise (NHO) and the trade union (LO) can lead to a work culture with expectations, rights and obligations, far beyond what is expressed in formal agreements, and what this can mean for work immigrants. This culture forms the understanding of what it means to be both leader and employee in the Norwegian labor market. Although “The Norwegian model” has received
growing attention in the literature, little focus has been on what consequences this can have for work immigrants and MDI in Norway today.

**Social types of the Russian domestic circular migrants**

Natalia Nikolaevna ZHIDKEVICH (Higher School of Economics, Russian Federation) | nzhidkevich@hse.ru

According to expert estimates, up to two-fifths of Russian families live off domestic circular migration (otkhodnichestvo). The phenomenon has a substantial impact on economic, social, political, and cultural processes in the province.

To describe otkhodniks’ economic behavior strategies, we have developed a typology based on the following criteria: 1) labor migration motivation; 2) professional potential (sought-after competence); 3) adaptability. The balance of these parameters allows determining the particular aspects of economic behavior that specify social types of otkhodniks.

Field research conducted in 2011-2014 sponsored by the Khamovniki Foundation (Russia) provided the empirical basis of the study. Principal methods are on-site observations and interviews with otkhodniks. We obtained data from 60 settlements in 15 Russian regions. We interviewed 349 respondents, of them 140 otkhodniks and their relatives. We considered 47 indicators revealing motivational, psychological, demographic, labor, economical, household and status characteristics.

Of the feasible diversity, only two social types are the most frequent and representative. The first type is characterized by high labor motivation, ordinary professional competence, and high adaptability. These are workers prepared to endure harsh working and living conditions – builders, plant workers and truckers. This type is the “backbone” of otkhodnichestvo. The second type is distinguished by high labor motivation, professional competence, and adaptability and includes carpenters and "rotation workers" earning big money in a demanding and dangerous environment. Notable by high incomes that approximate the otkhodnik’s living standard to that of the middle class (under the material well-being approach).

**RN17S17 - Industrial Relations and the Welfare State**

**The Worried Worker: How Job and Employment Insecurity Mediate between Policy and Anxiety**

Lindsey Marie KING (University of North Carolina, United States of America) | lmking@email.unc.edu

How is workers' fear of job loss shaped by insecurity about labor market prospects? How do policies condition this relationship between insecurity and anxiety? These are central questions for the sociology of work, as the growth of precarious work and welfare state retrenchment shift risks from employers and states onto workers. Considering that stable, lifetime careers with a single employer are, from a historical standpoint, the exception rather than the norm, workers' experience of insecurity merits exploration.

Early scholarship cast insecurity as a reaction to an objective threat within the organization, but threats may also emanate from states and markets. As demonstrated in the work of Chung and van Oorschot (2011), Dixon, Fullerton, and Robertson (2013), and Anderson and Pontusson (2007), distal influences such as labor market policy and unemployment rates impact insecurity. Whether threats come from the organization or the labor market, the inability to foresee and manage threats causes workers to evaluate their employment situations as insecure.
Research identifies three types of policies influential over insecurity: employment protection legislation, active labor market policies, and passive labor market policies. Employment protection legislation establishes hiring and firing practices, protecting workers from job loss; active labor market policies facilitate labor market matching through job search assistance or skills training; and passive labor market policies mitigate income shocks induced by job loss. What these policies have in common is their function as institutionalized risk management strategies. Employment protection legislation aims to reduce the threat of job loss; active labor market policies help workers cope with finding new work; and passive labor market policies provide a means of coping with unemployment.

Scholars identify three components of insecurity: Cognitive job insecurity, defined as the perceived threat of job loss; employment insecurity, defined as the perceived ability to locate a comparable alternative job in an external labor market; and affective insecurity, or anxiety about job loss. Policies should act differently on each type of insecurity. Employment protection legislation is predicted to act on job insecurity by governing the threat of job loss. Active labor market policies facilitate labor market matching, which may reduce employment insecurity by boosting objective employability. Passive labor market policies also help workers cope with job loss through income smoothing, which may allow workers to concentrate on their job search, thereby reducing employment insecurity. I predict that policies operate directly on anxiety and indirectly through job and employment insecurity, both of which are reliable predictors of anxiety about job loss.

This study uses the 2005 Work Orientations Module of the International Social Survey Program (ISSP) supplemented by country-level data from the Organization for Economic Cooperation and Development (OECD). Included in the analysis are the advanced capitalist economies of Australia, Belgium, Canada, the Czech Republic, Denmark, Finland, France, Germany, Hungary, Ireland, Japan, New Zealand, Norway, Portugal, South Korea, Spain, Sweden, Switzerland, the United Kingdom, and the United States. The sample is limited to individuals aged 18 to 65 who work for pay at least 15 hours per week during the survey period.

The dependent variable is employment-generated anxiety, measured by the question “To what extent, if at all, do you worry about the possibility of losing your job?” The distribution of worry varies greatly: 66.0% of Irish workers “don’t worry at all” about job loss, compared to a mere 8.8% of Czech workers. Job insecurity is measured by a five-point Likert scale, ranging from “strongly disagree” to “strongly agree,” in response to the statement “My job is secure.” To measure employment insecurity, I use a question worded, “How difficult or easy do you think it would be for you to find a job at least as good as your current one?” with an array of answers from “very difficult” to “very easy.” My measure of overall labor market risk is the unemployment rate. Active and passive labor market policies are measured by spending per unemployed, standardized to 2005 U.S. dollars. Employment protection legislation (EPL) for regular workers represents policies designed to preserve jobs.

This study uses multilevel random-intercept path analysis with an ordinal dependent variable. Multilevel modeling accounts for the problem of within-country clustering; ordinal regression is appropriate when the dependent variable is non-linear and ordered on a Likert scale. Due to multicollinearity, each policy is modeled separately. Preliminary results reveal that employment protection legislation has little effect on either job insecurity or anxiety. Tests of both active and passive labor market policies support a mediating model: policies that facilitate job mobility or mitigate income loss during unemployment operate directly on affective job insecurity and indirectly through employment insecurity.

Taken together, the three models demonstrate an important role for state-sponsored risk management policies in workers’ anxiety. The significant mediating effect of active and passive labor market policies suggests that the state serves as a coping resource that shapes workers’ emotional reaction to risk. Welfare state policies offer workers greater power over their employment career, translating into a reduction in employment insecurity and, both directly and
by proxy, affective job insecurity. Effective policy will maximize coping resources, or at least match coping resources to threats. With ineffective policy, threats outweigh coping resources or coping resources are poorly matched to threats.

Labour market institutions in times of economic crisis
Luc BENDA (Erasmus University Rotterdam, Netherlands, The) | benda@fsw.eur.nl
Ferry KOSTER (Erasmus University Rotterdam, Netherlands, The) | koster@fsw.eur.nl
Romke VAN DER VEEN (Erasmus University Rotterdam, Netherlands, The) | vanderveen@fsw.eur.nl

Since the economic crisis of 2008 erupted, unemployment levels in European countries have risen tremendously. However, labour market outcomes differed tremendously during the crisis between countries. This suggests that the economic crisis affected these countries differently, but it may also imply that structural features of national labour markets and government policies produced different results. This study aims to provide more insight on how labour market institutions mitigate economic shocks and how the effects of these shocks are distributed among different social groups. Studies on the abilities of labour market institutions to mitigate economic shocks are still scarce, and those who do exist only look at the two classical labour market models, coordinated versus liberal, and do not include the flexicurity model. According to flexicurity theory high levels of flexibility and high levels of social security can be obtained at the same time and therefore contradict the trade-off assumption between flexibility and social security underlying the classical models. As the EU actively promotes this labour market model it is important to gain more insight in the effects it produces. We therefore include the flexicurity model, besides the two classical models, into the analysis as a moderator affecting the relationship between the economy and the labour market. By conducting a panel study using longitudinal macro level data of EU-countries we are able to make a cross national comparison through time in order to provide more insight on the workings of different institutional configurations and their effects on different social groups.

Varieties of Labour Regulation within Liberal Market Economies – Comparing Approaches from the USA, the UK and Ireland
Thomas Michael HASTINGS (University of Sheffield, United Kingdom) | t.hastings@sheffield.ac.uk
Jason HEYES (University of Sheffield, United Kingdom) | j.heyes@sheffield.ac.uk

Prevailing debates on the regulation of work and employment have often drawn on a ‘command and control’ vision of labour market regulation focussed upon outcomes for firms, employees and related stakeholders. The result has been a tendency to ignore the wider thinking behind regulatory approaches, including the possibility of more nuanced forms of regulatory
'craftsmanship' intended to nudge and modify behaviours in more complex ways than that afforded by 'command and control' conceptions of labour market regulation. For instance, few contemporary studies have utilised the concept of meta-regulation in exploring processes of self-regulation and the co-production of desired norms in both firms and workers. The following paper addresses this gap through empirical research into contrasting public administration systems tasked with regulating work and employment. In line with the recent work of Thelen (2014), the paper engages with and challenges the Varieties of Capitalism (VoC) literature through case study research of three liberal market economies – the USA, the UK and Ireland. These economies have been deliberated chosen to highlight the heterogeneity of regulation approaches - even within ostensibly similar LME economies - and to further challenge the idea of path dependence in the VoC literature.

**Occupational Health : a Public Health Issue ? The case of Inspectors**

‘Occupational diseases in Slaughterhouses’

Amandine GAUTIER (Triangle UMR 5206, France) | amandine.gautier@sciencespo-lyon.fr

While Welfare State is growing in the Northern Countries, particularly in matters of Occupational health, Public Policies are more and more run down: the States are wondering how to delegate, how to privatize without losing the quality of Public service. The French Ministry for Agriculture is coping with an increasing rate of occupational diseases among those in charge of meat inspection in Slaughterhouses. Indeed these French civil servants do control in a permanent way by practicing incisions on carcasses and organ meats, under heavy chain cadences. So how to ensure inspection without altering those who make it? In the meantime this permanent inspection is told to be inefficient, sometimes expansive, and the French Ministry for Agriculture is developing a very new policy in order to avoid those occupational diseases in particular musculoskeletal disorders. So how coping with a challenged State action and maintaining health quality? Finally how to guarantee health workers who are in charge of public health? This presentation proposes a sociological approach of the French public sector facing a crisis of its legitimacy and a very new occupational health policy towards its own staff.

**RN17S18 - The Diversity of Worker Participation and Representation**

**Factory Occupations as a Form of Resistance: The Experience of Kazova Textile Workers (in Istanbul) in Turkey**

Deniz GÜRLER (Kocaeli University, Turkey) | ddenizgurler@gmail.com

Kazova textile workers started their resistance in February 2013 as a response to their employer’s failure to pay their wages and other benefits. After a period of struggle without any gains, the workers occupied their workplace in 28 June 2013, and seized the machines and the goods in it. The banner they hung over the factory window declared their determination: “We will not get out of the factory until we receive what we earned”. Following the principles of self-governance, the workers resorted to the use of work-in and continued to produce finished products. Similar to those in history, this occupation is one of the radical forms of working class movements, which means an ontological intervention in capitalism.

This study aims to analyse factory occupations through the Kazova experience. The first part of the paper addresses the causes of factory occupations, the link between the crises of capitalism and factory occupations, and opportunities and limitations of self-governance practiced during these occupations. Based on the framework of the first part, the second part focuses on the
Kazova experience, by discussing the developments that gave way to the occupation, the stages of the occupation and the present situation.

**Interests and Interest Representation of White Collar Workers in the German Manufacturing Sector. Opportunity Structures, Framing and Resources**  
Thomas HAIPETER (University of Duisburg-Essen, Germany) | thomas.haipeter@uni-due.de

The employment structure in the German manufacturing sector is changing fundamentally. Recently, white collar workers have overtaken blue collars in numbers, going hand in hand with a changing composition of the workforce along lines of qualification and occupational positions. This is the reason why unions in the manufacturing sector in Germany increasingly try to develop strategies to become more attractive for white collar workers and place resources at the disposal. In this way, unions and works councils try to frame the interests of white collar workers in a new way, depending on the resources they have and the opportunity structures they are facing with respect to collective bargaining agreements, union campaigns or the employment structure in the plants.

Based on survey analysis and case studies combining qualitative and quantitative methods, we have analysed new initiatives and come to the preliminary conclusions that:
- the work situation of white collar workers is rather ambivalent, with high job satisfaction on the one and growing pressures on working time and work intensity on the other hand;
- that the initiatives take up new issues and/or develop new processes of joint construction of collective interests;
- that the initiatives are based on a new form of interest representation marked by the participation of employees and by supporting them to be successful in their individual pursuit of interests;
- and that the initiatives thereby help to improve the acceptance of works councils and of unions; however, significant effects on union density are still rare.

**An emblematic case of the Labor Domination in Brazil over the 20th century**  
Diego Tavares DOS SANTOS (University of São Paulo, Brazil) | diego.tavares.santos@usp.br

"Termomecanica" is an important factory localized in the heart of the most industrialized region of Brazil. The main feature of this enterprise is that its workers never held strikes. The sociological narrative that I tried to build of this company were started with a reflection about the various aspects of the working class experience in Brazil and about the combative identity that was resulted of this experience. Afterwards, I aimed dismantling the web of symbolic ties which constitutes the patronizing speech of its founder, developed in order to hinder the establishment of a rebellious working class consciousness among his factory’s workers, being able to create a subdued workers’ identity, loyal to their boss and company. Later, I tried to highlight the fact that the labor conflict has always been latent, in spite of the founder’s strategies to make the trade unions impotent. At that point, my intention was to acknowledge the ones forcefully silenced, especially the anonymous workers who had "Termomecanica" printed in their lives. Finally, I tried to recover the social traditions that – in a specific historical and socio-economic panorama – culminate in Termomecanica’s production process and engender the remarkable workers' engagement, creating a decisive factor to make the "Termomecanica" a case unique faced with the competitors, the others enterprises and the State. In fact, the founder and his company are representants of a traditional pattern of labor domination in Brazil. Therefore, this paper intends to present an important aspect of the Industrial Relations in Brazil over the 20th century.
Social enterprise, voice and engagement? The evaluation of a community health workforce in South West England
Stephanie Anne TAILBY (University of the West of England, United Kingdom) |
Stephanie.Tailby@uwe.ac.uk
Ana LOPES (University of the West of England, United Kingdom) | Ana2.Lopes@uwe.ac.uk
Stella WARREN (University of the West of England, United Kingdom) | Stella.Warren@uwe.ac.uk

Governments in the UK over three decades have advocated ‘third’ sector involvement in public service delivery. Social enterprise gained favour under New Labour as a business model with social objectives, untrammelled by a wider bureaucracy and making share ownership and other arrangements for employee engagement with new ways of working. Community health staff in England gained the Right to Request to ‘spin out’ from the NHS as a social enterprise in 2008 although proportionately few social enterprises were formed then or in 2011 when the Conservative-Liberal Democrat coalition government completed the Transforming Community Services programme, as part of its controversial NHS ‘reforms’. Studies listed the risks of social enterprise for community health providers, dependent on a main contract, obliged to re-tender for its renewal in the context of resource-constrained commissioning and a burgeoning population of would-be providers. Our paper concerns a community health provider whose management did opt for social enterprise in 2011 and since 2013 has partnered with health and social care providers in the locality to pursue efficiency savings through the innovation of integrated locality care teams. It draws on interview and survey data to report community health professionals’ views of the objectives and practices of the new ways of working which include co-location with local authority social care staff, under a unified line management structure and cross-organisation joint management team. Considered are employee views of the adequacy of the provision for their voice in the sets of work and management changes to which they have been exposed.

RN17S19 - Workplace Practices and Processes

Does work design improve employee business awareness
Victor HAINES (University of Montreal, Canada) | victor.haines@umontreal.ca
Vincent ROUSSEAU (University of Montreal, Canada) | vincent.rousseau@umontreal.ca
Radu CALOMFIRESCU (University of Montreal, Canada) | radu.calomfirescu@umontreal.ca

The aim of our study is to investigate the associations between work design characteristics and employee business awareness defined as non-managerial employee realization, perception or knowledge of the employing organization’s business environment as demonstrated when involved in decision making of problem solving that affects the business. Although several studies have examined the associations between work design characteristics such as decision-making autonomy or information processing and employee attitudes or motivation (Humphrey, Nahrgang, & Morgeson, 2007), few have examined their associations with cognitive constructs such as the one represented by employee business awareness. Drawing from a sample of 330 employees non-managerial employees from four companies located in Canada, our results suggest positive associations between decision-making autonomy, information processing, and employee business awareness. In turn, higher levels of employee business awareness were related to more positive assessments of extra-role performance by positive assessments of extra-role performance by supervisors. Finally, an extension of the information processing outlook was achieved by testing the moderating influence of affective organizational
commitment in the associations between work design characteristics and employee business awareness.

The Inefficiency of Delegating Indirect Tasks for Enhancing Job Autonomy: An Evaluation of a Production Structure Intervention Program
Lander VERMEERBERGEN (KU Leuven, Belgium) | lander.vermeerbergen@soc.kuleuven.be
Geert VAN HOOTEGEM (KU Leuven, Belgium) | geert.vanhootegem@soc.kuleuven.be
Jos BENDERS (KU Leuven, Belgium) | jos.benders@soc.kuleuven.be

Objectives: This study examines that the effect of delegating indirect tasks (e.g. preparatory, executive and regulatory tasks) on job autonomy is intermediated by the primary production structure. This is in contrast with a number of studies that underline the primordial importance of the delegation of indirect tasks for increasing job autonomy.

Methods: A total of 451 employees in 25 firms participated in a cross-sectional intervention study. Employees filled out a questionnaire about their job content before the intervention started and directly after the intervention. All organisations delegated indirect tasks to jobs in production divisions.

Results: Positive effects of delegating indirect tasks on job autonomy were found for organisations where operational tasks are ordered around parallelised flows of products or services (=product-oriented structure). Negative effects were found for organisations where different operational tasks are homogeneously coupled into divisions, independent of the flow of products or services (=operation-oriented structure). Furthermore, the strongest positive effects were noted for organisations that implemented a product-oriented structure and delegated indirect tasks. The strongest negative effects on job autonomy were found for organisations that implemented a combination of both production structures and delegated indirect tasks.

Conclusions: Delegating indirect tasks does not merely cause an increase in job autonomy. Moreover, the effect of delegating indirect tasks on job autonomy depends on the primary production structures of organisations. In addition, delegating indirect tasks in operation-oriented production structures decreases job autonomy. Delegating indirect tasks in product-oriented structures increases job autonomy.

Advantages and challenges of multicultural workplaces: migration of health professionals to Ireland
Alicja BOBEK (Trinity College Dublin, Ireland) | bobeka@tcd.ie

This presentation is based on qualitative data collected as part of ‘WORK-INT: Assessing and Enhancing Integration in Workplaces’ research project, which was funded by the EU Commissioner. The main focus of this study was the experience of working in multicultural hospitals in five European cities, including Dublin. Of particular interest were doctors and nurses with migration background.

For the purpose of the Irish case study we interviewed 30 individuals working in different hospitals around Dublin. Participants included doctors, nurses and their managers. Most of the participants were foreign-born; however, as the workplace was of main interest to the project, we also conducted interviews with some Irish workers.
Hospital managers interviewed for the purpose of this project perceived their foreign-born employee as an important asset. They particularly valued medical skills and the experience brought by these doctors and nurses to the Irish workplace. Furthermore, as the profile of the patients in the Greater Dublin Area is also multi-ethnic, migrant presence amongst the employees has also been an advantage. At the same time, there seemed to be very little diversity management developed within hospitals. Doctors and nurses also recognized positive
aspect of working in a multicultural environment. There were, however, some challenges related to their migratory background. Firstly, there were language and communication issues. Training and promotion was also problematic for many of those coming from non-EU countries. Finally, we also found cases of discrimination on systemic, institutional, and individual level.

**RN17S20 - Changes in Employment: Discourse Analysis and Policies**

**Qualifications and skills in 'knowledge societies': how do employers construct employable workers?**

Manuel SOUTO-OTERO (University of Bath, United Kingdom) | mso21@bath.ac.uk
Phil BROWN (Cardiff University) | mso21@bath.ac.uk

The article addresses the following question: how do employers define employable candidates? with particular reference to their qualifications and skills. The article makes use of 'big data' in order explore patterns of qualifications and skills demands in the UK labour market during the period 2010-2013. The text of more than 20 million employment adverts was analysed in order to identify their qualifications as well as soft and technical skills requirements. Based on this analysis the article argues that we are witnessing a process of increasing atomisation, diversification and specification of the skills that define 'employable' candidates. This has fundamental consequences for inequality dynamics, and the extent to which these can be addressed by education systems, as providers of what Michael Young has called "powerful knowledge".

**Critical Discourse Analysis in the research on industrial relations: three case studies from Poland**

Piotr OSTROWSKI (Univeristy of Warsaw, Poland) | ostrowskip@is.uw.edu.pl
Wojciech FIGIEL (Univeristy of Warsaw, Poland) | w.figiel@uw.edu.pl

Over the past 25 years, Poland has undergone an important socio-economic transformation, which had a profound impact on labour relations. These changes were reflected in the discourse on industrial relations. However, this question has received scant attention from social scientists and linguists. This is particularly unfortunate since there are efficient analytical tools that allow us for acknowledging those factors. The aim of this paper is to bridge the above-mentioned gap by demonstrating that Critical Discourse Analysis (CDA) is a relevant tool in the context of research in industrial relations. It helps to study the asymmetry between the forces of Labour and Capital. For CDA, language is the key element of all socialisation practises, and therefore is the most important factor behind the creation and reproduction in the society. One of the basic tenants in CDA is its position regarding the nature of power and symbolic domination.

The paper presents an application of critical discourse approach to industrial relations in Poland by using the examples taken from several studies which were conducted in the past three years. The projects include: a multi-faceted analysis of the meetings of Tripartite Commission on Socio-Economic Affairs between Autumn 2012 and Spring 2013; a multi-modal analysis of the debates between the representatives of the employers’ associations, the unions and the government between the Winter of 2013 and Spring of 2014; the analysis of two most widely-circulated Polish opinion-making weeklies’ coverage of the entrepreneurs and employers in 2013.
The Politics of Managerial Reform in Public Service Organisations: a study of performance management and austerity in UK local authority museums.

Whyeda GILL-MCLURE (University of Wolverhampton, United Kingdom) | w.gill-mclure@wlv.ac.uk

The paper contributes to the emerging political interpretation of managerial reform in the public service organisations. The paper’s underlying argument is constructed around a central analytical question: if the public sector is distinctive then why does the new public management (NPM) aim to make it more like the private sector? In other words: what are the political drivers behind managerial reform? The paper outlines a theoretical framework that articulates the links between administration models and labour management in order to demonstrate the central political imperatives behind the organisational reform of UK local government. The study shows these to be rooted in a number of inter-related central political priorities: the need to control local politicians and the need to control pay and performance. The paper examines the problematic assumptions underlying NPM when applied to public service organisations and professionals. It finds that centrally imposed performance targets erode the important political and mediating role of public organisations and professionals in public policy making. The cogency of the political interpretation of reform is illustrated through a case study of the adverse impact of NPM on curator workloads, morale and the museum service.

Rationality in discourses on work and entrepreneurship. Institutional reflexivity versus dominating methods of defining reality in (post)transformational Poland

Konrad KUBALA (University of Lodz, Poland) | suspenso@o2.pl

The main objective of the presentation is to reconstruct discursive practice of constructing the dominant types of rationality in the modern Polish society. The subject of research is primarily the ways of creating certain models of rationality in public discourse about the work and entrepreneurship. I assume that the study of discourse is the study of all kinds of practices and rituals, language and non-language, by means of which it is constructed and maintained a sense of reality and the specific vision of society (including politics). I also assume that an important part of discourse analysis are "relations of defining" (U. Beck) of crucial problems for specific social systems. Rationality is a concept that has crucial influence to the organization of social life in modernity. Therefore the impact on specific ways of its defining is tantamount to the power of applying certain institutional arrangements and the impact on individual life strategies adopted by individuals. Considering such subjects of research, I want to answer the following research questions:
1. What objectives are considered rational in the Polish public discourse about the economy?
2. What axiological justification underlie beliefs about the valence of these objectives?
3. What are the consequences (material, social and individual) of the functioning of a particular way of defining the objectives?

Empirical research material based on the data gathered in qualitative research (discourse analysis [DA] membership categorization analysis [MCA]). The base of research in discourse analysis and membership categorization analysis will consist of articles from the socio-political weeklies (“Polityka”, “Wprost”, “Sieci”, “Do Rzeczy”). In addition, will be analyzed radio broadcasts titled "Economics-capital-economy" and selected exposé given by the Polish prime ministers during the Third Republic of Poland.

Axionormative level of analysis can be a valuable element of social diagnosis on many contemporary sources of systemic problems and private concerns. Critical study of the results obtained during the research will become an empirical indication in an attempt to answer the question of why the system cannot cope, in return, with institutional and personal problems caused by itself.
RN17S21 - Analytical Perspectives on Work and Organisations

Factors Influencing Job-Offer Acceptance Among Campus Recruits
Murale VENUGOPLAN (Amrita University, India, USI Switzerland) | venugopalan.murale@usi.ch
Vandana MADHAVAN (Amrita University Amrita School of Business) | mvandanagopi@gmail.com

It is often found that some employers are favored more by campus recruits. Undergraduate and postgraduate students have some preferences as far as employers are concerned. Some companies seem to attract them more than others. The primary market of a company definitely is the organization's own employees. Thus, jobs become internal products. It is very important for an organization to look attractive to its existing and prospective employees. When an employee works for an organization that he perceives as attractive, he might be motivated to put in his best efforts to meet the expectations set for him. Satisfied employees lead to satisfied customers. The study of employer attractiveness becomes more relevant in today's context when recognitions like 'employer of the year' awards are gaining in popularity. It is also especially important when dealing with a more informed labor market. Aspiring employees are becoming choosier about the organization they decide to work for. Several researchers have tried to study the attitude of prospective employees towards companies. The uniqueness about the present-day prospective employees is that they formulate and go by their impression about an organization before they accept an offer from it. Therefore, it is relevant to understand what attracts aspirant employees to a particular company. This study aims to look at the attributes that make an employer attractive to a prospective employee who is yet to complete his education. This is carried out through in-depth interviews with students in their final year of their college from a top university in India, who are in the process of choosing jobs for themselves.

Self-perceive occupational prestige among Romania teachers: organisational explicative factors
Valeriu FRUNZARU (National University of Political Studies and Public Administration, Romania) | valeriu.frunzaru@comunicare.ro
Diana-Luiza DUMITRIU (National University of Political Studies and Public Administration, Romania) | diana.dumitriu@comunicare.ro

Most studies discuss occupational prestige by stressing out the macro-social aspects related to specific social stratification models. This paper aims to address the impact of organizational aspects on how teachers perceive the prestige of their occupational group, moving the focus on the micro-social context of their daily activity. The way teachers evaluate the social prestige of their profession fulfills normative and motivational functions and is reflected in how they actually perform their professional roles, serving both explicative and prospective purposes. In trying to identify what are the main factors that can explain the self-perceived level of occupational prestige among teachers, we conducted a national level study among Romanian teachers (N=2165) from preschool to high school educational stages. Within the explicative model (R²=0.38), we were able to group the factors in three main categories: material conditions, bureaucratic and relational aspects. The findings revealed that teachers involvement in bureaucratic activities such as elaborating different reports, as well as a lower level of satisfaction regarding the relation they have with students, parents and representatives of the school's management end up decreasing the self-perceived occupational prestige.
Our study lays emphasis on the fact that organizational factors influences teachers self-perceived prestige and, thus, can affect the overall quality of the educational act. Therefore, to improve this, a greater involvement of national and local authorities in providing better material conditions in schools, in supporting the debureaucratization of the educational system and reevaluating the role of teacher-student-parent communication is needed.

Interpersonal justice and employment flexibility as determinants of job satisfaction of Polish knowledge workers

Aleksandra Ewa Wilczynska (Open University of Catalonia, Spain) | awilczynska@uoc.edu
Dominik Batorski (University of Warsaw, Poland) | db@uw.edu.pl
Joan Torrent Sellens (Open University of Catalonia, Spain) | jtorrent@uoc.edu

Organizational justice is a crucial aspect of a good management. It was shown numerous times that unjust work environment has an adverse impact on employees in terms of, among others, job satisfaction. Yet, is this effect homogeneous among all groups of workers? Does unfair treatment affect freelancers in the same way it affects permanent workers? In the presented paper we strive to provide explanation to these and other yet unanswered questions, presenting a study about the impact of organizational justice on job satisfaction of workers in Poland. In particular, we concentrate on group of knowledge workers, demonstrating how justice at work influences their job satisfaction, in comparison to rest of the workers. Subsequently, we disaggregate the workforce even further, to see if within the groups of knowledge workers and other workers, individuals with different types of contracts are affected by unfair treatment in a distinct way. We focus on interpersonal justice, which reflects the degree to which an employee is treated with dignity, and respect by superiors. We estimate two logistic models of job satisfaction, separate for the groups of knowledge workers and other workers. The models include interpersonal justice and type of contract as independent variables. The data used in the analysis come from Social Diagnosis, a dataset comprising seven waves and over 75,000 observations. In both groups of workers, the findings proved interpersonal justice to be one of the most influential determinants of job satisfaction. However, the strength of the impact depended immensely on their type of contract.

Concessions: Explaining unexpected success in wage negotiations

Hanna Brenzel (Institute for Employment Research (IAB) of the German Federal Employment Agency (BA), Germany) | hanna.brenzel@iab.de
Judith Anna Czepek (Institute for Employment Research (IAB) of the German Federal Employment Agency (BA), Germany) | judith.czepek@iab.de
Martina Rebién (Institute for Employment Research (IAB) of the German Federal Employment Agency (BA), Germany) | martina.rebien@iab.de

Wages are often understood as indicators for matching equilibria between demand and supply on labour markets. According to human capital theory the ‘match’ is determined by the qualification of the candidate on the one hand and the expected productivity of the worker on the other. To a certain degree, in this view wages resemble the individual return of investment (education and skills) of the worker and the use of this productive capital by the employer respectively. However, this return of investment is dependent on structural effects on the job market. High unemployment rates may lead to lower wages (strong position of the employer, fierce competition between job seekers). While research tends to focus on explaining substandard wages in this contribution we seek to outline an explanation for unexpectedly successful wage negotiations.
By drawing on the German Vacancy Survey we want to answer the question: How comes that workers get higher wages than initially offered by the employer? We’ll explore problems during the hiring process as well as concessions made by firms and consider information about the hired persons and the employer’s characteristics. From the perspective of human capital theory such successes may indicate that high skilled workers benefit from offering additional prospects of productivity. However, we’re more interested in possible information deficits by the employers. As a working hypothesis companies may try to compensate for wrongly believed labour shortages. Therefore wages may not be indicators for matching equilibria.

**RN17S22 - Regulations of Work and Employment**

**Working 24/7? Evidence from the Finnish Time Use Survey, 1979-2010**

Pasi Juhani PYÖRIÄ (University of Tampere, Finland) | pasi.pyoria@uta.fi
Satu OJALA (University of Tampere, Finland) | satu.ojala@uta.fi

This paper draws on Finnish time use data spanning the past three decades (1979-2010), with a focus on the prevalence of wage and salary earners’ work at different locations, namely at the employer’s facilities, at home, outside the home or the main place of work, and on the move. The diary data (N = 13,277) depicts respondents’ time budgets in ten minute intervals around the clock. According to the results, work practices have remained surprisingly conventional. Although the absolute time spent at the respondents’ main place of work has been decreasing, the vast majority of employees still work at their employer’s facilities during conventional business hours. Neither working from home nor during free time has increased, lending no support to the 24/7 society thesis. However, during a standard working week, alternating between different business facilities has become more common than before, pointing to the growing importance of distributed work arrangements.

**Temporary agency work in the Czech Republic and Slovakia: a threat to collective bargaining or an opportunity for revival?**

Monika MARTISKOVA (Central European Labour Studies Institute, Slovak Republic) | monika.martiskova@celsi.sk
Marta KAHANCOVA (Central European Labour Studies Institute, Slovak Republic) | marta.kahancova@celsi.sk

Temporary agency work (TAW) has been on the rise before and after the crisis both in the ‘old’ and the ‘new’ EU member states. In Czechia and Slovakia, two post-socialist Visegrad countries with a significant share of automotive industries in their economies, TAW helped employers to shift responsibilities onto the workers and agencies and coping with the crisis. However, the legislative response to the expansion of TAW lagged behind in both countries. In industrial relations, the increased presence of TAW raised the issue of labour market dualization, with trade unions not taking a clear stance on this issue. In the light of these developments, this paper questions the implications of the rise of TAW in Central and Eastern European (CEE) member states for these countries’ collective bargaining structures. While non-standard employment forms, including TAW, are often seen as drivers of bargaining decentralization, our evidence shows that in some conditions the lack of regulation in the unorganized TAW sector may facilitate the interest of employers and trade unions to coordinated bargaining.
In this paper, we aim to explore responses of the social partners on the temporary agency work in Slovakia and Czechia, two countries which share common history in the former Czechoslovakia and to some extent also demonstrate similar industry structures and bargaining institutions. However, the responses of employers and employees to TAW differed across these countries. In Slovakia, the increased presence of TAWs, coupled with the lack of governance and regulation in the TAW sector, contributed to an important shift in the strategies of employers and trade unions; and facilitated the emergence of sectoral bargaining institutions. The foundation of the employers’ structures and the change of trade union strategy from exclusion to inclusion of TAWs in union interests is driven by the social partners’ effort to balance the lack of regulation in the sector. In contrast, the Czech trade unions have not yet seized opportunities from including TAWs into their target groups, and their actions indirectly contribute to a deepening dualization of the labor market.

We argue that the changing labour market dynamics and the lagged or fully lacking legislative responses of the state can facilitate action on the side of sector-level social partners even in generally hostile conditions of bargaining decentralization and declining bargaining coverage.

Defending Social Equality in Hard Times: The Failed Strategy of Social Democracy in France and Italy
Fabio BOLZONARO (University of Cambridge, United Kingdom) | fb319@cam.ac.uk

Persistently high unemployment rates pose serious social problems in several Western European countries and require difficult decisions by political leaders. Given the widespread distrust with past social democratic policies, centre-left governments have increasingly opted for supply-side policies that reduce the cost of labour, increase labour market flexibility, and restrain employees’ rights. Though the new policies may favour job creation, they may also exacerbate social inequality. This paper intends to contribute to the scholarship addressing how new employment policies introduced by social democracy impact social inequality and the changing industrial relations by investigating the recent labour market reforms implemented by left-wing governments in France and Italy.

The analysis of parliamentary documents, official publications, and several interviews with politicians, labour unionists, and employers’ representatives permits to identify in both countries a distinct preference for liberal-oriented policies supported by employers’ associations and international organizations, greater attention to economic competitiveness, and decreasing political concern for social inequality. However, France and Italy have followed two different trajectories. While French social democracy has attempted to preserve some degree of social solidarity and existing workers’ rights, Italian social democratic governments have been engaged in introducing a radical model of labour market flexibility that is particularly affecting the employment positions of vulnerable professional groups (e.g. young people, women, precarious workers). The new labour market reforms implemented in France and Italy are thus likely to increase social inequality, employment precariousness, and the power of capital over labour.

The Effects of Automation - How the development of new technologies affects the change in the popularity of various professions.
Dominik BATORSKI (University of Warsaw, Poland) | batorski@uw.edu.pl
Marek BLAZEWICZ (University of Warsaw, Poland) | mablazewicz@gmail.com

Rapid development of digital technologies affects the demand for work in various occupations. Some professions are becoming increasingly popular but many others are less needed due to automation and greater efficiency of workers through the use of new technologies. In this paper we examine the dynamics of occupational structure in Poland, analyzing how changes in...
employment in the various professions depend on the risk of computerization. To this end we use the probabilities of computerisation of different occupations that were estimated by Frey and Osborne (2013). Using longitudinal data from Social Diagnosis study, i.e. a large survey conducted every two years from 2003 to 2015 with over 26000 of respondents in each wave, we make an empirical verification of the effects of work automation in different occupation predicted by Frey and Osborne. We verify whether the probability of automation of a given profession explains the risk of the job loss, as well as how large was the risk of unemployment associated with automation in recent years. Finally, we discuss the situation of people who lost their jobs estimating the scale of technological unemployment in Poland. The results demonstrated in this paper suggests that the automation is an important factor in the dynamics of the labor market.

**RN17S23 - Globalisation and Capitalism**

**Classes, work and reproduction**

Raimo BLOM (University of Tampere, Finland) | raimo.bлом@uta.fi
Harri MELIN (University of Tampere, Finland) | harri.melin@staff.uta.fi

Our thesis is that class matters. One of the main areas where class influences in people’s lives is the area of work and reproduction. Class analysis is not only about class structure. It has many phases: class structure, class situation, consciousness, organization, classes and state. Different phases has different questions and different concepts. The second phase class situation focuses on the analysis of work and reproduction situation of different class groups. Our analysis is focused on relations between class, work and reproduction. It aims at telling about the differences between different class groups in work and reproduction. The analysis covers different wage laboring class groups from managers to unskilled workers.

In the paper, we are interested in quality of working life and also differences and inequalities of work and reproduction conditions between class groups. Our basic question is does class count? We analyze how the classes differ in their work profiles, that means, is the relation of main matters at work different in different class groups. We ask what kind of differences there are between different wage worker groups? Secondly we ask, can we find any hierarchical order in this respect if any? Our empirical data is from Finland. Data sets covers the years 1977-2014. The paper is not only about classes it is also a research about the change of work and reproduction conditions in contemporary capitalism.

**Mortgage in the Making of a Middle Class in Poland**

Mikołaj LEWICKI (University of Warsaw, Poland) | m.lewicki@uw.edu.pl

Transformation of capitalism brought about the problematic status of labor as a central institution that structures societies (Giddens 2000, Beck 1985, Castells 2001). Instead of building on the theories of labor, many theorists encourage to focus on consumption and prosumption as new forms of activity that shapes values, identities, group coordination and generally - present societies (Ritzer Jurgenson 2009, Castells 2001, Jenkins 2001, Appadurai 2007). And even if seen as still important, its structuring functions among societies have been further questioned (Standing 2010, Rifkin 1985). For the most of theorists already mentioned this is equal with the dissipation of class societies as we know them. My main question concerns hypothetical new institutions or to be more specific - market devices (Callon Muniesa Millo 2007) that seem to shape classes; and specifically - middle class in Poland. I focus on the population of credit-takers who took on mortgage in Swiss Franc denominated or indexed currency mostly in order to start the new living in the brand new apartments. Their life-projects
are spanned into the abstract future of usually 20 years long credit contracts meanwhile their day-to-day activities are shaped by the fluctuating rates of credit, depending on the currency fluctuations directly associated with the global currency and economic markets. I combine qualitative research on the indebted and the so called "FX [Foreign-Exchange] Mortgage" with the EU-SILC data on the households with mortgages in order to demonstrate how we can research and identify new institutions that seem to shape classes in the "class-less societies".

"Take a pride in what you're doing" - workers in declining monoindustrial cities.
Cases of Lodz (Poland) and Detroit (USA) in comparative perspective
Agata Magdalena ZYSIAK (University of Lodz, Poland; University of Michigan, USA) | agatazysiak@gmail.com

The paper aims at examining the trajectories of the rise and fall of two important industrial centers in different political and economical contexts – Lodz in Poland (textile industry) and Detroit in USA (automotive industry). My interest lies not on the level of “objective” data, but on individual level, that is the subjective perception of change, self-identity building strategies and language describing the trajectories of the two cities in workers biographical narrations.
Macro-scale processes certainly shaped biographies. Both cities underwent rapid modernization and intensive growth, both experienced serious social and economical problems and conflicts, and finally spectacularly collapsed during a last few decades. Changes of production structures and locations, the inflexibility of mono-industrial giants, and class conflicts were common for both cities. The important features of this comparison are not only similarities, but also differences, especially on macro level, that is the political and economical parallels of socialism and capitalism. Were workers' stories about failure or struggle? How were their experiences reorienting sometimes their entire existence dealt with, reconstructed, and worked-through in objectified narratives? What where a constructed concepts of work, workplaces and cities? What were the role of those in peoples lives and how it have changed during cities collapse? The paper traces macro-economical changes on micro level trying to find answers for questions mentioned above.

Rhetoric of Decline: Workers’ Committees and the Decline of Labor in Contemporary Israel
Gadi NISSIM (Tel Aviv University, Israel) | gadinissim@gmail.com

In the past three decades, Israel has witnessed a drastic transition from a Fordist state-capitalism, led by the Zionist-Labor party, to a post-Fordist global capitalism, justified by a neoliberal ideology. This dramatic turn has made labor relations in Israel a compelling case study of the rise of neo-liberalism and of the decline of organized labor.
This paper is based on a qualitative research of twenty workers' committees in Israel's private sector, which was conducted in 2005-2009. The research demonstrates the adaptive mindset among committees' activists. While the committees' activists are expected to be potential contestents of the neo-liberal order, they tend to accept the fundamentals assumptions of neo-liberalism, rhetorically reproduce the notions of the determinism and the laws of the free market, and accept their inferiority in the workplace. Therefore, the activists tend to employ defensive strategies and neglect ambitions to transform labor relations. For example, they see privatization as an inevitable rather as a political act that works against them. Thus, they prefer to mitigate its grave consequences upon workers instead of opposing it altogether. Their adherence to what they consider as "universal laws of the market" also leads them to idealize practices that they identify with business world and often to mimic management tactics (like
master themselves in business administration and hire consultants who usually work with the employers).
As an outcome, the workers committees safeguard the minimal rights and needs of the workers, but they forgo any ambition to reshape employment relations.

**RN17S24 - Critical and Innovative Perspectives on Work and Employment**

**Precarious Agency. Analysis of Biographical Interviews in Services**

Agata KRASOWSKA (University of Wroclaw, Poland) | agata.krasowska@uwr.edu.pl

Precarious agency is an agency of persons belonging to the category of precarity. Agency is 'individual's ability to cause a difference' in the current state of affairs, or sequence of events (Giddens 2003:53). The result of the agency is transformation or reproduction of social forms (Archer 1995), which arise as the result of individual and collective actions, such as social movements or political organizations. Agency may be 'involuntary' (Archer 1995), which may not always be associated with the activity of the entities of action. In my paper I will present how marginalized groups, to which must be precariat, exhibit agency. For this purpose, I am going to present a comparative analysis of biographical interviews accomplished in the two studies with precariat working in services in Wroclaw (Poland). The first study took place in May 2013, the second study will be held in May of 2015 (in cooperation with Adam Mrozowicki).

In my paper I am going to answer the question about which is subjective sense of agency of precarious workers and their real opportunities of agency in private and public sphere? Whether and to what extent, the feedback can be observed between the situation of precarious workers, their biographical and strategies, transformation and reproduction of the wider social order? Whether and to what extent precarious employees take activities aimed at organizing people in a similar situation on the labor market?

**Welfare effects of subsidized employment. Results of a model project in North Rhine- Westphalia**

Nicole KOECK (Institute for Labor Research, Germany) | koeck_nicole@yahoo.de
Nastaran KHOSRAVI (Institute for Labor Research, Germany) | nastaran.khosravi@iab.de

All European countries have to face as one consequence of a more capitalistic defined labor market policy the situation of underemployment by now. This leads to an increasing inequality, not only in between the well-known asymmetry between "labor" and "capital" but also among the work force itself. The struggle for decent jobs becomes harder and rules out certain groups on the labor market, who do not belong to the class of "premium" workers.

Although the German labor market looks quite relaxed as occupation rises to new levels and unemployment is very low, the situation is severe, because the labor market reforms within the past ten years formed a steady group of unemployed people without any perspective of getting a job, but who are nonetheless stigmatized by processes of re-commodification and the regime of an activating labor market policy. These people share the values of the labor society and the laboristic consensus, but at the same time they cannot meet these values.

To that group the ultima ration of labor market policy is subsidized employment. In our project we investigate on the impact of publicly subsidized employment for people with so-called person specific obstacles, which impede to find or maintain jobs on their own. If, as it is a common knowing in political thinking, work as such has positive effects on people’s welfare, is this also
valid for the particularity of the subsidized employment? Our qualitative and quantitative findings suggest evidence that even a simulated way of working improves the people’s well-being and stability, especially because it reduces the strain and allows a certain kind of individual economic autonomy.

**Incorporating differences in (the failure of) workplace democracy**

Jana LINDBLOOM (Institute of Sociology, Slovak Academy of Sciences, Slovak Republic) | jana.lindbloom@savba.sk

Differences and inequalities define our life and work experience. They are present at various levels, including the workplace environment and structure. One of the arrangements designed to counterbalance manifold workforce asymmetries is workplace democracy, where equal participation in decision making should be granted. Such alternative organization, however, is no simple form of government. External pressures, as well as internal tensions resulting largely from numerous positional differences and diverging expectations, regularly come into prominence and challenge, compromise or even defeat the notion and ideal of equality. This paper, which draws on research of (vanishing) Slovak post-socialist agricultural cooperatives, discusses the delicate relation between differences and equality at the (democratically run) workplace level. Special attention will be paid to the (unintended) consequences of reconsidering the in/equality and of translating it into an amendment on voting rights. Distinction-making is analysed as an interpretative and performative act tailored to re/order (workplace) reality. Thus, while certain differences make the success of workplace democracy and the true involvement of everyone less likely, the utilization of particular differences in the reformation of labour relations is also a discursive and gradual process which usually (or always) includes the (often uninformed) consent of (at least) a majority of the workers.

"The Surplus-Friends": Case of the Bar Workers' Strike in Ankara"

Akin BAKİOĞLU (Ankara University, Turkey) | akin.bakioglu@gmail.com
Yasin DURAK (Ankara University, Turkey) | durakyasin@hotmail.com

The problem of this study is the absorption of the reaction of labourers who work in conditions without work assurance, against the working relationships which are invaded by informal networks, by leftist political ethos. Oppositional political ethos creates the main norms of labour control patterns in the wage relations of the workers of a bar in Ankara (capital city of Turkey) and known for its politically critical stance. In addition, the informal relations created by the employers on the level of “friendship” become one of the fundamental reference point of the strategies in order to increase the amount of monetary gain of the business. Surplus-friendship is the production of the surplus-value in that informal network. The friendship relations between the workers and the customers turn into the focal point of monetary gain for the employers. In the research, the interviews with the bar workers who strike due to their inability to subsist within the work environment without work assurance, and their employers are used alongside the empirical data collected through observation in duration of the strike (that strike was the first bar workers strike in Ankara and it was aimed to stop the consumption rather than production). Lastly, the effects of the worker strike on oppositional political circles are discussed and how employers besmeared the legal struggle started by workers to gain their rights, using an oppositional political rhetoric is unfold. In conclusion, the rhetorical conflict which appeared in one of the main resorts of the labour-capital relationship reflects upon the whole process.
RN18 - Sociology of Communications and Media Research

RN18S00 - Critically Understanding Inclusion, Exclusion and Participation in the Media and Internet Age

Visual democracy and plural policing: the power of spectatorship
Elaine CAMPBELL (Newcastle University, United Kingdom) | elaine.campbell@ncl.ac.uk

This study is concerned with policing and democracy, more specifically with the visual energies which mobilise popular empowerment over plural forms of policing in representative political systems. At issue is a questioning of the rhetoric of inclusion, deliberation and engagement which has become synonymous with proceduralist concepts of ‘people power’ in representative political systems. Who is involved as a democratic actor; what is the nature of their political agency; and what counts as democratic participation and political practice are critically interrogated through an original, provocative and eclectic theoretical framework which draws on insights from a range of post-representative approaches to democratic theory. With reference to the work of, inter alia, Young, Arendt, Rancière and Badiou, the paper foregrounds Green’s model of ocular democracy which regards democratic engagement as a primarily visual practice centred on spectatorship and the gaze. In an age of multi-screen, mass communication, and the proliferation of televisual, broadcast and digital technologies, a particular style of visual politics is normalised; the photo opportunity, the TV interview, the viral news event, and the cult of personality, not only cement the gaze into the fabric of everyday life and the public sphere, but also empower viewers to scrutinise and appraise the democratic credentials of policing arrangements and practices. The daily spectacle of policing scandals and controversies, alongside more positive images of service and responsiveness, incite a practical politics predicated on the visual vigilance of a watchful and empowered public who pass judgement on a myriad of policing events, activities and agents, giving form and expression to the democratic power of their spectatorship.

Keeping up with the information society: how active older users negotiate inclusion and participation
Magdalena KANIA-LUNDHOLM (Uppsala University, Sweden) | magdalena.kania@soc.uu.se
Sandra TORRES (Uppsala University, Sweden) | sandra.torres@soc.uu.se

This paper builds on an on-going project that aims to contribute to the scholarly debates on the “digital divide” and “digital inclusion” by bringing to fore the complexities of older people’s understandings and usage of digital technologies. Older people are often considered one of the vulnerable groups and are among the key targets of the digital inclusion policies, which tend to focus on user-centered solutions on the micro-level. The critical approach employed in this paper allows reconsidering the normative, inclusionary, micro-level foundations of digital inclusion discourses that often inform the policy. The paper builds on the analysis of focus group interviews with 30 older adults (65+) who are active internet users in Sweden, the country often considered as one of the leading IT nations worldwide. We analyze how active older users construct, reproduce and negotiate ideological notions of participation, inclusion and their
privileged position of (active) users as imperatives and prerequisites of “keeping up with the (information) society”. Additionally, the analysis suggests that discourses on digital inclusion need to acknowledge the divide that older people themselves create as they discursively position themselves against non-users when describing when, how and why they engage with digital technologies.

**Gaming Alone? Participatory Dimensions of Social Capital in Croatia’s Video Gaming Population**

Krešimir KROLO (Sociology Department, University of Zadar, Croatia) | kkrolo@unizd.hr
Ivan PUZEK (Sociology Department, University of Zadar, Croatia) | ipuzek@unizd.hr

The aim of this presentation is to explore the relationship between selected dimensions of social capital and gaming preferences of the video gaming population in Croatia. For that purpose, a large scale online survey was conducted in September 2014 (N=2956). Although video games share little technological and communicational specifications with the medium of television, it is a widely held opinion (with some supporting research evidence) that interacting with video gaming content consequently results in withdrawal from public life and communal activities. The theoretical starting point is the work of Robert D. Putnam and his main thesis that home entertainment distracts people from active public participation. We use his elements of social capital, but with necessary adjustments to both the technological-communicational characteristics of video games and broader socio-cultural shifts.

In order to address the reality of social capital in the digital interactive environment of video games, the following steps were undertaken.

Firstly, we decided to use civic activism as a key outcome variable in order to enhance Putnam's definition of social capital as a structural „byproduct“ of social networking. We find post-institutional and post-organisational participation a more adequate form of measure for social capital as it better fits the reality of information society (Dijk), network society (Castells) or even networked individualism (Wellman & Rainie) in comparison to organizational „loyalties“ as described by Putnam.

Secondly, in order to explore the relationship between video gaming culture and civic activism, a secondary set of independent variables was used: aspects of social capital in the form of structural social networking - operationalized as organizational and participatory membership in both offline and online contexts - as well as generalized trust and bridging/bonding constructs that are being accumulated during gameplay.

Thirdly, video game play was operationalized through variables of intensity of play, genre preferences, self identification with gaming (sub)culture and in the form of actual partners during the video game play as a direct answer to the question whether video game users are gaming alone or not.

Furthermore, seeing video games as part of a broader cultural, media and technological shift that both fits and fuels global socio-cultural transformation, we propose that identity, genre preferences and intensity of videogame play will manifest a different relation to civic activism and to other constructs of social capital that we used in the research. Certain genres will be a more suitable ground for fostering different dimensions of social capital as their narrative context as well as communication capabilities provide ground for more intense elements of social interactions, information exchange and more cosmopolitan and civic norms in regards to other genres. Genres such as FPS (First Person Shooters), sport simulation games (FIFA, NHL, Pro Evolution Soccer) and other competition and achievement oriented games, are more compatible with local identity and bonding elements (playing between groups of friends from a neighborhood) and in general do not need media competency and literacy that other genres require. Therefore we argue that genres like MMORPG (Massive Multiplayer Online Role
Playing Games), MOBA (Massive Online Battle Arena) or RPG (Role Playing Games) on average attract players with cosmopolitan identities, prone to bridge local social constraints, and engage in interaction with players from the global playground. In addition to the variables of genre preferences, we have also included the intensity of gameplay and self-identification with gaming (sub)culture. Intensity was defined as a negative contributor to social capital which follows the logic of Putnam's conclusion about the negative impact of entertainment industry on civic activities, as well as the epistemological line of the media effects approach. Self-identification with gaming (sub)culture was used as a potentially positive contributor to social capital as it is viewed as part of a participatory culture along the theoretical lines of Henry Jenkins.

Using these three sets of constructs, we developed a series of multivariate linear regression models, aiming to examine the contribution of each set of predictors towards explaining the variance in the key outcome variable, civic engagement. The models were built hierarchically, starting with socio-demographic correlates (gender, age) and then adding a new set of predictors in each step and noting the changes in explained variance (R2), predictor coefficients and standard errors at each step. Our final model consisted of socio-demographic predictors, structural social capital indicators (group membership), cultural social capital indicator (generalized trust), online social capital indicator, bridging-bonding indicators and a series of gaming-specific predictors like gaming intensity (in various periods), gaming genre preferences and self-identification.

The results point to clear differences in the variable of civic activism between younger and older video game players whereby the latter show a greater tendency for active participation. Our multivariate models, controlling for other relevant factors, show sporadic statistically significant association between intensity of play, self-identification with gaming (sub)culture and genre preferences with civic engagement.

However, statistical significance does not hide the fact that the effects of "gaming variables" identified in the regression analyses are weak, and do not point to a large influence (positive or negative) of gaming towards civic engagement. We have, however, found that participation in online groups explains civic activism better than participation in offline groups which supports the hypothesis of post-industrial or networked individualism participatory practices. Also, generalized trust has a small effect which points to the fact that the structural components of social capital (participation) have a stronger association than its cultural counterpart (trust).

**Travelling Communities in a Digital Age**

Leanne Claire TOWNSEND (University of Aberdeen, United Kingdom) | l.townsend@abdn.ac.uk
Claire WALLACE (University of Aberdeen, United Kingdom) | claire.wallace@abdn.ac.uk

To date, little research has been conducted in the area of digital communications that engages with difficult to reach communities such as ‘gypsy travellers’ who are often peripheral to more mainstream currents in society (Sibley, 1981,1995). This paper presents research exploring how travellers engage with digital technologies on an everyday basis, as well as exploring any barriers to accessibility. Factors such as; peripheral social and geographical positions, low levels of literacy and digital skills, problems of accessibility (to networks, technology and education), gender relations, transitory lifestyles all represent possible reasons for digital exclusion. This potentially isolates them from opportunities afforded by digital engagement such as those relating to education, employment and skills development (Townsend et al., 2013). The research investigates how engaging online (e.g. through social media) may impact upon identities of place for different types of traveller groups (settled and transitory) and forge better linkages with disparate but relevant other groups. A theoretical framework is employed which is grounded in Helsper’s (2012) social, cultural, economic and personal fields of inclusion, through
investigating the extent to which current approaches taken by travellers groups to digital participation are impacting on these fields. Further, we explore how barriers to participation (whether external or internal to the group) may influence the fields of inclusion, potentially leading to forms of exclusion. Finally, we reflect on support mechanisms which may be provided, for example through local support agencies for such groups.

RN18S01 - Critical Media Sociology and Karl Marx Today

Karl Marx as Media Sociologist: Reading Marx’s Capital Volume 1 in the Information Age: The Prefaces, Postfaces, and Chapter 1
Christian FUCHS (University of Westminster, United Kingdom) | christian.fuchs@uti.at

RN18_1: Critical Media Sociology and Karl Marx Today
In this presentation, I argue that in the contemporary situation of capitalist crisis and the rising importance of media, communications, and the Internet in society, reading Marx’s “Capital” from a media and communication studies perspective is important. The talk engages with Volume 1’s prefaces, postfaces, and chapter 1: The Commodity from a media and communication studies perspective. It suggests that the categories of the commodity, use-value, exchange-value, value, abstract labour, concrete work, the value-form, and the fetishism of commodities are important for a critique of the political economy of media, culture, communication, and the Internet in 21st century capitalism.

The notions of the commodity and exchange-value bring up the question of how the media’s political economy is organised today and which role the various commodity forms and non-commodity forms play. Marx’s notion of use-value allows us to ask what peculiar characteristics information has as a use-value. Marx’s notion of concrete work enables based on a Hegelian dialectic of subject and object a systematic understanding of what information production is and how it relates to culture. Marx’s value form is a tool for thinking about how the production of information’s economic value and the exchange of information is organised under capitalist conditions. The concept of the fetishism of commodities is important for understanding how ideologies in general and ideologies in the media in particular communicate meanings in class societies. In the prefaces, postfaces, and chapter 1, Marx also makes important methodological remarks on dialectical philosophy as a method and shows how to apply this method for the analysis of capitalism.

Marx (Dis)Likes Facebook: Social Media Between Emancipation and Commodification
Thomas ALLMER (University of Edinburgh, Scotland, United Kingdom) | thomas.allmer@ed.ac.uk

The fact that one can find social media platforms such as Facebook, YouTube, Twitter, and LinkedIn among the most frequently accessed websites worldwide, indicates the enormous popularity of these sites. Apart from a few exceptions, there are no studies combining critical theoretical and empirical research in the context of social media. The overall aim of my talk is to study the constraints and emancipatory potentials of web 2.0 and to assess to what extent social media can contribute to strengthen the idea of the communication and network commons and a commons-based information society. I follow an emancipatory research interest being based on a critical theory and political economy approach in three sections: I provide some foundational concepts of a critical theory of media, technology and society in section one. The task of section two is to study the users’ knowledge, attitudes, and practices towards the
potentials and risks of social media. This section can be considered as a case study of the critical theory and dialectics of media, technology, and society. In section three, I raise the question if technological and/or social changes are required in order to bring about real social media.

**Imageries of Society and Social Action in Structural-Marxism**

Matti KORTESOJA (University of Tampere, Finland) | matti.kortesoja@uta.fi

In my presentation, I talk about conceptual metaphors by describing the imageries of society and social action in the structuralist and Marxist thinking and in its post-structuralist critique. I show how the conceptions of society and social action have changed by means of the root metaphors of sociological thought (Brown 1977). In terms of these root metaphors, society is conceived as an organism or a machine and social action is seen as language, the drama or a game. In relation to these root metaphors, I point the ways in which Karl Marx’s notion of society as an articulated whole (Ger. Gliederung) has changed into a concept of articulation that describes social action as language by means of which social and political linkages are taken as discursive practices.

A structuralist notion of social action as language (see Saussure 1916/1966) emphasizes the semiotic processes. In the post-structuralist discourse theory, it is claimed that society does not exist without a discussion about it (Laclau & Mouffe 1985/2001). In this manner, society is seen to operate like language which can reduce to a notion: “society is language.” (Hall in Grossberg 1986). This is a radical point of condensation if this metaphor is taken literally. In the structural-Marxist line of thought, economy and politics are not distinct from one another (cf. “economism”), but seen in terms of an articulated whole of society. I study the imageries of society and social action on a conjuncture, which is substantively different from the 1960–70's “return to Marx”.

**Theorizing Digital Labour: Implications of Marx, Arendt and Sennett (RN18_10)**

Adem YESILYURT (Middle East Technical University / Kocaeli University, Turkey) | yadem@metu.edu.tr

With the gradual development of information and communication technologies, labour-time spent in ICT industries increases day by day. One way or another, a new form of labour, called digital labour has emerged working in various ICT industries such as software companies, search engines, social media and so on. How should we theorize such forms of digital labour? In this respect, this paper attempts to contribute theorizing digital labour via different implications from the works of K. Marx, H. Arendt and R. Sennett. By criticizing the classic labour theory of value, Marx has developed his unique labour theory of value differentiating the labour and the labour-power. According to Fuchs, Marx’s separation between work creating use-values and labour creating the value is significant to examine digital labour. Marx’s labour process theory is crucial to understand the organization of the labour process and the valorization process. Marxist analysis is fundamental to examine digital labour. Yet, the works of Arendt and Sennett may contribute theorizing digital labour as well. Arendt criticizes Marx because of his nondifferentiation of work and labour. In contrast, Arendt differentiates labour, work and action as different forms of politics. Against Arendt’s differentiation of animal laborens and homo faber, her student Sennett prefers homo faber as “the man as his own maker”. Sennett’s analysis of the craftsman and the skill of cooperation may open up new perspectives to analyse digital labour. But how?
RN18S02 - Critical Media Sociology and China I

Exploring the Concept of the Society of Spectacle and the Mechanical Reproduction in the Film Be Kind Rewind and the Reflection on the Case of ATV in Hong Kong 2015

Wendy Wing Lam CHAN (Hong Kong Baptist University, Hong Kong S.A.R. (China)) | chanwinglamwendy@gmail.com
Chi Hung WONG (Hong Kong Baptist University, Hong Kong S.A.R. (China)) | chanwinglamwendy@gmail.com

Abstract

Be Kind Rewind, as spoken by the film’s title, one may understand the trick that hides behind as Rewind is also associated with the same consonance Remind telling us a film that shares the collective memory of the public. The concept of the Society of Spectacle is brought forward by Guy Debord in 1970s, which he sheds lights on the class alienation, commodification of cultural products (Debord, 1967) as well as the role of mass media’s metamorphosis in staging the so called “reality” on TV, is considered to be a mainstream channel in 1970s-1980s for people to obtain the news and enjoy entertainment. With this concept, we draw the central theme of discussing this with the film Be Kind Rewind in which it stages how the antique video rental store is forced to be demolished and the adventure that the new generation help renew the product and share the collective memory, going back to the theme of commodity fetishism (Jappe, 1999). The sense of nostalgia as well as the conflict of urbanization and modern development makes it an echo to the concept of the spectacle of making the class alienated through the commodification process of video rental store and also alienate the old people from the rapid development of the modern city. With the revival of reshooting the film with no budget, it connects closely to the concept of the work of art in the age of mechanical reproduction that Walter Benjamin put forward that the unique existence of the work of the art determined the history to which it was subject throughout the time of its existence (Benjamin, 1955). Most importantly, while we watch this film, the real life example that happens in Hong Kong media industry would be Asia Television (ATV) that they stage their "Rescue Our ATV Show" in order to save their company by attracting the "potential investors". The television under such circumstance is not limited to provide information and showing the greatest entertainment programme but becomes a spectacle to ask for money yet not in a glamourous and commodified manner. In light of this, this research is going to explore how mechanical reproduction alienates our society from the real life and how commodification of cultural product especially in Hong Kong TV industry make themselves become the spectacle in this day and age by carrying out content and textual analysis of the above mentioned cases. It would offer a theoretical contribution in which society of spectacle not only brings the success of TV industry but also actually polarizes the TV industry into the "mass" product and only through exposing its weakness to the audiences as to save the reputation and attract upcoming investors.

Keywords: ATV, Commodification, Class Alienation, Mechanical Reproduction,

Can there be a genuinely critical sociology of Chinese media?

Colin Stuart SPARKS (Hong Kong Baptist University, Hong Kong S.A.R. (China)) | sparksc@hkbu.edu.hk

Critical media sociology has a problem with China. Most, if not all, international analyses share a `critical' attitude to the Chinese media, whether the author is critical of the media in their
country of residence or not. The only place you are likely to find “administrative” research on Chinese media is in Chinese language publications originating in the PRC mainland. This paper argues that, properly considered, a critical sociology of Chinese media must share most of its theoretical concerns and methodological tools with a more general approach that applies also to other countries. China is not a special case needing different theories, although it is certainly a unique case requiring careful analysis. The balance of social power exercised on the media in China is different from that in, for example, the USA: the degree of political, as opposed to economic, determination of the media is far greater in China. The paper argues, however, that recent developments in the media market in China have demonstrated that no purely political perspective derived from the critique of some supposed “Leninist theory of the press” is adequate to understand the dynamics of the system. The paper attempts to set the analysis of Chinese media within a more general framework of the relations between media, capital and political power that is sufficiently robust as to permit a critical approach to issues which are common to both China and the West.

Imperialism on the Internet and Social Media: On the Reproduction of the Conditions of Production
Yuqi NA (University of Westminster, United Kingdom) | na_vicky@hotmail.com

The Internet is defined as a global network. Social Media operate all over the world. Facebook seeks to enter China for many years whereas LinkedIn has already launched a Chinese-language website and entered Chinese market. Sina Weibo and WeChat both launched English versions. What are the driving forces behind them? How to explain these globalized operations? Are they doing this for users to share and to link with more people or for the purpose of making profits? This article will answer these questions by referring to the theory of capital accumulation, reproduction, and imperialism on the Internet.
It will first explain how capital is accumulated on social media. By exploiting users’ online data and behaviours, social media companies make huge profits. It will then illustrate that the real reason lying behind the expansion of social media all over the world is the purpose of reproduction. It is based on the capital accumulation on social media. Social media platforms need to attract more users to reproduce the means of reproduction–users’ data that first generated by users and then shared or ‘liked’ by others to produce more data and to attract more users’ attention. Meanwhile for the purpose of the reproduction of productive forces, social media platforms retain users' active online behaviours by using ideologies such as ‘share’, 'link', ‘free expression’, etc. Finally it will refer to theories of imperialism and to conclude that the expansion of social media is actually imperialism on the Internet.

Yu Xiang (University of Westminster, United Kingdom) | yu.xiang@my.westminster.ac.uk

In the field of political economy media studies, China has long been regarded as the vulnerable periphery nation. Despite the fact that China is actually still playing the role of a passive recipient of Western cultural hegemony, it has also attempted to build up its own dependent relations with other peripheral countries to maximize profit from multi-lateral business activities. The state-own media like CCTV-News is one of the good examples of how CCP is trying to expand its soft power to gain itself more benefit. Therefore, it may be the right time to rethink the ‘cultural imperialism’ theory in a more dynamic and multipolar global arena that has expanded in the late 20th and early 21st centuries with new players like China and potential trend of sinicization. The theory of structural imperialism developed by Galtung has also proved the self-
sufficient nature of capitalism through objectified international relations, which has indirectly reflected Lukacs’ reification theory, from the perspective of the internal structures of periphery countries. The originality of this research is mainly to bring up a new model, or to revise the structural imperialist model as well, in order to explain the rebalanced relationship between Centre and Periphery countries. And this research will also deploy the audience research based on CCTV-News as the triangulation method of the theory part of this research.

RN18S03 - Critical Media Sociology and China II

Who Are Constructing the Foxconn Worker’s story about Life? — Discourse Analysis of the Voices on Young Workers Suicides
Wei BU (Chinese Academy of Social Sciences, China, People’s Republic of) | bupipi@gmail.com

The national official data showed that there is above 245 million rural-urban workers in the end of 2013. In China's Beijing and Tianjin, the Yangtze River Delta and Pearl River Delta region, a large number of young migrant workers have been hired working in the manufacturing and the electronics industry. These factories are mostly one of chains from globe capitalism manufacture. The most low-end industry chain has coupled with the influx of a large number of cheap labors, to make the world CEM (Contract Electronics Manufacturing) has been able to survive and earn huge profits in mainland China.

Foxconn Technology Group is a professional high-tech enterprise engaged in the computer, communications, consumer electronics, digital content, automobile components, and pathways 6C industry. In 2010, the annual income of the Hon Hai Group (Foxconn as a part of Hon Hai) was 112 in the Fortune Global 500, and is 32 in 2014. Foxconn employment of migrant workers in mainland China has up to one million people. However, in the first seven months of 2010, the Foxconn four factories located in mainland China, 16 workers had jumped from high building for suicide. These suicide workers aged between 17-25 years old. The suicide event shocked the Chinese mainland China and Taiwan regions.

This paper will focus on different “voices” from the mass media, experts, labor NGOs, government, and capitalists during May to December in 2010 to do discourse analysis. Specially, taking an art activism event “5.28 Dignity of Life” by a labor NGO (Beijing Migrant Worker’s Home) as a case, the author will explore the migrant worker’s interpretation and construction on this event based on their music, ballads and poetris, and discuss labor NGOs’ resistance to the mass media with the left’s perspective.

Wither Ideology: the Depoliticized Chinese Cultural Revolution
Can ZUO (university of essex, United Kingdom) | czuo@essex.ac.uk

Through examining the media representation of Chinese Cultural Revolution, this paper analyses how ideology works through media, and how the market and the state influence the media. In the research, I mainly compare the reconstructions of the Chinese Cultural Revolution in Chinese (mainland China) films and television dramas before and after the 1990s. Before the 1990s, there was a dominant narrative, which, implicitly or explicitly, depicted the Cultural Revolution as a traumatic event for the individual, the society and the country. This complies with the Chinese Communist Party’s condemnation of the Cultural Revolution as a 10-year catastrophe. Whereas since the 1990s, divergent ways of reconstructions, such as narratives of romantic youth experiences and love stories, appeared in mass media, and challenged the
mainstream narrative of the 1980s. On the one hand, the diversified new narratives embody new possibilities of rearticulating the Cultural Revolution. On the other hand, the Cultural Revolution was depoliticized, with the relative disputes being obscured. I argue that what were inscribed with the changing discourses of the Cultural Revolution were the Chinese Communist Party’s efforts to re-establish legitimacy and to respond to the discontent of the people, which was caused by the economic reform since the 1980s.

Political Weibos in China as Public Sphere in Appearance
Liangen YIN (Shenzhen University, China, People's Republic of) | yinliangen@hotmail.com

Regarding the new media, Chinese government mainly adopts the strategy of “following and occupying”. By analyzing the five Chinese most-influential official Weibos and placing the analysis within the theoretical framework of public sphere, we argue that political Weibos in China are intended to act as public sphere in appearance and pseudo intimate sphere. Concretely, what dominate political Weibos are knowledgeable information including dishes and healthy lifestyles, and regular information such as traffic and climate. In other words, the official Weibos would like to make the public focus their attention on their private lives only. On the contrary, social events or public issues which easily lead to public discussion are hardly found their way on political Weibos. It is essentially de-politization, yet it is claimed that political Weibos attempt to establish the bridge and connection between the government and the people. The political Weibos entering public sphere is truly a distraction rather than promotion with regard to the public discussion; it is people-oriented merely in terms of narrative styles. We conclude that it is the specific relationship between media and politics in Xi Jinping’s era that makes Chinese political Weibos illustrate those seemingly unique characteristics mentioned above. Xi’s government makes mass media dis-ideologicalization by tight censorship in negative term and establishing their own media outlets such as political Weibos in positive term. On the other hand, the government extends their political control to those journalism schools in the universities – the personnel source of the media and renders the schools highly ideologicalized.

Exploring a third type of Chinese media: The “popular” official media and the characteristic of its journalism
Haiyan WANG (Sun Yat-sen University, China, People’s Republic of) | haiyan.wang2009@gmail.com
Colin Stuart SPARKS (Hong Kong Baptist University, Hong Kong, China) | sparksc@hkbu.edu.hk
Yu HUANG (Hong Kong Baptist University, Hong Kong, China) | s03033@hk

It is often said that there are two types of media in Chinese press, the official media versus the commercial media. While the former is oriented towards serving the party interest and promoting the official line, the latter serves the popular interest and pursuing the market line. However, there might be a third type of media that looms between the Party v.s. market dichotomies. In this paper, we argue that, empirically, there exists an in-between type of media, which caters both the party interest and the market interest, which we call the “popular” official media. This study is drawn from a comprehensive study of the contents of five representative Chinese newspapers across two years (i.e. 2012-13). The choice of these papers reflects a range of different determinants of the current landscape of Chinese press industry, political and geographical differences and newspaper type. Among the five journalism models we are exploring (i.e. interpretation model, watchdog model, loyal-facilitator model, service model, and infotainment model), we find that apart from the loyal-facilitator’s role, the popular official media also displays strongly distinctive characteristics of infotainment model, which is often assumed
to be the signature of popular commercial press. In addition, the watchdog model, which tends to be avoided by the official media, is relatively strong in the popular official media. Other characteristics of the popular official media, including source pattern, reporting methods, rhetoric techniques will also be reported and discussed.

Localizing Global Television Formats in China: Tension between the global and the local

Hong Li (University of Westminster, United Kingdom) | hong.li@my.westminster.ac.uk
Hugo DE BURGH (University of Westminster, United Kingdom) | H.De-Burgh@westminster.ac.uk
Jeanette STEEMERS (University of Westminster, United Kingdom) | J.Steemers@westminster.ac.uk
Rong ZENG (University of Westminster, United Kingdom) | gloria_zeng@hotmail.com

In China, the increasing use of international television formats has been witnessed in recent decades. On the surface, the popularity of formats in China may suggest not only Chinese broadcasting’s increasing interconnectivity with global television networks but also the standardisation of content and technology. At a deeper level, on one hand, the adoption of television formats is changing the landscape of the Chinese television industry. On the other hand, the local political, cultural and commercial imperatives are impacting upon the way in which formats are localised in China.

The Voice of China has been one of the most successful and influential television format shows in China in recent years. Originating from the Netherlands, the Voice format was created by Dutch television producer John de Mol as The Voice of Holland and managed to capture the eyes of viewers in more than forty countries and territories around the world. In July 2012 the Chinese version of the format, The Voice of China, premiered on Zhejiang Satellite Television and became an instant ratings hit in China.

By studying the case of The Voice of China, this article explicates how the production team localised the Voice format to fit in the Chinese television environment and specifically how the television professionals responded to the local imperatives in the localisation process. Furthermore, this study maps out the development of television formats in China and reveals the business logic of the international circulation of television formats.

RN18S04 - News Coverage in Times of Capitalist Crisis

The news media’s illusion of objectivity and the dismantling of the working class

Diana JACOBOSSON (Gothenburg University, Sweden) | diana.jacobsson@jmg.gu.se

(RN18_8: Critical Media Sociology and Ideology Critique Today)

As suggested by Skeggs (2004) the arena of media representations is where the ‘cold war’ of class struggle is fought out and thus where we need to look in order to understand what role media plays in matters about class, power and ideology. This paper takes an interest in the voice of the working class; how they are represented in the news in conjunction with crisis on the Swedish labor market during two different political contexts, the textile industry crisis in the 1970s and the automotive industry crisis in the 2010s. The question is how ideology operates within the news media and also if journalism could do differently in their construction of crisis? In the comparison of two different contexts it becomes visible that the news media’s illusion of objectivity when reporting about political matters in the neoliberal and depoliticized sphere of today generates an ideologically marked report. The analysis shows that the focus on compassion instead of solidarity is a way to individualize the problem (cf. Kress 1986). When
the ability to feel becomes both starting- and end point in the news about labor market crisis, media does ideological work and becomes an agent in dismantling the working class. Understanding how the emotional focus prevents political action and collective unity in times of crisis is an important step if we strive for a change concerning these matters.

**The ongoing crisis: media as a battlefield**

Georgios Giannakis PLEIOS (University of Athens, Greece) | gplios@media.uoa.gr

As previous research work has shown during crisis and in countries in crisis, the mainstream media leave behind the “impartiality principle”. They tend to close financial, institutional and ideological cooperation with the governments and the elites. They have been used heavily by the political and economic elites as means for legitimation of the proffered by them strategy for dealing with crisis. On the other hand although social media represent an open cyberspace they were dominated by alternative and oppositional voices where mainstream media’s views are disputed. However there are differences between the public that follow mainstream old media and new alternative media respectively.

The more or less collapse of those strategies in the eyes of the public raises a series of questions about the reason(s) of such a collapse related to the media depiction of crisis and the battle about it. Was the exhausting of coding strategies, the strengthening of oppositional decoding, the widening of social media sphere and the oppositional voices, the shift of public from old to new media etc some of the reasons for delegitimation of the dominant strategies for dealing with crisis? Which are the current characteristics of the media “crisis discourse”? What was its development during the crisis period?

In the proposed paper we analyze the issues, the framing, the tone of journalists and the “talking heads” to crisis and various political, economic and social actors, as well as the main discursive strategies that were undertaken by mainstream media and alternative voices in social media during last four years.

For the purposes of our analysis we use a series of recent research data from content and discourse analysis of television news bulletins and daily newspapers from Greece and other EU countries.

**Covering Capitalism: ideological breakdown and recuperation in the news reporting of the economic crisis over time**

Laura Shanti BASU (Cardiff University, United Kingdom) | basul@cardiff.ac.uk

The ongoing economic crisis has involved a further redistribution of wealth from Labour to Capital, a process begun with the onset of the neoliberal era. This has over the course of time required some remarkable ideological gymnastics on the part of the media. Directly after the outbreak of the crisis, the mainstream British news media started using the word “capitalism” with reasonable frequency for perhaps the first time in my lifetime. Not only that, it started questioning whether capitalism might be in trouble or even have run its course. As Justin Lewis and others point out, this moment was fleeting and the media have returned to business as usual, narrowing focus to questions of growth, interest rates and inflation, and forgetting about structural problems with the economic system itself.

This paper asks, what happens over time when a thoroughly capitalist institution, that of the mainstream media, is forced to take capitalism as its main news story? It presents the results of research tracking the narrative shifts over seven years from credit crunch to banking crisis to sovereign debt crisis, Eurozone crisis and austerity, exploring the increasingly bizarre discursive displacements and mutations which have led not only to austerity being presented as the only option but also to discussions of deficit and national debt problems being almost completely
severed from their roots in neoliberal capitalism and the financial crisis. Bringing together discussions around journalism and democracy, political economy, cultural memory and the postmodern "liquid" society, it shows that the fluid nature of news, its incessant flows over time, themselves caused by capitalist profit motives, is responsible for the narrative morphing which retroactively takes the capitalist out of capitalist crisis.

**David and Goliath: Left-Wing attempts to Influence News Media Coverage of the Crisis**

Torsten Rosenvold GEELAN (Department of Sociology, University of Cambridge, United Kingdom) | tkg22@cam.ac.uk

The North Atlantic financial crisis has had a dramatic impact on labour markets across Europe: declining wages, high levels of unemployment and increasingly precarious employment, with economic inequality continuing to widen. The policy response has been dominated by the political consensus of austerity, with welfare retrenchment and supply-side labour market reforms often exacerbating the situation. As one of the largest and oldest left-wing political actors, trade unions have responded with large scale mobilisations and media campaigns. To what extent have trade unions been able to shape the political debate around austerity and the alternatives to austerity? This paper examines this question cross-nationally in Denmark and the United Kingdom. The sample of organisations includes the three largest labour union organisations in the private and public sector and the largest confederations. Data was gathered using a mixed-methods approach of semi-structured interviews with senior union officials; and a political claims analysis (using NVivo) of 2,256 newspaper articles from the five largest national newspapers in each country and Reuters (2010-2015).

In short, the findings reveal that Danish unions have demonstrated an impressive capacity to shape news media coverage using their exceptional capacity for news production (the four largest unions' produce 10% of all news in the country). In contrast, the British unions have been relatively ineffectual due to their scare resources, unfavourable opportunity structures and a tougher discursive environment. The paper concludes by reflecting on the increasing centrality of communication and the media in union attempts to exercise power in the 21st century.

**RN18S05 - The Political Economy of Digital Labour I**

**The Double Free Internet User**

Sebastian SEVIGNANI (Friedrich-Schiller-University Jena, Germany) | sebastian.sevignani@uni-jena.de

Recent developments in critical media sociology try to illuminate labour as the discipline’s blind spot. What has to become known as the digital labour debate (Fuchs 2014, Arvidsson and Colleoni 2012; Huws 2014; Proffitt et al. 2015), proofs to have a core where scholars do not convene: Is user participation in the corporate Internet subsumed to capital? This question begs exploring the preconditions of how capitalism can reproduce. Marx has analysed the rise of capitalism as a process of primitive accumulation creating a double free work-force that is ready to be exploited and fuels the profit principle. Scholars, such as David Harvey and Klaus Dörre, assume that this process is an ongoing quality of capitalism. So, is it rational to speak of the Internet as a location where users now are double freed? My contribution defends an application of this category to the Internet, particularly to social media, and thus challenges recent lines of argumentation that bind capital subsumption to the wage form or see capital only exercising formal control. First, I refer to the concept of means of communication and its
relevance to live a good, socially connected life. Second, I argue that extensive surveillance and resulting privacy outrages exemplify continuing capital control that conflicts with user’s autonomy. Third, due to accumulated money and network power, capital is able to set the terms of using the Internet by determining online information flows and clicking behaviour according to profit interests.

Literature:

Digital Labour: Analyzing emerging contradictions in two German sectors
Anne SUPHAN (University of Hohenheim, Germany) | anne.suphan@uni-hohenheim.de
Sabine PFEIFFER (University of Hohenheim, Germany) | prof.sabine.pfeiffer@uni-hohenheim.de
Elke OESTREICHER (University of Hohenheim, Germany) | elke.oestreicher@uni-hohenheim.de
Birgit KLEIN (University of Hohenheim, Germany) | birgit.klein@uni-hohenheim.de
Raphael MENEZ (University of Hohenheim, Germany) | raphael.menez@uni-hohenheim.de

Information and communication technologies have drastically changed both living and working environments. This increased digitalization lead to a controversial debate about the dissolution of boundaries between private life and work. While many studies reveal correlations between the dissolution of boundaries and digital work, none of them prove causality. Mere empirical studies have not been able to clarify whether human ”labouring capacity” (Pfeiffer 2012) is more affected by technical devices and new forms of their usage, by the economic driven change of working conditions, or by their entanglement Critical Theory captures as the development of productive forces.

Whether we see an ever increasing ”cybertariat” (Huws 2003), new forms of exploitation (Fuchs 2012) and/or new contradictions between „playground and factory” (Scholz 2012) is as much an empirical question as it is one of theoretical and critical reflection. Our contribution aims at both: Based on a quantitative analysis of three German employee surveys (N=540.000, 2012-2014), first we evaluate risks and opportunities of digital work in ICT services and automobile production. Both sectors are seen crucial for the next step in digitalization which is discussed under the label ”Industry 4.0”. Furthermore, both sectors stand for different traditions in labour relations and varying unionization rates. Thus, our empirical results give insight into new forms of digital labour as well as into challenges of digital class struggles in informational capitalism. We then discuss our results from the theoretical perspective of Critical Media Sociology and the concept of ”labouring capacity”.

Digital Labor Power and Social Class Inequality with Online Activism
Jen SCHRADIE (Institute for Advanced Studies in Toulouse, Toulouse School of Economics, France) | jen.schradie@last.fr

The assumption of more recent social movement theories on digital activism is that people are already wired and at the starting gate ready to participate online. But individuals and organizations should not be assumed to use technologies in the same way. Structural constraints affect groups’ Internet use for online participation. This paper conceptualizes digital labor power as mechanisms of a class-based digital activism gap. Though some scholars
suggest that the Internet transcends Olson's collective action theories due to the reduced costs of online-intense organizing, my findings suggest that digital organizing does not produce reduced costs of participation for all types of organizations or their members. Instead, the costs of participation vary by class composition. All groups face costs to being online, including the economic costs of digital connectivity and the labor costs involved in producing online content. But these costs are much higher for working-class people and organizations. Studies that examine digital activist participation on an individual level fail to capture the class relations that shape digital inequality. Working class groups reported wanting to do more online but not having the time, resources, or entitlement to do so, encapsulating digital labor power. Costs and resources matter for participation, but so do broader class, social and power relations. People of different classes have varying experiences of power, powerlessness and entitlement in relation to the Internet. This sense of entitlement was fostered through the practice of producing digital content in the language and discourse of the digital elite.

‘Pennies an hour’: subjective experiences of digital labour in the post-communist Balkan
Ana ALACOVSKA (Association of Artists Media Artes, Macedonia, Former Yugoslav Republic of; Copenhagen Business School, Copenhagen, Denmark) | aalacova@yahoo.com

The new media technologies have radically transformed the nature of work. In essence, they have added to the ‘virtualization of work’: made creative work fluid and mobile (flying across platforms and physical spaces), modular (fragmentation to smaller units) and asynchronous (annulled the need of temporal co-presence) and hence divested (digital) labour from the physical proximity inherent in organisation. Such a transformation enabled geographical relocation of work. By implication, a ‘new global division of cultural labour’ and ‘runway production’, disturbed the balance of global labour markets by shifting creative jobs from costly and developed to low-cost production regions, such as the post-communist Balkan countries. Digital technologies ushered the already vulnerable and weakened post-communist economies into a new era of offshoring - governments insidiously stressing the ‘cheap’, ‘copious’ and ‘young’ creative digital labour pools in their respective ‘invest-in-campaigns’ bidding to provide the world’s creative industry with ‘alluring’ back-office services.

Yet, while scholarly literature of the impact of the virtualization and geographical distribution of work on the casualization of Western professionals is burgeoning, research on the psycho-social dynamics and professional standing of sub-contracted virtual work carried out by ‘Others’, such as post-communist ‘cybertarians’, is still sparse. This paper fills this gap by focussing on the subjective experiences of post-communist digital labourers sub-contracted by global media companies. Empirically, the study builds of in-depth interviews with new media workers in Macedonia and Albania mainly in the area of game programming, visual effects and 3D animations.

RN18S06 - Re-inventing Worker Politics: Co-operatives, New & Old Trade Unions in the Age of the Internet and the Culture Industry

‘Come one steel worker, come all’: the facebook group of the steel factory strikers in Greece 2011-2012
Regina ZERVOU (Ministry of Education, Greece) | rzervou@gmail.com
The expanded use of social media has deeply influenced the way social struggle is organized and the resulted culture is lived and expressed. During the nine months’ strike of the 400 steel workers of Elliniki Chalivourgia in Attica (November 2011 – July 2012), that busted out together with the parliament vote to the multi – law project that abolished collective bargaining, the scarcity of the internet means used for the communication of the community of strikers with the rest of the society was more than obvious. However, factory unions are not familiar with the new technologies and opt for the traditional form of propagating struggle. This absence came in total contradiction with the expansion of the solidarity movement in the digital sphere, all over the world. The need of information and digital communication was evident, so the strikers themselves, apart from the union, rushed to a means whose function they have already known – facebook, which has been proven to be the internet means of the technologically illiterate. This paper examines the role played by that facebook group during the strike process. The research is based on the archives of the group (content analysis and categorization) and five semi – guided interviews of the strikers that created and managed the group. The research question is whether this group constituted a ‘proletarian public and how it developed the vision of a ‘promised’ future that was to be expected by the strike and any kind of social struggle.

**Networking Unionism in Portugal? The uses of Internet by the Portuguese unions in the health sector**

Paulo Marques ALVES (ISCTE-University Institute of Lisbon, Portugal) | p.alves61@gmail.com
Carlos Tiago LEVEZINHO (ISCTE-University Institute of Lisbon, Portugal) | iniciativas.iscte@gmail.com

In general, the trade unions movements are living “hard times” (Chaison, 1996) since the 70s. Facing the problem, they are implementing a set of actions towards their revitalization (Frege and Heery, 2003). The adoption of the ICTs, mainly the Internet, emerges as an important tool for supporting those actions. The unions adopted the ICTs later than their counterparts (Pinnock, 2005), but the competitive advantages they offer and their flexibility encouraged them to adopt ICTs more and more. Everywhere, they are making an investment in this domain using them for various purposes. Some studies reveal that they have a relevant impact in the organizing issues but a more mitigate one in the overall unions’ efficiency (Fiorito et al, 2002). However, some authors go forward and, in a cyber-optimistic view as Castells (2012), state that ICTs have a relevant contribution for a qualitative transformation of the unions’ nature. According to them, a new union form is emerging called “cyberunion” (Shostak, 2002), “e-union” (Darlington, 2000), “open-source unionism” (Freeman and Rogers, 2002) or “trade unionism 2.0” (Gutiérrez-Rubi, 2009). In this paper we intend to analyze the presence on the Internet of fifteen Portuguese health sector unions and understand whether they are or not to withdraw all the potential of Web 2.0 (O’Reilly, 2005) and to build a networking unionism that give a contribution to their revitalization. Our main conclusion is that these organizations are very far from achieving this goal and that they are closer to what Shostak (2002) called a Cyber Drift.

**Labor gone digital! Swedish trade unions’ use of videos**

Jenny JANSSON (Uppsala university, Sweden) | jenny.jansson@statsvet.uu.se
Katrin UBA (Uppsala university, Sweden) | katrin.uba@statsvet.uu.se

Information and communication technology (ICT) has offered new ways of mobilizing for social movements. Recent research has mainly focused on the use of ICT by new social movements (e.g., the Occupy Wall Street) and less on old movements such as the labor movement. It has been shown that trade unions do use social media and other resources of ICT, but prior
research has treated labor movement as a homogenous actor. However, today the movement consists of many different unions representing different classes. Classes differ by level of education, computer skills, and work tasks - factors that also impact how union members consume messages conveyed through ICT. Therefore we expect that class plays a role for unions’ use of ICT, and particularly the videos distributed via Youtube. The study provides a descriptive analysis of the use of videos by three different trade unions in Sweden – LO, TCO, and SACO, representing respectively working class, white-collars and professional/academic employees. The Swedish union movement is a good case for two reasons. First, despite membership losses the past ten years, it is still one of the strongest and most successful union movements in the world. Moreover, the Swedish union movement is the most class-segregated union movement in the world, making it the most likely case for finding the intra-movement variation of the use of ICT. Second, there is almost no research on “digitalization” of Swedish trade unions and thereby we can make an important empirical contribution. The study is based on visual analysis of a random sample of all videos produced and distributed by the selected three unions. Results suggest that for better understanding of the use of ITC it is important to account for the class organizations of the labor movement.

Fighting Precarity with Co-Operation? Worker Co-Operatives in the Cultural Sector.

Marisol SANDOVAL (City University London, United Kingdom) | marisol.sandoval.1@city.ac.uk

Research on cultural sector work has shown that the working lives of so-called creatives are complex and contradictory, combining work satisfaction, pleasure and autonomy with job insecurity, low pay, anxiety and inequality. While the literature on cultural work gives a rich picture of its merits, problems and contradictions, the question how working conditions can be improved has been hardly addressed.

In this paper I therefore explore avenues for resistance to precarious and exploited labour in the cultural sector. In particular, I investigate the potential of worker co-operatives to help improve working conditions and reimagine cultural work.

The concept of worker co-ops focuses on democratizing ownership and decision power, suggesting an alternative way of organizing ownership that is neither private nor administered via the state. It challenges class divisions and promises to empower workers by giving them more control over their working lives.

I discuss the potentials and limitations of worker co-ops by looking at precariousness, inequality and individualization of cultural sector work. I argue that worker co-ops are confronted with an economic contradiction between anti-capitalism and capitalist reality, a political contradiction between radical politics and neoliberal self-help and a cultural contradiction between values co-operation and values of competition.

Critical Media Sociology, the Commons, and the Alternatives Today

 RN18S07 - The Political Economy of Digital Labour II

Hard Labor under “Soft Power”: Labor Conditions of Turkish Soap Opera Workers

Ergin BULUT (Koc University, Turkey) | ebulut@ku.edu.tr

Western media has recently highlighted the role of Turkish soap operas within the Balkans and Middle East in relation to their cultural and social impact on gender identity. Turkish soap operas
have also been foregrounded by cultural observers and critics as part of the nation’s “soft power” in the “New Middle East.” However, academic scholarship has neglected the working conditions and organization attempts of soap opera workers. Drawing on ethnographic research in Istanbul, this paper investigates the work experience of soap opera workers (above and below the line) in Turkey to expose the “blindsop” of cultural production of “soft power”. Deploying the Marxist labor process theory of Harry Braverman (1998) and theories of immaterial labor (Lazzaarato 1996, Hardt and Negri 2000), I argue that there is a strict class division across soap opera workers in Turkey. As in other media industries, social networks and cultural capital strictly drive entrance to the market. The interest of the state in regulating the ratings system further complicates the labor process by creating a situation where many shows cannot see more than 10 episodes, leading to normalization of intermittent employment and precarity. However, the organizational attempts of both above and below the line workers underline the fact that insecure employment is not a destiny. Finally, this paper critically addresses the discourse of “digital labor” by way of underlining the materiality of labor, whether it is on computers or on glamorous TV screens.

Crowdsourcing creativity
Sara MONACI (Politecnico di Torino, Italy) | sara.monaci@polito.it

As a process and a product of the ‘wealth of networks’ (Benkler, 2006), creativity is an essential key to understanding how the Web promotes open innovation, knowledge sharing and cultural peer production in its many forms (Chesbrough 2003; Potts et al. 2008; Von Hippel 2005; Lessig 2005; Jenkins 2008). Crowdsourcing though, evolved in recent years from a “new” label used to describe ‘the new pool of cheap labour: everyday people using their spare cycles to create content, solve problems, even do corporate Research & Development’ (Howe, 2006: 1), to a new organizational model of cultural peer production which involves not only cheap labor (e.g Amazon Mechanical Turk), but also high-profile creative skills in new digital environments and platforms devoted to the recruitment, selection and networking of creative talents at a global scale (Brabham, 2013). New crowdsourcing environments such as Userfarm, Tongal or even Amazon Studios are increasing their popularity and attractiveness among creatives, as new digital intermediaries and creative marketplaces. Through a multiple case analysis based on more than 70 web platforms dedicated to Crowdsourcing Creativity (especially in audiovisual production), my paper will try to investigate the following research questions:
What are the problems when creativity is crowdsourced? Is it the phenomenon of “open innovation” or is it just a late-capitalistic organizational mode of cultural production? Is it possible a virtuous balance between them?

Amusement is the prolongation of work during Late Capitalism. On media-user commodity and its production time in the advertising supported media
Marialuisa STAZIO (Università di Cassino e del Lazio Meridionale, Italy) | ml.stazio@unicas.it

The paper considers the similarities and differences among the processes by which users – in the advertising supported media system – turn themselves into a commodity and are bought and sold, through different processes, in the advertising marketplaces. It assumes that, in these processes, media-users create their own ‘use-value’ (and thus their exchange-value) throughout ‘non-sleeping time’, in which they ‘learn to buy particular “brands” of consumer goods, and to spend their income accordingly’ (Smythe, 1977). So the quote from ‘Dialectic of Enlightenment’ in the title would signify that, when the ‘product’ of communication industries consists in the users themselves (or better, in their propensities and competences in consumption) the more
the media-users are ‘creative’ and involved in meaning co-production and/or of ‘communication, community building and content production’ activities, the better they can be turned into a selected/segmented ‘commodity’. In other words, the ‘immaterial labour’ of media-users starts a dialectical tension between the interacting forces of exploitation and empowerment. So, in the relations of production of informational capitalism, the media-users can construct the means to struggle against the self-commodification by which they ‘pay’ the satisfaction of their communicative and informative needs. For example, they can strategically connect many ‘tactical practices’ (De Certeau, 1980) and capitalise them into ‘individualized collective actions’ (Micheletti, 2003; Micheletti, Follesdal e Stolle, 2004). So, paraphrasing Benjamin’s words (1934), it’s possible to affirm that when ‘the media-user as producer’ identifies the relations of production in which he/she lives and produces, he/she can consequently decide how they stand (and act) in relation to them.

Social media as pseudo-public space: the illusion of freedom in participatory spaces
Anu Annika HARJU (Aalto University School of Business, Finland) | anu.harju@aalto.fi
Ella LILLQVIST (Aalto University School of Business, Finland) | ella.lillqvist@aalto.fi

Since its beginnings, the Internet has inspired great hopes of increased democracy in this new “public sphere”, but what may have started as an egalitarian project soon became marked by a commodified Internet economy (Fuchs 2009b). Most social media being free of charge makes it difficult for users to see platforms as capitalist endeavours: despite social media organizations controlling the resources, users still expect freedom of speech, seeing social media as a facilitator of their self-expression. Violation of this expectation results in public outrage; yet, users stay.

To investigate the contradictory relationship between users and platforms, this paper examines social media sites as “pseudo-public” spaces. We argue that expectation of “freedom” arises from a “cognitive illusion” (cf. Johnson-Laird & Savary, 1999; Maillatt & Oswald, 2009) of publicness that blurs the governing commercial rationale. Digital spaces are equated with offline public spaces, evoking expectations regarding freedom and regulation. This also leads to demands that platform owners take the role of public authorities, policing the space: regulation is both sought (privacy issues, troll control) and condemned (censorship, surveillance).

We critically analyse the discourses and understandings related to the expectation of “freedom” on popular social media sites. The paper sheds light on the symbiotic, yet problematic, relationship between platforms as capitalist, commercial organizations and users as unwitting commodities (cf. Fuchs, 2012). The study contributes to a theoretical understanding of commodification of online participation and discourse in informational capitalism (e.g. Fuchs, 2009a; 2010; 2014).

RN18S08 - The Political Economy of Cultural and Digital Labour

‘Uncool’ Media Labourers in the Neoliberalised Cultural Industries in Taiwan: The Labour Process of Identity, Exploitation and Resistance
Hui-Ju TSAI (Loughborough University, United Kingdom) | H.Tsai@lboro.ac.uk

This article dissects the neoliberal cultural industries policies in Taiwan, in particular, how the neoliberal discourse shapes the image of the ‘creative class’ and profoundly changes the labour process. It probes this issue across three dimensions: the adoption of the British creative
industries model of accelerated neoliberal development in the culture and media industries; the manner in which the neoliberal rhetoric of the creative industries policies discourse has faded almost imperceptibly into our common-sense and, finally, the practices of creative labourers in competitive and cooperative situations that are reflective of a dynamic relationship.

The first section presents the adoption of the British creative industries model in Taiwan for the 2002 launch of the Project of Taiwan Cultural and Creative Industries, which is based on the Creative Industries Task Force (CITF) established by the British Labour Party in 1997. The paper also looks at the extent to which the British model accelerated the neoliberalisation of cultural and communication policymaking in Taiwan. The neoliberal rhetoric of creative industries policies, which was pivotal to the success of the ‘common-sense’ of creative labourers (even its ‘reserve army of labour’), will be analysed by employing the critical discourse approach in the second section. Finally, creative labourers who work in the film and media industries have had to face the plight of market-oriented policymaking and the commercialised public subsidies system, which are under the framework of the creative industries project. Their viewpoints will be explored in in-depth qualitative interviews. The focus will be on their opinions about their working conditions (e.g. neoliberal self-exploitation and emotional identity). The paper will implicate neoliberal creative industries policies as a pivotal to the crumbled public-cultural landscape in Taiwan.

Strategies for Resistance. A case study on digital journalists in Romania
Romina SURUGIU (University of Bucharest, Romania) | romina.surugiu@fisc.ro
Raluca PETRE (Ovidius University, Constanta, Romania) | rpetre@univ-ovidius.ro

The paper will focus on digital journalists in present-day Romania, in an attempt to understand their working conditions, institutional pressures and their strategies for resistance. The paper provides an interpretive approach, by using accounts of journalists’ description of day-to-day activity. The research consists of semi-structured interviews with young journalists working for online publications. Although, Romanian journalists hesitate to join a union or a professional organization that could defend their rights, they use other strategies to resist in front of inadequate working conditions and extreme institutional pressures. Young journalists started crowdfunded online publications in which they speak out on important topics in the Romanian society. Others anonymously share on blogs or independent websites “inside” information about difficult working conditions in different media companies. Activist online platforms have interviews with journalists and other media employees that criticize: low wages, political pressures, lack of editorial freedom, PR and advertising constraints. Also, they question the working contracts offered tale quale by media companies, without any possibility to negotiate the terms and conditions. In many cases, leaving journalism after only several years of practice is the only form of resistance.

Paid Usership
Renée RIDGWAY (Copenhagen Business School, Denmark; Digital Cultures Research Lab, Leuphana University, Germany; n.e.w.s (northeastsouthwest.net) Netherlands) | rr.mpp@cbs.dk

The key concern for what can by some be termed ‘Web 3.0’ is the giving of data in exchange for free services and the debate over control of personal time and public space. How does this affect cultural and academic practitioners working in an expansive sector that is increasingly incorporating other fields of inquiry, along with its financial systems and structures of support in processes of digital labour? One draws on one’s network to invite collaborators, participants, partners, and contributors to projects without necessarily having allotted funds for honoraria.
Instead, many ask for donations. Online creative labour is thus being organized differently and the role that labour plays today and historically, needs to be elucidated.

In the era of the prosumer why do some cultural producers and researchers (artistic and academic) not demand to be remunerated for their endeavours? Even more than for the reputation economy or the attention economy they do this for ‘self-actualisation’. Through their work in research, cultural projects, activism, media ecologies and so forth, they engender a sense of community, provide mutual support, obtain personal growth, create engagement and potentially, implement ‘paid usership’.

This presentation draws on contributions to an online forum at n.e.w.s. (http://northeastwestsouth.net) that maps counter cartographic practices ranging from art, media, academia, literature, to the sharing economy or ‘platform capitalism’. These visions of post-work, microfinance and entrepreneurship all encircle the online labour debate of the wage, the employment of artistic practitioners, the academic discussion concerning unremunerated peer review and the general data economy.

**TV consumption and its invisible infrastructural work**

Silvia POPA (University of Bucharest, Romania) | silvia.popa@sas.unibuc.ro

Much of media consumption research has focused on the meaning, practices, relations and narratives that people practice in relation to media products. The invisible work required to keep TV production available has received little interest, despite its importance in shaping the consumption experience. In this paper, I will present an ethnography of the infrastructures, technologies and standards that are used in Romanian TV companies. I will show how they are used, what standards are used, the maintenance of the equipment, their calibration according to the maximum or minimum, the role of the official documentation and improvisation, how employees manage the technical issues. I will focus especially on a neglected moment in the lifecycle of TV infrastructure, that of pre-usage calibration. This becomes particularly visible in the conflicts between standards, when new ones replace previous, older ones. It also becomes visible in processes of automatization, which replace the maintenance work of humans with new devices, thus increasing the importance of infrastructures and technology.

**RN18S09 - Critical Sociology, Political Economy and Critical Theory of the Internet**

**New digital economy? New political economy!**

Dave ELDER-VASS (Loughborough University, United Kingdom) | d.elder-vass@lboro.ac.uk

Two traditions of political economy dominate thinking about the economy today. Alongside and in direct conflict with Marxist political economy, the mainstream neoclassical tradition of economics is intensely political despite its aspirations to objectivity, and continues many of the faults of the earlier political economy that Marx himself opposed. Despite their differences, however, both share an understanding of the contemporary economy as a thoroughly capitalist market system founded on wage labour and commodity production.

Yet the digital economy is the site of numerous economic forms that refuse to conform to these preconceptions. To take only the most obvious examples, Wikipedia and to a lesser extent open source software embody a modern economy of the gift, while Google gives away numerous services in a model that articulates gifts with the sale of advertising, and sites like Facebook and
YouTube depend on the unpaid contribution of user created content to sustain profit-oriented businesses.
This paper will argue that both of the dominant political economies are broken. They were broken already, but the digital economy has provided us with ever more evidence of the diversity of economic forms that neither tradition can explain. We need a new kind of political economy. To produce one is far more than the work of a single conference paper, book, or even career, but this paper proposes a beginning: to analyse the appropriations that occur in diverse economic forms as the outcome of varying complexes of appropriative practices.

Paranodal Politics and Ethics: Critical Responses to Digitality
Ulises Ali MEJIAS (State University of New York at Oswego, United States of America) | ulises.mejias@oswego.edu

From a sociological perspective, the reasons for theorizing alternatives to the commodification of our lives by social media are obvious: social spaces owned and controlled by corporations reify a “myth of us” (Couldry, 2014) constructed around profit motives, and create a new type of “black box society” (Pasquale, 2015) that is difficult to study because it keeps the big data we generate hidden behind corporate algorithms, to be used only for the purposes of marketing. But in an age when even anarchists have Facebook accounts, is it possible to be against or even outside this type of digitality? In my critique of digital networks as templates for organizing sociality (Mejias 2010, 2013), I introduced the concept of the paranodal to help conceptualize those spaces that do not conform to the logic of the network. In this paper, I attempt to frame the paranodal in undialectical terms (following Laruelle’s principles of non-philosophy), away from digital or binary formulations of difference and opposition (following Galloway, 2014). The goal is to rescue the paranodal from being trapped in representation. Instead, the paranodal should be applied as an ethics that un-mediates and de-individuates the node to arrive at an understanding of ourselves based on the indistinction of self and other--or in this case, the indistinction between what the network includes and excludes. Sociologically, I suggest it might be more productive to analyze the commonality of the paranodal experience than to focus simply on the creation of “alternative” network platforms or projects.

Good Media Studies: Why the Political Economy of the Internet is the Order of the Day
Andreas WITTEL (Nottingham Trent University, United Kingdom) | andreas.wittel@gmail.com

This paper makes an argument about the relevance of political economy approaches in media and communication studies. The argument unfolds in three steps. The first step starts with a reference to D. Gauntlett's (2000) provocative distinction between old (= boring) media studies and new (= exciting) media studies and provides – inspired by Marx's 11th thesis on Feuerbach – an update of this provocation for the age of the deepening crisis of capitalism. Good media and communication studies make an attempt to change the status quo rather than merely interpret it. Good media studies are engaged in the struggle to establish an alternative to capitalism. They move from critique to construction. As they are engaged they will have to sacrifice to some extent their distance to the topic of their academic enquiry (metaphorically speaking, they will have to leave the so called 'ivory tower'). Bad media studies hang on to the dominant academic ‘doxa’ (Bourdieu) of doing research. They are content with an interpretation – even a critical interpretation – of the current predicament. The first step of the argument will also provide an rationale why the rhetoric of provocation or simplification (good versus bad) is a promising, even necessary, response to the crisis.
In a second step I will outline the core challenges for good media studies. In an nutshell the core challenges for good media studies refer to the development of better media and a better internet. In the deepening crisis of capitalism the notion of a better internet should be theorised with respect to two fundamental threats. The first threat comes from nation states and their desire to establish complete control over all communicational practices of internet users. This is the threat of surveillance, which results in Orwellian monitoring and the accumulation of big data in the name of a 'war against terrorism', which conveniently establishes (and at the same time hides) control over all forms of resistance. The second threat comes from capital and its enclosure of the digital commons, which needs to be contained by strategies of 'counter-commodification' (Wittel 2013) and the enclosure of digital commodities.

In a third and final step I will outline three fundamental realms of resistance – the realm of critique, the realm of destruction, and the realm of construction – and link them to specific aspects of a Marxian political economy, more specifically to value (which corresponds with critique), to commodity (which resonates with destruction), and to labour (which equals construction). This third step is a conceptual experiment. While the links and connections between forms of resistance and core categories of Marx's political economy are not exclusive and much more fluid than indicated, they all point to the significance of a political economy approach to what I call good media and communication studies.

The Crisis of Sociology and the Revival of Critical Theory in New Media Studies: Paths and Perspectives
Giorgio PORCELLI (University of Trieste, Italy) | giorgiots@gmail.com
Ivo Stefano GERMANO (University of Molise, Italy) | ivo.germano@gmail.com

For several years now the sociological debate has being sharing the perception of an internal crisis of identity of the discipline that has become almost exclusively empirical and descriptive, thus making marginal other search paths. This drift has effectively sidelines the critical soul of sociological studies that characterized its classic authors (Marx, Durkheim, Weber, Simmel). In this contest New Media Studies represents the exception since from the beginning they have become a fertile ground for the application of critical theory. The paper analyzes the reasons of this exception and speculates that this is mainly due to the centrality that the user holds in the environment of Web 2.0, which results in unexpected possibilities of cultural resistance on the part of the subject. These reflections have been developed specifically within the tradition of Cultural and New Media Studies. This contribution would also look at other models of critical sociological matrix. Some of these approaches have already found application in the study of new media, such as, for example, the issues of privacy and surveillance which are analyzed in the light of the thought of Michel Foucault about the microphysics of power. Other approaches vice versa could be usefully applied in the investigation of the specificity of the communicative dynamics of social networks. We will, in particular, consider the phenomenological analysis of Schutz and Goffman's study of the Forms of Talk. A further enrichment of the critical theory in the study of new media could also come from the classic anthropological studies on the gift (Durkheim, Mauss, Malinowki) and in particular from the category of the "poisoned gift".

RN18S10 - Challenges and Perspectives for Public Service Media and the Mediated Public Sphere Today

Potentials and limits of the mediated public sphere - three levels of analysis
In the last 25 years there has been a “deliberative turn” in the democratic theory as more attention was drawn towards the role of public debate in the political processes (Gripsrud et al. 2010) and with it, towards the media. The paper revises contemporary theory on democracy and the media mapping and systematizing both potentials and limits of the mediated public sphere. The basic potential seems to be evident – while letting the agora grow bigger, the mediated public sphere has a chance of becoming more inclusive, vibrant and vital. But its inclusiveness proves to be questionable as well as its ability to boost citizens’ impact on the decision makers (Cottle 2008). Other described limitations include: the invasion of private interests into the public sphere and the rise of individualism (Habermas 1981), commercialization (Murdock 2001), tabloidization (Gripsrud ib.) and infotainment (Sartori 1998). As a result, the media “hide by showing” (Bourdieu 1998: 19) as they omit facts and opinions highly relevant as far as the public interest is concerned. New digital media broaden the spectrum of sources, on one hand, but on the other, they fragment the audiences weakening the public sphere (Sunstein 2007, Wolton 2000). They do not escape commercial interests, either (Fenton 2010). I argue that the macro societal level (with class divisions and power relations) is too often forgotten in such systematizations and I go on to suggest three levels of analysis: the societal, the political-economical and the organizational level of the media that includes journalistic practices.

From user generated content to user generated (crowdfunded) public service: A proposal for a new participatory model of funding PSM.
Tiziano BONINI (IULM University of Milan, Italy) | tiziano.bonini@iulm.it
Ivana PAIS (Università Cattolica, Milan, Italy) | ivana.pais@unicatt.it

For most of the twentieth century, Public Service Media (PSM) were institutions that were taken for granted; their services were regarded as guaranteed and essential components of European societies. On the other hand, at times, PSM considered themselves and their position of privilege with a sense of entitlement. But since the end of the 1900s, PSM have been called into question by both the liberalization of the telecommunications markets (Lowe & Berg 2013) and by the emergence of the Internet and digital culture (Bardoel and Lowe 2007; Enli 2008). PSM have never been under as much pressure as with today’s ongoing financial, economic and political crisis. European PSM are now strained by budget constraints, editorial independence, technological challenges, audience shares and public service values. In this paper we will discuss the current debate on PSM shifting values and funding models, then we will propose a new model of funding PSM, integrating crowdfunding practices in the traditional licence fee model. Opening up the possibility for citizens to use crowdfunding to decide how to allocate a part of the resources gathered through the licence fee means recognizing citizens’ increased decision-making power, making them responsible for choices. We have tested this potentially innovative model on more than 400 Italian citizens and we will show and discuss the results of this test.

Child’s Play: Jimmy Savile and the Dark Side of BBC Light Entertainment
Simon James CROSS (Nottingham Trent University, United Kingdom) | simon.cross@ntu.ac.uk

Throughout its history the British Broadcasting Corporation (BBC) has been embroiled in crisis moments, but until 2012 it had not known one like the Jimmy Savile sexual abuse scandal; at
least 450 men, women and especially children assaulted or raped including on BBC property over more than fifty years. While Jimmy Savile is alone responsible for his industrial-scale abuse, the scandal is one of the BBC’s making. The moment a scrapped BBC Newsnight investigation into Savile’s abuse of vulnerable school girls coincided with BBC tributes to his broadcasting and charitable legacy, the Corporation’s double-standards were exposed. This paper begins by showing BBC TV tributes that held the line on Savile’s ‘achievements’ immediately after his death, ignoring the widely rumoured knowledge of his abuse. It then considers the BBC’s light-entertainment milieu in which celebrities’ sexual offending (not just Savile) past and present was known, yet no-one alerted authorities. The paper concludes by discussing inter-relations of celebrity, power and silence that enabled Jimmy Savile (and other BBC celebrities and producers before him) to molest victims with impunity.

Contemporary Democratic Crisis and the Public Sphere: Whither Public Service Broadcasting?
Mark CULLINANE (University College Cork, Ireland) | mark.cullinane@umail.ucc.ie

Despite the undermining of their original technical, political and cultural rationales, uncertain political and public support and the proliferation of commercial competition, public service broadcasters continue to occupy a position of institutional centrality in many national public spheres. Imbricated in and answerable to in different ways to their host states, markets and demos, PSB institutions occupy a unique structural position in the broader field of power. Given the close affinities between the (dominant) institutional and professional ideologies of public service broadcasting and representative liberal democracy, this paper suggests that the crisis of liberal democracy accelerated and deepened by recent crises in the economic realm also entails a crisis of the classical public service model. It is argued here that PSB institutions, by virtue of their ideological and material proximity to the state and market themselves face the prospect of a crisis of legitimation arising from their constitutional inability to sufficiently thematise the (domestic and supranational) legitimation deficits widened by the political response to economic crisis in Europe, characterised by a radicalisation of neoliberalism and the entrenchment of technocratic logics of governance.

Drawing on findings from the author’s empirical exploration of Ireland’s public service broadcaster incorporating newsroom ethnography, interviews, frame analysis of news output and participation in a statutory forum for public involvement in PSB governance, this paper suggests that the diminished critical capacities implied in the normative orientation of Irish public service broadcasting render it an impediment to the crucial task of thematising counter-hegemonic understandings of and responses to crisis.

RN18S11 - The Critical Sociology of Ideology and Media Representation I

Left wing parties in the European Parliament elections 2014: Redefining EU economic and political priorities
Roy PANAGIOTOPoulos (National and Kapodistrian University of Athens, Greece) | rpanag@media.uoa.gr

In recent years euroscepticism among European citizens has increased, as it has been witnessed in the outcomes of the last European Parliament (EP) elections (2014). Primarily, the financial crises in association to a political crisis and a democratic deficit of the EU
communication policy have nourished extreme stances in many member states. It seems that in times of economic-political uncertainty, national interests and national policies tend to prevail and be sustained by larger parts of the electorate.

In some Southern European countries, where austerity measures have increased poverty, social inequality and a deterioration of living standards, one witnesses an increasing trend to support left wing parties and their proposed policies. Social movements together with political parties try to express the discontent and propose new approaches to overcome the crisis, aiming to oppose neoliberal policies and redefine European unity and solidarity.

This paper aims to analyze publications that depict left wing parties and their candidates and been published during the election campaign for the 2014 EP elections in national distribution newspapers in Greece, Italy, France and Spain. The aim is to present common arguments and scopes of the parties’ political program that criticize various aspects of EU politics. The political argumentation of the left wing parties will be compared to each other and frames will be created intending to point out possible similarities and prospects to shape a common EU policy. Regarding the monitoring of news items we will use a combination of framing and content analysis.

**Media Representations of Left-wing Politics: A Review of Representation of Left-wing Politics in Turkish News Media**

A. Fulya SEN (Firat University, Turkey) | fulyasen@firat.edu.tr

In media and communication research, there are two fields that have mainly contributed knowledge about the relationship between capitalism and the mass media, i.e. political economy, and cultural studies. One focuses on mass media's structural integration within overall economic system. The other field emphasizes the particular character of the mass media, i.e. its relative autonomy from the rest of society instead. Cultural studies focus on how dominant (capitalist) ideology permeates to mass media. Capitalism, communication and class relations have emphasized the economic determinants of culture. The relations between communications entrepreneurs and the capitalist class have lead to dominance of capitalist ideology in communications industries, and the dominant ideology is produced and reinforced by mass media. Since the mainstream media have a homogeneity and monolithic character, it will be blind to other views. The trends of privatization, conglomeration, trans nationalization and deregulation have amplified and broadened the mercantile logic of media operations. The free-market approach excludes broad social interests from participating in the control of the mainstream media, and it leads to concentration of media ownership and promotes cultural uniformity. An adequate media system should enable the full range of political and economic interests in the public domain. In this context, I will focus on both the visibility of left-wing politics in media and the biases of Turkish mainstream media against left. I will also examine the media coverage of leftist discussions relating to social policies, the issues of working class, social equality, egalitarianism, equitable distribution of income, left-wing political parties and actors. By examining quantitative and qualitative view of the news of leftist political discourses and actors, I will try to discuss the viewpoint of mainstream media relating to left-wing politics and the importance of pluralistic media in a democratic society.

**Forget objectivity, rediscover ideology**

Daniëlle RAEIJMAEKERS (University of Antwerp, Belgium) | danielle.raeijmaekers@uantwerpen.be

Pieter MAESEELE (University of Antwerp, Belgium) | pieter.maeseele@uantwerpen.be
Already in the 1970s and 1980s Stuart Hall took aim at the ideal of objectivity for disabling mainstream media to contribute to an ideologically-pluralist debate on significant social issues. In this regard, he once stated: ‘It is not the vast pluralistic range of voices which the media are sometimes held to represent, but a range within certain distinct ideological limits (Hall et al., 1978: 59).’ Therefore, he promoted his work as part of a larger social paradigm shift from a belief in ‘the end of ideology’ to the ‘rediscovery of ideology’. No longer should media be expected to be simply reflective mirrors of a society free from ideological conflicts and characterized by social consensus, but instead media messages should be analyzed in terms of their contribution to the (re)production of hegemony and the assumption of a social consensus. Several decades later, this need for ‘a rediscovery of ideology’ is still as urgent as ever. In the context of a largely undisputed neoliberal social consensus in mainstream journalism, this paper continues Stuart Hall’s search for alternative analytical concepts that allow to evaluate mainstream media beyond and about the limits of social consensus. Since this implies moving from a conceptualization that premises social consensus (‘objectivity’) to an approach that acknowledges ideological contestation (‘politicization’), both in terms of its scope and form, we put forward the analytical concepts of depoliticization and politicization as potential alternatives.

Ideology Critique of an Islamist TV Series
Yunus YÜCEL (Middle East Technical University, Turkey) | yunusycl@gmail.com

Turkey has been governed by an Islamist party, Justice and Development Party (JDP) since 2002. In this period, JDP has constructed its hegemony in political, economic and cultural realms. In the construction process, media is a great supporter of JDP to produce consent. Besides, JDP has been defined itself as a conservative party, religion i.e. Islam is one of the major instrument of JDP to produce consent. Therefore, in this presentation, I want to question the ideological role of Islamic discourse in daily Islamic TV series by analysing representation of poor in the case of the TV series "Fifth Dimension".

Media in capitalist societies has two main roles. In capitalist production relations media is one of the main area for capital accumulation and ideological messages. I will focus upon in this paper mainly discourse analysis of cultural productions and its ideological role as Althusser (2003) remained us the main purpose of ideology is "reproduction of labour relations". According to Abercrombie (1990) textual ideologies can only be successful when they mix dominant ideology and hegemonic discourse. Besides, for ideology to convince its audience it should base on a common experience. In this point, the concept, representation has a part because as Hall (1997) states "representation connects meaning and language to culture". Therefore, representation is not something produced in any individual's mind, it has a social meaning. Visual, verbal, musical and written productions contain a representation of our world, our society. In this sense, the nature of representation and ideology should be thought together because the difference between reality and fictional takes part in the realm of ideology.

This paper aims to show ideological side of representation of poor/subaltern classes in the case "Fifth Dimension" and arrive general results about Islamist ideology. In this regard my main concern to investigate role of ideology in Islamist TV series. Therefore, this study tries to show the meaning of representation of poor/subaltern classes in Islamist populist discourse and relation between representation of poor/subaltern classes and hegemonic, politic and ideological processes and I propose that Islamic TV series are part of Islamist populist hegemonic project by the messages given by them.

It can be said that January 24 Decision and September 12 coup d'etat leads important economic, political and cultural results in Turkish history. With the neoliberal restructuring Turkish capitalist economy, political, cultural life and ideologies are restructured with respect to this transformation. Media in this period has a big impact to realize this transformations because
with the ability to reach countless number of people, media has an important role. While the neoliberal restoration of Turkey and media, poor classes have been presented as source of fear. However, Islamist discourse has an opposite discourse about poor classes and by a populist image of poor classes, Islamist politics can construct a cultural and political hegemony. In this regard Islamist TV series especially "Fifth Dimension" TV series, takes an ideological form because they represent a particular class interest. Construction story, music in background, images take place become an ideological tool to realize dominant class interest and to do that it uses language of poor/subaltern classes to interpellate its audience by muting "real" voice of poor/subaltern classes. I will explain ideological frame of Islamist discourse by showing how class hierarchies are made invisible and how Islamist discourse tries to prevent a rebellion chance of poor/subaltern classes. Therefore, I want to argue role of media specifically its role for ideology and producing particular class interests, interests of ruling class. Secondly, I will examine a genuine case, Islamic TV series while representing the poor with a critical perspective.

RN18S12 - The Critical Sociology of Ideology and Media Representation II

The myth of the long suffering public: Resurrecting the 1970s in British austerity news coverage
Anita Ruth BIRESSI (University of Roehampton, United Kingdom) | a.biressi@roehampton.ac.uk
Heather NUNN (University of Roehampton, United Kingdom) | h.nunn@roehampton.ac.uk

In times of national adversity public culture turns to its own domestic history for guidance and strength. This was certainly the case in Britain following the 2008 global financial downturn when the mythology of the 1970s 'times of strife' was resurrected and repackaged for a new era. In this paper we aim to highlight the ways in which historical lessons were ideologically deployed in political and journalistic discourses to encourage citizens to rethink their political and personal values, future prospects and aspirations in the face of financial adversity. During this period and the subsequent recession citizens were faced with difficult questions. Who should they blame for the damage done to a buoyant economy, and how should they conduct themselves? Should they support the public sector and defend its funding, or accept that deep cuts need to be made? Was it right that organised labour should strike over terms and conditions of employment, or should workers make financial sacrifices? Were Britons really all in this predicament together, as Chancellor George Osborne (2009) famously declared, or were they being conscripted to a myth of national unity which belied deep and deepening inequalities? Here we analyse the ways in which public political discourses deployed historical resources, analogies and stories to provide certain authorised and persuasive answers to these questions: answers which, we will argue, were generally supportive of the continuance of neoliberal enterprise, its values and its current practices.

Through an imperialistic gaze? Journalism, ideology and the notion of democracy
Ernesto ABALO (School of Learning and Communication, Jönköping University, Sweden) | ernesto.abalo@oru.se

Despite that the notion of democracy has a central place in the Western self-image, and also in media studies, research that focuses on how democracy is ideologically loaded in journalistic content is still in its infancy. In recent times, democracy has been used with great enthusiasm by
Western political leaders, while the meaning of democracy perhaps is more fuzzy than ever. In
times of economic and political crisis, and of a weak Left in most European countries, it is
important to examine how journalism constructs notions of democracy, and how such notions
reflect specific political positions and interests. This study, which is theoretically rooted in
ideology critique, and methodologically inspired by critical discourse analysis, examines how
news journalism in the coverage of Venezuela and the Ukraine conflict constructs notions of
democracy. The study is specially interested in exploring and discussing the ideological
interconnections between imperialist and geopolitical interests, and the journalistic construction
of democracy.

**Eurorepulsion or Eurocritical? When the public sphere is shaped by media**

Marinella BELLUATI (University of Turin, Italy) | marinella.belluati@unito.it

In the last two decades, the idea of Europe has become worse for the public opinion, allowing
Euroskepticism to grow. This is due to the economic crisis, the pressure of the EU economic
decisions on single countries and a lack of political governance. In this contest, populist parties
try to ride these negative feelings using an anti-European frame. Within this climate, the media
played a very important role in enhancing an anti-European feeling. Starting with the framing
effect theory, this works tries to show that anti-Europeanism is the result of different and
sometimes opposite points of view. The last European election is a good starting point to
observe these trends because it is in this period that the presence of anti-European leaders and
parties, both from the left and right wing, becomes more evident.

In a comparative perspective, this paper analyses the media coverage, of five important
newspapers The Guardian, Le Monde, La Stampa, El Pais, The Suddeutche Zeitung and Irish
Time during eight weeks of electoral campaign. All these newspapers are selected because
they are involved in the project of European journalism EUROPE. In order to explore different
kinds of anti-European discourses, in the above mentioned newspapers a computerised content
analysis is used to prove the multilevel of the anti-European discourse in the EU public debate.
The implications of this research would contribute to confirm that the role of the media is crucial
to create a cognitive environment capable of orienting public opinion.

**Representations of Labor Protests Against Privatization in the Turkish Press: The**

**Cases of SEKA and TÜPRAŞ**

ceyda TIRMAN (METU, Turkey) | ceydatirman@gmail.com

The main Objective of this study is to analyze how labor’s protests against the privatizations in
Turkey, are reconstructed in news. So news discourse on labor protests against privatization of
SEKA and TÜPRAŞ investigated in five newspapers of Turkey. During analysis, on which
reconciliations meaning in the news are constructed was probed by both identifying the linguistic
and narrative aspects of the news. Therefore discourse analyses will be applied to study how
and on which level a pro-privatizations ideology production is ralalized in the labor protest
against privatizations news. So, construction of a hegemonic ideology in the Turkey by joining
various discourse elements, and if there ara any conflicts between parties in this construction
was investigated.

**RN18S13 - Critical Cultural Sociology and the Media**

**Cultural Materialism: a step back in the theoretical development of Marxism**

Arwid LUND (Uppsala University, Sweden) | arwid.lund@abm.uu.se
The base/superstructure metaphor is directed at social totalities, but has sometimes been misunderstood and reified into three external and sequentially organized levels: forces of production, relations of production and superstructure. The resulting economic-technological determinism reifies this into observable areas.

The problem with Raymond Williams' critique of this is his preferred notion of social life determining the consciousness of an individual, rather than the base. But base/superstructure is a conceptual instrument for historical and social determinations and explanations, rather than stating the obvious materiality of human existence and praxis. The base today contains all kinds of commodity production including services and performances in other persons’ presence. Some social totalities around “earning money to survive socially” relate directly and some less directly to the laws of capital (and the counter-forces attached to it) that are grounded in commodity production and market exchange. The accumulation of capital set the limits for other social totalities in capitalist society. These other social totalities have influence on the accumulation, but they also mediate the influence of the laws of capital and their counter-forces to other social totalities.

There is a risk that Williams stress on the importance of other social totalities than the ones included in the commodity production, obscures how power is constructed and maintained in capitalism, even if the layers outside of value production is becoming more prominent in today’s post fordist capitalism with the potentially emancipatory influence of commons-based peer production.

Asocial media studies: Bourdieu as remedy
Johan Eric LINDELL (Karlstad University, Sweden) | johan.lindell@kau.se

Contemporary media studies has a tendency of ‘bracketing out’ the social dimension, and thus it needs to be better versed in social theory. Failing to account for “the social” is problematic since all media, and all communication are located in social contexts. This paper offers an exploration of the epistemological consequences of insisting on the location of media production, media content, and media use in social contexts in terms of Bourdieu’s social theory. A Bourdieusian approach to media and communication involves understanding that media production is always situated in complex, multi-leveled relations of power, be it the journalistic field, the field of cultural production or the wider social space occupied by the ‘produser’ of mediated content. The perspective furthermore implicates a refusal to succumb to an ‘internalist vision’ when studying communication or the content of the media that is the result of isolating communication from its context of production and consumption, which is where meaning is ultimately generated. Finally, it involves studying media use as a classifying practice that is becoming increasingly mediated through the habitus and an agents’ position in social space as the media landscape gains in appeal to persons – as individuals with preferences, tastes and lifestyles – rather than masses. It is argued that a move towards Bourdieusian media studies ushers the study of old and new forms of media production, content and use onto paths that provoke critical and enduring questions of the role of media in society.

Is there an alternative to no alternative? Instrumental political communication and politicians-as-commodities
Marko RIBAĆ (The Peace Institute, Ljubljana, Slovenia) | marko.ribac@mirovni-institut.si
Jernej AMON PRODNIK (Faculty of Social Sciences, University of Ljubljana, Slovenia) | jernej.amon-prodnik@fdv.uni-lj.si
In his 1960’s essay Dallas Smythe pointed out that political candidates have been turned into commodities, with politics now consumed as entertainment. A few decades later Schiller (1984) compared politics to advertising; political candidates are sold in a similar fashion to soap, he lamented. Crouch (2004) recently came to a similar conclusion, when he likened politicians to shopkeepers that do anything to stay in business. Our research focuses on the institutional political arena and analyses to what an extent the intensification of commodity-logic, based on instrumental reason, has extended to Slovenian political parties. Through an ethnographic inquiry into how political actors perceive democracy, citizenship, public (mediatised) communication and voters, we analyse in what ways parliamentary democracy (by mimicking capitalist relations) is turning into an instrumentalized technocratic governance devoid of democratic substance (e.g. Crouch, Blumler, Habermas). The study will proceed from critical theory (critique of instrumental reason and commodification) and Bourdieu’s theory of fields (1991/2003; 2005). The empirical part will be based on in-depth interviews conducted with general secretaries of Slovenian parliamentary parties and selected extra-parliamentary parties. It will delineate: (a) in what ways structure and functioning of the political field (Bourdieu) limits its agents; (b) how the logic of this relatively autonomous, yet socially embedded field, constrains actors to use its advantages and limitations to benefit themselves; and (c) in what ways (if any) parties differ in their acceptance of the (apparent) “rules of the game” of rationalized collecting of votes. Is there really no alternative (to use Thatcher’s famous slogan)?

Between Democracy and Civility: Dialogue, Media and the “new” Cultural Sociology
Sam HAN (Nanyang Technological University, Singapore; Hawke Research Institute, University of South Australia) | hansam@ntu.edu.sg

Amid the growing amount of criticism of contemporary digital culture, one of the most frequent points made by critics has been about the lack of civil discourse on the Internet. From headlines such as “Is Google Making Us Stupid?” to declarations of “digital Maoism” online, there is, as expected perhaps, a backlash to Internet-based digital culture. With the preponderance of “trolling” and “flame wars,” the Internet seems to breed something quite contrary to what the early proponents of Internet culture had predicted regarding the democratizing potential of digital culture, with its peer-to-peer nature and the seemingly uncontrollable flow of information. But, with hacking, cyber-bullying and the like taking up so much space in public discourse, many critics suggest, contemporary Internet culture is far from the Habermasian “public sphere” that many had hoped for.

In social theory and sociology, there has been a recently renewed interest in the nexus between democracy and digital culture, specifically among scholars involved in what is called the “strong program” in cultural sociology. Taken by the uprisings in the Arab world as well as the social media strategy of the Obama Campaign of 2008, these social theorists and sociologists have paid great attention to facets of digital culture and social media that, for them, promote democratic values that amount to what they call “civil society.” In this paper, I analyze and critique this stance by suggesting that they hold a particularly ideological view of contemporary digital media as “dialogic.” By equating democratic media with dialogic media, I argue that they miss not only the actual nature of contemporary media but also constrain themselves conceptually in equating “democracy” and “civility” with a particular form of communication that narrowly confines communication to rationality at the cost of emotion and affect.

RN18S14 - The Critical Sociology of Social Media, Activism and the Public Sphere
Social Media and the Polarization of the Public Sphere
Kamil FILIPEK (University of Warsaw, Poland) | kfilipek79@gmail.com

Much of the public activities and behaviours can be found in the new public space made accessible through social media (Bode et al. 2014, boyd 2014, Fuchs 2014). Political ideas, social problems, public issues or policies are examined in the discussion networks appearing on various social media sites. The way people connect, follow, like, comment, retweet, rate etc. codetermines the new communicational patterns affecting relations between actors of the public sphere. May we therefore assume that social media became one of the primary outlets for citizens to produce, share, consume and exchange information?

Both qualitative and quantitative analysis of the communication patterns from Twitter and Facebook reveals explicit processes distinguishing the new models of the public sphere (Benkler 2006, Castells 2009, boyd 2014) from the old models (Arendt 1958, Habermas 1991, Rawls 1997). However, past studies (Smith, Rainie, Himelboim, Shneiderman for PEW Internet 2014) and the research conducted for the purpose of the essay melt the enchantment of social media enthusiasts. Despite of apparent advantages related to the network effects of communication, it's evident that social media are not the ultimate solution for most of the failures of the old public sphere.

Much attention in the essay has been paid to the polarized, semi-polarized and clustered structures formed when public or political issue is discussed (Smith et al.). The structural analysis helps to understand complexity of the new public sphere arising on social media sites e.g. Twitter and Facebook.

Colonising dissent: Proprietary social media and online social movement activity
Vassilis CHARITSIS (Karlstad University, Sweden) | vasileios.charitsis@kau.se
Mikko LAAMANEN (Hanken School of Economics, Finland) | mikko.laamanen@hanken.fi

Digital communications, and particular the participatory nature of Web 2.0, have transformed the way people interact, collaborate, learn and work. Social media platforms have actually been lionised as the great white hope for participatory democracy as it is argued that digital networks extend the space and place of social, economic and political participation (Castells, 2012). It has even been maintained that the emancipatory nature of social media is embedded in the opportunities for organising collective action anew, either by using individuals and their personal networks as conduits of movement messages, or employing social media platforms and applications in lieu of established political organisations (Bennett and Sederberg, 2012). However, this liberatory conviction is heavily criticized as nothing more than naïve cyber utopian rhetoric about the role of social media (Morozov 2012) based on a techno deterministic ideology (Fuchs 2012).

In fact, communicative capitalism not only produces a fantasy of participation (Dean 2005), but also commodifies every single expression of that illusionary empowerment. We focus on this colonization as we look at movements that use social media platforms as vehicles for their activity. Looking at movement activity that opposes the platform where it takes place, we analyse the conjunction of collective action with the attempts of hegemonic proprietary social media to capture value, even from opposition. We argue that this shows how the cyber utopian logic of socially empowering social media is negated by the capitalist logic of commodification that co-opts any attempts for dissent and resistance towards them. Consequently there is a need for alternative models of online platforms that are not based on the colonization of users’ activities. We conclude by looking at recent social media platforms and critically examining whether they provide an answer towards that direction.
Can Social Media Be A Counter Public Sphere? The Case Of the Gezi Park Protests
Cem Koray OLGUN (Adiyaman University, Turkey) | simulacr@gmail.com

Mass media not only effects people in the public sphere but also effects them via social media in a private sphere. In this way, the words of Manuel Castells “virtual space” become a new public sphere as a person who described himself/herself. Therefore, now there are two different public spheres. As a new public sphere social media aims to transform public sphere before increasing the accessibility from anywhere. Starting on, May 30, 2013 Taksim Gezi Park protests in Istanbul Turkey, showed that how social media can create the possibility of a counter-public sphere also. During the events, protesters use social media, especially via twitter for support and help to each other against to the any intervention. In this study, we will discussing the Gezi Parkı protests -by the framework of Jürgen Habermas and Hannah Arendt's public sphere concepts- through the social media how it was created the possibility of alternative or counter-public sphere.

RN18S15 - The Critical Sociology of Alternative Media and Social Media Alternatives: Civil Society Media, Peer Production, and Commons-Based Media

The Social Meaning of Sharing. How users of hospitality exchange networks understand their engagement
Karolina MIKOŁAJEWSKA (Kozminski University, Poland) | k.mikolajewska@gmail.com

The paper offers an analysis of the ways in which users engaged in hospitality exchange networks (mostly active in Couchsurfing) understand the character of their activities. Despite the rapid growth of the phenomenon of the so-called sharing economy (Botsman & Rogers, 2010), sharing as a modality of production (Benkler, 2005) remains undertheorized. It is impossible to contribute to theorizing it without grasping the users’ perspective.

In 2011 Couchsurfing has changed its legal status from a non-profit to a for-profit organization and is now funded by venture capital. The symptomatic change leads to thinking about the possibilities for building a network of alternative consumption and about the question about the purpose of doing organizational work. In the interviews I have conducted narratives concerning the meaning of this change have often also triggered descriptions of how CS-ers understand the
character of their engagement. In the paper I discuss the relevance of the notion of immaterial labour (Hardt & Negri, 2000; Lazzarato, 1996), proposing arguments for understanding sharing as labour and also pointing to some shortcomings of the concept of immaterial labour, that have to do with the material character of labour in sharing economies.

I have recorded nearly 40 interviews with devoted CS-ers, who sometimes have been also active in Servas – an ‘offline predecessor’ of CS, HospitalityClub – arguably the first online hospitality exchange network, or BeWelcome; or have started incorporating accommodation booked via Airbnb with surfing couches in their travel itineraries. This material is supplemented by ca. 40 interviews with CS or Airbnb users recorded by students at Kozminski University in 2013 and 2014.

Monetary materialities of peer-produced knowledge: the case of the Wiki-PR controversy and its resonances in the Wikipedia community

Juhana VENÄLÄINEN (University of Eastern Finland, Finland) | juhana.venalainen@uef.fi
Arwid LUND (Uppsala University, Sweden) | arwid.lund@abm.uu.se

In this presentation, we will analyze the operational logics of Wikipedia through its monetary materialities. Wikimedia Foundation (WMF), the governing body of the peer-produced encyclopedia, has annual expenses of over $50 million per year (2013), supported by donations from private firms and individuals. The monetary flows are only one side of the coin, another being the unpaid labor that actually produces the content that makes Wikipedia valuable. Wikipedia, thus, is organized through a two-tier gift economy: the donations of money on one hand, and the donations of knowledge and labor time on the other. From the neutrality point of view, the monetary flows of WMF and the informational flows of Wikipedia should be kept apart. Still, Wikipedia has seen plenty of paid advocacy, risking its encyclopedic ideals. In our analysis, we will bring forward the case of Wiki-PR, a consultant firm involved in helping 12 000 firms to edit their Wikipedia presence. Based on a close reading of articles in The Signpost, we will highlight two aspects of the Wiki-PR scandal. First, in course of the votings against paid advocacy, the response from the editing community was more liberal than the one from WMF. Second, the relative financial independence of WMF is stressed and a new view on the editorial attitudes is presented. Through these perspectives, we seek to highlight the more general contradictions in organizing immaterial peer production upon a materially mediated infrastructure.

Civil Society Media and the Internet Today

Goran TOMKA (Faculty of sport and tourism, Serbia) | goran.tomka@tims.edu.rs

Affordances of digital media are theoretically vast (boyd, 2011), but they can only be enacted through actual media-related practices (Couldry & Hobart, 2010) organized by “shared practical understanding” (Schatzki, 2001: 11) of media use. As audiences are the necessary other for any media (Dayan, 2005), shared understanding of media-related practices are socially construed through, amongst else, discursive practice on audiencehood. This research looks into historical and contemporary discourses on audience to better understand the limits and possibilities of civil society media today.

From the earliest days of media, audiences have been othered and defined as an imaginary object of deliberation. Enlightenment thinkers were construing the reading public as an ideal for their project of rational deliberation on society, politics and arts. They objectified readers as rational and critical social entity, which can stand against the representative publicness (Habermas, 1991), but at the same time they encapsulated women and illiterates into spheres of lesser value – private domain and entertainment (Fraser, 1990). Early cultural capitalism –
entertainment industry of boulevard theatres, bestseller publishers, vaudevilles, and cinemas – created their own version of the audience discourse: the consumer. It bore the promise of freedom, relaxation and a new kind of salvation through consumption. Rising profits of entertainment industry and spreading of the market required a type of depersonalized, ‘massed’ audiences. As these institutions strengthened, so did their discourse, which became naturalized and almost unquestionable (Ang, 1991). As soon as the nation-states were born, they also required a discourse on national publics that would support the unity, imagined history and unlimited future of the nationness (Anderson, 1991). Cultural citizenship manufactured through media became a powerful hegemonic force that shaped identities, feelings and beliefs of millions.

As we see from this rather sketchy history, talking about audiences has been a part of various public practices resulting in numerous discourses – readers, public, people, viewers, listeners, consumers, followers - every contingent upon the historical moment and place of its creation and the power of its creator. All these discourses make up a reservoir (Laclau & Mouffe, 2001) for present and future discursive practices. The function of these discourses was/is rather normative, than descriptive, for each of them projects an ideal way of being audience for ideal cultural content (or cultural practice) and excludes other. The clash between audience as a norm and as a social reality has been made clearly visible by numerous empirical audience studies (Ang, 1985; Morley, 1980; Radway, 1991; etc).

Despite that, in today’s media-saturated world, discourses on imagined audiences are needed as ever before and they are reproduced with much effort and material resources. It is rather easy to see the recycling (and sometimes upcycling) of old discourses on the Internet: Facebook and Twitter are promising web 2.0 democratic communities and free speech to boost data production by users (Fuchs, Sandoval, 2014); public broadcasting services guarantee selection and high quality of hegemonic/national media content and so on. However, Internet has made possible relatively large sphere of civil society media that operate as un-hierarchical communities of users with balanced power relations. Or so does the argument go (see Benkler, 2006; Rheingold, 2003; Shirky, 2008). But does that mean that new media affordances offer these communities resources to construct their own discourse of their media practices (or “to have a voice” as Couldry might say, 2010)? This research sets out to investigate discursive practices of digital media communities.

Case study is a self-organized, non-profit portal Vukajlija, which started in 2003 in Serbia as a kind of urban dictionary, but eventually became a super-popular multipurpose regional site in 2011/12 (lately, with the wide adoption of international social networking sites it started losing audiences). Users who publish their own dictionaries, who make fun of politics, retell their favourite movies and comment news headlines also construe discourses of their practices. Empirical analysis of those discursive practices (through interviews and virtual ethnography) shows several departures from both the ways audience discourses are produced and maintained in official media, and the promises of democratic network structures. First, unlike highly institutionalized media fields, there is a plurality of discourses inside one community (e.g. some imply rationality and citizen engagement, some fun and laughter) – loose organization enables co-existence of diverging views. Second, individual discourses are incoherent and practice is not highly ritualized (crossing from one discursive position to the other inside the conversation is highly possible). Third, plurality doesn’t necessarily imply novelty. The most of discourses are made out of the existing surplus of meaning (Laclau, Mouffe, 2001) – meanings and constructions excluded form major public discourses. Discourses are a kind of remix of already existing ones (just like the content itself – see Manovich, 2001). Fourth, low formalisation and plurality still doesn’t eliminate hierarchy (unlike many celebratory accounts of internet users claim). There is an order of discourses (Fairclough, 1989), though not very strict, and it is maintained through the architecture of the site (algorithms of selection, voting mechanisms) as well as the institution of the moderator. Finally, all discourses recognize the
difference between media practices on Vukajlija, and practices of commercial news portals (often highly controlled by the state), as well as internationally owned social networking sites (Facebook being the most common reference).

Findings show that even though there is a seemingly rich historical reservoir of discourses to be used by social agents for explaining audiencehood (both their own and of others), discourses of civil media users gravitate towards the big commercial or national ones. We could conclude that all media organizations may try to produce discourses on audience that will benefit them and their goals, but their ability to actually achieve that are very disproportionate.

Revolutionary only as a mode of production? Sexism and patriarchal culture in peer-production communities
Ivo FURMAN (Goldsmiths College, University of London) | i.furman@gold.ac.uk

While it is true that the advent of the information commons and peer production has created new opportunities for mass collaboration and large-scale digital sharing of knowledge on the Internet (Bauwens 2005; Benkler 2002, 2004, 2006; Kostakis 2012; Reagle 2010; Wittel 2013), the culture of most peer-production communities continue to be dominated by values of the male “geek” cultural milieu. As evidenced by the lively debate that followed from Ubuntu founder Mark Shuttleworth’s alleged sexist comments in a keynote address (Schroder 2009), sexism remains an entrenched problem in the culture of communities organized around peer-production (Yuwei 2005, 2008). Within the context of the Free Culture Movement, John Reagle (2013) has suggested that the “values and rhetoric of freedom and openness can also, ironically, create informal but significant barriers to women’s participation.”

Accordingly, this paper would like to argue that focusing solely on peer-production’s non-hierarchical and post-capitalist mode of production carries the risk of naturalizing sexism and patriarchal culture commonly encountered in peer-production communities. The naturalization of sexism and patriarchy not only perpetuates male hegemony and reinforces masculine normative assumptions about the role of women in peer-production communities, but also carries serious implications for the nature of peer-produced knowledge itself. As the recent controversy around the categorization of American women novelists on Wikipedia demonstrates (Filipacchi 2013), male domination within peer-production communities can have epistemological consequences for peer-produced knowledge (see Zandt 2013).

Drawing on literature about gender relations in online communities (for example Carstensen 2009, Filipovic 2007 or Herring 2003) and ethnographic data drawn from a number of peer-production communities, this paper aims critically address the problem of sexism while opening the discussion on possible interventions (see Cárdenas 2013, 2014) that can transform the culture of peer-production communities and make peer-production a truly emancipatory and radical mode of production.

The MacBride Report at 35 and the Historical Context
Jernej AMON PRODNIK (Social Communication Research Centre, Faculty of Social Sciences, University of Ljubljana, Slovenia) | jernej.amon-prodnik@fdv.uni-lj.si
Saso Aleksander BRLEK SLACEK (Social Communication Research Centre, Faculty of Social Sciences, University of Ljubljana, Slovenia) | saso.brlek-slacek@fdv.uni-lj.si

This paper analyses historical development of political economy of communication as the key critical approach in media and communication studies. It does so by putting an emphasis on The McBride Report entitled “Many Voices, One World”, which can be seen as a key historical document aiming at a political establishment of an alternative information and communication order. It is an aim of this contribution to show: (a) in what ways the approach of political economy of communication was embedded in the historical context in which it developed, (b) what are the historical parallels between this research tradition and The MacBride Report, and (c) in what ways The Report and political economy of communication theoretically and epistemologically overlap, and in which they part. In the paper historical development of political-economic research tradition is divided in five historical periods. It is claimed that social though and social analysis are inextricably linked to political, cultural and economic relations in specific historical epoch. These relations either enable or disable development of social critique and to an even bigger extent influence possibilities for its actual deployment (praxis) that could lead to “changes in the world” (instead of "only interpreting the world", as pointed out by Marx). Development of political-economic approach reaffirms this thesis, especially when considering its conflictual emergence in 1960's and its considerable expansion in the 1970's, which in fact
led to The New World Information and Communication Order (NWICO) initiative and its intellectual and political culmination in The MacBride Report in 1980.

**A Critical Political Economy Analysis of the Taiwanese Film Industry (2010-2014)**

Yu-Peng LIN (The University of Nottingham, United Kingdom) | yupeng.lin1011@gmail.com

This article presents an assessment of the state’s role in the Taiwanese film industry. The Taiwanese film industry has been weak and ineffective for a long time. Hollywood has nearly dominated the box office in recent years. However, there was a turning point in the Taiwanese film industry in 2007 when a Taiwanese film, Cape No. 7 (海角七號), became the highest-grossing film in Taiwanese cinema history, which has encouraged more production and capital investment into the Taiwanese cinema market. Overall, the Taiwanese box office has improved a lot, especially when compared to the previously depressive years.

Logically, the Taiwanese government should implement more policies and measures aimed to benefit the Taiwanese film industry and stimulate industrial growth. However, the Taiwanese government has chosen to seek a ‘niche’ of mainland China’s grand cinema market rather than instilling more resources into the Taiwanese film industry. In 2010, the Taiwanese government signed the Cross-Straits Economic Cooperation Framework Agreement (ECFA) with China, and Taiwanese films officially began being featured in China. In 2014, the Taiwanese film industry prepared to sign the Cross-Strait Service Trade Agreement to broaden the market as one way to help Taiwanese cinemas to thrive. However, there seems to be a gap in this development with differences between the state and the film industry, and it needs to be probed further.

In this research, I will explore the role of the state under the frameworks of the economic agreements. Also, I will examine the development of Taiwanese cinemas in China between 2010 and 2014 and contrast this to the development of the Taiwanese film industry during the same period. This research features a critical communication political economy approach and is expected to provide a new perspective that re-evaluates state power in media industries.

**You talking to me? Political economy of the Internet and the editorial boards of popular news websites in Croatia**

Pasko BILIC (Institute for Development and International Relations, Croatia) | pasko@irmo.hr

Ivan BALABANIC (Institute for Social Sciences Ivo Pilar, Croatia) | ivan.balabanic@pilar.hr

The internet is increasingly commercialized globally and locally. Companies such as Google dominate web search and online videos through YouTube, while Facebook dominates social networking. Statistics on audience reach of news websites in Croatia show that the most popular websites are owned either by transnational media companies, or by large local media conglomerates that also own high circulation daily newspapers. Since 2008 advertising revenues have been dropping dramatically for all media in Croatia except for the Internet. Between 2008 and 2013 online advertising revenues have almost quadrupled. Reflecting a global laissez-faire regulation approach there is almost no legislation focusing on the Internet and its impact on the sphere of public communication. How do these structural conditions shape the editorial boards of online news websites in Croatia? What are the online strategies of public communication of these media? How do they frame their supposed social role and impact? What are their targeted audiences and how do they reflect their interests? Who do they represent? These are some of the questions we will focus on in this presentation. The paper will, first, present an analysis of a series of in-depth interviews conducted with members of the editorial boards, and second, present a detailed qualitative and quantitative content analysis of articles on relevant social issues published on these websites. The data will be collected and analyzed as part of a large-scale project funded by the Croatian science foundation.
Critical Media Sociology of Authoritarian Politics: Surveillance and Right-Wing Extremism

Opening Internet Networks, Sealing International Borders: Right-wing extremist discourse and contradictions
Miranda CHRISTOU (University of Cyprus, Cyprus) | Miranda.Christou@ucy.ac.cy

This paper analyzes how a right-wing nationalist party in Cyprus (ELAM) uses the internet to solidify the group’s identity and articulate an anti-immigrant ideology under the guise of rescuing the Greek identity of Greek Cypriots. I locate this case within larger debates about youth, citizenship and the role of new media in a globalizing world. I point out that, especially for youth groups, globalization has been exemplified in the form of new media usage that has radically transformed the experience of belonging and the understanding of difference, both within and beyond national borders. Through the method of critical discourse analysis, the chapter focuses on ELAM’s views of migrants as these are articulated in their internet site and debates. I argue that the group uses the internet as a space where hierarchies are clarified and borders between “self” and “other” are drawn. The paper concludes that analysis of right-wing extremist expressions on the internet reveals the inherent contradictions of cyber-networking: on the one hand the internet is used as a means of breaking down national borders in order to network with other nationalist organizations around Europe, but, on the other hand, the groups’ ultimate ideological goal is to reinforce the impermeability of these borders by invoking the threat of immigrant populations.

Social Media, Democracy and the Authoritarian Government: The Case of AKP Government in Turkey
Bedriye POYRAZ (Ankara University Communication Faculty, Turkey) | poyraz@media.ankara.edu.tr
Esra INCE OZER (Ankara University Communication Faculty, Turkey) | esrain90@gmail.com

This paper argues that we need to critically scrutinize the claims and cases presented in favor of the idea that social media strengthens democracy. The claim that technology increases communication and mobilization and hence strengthens civil society is questionable on many aspects. Many believed that democratic governance could be improved through citizens and policy-makers supported by the new information and communication technologies (Loader and Mercea, 211).

It is important to avoid the utopian optimism of the digital democracy. However, new technologies also do point to the potential of disrupting actions which open the possibilities for some co-construction of networks and platforms where the formation, maintenance and defense of political positions may be played out (Loader and Mercea, 211). It is important to keep a clear perspective and not exaggerate the extent of the activities or their impact. On the other hand, it would also be foolish to underestimate what seems to be a major development in the contemporary history of Western democracy (Dahlgren: 2005). Optimism about the potential of communication technologies to raise democratic consciousness and capacities and ultimately to promote democratic transitions in authoritarian regimes is very
common (such as Diamond 2012). However there is now a technological fight ongoing between democrats seeking to avoid Internet censorship and dictatorships that want to extend and refine it. The history of communication technologies provides many cases wherein new innovations raise hopes about extending democracy that at the end brings another round of disappointment. It would not be wrong to say similar things for the social media platforms such as twitter, Facebook, YouTube etc. In this context, arguing that the claims that second generation social media will enhance digital democracy serve commercial and ideological aims than democratic inclination do not seem baseless (Schiller: 1993; Mosco: 2005).

In this study we will try to analysis how twitter became an instrument of pressure, censure and control utilized by Turkey’s AKP government especially its authoritarian leader, Erdoğan. The Turkish government has started to control and conduct criminal investigation into officials who are criticizing the government based on democratic criteria through Twitter.

Racism in the Parliament: Comparative analysis between the speeches of Jobbik and Golden Dawn MP-s in the Parliaments

Aniko FÉLIX (MTA-ELTE Peripato Research Group, Hungary) | aniko.felix@gmail.com
Nikos FOKAS (MTA-ELTE Peripato Research Group, Hungary) | fokasnikosz@gmail.com
Gergely TÓTH (MTA-ELTE Peripato Research Group, Hungary) | toth.gergo@gmail.com

Although the ‘economic-crisis-breeds-extremism thesis’ has failed in general, Greece and Hungary are two countries where the far right rose between the pre-crisis period and the crisis (Mudde, 2013). Jobbik in Hungary and Golden Dawn in Greece have realized the opportunity in the political and economic crises of these two countries to gather new supporters. One of the main characteristics of these two parties is the strong xenophobic attitudes. For Jobbik the objective of this xenophobic issue was basically the Roma community, meanwhile for Golden Dawn it was the hostility towards illegal immigrants, especially Muslims. Our hypothesis that these parties somehow owned these issues in the political field, provoking a discourse with other parties. Our investigation based on a quantitative and qualitative analysis of speeches of Jobbik and Golden Dawn MP-s in the two national Parliaments. The time period of the research is from the year when they entered the Parliament, til 2014. We analyze those speeches of the lawmakers, where they are talking about these certain groups. We present the similarities and differences of the two parties’ speeches in a comparative way, questioning that whether in what context they were talking about these groups, with which words and phrases they were co-mentioned. The main topics connected to the certain groups will be visualized with network graphs year by year. Thereby, it can be detected how these parties started to discuss the topic in the beginning and how the content of the speeches were changed during the time according to their position and interest in the wider political context.

Applying Critical Media Sociology: Mapping the Intersections of Media and Communication Research with Surveillance Studies

Ilkin MEHRABOV (Karlstad University, Sweden) | ilkin.mehrabov@kau.se

The revelations of otherwise confidential intelligence files by Chelsea Manning, Edward Snowden and journalistic organization WikiLeaks showed once more that we live in an era of intensified and all-encompassing communications surveillance, conducted by secret services, intelligence agencies and private companies. This is an era of rapid transformations in the sphere of media and communication, which, according to Robert W. McChesney, “veers toward a classic definition of fascism” (McChesney 2013, 171). Thus it becomes urgent that better sociological conceptualizations of the stance of media and communication as an academic field.
within these metamorphoses is conducted - together with the explorations of what comprises the fast growing field of surveillance studies. Within such scope this presentation attempts to sociologically map the academic branch of surveillance studies from the perspective of the scholarly field of media and communication, and to seek out boundaries, limitations, strengths, and weaknesses of the currently conducted research. To be able to properly map out the field and mark important points within the landscape, the Journal of Surveillance & Society, a premier interdisciplinary journal in the field of surveillance, is chosen as a point of departure. Analysis of reiterating topics within the surveillance studies field is conducted based on 296 articles from 40 issues published between 2002 and 2013. While providing the analysis of the frequent topics and thus mapping out the field, the article also engages in the argumentative discussion of the missing points and aspects believed to be in the need of fortification and wider coverage.

RN18S18 - Doing and Applying Media Sociology Today: Four Case Studies

Identifying the Wurst: the “play” of identities in a hybrid media system
Marian Thomas ADOLF (Zeppelin Universität, Germany) | marian.adolf@zu.de
Amanda MACHIN (Zeppelin Universität, Germany) | amanda.machin@zu.de

Identities are enduring socio-political features that limit, disrupt and rejuvenate the public sphere. Their implications are hard to pin down - precisely because identification is always ongoing, ambiguous and never entirely under control. Traditional, biographical, collective, corporeal, and economic contexts shape and delimit how we identify ourselves and how others identify us. Yet the transformation of identifications can challenge conventions and upturn preconceptions, through the provocation of entertainment, surprise or outrage. Both individual and collective identifications are dynamized by processes of communication, through which individuals discover, develop and negotiate the “fit” of any identity. Since identification occurs in communication it is open to discussion in public debate through various media, old as well as new, and is thus situated in multiple (semi-)public spheres. This phenomenon is amplified today, since communicative possibilities are multiplying and expanding. Identities thus have become more vulnerable and dynamic than before. Anyone can enter a debate about an identity without having to be admitted; every temporarily stabilized identification might change. Does this imply the emergence of new, playful, political opportunities?

This paper, tying together recent developments in both political and communication theory, analyzes Conchita Wurst (Eurovision song contest winner 2014) as an example of the negotiation of identities in today’s hybrid media environment. Playing with both sexual and national identities, Thomas Neuwirth created a highly successful and contentious persona that had ambiguous yet significant impact. Conchita Wurst, a media phenomenon situated right in the center of the new, hybrid system where creation/representations of identities intermingle, serves as a formidable case study of identifications and their potential.

Sociological insights on the impact of digital tools on students’ writing/reading
Manuela FARINOSI (University of Udine, Italy) | manuela.farinosi@uniud.it

This contribution aims to investigate the impact of digital tools on writing and reading practices. It explores the affordances of writing and reading on paper and those of writing on a keyboard
and reading on a screen and examines how the use of digital tools is reshaping the traditional modes of using paper for reading and writing among students. The study is based on the qualitative content analysis of 129 essays written by undergraduate students (M=77 / F=52) of the course of Multimedia Sciences and Technologies at the University of Udine (Italy). The principal findings of this analysis show that reading and writing competencies are changing with the use of digital tools but that paper and digital interactions are not mutually exclusive. Very often students’ choice of paper and pencil vs. screen and keyboard is situation-dependent. According their opinion, both reading on paper or screen and writing with a pencil or a keyboard has advantages and disadvantages at the same time. Furthermore, students still perceive several virtues of writing on paper, which they continue to use extensively. It appears that chirographic writing and paper is more multi-sensorial and meta-communicative than using the keyboard or screen.

Operation 'Protective Edge’: A Disaster Marathon
Noa LAVIE (The Academic College, Tel Aviv-Jaffa, Israel) | lavie@mta.ac.il
Talia TRAIBER (Tel Aviv University) | taliatraiber@gmail.com

This ongoing study focuses on the news broadcasts of the public-commercial television channels in Israel – channel 10 and channel 2 – during the war between Israel and Gaza, named operation 'protective edge' in the summer of 2014. During the war, news broadcasts have taken over the entire broadcast schedule in what is called a 'disaster broadcasting marathon' (Libbes and Grabelzky, 1996). This 'disaster marathon' won very high viewing rates despite the technological capabilities of viewers in Israel to break away from that 'marathon' and watch VOD (Video On Demand) or consume online news (Wertheimer, 2014). Public-commercial television in Israel still earns high rating compared to other Western cultures and has a significant socializing power (Cohen, 2013). Prior studies of war time television news broadcasts in Israel show how television in Israel reinforces the Zionist-militarist stance almost without essential criticism (Peri, 2001, Neiger, Zandberg and Mayers, 2009).

It is therefore our aim to examine the content of the commercial channels 'news marathon' during operation 'protective edge'. Using a semiotic research method (Barthes, 2004), we hope to examine and dismantle the manner in which the commercial channels in Israel framed operation 'protective edge' for the public.

Medical research and scientific publications driven by vested interests? A case study: CCSVI and Multiple Sclerosis.
Antonello BOCCHINO (University of Westminster, United Kingdom) | a.bocchino@westminster.ac.uk

This presentation will examine the ways in which medical publications are used to selectively highlight research that appears to align with vested capitalist interests, in particular, pharmaceutical companies. My presentation will focus on a case study involving the discovery of Chronic Cerebro-Spinal Venous Insufficiency (CCSVI) as a potential cause for Multiple Sclerosis (MS), which offers the possibility of a non-pharmaceutical treatment option. I will consider the way this discovery has been treated in the media and in institutional communications. Among others, I will review the case of an article published in The Lancet in 2013, which called into question data from clinical studies demonstrating the prevalence of CCSVI in MS patients. One of the leading doctors from the study that had been challenged, submitted a comment in response, which The Lancet declined, instead choosing to publish comments which claim to “close the curtain" on this non-pharmaceutical treatment option.
RN19 - Sociology of Professions

RN19S01 - Professional Autonomy, Practices and Boundaries

Professional Autonomy: The Reconciliation of Principal Agent Conflicts in Professional Relationships
Mark GOULD (Haverford College, United States of America) | mgould@haverford.edu

In a wide variety of contexts, professional relationships are beset by conflicts where two or more principals have conflicting expectations of how professionals ought to act. This paper discusses the nature of these conflicts, explaining why their adequate conceptualization is impossible from within standard economic models. It then conceptualizes such conflicts sociologically, arguing that their reconciliation requires a higher-ordered normative regulation of professional activities, a regulation that constitutes the normative autonomy of professionals and their activities.

Inequalities in the health care system, meaning making and the consequences for professional autonomy
Friedericke HARDERING (Goethe-University Frankfurt, Germany) | f.hardering@soz.uni-frankfurt.de

Although the work of physicians is generally viewed as meaningful work and physicians have high occupational prestige, the work is also hazardous to the physicians’ health, as evidenced by recently documented high rates of burn-out syndrome and depression among physicians due to psychological stress. These burdens are seen as a consequence of the ongoing process of economization and increased workloads. In the literature it is assumed that the processes of economization make it difficult for the physicians to perceive the meaningfulness of their work. In this contribution I focus on the question of how physicians deal with stressful working conditions and in how far the meaningfulness of their work can be interpreted as a resource against these stressful conditions. To answer this question, I take a closer look at the processes of how physicians ascribe meaning to their work. On the basis of 18 interviews with physicians from different clinics in Germany I identified distinct levels of the experience of meaningfulness and different sources of meaning that were used. While in some cases the inner relation to work seems unbroken, there are other types whose inner working relationship seems to be more offended. Feelings of inequalities resulting from the Diagnosis Related Group System, which favors some specialist clinics, seem to play a crucial role in the experience of meaningfulness.

Innovation and creative occupations. A theoretical and empirical approach
Liviu Catalin MARA (UNIVERSITAT ROVIRA I VIRGILI, Spain) | liviucatalin.mara@urv.cat
Ignasi BRUNET (UNIVERSITAT ROVIRA I VIRGILI, Spain) | ignasi.brunet@urv.cat

The objective of our presentation is, first of all, to critically outline Florida’s theory of creative occupations. This author does not refer to the creative class as an economic class in terms of ownership of properties, capital or means of production. The creative class does not own or control the means of production in a physical sense. In the words of Florida (2002:68), their property- which stems from their creative capacity- is an intangible because it is literally in their heads. Furthermore, its definition is still in the process and is determined by the type of work-
related activity that is performed by its members. In these types of activities the task performed are those that imply “creating meaningful new forms”. Second of all, we will present the empirical studies that have been carried out regarding the creative class in Europe. These are studies that were performed by Florida, and also by other authors. Our intention is to formulate a set of hypothesis that we will use in our research on the creative occupations in Spain. The methodology that we will use in our research is both qualitative (semi-structured interviews, discussion groups) and quantitative (questionnaire).

New professionalism or old wine in new skins? On shifting boundaries, hybridisation and professional ethics in the oncological field

Christiane SCHNELL (Institute of Social Research at the Goethe-University Frankfurt, Germany) | ch.schnell@em.uni-frankfurt.de

The field of oncology is an interesting example to study the transformation of professionalism: The biomedical approach changed the knowledge base profoundly, interdisciplinary collaboration plays an important role within current therapeutic approaches and due to the influence of the pharmaceutical industries several aspects of hybridisation could be observed. Above that oncological research and drug development takes place within an internationalized scientific community, huge affiliated groups and global market structures. The question is now, how the professional field develops under these conditions. If a new type of professionalism is born and how it could be characterized with regard to professional power, inclusivity and ethics. Based on a German field study two empirical examples are contrasted.

RN19S02 - The Complex Boundaries of Professional Groups in Health

The case of Finnish rehabilitation examinations and the possibility of shared professionalism in the varying value-environments

Kaisa HAAPAKOSKI (University of Jyväskylä, Finland) | kaisa.haapakoski@jyu.fi

‘Rehabilitation examinations’ have over 60 years long history in Finland. These cross-professional practices are performed in the public health care units and in the units producing services through procurement proceedings. A national survey (N=76) and a qualitative interview-material (N=13) were gathered to examine the viewpoints of good work and quality. Informants were from different professions e.g. medical and health care professions, social work, psychology.

It was observed that some goals and aims were mentioned just in one type of organizations. In addition some goals were mentioned just in the personal level not in the organizational. Especially the goals of quality and ‘good’ were spreading throughout the levels and the organizations. The qualitative material showed how the call for the good work was strongly set as an inner aim of the worker while the efficiency and profit-making seemed to have varying positions.

These results lead to consider how the values of professionalism, managerialism and consumerism (Freidson 2001) are realized in the practices. While the ideals of quality and good are spreading throughout the organizations and levels they give a possibility to act in many ways in the situated work. Organizations may take advantage of the inner call for the good work of the professionals but could the professionals also be able to crystallize the aim of the shared professionalism. The attachment to the humans in the work seemed to be crucial for the
workers. They described the meaning of the good work through the processes of the human beings.

**Breaking boundaries and a gendered professional project: The case of dental therapists in the UK.**

Ruth MCDONALD (University of Manchester, United Kingdom) | ruth.mcdonald@mbs.ac.uk
Lucy O’MALLEY (University of Manchester, United Kingdom) | lucy.omalley@manchester.ac.uk
Richard MACEY (University of Manchester, United Kingdom) | richard.macey@manchester.ac.uk
Katie MCKENZIE (University of Manchester, United Kingdom) | katie.mckenzie@student.manchester.ac.uk
Harry HILL (University of Manchester, United Kingdom) | harry.hill@manchester.ac.uk
Stephen BIRCH (University of Manchester, United Kingdom) | birch@univmail.cis.mcmaster.ca
Martin TICKLE (University of Manchester, United Kingdom) | martin.tickle@manchester.ac.uk
Paul BROCKLEHURST (University of Manchester, United Kingdom) | paul.brocklehurst@manchester.ac.uk

The fledgling professional project of dental therapists (DTs) in the UK is proceeding with difficulty. Patients can only access DTs via a dentist, who acts as a gatekeeper and DTs are based in premises owned by dentists. Drawing on interviews with DTs, dentists and patients we describe how some dentists defend their boundaries, often exploiting the gendered nature of the DT profession. The absence of financial incentives also presents a potential barrier to acceptance of DTs, as does the existence of 2 competing DT professional bodies. Amongst DTs, the lack of opportunity for and experience of operating across the full scope of practice means that the appetite to do so is variable. At the same time, many patients are appreciative of DTs and not all dentists are hostile. Indeed some have actively recruited DTs and are encouraging them to operate across their full scope of practice. Support for DTs is to some extent, a means of displaying one’s credentials as an innovator and an enlightened professional. Positive personal experience of working with DTs also influences dentists’ attitudes, as does a concern for patients. The latter may indicate altruistic motives, but self-interest is also involved since many patients are also payers. Our findings demonstrate that conceptualising the situation as yet another struggle for social closure, with a powerful professional group defending its territory is too simplistic. The need to pay greater attention to complexity is discussed.

**New accountabilities in professional work: Navigating towards a new value horizon in occupational healthcare services**

Inka Maria KOSKELA (Finnish Institute of Occupational Health, Finland) | inka.koskela@ttl.fi
Lea HENRIKSSON (Finnish Institute of Occupational Health, Finland) | lea.henriksson@ttl.fi
Katriina TAPANILA (University of Tampere, Finland) | katriina.tapanila@uta.fi

In the current context of the Finnish competition state, the occupational healthcare service is facing new challenges and demands for professional work and value prospects. Pushed by the economic reasoning, organizational aims and mission statements call for high quality services and increasing profitability. Consequently, this new value horizon embedded in the rationality of efficiency is reconfiguring professional work and transforming its accountabilities. At the same time, however, national policy acts and initiatives are redefining the jurisdictions of occupational health care professionals to reorder the customer services and expand the collaborative action networks. The paper draws on qualitative data, including policy documents, professional journals and interviews and applies professional accountability as an analytical notion, to
explore the emergent transformations of accountabilities, professional work and ethos from the perspective of occupational health nurses.

The results show the multifaceted nature of accountabilities in professional work and emerging tensions and contradictions between diverse professional accountabilities and rationalities embedded in the recent policy context. On the one hand, occupational health professionals are striving for professional accountability while producing comprehensive, high-quality services in collaboration with the customer company and its individual clients enhancing mutual trust, loyalty and collaborative partnership. Moreover, these professionals are encouraged to transform this confidence, collaboration and partnership into productive and profitable outcomes within their own organizations. At the service system level, policy transformations are opening up an unexplored value horizon with standards and outlooks for being accomplished to serve both the public and private interests and needs.

The Professionals in Power. Doctors, Lawyers or Celebrities?
Agnieszka JASIEWICZ-BETKIEWICZ (University of Warsaw, Poland) | ajasiew@is.uw.edu.pl

In the case of a young democracy, like the Polish one, the process of political professionalization is crucial for the system’s consolidation. One of the fundamental questions about the way democratic collegial bodies work concerns the mechanisms of promotion to posts that are endowed with the power of decision making. This is true not only on the national, but also on regional and municipal levels. The latter will be the subject of this study.

The matter of political professionalization has been a significant theme in the social sciences ever since the times of Max Weber. If we look at professionalization as a characteristic of an individual, we can put it on a continuum from amateur to professional politician (Steyvers Verhelst, 2012). Amateurs get involved in politics to solve a specific problem; their involvement is based on their previous life experience. They are fulfilling the mandate of a deputy or councilor in their spare time and are not seeking promotion to higher levels of politics. Professionals are typically involved in the functioning of a political party on both the organizational and programmatic level, with a desire to forward their future political career. In the case of professionals, it is obvious that their main assets are associated with party membership. More perplexing is the question of who are the political amateurs (members of other professions such as doctors, lawyers, and local celebrities, such as artists and athletes), and what are their competitive advantages. With that comes the question: To what extent do their political careers and strategies differ from patterns prevailing among other metropolitan councilors?

The aim of this paper is to identify the main factors that influence the possibility of taking a key position in City Councils in Poland and to describe the different types of professionalization that we can observe there.

RN19S03 - Inequalities in Social Work and Workers in a Global Perspective

Trust in physicians in 22 OECD countries
Arttu SAARINEN (University of Turku, Finland) | aosaar@utu.fi
Pekka RÄSÄNEN (University of Turku, Finland) | pekras@utu.fi
Antti KOUVO (University of Turku, Finland) | ansako@utu.fi
The purpose of this comparative study is to analyze citizens’ trust in physicians in different OECD-countries. In the paper, we argue that patients’ trust in physicians is one of the most important prerequisites of the modern health care. In other words, if you do not trust your physician you might not listen to his/her advice on your treatment. We assume that the higher general trust in physicians increases satisfaction with care and willingness to follow physicians’ recommendations. In addition, we assume that more particularized trust in physicians’ medical skills associates with their use of health care services and various socio-demographic factors. However, the key focus in the analysis is in the macro-level variation among OECD countries. We assume that health care system can influence in trust by two different ways, first by institutional guarantees and second, by the availability of good quality care. Our data are derived from the International Social Survey Program (ISSP) from 2011-2012. From each 22 country selected in the analysis there are 1,000-1,800 respondents. Our analyses are based on descriptive statistics and xtlogit multilevel models. The findings demonstrate the importance of both individual-level socio-economic determinants and macro-level characteristics of the society (eg. income inequality and physician density) on the general trust in doctors. The variation of the particularized trust in the medical skills of the doctors, however, is explained mainly by the individual level determinants. The suggestions for future research and policy implications are discussed.

Improved Training Methods for Social Workers in Russia
Svetlana Sergeevna NOVIKOVA (RGSY, Russian Federation) | s_novikova60@mail.ru

Integration of education, science and practical social tasks required the modernization of the social sectors. To do this, in the process of teaching not only should practice social work, but students must develop the methodology and to research on pressing social issues. Thus, firstly, to understand the needs of students knowledge for informed decision-making in the process of practical activities; secondly, is the motivation of acquiring skills to assess its practices on the basis of professional standards.

Students and social workers often dismissive, at times hostile to research. Students become familiar with the types and methods of social sciences research. Unfortunately, many students-future social workers, show resistance to the training course. To overcome this resistance in our country in the curriculum areas of training included a course “methods of research in social work”. Some students simply doubted their capabilities and abilities to deal with count data. Another portion of the students are not aware of the importance and need for this subject, because it does not understand how this is useful to him later on in his career. And only a small portion of students anticipate the importance of getting research knowledge, the need for their use in future practice.

Sequential activities, using scientific methods enables social workers to explain not only the nature and effectiveness of their actions, but also to identify problems encountered in the decision-making process, which ultimately increases the ability of the social workers to improve practice.

Involvement of service users – implications for professionals
Tone ALM ANDREASSEN (Oslo and Akershus University College of Applied Science, Norway) | tone.almandreassen@hioa.no

Service user involvement is increasingly prominent in European health and welfare services and takes place in a variety of organizational forms and relationships outside or beyond the individual encounters between the professionals and their clients or patients. Consultative boards and advisory councils of service users are established. Service users occupy positions
as teachers in patient education and self-management training. Peer support and lay-led training complement educative work of professionals. Professional development programs are performed in collaboration with professionals and service users. Service user employment are taking place in care services and research projects. In post-modern times the “expertise of experience” is elevated, at the expense of professional knowledge?

This paper investigates how these various organizational forms relate to the work of professionals and how the professionals are positioned through or within new involvement relationships. While individual encounters with professionals place the latter as experts with the task of diagnosing and/or remedying the problems of the service user, the various forms of service user involvement add new roles to the professionals’ repertoires. The aim of the paper is to systematize the features of these new roles as they are constructed through different organizational designs of service user involvement. The paper is based on previous research on service user involvement, from Norway as well as other European countries.

Measuring Social Work - increased expectations on measurements, key indicators and national comparisons within the Swedish Social Services
Teres HJÄRPE (Lund university, Sweden) | teres.hjarpe@soch.lu.se

Current endeavours of influential Swedish authorities (such as the Ministry of Health and Social Affairs and the Swedish Association of Local Authorities and Regions) to support “evidence based practice” and “good quality” within the Social Services have one distinguished feature: the growing reliance on figures. Besides the general idea that evidence based practice can be achieved through systematic learning, monitoring and documentation, measurements, indicators and national comparisons are believed to solve the challenges facing the Social Services. Among other initiatives from the authorities, national statistical databases are being built up and big scale teaching programs on “measuring methods” are offered to professionals and managers within the Social Services.

My field studies of a management team participating in such a program showed a tension between the general confidence in figures on the one hand, and reluctance and confusions when applied to practice on the other. Repeated mantras of the program are: “To know is to measure” or “When other solutions fail, the measurements remain”. However, at a practical level, the management team struggled to find satisfactory measures, to avoid misunderstandings and manipulations of numbers and with other consequences following "figure based" governance. Based on those observations I want to discuss the possibilities and limitations of "the measurement" as a tool for professional social workers and its potential to describe the reality of social work and social problems.

RN19S04 - Academic Profession in a Global Context

Professions in Incentive Society: The Legacy of the 1990s in the Swedish Academic profession
Ola AGEVALL (Linnaeus University, Sweden) | ola.agevall@lnu.se
Gunnar OLOFSSON (Linnaeus University, Sweden) | gunnar.olofsson@lnu.se

The early 1990s are marked by two types of important events on a global scale. First, these were years of economic recession, accompanied by rising unemployment, the widespread ascendance of new forms and techniques of governance, and politically enforced restrictions on public spending. Second, the early 1990s made knowledge society a common trope, and the
global university enrolment ratio rose steeply. The two changes are interlinked – expansion of higher education bolstered youth unemployment, a knowledge economy was held up as a model for western societies – and both impact the system of professions. This paper examines how the combination of recession and university expansion was accommodated in one specific locale in the system of professions, the case of Swedish university teachers. The academic profession was subjected to the same changes in the forms and techniques of governance as other Swedish professions. But whereas most professions encountered novel forms of steering under conditions of scarcity, the higher education sector was reformed during a period of a sector-specific abundance. Two resource-shocks hit the system. One derived from an increased flow of research funding, the other from the rapidly increasing number of students. We argue that this timing and modality in introducing new forms of governance in the Swedish universities (1) postponed the perception of adverse effects on the profession, (2) aligned with, accentuated and altered the structure of an internally differentiated but formally unified university system, (3) created specific groups of beneficiaries at different poles of the system – and that, thereby, (4) an incentive-based institutional framework was worked into the tissue of the professional body, meeting little resistance.

Vocationalism or social reproduction? Recent evolution of selectivity of fields of study in Romanian universities

Adrian HATOS (University of Oradea, Romania) | adrian@hatos.ro
Pop ANDREA (University of Oradea, Romania) | andrea.suta@gmail.com

Researchers into higher education give a peculiar attention to the variables that correlate with the choice for a specific field of study or the other. According to the Effectively Maintained Inequality Model when ability and differentiation of tertiary education are controlled the social and economic rewards anticipated from a specific area are expected to determine the demand for it, their subsequent selectivity, especially if the labor markets for the specific profession are controlled by powerful groups. Consequently, the evolution of demand for certain higher education qualification can be understood as an indicator of the perception of it’s future economic and status prizes. In our presentation we describe the results of investigating the evolution of demand and selectivity of fields of study in Romanian universities during the last 5 years in an attempt to depict the evolution of representation of rewards associated with specific fields of studies as well as the impact of a stratified higher education system has via the different selectivity indicators across the tiers of Romanian universities.

Differences in academics perceptions under the same global pressures: The Portuguese and Finnish cases

Sara Margarida DIOGO (University of Aveiro, Portugal; CIPES (Centre for Research in Higher Education Policies), Portugal; University of Jyväskylä, Finland) | sara.diogo@ua.pt
Teresa CARVALHO (University of Aveiro, Portugal; CIPES (Centre for Research in Higher Education Policies), Portugal) | teresa.carvalho@ua.pt

In the last decades, the pace of social, economic and cultural change has accelerated at an unprecedented rhythm, mostly due to globalisation. With the development of new technologies, ideas travel the world instantly causing changes in the way and locals where knowledge is produced and disseminated. Concurrently, governance and management have been modernised, accompanying reforms in public administration at the domestic level leading to
some convergence of practices and policies in public and private organisations and their professionals. Although Portugal and Finland differ significantly; both countries have recently undertaken similar higher education (HE) legislative reforms (Law 62/2007 in Portugal and the Yliopistolaki 558/2009 in Finland) aiming at changing institutional governance structures, management and decision-making practices. This article analyses the perceptions of (some) Portuguese and Finnish academics on the impact of these reforms in their HE systems and institutions. Concurrently, the paper sheds light on the role of this group of professionals in the process of institutional change and on changes they perceive as have been happening in their professionalism.

Using institutionalism and professionalism it is aimed to portray a description of the dynamics and relationship of power, academics’ participation, institutionalisation and professionalism. Findings rely on legal documents and on the voices of practitioners (in total 61 semi-structured interviews were conducted in both countries). It is argued that managerialism, also disseminated by international organisations' agendas, has pervaded academics’ discourse while simultaneously (and curiously), still triggers mixed feelings towards such developments. We wonder if is possible to observe a movement from an academic capitalism (Slaughter and Leslie 1997) setting to a more academic limbo environment (Siekkinen 2014).

**Academic Career through Informal Communication Networks: A Grounded Theory Approach**

**Constantin Florin DOMUNCO (Stefan cel Mare University from Suceava, Romania) | fdomunco@usv.ro**

Academic career is often perceived as a career in which the principle of meritocracy seems to be the most widely used. However, social reality reveals that also in this domain saying that "not what you know but who you know" is sometimes true (Di Leo, 2003; Pifer & Baker, 2013). This perspective made me focus on the way in which informal communication networks can facilitate or stop the development of academic careers.

In investigating the role of the informal communication networks, I use the constructivist grounded theory approach (Charmaz, 2006). In-depth interviews with academics from three different scientific fields (engineering sciences, philology and economics) allowed the emergence of a theory of the role that informal communication networks play in academic career.

The results of research show that informal networks of communication initiated and developed by university actors facilitate the development of academic career on two dimensions: Professional Becoming and Professional Obtaining. Thus, I identified six ways of academic career development: Becoming – Obtaining, Becoming → Obtaining, Becoming & Obtaining, Obtaining - Becoming, Becoming → Obtaining, Obtaining & Becoming. The research reveals that at the individual level, these ways represents the effects of academics affiliation to their informal communication networks.

This perspective upon the role of informal communication networks following the two dimensions (Professional Becoming and Professional Obtaining) offers a new way to understand the university career evolution and provides arguments to integrate in professional development strategies an efficient management of interpersonal networks.

**RN19S05 - Professions in Transition Effects of Social and Economic Transformations**
Paradoxical Professionalism Processes of Human Resource Managers
Shani KUNA (Sapir Academic College, Israel) | shanik@mail.sapir.ac.il
Ronit NADIV (Sapir Academic College, Israel) | ronitn@mail.sapir.ac.il

The significance of human resource (HR) managers in organizations is unprecedented given the centrality of work in our society. HR managers are the organizational agents in charge of the recruitment, training, appraisal, compensation, welfare, health and safety of their employees, and are also responsible for labor relations within the organization. Nowadays, HR managers are required to develop their expertise and professionalism in order to remain relevant and significant as a professional group. Within the uncertain and dynamic environments within which organizations operate, HR managers currently confront multiple challenges such as the need for a diverse workforce, growing sensitivity to global trends and technological innovations.

A review of the literature on the professionalism of HR managers yields ambiguous findings. On the one hand, the practice of human resources management has evolved significantly in the last decade from an administrative role to a more strategy-oriented "business partner" whose professionalism is more widely acknowledged (Ulrich et al., 2012). On the other hand, it is still uncertain whether the professionalism of HR managers is indeed evolving fast enough and in directions suitable for the profound societal challenges this practice confronts. Based on in-depth interviews with senior HR managers, we offer an analysis of organizational and societal forces which simultaneously inhibit and encourage the professionalism of HR practitioners. Paradoxically, forces aimed at strengthening professionalism might yield opposite results. This hybrid picture portrays typical tensions faced by professional groups today (Evetts, 2011, 2013).

Beata Maria KOWALCZYK (University of Warsaw Poland; Université Paris 1 Panthéon Sorbonne) | b.kowalczyk@is.uw.edu.pl

This paper examines professional trajectories of Japanese musicians on the European market of classical music, namely in France and Poland to see whether a profession of classical musician can be conceived as transnational, to trace and reconstruct the process of becoming “transnational” musician or “transnational professional” (Wagner). To be more precise, I wish to analyze the process of adapting oneself as a professional trained and socialized in one cultural environment (here: Japanese one) to conditions, expectations and requirements existing towards this profession in a different milieu of classical music (here: French and Polish ones). On account of its universal language, which is largely based on musical notation as well as French and Italian terminology, we tend to imagine that this environment encourages equal international exchanges and is open to all musicians in spite of their national, cultural or personal characteristics be it nationality, education, language, value system, socially accepted behavioral patterns etc., provided that s/he has an excellent command of the musical instrument (technique, expression, interpretation or a sense of music etc.). This representation is often accompanied by an essentialist myth of a talented cosmopolitan artist (Lehman, Ellias), who due to an individual system of education escapes standard socialization of his/her compatriots, who thus is apt to freely cross boundaries between countries, world arts (as defined by Becker) or artistic labor markets, since it is the universal genius that is at the core of his/her profession.

To verify whether this cliché reflects reality I have carried out around 30 semi-structured interviews with Japanese musicians, music teachers, composers, who currently reside and continue their professional career in Poland or in France, as well as with those who being unable to carry out their profession in Europe, have come back to Japan. This material was
supplemented with statistical data (Japanese musicians in European orchestras, Japanese winners in various music competitions etc.) and participant observations during rehearsals and international musical projects, concerts as well as other performances or piano lessons. My aim was to reconstruct the dynamics of the profession-(re)making process in the artistic milieu of classical musicians. I was asking myself whether all musicians have equal opportunities to create their professional path in the European world of classical music regardless of his/her nationality, whether a good musical technique and proper understanding of the musical language are sufficient conditions to become a competitive artist. What are the objective (relatively independent from individual decisions, such as education system, labor market, immigration law etc.) and subjective (resulting from the person’s individual choices), factors in biographies of Japanese musicians, which influence their professional trajectories? Ultimately, what does it tell us about the rapid progress of globalization and universalization at least in the domain of the world of classical music?

In the following analysis I stress the interactionist aspect of profession (Strauss, Hughes, Becker), which in case of my respondents, means always a cooperation with other people in a Beckerian art world, that is a sphere founded on patterns of collective activities or conventions. Every group of musicians, who work together, elaborates its own original assortment of conventions, which are culturally biased. The cultural context (composed of such elements as system of education, socialization to the role of Japanese citizen, socialization to the profession of classical musician, but also gendered socialization to certain professions, the system of interpersonal relations etc.) is important as a constant variable, whereby socio-professional relations in the artistic milieu are affected. The Japanese migrating to or circulating around Europe are already formed as musicians and as social actors when leaving Japan. If they wish to perform their profession outside the Japanese environment, they will have to adopt conventions produced by people from that environment to take on the roles of the others to be able to co-work with them. In other words, they will need to redefine their idea of being a musician and learn anew how to carry out their profession in a culturally different musical milieu. For many of them this task will overcome their adaptive skills and thus will force them to return to Japan.

In my presentation I shall argue that a good musical technique and a proper understanding of musical language are insufficient conditions to be a professional musician, since there are various objective obstacles (labor and migration law, network of relations, language and cultural barriers, conditions on the local labor market etc.), which hinder the professional development in the first place. These are followed by private decisions (subjective aspects of career following Hughesian distinction) related to family issues, cultural distance, inability to adapt oneself to a new environment, etc. My findings actually undermine the conviction about classical musicians, who can freely carry out their profession, wherever they want to.

Furthermore, I shall also try to show that an efficient network of interpersonal relations of good quality (with teachers, entrepreneurs, musicians, institutions etc.) is an important and determinant factor in achieving professional success on the scene of classical music. One good encounter with an influential professor for instance, who can introduce a musician to a local orchestra, give this musician an opportunity to tie relations (a phenomenon described by Izabela Wagner as career coupling), which will bring him/her job and hence enable him/her to continue a professional path outside Japan. If all these encounters constitute crucial moments in one’s professional trajectory, it is because people raise the aforementioned objective barriers and only people can help to overcome these barriers. Contrary to the saying that talent opens up all doors, the more because we are living in a globalized reality in terms of a border-free movement of persons, the world of art is very much inclusive, as Howard Becker claimed, in a sense that it privileges only those, who either have already found their place inside its structure and keep good relations with a certain group of people, or who have well developed adaptive skills and
can easily in short time redefine their way of being musicians to match with the new environment.

**Art appraisers: establishing profession on a developing art market**  
Natalia DANIKLOVA (NRU HSE, Moscow, Russian Federation) | shadaniq@gmail.com

In institutionally developed markets art objects are reliable, trustworthy investment instruments and assets. Therefore, art markets are prone to strict institutional regulations. Moreover, price-forming factors for the art pieces are an object of scientific concern for many scholars. However, even among American and European scholars art prices get far more attention than professionals whose opinions contribute to their shaping. Art market in Russia is quite young and still developing in terms of institutionalization and professionalization; historically, profession of art appraiser had formerly ‘inhabited’ noncommercial milieus before it started being transformed (and at the same time, institutionalized) in market conditions.

The main research question of the project is if art appraiser in Russia could now be called a profession, as Eliot Freidson understands it. In order to find it out expert interviews have been collected to check a list of criteria concerned developed regulative institutions, professional community, professional culture, professional self-identification inter alia. It is already seen that the Russian legislation includes ultimately all possible criteria of profession as an ideal type related to professional autonomy, responsibility, professional community etc. Still profession is not only what is written on the paper. Logically the next step of the research is to explore how the established legal system interacts with actual professional practices.

**Immigrant drive – a resource in the labour market for professions?**  
Bente ABRAHAMSEN (Oslo and Akershus university college of applied sciences, Norway) | bente.abrahamsen@hioa.no

The study investigates how ethnic minority professionals in Norway navigate occupational opportunities after graduation from professional bachelor programmes. Professionals’ career ambitions and career development are investigated. The study adopts a comparative approach and includes professionals of Asian origin and western minorities as well as majority professionals. The findings show that ethnic minorities of Asian origin have higher career ambitions than majority professionals, but their career development are not correspondingly high. The study identifies ethnicity both as a resource and as an obstacle in professionals’ career. Immigrant drive as a resource appears particularly strong in the development of career ambitions and in the effort to pursue educational qualifications. On the other hand, labour market discrimination seem to curb the utility of immigrant drive in capitalizing on occupational opportunities.

**RN19S06 - Professional Transformations in Changing Welfare Systems**

**Transforming care professionalism in the Finnish welfare state**  
Helena Marjatta HIRVONEN (University of Jyväskylä, Finland) | helena.hirvonen@jyu.fi

The paper draws from my PhD study (Hirvonen 2014) that assessed professional transformation in the context of the post-expansive Finnish welfare state using semi-structured interviews
Austerity of public resources and rapid aging of population have forced welfare state to undergo a forceful reform. The paper suggests the reform transforms care as a professional practice. Paid care work has traditionally relied on professional practices that endorse proximity, emotional and corporeal work of care. Now, clients and managers have become more empowered in relation to health and social care professionals. The managerial techniques of the post-expansive welfare state endorse ‘accountability work’ that aim at standardization and improved transparency, measurability and comparability of care services. Professionals need to reassert their accountability through various audit techniques that are often put into practice with the help of ICT, promoting digital relocation of care.

Against this background, the paper suggests that endorsement of ‘accountability work’ transforms care as a professional practice by promoting disembodied professionalism that emphasizes practices of medical care and conventionally masculine characteristics of (health) professionalism, such as emotional distance and technical expertise that can be submitted to the managerial goal of standardization of care. Meanwhile, workers’ skills in culturally feminine, immeasurable practices of corporeal and emotion work become ‘non-professional’ activities. Endorsement of digital relocation and disembodied professionalism may have negative consequences for workers’ professional self-images and also for client-trust, as they tend to increase the physical distance between workers and service users.

Professionalism across the organisational divide - nursing a positive impression
Kathy HARTLEY (University of Salford, United Kingdom) | k.a.hartley@salford.ac.uk

Traditional or “pure professionalism” (Noordegraaf, 2007) is argued to have given way to a more hybrid form in recent years, as professional organisations in the public and private sector have become more managerially controlled and oriented (Brock, 2006; O’Reilly and Reed, 2010). By contrast, other types of organisation are argued to have co-opted aspects of the “pure professionalism,” such as self-discipline and service (Evetts, 2011), in attempt to exert more indirect control over the behaviour of a wide range of workers. Thus, the distinction between behavioural expectations in ‘professional organisations’ (such as hospitals, schools and professional service firms) and other organisations that are, arguably, entirely profit-oriented, may be blurring. Little is known, however, about professionals who cross such a divide: how they might be socialised, what professionalism might mean in the new context and whether any elements of the ‘original’ professional identity are maintained. Nurses are an interesting group in which to explore such questions. Internationally the profession has a relatively high turnover (Hales et al, 2012) with nurses exiting, amongst other things, for roles within the pharmaceutical and healthcare industries, where one might expect their background to be an asset. Initial findings from pilot telephone interviews with nurses working as sales representatives and regional managers within the healthcare industry, suggests that behaviour is largely cued informally, by the immediate line manager, with professionalism perceived to be display of a consistently ‘positive’ demeanour.

Doulas in Italy: a profession is arising
Pamela PASIAN (University of Padova, Italy) | pamela.pasian@gmail.com

The purpose of this paper is to analyze the emergence of the doula profession in Italy. Doulas represent a new occupational group that offers emotional and practical support to pregnant women and new mothers. One of doulas’ goals is to fill the gap of services needed by mothers and not provided by the public welfare system; services that were covered by the family network in the past.
Doulas are women with different education backgrounds and different occupations, who decide to follow a 9 weekends training to support other women. Despite the opposition of the professional group of midwives, whose activity is regulated by the State, doulas are growing, developing and obtaining acknowledgment from civil society.
According to the disposition of the Italian law num. 4/2013 about professions not regulated by the State, doulas and their professional associations have begun an institutional process to obtain a special kind of recognition by the State.
This contribution, which is part of my PhD research about the emergence of the doula profession, its practices and its organizational culture, shows the results of the analysis of 33 biographical interviews conducted with doulas, 13 biographical interviews with midwives and participant observation during trainings, seminars and workshops for doulas.
The analysis of doulas’ practices and activities and the way they are imposing their presence, in the public domain as well as in private spaces, are the main topics of this paper which validates Abbott's (2002) definition of profession.

Aged care nurses - the truly professional nurse?
Kjersti NESJE (Oslo and Akershus University College of applied sciences, Norway) | kjersti.nesje@hioa.no

Globally the world is expected to experience a shortage of nurses in the immediate future. The aging population being the most significant cause. The need for more nurses to work with and for older individuals will therefore increase. However, in many western countries, recruiting newly educated nurses to work in nursing homes is difficult. Working with older people is seen as less professionally demanding and associated with less status than working in somatic hospitals. Some view this lack of status as a paradox as the overall aim of aged care institution pertain to the core professional aims and goals of the nursing profession, namely "caring". Comparably, in hospitals the overall aim of cure "belongs" to the medical profession. Being able to execute ones core professional tasks and not be subordinate to another profession should, in a professionalization perspective, be attractive for nurses. Most of the studies investigating nursing career field status and preferences have been conducted among nursing students, but how are registered nurses attitudes to factors associated with professionalization? In the present study registered nurses working in hospitals are compared with registered nurses working in aged care institutions. A survey design is utilized. In short, the result show that nurses working in aged care institutions are as committed to their profession as nurses working in hospitals, and they experience to be more autonomous at work. The results are discussed.
RN19S07 - Professionals Responses to New Expectations. Managerialism and Accountability

Accountability requirements for social work professionals and the quality of discretion.
Jorunn Theresia JESSEN (Oslo and Akershus University College of Applied Sciences, Norway) | Jorunn.Jessen@nova.hioa.no

Working in the frontline of public welfare services, social workers are entitled to make independent decisions when determining eligibility claims and follow up on clients, assessing needs and work abilities. Within the Norwegian labour and welfare administration, discretion is closely related to the implementation of activity goals and integrated services following the welfare reforms. At the same time, management and control by governmental regulations and the demands for more effective accountability are steadily increasing. This paper questions how to improve the quality of service and discretionary practice by imposing standard procedures, targets and outcomes. Accountability regulations may contrast or even contradict mechanisms of support and collegial control. The empirical data derive from a survey conducted among social service workers and local managers in the Norwegian labour and welfare administration in 2011. Their opinions vary according to age, professional belonging and working area. The results present different perspectives, pointing at ethical arguments for regarding the accountability mechanisms as both positive and negative.

The Technological Field and Engineering Professions after Neoliberalism: Still failed professions?
Glenn SJÖSTRAND (Linnaeus University, Sweden) | glenn.sjostrand@lnu.se

The engineering profession have been called “a failed profession” owing to its lack of social closure. Other reasons for being a failed profession, such as a weak correspondence between engineering education and the unclear definitions of task assignments and to the unsuccessful monopolization of the task assignments, has been furthered by the breakthrough of neoliberal measurements from the mid 1980s and onwards. In this paper it is argued that the engineering professions and their professionalization processes has been affected negatively by the circumscription, that has followed by neoliberalism – although perhaps less than other professions. The argument is partly based on a study (Brante, Johnsson, Olofsson & Svensson 2014) reporting a survey of the governance and control of professions, inquiring engineers attitudes towards the changed work content and specific engineering skills necessary for the labour market requirements and (high performance) task assignments at work. The preliminary results suggest that engineers’ perception of the task assignments have become more governed and circumscribed (in both economic, political and bureaucratic aspects) through time and that it has been of detriment to the work.

The impacts of increased managerialism on professionalism
Oddgeir OSLAND (Oslo and Akershus University College, Norway) | oddgeir.osland@hioa.no
Berit BRINGEDAL (LEFO - Institute for Studies of the Medical Profession. Norway) | berit.bringedal@legeforeningen.no
Andreea ALECU (Oslo and Akershus University College, Norway) | Andreea.Alecu@hioa.no

There has been an increased bureaucratization of core institutions in the public sector since the 1990’s due to policy changes and increased demands for accountability. In the sociology of
professions, it is traditionally distinguished between professionals and managers. It has also been argued that there is a trend towards hybridization (Noordegraaf 2007, 2013). At stake here is the relation between, one the one hand, professionalization of management and, on the other hand, increased managerial control from the professions traditionally predominant in core societal sectors.

In this paper, we explore these issues by examining the growth of managers and senior administrative staff and the educational background of those occupying these positions. We make a comparative analysis of two core societal sectors in Norway, health care and higher education institutions.

In the paper, we first make a systematic review of the existing literature. Secondly, based on register and administrative data, we study the changes in educational patterns and types of positions occupied by the core professionals and managers in these two sectors.

**Entreprenuerial Identity Patterns in Different Cultural Contexts: Estonia and the Czech Republic**

Tarmo TUISK (Tallinn University of Technology, Estonia) | Tarmo.Tuisk@ttu.ee  
Katri VAAKS (Institute of International Relations, Czech Republic) | Katri.Vaaks@gmail.com

The aim of the study was to assess entrepreneurial identity by focusing on the beliefs and values such as individualism, risk-taking, innovativeness, opportunity recognition and tolerance. Identity Structure Analysis (Weinreich 2003/2012) (ISA) as a metatheoretical framework has been applied to conceptualize identity and identification patterns related to one’s entrepreneurial intentions. While illustrating commonalities (indicating about shared dimensions existing among groups of different entrepreneurial experience and cross-culturally), the results also disclose specific identity processes peculiar for each group (indicating diversity). The results of this study - carried out among university students in Tallinn and Prague - demonstrate that dominant and increasing role of identifications with a significant other as ‘father’ strongly contributes to one’s personal entrepreneurial development while simultaneous distancing from ‘co-students’ seems inevitable. For Czech entrepreneurs their identifications with their ‘government’ and their own ‘ethno-cultural group’ (Czechs) are essential while Estonians express minimal positive evaluation of their government and their identification with ‘Estonians’ remains on the low level. The results are consistent with earlier studies and the application of ISA together with its methodological possibilities has been justified despite the small number participants (n=81) in this quasi-experimental exploratory study.

**RN19S08 - Changing Welfare Regimes and Changing Professional Work**

**Who’s story - digital storytelling in professional social work**

Elizabeth Martinell BARFOED (Lund university, Sweden) | elizabeth.martinell_barfoed@soch.lu.se

The storied form is a strong cultural figure when talking about personal social problems. Service users tell stories which the social worker transforms into professional storylines used to motivate interventions of different kinds (benefits, housing etc.) However, the classical Labovian storyline (abstract, orientation, complicating action, resolution evaluationen and coda) has in recent days been challenged by a new trend in social work, which might be called the standardized turn.
Standardized assessment instruments are introduced in social work as part of an outcome measurement trend in Swedish social work, on the initiative of the authorities. The ASI (Addiction Severity Index) is an example where tic-boxes are filled in by the social worker during a personal meeting with the service user. The "data" produced are ideally fed into a national database, the ASI-net. However, the meaning and use of the instrument has been questioned by the profession. In response to this critique, software engineers have produced a program where the computer becomes the story-teller, that transform the binary codes into a digital story. The presentation elaborates on this digital storyline, and discuss the consequences for the profession as well as the client. This new way of producing knowledge have implications for social work in a broader sense, which also will be elaborated upon.

Social Education: New Trends and Prospective Professions
Irina Nikolaevna TUPITSYNA (Moscow Institute for Advanced Professional Training in Social Sphere, Russian Federation) | tupitsynain@mail.ru

Social education in Russia is closely connected with socio-economic development of the RF, its educational reforms, as well as with global processes. Proportional combination of state, national, social and personal values in education is important for modern social education. There is an urgent need to develop a comprehensive program of training of social workers, which would provide a high quality education based on modern concepts of learning, principle of long-life social education from initial vocational training through college and university training to advanced training of specialists in the social sphere. Educators should take into account modern trends in the development of the Russian economy, characterized by a high rate of changes in social processes and a constant increase in the complexity of professional tasks. At present experts have put forward many interesting, noteworthy ideas about prospective industries and occupations for the next 15-20 years, including social sphere. This can be used for training future specialists for the Russian society at all levels of professional education. Together with professional skills, future specialists in social sphere should acquire cross-industrial competencies that can help find work in different sectors of the economy, and universal professional competencies. Among the predictable prospective professions in social sphere we can mention the following:
Specialist in crowdsourcing of social problems
Moderator on communication with state authorities
Specialist in adaptation of migrants
Moderator of personal charitable programs
Social worker for rehabilitation of disabled people through the Internet
Mediator of social conflicts
Specialist in organizing public-private partnerships in social sector

Breaking and Rebuilding Boundaries Collaboration between Professionals and Volunteers in Care and Social Services
Marianne VAN BOCHOVE (Erasmus University, Rotterdam, The Netherlands) | vanbochove@bmg.eur.nl
Loes VERPLANKE (University of Amsterdam, The Netherlands) | l.verplanke@uva.nl
Evelien TONKENS (University for Humanistic Studies, Utrecht, The Netherlands) | e.tonkens@uvh.nl

Current policies of the Dutch welfare state have important consequences for the relationships between professionals and volunteers. Welfare states increasingly expect their citizens to take care of themselves and others, instead of turning to the government for professional support.
Particularly in care and social services, policy makers have high expectations of volunteers, who are supposed to assist paid workers or even to completely take over certain tasks and responsibilities. Such shifts from paid to unpaid labour challenge the boundaries between professionals and volunteers. Using the notion of ‘boundary work’, we investigate in this paper how professionals and volunteers maintain, break and rebuild the boundaries between them, and why they do so.

Based on interviews and observations in their everyday routines, we show that both professionals and volunteers often prefer the distance between them to be small, since large differences in skills and authority cause problems for the quality of services. However, when the boundaries between them are perceived as too indistinct, professionals and volunteers re-emphasise their differences, based on what they think a ‘real’ professional or volunteer is. While scholars usually stress its tactical and strategic nature, our research pays more attention to how the actors involved deal with each other’s presence on a daily basis and in their everyday routines. This makes it possible to not only detect intended and explicit types of boundary work, but also more subtle types, which can be found in the ways professionals and volunteers talk about and with the ‘other’.

The governmentality in Social Work. Social pedagogy as a technique of power in early childhood intervention

Wolfgang WALTER (University of Applied Sciences, Vorarlberg, Austria) | wolfgang.walter@fhv.at

Analyses of the interconnections of power, professions and inequality tended for a long time to use an asymmetrical concept of “power over”. As many professions as e.g. medicine or jurisprudence were formed with the help of and through institutions of the state and received their exclusive responsibility for a selected area of matters (e.g. health/sickness, justice) via the law, the picture drawn by notion of experts having “power over” laypersons earned a lot of plausibility. Also the historical power struggles of professionalization to gain monopolistic competence supported this view.

In this article I will work out a conceptual framework for the study of certain aspects of Social Work as a profession by turning the two above mentioned basic tenets around. First, I will use the Foucauldian approach to governmentality to analyse the “power to” generated in Social Work. Second, I will focus not on the historical establishing of the profession but its functioning as a part of a knowledge-based power infrastructure.

The central question of the paper therefore is how Social Work constitutes a relatively stable form of domination of experts on clients by using broadly designed techniques of normalizing and disciplining as well of a micropolitical strategies in everyday situations. By way of a case study, systems and approaches to early intervention services in child welfare will be reviewed. Thus, it is possible to differentiate three strategies to constitute a stable power relation: the medicalized justification of these interventions, the panopticon-like monitoring of risks, and the pedagogical impact by experts to internalize perspectives and behaviors in the clients which comply with the mandate of child welfare.

The use of pedagogical techniques is a striking feature of the early interventions as a whole, not only the last point. Medicalized views and performance standards for monitoring “vulnerable individuals” or “families at risk” have also be imposed on the participating professionals who thus become part of the knowledge based power infrastructure.

This analysis sheds light on a possible advancement of Mill’s concept of sociological imagination. In its core, it guides sociology to discern the connection of the individual and the broader society and in the consequence to a distancing effect to our everyday modes of perception. By applying governmentality studies to the functioning of (an area of) Social Work, social pedagogy is pictured as a set of methods and techniques that simultaneously constitute
unequal relationships between experts and laypersons and disguise the power structure by giving it an objective appearance.

Professionalism and Entrepreneurialism – Discrepancies and Continuities in Research
Anne KOVALAINEN (University of Turku, Finland) | anne.kovalainen@utu.fi

This paper takes up and brings together connections, linkages and differences between professionalism and entrepreneurialism. The paper addresses the two separate fields that are aligned in some theoretical studies but less so in empirical research. There are several aspects through which professionalism and entrepreneurialism can be valorized and related to each other. Research on professions and on entrepreneurship will be explored for the building-up of further theoretical and empirical research linkages and programmes. Intersectionality, work arrangements and aspects of power, capitalism, new economy and markets are helpful in establishing differences and linkages between the two fields. The paper looks for assemblages and differences between the two conceptual fields in the modern post-Fordist world of work. The paper ends with notions of blurring boundaries, possible interconnections and the future shaping of the research field common for professional and entrepreneurial studies.

RN19S09 - New Governance Models and Differences in Professional Values and Attitudes

Dentistry in the tension between professional and economic values
Karin BERG (University of Gothenburg, Sweden) | Karin.Berg@socav.gu.se
Ylva ULFSDOTTER ERIKSSON (University of Gothenburg, Sweden) |
Ylva.Ulfsdotter_Eriksson@sociology.gu.se

Dental care is, in contrast to medical care, more costly for the individual care seekers who have to bear a much larger part. In Sweden, a national oral health insurance was launched in the ‘70s, in order to remedy inequalities. Despite improved dental health for some, differences remains and socio-economically disadvantaged groups still have poorer dental health, and visit the dentist less often.

In 2007 a new payment system for patients were introduced within Public Dental Service in order to help patients to more predictable costs. The preventative dental care is an assurance where the patient pays a fixed, monthly fee. The insurance is “sold” to the patient by dentists or dental hygienists who also make a risk assessment and draw up a care plan. Previous studies have shown that the new insurance system created a “moral dilemma” for the professions, in for instance, the contradiction between professional values and economy and profitability. In a way, the new insurance policy turned the professionals into sales persons since they were to ones to introduce and perhaps persuade the client to sign in.

Based on a qualitative interview study with 15 dentists and dental hygienists, we describe how they relate to dental insurance seven years after the introduction. We describe how they work with sales, and whether they perceive that it is a tool that improves equality in dental health. The insurance, with enhanced pressure on the professions to act in a more economically competitive way, with demands on sales figures and outcomes, is an expression of the management ideas which falls within NPM. Theoretically we draw on these changes and analyses how it has affected the dental professions.
Reinforcing ‘medical technocracies’: hybrid professionals and mixed forms of governance in health care
Helena SERRA (Faculty of Social Sciences and Humanities of the New University of Lisbon, Portugal) | helena.serra@fcsh.unl.pt

Across European countries, potential challenges in health professions indicate new emergent configurations of hybrid professionals and mixed forms of governance in health care. The relationship between professionalism and managerialism indicate new emergent configurations of hybrid professionals and mixed forms of governance in health care. Concerning the Portuguese case, several studies show a particular situation due to the power the medical profession stills to exert over health regulation (Serra, 2010; Carvalho, 2012; Correia, 2012; Kuhlmann, et al. 2012). In Portugal, doctor’s influence on state regulation seems to counter the dynamics that have been described in sociology of professions and organisations, which point out the increasing criticism of medical autonomy, the growing managerial control over medical authority and the state regulation of medical procedures.

The control of technologies is an example of the intersection between state and medical regulation. Serra (2010) had already defined the notion of ‘medical technocracies’ to described different systems of governance based on the physician’s technical skills in a given medical area of expert knowledge. The domination of a technology is important insofar as it boosts the self-regulation mechanisms of the profession whilst also allowing the organisation to attract investment that brings greater financial sustainability. From the notion of ‘medical technocracies’ the aim of this paper is to look to key question of technological dependence and the control of management instruments by medical profession, which allows medical procedures to meet the demands of the 3Es – economy, effectiveness and efficiency (Rhodes, 1994) and, simultaneously, boost the self-regulated professional power.

Drivers of Migration and Mobility of Russian Healthcare Professionals to Finland: A Relational Approach
Driss HABTI (University of Eastern Finland, Finland) | driss.habti@uef.fi

International mobility of health professionals has markedly increased, with emergence of new complex migration and mobility trends and patterns in many parts of the world (Iredale 2012). In Finland, a large number of these professionals are from Russia and Estonia as their number almost doubled between 2000 and 2007, and increased nearly to 7 % for total rate of physicians (Kuusio et al. 2011, 166; FMA 2014). In-depth and comprehensive research on the migration and mobility processes and patterns of Russian physicians has remained relatively under-theorised and under-researched. This research focus is driven by the assumption that the processes dynamics that sustain international migration have been explained through a narrow focus on origin and destination and push-pull factors approach. Increasingly, researchers recognize the importance of multi-faceted and relational aspects and conditions, the institutional frameworks and interactions, individual agency and everyday practices in their analysis of migration patterns and processes. I argue that structural and agentic processes are always and continually interrelated through migration processes and patterns and that the goal is to uncover migration drivers. Using Bourdieu’s theoretical concepts and relational approach, this research tests empirically the relevance of this multi-level approach to account for the drivers of these professionals’ migration and mobility. This relational approach, using biographical in-depth semi-structured interview data, aim to uncover multi-faceted factors that explain their migration processes and patterns, and advance theoretical and evidence-based understanding of these complex relationships between factors that these physicians create, shape and reproduce in their migration and mobility to Finland.
Cancer coordinators in Norway- bridging boundaries to create interdisciplinary professional networks in the field of cancer care
Nataskja-Elena LIE (University College in Oslo and Akershus, Norway) | elena@hioa.no

Background: Increased patient knowledge, user involvement and the need for comprehensive treatment imply changes in roles of health professions in the field of cancer care. The requirement for coordinated services is bringing about further important challenges to the professionals, demanding for new ways of managing professional groups. Cancer coordinators (CC) in Norwegian municipalities were established to promote interdisciplinary cooperation between the stakeholders. Yet, little is known about the professional role of CC, as well the means through which they establish interdisciplinary professional networks remain unclear.

Objective: This study aims to investigate CC role in the network of stakeholders in cancer rehabilitation. It seeks explore draw-backs and merits of the pioneer profession, from the perspective of the main stakeholders involved.

Methods: This qualitative study embraces 20 semi-structured in-depth interviews with CC in Norway. Focus group- interviews are conducted with respectively 4-6 coordinators, cancer survivors, health professionals and municipal leaders. A phenomenological approach is applied, using thematic analysis (TA) as method for analysis.

Results: Findings suggest main facilitating features CC apply to establish interdisciplinary networks: information and knowledge dissemination on cancer services amongst professionals; facilitation of a common understanding of key terms; introduction of network meetings and the application of a common technological system to promote better communication between the involved professionals. Main challenge seems to be the diversity in the ways CC are established in municipalities, bringing about a lack of professional identity and respectively various challenges in the interaction with other health professionals.

RN19S10 - Legal Professions within Unequal Societies

French judicial professions and criminal justice : struggle and adjustments between professional and political dominance
Philip Andre MILBURN (University Rennes 2 France, France) | milburn@neuf.fr

The French criminal justice system gathers several professional actors with separate prerogatives and expertise, namely prosecutors, judges, probation agents and educational staff for minors. The paper analyses results from several research data concerned with the way criminal justice is implemented in various domains. It stresses both the divergent conceptions according to their professional references and the convergent expertise as to the issues they are meeting in terms of punishment and probation. Yet they are facing a third party: public policies which are imposing devices that challenge professional expertise and options. Imprisonment, minors’ custodial facilities, probation measures imply choices in terms of targets, relational practices or the demands put on the beneficiaries. These options are taken in the confrontation between the unequal professional powers and expertise of magistrates (prosecutors and judges, with specific professional statuses) and probation and educational agents with a mandate from the latter but with some autonomy in practice. Out of the confrontation stems out adjusted devices and pracitces, which can be considered as cross-expertise. It remains within the directions of penal policies but decisions are founded on the principle of the independence of justice which does not always meet the intentions of political
ideals, as statistical data of measures and decisions reveal. Recent policies (since 2000) have tried to break through this professional congruity and to implement very precise devices to control practices. The actual devices and practice examined by our research surveys hence reflect this struggle between professional dominance, founded on ethical and technical references, and policies’ dominance.

Making Legal Professions in the (Semi)periphery. The Case of Poland.
Tomasz WARCZOK (Pedagogical University of Cracow, Poland) | tomaszwarczok@gmail.com
Hanna Olga DEBSKA (Pedagogical University of Cracow, Poland) | hannadebska86@gmail.com

The paper shows the process of legal professions’ formation in Poland from the fall of communism in 1989, until the present. The core theoretical framework of the analysis is Pierre Bourdieu’s field theory, applied in particular to semi-peripheral conditions. The authors claim that in (semi)peripheries, under the conditions of general weakness of the State as the ‘ordering’ meta-institution, particular social fields (i.e. scientific, legal, political, administrative) are poorly differentiated and overlapping – contrary to states of the world core. Because of this, agents are realising their practices in various contexts, combining resources from different fields. It is particularly visible in professional legal practices, where combining a purely scientific capital (professor of law) and professional capital (solicitor, barrister) is very common. These practices were already visible before 1989, but became most prominent under the conditions of (semi)peripheral capitalism, when the status of being an academic, together with the cultural and social capital connected to this position facilitated (and still does) the occupation of dominant positions in the local field of legal counsel with regards to a myriad of matters, especially the lucrative advisory services rendered to global corporations. The high status of cultural capital (and intellectuals) is in turn caused by an absence of local bourgeois, characteristic for the (semi)periphery.

The above presented situation alters the grounded sense of inter-professional conflicts, monopolisation processes, as well as the very concepts of ‘profession’ and ‘professionalization’. Instead of a narrow specialisation in a specific area, the (semi)peripheral conditions cause a constant game of multiple inter-strengthening capitals.

Conflicts between professionals in the field of restorative justice: a case study in Sao Paulo, Brazil
Juliana TONCHE (University of Sao Paulo, Brazil) | jutonche@gmail.com

In a context of high demand for access to justice in Brazil, restorative justice has grown among other alternative forms of conflict resolution. These initiatives related to restorative justice are being encouraged by judges in order to address a specific type of criminality. The main goal of these programs is to prevent cases of low offensive potential, committed by adolescents from public schools, to come to the Courts. This paper analyzes the reception of restorative justice in the state of São Paulo through a case study. I argue that these initiatives are inaugurating programs with unprecedented configurations mixing formal and informal, lay knowledge and expertise. Thus, the application of restorative justice in Brazil has created a new field for groups specialized in training future mediators, which indicates that we may be witnessing an ongoing process of professionalization. In addition, the importation of this agenda created tension and conflicts between legal professionals involved with the programs and their colleagues; jokes among them indicates that the professionals linked to the orthodoxy of the profession question whether there is expertise related to restorative justice. This ends up being confirmed by the judges who are applying this alternative model as they delegate cases considered less
prestigious to other people located lower on the professional hierarchy; I also argue that the negotiation of meanings, a key concept of interactionism is mobilized by agents in this field often as a strategically defense, sometimes as opposition, or to certify a successful discourse that they want to sustain.

**RN19S10 - Legal Professions within Unequal Societies**

**On Politicized Lawyering**  
Helena FLAM (University of Leipzig, Germany) | flam@sozio.uni-leipzig.de

For long "neutrality of professions" has been a main pillar of theorizing about professions in the sociology of professions. Some recent texts on lawyers and doctors show that the principle of neutrality may be professed by scientists but is often not practiced. At first the idea will be investigated that we deal with a "shift" from value-neutrality to politicized professional practices, using lawyers as an example. To explain the posited "shift" to value-laden professional practices among lawyers changes in the general employment structures and opportunities will be taken up. Thereafter the question will be raised whether we can really talk about a "shift" from neutral to politicized lawyering or should rather ask why the sociology of professions for long posited professions as neutral. Historical examples will be presented to reject a mere "shift" thesis. Time permitting, a German court case in which ca. 60 lawyers represent the surviving family members of 9 small businessmen with migrant background who were killed by the racist members of the National Socialist Underground between 2000 and 2006 will be briefly presented in order to argue that at least half of these lawyers are involved in the case following their understanding of what it means to do good (politicized) lawyering.

**RN19S11 - Unequal and Diversified Labour Markets. Professionals Training**

**Social boundaries of military profession and their unforeseen consequences**  
Olga NOWACZYK (University of Wroclaw, Poland) | olga.nowaczyk@uni.wroc.pl

Being a soldier is a special social role, it is also a profession, work, service or vocation. There has been discussion about whether the military service should be seen as more of a profession rather than an institution. Although the military service still retains institutional principles (patriotic values, historic traditions, etc.) it is becoming oriented to the principles of business and economics and can be fairly categorized as a profession. This can be explored in relating to other professions in the grouping of power and compensation. There are different ranks within the military, granting some people more power. Many young people look at the military for compensation benefits and the opportunity to attend college without enormous loans. In recent years, as a result of economic, institutional, social and cultural changing which take place in polish society, the soldiers work, especially those who serving on military missions abroad, was redefined. If we look at how the soldiers profession is constructing in various discourses (medial, political, etc.) and how these constructs are functioning in social life, we will see that there is no compatibility between them. They create a continuum describing the soldiers profession in a positive (hero), neutral (normal work and normal service) and negative light (wicked, murderers, mercenaries). Such radically different discourses are particularly interesting in the case of Polish, whose politics and society are rooted in a historical context and a kind of
mythology describes the military heroes fighting for independence. The international context of the soldiers profession is also important, particular those soldiers serving on military missions abroad. From the beginning of the XXI century, we can observe the intense (compatible with the neoliberal markets policy) development of the private military corporations which contribute to privatizing the soldiers work (including to what the soldier does, and what is involved of his profession, hence we can talk about privatizing the war or the war as a service). Thereby, a soldier trained by the state to defend its borders and society, becomes a contractor at a private military corporations, whose interests are often conflicted with the interests of the state and society. In the case of Polish soldiers, the decision to start working at a private military corporations is dictated by economic factors (high salaries) and professional (the possibility of further improve their skills and trainings other soldiers). This prompted me to ask themselves the following questions: 1) what are the social boundaries of profession of the polish soldiers serving on military missions abroad? 2) which contexts (social, economic, political, etc.,) determine their profession? 3) who or which groups deem these social boundaries of this specific profession? The described issues are part of the research which I carry out as part of my habilitation thesis. Its subject matter is related to, among others, the experiences of biographical Polish soldiers serving in the military missions in Iraq and Afghanistan.

Socializing sociologists: Representation of sociology and the sociologist in Flemish introductory textbooks.
Freek VAN DEYNZE (University of Ghent, Belgium) | freek.vandeynze@ugent.be

This article investigates how sociology and the role of the sociologist has been represented in a selection of introductory sociology textbooks used at Flemish universities from 1911 to 2014. More specifically, we relate the changing representation of sociology as a science, the role of values and objectivity, and the possible public role of sociologists and their knowledge to the wider social context. In doing so, this article contributes to the Public Sociology debate and the sociological study of our own discipline’s history.

Our research finds these themes, concerning matters of scientific status, objectivity, values and the public role of sociology, to be less prevalent in the first half of the twentieth century, whilst being subject to more varied interpretations. Sociology is seen more as a social philosophical reflection and taxonomy of society. The aforementioned themes become more uniform and widespread starting from the sixties. Sociology is construed as an objective, empirical science that can serve social policy and aid in resolving social problems. This shift in meaning occurs at a time of increased government demand for social scientific knowledge and mirrors the expansion and institutionalization of sociology as a scientific discipline and the accompanying professionalization of sociology as an occupation. Starting from the eighties, differing viewpoints on these matters are mentioned more often, including more social reformist and public intellectual roles and attention to the role of values and power in the production and utilization of sociological knowledge.

Social attitudes and status of women engineers in Russia in transition
Valeriy MANSUROV (Institute of Sociology of the Russian Academy of Sciences, Russian Federation) | mansurov@isras.ru
Olesya YURCHENKO (Institute of Sociology of the Russian Academy of Sciences, Russian Federation) | olesya@mail.ru

The dialogue around engineers has increased as concerns about the quality of engineering have been raised in the country. Privatisation resulted in the change in Russian engineers’ status. There are transformations in the common standards of practice, discipline, payment and
social attitudes. The engineering profession has acquired some possibility of self-regulation in the labour market. The scope of engineers' autonomy in the private sector has slightly increased.

Soviet industry had a lot of special features that set it apart from other advanced industrial countries. A much higher proportion of women engineers was one of the peculiarities. Workforce ‘feminisation’ became one of the most particular features of the Soviet industry and was connected in part with state politics – insofar as there was a drive towards equal rights for all. Women's interest in higher education in Engineering remains unchanged since the Soviet period. In terms of administrative position, most women have been rank-and-file engineers. The highest managerial posts are mostly preoccupied with men engineers. Many women engineers work on a part-time basis.

An analysis of women-engineers’ social status and their views on their current social standing have become one of the central issues in the ongoing project Russian Engineers: Formation and Development of the Profession. Semi-structured interviews have been undertaken with women engineers from the major organisations representing them. The research aims to investigate the background, work situation, and the attitudes and values of engineers in contemporary Russia.

“On the shoulders of giants”: Teachers' motivation and professional development through scientific training

Jose Antonio RODRÍGUEZ (University of Barcelona, Spain) | jarodriguez@ub.edu
Jose Luis CONDOM-BOSCH (University of Barcelona, Spain) | jlcbosch@ub.edu
Marta SOLER (University of Barcelona, Spain) | marta.soler@ub.edu
Ramon FLECHA (University of Barcelona, Spain) | ramon.flecha@ub.edu

Prior literature has analysed the motivations for professionals of education to engage in in-service training initiatives, focusing on issues such as satisfaction and perceived effectiveness. This study focuses on the analysis of the “Seminar on the shoulders of giants”. By adopting the aphorism popularized by Merton, this Seminar constitutes an experience of teacher's professional development that brings together 150 teachers who meet, one Saturday a month, out of their working hours, to discuss the most relevant scientific works in the field of social sciences and education. The study explores which are the components that have made possible the sustainability and growth of the seminar for more than four years. Information was gathered through a questionnaire, which was distributed to all participants. Preliminary results show that participants' motivation for the seminar is the result of both scientific rigor and the direct impact on the improvement of their professional practice. The seminar provided new expertise to participants through reading and debate of primary scientific knowledge. Participants were empowered with argumentation and they were able to observe a positive impact on their students’ outcomes. The seminar increased their perceived professional self-efficacy.

RN19S12 - Professions and Institutions

Education and Experience in Nursing: A Comparison Between Vocational School and University Graduates
Rana CAVUSOGLU (Hacettepe University, Turkey) | rana9.cavusoglu@gmail.com

Nursing has undergone transformations in terms of being a traditional activity to an institutionalized occupation in years. Nursing also has been influenced by social, political and
economy as well as by technological advances particularly in science during the transformation. It is possible to observe the similar way of transformations in Turkey equally with world at the same time. This study aims to examine the transformation of nursing from a traditional activity to a professional within Turkey’s context within at least two decades and evaluate in comparative manner across nurses in different ages. The evaluation will be basically on the basis of representing different family background, education, understandings images of nursing in society, approaches towards traditional and professional ways of nursing. Various educational levels and nursing titles might cause to apprehension of understanding of care and emotional labor in nursing in different forms. In this framework two group of nurses will be selected for in-depth interview. These will be experienced nurses with at least 20 years work experience and incipient nurses with at least 1 year work experience. The field research will be between the two nursing cohorts: The first group is experienced nurses who are educated in vocational nursing schools and fresh graduated nurses who are university graduated. The study is to examine two groups approaches towards nursing within the scope of experience and education and the possible effect on perception of both nurse cohorts towards emotional labour and care.

**Professionalism and Institutionalism – Looking at inequalities within professional groups and institutions**

Teresa CARVALHO (University of Aveiro and CIPES, Portugal) | teresa.carvalho@ua.pt

Along the last decades several social changes in society, which include the globalisation process, the state roles in society; the transformations in public organisations, the changes in working conditions and relations, among others, submit professional groups to singular challenges that may put in question their professionalization process and their professionalism. Different theoretical perspectives emerged to try to interpret the impact of these challenges over professional groups (Evetts, 2003, 2006; Freidson, 2001; Svensson, 2006; Whitty, 2001). At the same time, theoretical developments have also been developed to analyse the process of institutional change, taking the interaction with the boarder institutional field, and the actors' behaviour within organisations (Fligstein & Mc Adam’s, 2011; Whitley & Glaser, 2014).

This paper tries to use both professionalism and institutionalism to analyse and conceptualise internal changes in professional groups, taking the academic profession as a case study. Based on document analysis of national statistics and on interviews with academics the paper concludes that changes in professional groups can only be understood if taking into account the internal differences within the group and the power struggles within the institutional field.

**Contradictory institutional logics?**

Jens-Christian SMEBY (Oslo and Akershus University College of Applied Sciences, Norway) | Jens-Christian.Smeby@hioa.no

Professional competence composes theoretical as well as practical knowledge and most professional programmes composes a combination of education and training within a higher education institution and practical settings. Especially professional bachelor programmes tend to follow a concurrent model were coursework in a university or college are interchanged. Nevertheless, many students experience a gap between “theory” and “practice”. (Laursen 2015) and it is reported that students experience of coherence between the two learning arenas impacts their learning outcome (Smeby & Heggen 2014).

The aim of this paper is to explore whether lack of coherence between the two learning arenas primarily is due to different epistemological beliefs (Joram 2007) among college teachers and placement supervisors or mainly due to different organisational logics and lack of collaboration and coordination. Data are based on surveys among college teachers, placement supervisors
and student in social work. Preliminary results indicate that lack of coherence not is an epistemological issue. College teachers and placement supervisors emphasise the importance of various aspects of theoretical knowledge to the same extent and placement supervisors emphasise practical and social skills as well as ethical competence only a very little bit higher than college teachers. A significant proportion of college teachers and placement supervisors have limited knowledge about what students learn in the other learning arena, however. Moreover, particularly among college teachers there is a somewhat widespread critical attitude to the methods students learn during placement. Even though lack of trust and collaboration between college teachers and placement supervisors do not seem to be a dramatic problem, there seem to be important possibilities for improvement. In the conclusion, the practical implications of the results are discussed. An important question is whether lack of collaboration and coordination is a result of contradictory institutional logics and whether partnerships between educational institutions and employers is a way to overcome these challenges.

Professional career within and outside the profession (the case of young Russian lawyers)
Irina P. POPOVA (Institute of Sociology, RAS, Russian Federation) | irina_popova@list.ru

The paper considers the formation of professional careers types of the graduates with higher legal education in Russia. The differentiation of career patterns in legal profession depends on many social factors, including institutional conditions and individual attitudes. The social context of career patterns formation in Russia is associated with the "overproduction" of lawyers due to increased demand for legal education in post-soviet period. The system of legal education has been developing in response to the requirements of the market out of professionals' control. These development leads to the deterioration of the quality of vocational education and professional development and deformation of professional careers. The analysis focuses on the impact of training and employment institutions, as well as individual attitudes towards education and professional development. Particular attention is paid to the careers of the graduates with higher legal education, who abandoned their specialty, and educational potential to engage in professional careers in other fields of activity. Their decisions have been usually formed in the university during the academic legal practice. The analysis combines quantitative and qualitative strategies on the basis of the study "Structural features and motivational bases of social mobility of young Russian lawyers " (RHF 13-03-00049). The study was conducted in two stages: 1) semi-structured interviews (N=31). 2) survey based on formalized questionnaire with law school graduates obtained a law degree between 2000 and 2010 (n=414, 25 cities).

RN19S13 - Social Inequalities and Professions

Occupational Prestige in Turkey: Changing Occupational Structures and Socio-Economic Status
Lütfi SUNAR (Istanbul Universitesi, Turkey) | lsunar@istanbul.edu.tr
Yunus KAYA (University of North Carolina Wilmington, USA) | yunuskaya@gmail.com
Seran DEMIRAL (Istanbul Universitesi, Turkey) | serandemiral@gmail.com

Occupational structures and work life in Turkey, although with some delay, are in the process of transition to a post-industrial stage. Today occupations have had a central importance in contemporary sociology, especially in the studies on stratification and the Socio-economic
status scales. Such scales as EGP and CAMS IS, which are extensively used today, depend directly on measuring the occupational prestige. Thus, the structure of occupations and changes in their prestige is subject to ongoing debates. However in Turkey, occupations are not studied regarding this dimension. One of the reason for this is the fact that the occupational data Turkey was never properly collected. In this paper we aim at exploring the changing occupational life and prestige of occupations by using the data from the quantitative research we conducted with a nationally representative sample of 2500 persons all across Turkey in 2014. We utilized ISCO08 occupational classification that was adapted by Turkish Statistical Institute (TUIK) to develop a prestige scale. In the survey, participants were asked to grade an occupation from each of the 128 occupations at the third level of ISCO08 with a score ranging between 1 and 100. Then, by applying these scores to other occupations in the same occupational group, a full occupational prestige rank was created. After that, we compared the scores given by different SES groups. Thus in this paper, a systematic framework will be offered to analyze the occupational life and the factors that drive the occupational change in Turkey will be discussed.

Profession as a measure of social stratification
Marina KHOKHLOVA (IMEMO (Russian Academy of Sciences), Russian Federation) | marina_khokhlova@mail.ru

Profession can be regarded as something extremely important for 'building' the future in accordance with the demands of the markets and competition that need constant innovation. This results in professions acquiring new roles: they do not only safeguard professional values but also challenge the status-quo. However, the economic crisis aggravates the transformational crisis, and innovation stumbles upon those unprepared (who cannot or are not willing to adapt to the new situation). Professions always have to be relevant for different market economies. This may concern the role of professions not only in the functioning of the modern economy but also in solving the following social issues:
- dissatisfaction with social relations usually decreases when a person acquires a profession since in is the basic component of one's status and role in the social division of labor, and because of the salary - a gauge of quality of life;
- Professional occupation channels a person's efforts into work-related activities, which can decrease the ethnic and cultural tension if not eliminate it at all, and favor the development of professional skills (in multiethnic working teams). Professional occupation prevents discrimination (e.g. on ethnic grounds) because it helps people judge others by their merits. A successful career gives one a feeling of stability and prosperity, though different ethnic groups are usually on different levels of the social ladder.
- Professional occupation as an element of the social relations can reproduce inequality that is embedded in education in the form of tracking, regional differences, varying number of children in families, the approach of parents from different social groups to their children's education, a 'limited' language that children from less educated families speak and that keeps them from efficiently solving tasks.

Elites and professions
Trygve GULBRANDSEN (Institute for Social Research, Norway) | trygve.gulbrandsen@socialresearch.no

Sociology of elites and sociology of professions are two distinctly different fields of sociology. Admittedly, there are overlapping research interests as in studies of “elite professions”, for instance lawyers or medical doctors, or similarly studies of elite educations within law and medicine. Nonetheless scholars within these two fields are engaging themselves in different topics and research questions. In this paper I argue that particularly elite research and elite
theory can benefit from theories and empirical knowledge developed within the sociology of professions.

I will work out my argument theoretically by presenting three main areas within elite sociology and identifying some significant issues within these areas. Then I will discuss how studies of professions can help throw light on these issues, illustrated by empirical examples. The three areas within elite sociology I will focus upon are: (1) Elite circulation, (2) elite integration or cohesion, (3) elites and legitimacy.

(1) Elite circulation

Under this heading elite scholars have studied the changes in the composition of the holders of elite positions as to class, education or gender and the emergence of new elite positions. Elite scholars have often traced elite circulation to fundamental socioeconomic changes with political and cultural factors operating as important independent and intervening variables affecting the relationship between socioeconomic change and elite transformation. In this paper I will argue that significant cases of elite circulation have been embodied by particular professions, and in these cases the changes can be traced both to successful efforts on the part of the professions to obtain a collective uplift, or opposite, to inadequate actions to uphold elite status. As examples I will discuss the rise of auditors to the pinnacles of power within private business and how engineers lost ground to business economists as holders of top positions in private business.

(2) Elite integration or cohesion

Within elite research much attention has been devoted to the question of elite integration. Many scholars have argued that the establishment and upholding of a viable democracy depends in some important measure on the unity exhibited by the leading groups in society. Others have focused upon how elite cohesion can underpin the power of elites. In much of this research there has been a tendency to assume the presence of cohesion because elites have similar social origin, have kinship ties to each other or live in similar neighborhoods.

Empirical studies from western countries have, however, demonstrated that elites’ orientation and actions are only marginally related to their social background and their class status. Their attitudes towards significant political issues are first and foremost explained by their occupations and particular by the sector in which they practice their occupation. This fact indicates that in a modern society elites are mainly representatives of institutions and organizations which stand for different concerns and interests. Elite integration is generated through mutual accommodation, compromises and consensus between these institutionally based elite groups. Through socialization (and self-selection) the opinions of the top leaders are influenced by the ethos or culture prevailing in the particular institution or sector. Some of the main elite institutions in society are dominated by one particular profession. It is reasonable to believe then that the ethos of these institutions has taken an impression of the basic knowledge, outlook and norms of these professions. How different elite groups relate to each other and the possibility of elite integration is probably affected by the basic ethos of the individual institutions and of the professions dominating the institutions. Elite research has, however, paid very little attention to these characteristics of elites in a modern society.

In the processes of elite accommodation some elite groups may play a more significant role. In Norwegian history the civil service elite has played such a role. In the 19th century the members of this elite acted as creators of the basic institutions in the new nation. Today they adhere firmly to political impartiality and to virtues associated with the roles as “institutional memory”, “gyroscope of state” and “test, counter and check”. In these ways they have functioned as stewards of national unity and national elite compromises. The norms and virtues characterizing the civil service elite are to a large extent influenced by the values and culture of two professions - lawyers and social economists, which will be illustrated in the paper.

(3) Elite legitimacy
As holders of power positions elites are wary of the need to have their power accepted both by the citizens and other elite groups. Mosca, one of the “founders” of elite theory, suggested that elites justify their power and rule by theories and principles which are in turn based on beliefs or ethical systems which are accepted by those who are ruled. Edvard Shils maintained that elites are given legitimacy to the extent that they can guarantee political, social and cultural order. Today elites also legitimize themselves in reference to the constitutional and legal basis of their position and to their professional knowledge and “fiduciary responsibilities”. In the present 24 hour media society where top leaders both within politics and private business are continually scrutinized by mass media and expected to be answerable to the general public securing, elite legitimacy has become particularly precarious. In this paper I want to call attention to a new occupation (not yet a profession) which to a large extent has emerged in response to this situation - PR- and communication practitioners. A significant part of their job is to help elite persons to bolster their legitimacy. The practitioners of this occupation are, however, caught in a dilemma between ideals of managing communication between an organization and its stakeholders in a balanced way and expectations of shoring up the legitimacy of their principals.

**JS_RN16+RN19 - Citizens and Professionals: Unequal and Diversified Healthcare Societies**

**Changing Landscapes of Patient and Public Involvement in UK National Health Service Research**

*Mary MADDEN (University of Leeds, United Kingdom) | m.t.madden@leeds.ac.uk*

The UK National Health Service (NHS) is a system of socialised medicine, into which, over the last thirty years, neoliberal economic policies have been introducing marketization. The Health and Social Care Act 2012 passed by Parliament in England effectively ended the NHS by abolishing the 60-year duty on the government to secure and provide healthcare for all while potentially laying the ground for wholesale privatisation. This change, which NHS England Chief Executive David Nicholson famously described as so big “you could probably see it from space”, is in the process of creating a new architecture of power in the NHS. Replacing publics with markets, including the creation of a de-socialised healthcare market which gives expression to the liberties of individuals and within which they are free to pursue their own self-defined ends, has been seen negatively by some as part of the deconstruction of democracy; a hollowing out of civil society which poses a challenge to traditional notions of professionalism and public service ethos. At the same time patient and public involvement (PPI) in NHS services and research has become an imperative, yet the empirical evidence-base underpinning the worth and impact of PPI remains poor and there is contestation between professional and ‘lay’ power/knowledge. PPI remains conceptually unclear and this paper will discuss ways in which this ongoing lack of conceptual clarity impinges on patients and the public working inclusively and meaningfully with health professionals in health research within the context of neoliberal reorganisations of the UK NHS and University sectors.

**The changing nature of professionalisation in a global and unequal world:**

**Comparing medicine in Britain, the United States and Russia**

*Mike SAKS (University Campus Suffolk, United Kingdom) | m.saks@ucs.ac.uk*
This paper asks whether the nature of professionalism is changing in a global and unequal world. It was once projected that an elite knowledge class was fast developing with increasing professionalisation in a converging modern world, primarily driven by developments in technology. However, recent trends such as growing corporatisation, the new public management and increasing citizen engagement suggest that we may be witnessing rising deprofessionalisation, as opposed to increased professionalisation. Using medicine as a case study, the impact of these trends on doctors specifically is discussed from a neo-Weberian perspective in three societies with very different socio-political philosophies – namely, Britain, the United States and Russia. With due regard to methodological issues arising from comparative evaluation, it is argued that the pattern of professionalisation in the societies concerned is more divergent than convergent. An overview is provided of the patterns that have emerged as a result of the complex interplay between the professions, state and the market in each country. It is claimed that there is no necessary logic of industrialism as far as professionalisation is concerned or even any straight forward relationship between the form of professionalism and private and public sector settings. The implications for the public, including in relation to inequalities, of the different patterns in each of the models characterising the countries considered are also explored. These raise questions about best practice for the future in relation to medicine, as well as professions and citizens more generally.

Medical and nursing professional culture after thirty years of corporatization in the Italian healthcare system.

Roberto LUSARDI (University of Bergamo, Italy) | rob.lusardi@gmail.com
Stefano TOMELLERI (University of Bergamo, Italy) | stefano.tomelleri@unibg.it

In the last decades, the Italian healthcare system (as the majority of the European countries' healthcare systems) has been interested by processes of rationalization of governance structures, of administrative procedures and of professional practice. Effects and impacts of these innovations are mainly measured in terms of services effectiveness/efficiency. Nevertheless it has been reported how these structural changes have been accompanied by a vertical segmentation within the medical profession, including: clinical-physician (the professional), manager-physician (the administrator) and researcher-physician (the academic). These peculiar roles within the same professional profile diverge for power and influence on others, formal knowledge and professional duties. Analogue but less articulated differentiation can be identified within the nursing profession, where some people perform managerial tasks aimed at managing working activities and information spreading.

This paper discusses the results of a qualitative study carried out in an Italian healthcare organization, and aimed at investigating the impacts of these changes on the professional cultures (medical and nursing in particular). The empirical dataset is composed by thirty-three interviews with physicians and nurses in charge of managerial and academic responsibilities. Three main cultural frames emerge from the content analysis of data: the corporate-managerial culture, the clinical-professional culture and the academic-technological culture.

In this paper we will discuss these cultural profiles on details, identifying for each of them professional identity changes, social expectations and styles of leadership in both medical and nursing staff.

Constructing meanings of experience by health care professionals and patients

Tiina Maria TIILIKKA (University of Tampere, Finland) | tiina.tiilikka@uta.fi

The presentation discusses how co-operation between health care professionals and experts by experience is part of changing Finnish health care and the third sector. The aim is to analyse
how the need for experience of citizens using health services is constructed between health care professionals and patients who act as experts by experience. This presentation gives examples of how health care professionals and experts by experience give meanings to the mental health and alcohol use. The aim is also to find out how experience of citizens was presented before and how the need for individual experiences of citizens is emphasized in current Finnish health care.

The presentation is based on a research which is focused on social and health care and the third sector and how they operate. This project takes a broad view on the processes of societal change. The research project is designed as a third sector view of how Finnish society has changed from the early 1970s to the present day. The context of the study is Finnish alcohol and mental health policy.

The research data consist of writings about Finnish alcohol policy and mental health care published between 1970-2014. The data also include the interviews of health care professionals and experts by experience. The content analysis and discourse analysis offer the methodological tools for the research.

Working through? Labor in the perspective of psychotherapists
Sabine FLICK (Goethe University Frankfurt, Germany) | s.flick@em.uni-frankfurt.de

The paper focuses on therapist's knowledge of labor in the frame of psychotherapeutic treatment. Medical as well as psychological psychotherapists are more and more confronted with a problem: patients search their treatment with the descriptions of stressful working conditions. The question is, to what field of knowledge the interpretations of the psychotherapists of the patient's suffering is related. Do they locate the patient's status despite their narrations in inner processes or do they relate to knowledge of pathogen structures of today's working conditions? Do they reflect the debates on precarity or the blurring of boundaries of work and life? What results from this reflection for their therapeutic practice? The paper presents results of an empirical study in two psychosomatic clinics in Germany that work with psychodynamic approaches. On the basis of protocols of supervisions as well as interviews with these therapists three scenarios can be anticipated: a small group of the therapists discuss the stressful working conditions and try to overcome their own professional means with empowering the patients to either change or leave the working situation. A second scenario questions the patient's narratives about their work and already interprets these as part of the patient's pathology which sometimes is based on a lack of knowledge of today's working conditions. The majority of the therapists focus on the family biographies and the inner conflicts of the patients and even try to softly direct the content of the patient's narrative in the direction of family-biographic experience.
RN20S01 - Qualitative Analysis

Opening the black box. Three logics of data interpretation in participant observation studies and their consequences
Elisabeth SCHEIBELHOFER (University of Vienna, Austria) | elisabeth.scheibelhofer@univie.ac.at

While ethnographic work and participant observation are well established in qualitative inquiry, few reflections have been published of how to analyse data gained from participant observation. The presentation will start with an overview of the existing literature in sociology and neighbouring disciplines such as anthropology. On this basis, it is argued that there are three main types how in qualitative research practice analysis of participant observation data is carried out. These three “ideal types” are: firstly, anthropological approaches, secondly hermeneutic ones and thirdly analytic works oriented towards Grounded Theory. While the first one is relying on the reading and reflecting of the written material, the second one is based on the hemeneutic circle, and the third one on coding the material. Each of these three main analytic strategies is embedded in specific research traditions and in their epistemic contexts. It is argued that reflecting the differences of these three diverging approaches to analyses might help raise the quality in interpretative sociological work.

Framing via Metaphors: How can metaphors contribute to framing analysis?
Milan HRUBES (Masaryk University, Czech Republic) | hrubes@fss.muni.cz

Frame/Framing has been a useful concept for studying various phenomena concerning social interactions in the fields of e.g. social movements and public policy research. Although it proved to be a useful concept there are still debates on how to locate and analyse frames and more important how to capture the dynamics of framing. In my paper I draw on Schon and Rein’s (1994) concept of framing which focuses on intractable policy problems that are unsolvable because of different framing applied. To find out what the problem is and why it is intractable the researcher must analyse the framing so he/she is able to find or set a new setting under which the problem can be approached. The question that is still to be answered is to how to analyse it. Schon and Rein (1974) as well as Yanow (1996) suggest that metaphors are significant means of framing, while leaving the field of metaphors still opened for further explorations. First I focus on the theoretical assumptions of recent theory of metaphors, mainly conceptual theory of metaphors, which enables me to show how metaphors analysis provides a significant penetration into the process of framing. Then I present an empirical case study based on framing the Czech accession to the European Union during the pre-referendum political debates in 2003. This case shows how employing metaphor analysis contributes to the study of framing in terms of uncovering different constructions of the necessity of the Czech accession in highly changeable environment of the pre-referendum debate.

How to examine social worlds? – on the base of the research on social world of climbing
Anna KACPERCZYK (University of Lodz, Poland) | anna.kacperczyk@gmail.com
Social worlds theories embrace a wide range of approaches developed to understand social reality. Having seven-year experience of ethnographical study on social world of climbing, I consider possible ways of examining social worlds. Theoretical foundation of my study has been symbolic interactionism and particularly social world theory. Methodological base of the analysis of empirical data was grounded theory methodology. The substantive area covered processes and actions in the social world of climbing. During the research process, I was considering methodological issues: how to study social worlds and how to make good research about such specific substantive areas like climbing activity. I wondered what aspect of climbing reality needed to be studied and what kind of ontological, epistemological, and methodological criteria must be realized in the research process to achieve thick description of particular social world and credibility of the final theoretical conclusions. On the base of literature and own research experience I present some aspects that need to be taken in the research on social worlds.

How to Write a Grant Proposal? A Qualitative Methodology for the Analysis of Instruction Texts
Kathia Esperanza SERRANO VELARDE (Heidelberg University, Germany) | kathia.serrano@soziologie.uni-heidelberg.de
Miriam SCHWARZ (Heidelberg University, Germany) | miriam.schwarz@csi.uni-heidelberg.de

Although instruction texts can be considered important material artifacts of organizational practices, organizational discourse scholars are reluctant to use them for their analysis. This paper argues that due to the ontological assumptions that underlie data selection in organizational studies, scholars might have overlooked the merits of instruction texts as empirical data. Thus, we present an integrated methodological framework that allows us to conceive of agency and performativity in different ways, thereby restoring instruction texts to the discursive study of organizations. We therefore combine methodological insights from discursive positioning theory and systemic functional linguistics into a content analytical framework. By developing a fine-tuned instrument capable of deconstructing instructive situations through social and linguistic analysis, we developed a reliable methodology for exposing the "social" aspects in communicative patterns that have often been considered too "standardized", "staged" or "contrived" (Potter 1973, Spree 2002) for qualitative analysis. To back our methodological argument with concrete data and examples, we present findings from our research project on the emergence and evolution of grant-writing practices in German academia. The data we use stretches a fifty-year period between 1960 and 2010, thus allowing us to develop a longitudinal perspective on the changing nature of organizational instructions.

RN20S02 - Sociological Imagination in Qualitative Research

Do we really have to choose? Applying an integral framework to the study of everyday life as a “middle way” for qualitative research
Paul Conrad KOTZE (University of the Free State, South Africa) | pckotze@yahoo.com
Jan K. COETZEE (University of the Free State, South Africa) | coetzejk@ufs.ac.za

This paper furthers two arguments that are central to the topic of the session ‘Sociological imagination in qualitative research’. The first is that the debate around intellectual craftsmanship versus abstract empiricism is but the latest incarnation of the dichotomy between subjectivity and objectivity in sociological practice. As such, it is rendered irresolvable by the presence of deep-seated assumptions on the part of proponents of both views. When reflexively considered,
it becomes clear that both positions rest on more or less arbitrary abstractions of the fundamentally irreducible holon of social reality into one of its constituent parts. The favoured aspect is then taken for and analysed as the whole. In order to resolve the debate, it is necessary to transcend the illusory gulf between positivist and constructivist paradigms that underlies this impasse. The second argument offers a plausible solution, in the form of an integral sociological framework that acknowledges the ontological precedence of social reality as it naturally manifests itself to perception. Such a framework considers objective, subjective and intersubjective dimensions in its analysis of social reality and acknowledges the relative validity of the various theories and methods sociologists use to investigate these dimensions. Examples from two recent studies in the programme ‘The narrative study of lives’ (University of the Free State, South Africa) are used to illustrate the nature of such an integral approach, which is modifiable at the methodological level in order to meet the demands of a vast range of research fields and theoretical frameworks.

Reseaching inequality with new materialisms
Cornelia SCHADLER (Ludwig Maximilians University Munich, Germany) | C.Schadler@lmu.de

A recent nexus of theories subsumed under the notion of new materialisms is increasingly recognized within sociology. Theories, such as the agential realism of Karen Barad (2003, 2007), the posthumanism of Donna Haraway (1992, 2008) or the deleuzian materialism of Rosi Braidotti (2002, 2006) claim to rewrite definitions of humans, overcome dualisms and representationalism, include material processes into research and redefine the relationship of subject and object in research. Some of those claims where already made by poststructural and postmodern theories, which also found their expression in a reformulation of qualitative methods. The questioning of the subject-object dualism and categorizations was transformed into research methodologies like autoethnography (Carolyn Ellis et al. 2010) or performance ethnography (Denzin 2003).

New materialisms add a concept of dynamic materiality and situational realism to poststructuralist and postmodern ideas. This turn in theoretical thinking left sociologists and qualitative researcher with the question how these theories can be transformed into a methodological framework to actually work with. Some recent research from the perspective of new materialism follow the methodological paths provided by postmodern inquiry (Pierre & Jackson 2014). In this paper I propose that new materialisms allows anti-dualist and anti-categorical research to turn to more analytical research methods, without the need to use the epistemologies of positivism and representationalism.

I discuss the ontological and epistemological foundations of new materialisms and illustrate my own enactments of a new materialist ethnography, which included a cycle of data collection (interviews, observation, documents, websites and artefacts), analysis and presentation. I also discuss how hierarchies and inequalities are addressed as multifold, paradox and complex processes.

Performing Complexity and Diversity: A Pinboard Approach
William Arthur CRAIGE (Durham University, United Kingdom) | wcraige@gmail.com

It is argued in this paper that conventional methods of qualitative data analysis, such as Grounded Theory, typically work towards the erasure of complexity, heterogeneity and difference by reducing reality to limited sets of analytic categories or themes. While acknowledging that such reductions can be – and often are – both powerful and productive, it is argued that the erasure of complexity and diversity renders certain realities absent and ‘other’, in turn (re)producing problematic relations of power and inequality.
In view of this argument, the paper draws upon an historical study of US telemedicine in the 1960s and ‘70s to offer an illustration and discussion of an alternative, novel method of qualitative data analysis which John Law (2002) refers to as a ‘pinboard’. Conceptually grounded in post-Actor-Network Theory, a pinboard works through juxtaposition and pastiche to produce a heterogeneous array of different accounts which together perform social phenomena as complex, decentered and multiple. Accordingly, it resists the kinds of erasures that are performed by conventional approaches to qualitative research. Nevertheless, it is argued in the conclusion that a pinboard performs erasures of its own, with the implication that it is best understood as complementary to conventional practices rather than opposed to them.

Recovering a Forgotten Tradition. Against the Technification of Qualitative Methods
Mariano LONGO (university of salento, Italy) | mariano.longo@unisalento.it

Wright Mill's Sociological Imagination, intended as a critique both to grand theory and abstract criticism was deeply rooted in non-mainstream trends of the American sociology. In his The Method of Sociology (1934), Florian Znaniecki warned against the technicalization of sociology. He referred to statistical methods, which were then gaining in relevance, as eventually able to eliminate “theoretical thinking from the process of scientific research” (Znaniecki, 1934: 234). Another Chicagoan, the anthropologist Robert Redfield underlined how, although new research techniques had greatly increased the reliabilities and measurability of human phenomena, yet complex questions, the ones which can be hardly reduced to variables, were left unconsidered. The strongest protest against technicalization in research methods is to be found in Nisbet's two essays titled Sociology as an Art Form (1962; 1976). By claiming the intuitive power of sociology, Nisbet made reference to classical sociology which had structured a refined description of modernity without the recourse to standardized methods. According to Nisbet, an excess of technality leads to the trivialization of sociological analysis, unable to give sophisticated, thick, counter-factual explanations of social reality. The paper is an attempt to recover this in part forgotten tradition against any process of excessive technification of sociological research methods. This process may affect qualitative techniques, traditionally intended as a source of thick interpretation of social reality. Against this trend, strong methodological awareness is advocated, as well as a deep theoretical understanding of society and social interactions as a peculiar object of our investigation.

I am not I: Using Ipoems to explore identity
Zigganni BOOTH (Queen's Univeristy Belfast, United Kingdom) | zbooth01@qub.ac.uk

Thematic analysis has cemented itself as the dominant form of qualitative analysis within the social sciences (Guest 2012); allowing for reoccurring themes and patterns to be recorded and explored. Whilst this form of analysis has shown itself to be useful; especially in the field of identity research; due to its effectiveness at responding to research questions which go beyond the experience of the individual. It is my opinion that, a great failing of identity research lies with the hegemony of analytical tools utilised by researchers – namely the over-reliance of social researches on thematic analysis; resulting in the nuances of individual identity being overlooked in favour of overarching themes which respond to the research question( Guest 2012). In this paper, I argue that the utilisation of I poems in qualitative analysis allows for the experience of the individual- in all its messiness and contradictions- to be more accurately captured and analysed. Using data from my PhD thesis, which focuses on how LGBQ women negotiate their identity; I aim to demonstrate how I poems can be used to interrogate qualitative data more
deeply and allow for an exploration of identity situated in the lived reflections and experiences of
the individual research participants.

RN20S03 - Exploring Local Knowledge

Individuals and states. Narrative resources in accounting for migration as life strategy
Alexandra DELIU (Research Institute for Quality of Life, Romania; University of Bucharest) | alexandradeliu@yahoo.com

Contemporary Romania is an emigration country, and current estimates show approximately 3
million Romanians living and working outside Romanian borders. With international migration as
the broad theme of this paper, my current interest is in revealing the narrative resources used
by individuals in order to make sense of their experience. Specifically, I am concerned with how
people account for their decisions to live and work abroad, as well as for the alternative
strategies adopted by their peers or neighbors. Moreover, while analyzing the narratives of
migration, emphasis is put on how concepts such as ‘individuals’ (citizens) or ‘structures’ (the
state) appear in people’s discourses and how they are used as resources for reality
construction. The empirical data used in the analysis consists of interview transcripts and field
notes from a research started in 2012 and focused on studying the social effects of migration on
the sending communities. As evidences and records of the interactions between researchers
and respondents, the interviews are considered here to be social situations in which discursive
orders are at stake and in which narratives get co-constructed by the participants. The
structures of these narratives as well as the concepts, scenarios and arguments used by
migrants and non-migrants when talking about migration as a personal choice or as something
outside their own horizon are presented and discussed in order to address the above mentioned
research interests.

What`s needed to be a bona fide member in the economic lab
Juliane BÖHME (Berlin Social Science Center, Germany) | boehme@wzb.eu

The research I want to present takes place in an economic laboratory which is used for
experiments about decision-making. The research situation in the economic lab is a special one:
Communication is prohibited during the sessions and the material setting limits the possibilities
of participant observation. I made interviews with experimental subjects right after the
experiments and recorded video data from several experimental sessions with a ceiling camera
and webcams.
The aim is to find out how experimental subjects frame and understand the situation and the
given tasks in the laboratory. In line with Garfinkels Ethnomethodology (Garfinkel 1967) I
assume that actions of people are not arbitrary but organized and that people use specific
ethnomethods to solve their ongoing problem of action. The ethnomethodological position
focuses on how a specific social situation is produced. From this point of view, knowledge must
be understood as procedural knowledge which needs to be observed in its situational
evolution. The use of local knowledge of subjects and experimenters is a crucial aspect in
order to understand the actions in the lab. Based on empirical examples, I aim to show how the
social situation in the laboratory is organized and which kind of local knowledge is needed to be
a bona fide member in the experiment.
Exploring local memory about "difficult past": ways to obtain valuable qualitative data during research on remembering and forgetting about mass murders committed by Poles on "Others"

Mateusz MAGIEROWSKI (Jagiellonian University, Poland) | mateusz.magierowski@gmail.com

"Difficult" or "shameful" group past - i.a crime committed by ingroups on "Others" - is one of those research topics which should be considered as sensitive. Individuals, when identifying with the group are likely to avoid talking about it's members' guilts and undermining their own positive and stable group identity. Obtaining valuable data about ingroup's socially shaped memory about such events seems to be more problematic in local perspective, where the influence of social bonds and social control on members' actions is often considerable.

The aim of the paper is to discuss various difficulties emerging during qualitative research on social memory about "difficult past" in local communities. When considering this problem, I shall present some examples from individual in-depth interviews carried out during my research project on social mechanisms of remembering and forgetting about mass murders committed by Poles on members of other ethnic groups in local communities. I shall not only go beyond problems related with the sensibility of the topic, but also consider those resulted from the specific characteristics of respondents: age, education level, topic involvement and social status. Concluding, I shall suggest some empirically-based proposals on how to deal with previously mentioned difficulties.

What Micro-Analysis of Misunderstandings tells us about Local Knowledge

Ulrike Tikvah KISSMANN (University of Kassel, Germany) | ulrike.kissmann@sowi.hu-berlin.de

Misunderstandings interrupt our involvement in the social world whose contours we otherwise unthinkingly accept as we carry on with daily activities. Drawing on the work of Harold Garfinkel’s breaching experiments, and in turn, Alfred Schütz, this paper examines the concept that misunderstandings implicate a suspension of the “attitude of daily life” and through this render visible the presupposed “background features” of everyday order (see Garfinkel 1963; Schütz 1945). The paper will show why micro-analysis of misunderstandings in video-recorded interactions is an efficient tool to study knowledge in local contexts, where local ways of knowing may be overlooked by the researcher because they are seen but unnoticed. Through video, the researcher can use the confusion and the anomie that are engendered through misunderstandings to reconstruct the implicit knowledge of participants. The presentation will also introduce Garfinkel’s late work (2002) where he referred to Merleau-Ponty’s writings on the body. With this and my own work on Merleau-Ponty, I will show to which degree misunderstandings are made up of pre-reflexive gestures and facial expressions (see Kissmann 2014) and prove that local ways of knowing may thus comprise corporeal knowledge beyond language and consciousness. The concept of misunderstanding that draws upon the Schützean phenomenology must be complemented by Merleau-Ponty’s phenomenology of the body in order to grasp both reflexive and pre-reflexive local knowledge.

Local production of security in upperclass neighborhoods. Comparison between suburban areas of Paris and Milano

Lorraine BOZOULS (Sciences Po/Università degli studi di Milano Bicocca (Cotutelle), France) | lorraine.bozouls@sciencespo.fr

In many European countries, local contexts and residents are increasingly included in security policies. There is a shift from a response to unsafety totally based on police repression to a
more complex set of practices including prevention and social reassurance, which involve populations, associations and local governments. The combination of this paradigm shift with the growing importance of security in the public debate leads us to analyse the relation that people forge with their security, how this issue is addressed both in their speech and actions, and what kind of relationships are maintained with institutions. In our PhD thesis we focus on the issue of security in upper class neighborhoods through a qualitative research in two municipalities located respectively in Paris and Milano suburbs. Our materials combine interviews with ethnographic observations. First, we will insist on the coproduction of local order between inhabitants, police and municipality. Upper classes are generally mobilized for the protection of their spaces. They can use their social, economic and cultural resources in municipal networks, like neighborhood council meetings, or to organize themselves into initiatives directly derived from the American neighborhood watch programs. Those practices contribute to the making of a specific local knowledge about security issues. Well-off communities also frequently and increasingly resort to private security devices. Then, we will analyse how the production of this local knowledge differs between Paris and Milano. We will discuss the advantages of an international comparison between two local field researchs of restricted spaces.

**RN20S04a - Qualitative Interviewing and Power I**

**Talking about violence of women in prison: the relevance of gender and difference in methodology and meaning-making**

Satu VENÄLÄINEN (University of Helsinki, Finland) | satu.venalainen@helsinki.fi

My presentation is based on data that I have collected for my PhD study in prisons in Finland, consisting of interviews and written narratives in which women talk about violence they have committed. I discuss how interaction between the researcher and the participants, as well as both local and socio-cultural contexts, are inscribed into ways of making sense of violence in the data. I especially focus on ways in which conceptions about gender and how it relates to violence play a part both in my data collection as well as my interpretations, and how these conceptions may or may not be shared by the participants. I draw on a feminist poststructuralist approach to gender, and thus view it as diversely, ambiguously and fluidly constructed in discourse. I put forward an interpretation that when making sense of their violence, the participants both resist and rely on the ways in which gender was made relevant in my study. Touching upon methodological, and ethical, issues in my study due to the prison context, as well as violence as a sensitive topic of inquiry, I aim to grasp the multifaceted enactments of power and difference in my study that these various ways of making sense of gender and violence entangle with. I especially discuss the issue of representing, and thus constructing, difference between the researcher and the participants, as well as between groups of participants.

**Living Up to the Altruism of the Public: A different take on power, ethics and the archiving of qualitative data**

Robert Lee MILLER (Queen’s University, Belfast, United Kingdom) | r.miller@qub.ac.uk

The basic principle of ethical qualitative research can be seen as a sociological version of the Hippocratic Oath: “First, do no harm (to the research subject)”. The rights of an interviewee to
anonymity, or at least strictly-observed confidentiality, and to informed consent stem from this. The researcher is seen as ceding these powers, to remain unidentifiable and to make a reasoned decision to participate (or withdraw) freely to the researched. These rights are seen as core, to only be breached in exceptional circumstances such as the imminent danger of harm to the person being interviewed or to others.

This presentation will seek to question these givens. It will argue that, particularly when qualitative interview data are subject to secondary analysis, interviewee confidentiality instead promotes the commodification of interview material with it being somehow transformed into the property of the researcher rather than the person who donated it. As such, the strict maintenance of confidentiality, rather than empowering the researched, can be seen as serving the interests of the researcher with interview material being controlled and exploited in a manner contrary to the altruistic impulse of the person who gave it freely. Similarly, it can be argued that true informed consent is a chimera since interviews can take paths unanticipated before they happen, third parties do not consent and, most crucially, interviewees cannot be made aware of the profound invasion of privacy that can be attained through an in-depth qualitative analysis.

When a female professor studies men who buying sex abroad: reflections on doing qualitative research on Taiwanese men’s sexual consumption abroad
Mei-Hua CHEN (National Sun Yat-sen University, Taiwan, Republic of China) |
mc153@mail.nsysu.edu.tw

Taiwanese men have been traveled abroad to buy sex since mid-1990s. The phenomenon however is under theorized. Difficult to access potential interviewees or research participants might be one of the reasons for this under theorizing. In the past five years, as a female researcher I have been studied Taiwanese working-class men’s sexual consumption in China by using in-depth interview and observations. 40 Taiwanese men were interviewed between 2010 and 2012. I also conducted observations of a group of five men buying sex in Guangdong province, China across two trips between 2010 and 2011.

Basing on my own empirical research on these Taiwanese men, the paper aims to reveal the ways in which class, gender and sexuality are complicatedly interweave with each other, and how the filed as a site of power struggles. The paper firstly would unpack how Taiwanese hypocritical sexual morality and gender politics serves to make a female researcher difficult to access potential research participants. Secondly, I will dig into the surface to examine the ethical issues and power relations involved in the whole research process; e.g. the strategies and gendered politics regarding recruiting research participants, the ways in which me and my assistant (a gay man) consciously positioned ourselves as un/desirable sexual beings in the field to carry out observations, and how we deal with all those complicated gendered and sexual emotions occurred in the field.

"Everybody is equal among us – from the manager of the factory to a dishwasher". Articulating power relations during fieldwork on kibbutz
Karolina WISNIEWSKA (University of Warsaw, Poland) | wisniewskak@is.uw.edu.pl

Equality and sharing are the basic organising principles on which the social life of the community under study is based. Every member’s standard of living, annual income and his/her children’s educational opportunities are “the same”. Kibbuz Shalev, located in the southern peripheries of Israel, seems to belong to a shrinking minority of kibbutzim working according to classic, egalitarian rules. At least so is declared, but closer observation proves otherwise. Social
structure is more complex and hierarchical than community members are ready to admit. A popular "from the manager of the factory to a dishwasher" saying outlines the edges of the social ladder. I was a dishwasher in the kibbutz kitchen and an anthropologist researching reasons, agency and consequences of social change that the kibbutz has been undergoing. Both of these perspectives were immersed in power relations.

This paper is based on the analysis of fifty interviews which I carried out during my fieldwork on kibbutz Shalev in 2010 and 2012-13 and has three goals. Firstly, it aims at showing complex and dynamic nature of power relations and postulates researching them in their local contexts. Secondly, it challenges the notion of anthropologist's alleged hegemony and underprivileged natives. Thirdly, it shows how analysing power relations can be used as a useful tool for researching into social processes within the studied community.

RN20S04b - Qualitative Interviewing and Power II

Power Dynamics in Group Interviews in Consumer Research: Empirical Explorations
Emma SAMSIOE (Lund University, Sweden) | emma.samsioe@ism.lu.se

The traditional market research approach to focus group interview dynamics in consumer research draws on a psychological perspective bringing issues solely focused on the individual’s behaviour to the front (Catterall and Maclaran 2006). How individual attitudes alter in group situations are of interest; that is how individual reasoning and thinking processes are transformed by group power structures. In contrast to this work I am using a consumer culture theory approach that shifts the unit of analysis to shared culture and collective social group dynamics (Moisander, Valtonen and Hirsto 2009). The focus is on the context in which collective actions take place and how participants share cultural meaning systems that they draw upon to interpret their surroundings and in turn also shape their behaviour. Through this approach I am currently in my dissertation work, on the negotiation of consumer learning strategies of trendy fashion set in a Swedish context, exploring two empirical issues related to how power dynamics are manifested and enacted during group interviews.

First, I explore power performances in consensus seeking. Attention is directed to the interactions between participants and the ways in which meaning is jointly created, contested, and reworked within the group. This interaction is not just about speech but also include non-verbal communication. What are the possible contributions to how power dynamics are manifested and enacted?

Second, and related to the first issue, does the sometimes egalitarian Scandinavian (Swedish) context have any particular impact on the negotiations and the kind of power dynamics at play here?

Silence of the interview: Paying attention to the unsaid of qualitative interviewing
Tea Torbenfeldt BENGTSSON (University of Copenhagen, Department of Sociology, Denmark) | tb@soc.ku.dk
Lars FYNBO (University of Copenhagen, Department of Sociology, Denmark) | lf@soc.ku.dk

Methodological research often uses failed, odd, or deviant interviews as examples of how qualitative data generation is a complex process that sometimes takes unpredictable and uncontrollable turns. Despite such exemplifications of the fundamental complexity of qualitative analysis, little analytic attention has been given to the significance of silence in qualitative
interviewing or to the assumption that silence in an interview is something that causes interviews to fail and, accordingly, something interviewers should try to avoid. In this paper we challenge the assumptions that silence cannot generate rich data and that silence should be avoided during qualitative interviewing. Drawing on our own experiences of interviewing young delinquents, we argue that paying attention to the unsaid, the pauses, the discomfort, and to silence is highly productive both during interviews and for the subsequent qualitative analysis. Our argument is formed by analyzing three different modes of silence: 1) Silence of the interviewee, 2) Silence of the interviewer, and 3) Silence of the interview. We conclude that silence is a creative, sometimes very effective tool for qualitative interviewers, and that paying attention to silence contributes both methodological and analytic value to the research potential of qualitative interviews when interviewing people about actions related to social delinquency.

Probing tactics and situational differences in power in open interviews
Gerben MOERMAN (University of Amsterdam, Netherlands, The) | gmoerman@uva.nl

Probing in qualitative research interviews is usually done in a rather positive and accepting manner, in what could be called an encouraging probing tactic. For many interviewers this follows automatically from a person-oriented interviewer role, focussed on rapport and sharing power. However, a ‘neutral’ accommodating or more challenging probing tactics can also be combined with a person-oriented interviewer role and possibly with sharing power as well. From a large-scale field experiment it turned out that the use of the three different probing tactics in open interviews has hardly any effect on the average quality and content of the received information. This does not mean that these interviews are similar. The prompts and probes used in these interviews are very different. In this paper it is shown how these different probing tactics can lead to situational differences in interviewer power, interviewee power and rapport. The question is posed whether these probing tactics are to be considered and conceptualised in terms of situational power or possibly a more dramaturgical view on interviewing.

Lorenza BONINU (University of Pisa, Italy, MIUR, Italy) | lboninu@gmail.com

The Weight of the World [Bourdieu,1993] starts with the chapter "To the reader" and ends with the chapter "Understanding". Both chapters are about the methodology Bourdieu and his team used for this research. They can be included in the framework of Bourdieu's many efforts to illustrate his social theory and his peculiar and complex epistemology. Most of all they are useful to explain Bourdieu's political engagement as a coherent effect of his trajectory in the academic field. In Bourdieu's view, conducting an interview should have a double effect: on the interviewers' side, it is a true «spiritual exercise that, through forgetfulness of self, aims at a true conversion of the way we look at other people in the ordinary circumstances of life»; on the interviewees' side it gives «an exceptional opportunity to testify, to make themselves heard, to carry their experience over from the private to the public sphere». The use of this particular approach to the hermeneutic interview in The Weight of the World pragmatically shows the results of Bourdieu's methodological and epistemological assumptions: the sociology, as scientific enterprise, should take charge to pursue the truth of social relationship by the mean of a constant practice of reflexivity, struggling against the illusion of immediate knowledge.
In other terms, the sociologist repeats the Socratic action to unveil, through maieutic inquiry, the truth under social appearances. Only by this kind of maieutic activity and the awareness that follows it, the committed intellectuals will be able to accomplish the indispensable "Realpolitik of Reason".

RN20S05a - Ethnography and the Study of Situations I

Ethnography of Objects in Action. The Performative Deployment of Social Robotics in Dementia Care
Michaela PFADENHAUER (University of Vienna, Austria) | michaela.pfadenhauer@univie.ac.at
Christoph DUKAT (Karlsruhe Institute of Technology, Germany) | christoph.dukat@kit.edu

Since two years we have been conducting ethnographic research at a residential care center for the elderly in which two units of a social assistive robot are being deployed. Participant observations and videographic documentation of the application of the robot by so-called “additional care workers” constitute the core of our data material. While viewing socio-technical arrangements from a microperspective, our focus is on the (artificial) object. In the case of interest to us, the use of the technical artifact can be interpreted as an offer of communication. This is not merely an offer of communication in the broadest sense of the word, for example in the sense of a status symbol. Rather, it is a very concrete offer of com- munication extended by one (type of) person to another. Our research in this regard focuses on the process of action—that is, the performance of the deployment of social robotics. Technical artifacts are “objects in action” that require interpretation. How do people incorporate such objects into their social interactions, thereby changing these interactions? In what way do the care workers use social robotics in their everyday situations, thereby changing not only their everyday lives but also culture—in the present context, the culture of professional caregiving?

A classroom situation on a practice-oriented secondary education programme
Sofie KRANTZ (Linnaeus university, Sweden) | sofie.krantz@lnu.se

My PhD project is linked to a larger research project that deals with issues of multicultural incorporation and school achievement. I am doing an ethnographic study, conducted in a vocational high school on a vehicle programme during 2011-2014 in southern Sweden. The pupils that attend the programme are mainly boys from various immigrant backgrounds living in heavily segregated areas.

In this paper I analyse a specific situation that occurred during fieldwork with a mathematics class, which elucidates interaction between some of the pupils and their teacher in the classroom. The analysis reveals the importance of understanding the intersections of class, masculinity, religion and ethnicity.

The classroom environment involves an on-going negotiation between the students and the teacher about what should be the content of education. Between the students an on-going fight takes place regarding their status in the group, which is expressed in insults and jokes. The teacher responds pragmatically, observing the pupils’ behaviour between her fingers, letting them construct mathematical tasks using their own examples that in some cases include offensive stereotypes. In the dialogue she deals with the contents that relate to maths and ignores some of the norm— and rule breaking parts occurring during the lesson. The analysis shows how different negotiations between norms and rules become necessary for reaching a situation where mathematics can be learned in this context.
I also discuss how the term ‘situation’ is conceptualised in this study, as well as how ‘situation’ may be related to ‘context’ and the need for contextualisation.

A classroom situation on a practice-oriented secondary education programme
Analysis and discussion

Beyond "modern", "secular", and "religion" through dance improvisation:
Handling situations of uncertainty in interaction
Milan FUJDA (Masaryk University, Czech Republic) | milky@mail.muni.cz

Mary Douglas viewed with irony the anthropologists' notion that " primitives expect rites to produce an immediate intervention in their affairs", and their tendency to "poke kindly fun at those who supplement their rituals of healing with European medicine...". Ernest Gellner expressed the idea that "oracle-surrogates" remain in use in a modern society in cases of serious non-calculable problems. My ethnographic fieldwork of contemporary dance improvisation shows that various kinds of "oracle-surrogates", "magic", and other "uncertain techniques", like "intuition", belief in rightness of what is happening by itself, and various forms of bodily intelligence, in combination with various "instrumentally rational techniques", form an important part of pragmatic handling of uncertainty and ambivalence. Practices we tend to classify as "religious" thus tend to be pragmatically mixed together with "instrumentally rational" techniques even in "non-religious" settings in order to handle situations of uncertainty, risk and ambivalence. Inevitable existence of uncertainty, ambivalence, and risk – including rising significance of ultimate risks (Beck) – in private and public spheres thus seems to make us unable to be practically secular. My presentation attempts to analyse in detail the ways of ordinary practical management of situations of uncertainty in dance in order to transcend the theoretical limits of categorical dichotomy "religion" / "non-religion" in understanding (non)differences between "modern" and "traditional" societies. I believe that this may add some important detail to theorising about our society in the crossroad of the sociology of risk and the sociology of religion, and to point out some reasons why "religion" inevitably (re-emerges) in politics and business.

RN20S05b - Ethnography and the Study of Situations II

The use of force as a routine. An ethnography with photo elicitation inside a forensic psychiatric hospital
Luigi GARIGLIO (University of Milan, Italy, academic visitor University of Oxford) | luigi.gariglio@unito.it

The aim of this paper is to give a ‘thick description’ of the day-to-day situations in which prison officers use force with the kept in an Italian custodial institution for psychiatric patients and very violent inmates. It is about the fluidity of the research process, and its stages, inside such a custodial institution and the impact that methodological decisions had in the field. Furthermore, it shows the utility to integrate qualitative methods with visual methods in order to adapt to the research site and to grasp the multifaceted and complex realities of it and to enter into the actual day-to-day working practices and group loyalties that characterise such closed institution. Over almost two years of participant observation, video-recorded photo elicitation of images taken in the special hospital combined with recorded qualitative interviews did play a major role unpacking the complexities of these situations and their participants’ interpretations. These images, prompted participants (prison officers, medical staff and kept) to tell me things I
wouldn't have ever dared to formulate in words. One single image depicting the aftermath of an officer's assault for instance, triggered some of the officers that started to talk about to reflect on assaults, violence, their own (or their colleagues) "misbehaviour", "provocations" towards inmates and the use of force as well as of their vulnerability and very low level of safety and satisfaction at work.

**Grumling about meetings**

Malin ÅKERSTRÖM (Lund University, Sweden) | Malin.Akerstrom@soc.lu.se

Grumling about meetings

Even though modern society has been called "a society of organizations", and meetings have been described as one of its indispensable and essential conditions, formal meetings have been little studied by social science. In an ongoing project we try to address this lack of studies. By means of field observations, ‘go-alongs’, interviews, and document analysis we examine the nature of formal meetings: their forms, idioms, cultures, frequency, and their manifest and latent functions for modern organizations.

One of the recurring themes in our material is the complaints about meetings: their frequency, their emptiness, and the "forced attendance". This is found in various forms: in interviews, small talk as voiced during ‘go-alongs’ with various professionals, and in media comments, in reflections in biographies, and in handbooks about meetings.

In this paper variations in the form and content of the critique and grumbling about “job meetings” will be discussed.

**Events in ethnography: Exploring dynamism and temporality of the situation**

Elina PAJU (University of Helsinki, Finland) | elina.paju@helsinki.fi

In my paper I examine how situations are being researched in ethnographical praxis. I argue that taking the dynamism and temporality of the situation into account is crucial for the understanding of the part that the situation plays in ethnographic knowledge-production. For this aim, I employ the notion of the event.

The data of the ethnographer, especially field-notes, consist mostly of observations of situations, either those the researcher has decided to observe in advance or those the researcher encounters in the field. In either case, the situation provides an act or behavior with a context, the essential ingredient of ethnographic understanding. However, an event understood as concrescence (Whitehead 1979; Halewood & Michael 2008), a coming together of different elements at play in a certain temporal moment, emphasizes the creation of each situation in different temporal moments as new and, thus, dynamic. In practical terms this allows for the temporal expansion of the situation: the situation that is first encountered in fieldwork is created anew in the office of the researcher where s/he analyses the data, and again five years on when the researcher returns to the situation with a new interest. In this sense, I argue, the event pushes the (temporal) boundaries of the situation.

I base my analysis of the ethnographic event on my research in children’s day care setting as well as activating workshops aimed at the over 15-year-old youth outside of employment and education.

**Ethnography of Situations and Social Worlds Analysis**

Bernd REBSTEIN (Bayreuth University, Germany) | bernd.rebstein@posteo.de

One of the pending methodological questions in Ethnography refers to the ways in which to combine different levels of analysis. How can the focused study of social situations be improved
with additional explorations of the broader social context? Using the example of my own research in social worlds of migration I will discuss, how the combination of different methodological approaches can enhance new forms of ethnographical and videographical fieldwork.

Without doubt, videography has been developed as a powerful tool for the study of social situations. In my own project it is used for a minute analysis focused on the process of knowledge communication on cultural public events such intercultural theme weeks, ethnic festivals and carnivals.

Nevertheless for a thick description of social worlds in migration research and elsewhere, analyzing naturalistic audiovisual data alone is not sufficient. Against this background, I will discuss the possibilities and boundaries of additional explorations.

**RN20S06 - The Time of Mobile Methods**

**What does qualitative longitudinal research offer to the study of mobilities?**

Camilla LEWIS (University of Manchester, United Kingdom) | camilla.lewis@manchester.ac.uk

The study of mobilities has led to a call for appropriate mobile methods. Explicit in this is the assumption that existing methods are not sufficient for the task of studying mobilities. Interviews, focus groups and ethnography are regarded as static, immobile and fixed in place. But despite the obvious reference to time, the new mobilities paradigm (NMP), is a field often more explicitly concerned with spatial than temporal movement. This paper extends emerging critiques of mobile methods (eg Merriman 2014), by suggesting that mobile methods are limited as they rely on an over simplified theorisation of time and temporality. As noted by Cresswell (2010), particular conceptions of time are at work in the NMP with, for instance, Urry arguing that the present state of mobility offers a radical break from the past. However, such depictions of rupture or epochal change are often vague about ‘duration’ and about when ‘the present’ begins. This paper suggests that unexamined assumptions about time which are implicated in the turn to and demand for new mobile methods are not especially helpful in addressing the complexities of specific, locally grounded, changes and continuities in travel and transport behaviour. It draws on material from from a qualitative longitudinal panel study which has collected life and mobility history narratives from 245 participants in Leeds and Manchester from the Step-Change project (http://www.changing-mobilities.org.uk) and suggests that the findings offer valuable insights into changing travel and transport practices in the everyday and over personal and historical time.

**Moving Stories: The Time of Trauma**

Niamh MOORE (University of Edinburgh, United Kingdom) | niamh.moore@ed.ac.uk

In this paper we address an underlying assumption of much mobility studies research, that such research requires mobile methods, and that many existing methods are somehow ‘static’. In this paper we restate a central assumption of much qualitative research, that interviews can clearly be understood as involving movement through time. Specifically we draw on trauma narratives to highlight the movements in people’s lives. This paper draws on data from an innovative qualitative longitudinal panel study, focusing on travel and transport and everyday lives and life histories, and which forms the empirical core of the multidisciplinary Step-Change project (http://www.changing-mobilities.org.uk). We have been struck by the number of trauma narratives, many of which revolve around serious illness, which have emerged in our interviews. While the new mobilities paradigm appears to struggle with time, transport studies exhibits
different dilemmas, an obsession with time, though usually time that is reducible to cost. More recently transport modelling has begun to take on board the notion that ‘active travel’ may contribute to well-being; however it has rarely taken into account that people may get ill. Understanding trauma as a response to overwhelming events, which is about time (eg repetition, amnesia, forgetting, return, rupture, turning points) and movement (freeze, flight, fight), we turn to our interviews as exemplary sites through to think through the relationship between time, space and movement in mobility studies, as well as to raise questions about academic amnesia, which forgets that interviews are sites of movement.

Mobility Biographies
Andy MILES (University of Manchester, United Kingdom) | andrew.miles@manchester.ac.uk

This paper introduces the methodological approach to the first and second wave of data collection in the innovative qualitative longitudinal panel study, which forms the empirical focus of the multidisciplinary Step-Change project (http://www.changing-mobilities.org.uk). The first wave involved eliciting life history narratives from interviews, alongside timelines and life diagrams, with 245 participants across the major urban conurbations of Leeds and Manchester. The second wave asked participants about perceptions of change, in relation to their everyday lives and also more broadly, in regards to societal change. Interviewees were also asked to draw a map to represent places which are important to them. Our paper discusses how we are using these interviews, life diagrams and timelines to develop the concept of ‘mobility biographies’ (Frändberg 2008; Lanzendorf 2003; Scheiner 2008) emerging in transport studies; a model that appears to offer a number of possibilities for developing a broader understanding of the dynamics of travel behaviour. Specifically here we explore the potentials of bringing a more interpretive and narrative approach to the concept of mobility biographies, which thus far has relied on linear notions of time, on fixed transitions in the life course and a segmented approach to life stages. We focus on the ways in which life trajectories and personal histories of mobility, travel and transport impact future behaviours through engaging both theoretically and empirically with the panel study data to examine how people’s decisions are embedded in shifting networks of relationships over time and in different dimensions of the life course.

RN20S07a - Field Access: The Case of Hard to Reach Groups I

Field access in disability studies – Norwegian and Polish cases.
Marta SAŁKOWSKA (Collegium Civitas, Poland) | msalkowska@civitas.edu.pl

This paper examines various access strategies applied during qualitative study among mothers of persons with Down’s Syndrome in Norway and in Poland. The main aim of the study was to reconstruct mothers’ strategies of coping with their children’s stigma of intellectual disability. Mothers of persons with Down’s Syndrome establish an extremely vulnerable (Liamputtong 2007) and, therefore, difficult to reach social group. They experience double stigmatization. The first one is directly connected with their children’s visible disability (Goffman’s idea of stigma by association). The second lies in the consequences of the latter – these women very often are excluded from “normal” social life and their life concentrates around private issues. This paper presents differences in gaining access to interviewees in Norway and in Poland. It discusses the role of individual and institutional gatekeepers, ethical issues concerning possible exploitation of research participants, various ways to build trust between researcher and interviewees. It also examines participants’ reactions when asked to take part in the research project.
Access to Disadvantaged Groups in a Cross-national Comparative Framework
Juan Carlos REVILLA (Universidad Complutense de Madrid, Spain) | jcrevilla@cps.ucm.es
Markus PROMBERGER (IAB, Germany) | Markus.Promberger@iab.de
Maria Paz MARTÍN (Universidad Complutense de Madrid, Spain) | mpaz.mart.mart@gmail.com
Araceli SERRANO (Universidad Complutense de Madrid, Spain) | araceli@cps.ucm.es

People exposed to or threatened by poverty, unemployment or other socioeconomic risks of social exclusion are a classical hard to reach population for social research for several reasons. In the first place, they may be fearing stigmatization or ‘otherness’, or, to be more precise, a ‘doubling’ of stigmatization not only by their social environment and institutions, but also by social researchers, what is strongly resented as they are often trying hard to at least superficially keep their social position. Second, there is the exposure to social control and suspicion, which at least morally, if not institutionally may go hand in hand with receiving transfer incomes or welfare benefits. Third, they may experience the shame of having less and therefore being less in a society, where the availability of money and commodities creates a major part of the social belonging, complying with Georg Simmel's double definition of poverty – having less than one’s peers, and being a client of the welfare state. Fourth, they are suffering from the popular image of inactive welfare dependency that in fact applies just for quite a small part of the poverty population, as most of them are actively trying to compensate or ease hardship through a widespread set of practices, including various informal activities which are judged quite differently by society, peer groups or the organizations of the welfare state.

Therefore, research on socioeconomically vulnerable populations poses major methodological challenges. It is not just that they are hard to reach, but that they are also quite heterogeneous, as long as the population in situation of hardship increasingly is coming from more diverse backgrounds, living circumstances, biographies, experiences and practices within different cultural settings. This may lead to severe, and difficult to measure, selectivity in any way of access one may choose, what might lead to blank spots or to an inappropriate coverage of certain vulnerable groups.

The thesis we want to work out in this contribution is that those challenges can – in qualitative research – be handled far better, if there is not only variation, flexibility and openness for inductive and procedural decisions when the units of observation are selected and identified, but also, if access ways and techniques of data collection are also undergoing contrastive variation alongside. Our thesis will be demonstrated on the fieldwork diaries and reports of a cross national qualitative study on “Patterns of Resilience during Socioeconomic Crises among Households in Europe”, called RESCuE, in which the ways of living of more than 200 Households are investigated through visual and interview methods. The project comprises research teams from Greece, Spain, Portugal, Ireland, United Kingdom, Poland, Finland, Turkey and Germany, and is funded by the European Commission under the Seventh Framework Programme.

At home among strangers. Particularities of field access to territorially isolated and self-isolated local communities
Artemiy Alekseevich POZANENKO (Higher School of Economics, Russian Federation) | apozanenko@hse.ru

Under an individual research project, The Social Structure of Local Communities Territorially Isolated from Public Authorities (financed by the Khamovniki Foundation, 2012-2014, Russia) the author studied two types of hard to reach groups: (1) territorially isolated and (2) self-
isolated local communities united by a certain ideology or philosophy (generally in the form of various ecovillages). In both cases, the role of an unbiased and neutral researcher was inappropriate, however different the two groups may have been. Some basic rules are to be followed.

(1) It is extremely important to gain the trust of group members, since due to the remoteness and lack of transport connections, the researcher will not be able to leave the village easily and will have to spend several days there. In such villages, community relations prevail, and a stranger is more likely to be an alien than in an ordinary village. The locals are accustomed to straightforward and familiar communication, which should be matched. The researcher should use plain and clear language; abandon urban and highbrow attitudes; avoid demonstrating well-being; wear inexpensive and suitable clothes, and attempt to erase the line between himself and the respondents.

(2) Group members that distance themselves from modern society are extremely wary about any outside intrusions. Primarily, the researcher must assure his respondents that he is not an official or a journalist seeking sensations or wishing to demonize or ridicule them. He must demonstrate sincere interest and even loyalty in certain matters. He must never criticize their ideology or lifestyle.

Into Deaf World. Hearing researcher among deaf respondents.
Agnieszka FIGIEL (Adam Mickiewicz University in Poznan, Poland) | aga.figiel@gmail.com

Status of deafness is ambiguous in contemporary world. On the one hand it is defined as disability, body defect. On the other, it defines the membership of specific social group, the cultural minority. Regardless of ways of understanding deafness, researchers have the same sort of problems.

The most important question is: how to communicate with deaf people? Theoretically, there are many ways of communication: spoken, writing or sign language. In fact, it is hard to find the best way of communication. Many of the deaf use only sign language, even if they have hearing aids. Sign languages have their own grammar and “words”: gestures, facial expression and body language. Furthermore, sometimes the deaf do not understand either spoken or writing language. The social consequence is the deaf groups are closed, very hermetic and hard to reach by hearing people.

Taking all above into consideration, there are very important dilemmas:

a) How to find access to group of the deaf if you are hearing researcher? Who could be the gatekeepers?
b) How to research when phonic and writing languages are difficult in use? Is the interpreter’s help necessary?
c) How to organize data gathering, how to record interviews or observations, and how to transcribe them when sign language is used by respondents?

In my speech I would like to describe my own experience in research deaf people; how I had found accessing and who had been my gatekeeper. I will tell about interviewing the deaf and solving some methodological problems, such as standardization of measurement or translation interviews from sign to spoken/writing language.

Negotiating access to adults with profound intellectual and multiple disabilities
Reetta MIETOLA (University of Helsinki, Finland) | reetta.mietola@helsinki.fi
Sonja MIETTINEN (University of Helsinki, Finland) | sonja.miettinen@helsinki.fi

This paper will report our experiences in negotiating access in a four-year ethnographic project focusing on adults with intellectual and multiple disabilities (PIMD). The ethnographic fieldwork
will take place in multiple day centers and housing units providing services for people with PIMD in Southern Finland. Our paper focuses on the one hand on the current regulation of research ethics in Finnish social sciences, especially concerning research including individuals belonging to the ‘most vulnerable’ groups. On the other hand, we will also discuss how the current policy in learning disability services, especially the ongoing rapid deinstititutionalization of the services, has impacted our negotiations with the social service sector.

Adults with profound intellectual disabilities are an under-researched group in social studies. This is understandable since including people with PIMD in research means negotiating access to multiple institutional contexts of their everyday living. However, our paper stresses the right of people with PIMD to be included in research that aims to provide understanding of their lives, as well as contribute to the development of policies and services sensitive to their needs and interests. We suggest that the ethics guidelines need to be developed also from the point of view of this group with an understanding of their complex position in the society. This would require detailed discussion, for example, of proxy consent in the case of adults with legal guardianship, and research permit practices in services provided in public-private/third sector partnerships.

RN20S07b - Field Access: The Case of Hard to Reach Groups II

Is the German minority in Poland a hard to reach group?
Magdalena LEMAŃCZYK (The Academy of Tourism and Hotel Management in Gdansk, Poland) | m_lemanczyk@wp.pl

The status and role of the German minority in Poland is peculiar due to complicated polish-german history and heavy burden of stereotyping. Ethnic “renaissance” of the German minority after 1989 posed a particular resentment in Polish society, resulting in the relative closeness of presented minority members and their reluctance to researchers. The author will present a methodological report on the various phases of accessing the German minority institutions. In proposed paper particular emphasis will be put on the role of research reconnaissance, as a significant factor supporting the next phases of the study. The main object of presented research are German minority associations in selected areas of Northern Poland, whereas subjects are their leaders (formal and unofficial).

Research area includes the Northern Poland, precisely Gdańsk Pomerania. Location of those associations covered the most of the territory of former Province West Prussia (1878-1920) and the territory of former Second Free City of Gdańsk (1920-1939).

In total one hundred sixty German minority leaders was examined, in the period from September 2006 to March 2009, however, the author conducts further research concerning this group, furthermore among compatriots’ associations living in Germany.

Negotiating Access to Interviews with the Members of a Minority Community
Bengi BEZIRGAN (London School of Economics, United Kingdom) | b.bezirgan@lse.ac.uk

This paper presents a methodological discussion on the issues of gaining access to Armenian interviewees as the members of a hard-to-reach ethnic and religious minority community in Turkey. Drawing on my qualitative PhD research which is methodologically based upon critical discourse analysis of the media representations of Armenians and semi-structured interviews with forty-five Armenians, this paper focuses on only the findings concerning the field access,
sampling design and the multi-layered relationship between the interviewer and the interviewees. During the five-month period, I interviewed twenty five male and twenty female Armenians. The main goal is to explore the ideas and experiences of Armenians about their understanding of the ‘Armenian issue’, the recent events concerning the Armenian community and their positioning within the nationalism debates and media representations. I employed the snowball sampling technique to reach interviewees which plays a key role in three critical stages of data collection such as locating, accessing and involving hidden and hard to reach populations (Cohen & Arieli 2011: 428). My position as a researcher and ‘assumed’ identity during the interview process evokes the question whether the responses would be different in some ways if the interviewer had been an Armenian researcher. Some interviewees expressed that they feel pleased to find out that such a sociological research is being carried out, and underlined its importance for the visibility of their community. However some of them seemed uncomfortable about voicing their views on such a delicate topic and stated that such studies only ‘(re)open the old wounds’.

No Job, No Time, No Interview? – Issues of Accessing Long-term Unemployed Migrant Populations

Uwe FLICK (Free University of Berlin, Germany) | Uwe.Flick@FU-Berlin.de
Andreas HIRSELAND (Institute for Employment Research (IAB), Nuremberg, Germany) | Andreas.Hirseland@iab.de
Sarah RASCHE (Free University of Berlin, Germany) | srasche@zedat.fu-berlin.de

Qualitative research in the field of studying migrants’ experiences with being long-term unemployed is facing several issues which make the access to this hard to reach group complicated: We encounter typical problems in motivating the interviewees and issues that arise when interviewing people with varying cultural backgrounds and languages. Beyond that we try to get in touch with people in a very specific situation: Being considered as a migrant and being unemployed at the same time can be difficult as ‘work’ represents a key-value within the majority society. Being employed thus turns out as the crucial means of recognition. In the case of unemployed with a migrant background this quite often leads to a doubled risk to be discriminated as a migrant and as an unemployed especially if unemployment goes along with the recipience of social benefits In the case of Germany, according to Social Code II, welfare recipients are facing the expectation to self-responsibly overcome neediness and thus are subject to activation rules fostering employability and motivate clients – even by imposing sanctions - to take up any available job. In a current study, we conduct interviews and do observations among welfare recipients in Russian and Turkish communities about their experiences of being unemployed and with institutional support and control. Members of these target groups often refuse access using seemingly ‘practical’ arguments like having “no time for an interview”. Our attempts to overcome such refusals and to find access will be reflected in this paper.

Transnational Family: the challenges of accessing and interviewing elderly parents

Tania TONHATI (Goldsmiths College - University of London, United Kingdom) | taniatonhati@gmail.com

In this paper I will discuss the difficulties to access and interview elderly parents in a context of transnational research. Based on my PhD thesis, which explores how Brazilian transnational families negotiate ways to incorporate Information and Communication Technologies (ICTs) to
cope with distance, I draw on a qualitative methodology which includes ethnography at home and biographical interviews with Brazilian migrant women in the United Kingdom and their elderly parents in Brazil. The first phase of the fieldwork took place in the UK with the migrant daughters, whilst the second phase was in Brazil. The rationale behind interviewing the parents was to engage with the transnational family idea (Baldassar et al., 2007) of giving a voice to the non-migrants as well. They are also part of the migration process and have to face the consequences of the geographical mobility. Therefore, including parents in this research have provided a more complete knowledge about transnational Brazilian family relationships. In this presentation, the focus is exclusively on the methodological task to access and interview elderly parents. It has posed particular challenges to the research such as how to deal with ageing, loss of memory, difficult to speak and listen, illness and even death.

RN20S08 - Issues in Mixed Methods

The integration of quantitative and qualitative approaches in the study of social mobility
Elizaveta POLUKHINA (National Research University Higher School of Economics (HSE), Russian Federation) | liza.polukhina@gmail.com
Alexandra KOCHKINA (National Research University Higher School of Economics (HSE), Russian Federation) | alexandra.kochkina@inbox.ru

Sociological studies traditionally explore social mobility (the individual's movement from one social position to another) applying qualitative or quantitative methods separately. Our project combines both approaches in order to understand the multidimensional and ambivalent nature of social mobility phenomena. The collected research data includes the archive of Russian family histories (120 biographical in-depth interviews with 68 families, conducted in 1992-1994) and quantitative longitudinal data. Surveys interviews revealed the issues of decision making in significant biographical situations including the descriptions of starting and achieved individuals positions as well as members of extended their family (cousins, uncles, aunts and others). Generally, each questionnaire describes the life trajectories of 20-30 family members. We plan to reveal family trajectories of social mobility (based on residential mobility example) including the role of subjective perception (qualitative biographical in-depth interviews) as well as trends of generality (quantitative longitudinal data).

Content analysis and/or discourse analysis? A mixed methods approach in textual analysis.
Zsuzsanna GÉRING (Budapest Business School, Hungary) | gering.zsusannamargit@gkz.bgf.hu

Content and discourse analyses as methods represent rather different approaches in terms of their theoretical backgrounds and research design. However, the author attempted to utilise these methods together in a mixed methods approach in order to analyse the online discourse of Hungarian medium-sized and large companies (N=146) regarding their social role and responsibility (CSR).
In order to understand what companies define as their societal role and what they thematise as part of their CSR, the author examined the texts on their homepages. In this research project, content analysis and discourse analysis complemented each other on the one hand, and provided both quantitative and qualitative descriptions about the subject of the research, on the
other. Furthermore, both methods allowed not only the direct analysis and interpretation of corporate texts but also of the social phenomena covered by them. Building on the methodological lessons of this project, the main differences of the two methodological approaches are discussed through three dimensions. The first dimension concerns the coding process, while the second and the third are related to the differences in the actual analyses of texts and the role the context plays in these analyses. This paper, by focusing on these methodological characteristics, aims to point to the complementary nature of these methods and to demonstrate how a mixed methods approach can be utilised for textual analysis in social science research to reach deeper understanding of the examined social phenomena.

Relating Materiality to Communication and Meaning: A Combination of Qualitative and Quantitative Methods

Anisya KHOKHLOVA (St. Petersburg State University, Russian Federation; Center for German and European Studies, St Petersburg State University – Bielefeld University) | anisya_khokhlova@mail.ru
Nikita BASOV (Center for German and European Studies, St Petersburg State University – Bielefeld University) | Nikita.Basov@gmail.com

This paper focuses on techniques to grasp material context in its relation to symbolic and social orders by combining qualitative and quantitative methods of social research. Departing from Latour’s ANT and Knorr Cetina’s object-centered sociality, we seek to relate social and meaning structures to everyday material context. In doing so, we study artistic collectives, for which the role of space and materiality has been widely recognized (Carlozzi et al. 1995; Meusburger 2009; Griswold et al. 2013), as artists are particularly responsive to stimuli from material environment. Few studies aimed to empirically tackle the relations between the symbolic world of artistic creation and the material world of objects normally use ethnographic observation, interviews and photo elicitation. Supplementing those with quantitative methods, such as formal textual analysis and sociometric surveys, we attempt to trace patterns in how objects are used and narrated applying a set of techniques to map and triangulate relations between objects, individuals and meanings within multiple data collection waves. This enables further formal analysis of jointly considered material, semantic and social dimensions with the recently developed network analysis techniques, like tripartite (Knoke, Christopoulos, in press) and multi-level dynamic (Wang et. al 2013) network analysis. The paper discusses methodological challenges put by such a research design experienced throughout the study of six European artistic collectives: operationalizing network links with and between objects; tracing relations of objects with individuals and meanings; providing the analytical balance of material order with its symbolic expressions and social functions, - and suggests some methodological solutions.

Research through movements: mixed approach in social mobility studies

Anna STRELNIKOVA (National Research University Higher School of Economics, Russian Federation) | astrelnikova@hse.ru

In this paper we consider the problem of choosing an approach to studies of social mobility and inequality. Here we introduce a method which is called "biographical walk". Urban biographical walk is a qualitative method in which a biographical interview (or in-depth) is combined with participant observations during a walk in certain city routes. First, a researcher conducts an initial interview which includes questions about the perception of urban space, about usual urban routes from the respondent’s past, about general attitudes to the city etc. Having data collected, the researcher selects one of the urban places to walk with corresponding
respondent. When walking with a respondent the researcher ought to capture the way the respondent describes changes in urban space. During or after this walk a second interview is being complemented with follow-up questions that are supposed to clarify details of the initial interview. Thus, the idea of the method is that walking should help unfold the biography gradually. Here we proceed from the premise that movements transform to living experience and simultaneously geographical mobility transforms to the social one. Mobility is the key factor of accumulation and structuring respondent’s experience, and it applies to personal and family biographical stories. The method allows researcher to reconstruct the past in terms of space-body experience, to clarify sensitive topics (exclusion, inequality) and to see the results of subjective perception of mobility. This leads the researcher to generalizations of life trajectories to social mobility as its projection on physical space.

RN20S09 - Interviews with Panels, Groups and Couples

Social class in qualitative comparative research designs – Methodological reflections from research on lay understandings of health behaviour
Anu Katainen (University of Helsinki, Finland) | anu.h.katainen@helsinki.fi

The paper explores methodological difficulties in comparative qualitative research dealing with social class differences. The empirical examples come from two research projects which aimed at gaining in-depth knowledge on socio-cultural factors behind socioeconomic health differentials. Health behaviours such as smoking, drinking and physical inactivity explain a large part of the existing health differentials, but there has been a lack of attention to the subjective dimensions of health, and what differing forms of health behaviour actually signify in people’s everyday life circumstances. The first study investigated smoking practices in different occupational groups by utilising semi-structured interviews as a method. In the second study focus groups were conducted among teenagers from differing social background to compare alcohol related meaning-making. In both studies several difficulties emerged, relating to the definition of social class and participant recruitment, for example, but most importantly to the focus of comparison. In both studies major differences were found in the ways the participants responded to the study. In the first study, the non-manual workers were responsive and eager to talk about their views and experiences, whereas the data produced by manual workers were characterized by low level of reflection. In the second study the higher social background was also associated with greater engagement with the study. The both studies highlight the importance of considering participants’ ways of reacting to the research setting, and how social positions are expressed through these reactions.

ICT-related scenarios viewed by the middle management in the welfare services – e-delphi as method
Raija Koskinen (University of Helsinki, Finland) | raija.koskinen@helsinki.fi

This empirical paper examines the current and future situation in Finnish welfare state related to new technology. With aims to effectuate the service production and to manage the increasing demands for documentation, information and communication (ICT) is used increasingly. This development affects the practical work in many ways. The data of this paper consists of views of middle management working in the welfare services. The research setting is two-fold. Firstly, based on current interdisciplinary research, the researcher has constructed scenarios for Finnish welfare services in the year 2030. Various ways of using new technology, especially ICT is a central element in these scenarios. Secondly, e-delphi is used as the anonymous
participants representing the middle management view the given scenarios anonymously. The analysis of the data contributes with new understanding concerning the challenges met in the Finnish welfare services. Furthermore, the aim is to develop appropriate methodology to disseminate the complexity of practices in order to support informed decisions for the future.

**Interviewing spouses together. Negotiation of father’s involvement in domestic work and childcare among the couple**

Michael MEUSER (TU Dortmund, Germany) | michael.meuser@tu-dortmund.de

This paper discusses the potentials of interviewing spouses together. In family research as well as in gender studies private arrangements are usually inquired by interviewing partners seperately or only one of them, in case of heterosexual couples almost always the woman. In recent times there is a growing number of studies based on interviewing spouses together. But there is only little methodological reflection of this method. Based on research on dual career couples and on father’s involvement in domestic work and childcare it will be shown how this method allows for reconstructing the joint construction of private gender arrangements by the couple. A crucial difference to interviews with single persons is that the couple does not only report on its living together, but that the couple’s interaction and the dynamics of its relationship can be observed during the interview. This allows for focussing on homology between the reported arrangement of the couple and the arrangement accomplished in the interview. The interwoven life stories of the partners correspond with the discourse organization, the reported praxis with the praxis of reporting. Reconstructing where the mode of the discourse organization is collaborative and where conflictual, it can be shown how the couple produces shared as well as divergent perceptions of its living together. Further, in the case of heterosexual couples, it can be asked whether perceptions diverge in a gender typical way.

**Ethnographic panels for investigations of processes**

Grit PETSCHICK (Technische Universität Berlin, Germany) | grit.petschick@tu-berlin.de

Many issues investigated in ethnographies are complex and lengthy processes. The method of ethnography allows in principle to accompany such a process in-the-making, including its fractions, critical moments as well as the envisaged alternatives and "dead ends". So tacit knowledge about practices and routines can be experience at first-hand. At the same time real-time studies of processes with long field stays are very resource consuming and not feasible for many ethnographers. Furthermore, such processes are often not localized in space and time, i.e. not limited to a specific place or group of people. This confronts the ethnographer with the unsolvable situation that he cannot be in several places at the same time and thus may not entirely follow possibly parallel decisions.

In interviews, however, non-observable aspects, such as interpretations, reflections and thoughts about situations and decisions can be asked. The possibilities of purely interview based studies are limited, as they lack the detailed knowledge of the field stay and only the explicit knowledge of the process is ascertainable. The presented method of attempts to combine the advantages of these two methods for investigating processes. The author proposes Ethnographic-Panels as a mixed-method of repeated, short participant observation and retrospective interviews. The time spend in the field can thus be reduced. While intensification further allows a process accompaniment. The present article outlines the method and illustrates the research approach with an empirical example.

**RN20S10 - Ethnography**
Young People Living in Segregated Areas and Their Relationship to the Police
Carolin ANDERSSON (Linnéuniversitetet, Sweden) | Carolin.andersson@lnu.se

Applying for (1) General Session
The overall aim of my Ph. D. project is to contribute to further knowledge of young people living in poor and segregated areas of Sweden, and particularly their relationship to the police. Previous research shows that young people, particularly young men, have an infected and hostile relationship to the police, with explanations pointing to their marginalized and underprivileged situation (Björk 2007; Sernhede 2006). However, other results indicate a more complex picture of young people living in these areas: while some declare to hate the police, others express trust and appraisal (Hallin m.fl. 2010; Pettersson 2012). Using ethnographic fieldwork I intend to capture different narratives of young peoples’ conceptions and experiences of the police, and by means of an insight into their local context and daily lives reach an understanding of how different narratives emerge. In this paper I present empirical results from observations in the areas in question, and discuss the methodological challenges of establishing contact with young residents, challenges that I intend to overcome, e.g., through using my dog during my fieldwork. I also discuss some ethic challenges that my study imposes.

Local contexts of integration and segregation
Florian ELLIKER (University of St.Gallen, Switzerland) | florian.elliker@unisg.ch

This paper presents an ethnographic case study which aims to understand why students in recently integrated student residences of a historically white Afrikaans university in South Africa resist organizational efforts to create ‘inclusive diversity’. It looks in more detail at those structures and processes that make informal segregation practices resilient in residences with an interracial student body composition. Research into this question has justifiably focused on racist formations and (in)formal practices of racial and ethnic discrimination, some of which continue to inform everyday practices – albeit frequently employing strategies of ‘plausible deniability’ (Liu and Mills 2006). However, if we treat race and ethnicity as an integrated domain and study empirically how it is enacted in terms of categorization and membership, social organization, and political action (Brubaker 2009), we discover that there are other, non-racial domains that prevail in certain social situations. As local contexts, the student residences provide such alternative systems of relevance. They constitute small local groups with a specific culture, history, and multiple webs of relations among the group’s routine participants (Fine 2010). Their members reciprocally identify themselves using a variety of relational and categorical identifications that are embedded in the local residence culture. This paper examines these local contexts as social spaces that provide both: common ground for interactions in which local identifications and practices prevail, but also ways and means to lead separate lives along racial categorizations.

Difficult weaving: the ethnographer, the field access and the vulnerability of groundlessly accused participants
Morena TARTARI (University of Padua, Italy) | morena.tartari@unipd.it

This paper aims to discuss the strategies for the field access in ethnographic research studies that concern a particular category of participants like the people accused of crimes. Research studies considered by this paper concern two ethnographies of communities involved in sensational cases of alleged paedophilia. The defendants were accused without concrete
evidences, temporarily suspended from their duties and socially marginalized, and then, after trials lasted many years, they were acquitted and received the verdict of not guilty. The studies were carried out through participant observation and in-depth interviews and analyzed the marginalization and the stigmatization of the defendants during the different stages of the trials, also within the media. Through fieldnotes, this paper analyzes the effective and not effective strategies used to access the different fields, to gain defendants’ confidence. In particular it focuses on the role and identity of the ethnographer and participants emotions and feelings, the way of maintaining the difficult balance between involvement and detachment, the representations of the participants with regard to the consequences of the study on their lives, the lives of their relatives, and on the outcome of the trials. Those strategies are compared with the literature and with other studies carried out by the author on different marginalized categories of subjects like drug addicts, prisoners and abused adolescents. Furthermore discussion points out the active role of sociological imagination in interweaving research questions, ethics of the fieldwork, participants vulnerability and ethnographer sensitivity.

RN20S11 - Issues in Observation

Standing in the Public Places. Etno-Zenistic experiment.
Krzysztof Tomasz KONECKI (Lodz University, Poland) | krzysztof.konecki@gmail.com

The paper describes and analyse the etno-zenistic experiment that is connected with the standing in the motionless position in public places (at the entrance to the mall, in front of gasoline station, in front of the Bank or shop, at the corner of the street etc.). The research is inspired by the ethnomethodological approach to lived order and Buddhism Zen knowledge on the work of mind. The experiment is aimed to get to know the basic assumptions underlying our everyday life activities. Second goal, the most important, is to deconstruct the work of the mind (minding activity) especially concerning the process of looking-glass self and connected with it basic assumptions. The deconstruction will also deal with the process of production of emotions. There will be also discussion on the method of self – research (the ethno-zenistic experiments) to deconstruct the minding as a part of lived order at the concrete setting and the mindfulness as an effect of it.

The Role of Observation Method in School Program Evaluation
Ines ELEZOVIĆ (National Centre for External Evaluation of Education, Zagreb, Croatia) | ines.elezovic@ncvvo.hr

First systematic national-wide external school program evaluations were conducted most recently in Croatia. Health Education (HE) was introduced within maximum of 12 school lessons per year, depending on grade, within the homeroom classes in all grades. This process was accompanied by significant public interest and a clash of polarized views regarding the fourth module, i.e. sex education. Therefore, research processes had to be done with particular care for subjects, majority of them being children age 10 to 18 years. Mixed methods approach used for the program evaluation included testing of student knowledge, questionnaires for students, parents and teachers, group interviews with students and school staff, individual interviews with school principals and classroom observations. In three consecutive visits to 16 case study schools 94 classroom observations were conducted by trained researchers. School lessons of HE in target grades in elementary schools (N=52) and
secondary schools (N=42) were observed. Researchers evaluated lessons guided by “The protocol for classroom observation in elementary and secondary schools” which consists of three major parts: observations prior, during and after HE lesson. Classroom observations have proven to be powerful tool for determining immediate effects of teaching methods which are specific for HE program – student expositions, verbal dialogue methods, brainstorming, practical assignments, group discussions and schoolwork. Important social interactions within the school and classroom were noted only because researchers were physically present. One obvious disadvantage in lesser portion of situations was disrupting usual classroom atmosphere due to teachers’ feelings of obligation to do their best while being monitored.

Making a lesson 'one’s own'. Reflections on how to analyze the ethno-methods of school sabotage
David WÄSTERFORS (Lund University, Sweden) | david.wasterfors@soc.lu.se

Since Paul Willis’ (1977) studies on “the lads” there is a lingering interest in sociology on how pupils oppose order within the educational system. Willis’ formulation of a “counter-culture” among working class pupils is illuminating but also obscuring; the very practical accomplishments of disturbing a lesson and challenging a teacher’s authority are hidden within a presumably fixed culture. This presentation draws on ethnographic data from school work within the Swedish youth care system to discuss how to define and explore school sabotage. Youngsters in care face several obstacles in their school work due to institutional and biographical circumstances, but they are sometimes also personally engaged in avoiding or dismantling social order during lessons. Two major paths to accomplish school sabotage are distinguished (1) to “pepper” a lesson and (2) to “outperform” it. The first path includes various ways to tactically undermine (but not interrupting) the lesson by a series of disturbing maneuvers, whereas the second path involves more openly antagonistic or upfront strategies that ultimately suspend the lesson. The presentation revolves around observational and analytical considerations when exploring such school sabotage.

Drawing Directly from Nature. The Art of Catching the Unmediated Phenomena
Lukas Tomas MARCINIAK (Lodz University, Poland) | l.t.marciniak@gmail.com

There is a strange and growing tendency in social research nowadays to study social phenomena without studying a phenomenon. This false paradox is based on the common, for some even taken for granted belief that the best or sometimes the only way to approach the phenomenon is questioning those who witnessed or participated in actions, settings and events associated with the analyzed issue. With events right in front of their eyes, researchers choose to seek for rapporteurs instead of drawing directly from the field, preferring third-person accounts and perceptions more than unmediated occurrence. Even if such a practice is common in contemporary research strategies, it should be stopped immediately. First because it is at odds with everything the great founders of interpretive sociology stood for and what became a foundation for development of qualitative research methods. Secondly because this question-based practice has a lot to do with unplanned manufacturing of findings and dealing with constant incoherence and lack of data. Making use of many examples and understanding all the consequences we should therefore move beyond reporting third-person descriptions and start drawing our analyses directly from nature.

RN20S12 - Reflexivity & Collaboration
Researcher Reflexivity: Working with our Subjectivity
Hella VON UNGER (Ludwig Maximilians University Munich (LMU), Germany) | unger@lmu.de
Penelope Anne SCOTT (Ludwig Maximilians University Munich (LMU), Germany) | penelope.scott@wzb.eu

In the interpretative tradition of sociology, it is understood that researchers have to deal with the fact that they are both social actors and social scientists. A basic challenge is: How can we develop a scientific perspective on social life that is not a simple repetition and confirmation of our common sense beliefs? How can we achieve an analytic distance and reach an understanding that goes beyond what we already ‘know’ as social actors? Most qualitative methodologies treat the personal involvement and subjectivity of the researcher as an integral part of the research process. Researchers are asked to practice critical (self-) reflexivity in order to increase the validity of the findings. However, with few exceptions, these practices and their outcomes constitute a ‘black box’. This paper discusses the actual strategies and experiences of researcher reflexivity in a qualitative study on ethnicity categories and health discourses in Germany and the UK. The study was conducted in a team and we used different strategies to practice reflexivity – individually and collectively. Identifying our prior assumptions and beliefs in field notes, reflexive memos and team discussions, we documented and scrutinized our influence on the research process. A major struggle involved dealing with our prior experience and normative stances (e.g. pro human rights, anti-discriminatory positions) when analyzing racialized discourses. Using examples from our empirical work, we show how practicing reflexivity in a team opened up opportunities to use our subjectivity as an ‘epistemic window’ (Breuer) to deepen our understanding and improve the quality of our findings.

Creativity in Qualitative Methods
Ghazala Yasmin FAROOQ (The University of Manchester, United Kingdom) | yasminfarooq@hotmail.com

This paper aims to provide methodological reflections and examines empirical findings from a doctoral study that involved in-depth interviews with 27 overseas-trained South Asian doctors practicing as general practitioners in three geographical locales with varying ethnic density and urban/rural mix in the UK. The study set out to explore how this group of highly skilled elite migrants integrated into the UK society, perceived their identities and whether they had acquired a sense of belonging to Britain. The key concepts examined included whether the experiences of racism differed for elite and low/unskilled migrants and whether class and context had a role in shaping differential experiences of the doctors in the study.

A cornerstone of the process in interpretive research is the researcher’s own reflexivity (Paulus et al., 2008) as a researcher is always implicated in the research process of all qualitative methodologies in one way or another (Willig, 2008). Recognising the limitations of previous studies, this paper will explore how I as a researcher incorporated the principles of anti-racist research advocated by Dei and Johal (2005). The authors argue that anti-racist researchers need to acknowledge that the voices of the subjects are likely to have been somewhat polluted and affected by centuries of oppression and emphasise the significance of how these voices are interpreted. I also allowed the interviewees to articulate their feelings/responses in their first language which served to expose the complexity of issues involved. The findings show how race, class and gender intersect against a backdrop of pre-existing colonial relationships.

Who can be a scientist? - about crowdsourcing for cultural studies
Katarzyna LISEK (Jagiellonian University, Poland) | kat.lisek@gmail.com
New technologies made it possible to incredibly expand the opportunities of research tools. The vast amount of data can be processed and analyzed through information systems. Still, there are such areas of analysis, which cannot be performed without the human element – no one has created a machine which fully replaces human senses and intelligence. What could be done if the research process requires analysis of large amounts of material, which cannot be processed mechanically, to obtain quickly reliable and objective results? Outsource this task to the crowd.

Crowdsourcing is a new phenomenon, described by theorists only since 2006. It proves correct in business, especially as a marketing tool. More and more often it is used by non-governmental and governmental organizations, as well as by research teams. In this process, the institution defines clearly the problem, which it is dealing with and asks a large group of anonymous users of new media for a solution.

The tool is already implemented in strict sciences. Thanks to platform Planet Four, thousands of astronomers – amateurs can browse and interpret images of Mars shared to them by NASA and in the project EyeWire, the computer system is "learned" by players, how it should map the human brain. The key to the success of these projects is to divide the difficult tasks for small and uncomplicated ones and to ensure that their realization will make a pleasure for users. Does this type of methods can be applied for humanities research, especially for cultural studies?

My presentation will be a start of discussion about building a crowdsourcing tool for qualitative content analysis. We have a plan to create apps, through which hundreds of users will prepare the data for subsequent analysis by playing the games we will have proposed. The players will have a task to encode the content of documents provided by us, according to the key prepared before. Our solution can be vademecum for the problems associated with this method of research as a low objectivity, time-consuming and high cost of the process and the impact of the researcher on the results. This tool could be used not only by sociologists, but also by anthropologists, historians, ethnographers and others. We created a prototype of this tool and we want to consult its possible risks and weaknesses with representatives of different fields, to make our apps multidisciplinary and universal.

Communicative Methodology to tackle inequalities
Carmen ELBOJ (University of Zaragoza) | celboj@unizar.es
López Calvo LOPEZ (University of Barcelona, Spain) | lauralopez@ub.edu
Tinka SCHUBERT (University of Barcelona, Spain) | tschubert@ub.edu

In this paper, the history of the communicative methodology of research (CM) is presented through a review of its implementation in three research projects funded under the Framework Programmes of the European Commission. The CM is contributing to transforming the social realities studied and therefore especially useful in tackling inequalities. This methodology has been recommended by the EC especially for research with vulnerable groups. The FP5 WORKALO (2001-2004) analyzed innovative strategies of occupational patterns of ethnic minorities achieving major political impact. The FP6 INCLUD-ED (2006-2011) focused on educational strategies for social cohesion and inclusion and has contributed with successful actions in a variety of social domains that improve the lives of European citizens. The ongoing FP7 IMPACT-EV (2014-2017) develops a monitoring and evaluating system to track the impact of research in SSH. With a communicative orientation both qualitative as well as quantitative techniques can be combined aiming at social transformation and contributing to the projects’ success. The basic principles of the CM depart from the capacity of argumentation and communication of the people. It builds on breaking with the interpretative hierarchy, thus, the social subjects are directly involved in the research process from the beginning to the end and contribute to the construction of new knowledge developed in the egalitarian dialogue between...
the subjects and the researchers. The subjects contribute with their experience and researchers with the accumulated scientific knowledge. This paper provides some insights on the CM and its transformative potential of tackling inequalities.

RN20S13 - Various Forms of Elicitation

A comparison of pretest recommendations based on cognitive interviews

Wanda Louise OTTO (GESIS – Leibniz Institute for the Social Sciences, Germany) | wanda.otto@gesis.org

Cognitive interviewing is an active pretesting method that aims to gain insights into the cognitive processes underlying survey responding (Willis 2005). When answering a question respondents have to interpret the question, search their memory for relevant information, generate judgments, and edit their responses to fit the presented answer categories (cf. Tourangeau, Rips, & Rasinski, 2000). To obtain reliable and valid results it is crucial to make sure that indicators measure what is intended to be measured. By recognizing which problems exist within the answering process, researchers are in the position to formulate better – more accurate – questions. Unfortunately, little is known about the realized benefits from this revision (Beatty et al. 2006) based on the findings of cognitive interviews. Therefore, I examine recommendations based on three different item sets (role of women, internationalization, role of fathers) by using various cognitive interviewing techniques (e.g. Comprehension Probe, Category Selection Probe, Emergent Probe). For the empirical investigation a quota sample (by sex, age, and education) of 15-20 respondents is used. Thus results of the original items and results of the revised items are compared to find out which version is better. Therefore an error coding scheme taken from DeMaio and Landreth (2004) is used to evaluate both versions.

This procedure aims to find answers to the following research question:
1. Do pretest recommendations based on cognitive interviews improve the original items by easing the understanding and minimizing the problems while answering?
2. Are the findings consistent across item sets of different topics?

Researching work on screen: analysing, viewing and rebuilding memory work narratives

Luisa VELOSO (ISCTE-IUL, Portugal) | luisa.veloso@iscte.pt
Emília Margarida MARQUES (CRIA, Portugal) | em.marques@fcsh.unl.pt
Frédéric VIDAL (CRIA, Portugal) | frdvidal@gmail.com
João ROSAS (ISCTE-IUL, Portugal) | workscies@gmail.com

This paper discusses the qualitative methodology set up on a research on the representations of work in Portuguese cinema. After a research stage focused on films’analysis, two case studies were defined to develop an empirical approach on social worlds. One of them, part of Greater Lisbon, is where one of the most important Portuguese industrial economic groups dominated the economy and the employment from the early 1930s until the middle of the XXth. With its closing down, in the end of the 1980s, and the de-industrialisation process, the city has been dealing with problems of demographic ageing, urban decay and high levels of unemployment. When selecting this case study, we intend, both to study how films can reconstruct social memories and how do people re-configure their memories in the frame of contemporary realities. To attain these objectives, we held interviews with social actors and screenings of commissioned industrial films by former industrial workers who experienced the
social realities that the films represent (most of the films in an ideological and political engaged way), aiming at generating dynamics of informal conversation between the viewers and the research team. This innovative qualitative methodology had various results: i) the discover, through the interviews and screenings, of other amateur films that were also showed to the people; ii) the way the research influenced the memories of people generating a chain of actions by local actors; iii) and the importance of using the visual support to induce speech from the social actors.

**Photo-elicitation interview: the challenge of interviewing professional image-makers**

Alexandra ZAPOLSKAYA (Higher School of Economics, Russian Federation) | ajmulder@yandex.ru

Photo-elicitation interview (PEI) is one of the most popular visual methods in sociology. Photographs promise to be the bridge between the worlds of the researcher and the researched and to decrease the power differential in the interview. Paradoxically, it is rarely used in the research of the issues that are ‘visual by themselves’. The paper presents a methodological reflection on PEI triggered by its appliance to an unusual topic: professional image production. First, I examine how a matrix of possible topics of the method’s appliance was developed throughout the method's career. I suggest that the very trends that provided success of PEI (e.g. interest on everyday life practices or focus on the dominated subjects) implied the mainstream topics of its appliance and ignored the inquiry about the production of professional images.

Second, I draw upon my research experiences with news photographers (30 interviews) to examine the limitations of the method. Photojournalists are a specific category of interviewees who use a special language for visual images when commenting on their work. Therefore, if an interviewer does not know this language, the photographs are less likely to function as a “language bridge”. As a result, a situation of dominance of the interviewee can be created. However, photographs that were taken by the interviewee serve to guide him to share his experiences instead of giving abstract answers. Thus, the case of interviewing “visual professionals” inverts the methodological discussion on the potential of the images to change the power balance in the interview.

**Tracing interactions with and over documents**

Katarina JACOBSSON (Lund University, Sweden) | katarina.jacobsson@soch.lu.se

A common view of documents and paper work is that they are separated from "real life": people say and do things "in reality", whereas what people write tends to be seen as something other than reality, or another kind of reality. Researchers’ interest in documents and documentation often contributes to this divide when stressing content and form over the use of documents, thus constructing a documentary reality that is separate from the interactional order. A wider ethnographic approach to documents illustrates how they are integrated in various kinds of interactions, and makes it possible to capture interaction with and over documents. With examples from the fields of Swedish health care and the social services, I discuss how the study of documents can benefit from using a range of methods, such as go-alongs, following paper trails, "document mapping" and interviews among others. In focusing the use of the document the researcher is enabled to answer not only the question of what reality the document creates, but also how this reality is accomplished by members' talk and other interactions.

**Assessing data quality in calendar interviews: a qualitative study**
Calendar interviewing is used in life course research for collecting retrospective quantitative data with accuracy (Belli et al, 2013). However, calendar interviewing can also be used for qualitative biographic research. The present paper analyses a set of 12 interviews in order to assess the quality of the data collected with a calendar interviewing device (CID). Specifically, it analyses (1) the types of uses of the CID across the interaction between the interviewer and the interviewees; (2) the strategies used by the interviewees to provide time and place precision; and (3) how the uses of the CID meet the goals of life course research. The analysis puts in evidence two general dynamics of the interviews, alternating and developing one another: (1) the storytelling dynamic, where the interviewees narrated episodes of their lives, and (2) the location of these episodes in the calendar. Results show the flexibility of the CID, allowing for adapting to the specific ways the interviewees developed their narratives. The analysis also identified two groups of strategies of the participants for specifying time and place. The first group consists of “core strategies”, used by all the interviewees. These strategies are deeply intertwined with one another. They concern “specifying age”, “specifying date”, “identifying sequences of events”, “specifying duration”, and “referring to places”. The second group consists of “innovative strategies”, used by several interviewees without any request from the interviewer. These strategies are the following: “specifying school years”, “using documents”, and “referring to the historical context”. Finally, the CID also showed to be successfully used for completing complex tasks related to life course research, such as “matching different trajectories” and “locating turning points”.

**RN20S14 - Visual Research**

“What it means to be Irish”: adding novelty to the design by integrating audio-visual communication techniques
Yaqoub Jemil BOUAYNAYA (Trinity College Dublin, Ireland) | bouaynyj@tcd.ie

This paper presents an innovative and reflexive qualitative design that explores how participants’ perceive Irishness. It describes the multiphase approach taken to investigate individuals’ perceived sense of identity, either in stability or flux, by exposure to variations of Irishness through the viewing of an innovate reflexive multimedia presentation. The novel qualitative design relies on an audio-visual production made from one-to-one interviews with four individuals of differing backgrounds but are all Irish citizens. This integral technological component is essential to the fulfilment of theoretically justified objectives that aim to make the research iterative, participatory and emancipatory. The focus of interest on ‘the cultural’, thus also dictates the qualitative approach employed. The paper reveals how such a reflexive social investigation challenges and evokes responses from subjects specific to their perceived sense of Irishness and facilitates insight into the processes which affect an individuals’ self-understanding and social categorisation.

**The Extended Case Method in Visual Research**
Mirko PETRIC (University of Zadar, Croatia) | mpetric@unizd.hr

The last two decades have seen an unprecedented increase in the use of visual methods across the social and cultural sciences. In spite of that, as Erimsson and Smith (2000; 2013)
have reminded us, the previous marginalization and underutilization of visual information in the social sciences has resulted in "notable problems in connecting up /.../ to the central theoretical traditions and debates of social sciences". Such problems do not appear to have subsided to the present day, notwithstanding the ever-growing profusion of literature based on "visual methods" of research. Rather than being readily associated with idoneous sociological frameworks, such as symbolic interactionism, sociological phenomenology, ethnmethodology or constructivism, the results of empirical research based on visual data frequently remain in the domain of the broadly interdisciplinary or postdisciplinary defined "visual studies" or "cultural studies". This paper is an attempt to narrow the mentioned gap between the central sociological traditions and visual research by discussing their potential cross-fertilization with Buroway's elaboration of the "extended case method" (1998). Following Konecki's attempt to develop the framework for a "visual grounded theory" (2011), this paper sets out to do the same departing from Burawoy's reflexive "theorygraphy", in which research activities aim "to modify, exemplify, and develop existing theories" (Tavory & Timmermans, 2009). Such an approach is seen as especially fruitful in the task of placing the frequently disconnected visual data into their extralocal and sociological context. Examples included in the presentation illustrate the productivity of Buroway's approach in the field of visual research.

**Vernacular Video Analysis in Sports Training**  
René TUMA (TU Berlin, Germany) | rene.tuma@tu-berlin.de

How is video technology used in sports training to observe, reflect on, and improve performance? Practitioners use visual tools to make movement observable, and analyse it statistically and/or based on their specific theoretical background (kinesics, tactics theory, etc.). Based on the long lasting tradition of the use of visual media in sports training, video analysis is a well-established part of professional training practice. Combining a study of the historical developments and videographic studies of video analysis sessions in football training I am going to show how the members of the field use video technology to make bodily movement, spatial formations and distinctive moments in sports training visible and thereby available for communication (such as instruction of players). Based on a framework of communicative constructivism I am able to show how phenomena are made visible, translated into specific language and how knowledge about the interacting body is shared and produced in specific situations of analysis, that involve the participants' bodily resources. I can show, how in the work arc of video analysis in sports, the activities of analysis link situated seeing practices with theoretical resources that are dependent on the discourse in the field and organitational specifics.

Further discussion can go into the question how this reflexive methodology of analysing practices of professions allow us to improve our own methods (reflexive methodology).

**Self-representations and Identity Construction of People with Disabilities in Turkey**  
Mine ERSOY ÖZCAN (Middle East Technical University, Turkey) | mine_35290@yahoo.com

An auto-photographic research is conducted to understand the reconstructing of identity and self-representations of people with disabilities that were in a rehabilitation program. Auto-photography technic is combined with qualitative interviews to have a deeper understanding of the participants' feelings, thoughts and interpretations in their identity construction process. Auto-photography is considered to be an important tool for building bridges with marginalized groups since it enables the participants to speak for themselves. Data collection process was
two steps: first, the participants were given a disposable camera to take 20 pictures answering the question "who are you" and then they were interviewed individually to talk about these pictures. The interviews lasted about an hour. All data transferred into qualitative data analysis software (MAXQDA) and analyzed by the help of this software. Using the software let us code both the photographs and the interview data simultaneously. Thus, narratives and the related photograph were kept together in the same category. The emerging themes from the data constituted our first level categories during the analysis. We continued with MAXQDA coding to create sub-categories per each theme. In the third step we reorganize our categories under more abstract, theoretical categories. Findings of the research reveal self-representations of people with disabilities in relation with their identity construction in a cultural context. Family and friends has an important role in their identity construction process.

**JS_RN11+RN20 - Emotions and Qualitative Methods**

**Investigating Emotions by Using Computer-Assisted Qualitative Data Analysis Software**

Elgen Sauerborn (Freie Universität Berlin, Germany) | Elgen.Sauerborn@fu-berlin.de

In the context of sociology of emotions qualitative researchers always face the challenge of making the invisible tangible. Referring to Konopásek's idea of making thinking visible through computer-assisted qualitative data analysis software (CAQDAS), I argue that this software also has the power to visualize emotions in (interpretative) research processes. Using MAXQDA as an example, I will illustrate how software packages can be understood as more than simply a tool to structure data in emotion research. CAQDAS can rather be utilized as an instrument to visualize and therefore grasp emotions in your data. Furthermore, I want to emphasize the importance of cross-linking between different data sources for a better and deeper understanding of emotions.

I want to outline how sociological (not social!) interpretations in terms of memos, hyperlinked data segments, codes etc. within a variety of existing and gathered data sources can be visualized with the help of CAQDAS tools. When feeding the digital data with your own scientific interpretations, patterns and structures emerge out of your data that can assist in the analysis of emotions. This process of interpretations leads to new data that connects different sources and help qualitative researchers to disentangle the complexity of emotions via their visualization.

**Narrating emotion and affect: from examples to suggestions**

Jan K. Coetzee (University of the Free State, South Africa) | coetzeejk@ufs.ac.za

Narrative analysis is a qualitative way to unwrap the meaning ordinary people give of their experience of the life-world. This opening up of meaning cannot, however, be achieved without us understanding the rich variety of the experience in the life-world. We need to know more about taken-for-granted, familiar and largely unnoticed parts of everyday life, but we also need to know more about the experience of crises and turbulences, about turmoil and transformation, about the emotive issues embedded in experiences. Everyday life is not only situational and problematic; it is also experienced as a drama that does not follow any script. We are all—researchers and research participants—simultaneously writers, producers and actors on a stage that is not necessarily of our own choosing. This paper reflects on the need to capture sensibilities, passions, orientations to flux and emergence, and
even irrational aspects of life. The focus includes positive feelings as well as emotions such as greed, envy, pride, shame, hate and anger, all of which are part of the experience of being. The paper touches on the need to access down-to-earth, but rich and passionate data. Only through “thick descriptions” (Clifford Geertz, 1973) by our research participants can we come to understand, account for and enter their everyday life. By using examples of “impressionist tales” (John Van Maanen, 1988) from my programme The Narrative Study of Lives the paper offers methodological suggestions how affect and emotion elicit dramatic vignettes.

**Emotions in evaluation research**
Sanja MAGDALENIC (Independent researcher, Sweden) | sanjamagda@hotmail.com

Drawing on recent methodological discussions that identify qualitative research as emotion work, this paper sets to explore how evaluators who work with qualitative methods manage emotions while doing evaluation research. Like research in general, evaluation research was traditionally viewed as an endeavor based on rational thinking and emotional neutrality. By focusing on experiences of evaluators who evaluate issues within the field of health and social care, in which they typically come into contact with people and social problems, the paper seeks to illuminate emotion management that may arise in the process of evaluating potentially sensitive topics – for example violence, poverty, cancer and dementia – and how evaluators deal with these. In addition, the aim is to address the knowledge gap, and encourage a debate, regarding emotion management in this particular context. The theoretical framework draws on emotion work theory and evaluation theory, including the concept of “emphatic neutrality” (Patton, 2015). Empirical evidence comes from interviews with evaluators who have carried out evaluations on sensitive topics. Preliminary findings suggest that emotions may appear in different phases of the evaluation research process: from choosing the topic of evaluation, developing project design, data gathering and analysis to presentation of results, and may encompass both research participants and the evaluator. The paper argues that a more reflexive understanding - and an acknowledgment - of the ways in which emotions intertwine with evaluation research may improve both the quality of the evaluation process itself and evaluators working conditions.

**Emotions and belonging—from individual experience to organisational functioning. Exploring the process**
Asta Helen RAU (University of the Free State, South Africa) | rauahm@ufs.ac.za

Evaluation as a methodological approach gave access to very hard-to-reach populations: orphans and vulnerable children (OVC) and their primary caregivers. Secondary data from case files provided quantitative measures on the efficiency of the OVC programme, but this paper focuses on qualitative insights from interviews, focus group discussions, observations, field notes, and child-contact sessions that included activities such as drawing and decoupage. Using multiple methods and a range of participants generated rich in-depth data that reflected multiple perspectives and allowed for insights on emotions and belonging, which go beyond findings normally obtained in an evaluation of organisational functioning. For instance, the OVC programme was initiated specifically to address issues of inequality in relation to the children and their households, but what was not anticipated is how these very inequalities would manifest and operate within the organisation itself. In interacting with participants and analysing data researchers had to be very vigilant of their own assumptions and emotional hooks. One hook was to buy-in to dominant discourses of orphans and vulnerable children—discourses that emphasise their difference in relation to other children. Data show how real needs of children, the organisation itself, as well as the wider community remain unaddressed when such
assumptions are not challenged. What also struck researchers as sociologically significant—and which relates to the notion of the sociological imagination, was how themes within the organisation echoed themes in the wider social milieu—and how these themes reverberated in the individual as well as the collective emotions of participants.

**JS_RN20+RN28 - The Body and Embodiment in Sport – Studies on beyond Discursive Knowledge**

The implementation of the concepts of the practice knowledge in the sports field.
Honorata JAKUBOWSKA (Adam Mickiewicz University, Poland) | honorata@amu.edu.pl

The aim of the paper is to present and discuss the possibility and usefulness of the concepts of the practice, but also - working and situated, knowledge in the sports analysis. Beyond discursive knowledge plays a crucial role in sport and in the process of transmission and acquisition of sports skills. Rare sociologists which study this issue, base their research on the concepts of the embodied knowledge and the theories related to the sociology of body/embodiment. Meanwhile, the other concepts, mentioned above, are actually omitted. The paper will show the theories and methods developed in the other fields, mainly design and craftsmanship, and the possibility to deepen the sports sociological research due to their use. At the same time, the paper's author will present the planned research project concerning the discussed issue.

**Learning how to fight - as an ethnographer**
Larissa SCHINDLER (JGU Mainz, Germany, Germany) | larissa.schindler@uni-mainz.de

Like many forms of sports, martial arts are not predominatly learned and taught by means of verbal communication. Talk may be present in many classes and yet does not suffice for the knowledge transfer. "I can not explain that to you. You must feel it", my instructor often said. But how is it transferred then? And how can we explore silent knowledge transfer? Drawing on empirical data of a video-supported ethnography in a german martial arts club I will focus on two forms of 'silent' knowledge transfer, on visual and somatic transfer. The first one mainly covers the means of showing movements by using ones own body, a "body idiom" following Goffman. The latter is based on contact between (at least) two bodies. Martial arts apprentices not only learn from listening to instructions or watching demonstrations, but also from the feedback they get from a partner's body while accomplishing an exercise. In some way the movement itself gives instructions. In the classes, different forms of knowledge transfer enlance, as I will claim. Thus the embodied experience resulting from somatic knowledge transfer not only leads this learning process. It also helps to develop a practice-specific vis-ability that is necessary for a deep understanding of what is displayed in demonstrations. The challenge for the ethnographer finally is to transfer the relevant aspects of this vis-ability to sociologists who miss the embodied experien

**200 APM, Eyetracking and GoPro Cameras – How technology shapes the (re-)embodiment of eSports**
Heiko KIRchner (Universität Wien, Austria) | heiko.kirschner@gmx.de
Technology has always played a major role in terms of observing and understanding bodily movements and the discursive knowledge inscribed into it. Nowadays the possibilities of video recording due to its easy accessibility via mobile or smart devices seems to be the prime technology that shapes the discursive knowledge of bodily practices in a variety of ways. Closely linked to the rise of videoanalysis in sports is the ongoing process of discursive (self-)reflection with the help of video data. Athletes and coaches alike use video data today to shape the way they talk about the on screen represented bodily movements. In some cases like Parcours, Free-skiing or eSports this reaches as far as to that the aesthetics from 'on the screen' even shape future bodily movements as the athletes change the way they arrange their body to fit certain video aesthetics.

In my presentation I would like to present the development in eSport that led as a major factor to its present boom. ESports understood as professionalized videogaming rose from private LAN-parties to stadium filling mega events with enthusiastic audiences around the globe. Since eSport is in statu nascendi mediatized the bodily practice of athletes playing these games are typically not visible 'in game'. I'd like to present how the current state of eSport is heavily relying on the excessive use of merging media to (re-)embody the practice of professionalized videogaming in order to more or less strategically shape and direct the discursive knowledge connected to it.

Pugs in Trouble: Exploitative Symbiosis, Murky Dealings, and Struggle for Honor in Korean Professional Boxing World
Sungmin KANG (Yonsei University, South Korea, Korea, Republic of (South Korea)) | stubk04@gmail.com

This study explicates the peculiar logic on which the universe of professional boxing in South Korea manages to preserve its existence at the zenith of the sport’s unprecedented stagnation. Drawing on my own experience in the field as an amateur/professional boxer for the last ten years, this ethnographic report provides extensive demonstrations of (1) how people living in and off the pugilistic field are entangled with complicated webs relations which at once sustain and exacerbate the entire structure of the sport, and (2) which kind of socio-symbolic dimension of action and vision makes them immersed seriously in this play despite their penury. This analysis highlights that agents in the boxing world have no choice but to resort to exclusive social network and unofficial economy inside this relations insulated from the official market and relegated within sociocultural domain; yet underlying principle of this material structure is the symbolic structure of passion and dignity about boxing embodied within pugilists’ bodies. In so doing, I rest on some methodological principles of “carnal sociology” proposed by Loïc Wacquant, which underline the researcher’s bodily incarnation of the phenomenon under investigation so as to understand operative mechanisms and sociological principles from which implicit properties of the field emerges. The carnal sociology of boxing in Korea leads not only to thick description of the sport, but also to a broader analysis of classes, marginality, culture, and social action: a synthesis of “total social facts”, "Erscheinung−Ding an sich" imperceptible and inaccessible to spectatorial approaches.

JS_RN20+RN33 - Qualitative Enquiries into Femicide and Culture

Failed Femicides: Migrant Survivor Narratives
Shalva WEIL (Hebrew University, Israel) | shalva.weil@mail.huji.ac.il
Scientific literature on domestic violence among migrant women is rare; qualitative reports on femicide among migrants in the West are rarer. A study from 2005-2007 revealed that 29% of all femicides in Israel were perpetrated among Ethiopian migrants, who constituted 1.6% of the total population. This article highlights the experiences of these migrant women, who have survived ‘failed femicides’.

Thematic analysis of survivor narratives provides significant insight into the plight of the victims of extreme intimate partner violence (IPV). The analysis produced five key categories: village society in Ethiopia; cycle of domestic violence; motive; weapon; and recourse to authorities. Interestingly, the literature on survivors from Western traumas appears to be inapplicable to these non-Western female migrants.

Femicide in Conservative and Neoliberalizing Turkey
Nilay ÇABUK KAYA (Ankara University, Turkey) | cabukkaya@gmail.com
Haktan URAL (Ankara University, Turkey) | haktanural@gmail.com

This study examines the mechanisms giving rise to femicide in Turkey. Based on the qualitative data out of expert interviews conducted with activists in relevant NGOs, lawyers, professionals in forensic sciences and social workers serving for women’s shelters, and the analysis of juridical records of femicide cases in Diyarbakır and Ankara, we aim to shed light on the processes of femicide through the lens of gender inequality in an historical account. Drawing out the data, our study demonstrates how the manifestations of femicide address to two intermingling contexts. On the one hand side, deepening gender inequalities in globalizing and neoliberalizing Turkey provide with a convincing account to elaborate on women’s vulnerability to the lethal violence, especially perpetrated by their intimate partners and/or other family members. Concomitantly, femicide in Turkey addresses to the local cultural context of which the conservative and family-oriented value systems are deployed. These cultural patterns —in which honour-related meanings are constituted and circulated in the everyday interactions- play a decisive role to identify the social and cultural demarcations between appropriate and inappropriate gender performativities; and thus socially and culturally legitimate certain discourses and practices leading the way to the violent acts including women’s murder.

Using qualitative research to explore femicide among migrants and culture minorities
Anita NUDELMAN (Ben Gurion University, Israel) | anitanudelman@gmail.com
Santiago BOIRA (Universidad de Zaragoza, Spain) | santiago.boira@gmail.com

Considering that rates of femicide in various European countries tend to be higher among migrant women, as well as among women from cultural minorities, an ongoing project to develop in-depth culture and gender-sensitive interview guides aimed at better understanding this phenomena and identify specific aspects of the experience of violence in a foreign scenario was initiated by researchers from two different countries. It will be developed in several stages. The first one focuses on migrant femicide survivors and on family members of migrant or culture minorities femicide victims in Spain (mainly South American, but may include participants from additional countries and minorities), in order to “hear their voices” and understand their perspectives and personal experiences on this increasing global phenomenon. The final objective is to create a standardized interview guide, which can be adapted to local socio-cultural contexts, enabling comparative studies across Europe. Progress to date will be presented, as well as the outline of the next stages of this project.

Dowry, Women Oppression and Femicide in Bangladesh
Sadikur RAHMAN (Foundation for Women and Child Assistance (FWCA), Bangladesh, People’s Republic of) | sadikfwca@hotmail.com

The marriage transaction, commonly known as dowry, is a widespread phenomenon in Bangladesh, which has inevitably attracted much attention from development practitioners. This has transformed from bride wealth marriage to dowry marriage locally known “demand marriage” in the society of Bangladesh. Dowry is what the groom's side demand of cash and kind from the bride's side to complete a marriage. It is a major cause of women's oppression starts from diversified psychological and physical tortures and finally turns into femicide. Most of the academicians and development practitioners have addressed this as an development issue rather than a social problem. The main objective of this paper is to analyse the women's oppression because of dowry practice through marriage system as a social problem in Bangladesh. This paper also explains the various dimension of this problem, its multiple functions in women's oppression, natures of oppression in various stages before femicide and the nature of femicide. The paper draws on secondary data from Bangladesh. It is observed that women in Bangladesh are physically, psychologically and socially oppressed because of the dowry by their husband and his family members in many ways. The nature of oppression is divers in form but finally these oppressions turn into femicide. The nature of femicide also divers and some fire-related deaths, suicides of young married women are also believed to be related to dowry.

Cultural Issues: a critical assessment of qualitative data on patterns of intimate partner murders and other forms of femicide.

Christiana KOUTA (Cyprus University of Technology, Cyprus) | nnikolaou@cytanet.com.cy
Ksenia MESHKOVA (Humboldt University Berlin, Germany) | ksenia.meshkova@gmail.com
Anne RYEN (University of Agder, Norway) | Anne.Ryen@uia.no

The main issues of the European COST Action on Femicide is to provide knowledge and to gather data on cultural perspectives on the phenomenon of femicide, “honour killing” and intimate partner violence in relation to culture. Though often perceived as one unit, contemporary Europe is ethnically and culturally complex. This invites a wider spectre of approaches, theories and experiences to our multidisciplinary and multicultural work group. Our presentation aims at making an overview of the field of femicide research. We start up with cultural aspects of femicide as portrayed in literature. Second, based on incoming data from participating COST action countries, we will look into more country specific issues. Last, we will discuss and criticise how alternative paradigms and epistemologies invite us to see through alternative lenses, - illuminating as well as blinding. As to the latter, we argue a need to avoid the classic traps of naive approaches that uncritically circulate accounts that see representations as mirrors of experiences, that ignore contextual sensitivity and which fail to see “culture” as a category that constructs some version of the world appropriate to what we tend to see as self-evident about the person and contexts in question.
RN21S01 - Social Network Analysis

Methodological Considerations in Survey Collection of Ego-centered Network Data
Tina KOGOVŠEK (University of Ljubljana, Slovenia; Faculty of Social Sciences; Faculty of Arts) | tina.kogovsek@fdv.uni-lj.si
Valentina HLEBEC (University of Ljubljana, Slovenia; Faculty of Social Sciences; Faculty of Health Sciences) | valentina.hlebec@fd

The focus of the presentation is survey measurement of ego-centered social support networks. We will discuss and compare three methods of survey social network measurement: the name generator method, the role generator method and the event-related approach. We will focus especially on the effects of methods, response format and limitation of support providers on indicators of network composition. Results of five methodological experiments will be presented in meta-analysis and discussed.

The Use of Social Networks Analysis Tools to Study the Determinants of Coincidences
Modesto ESCOBAR (Universidad de Salamanca, Spain) | modesto@usal.es

The aim of this presentation is to introduce a framework to study data structures, which is founded on a combination of statistical and social network analysis, and is denominated coincidence analysis. Its purpose is to ascertain the most frequent events in a given set of scenarios; to study the relationships between them; and to analyse the influence of their attributes on their coincidences. In accordance with this procedure, the concurrence of persons, objects, attributes, characteristics, or events in the same temporal or spatially limited set can be classified as the following: null, simple, likely, statistically probable, and fully coincident. These tools of analysis can be applied to the exploratory analysis of questionnaires, the study of textual networks, the review of the content of databases, and the comparison of different statistical analyses of interdependence, insofar as the following techniques are used: multidimensional scaling, principal component analysis, correspondence analysis, biplot representations, agglomeration techniques, and network analysis algorithms. However, in this presentation, we will focus on regressions of links on attributes.

As an example of its use, the coincidences of people in photographs are studied using the albums of figures who were celebrities in Spain in the early twentieth century: Miguel de Unamuno (1864-1936), Joaquín Turina (1882-1949), Rafael Masó (1880-1935), and Antonia Mercé (1890-1936).

A Method for Generating a Macro Structure of Networks from Egocentric Networks
Hiroki TAKIKAWA (Tohoku University, Japan; Stanford University, U.S.A.) | takikawa@m.tohoku.ac.jp
Paolo PARIGI (Stanford University, U.S.A.) | pparigi@stanford.edu
Social integration is one of the most classic themes in sociology and has become even more widely discussed in recent times. Despite growing academic interest in social integration, however, little is known about how social interactions are structured broadly in society due to the lack of adequate data and methodology to analyze broader network in a society. Here, we propose a new method that generates macro-structural characteristics from egocentric network data to analyze the whole structure of social networks. We used the egocentric network data generated by “position generator” focusing on ties with occupational positions. The data generated by “position generator” can be seen as a type of a two-mode egocentric network, to which a well-known approach for transforming a bipartite graph into one-mode network based on the premise of “the duality of positions and actors” can be applied. Our methodological innovation, however, lies in controlling for “gregariousness”, a quantitative dimension of social positions as to how many other social contacts such positions bring to actors, enabling to capture “pure” similarity, homophilic relationships among different social positions. Thus, our method provides a occupational position network whose nodes represent occupational positions and whose edges represent similarity relationship between occupational positions. It is suitable for examining the extent of social integration and segregation in a given society. Using a national representative data on the social network in Japan, we illustrate the application of our method, showing that the occupational position networks are segregated into two different clusters, middle-upper class and working class.

Collecting and Analyzing Network Data with www.lome.io - Online Participatory Network Mapping Platform

Anita ZBIEG (Wrocław University of Economics, Poland; Lome - social networks) | anita.zbieg@gmail.com
Błażej ŻAK (Wroclaw University of Technology; Lome - social networks) | zakblazej@gmail.com

Authors present an online software for collecting network data and network analysis. It integrates and simplifies the process of network data collection, import, visualization and analysis, and is designed to provide support for network studies conducted by less advanced users. The platform contains highly customizable survey, visualization and analysis module to fully support various social and organizational network analysis (SNA, ONA) research process (Żak, Zbieg, Moźdżyński, 2014). Firstly, we shortly describe several key features of the platform, show its modules, and present algorithms built into the software. Secondly, we demonstrate two organizational network studies supported by data collected with the platform (Żak, Zbieg, 2014; Zbieg, Zareba, Żak, 2014).

RN21S02 - Quantitative Methods, General

Flipped Statistics Courses!

Andrea BREITENBACH (Goethe University Frankfurt/Main, Germany) | a.breitenbach@soz.uni-frankfurt.de

Statistics, a branch of mathematics, plays a central role in many fields of study, including the social sciences. However, many students attending statistics courses feel more horror than joy. In addition, students failing in these courses often have to drop out. The present concept attempts to present a combination of different teaching methods to constantly improve the statistics courses and increase the quality of teaching of the subject. A key component is the analysis of didactic concepts and expert interviews.
Prof. Spannagel, an expert in mathematical didactics, is known in Germany as a pioneer of flipped classroom. In an interview, he explained the method and sparked my interest. Now that new teaching methods and e-learning elements, such as ‘active plenum’, have turned out to be successful for some time, it seems the best time to test the concept of flipped classrooms.

Instead of face-to-face frontal teaching, video lessons are made available to students as preparation for the course. Seminars give students the chance to work with others—for example, it helps them to solve tasks and take part in discussions. Additionally, the learning platform records the meetings, gives numerous exercises and self-tests.

The experience from such sessions shows that the participants arrive well prepared, having learnt the main course content independently through the video lessons. The learning material is more intensely practised, illustrated with further examples and exercises, at seminars. Qualitative interviews and repeated evaluations, including before and after testing, are used to evaluate the effectiveness of the concept.

Appropriate and Inappropriate Relations between Common Sense and Scientific Knowledge in Social Research
Marco CASELLI (Università Cattolica del Sacro Cuore, Italy) | marco.caselli@unicatt.it

The objective of social research is to acquire scientific knowledge about the social reality that surrounds us. Such scientific knowledge sometimes disputes or even refutes common-sense knowledge and prejudices widespread in a society: this is probably, as Max Weber pointed out, one of the main functions performed by social research itself. But what guarantee do we have concerning the scientific validity of the conclusions reached by a given social research study if such conclusions cannot – except in very rare cases – be experimentally tested, and in any case, usually refer to not perfectly replicable processes? The main guarantee in this regard is provided by the critical assessment that the scientific community can perform with respect to the procedure used by the researchers to obtain their results, because those results themselves are generally not directly verifiable. However, critical scrutiny by the scientific community of research procedures is not conducted homogeneously – nor could it be, given the enormous amount of research that is produced every year. The aim of this paper is to show that prejudices and common-sense knowledge – which, as said, should be challenged by social research – may in fact have substantial weight in guiding critical activity by the scientific community. The latter may be induced to concentrate its criticisms on studies whose results do not correspond to any common-sense knowledge, especially if such knowledge complies with politically correct thought. Hence, in some cases, there may arise the paradoxical effect that scientific research strengthens rather than disputes common-sense knowledge and prejudices, regardless of the merits or otherwise of these latter. The analysis will be based on comments and articles which followed the publication, in November 2003, of the Flash Eurobarometer “Iraq and Peace in the World”.

Automatic Classification of Dependences in Sociological Research
Mikhail BASIMOV (Russian State Social University, Russian Federation) | basimov__@mail.ru

The non-linear sociology is a new approach to studying of the social phenomena, putting the main task studying of specifically non-linear properties in sociological researches. Non-linear properties of the social phenomena basically dominate in a complicated social reality. And for easier guidance in a considerable quantity of the strong non-linear dependences allocated at the first stage their automatic classification is necessary.
We offer a software-based method of classification of non-linear dependences. For classification types of non-linear dependences are defined: 10 for triads and 28 for quarters (triads and quarters of independent variables – groups for multiple comparison in author's method). The basic types of dependences: dependence with a maximum and a minimum, increasing and decreasing, but it is far not linear, fluctuations max-min and min-max. In each basic type it contains the various quantity (from 2 to 9) types of dependences (less for triads, more for quarters) which are defined by symmetry, the general increasing or decreasing tendency, shift to the left or to the right, uniformity of change. Criteria for such automatic classification are defined. Dependences which can't be put into one of 28 (10) types, are given in the end of the separate list.

When there is a lot of strong non-linear relations for their analysis becomes useful their automatic classification, allowing to define prevailing forms of statistical relation which sometimes becomes very important characteristics of this or that group of the respondents, often characterizing national and social features of studied groups more substantially, than parameters and results of their comparative analysis within the limits of these groups.

Finding One’s Place in Collective Meaning Structures: Socio-semantic Network Analysis of Discoursive Roles

Artem ANTONYUK (St. Petersburg State University) | artiom.a000@gmail.com
Nikita BASOV (Center for German and European Studies, St. Petersburg State University – Bielefeld University) | n.basov@spbu.ru

This paper focuses on ways to analyze relationships between individuals and collective meaning structures in communities through interconnection of social and semantic dimensions. We discuss how socio-semantic network visualization and analysis grounded in duality perspective (Breiger 1976; Friedland & Alford 1991) may be employed. We apply a set of techniques to study four art communities located in St. Petersburg jointly using textual, ethnographic and social network data. Visualization of two-mode network data allows to map complex relationships between individuals and meanings underlying production of art and to identify common or specific areas of produced discourse. Further formal network analysis helps to identify which types of semantic structures are associated with different members; to what extent these individuals join collective meanings; whether they are linked to more complex collective meaning structures on their own or when teaming up with others; and finally, how individuals’ positions in communication structures may be related to their discoursive roles. Limitations of the approach and its relevance to theory and practice, requirements to data gathering and processing are also discussed.

RN21S03 - International Comparison / Equivalence: Design

The Choice of the Left-right Scale Format: Design Effects in a Comparative Perspective

Elvira SCHOLZ (GESIS, Germany) | evi.scholz@gesis.org
Cornelia ZUELL (GESIS, Germany) | cornelia.zuell@gesis.org

Left-right self-placement on a uni-dimensional scale is one of the standard questions in many surveys to measure respondents’ ideological orientation in a minimalist way. Although the left-right scale is a standard question, the design of the scale is not standardized. One aspect of scale design is the offer of a midpoint. This paper is about design effects on central left-right
scale placement in a cross-national context. How do respondents answer without true midpoint? Do respondents, in the case of a 10-point scale, use scale middle categories to substitute a true midpoint? Offering a midpoint is much debated among researchers since a midpoint might serve as a hidden “don’t know”. Does non-response increase when non-response cannot be hidden by choosing the neutral midpoint? If middle categories in the 10-point scale work as a substitute for a true midpoint in the 11-point scale, non-response will not differ. Methodological research using a German SOEP experiment found that the 10-point and the 11-point scale are similar in non-response and perform well. Are these German findings robust across countries? We tested the effects in a split-half experiment where either a 10-point scale or an 11-point scale was asked in an experimental online survey fielded in Canada, Denmark, Germany, Hungary, Spain, and the U.S. Preliminary results seem to confirm the idea that respondents who are in favor of choosing a scale middle find a virtual center in the 10-point left-right scale and non-response does not show significant differences between 10-point and 11-point scale.

Methodical Equivalence – Another Step towards Equivalence in Cross-national Research

Martin WEICHBOLD (University of Salzburg, Austria) | martin.weichbold@sbg.ac.at

The idea of (functional) equivalence turned out to be very fruitful for international and intercultural comparisons, but is mainly discussed in terms of measurement equivalence or equivalence of concepts. In this presentation it will be argued that we have to take another step and extend the idea of equivalence on the whole research process, including basic assumptions, data collection methods, interpretation, and utilization of the results. This argument will be specified by the example of data collection methods. While the question of equality versus equivalence is widely discussed for questionnaires, it is also relevant (but rarely discussed) for the selection of the respondents (definition of the population, selection frame, sampling, nonresponse) and the fieldwork (survey mode, interview situation, time and duration of fieldwork). Applying comparable data collection methods in different countries is not only a question of methodological considerations, but of cultural, legal, financial, and infrastructural preconditions in the participating countries.

Comparing two major surveys, the European Social Survey and the World Value Survey, it will be shown that they follow two different approaches: The ESS has very strict regulations for data collection to guarantee high comparability of the different national data sets, while the WVS defines only very general principles and hands over responsibility to the national principal investigators. Nevertheless both surveys are confronted with problems which threaten the equivalence and comparability of the data.

The Culture Specific Loop Way – A New Strategy to Increase Comparability in Cross-cultural Research

Wolfgang ASCHAUER (University of Salzburg, Austria) | wolfgang.aschauer@sbg.ac.at

The challenge of comparability in cross-cultural research is particularly evident when we deal with the issue of construct equivalence. In many applied projects we can still observe the problematic strategy of an inconsiderate use of Western-based approaches which claim universality. On the other hand we can see clear methodological progress with the application of sophisticated methods to test for construct equivalence. But we have to be aware that also with those advanced methods (e.g. using MGCFA) we set the precondition that the same concepts and items must be valid across different cultural groups. Even those strict approaches of equivalence testing can thus go hand in hand with a decreasing validity of the measurement in certain countries.
The proposed new strategy of the culture specific loop way suggests that we should try to achieve content validity and equivalence with several research steps. We should start with an emic approach to search for the constituent parts of the construct in specific countries. If we succeed in establishing a high quality measurement of a concept within countries we can try to find a common denominator of indicators for comparing countries. Finally we can move on to test for equivalence and to evaluate the validity of the concept for certain societal groups or cultural contexts. The key term of functional equivalence in cross-cultural research precisely means, that the ways of operationalization need not to be the same in different cultural contexts, but they must follow the same function; in other words, you should sometimes use alternative paths to reach the goal of comparable results. This proposed strategy highlights that we should put more efforts in achieving validity instead of invariance and should establish comparability through the loop way of a higher appreciation of (diverse) socio-structural and socio-cultural contexts.

Cross-country Analysis of Response Style in Likert Scales
Sofia SEMENOVA (NRU HSE (StP), Russian Federation) | Sofya.semenova@gmail.com
Daniel ALEXANDROV (NRU HSE (StP), Russian Federation) | alexandrov.daniel@gmail.com
Ksenia TENISHEVA (NRU HSE (StP), Russian Federation) | tenishewa.soc@gmail.com

Proposed paper aims at disentangling individual effects (migration status etc.) and cultural effects (national cultural characteristics) in the choice of response style, i.e. the tendency to answer Likert scale questions without their real context (Harzing, 2006). We attempt to identify how cultural characteristics, like obedience, religiosity and independence values, as well as educational achievements of countries determine the type of response style (extreme or middle, acquiescence or disacquiescence style).

To study the effect in question we combine two databases: 2011 TIMSS survey of students (8th grade students, 250000 observations in 40 countries) and 6th wave of World Value Survey. The former provides us with individual variables (SES, migration status, academic achievement etc.) and a large set Likert scale questions; the latter with country level data on values. Hierarchical linear modeling (HLM) was employed as analytic method with individuals on the first level and countries n the second.

Results show that migrant children tend to show extreme acquiescence response style – we would argue that this response style is due to their uncertain social position in a receiving country. Extreme response style is negatively related to academic achievement, and we attribute it to the influence of SES on academic achievement as it is known that SES is negatively related to extreme response style. On the country level the value of obedience is positively related to middle response style, in other words, people from cultures where obedience is important, are much more likely to give answers in the middle point of Likert scale.

RN21S04 - Mixed/Qualitative Methods and QCA

Transition Analysis with Crisp-Set QCA: Exploring the Pathways Through the Space of Welfare Regimes
Georg P. MUELLER (Univ. of Fribourg, Switzerland) | Georg.Mueller_unifr@bluewin.ch

Crisp-set QCA seems to be made for analysing static problems: a configuration of social conditions determines a binary outcome, which in most studies occurs simultaneously with its causal conditions. This is insofar a simplification, as the mentioned outcome can also be a transition, which transfers a social system from its original state to an other-one. Thus there is
an implicit transition-graph with nodes representing the possible states of the system and arcs that can be used for describing its potential transfers. The presence or absence of these arcs is a binary variable that may be explained in the usual way by established methods of crisp-set QCA. The result of this analysis is a network of system states, i.e. a map of social reality with information about possible pathways from starting- to end-points, unreachable final states, one-way roads, deadlocks, etc.

As an illustrative example, the author uses the mentioned method in order to analyse the possible transitions between welfare regimes, as defined by Esping-Anderson (1990), who categorised nations according to the degree of socialism, liberalism, and conservatism of their respective social security systems. In a more recent publication, Scruggs and Allan (2008) present additional data about the observed transitions of countries between 1980 and 2005 on the mentioned regime dimensions. The author of this abstract attempts to explain these changes by the types of the considered welfare regimes as well as the public need for social security and the deficit in the national household budget.

Often Trusted But Never (Properly) Tested: Evaluating Qualitative Comparative Analysis
Michael BAUMGARTNER (University of Geneva, Switzerland) | michael.baumgartner@unige.ch
Alrik THIEM (University of Geneva, Switzerland) | alrik.thiem@unige.ch

In a series of simulation studies, several authors have recently questioned the validity of Qualitative Comparative Analysis (QCA) as a configurational method of empirical social research, ranging from suggestions for progressive curtailment to calls for outright rejection. Some representatives of QCA have replied in defense that simulated data are improper for evaluating this method. We take issue with either position. In arguing that simulated data provide the sole means of assessing the validity of a procedure of causal inference, we prove all previous simulations to have been so defective that no conclusions regarding QCA’s utility can possibly be drawn from them. The primary objective of this article, however, is the implementation of a battery of appropriate inverse-search tests for the purpose of evaluating whether QCA is able to recover sets of presupposed causal structures of varying complexity under different recovery contexts. The results of our tests indicate that QCA is a correct method by common evaluation standards, but only when employed in combination with the parsimonious solution type.

Qualitative Research Strategy: Methodology of Neo-Kantianism
Natalia NEMIROVA (Saint-Petersburg State University, Russian Federation) | nnemirova@yandex.ru

The ideas of neo-Kantianism are consonant to the development of a modern situation in Russian society and Russian sociological science. Recent political events in the country proved that quantitative research methods of social processes cannot cope with the given scientific and social task and explain the reasons of resulting changes. In this concern, the use of qualitative methodology as the strategy of researching social processes perfectly meets the requirements laid down by the scientific community to the social science. Thus, qualitative methods give an opportunity to fix the sociological reality, to expose the deep premises and accomplished consequences of social processes which could not be adequately comprehended before. When a researcher turns to qualitative methods of sociological research, he always faces such problem as what he must focus on: analysis of actions, causes, the world of values, intuition, etc. For neo-Kantians the answer is vivid, it lies in understanding a notion of goal, as it is teleology that determines existence and development of the human world, it underlies his
activities and actions, his world of values and intuition. The physical world can be explained by means of a notion of causality, and the spiritual world – by means of teleology. Such division is connected with the qualitative creative character of human activities. The element of creativity is present in all areas of spiritual life, that is why in the social world a cause does not contain consequences completely, and partly they are new and have never existed before.

**Taking the Oracle Online: Revisiting the Delphi Method to Engage European Experts in a Virtual Debate**

Jessica OZAN (Manchester Metropolitan University, United Kingdom) | j.ozan@mmu.ac.uk
Robert GRIMM (Manchester Metropolitan University, United Kingdom) | r.grimm@mmu.ac.uk
Christopher FOX (Manchester Metropolitan University, United Kingdom) | f.fox@mmu.ac.uk

The Delphi method is based on a structured process for collecting and distilling knowledge from a group of experts through a series of questionnaires combined with controlled opinion feedback (Adler and Ziglio, 1996). It allows for a reliable and creative exploration of ideas and the production of suitable information for decision-making. This approach is particularly useful when there is a lack of agreement about the nature of a problem or the components that must be included in a successful solution (Delbecq et al., 1975). Whilst this method emerged about twenty years ago, it is currently being revisited by European Commission funded projects as a web survey approach. This is particularly appropriate when time and cost considerations make it impractical to gather a wide range of geographically dispersed experts for a series of meeting. This paper draws on a project that is assessing the feasibility of a European longitudinal survey about children and young people’s well-being (MyWeb), which is sensitive to both scientific and policy imperatives. The Delphi process supported the creation of a platform of over 300 experts across Europe in the fields of survey methodology, policy, and children and young people’s well-being. This paper outlines how a Delphi survey was implemented to identify a short-list of options for a longitudinal survey that are methodologically rigorous, politically relevant, and offer value for money. It identifies the benefits of the approach and discusses challenges encountered when engaging with experts from various backgrounds in terms of language, culture, expertise, and research traditions.

**RN21S05 - Causal Inference / Experiments**

**The Short Term Effect of the Escalation of the 2008-Crisis on the Relation between Social Vulnerability and Welfare and Labour Market Threats. A Natural Experiment Approach.**

Marie-Sophie CALLENS (Luxembourg Institute of Socio-Economic Research (LISER), Luxembourg; University of Leuven, Belgium) | marie-sophie.callens@ceps.lu
Marie VALENTOVA (Luxembourg Institute of Socio-Economic Research (LISER), Luxembourg) | marie.valentova@ceps.lu

The existing literature suggests that public opinion and growing anti-immigrant sentiments are affected by the economic crisis and downturn. According to threat theory, especially people with a social and economic vulnerable position will be more sensitive to the welfare and labour market threats that come with the presence of immigrants. This paper uses the European Value study data (EVS) from 2008/2009 for a natural experiment that investigates the short term causal effect of the escalation of the 2008-crisis on the relation between social vulnerability and two different outcomes: perception of labour market threat and perception of welfare threat.
Social vulnerability is measured by variables on retrospective labour market vulnerability and welfare state dependency. The impact of the crisis is evaluated by a natural experiment approach that compares two groups of Luxembourgish residents: respondents interviewed before (control group) and after (treated group) the escalation of the crisis in September 2008. Propensity score matching technique is employed to assure that the sample of control units is comparable on selected observed covariates to a sample of units that did receive the treatment. The novelty of this paper lays mainly in the uniqueness of the data that allows for conducting a natural experiment based on the timing of the interview. This makes a real contribution to the academic debate dealing with natural experiments using survey data. Also due to its design, it estimates the causal impact of the crisis, not only the association between the crisis and the outcome variables.

"Wisdom-of-crowds" and "Wisdom within": Comparative Accuracy of Group and Individual Judgments of Isolated Social Facts
Inna F. DEVIATKO (Higher School of Economics, Russian Federation; Institute of Sociology, Russian Academy of Sciences) | deviatko@aha.ru

The paper presents the results of an experiment aimed at comparison of relative accuracy of averaged repeated individual estimates and averaged one-time group estimates concerning different spheres of "lay" knowledge of isolated social facts. The latter are the source of the much-disputed wisdom-of-crowds effect while the former could explain the purported improvement in accuracy due to averaging of two estimates from a single individual (Vul, Paschler, 2008). The self-evaluations of knowledge of varying social spheres (e.g., population sizes, marriage rates, etc.) were collected during the experiment (N=92, 22 males) in order to gain additional support to the previous conclusions on prevalence of the «illusion of knowledgeability» on varying social facts (Deviatko, et. al, 2010). The data received cast doubt on the universality of tendency to improvement in accuracy of repeated individual estimates while demonstrate the presence of the «illusion of knowledgeability» for most spheres of ordinary social knowledge touched upon in the experiment.

Assessing the Effect of Cultural Capital on Pupils' Progress in Language and Mathematics through a Bivariate Multilevel Analysis
Patricio TRONCOSO (The University of Manchester, United Kingdom) | patricio.troncoso@manchester.ac.uk

Educational research has extensively analysed the so-called socio-economic gradient in pupils' academic performance in the last few decades. In the case of Chile, the long-standing problem of socio-economic inequalities has taken a huge toll on the education system, producing segregation to such degree that children attend schools whose quality depends on what their parents can afford. Unsurprisingly, this has had a major impact on the equality of opportunities. A relevant source of insight on this matter might be derived from the concept of Cultural Capital (Bourdieu, 1977), which can be understood as a set of instruments that enable the appropriation of the cultural heritage of any given Society. Cultural Capital is hypothesised to affect academic performance directly and indirectly through other socio-economic conditions, insofar as the value of the cultural capital possessed by individuals heavily depends on their socio-economic position. In this study, a bivariate multilevel model was implemented to analyse the effect of cultural capital on pupils' progress in Mathematics and Spanish Language in Chile. The analyses show that the latent construct "cultural capital" has a sizable and non-linear effect on performance in Language, whereas its effect on Mathematics, controlling for the same set of variables, is also
considerable. Although there are some differences in how cultural capital affects performance in Language and Mathematics, especially at the extreme ends of the distribution, the overall effect follows the same pattern in both subjects: "culturally-advantaged" pupils tend to outperform the "culturally-disadvantaged", which is consistent with a Bourdieuvian theoretical perspective.

Relational Intelligence and Coalition Choice in Leadership Experiments
Dimitris CHRISTOPOULOS (MODUL University Vienna, Austria) | dimitris.christopoulos@modul.ac.at

Relational intelligence is the ability of agents to source tangible and intangible resources on the basis of their comprehension of social structure. This is of particular relevance to political actors lacking independence of decision making, as they have to depend on the support of coalitions to achieve their preferences. The key issue we investigate is whether the accuracy of perception of interactions among others impact their success in leadership tasks, as it associates to coalitions shaped around their preferences. We assume that political agents would strategise their political relations by considering affiliations between others in political space. In a series of experiments we control for the acquisition of political capital, and measure affiliation, controlling for the psychometric profile and the cognitive social structure of agents. The experimental evidence suggests that success at coalition formation is associated with extravert agents; leadership is associated with Burt’s ‘idiocentric’ brokerage; and popular agents are extraverts with high levels of political capital. The implication is that an agent’s psychological predisposition reflects on their position in political space, while their popularity reflects on their political resources.

RN21S06 - Causal Inference / Analysis and Design

Research Designs and Estimating Causal Effects: The Impact of Age-Period-Cohort Effects on a Design’s Performance
Tobias GUMMER (GESIS - Leibniz Institute for the Social Sciences, Germany) | tobias.gummer@gesis.org

Longitudinal research designs are used to measure individual change and, hence, estimate causal effects. Yet, the literature lacks empirical evidence on how different designs perform in this task. In reality, researchers face a complex context when trying to track change. First, the population of interest itself is subject to change by mortality, fertility, and migration. Second, change follows varying patterns, which can basically be defined as age-, period- or cohort (APC) effects. Determined by these two contextual factors, research designs differ in their ability to estimate causal effects correctly. This article outlines the impact of APC effects on the estimates drawn from panels with and without replacement, and different repeated panels with overlap.

The analysis relies on a dynamic microsimulation. In this simulation study, 1,000 artificial populations of 100,000 individuals are generated. Each individual of the respective population is subject to change in individual characteristics, following different pre-defined APC patterns. Based on these individual changes, causal relations are simulated. Overall, the population is changing, too, due to mortality and fertility. After simulating a population and ageing it, the different designs are applied to the data in order to estimate the different causal effects. Each design’s results are compared to the respective population’s value. Hence, the difference of both results is used to determine a design’s potential to estimate change correctly for a given APC pattern.
Effect Comparison in Nonlinear Dyadic Models
Petra STEIN (University of Duisburg-Essen, Germany) | petra_stein@uni-due.de
Christoph KERN (University of Duisburg-Essen, Germany) | christoph.kern@uni-due.de

Given the fixation of the unobserved error variance in nonlinear regression models, a naive comparison of logit / probit coefficients between different groups can lead to false conclusions. While a variety of studies evaluate the difficulties of group comparisons with single non-metric outcomes, the same problem applies to models with multiple equations, e.g. dyadic models in a structural equation modeling framework. With categorical dependent variables, comparisons of coefficients between different equations are similarly invalid when the assumption of equal residual variances is not met. Thus, in this case even effect comparisons within the specified model are an error-prone task.

Against this background, the present study discusses the usage of non-linear constraints in multivariate regression models with categorical outcomes. With this approach, effect differences between equations are made accessible to statistical tests while potential differences in residual variation are explicitly taken into account. Thus, in a dyadic modeling framework, differences concerning actor as well as partner effects can be identified which cannot be explained by differences in residual variation between equations. Furthermore, it can be shown that previous techniques that have been developed in the context of group comparisons (Allison’s (1999) model for group comparisons, Hauser and Andrew’s (2006) LR(P)PC and Williams’ (2009) heterogeneous choice model) are equivalent to the specification of non-linear constraints in multivariate regression models. However, the application of non-linear constraints extends these approaches into a structural equation modeling framework, which allows the researcher to address a broader range of research questions.

Inverse Propensity Scores as Weights in Quasi-experimental Research
Magdalena JELONEK (Cracow University of Economics, Poland) | magdalena.jelonek@uek.krakow.pl

This presentation reviews problems of working with observational data and making causal inferences using propensity scores as weights. It discusses and illustrates how propensity scores are used to improve inferences with quasi – experimental data. This presentation is based on the counterfactual model of Rubin (1974, 2010), Shadish (2010) and the Shadish-Cook- Campbell work on the main threat to internal validity (2002).

In observational studies - opposite to experiments where each subject is randomly assigned to a treated group or a control group – characteristics of the intervention group do not start of the same as that of comparison group. In such a situation propensity scores may be used to improve the validity of estimates. PS can be used in a variety of ways in quasi – experimental research: to stratify, match samples or weight data for balancing main control and experimental groups characteristics. The author in her presentation focus on the last of the approaches.

To illustrate these methodological problems author use the data from Study of Human Capital in Poland (students survey and fields of study data) on public intervention in the form of commissioned fields of study. The research question refers directly to the effect of the intervention (the purpose of intervention was to increase the number of graduates of fields of study of crucial importance for knowledge-based economy). The conclusion is that this effect was relatively small, when we consider the volume of financing. Additionally, we can formulate the question whether the observed effect of growing number of students of the strategic fields of study have to be caused by the intervention itself.
Confounding in Causal Analysis in Case of Binary Responses
Renáta NÉMETH (Eötvös Loránd University, Faculty of Social Sciences, Budapest, Hungary) | nemethr@tatk.elte.hu
Tamás RUDAS (Eötvös Loránd University, Faculty of Social Sciences, Budapest, Hungary) | trudas@tatk.elte.hu

The Rubin-Holland model gives a clear framework for approaching confounding in observational studies: it can be identified with the difference between the "prima facie" causal effect (TPF) and the true average causal effect (T). In the talk we will show that in case of binary responses, this difference can be decomposed into two biases, and different designs can be parameterized with these biases. Evaluation of these biases and the choice of treatment basically depend on two factors: the treatment/control allocation and the decision problem. There are different allocation mechanisms like preferential choice / selection based on ranking / choice and selection together / optimal allocation maximizing efficiency. Decision problems also vary: which treatment to choose for a patient? / which policy to make available for a population? / how to allocate finite resources optimally? Possible allocation/decision problem combinations are only partially dealt with in the classic approaches (eg. Rubin, Holland, Pearl). Some of these combinations well illustrate the fact that randomized experiments are not gold standard from the social sciences' point of view: they may be not only unethical or unfeasible, but also unable to cover the whole spectrum of causal problems.

Acknowledgments: RNs work was supported by the János Bolyai Research Scholarship from the Hungarian Academy of Sciences. Both RNs and RTs work was partially supported by the Hungarian Scientific Research Fund (OTKA K106154).

RN21S07 - Modeling/Simulation

Friendship as a Social Process: an Agent-based Model Grounded on Lazarsfeld and Merton’s Homophily Theory
Carmelo LOMBARDO (Sapienza Università di Roma, Italy) | carmelo.lombardo@uniroma1.it
Enrico NERLI BALLATI (Sapienza Università di Roma, Italy) | enrico.nerliballati@uniroma1.it
Pasquale DI PADOVA (Sapienza Università di Roma, Italy) | pasquale.dipadova@uniroma1.it

Since the publication of "Friendship as a social process" by Merton and Lazarsfeld, homophily theory has been widely used in contemporary empirical research. In that essay, the authors formulate some counterfactual hypotheses, and conduct a thought experiment to explain the tendency for some actors to make friends with similar others, supposing 800 social actors linked together by 400 social ties. Using the NetLogo language, in order to formalize such thought experiment, we develop an agent-based model grounded on Lazarsfeld’s description of the system of action. If we perform dynamically the process suggested in that work, and pursue the micro foundation of the social action, we observe the evolution of the process through the four typological categories of social ties developed by Lazarsfeld. We discuss two hypotheses formulated by the authors: the hypothesis of gratification, resulting from the duration of social interaction, and the hypothesis of formation of new social ties after a friendship breakup. Therefore, we implement four scenarios, each representing a specific combination of hypotheses. The results allow us to clearly observe four different emerging social patterns that are generated from the micro level by the interaction between individual agents who follow the mechanisms inspired by the original formulation of the theory. Through these simulations, we

Dawid BEKALARCZYK (University Duisburg-Essen, Germany) | dawid.bekalarczyk@uni-due.de
Petra STEIN (University Duisburg-Essen, Germany) | petra_stein@uni-due.de

The subject of our project is to model the future development (30-40 years) of the occupational status – as the central dimension of assimilation – of migrants, who live in Germany. The goal is to answer the question, how assimilation patterns will develop in the context of demographic transition in Germany. We expect that this transition will cause compositional effects, because it changes the ethnic structure of the migrants living in Germany as well as the proportion of all migrants among the whole population. This perspective contributes to the current discussion in the migration research, which is focused on the complex causal mechanisms of assimilation on the individual and institutional level.

For theoretical reasons, this project focuses on the third generation of migrants. It is currently not possible to analyze the occupational status in the third generation directly, because most of their members are too young. However, it is possible to forecast the development of occupational status in this generation reliably, because data exists for the most important mechanisms: education (results of in-between stages) and social origin.

The chosen method is the dynamic micro simulation. In contrast to a simple trend projection, this technique allows to model competitive hypotheses about assimilation mechanisms on individual level and to connect these mechanisms with demographic-relevant processes (child-bearing, aging, dying, migrating). Parameters for the prognosis model will be estimated by longitudinal analyses with empirical data (SOEP and Mikrozensus). Data from a current Mikrozensus shall act as empirical start data for the simulation.

Forecasting Romanian Migration Flows using Agent Based Modeling

Ciprian PANZARU (West University of Timisoara, Romania) | ciprian.panzaru@e-uvt.ro
Cosmin ENACHE (West University of Timisoara, Romania) | cosmin.enache@e-uvt.ro
Claudiu BRANDAS (West University of Timisoara, Romania) | claudiu.brandas@e-uvt.ro

According to Eurostat, at present, there are 2.28 million Romanians abroad, or approximately 13% of the total population of Romania. Unofficial sources, however, say that the number of Romanian immigrants is much higher, exceeding 3 million. With these figures, Romania is one of the leading contributors of migration in Europe. Accordingly, it is absolutely reasonable to ask ourselves, “Will other Romanian citizens leave the country? Can we expect a mass return of those who have already left? What will be the dynamics of migration flows in the coming years?”. The goal of the research was to provide explanations and make predictions regarding Romanian migration flows. Agent based modeling (ABM) has been used to identify the mechanisms and causes of international migration from Romania. Computer simulation, using agent based modeling, allowed a higher formalization of the theories on migration and observation of the specifics of the phenomenon. Based on ABM, key stakeholders (individuals, institutions) involved in the migration process were identified and their behavior was simulated based on various assumptions and scenarios. The model reproduced the real social, economical and political conditions from Romania, as an origin country, and destination countries for Romanian migrants.
**Diffusion of Innovations in Artificial Societies**

Igor KOREL (Novosibirsk State Technical University, Russian Federation; Institute of Laser Physics, Siberian Branch of the RAS) | ikorel@gmail.com
Natalia KAFIDOVA (Novosibirsk State Technical University, Russian Federation) | natakafidova@yandex.ru
Anastasia KOREL (Institute of Traumatology and Orthopaedics, Novosibirsk, Russia) | akorel@gmail.com

While diffusion of innovations in social networks was thoroughly studied during the last decade, it seems more new questions than solutions for the old ones were found. There is an ontological complexity of knowledge on the one hand and an entangled social graph on the other. We are studying possibilities of using a network automata — a hybrid of a cellular automata and social network, which combines functionality of the first and structure of the second — for the spatial diffusion of innovations modeling. Empirical calibration of the model associates with regional inequalities in innovation and socio-economic indicators in Russia. This is the case when knowledge (possibly a tacit knowledge) transfer can be expressed for example by migration flow and labour market. This work is supported by the Russian Foundation for Basic Research under grant 15-06-99592.

**RN21S08 - Incentives, Interviewers, and Recruitment**

**Interviewer Effects on Net Wealth in Household Surveys**

Martin SCHÜRZ (Oesterreichische Nationalbank, Austria) | Martin.Schuerz@oenb.at

The data basis of this paper is the Household Finance and Consumption Survey (HFCS) in Austria. In the first wave of the HFCS 2010 we have interviewed successfully 2.380 Austrian households. But we also interviewed the interviewers concerning a number of issues concerning attitudes, perceptions, income and wealth.

Interviewer effects on unit-nonresponse and item nonresponse have been studied extensively in the literature. However, this paper examines the role of interviewers’ personality traits and interpersonal skills in determining results of the survey. We study the interaction between the characteristics of interviewers’ and respondents’ net wealth. Our estimations are based on multilevel-regressions and we consider multiple imputations.

We find evidence of significant and robust negative effects of interviewers' qualification on net wealth. We also show significant negative effects of gross income of interviewers and positive effects of interviewers ‘net wealth on respondents’ net wealth.

We develop a number of hypotheses that help to understand these results based on sociological and psychological literature. Our paper indicates the need to do more research on social interactions in face-to-face interviews. In particular the habitus concept of the French sociologist Pierre Bourdieu seems to be of relevance.

**Does Personalized Feedback Increase Respondent Motivation?**

Martin KROH (Socio-Economic Panel, DIW Berlin, Germany) | skuehne@diw.de
Simon KÜHNE (Socio-Economic Panel, DIW Berlin, Germany) | skuehne@diw.de

Web-based interviewing gradually replaces traditional modes of data collection, in particular telephone surveys and mail questionnaires. Web-surveys technically allow to feedback personal information to respondents based on their previous responses. This personalized feedback may not only be used for targeted follow-up questions, but we argue that returning personal
information to respondents that they consider novel and important may also increase their interest in the survey. However, personalized feedback may as well provoke undesired respondent behavior. For instance, respondents may after the personalized feedback try to manipulate their previous answers to obtain desired information on their person.

To test the effects of personalized feedback on respondents’ motivation and behavior, we implemented a randomized trial in the context of the Berlin Aging Study II (BASE-II) in 2014. We assume personalized feedback on personality traits to be particularly suited to increase respondents’ motivation. The feedback in the randomly allocated treatment group consisted of a graphical representation of all five personality trait scores (Big-Five personality inventory) using markers on verbal scales. We investigate the effects of personalized feedback on respondent motivation and behavior using a number of indicators. First, we implemented multiple evaluation questions to measure interest in the survey, willingness to participate in future surveys, etc. Second, we compare response styles and internal consistency of answers between treatment and control group. Third, we use web-survey paradata, such as mouse movements, frequency and position of clicks as well as changes in responses, to analyze undesired response behavior provoked by personalized feedback.

**Does the Use of Respondent Incentives Affect the Measurement of Attitudes towards Social Inequality? Evidence from an Experiment Conducted in the German General Social Survey (ALLBUS)**

Michael BLOHM (GESIS - Leibniz Institute for the Social Sciences, Germany) | michael.blohm@gesis.org
Martina WASMER (GESIS - Leibniz Institute for the Social Sciences, Germany) | martina.wasmer@gesis.org
Jessica WALTER (GESIS - Leibniz Institute for the Social Sciences, Germany) | jessica.walter@gesis.org
Achim KOCH (GESIS - Leibniz Institute for the Social Sciences, Germany) | achim.koch@gesis.org

Declining response rates are a continuing problem for household surveys in many Western countries. To counter the problem of nonresponse, the use of respondent incentives has become more common also in face-to-face surveys like the German General Social Survey (ALLBUS). ALLBUS is a repeated cross-sectional, multi-topic survey conducted every other year to monitor social change in Germany. In 2014, a topical module was about attitudes towards social inequality.

In the 2014 survey, an experiment was implemented in order to analyse the effect of respondent incentives on response outcomes, sample composition and data quality. In the experiment, two treatment and a control condition were distinguished: a) A random subgroup of target persons was offered a monetary incentive of €10, conditional on the completion of the interview (promised). b) Another random subgroup of target persons was sent a monetary incentive of €10 with the advance letter (prepaid). c) The remaining target persons acted as a control group and received no incentive at all.

The response rate in the prepaid condition was considerably higher than in the promised and the control condition. The presentation will focus on the question whether the use of an incentive affected the measurement of attitudes towards social inequality. In order to analyse this, we will both investigate incentive effects on sample composition and incentive effects on the responses provided during the interview.

**Strategies for Implementing Mixed-Mode Designs in Business Surveys**

Henning BEST (University of Würzburg, Germany) | henning.best@uni-wuerzburg.de
Klaus PFORR (GESIS – Leibniz Institute for the Social Sciences) | klaus.pforr@gesis.org

The sharp decline in telephone survey response rates has strongly increased the need for alternative ways for surveying the general public. Web surveys with offline recruiting are a potentially promising option, but at the moment internet use and coverage is still limited. As a possible solution to this problem, Dillman and Colleagues have recently suggested using a sequential mixed-mode design combining mail and web survey modes (see e.g. Messer & Dillman 2011). The key idea is to initially contacting the respondents by mail, ‘pushing’ them to the web mode (Push2Web) and finally providing a paper questionnaire as a last resort to avoid unit nonresponse. The type of mode the respondents are expected to participate in is under the control of the researcher. Another conceivable strategy is to leave the mode choice to the respondents, and using various strategies ‘nudging’ them to the web mode (Nudge2Web). In this paper we experimentally vary and compare various Push2Web and Nudge2Web strategies in a survey of small and medium sized enterprises.

RN21S09 - Analyzing Inequalities and Discrimination

Mª Ángeles CEA D’ANCONA (Universidad Complutense de Madrid, Spain) | maceada@ucm.es
Miguel S. VALLES MARTÍNEZ (Universidad Complutense de Madrid, Spain) | msvalles@ucm.es

Two contextual elements have met to give ground to this paper: the specific topic on the conference theme (“Measuring Social Inequalities and Differences”) and the interest in survey methodology and mixed methods expressed by RN21. Our paper offers main results of the research on Multiple Discrimination Measurement supported by a grant from the Spanish Ministry of Finance and Competitiveness (CSO2012-36127): MEDIM Project. This project’s attempts are: 1) to elaborate a conceptual frame focused on multiple discrimination; 2) the proposal of a system of indicators that helps measuring blatant and subtle discrimination; 3) the exploration of main axes that articulate discriminatory discourses; 4) check which survey methods are more adequate to measure it (‘face-to-face’ or self-administered modes: Web surveys). These goals have been pursued combining different information sources and analytical strategies: available data (literature review, documentary research, quantitative and qualitative archival data) and data generated by the research team (qualitative and quantitative materials, gathered through individual or group interviewing natives and foreigners). The literature review has resulted in a theoretical framework. The system of indicators proposed derives from our evaluation of those applied in surveys on discrimination made in Spain (by CIS: Sociological Research Centre) and in Europe (Special Eurobarometer 380, mainly). As a complimentary source, we have used qualitative data gathered through focus groups and interviews. Some of the indicators were included in an experimental survey implemented through the traditional ‘face-to-face’ survey and CAWI. Survey mode effects were obtained. Some proposals for survey questions will be given.

Mind the Gap: A Multilevel Longitudinal Analysis of Rich-Poor Achievement Differences in London Schools
George LECKIE (University of Bristol, United Kingdom) | g.leckie@bristol.ac.uk
Education systems across the world are increasingly focusing on narrowing ethnic and other achievement gaps seen in their schools. We focus on England where since 2010 the Government have held schools publicly accountable for their rich-poor achievement gaps (socioeconomically disadvantaged pupils vs. their more advantaged peers) via publication of these statistics in national school league tables. It is hoped that this will also lead to the identification of successful schools and therefore policies which can be replicated broadly.

We present a multilevel longitudinal analysis of schools’ achievement gaps in London to illustrate severe limitations in the Government’s publication of these statistics. Specifically, we fit four-level (students within exam year within schools within school districts) binary logistic regression models to student exam success where we include random-coefficients on student disadvantaged status, exam year, and their interaction. We fit all models using Markov chain Monte Carlo methods.

The results show a slight reduction in the national rich-poor achievement gap, but substantial variation across schools. Unfortunately, many instances of apparent success in narrowing the gap are driven by a lowering of the performance of advantage pupils rather than any particular improvement of disadvantaged pupils. Other instances are driven more by the changing prior attainments of the two pupil groups rather than any genuine improvement in schools’ policies and practices. More fundamentally, the small numbers of students involved lead inferences about individual schools to be so unreliable that they are of limited use in identifying successful schools, whether for school accountability or improvement purposes.

**Measuring Social Inequalities with Confirmatory Factor Analysis**

Anna DOMARANSKA (Institute of Sociology NAS of Ukraine, Ukraine) | anna_doma@list.ru

The research question: The article considers the problem of measuring social inequalities. Nowadays, cross-cultural surveys, that include a broad list of questions as well as participants, provide a wide range of opportunities both for developing measuring instruments and conducting comparisons. At the same time, the question whether the measuring instrument functions in the same way across countries has arisen. The urgency of the question has been proved by the number of papers published over the last few years. Some of them deal with measuring social inequalities, while others study testing of invariance. For instance, British sociologists under the leadership of M. Savage combine measures of economic, cultural and social capital to determine class division by means of latent class analysis. Ukrainian sociologist N. Kovalisko suggests conceptual model of «positions & dispositions & practice». Russian sociologists headed by O. Shkaratan use entropy analysis to define attributes, which recognize the greatest difference between individuals’ position. F. Vijver and J. He consider methodological aspects of cross-cultural research, pointing out bias and equivalence. B. Byrne and F. Vijver describe difficulties caused by the comparison of large-scale cross-cultural studies. E. Davidov, H. Dülmer, E. Schlüter, P. Schmidt, B. Meuleman propose using a multilevel structural equation modeling approach to explain item bias. The purpose of this paper is to construct the measurement model of social inequalities and test its invariance across countries.

Theoretical framework: The traditions of social structure analysis provide a foundation for the measurement of inequality. Some researchers rely on the division of labour, exploitation and competition concept, others follow the capitals, assets and resources concept. Nevertheless, undoubted is the statement that access to scarce resources creates multidimensional space of inequalities and forms a hierarchically ordered system of social positions. Relying on theories of K. Marx, E. O. Wright, M. Weber, J. Goldthorpe, T. Parsons, P. Bourdieu, R. Dahrendorf, E. Durkheim and D. Treiman, the classification of scarce resources could be presented as: economic (ownership, income), authoritative (powers in the workplace), prestigious (reputation,
respect), cultural (cultural consumption, lifestyle), social (social networks, background) and personal (ability, talent, skill, competence).

Methodology: The article suggests using confirmatory factor analysis for constructing the measurement model of scarce resources as well as for testing invariance across countries. The data from the fifth round of the European Social Survey has been used. The analytical strategy consists of 1) operationalization, putting forth the available data; 2) model construction and testing; 3) verification and correction the measurement models for each individual country; 4) testing the measurement invariance across country; 5) defining groups where the conduction of comparison is possible.

Preliminary findings: The current study explores economic, authoritative and prestigious resources. Models with good-fitting solutions were achieved for all countries. The obtained latent variables «income», «authority» and «prestige» can be used for constructing a classification of social structure position, assuming that all positions of individuals can be located on the scale from the lowest social position to the highest one, determining their location by the presence and amount of scarce resources.

For instance, for Ukraine the results show that economic resources have the greatest influence on the determination of social structure position, followed by authoritative resources and then by prestigious resources. One-unit increase in the factor “social position” is associated with a 0.82-unit increase in the latent variable “income”, a 0.71-unit increase in the latent variable “authority” and a 0.65-unit increase in the latent variable “prestige”. The strongest is the association between authority and income – 0.56, then between income and prestige – 0.51 and, finally, there is a moderate association between authority and prestige – 0.42.

In addition, the four layers of society have been obtained:

§ The first layer. By socio-demographic characteristics it is mainly respondents under 30 years old with upper tier upper secondary education, crafts and related trades workers or representatives of elementary occupations.

§ The second layer. Respondents aged 30-54 with upper tier upper secondary education or advanced vocational training, service workers, shop and market sales workers, crafts and related trades workers or plant, machine operators and assemblers, who work for a private business employing less than 24 people.

§ The third layer. Respondents under 30 years old with advanced vocational training, technicians and associate professionals or service workers, shop and market sales workers, who work for a state owned enterprise or a private business employing from 25 to 99 or from 100 to 499 people.

§ The fourth layer. Respondents older than 54 with higher tertiary education, legislators, senior officials and managers, professionals or technicians and associate professionals, who work for a public sector (such as education and health) or a state owned enterprise employing from 25 to 99 or from 100 to 499, or 500 or more people.

Three groups of countries with the same model have been defined. For the first group the metric invariance has been supported, therefore the comparison of the relationships between the factor and other variables can be conducted. For the second and third groups the configural invariance has been supported, meaning that the same theoretical construct is measured in each country.

• The novel contribution and significance:

Social structure position, which is determined by access to scarce resources, is commonly used as an explaining variable. Often researchers analyze the social position along with sex, age, race, type of locality etc. There are two main reasons to prove the significance of this research. First, the submitted measurement model provides an opportunity to study the correlation between social inequalities and others social phenomena, taking advantage of the statistical methods for continuous data. For instance, to investigate the social inequalities influence on birth rate, mortality, morbidity, life chances, values, attitudes and behavior. Second, this approach allows conducting meaningful comparisons of scarce resources interaction, as well as
checking whether the structure of relationships between the mentioned resources is affected by the type of political regime, economic system etc.

**The Multidimensionality of Social Marginalisation in a Scandinavian Welfare State. A Latent Class Analysis for the Danish Adult Population**

Lars BENJAMINSEN (The Danish National Centre for Social Research, Denmark) | lab@sfi.dk  
Stefan Bastholm ANDRADE (The Danish National Centre for Social Research, Denmark) | sba@sfi.dk

This paper analyses patterns of social marginalisation based on administrative micro data for 4.4 million adult Danes. Data are combined from various sources. Labour market attachment, educational attainment and incarceration are measured by data from Statistics Denmark. Mental illness and substance abuse problems are measured by diagnosis data from the public health system. Homelessness is measured by data from a nationwide client registration system on homeless shelters. All data is linked on individual level through unique identifiers. The descriptive part analyses the multidimensionality of social marginalisation by mapping the intersectionality between key dimensions of social marginalisation and analysing how many people are affected by multiple social marginalisation. A latent class analysis identifies the underlying patterns across the different dimensions of social marginalisation and across age groups. The analysis identifies different groups of marginalised people. In all age groups we find a smaller group of people affected by multiple social marginalisation in terms of exclusion from the labour market, mental illness, substance abuse problems, and with a relatively high occurrence of incarceration and shelter use. We also find a group of people with severe mental illness who are excluded from the labour market but with relatively few indications of marginalisation in other dimensions i.e. a relatively low occurrence of substance abuse problems, incarceration and shelter use.

**Stuck In the Moment? Time Perspective and Time Allocation Across Social Classes in Poland.**

Ewa JAROSZ (University of Oxford, United Kingdom & Polish Academy of Sciences, Poland) | ewa.jarosz@sociology.ox.ac.uk

Individual’s time perspective and everyday time-use patterns have major impact on all realms of human life. They influence the chances for upwards mobility and affect individual life trajectories. As put by Jeremy Rifkin, “those who are most present oriented are swept into the future that others have laid out for them” (Rifkin, 1987). However, time perspective is a multidimensional phenomenon and needs to be studies in relation to the actual time use patterns – in which is it supposed to be reflected. Only combining attitudinal and behavioural data can give deeper insights into socially differentiating role of temporal arrangements. This study analyses daily time allocation patterns in conjunction with temporal preferences and the possible drivers behind them – such as individual time perspective and time constraints. It focuses on the relationship between the perception of time and daily allocation of time and individual position in the social structure. Using quantitative data for Polish population aged 24-65 (n=780), it shows how temporal orientations and perception of time are related to individual social position and how they differ depending on the respondent’s genders, age, educational attainment or occupational category. The study casts light on the much overlooked dimension of social inequality, including the effect of temporal perspective on time-use patterns, social determinants of the ability to plan long-term and delay gratification, as well as the life course-related choices and their consequences.
RN21S10 - Measurement and Response Behavior

Using Eye Tracking Data to Understand how Respondents Process Forced-Choice vs. Check-all-that-apply Question Formats
Cornelia Eva NEUERT (GESIS - Leibniz Institute for the Social Sciences, Germany) | cornelia.neuert@gesis.org

Recent experimental research has shown that the check-all and forced-choice question formats do not produce comparable results (Smyth et al., 2006). However, the cognitive processes underlying respondents’ answers to both types of question formats are unclear. Do forced-choice formats lead respondents to read each answer option and to more thoughtfully consider their responses? And are respondents who are presented with a multiple response list more likely to skim the list rather than read them thoroughly, a behavior also known as satisficing?

In this study, I use eye tracking data to gain a better understanding of the cognitive processes underlying respondents’ behavior when confronted with check-all and forced-choice questions and to more directly observe what respondents do and do not look at while responding to those questions.

In a lab experiment (n=84), half of the respondents were assigned to a version of a survey in which two questions were formatted as check-all-that-apply questions and the other half were assigned to a version in which the same two questions were formatted as forced-choice questions.

By analyzing the respondents’ eye movements, both question formats are compared concerning the amount of attention and cognitive effort (operationalized by response latencies, fixation times and fixation counts) respondents spend while answering the questions. Specifically, I examine whether the different formats affect the number of answer options read, how long respondents spend on each response option, and the distribution of responses selected.

Moderation Effects of Response Latencies and Meta-Judgments on Response-Effects and Attitude-Behavior Consistency
Jochen MAYERL (University of Kaiserslautern, Germany) | Jochen.Mayerl@sowi.uni-kl.de
Volker STOCKÉ (University of Kassel, Germany) | volker.stocke@uni-kassel.de

The aim of the paper is to test moderation effects of cognitive accessibility of the respective target information in respondents’ memory concerning a) moderation of attitude-behavior consistency, and b) moderation of the occurrence of response effects. The paper compares the indicators of self-reported response certainty and the time needed to answer the question, which are furthermore differently transformed prior to data analysis.

Respondents’ answers about their attitudes and behavior are found to be affected by different kinds of response effects. This means that they differ considerably depending on situational cues, context information, wording of questions, or format of response scales. Furthermore, self-reported attitudes are found to be very differently predictive for behavior. It has been hypothesized that both, the degree of attitude-behavior consistency as well as the susceptibility to response effects are determined by the cognitive accessibility of the respective target information in respondents' memory. We test these moderation hypotheses using self-reported response certainties and the time needed to answer the question under consideration. Furthermore, we test for how response certainties and response latencies should be transformed prior to data analysis in order to maximize their predictive power. Accordingly, we compare untransformed measures with logarithmic, square-root and reciprocally transformed
versions. In addition, several types of data treatment of response latencies are applied and evaluated (e.g. correction of baseline speed, outlier treatment, and interviewers’ time validation). We utilize two different computer assisted surveys (CATI and CAPI) with random probability samples in Germany in order to realize these aims.

The Implications of Aggregation in Index Building
Liv BJERRE (Berlin Social Science Center (WZB), Germany) | liv.bjerre@wzb.eu
Friederike RÖMER (Berlin Social Science Center (WZB), Germany) | friederike.roemer@wzb.eu
Malisa ZOBEL (Berlin Social Science Center (WZB), Germany) | malisa.zobel@wzb.eu

The number of indices that rank or assess countries according to some social, economic, political or environmental issue grow year after year. But what does an index rank really tell us about the concept we are trying to measure? And how sensitive are our findings to the methods that were employed in the construction of the index? The advantages and disadvantages of indices per se have been discussed by a multitude of authors; the construction of indices has not been paid the same level of attention. Nonetheless, both opponents and supporters of index building have criticized the lack of methodological reflection and thoroughness that prevails in index construction, especially when it comes to aggregation and weighting. To close this gap, this paper sets out to compare four aggregation methods: a standard additive aggregation function, an arithmetic aggregation function, a geometric aggregation function and a non-compensatory/non-linear aggregation function following a ranking procedure brought forward by Arrow & Raynaud (1986). In its theoretical part the paper discusses the underlying assumptions and requirements for each of the aggregation methods. In the empirical part the four methods are applied to the IMPIC data, a new dataset which measures immigration policies restrictiveness across 33 OECD countries for the period 1980-2010. The aim of the paper is thus twofold: it shall help researchers choose an aggregation function adequate for their concept and research question, while at the same time adding to the overall discussion of robustness and sensitivity of indices which is taking place across disciplines.

Predicting Randomness: Differences in Stability of Attitudes to a Foreign Policy Issue
Michaela ROSCHOVA (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | michaela.roschova@soc.cas.cz

Scholars studying public opinion long ago pointed out that there is a great deal of instability in attitudes expressed over periods of time. This finding received two distinct interpretations: (1) that most of the general public have no pre-formed attitudes and only report opinions off the top of their heads, (2) and that the public indeed have attitudes but instruments purported to measure them are plagued with vagueness and inaccuracy resulting in random measurement error. As the decisive test between these two interpretations, it has to be ascertained whether the degree of response fluctuation is homogeneous across population or whether it can be related to characteristics of respondents. If the random error can be predicted, then it is not mere noise attributable to measurement instruments, rather it is indicative of differences in attitude strength between various groups. Utilizing three waves of a Czech panel study with a measurement interval of one month, the present paper aims to isolate the extent of random fluctuation in repeated expressions of an attitude to a foreign policy issue with the so called quasi-Markov simplex model. Differences in the obtained estimation of attitude instability are then studied using socio-demographic variables as well as measures of political sophistication. From the range of predictors, only the level of political knowledge and importance of the issue to
respondent are shown to have a significant positive effect on the attitude stability. Implications of the findings for attitude measurement theory are discussed in the final part.

RN21S11 - Quantitative Research on Gender Inequality

Exploring the Extent of Inequality Associated with Occupational Gender Segregation in Turkey

Cigdem GEDIKLI (University of East Anglia, United Kingdom) | cgdmgdkl@gmail.com

This article investigates occupational gender segregation and its vertical and horizontal components in Turkey. In order to explore the extent of inequality entailed in occupational gender segregation (measured by the vertical component), average pay levels across occupations are used and it is investigated whether it is men or women who have a greater tendency to be employed in lower-paid occupations. In addition to the economic inequalities captured by pay, in order to explore the social inequalities inherent in occupational segregation, a social stratification scale is constructed by using a Correspondence Analysis. The results show that the extent of inequality associated with occupational segregation is notable. Women are more likely to be employed in lower-paid jobs and in occupations that rank lower across the overall stratification structure. The horizontal component of segregation is found to be larger than the vertical component, suggesting that overall differentiation in the employment patterns between men and women owes more to the fact that they are employed in horizontally different occupations.

The Influence of Occupational Characteristics on the Share of Women in Occupations: Results from a Dynamic Fixed-Effects Panel Analysis for the German Labour Market

Sabine Katrin EBENSPERGER (University of Erlangen-Nuremberg (Friedrich-Alexander-Universität Erlangen-Nürnberg), Germany) | Sabine.Ebensperger@fau.de
Andreas DAMELANG (University of Erlangen-Nuremberg (Friedrich-Alexander-Universität Erlangen-Nürnberg), Germany) | andreas.damelang@fau.de

This paper aims to investigate the effects of occupational characteristics on the share of women in occupations by using dynamic fixed-effects panel analysis. Occupational sex segregation is a distinct feature of the German labour market and has a wide impact on labour market outcomes. Among others, average wages are lower in typical female occupations than in male ones. Nevertheless, still a research gap exists concerning the determinants of the share of women in occupations. This paper focuses on occupational characteristics, such as aspects of the compatibility of family and work or qualification requirements, and their influence on the share of women in occupations. So far, only few studies exist which analyse the interplay between occupational characteristics and the share of women in occupations on the occupational level (e.g. Bielby & Baron, 1986; Busch, 2013; Cha, 2009). These studies are, however, based on cross-sectional data and are, hence, limited in interpreting their effects as causal. Building on this, we aim to improve causal statements with the help of panel data analysis.

First, we build a dataset on the occupational level by aggregating individual data of the 1996 to 2010 waves of the German micro census. For this reason, we merge the information of all respondents that work in the same occupation. Information on individuals hence become aggregated variables which depict characteristics of occupations. Relying on causal
interpretations of parameters obtained by dynamic fixed effects panel models we then test whether occupational characteristics influence the share of women in occupations. Our key findings show that rising working-hours, fixed-term contracts, mean income as well as the representation of academics lead to a decrease in the share of women in occupations. We trace this back to the preferences of women for jobs with a good compatibility of family and work as well as low requirements. The negative effect of the mean income may also show repression processes by men.

**Impacts of the Economic Crisis on Social Inequalities: A Class and Gender Analysis**

João de Freitas FERREIRA DE ALMEIDA (CIES-IUL, Institute University of Lisboa, Portugal) | ferreira.almeida@iscte.pt
Rui BRITES (ISEG-University of Lisboa) | rui.brites@outlook.com
Anália Maria Cardoso TORRES (CIEG/ISCSP-University of Lisboa) | atorres@iscsp.ulisboa.pt

With the beginning of the economic crisis it seems that the theme of inequality gained more space and relevance in the media as well as in the political discourse. In spite of that, there is still some resistance to consider inequality as a crucial social problem, prolonging a strong tradition of naturalizing poverty, of ignoring inequality social determinants. Social class and gender are two perspectives allowing the observation and better understanding of the crisis impact on social inequalities. Differences between European countries - including rescued and non-rescued ones - will be systematically accounted for. The main source of information is provided by the European Social Survey comparing findings from Round 3 (2006) to those from Round 6 (2012). The comparative data will be submitted to descriptive analysis using parametric and nonparametric methods, MCA, Multivariate Correspondence Analysis, PCA, Principal Component Analysis, CATpca, Categorical Analysis and Cluster Analysis (optimising technique).

**RN21S12 - Mixed Methods**

**Designing a Bridge to Cross the Quantitative-qualitative Divide: An Example on Children’s Empathy**

Floryt VAN WESEL (Utrecht University, Netherlands, The) | f.van.wesel@vu.nl
Simone ROERIG (VU University Amsterdam, Netherlands, The) | s.roerig@vu.nl

A subject such as children’s empathy can be studied from a solely quantitative as well as a solely qualitative point of view. Both viewpoints bring their own research methodology and insights to the matter and are as such complementary. Due to the diverging focus of both strands, mixing them is potentially interesting but doing so is not straightforward. So what to do if the default designs for mixing don’t apply? In the present study we sought for bridges, i.e., data that somehow link the quantitative and qualitative strands, to cross the quantitative-qualitative divide. The study design included three potential bridges to link quantitative data on empathy as an individual ability and qualitative data on empathy as an interactive process between two or more individuals. The first bridge was formed by measuring children’s ability to enact emotions (‘as if’ life) in an interactive setting by means of a Theatre Test. The second bridge involved mapping the social network within the school class. And the third bridge concerned the ideas and reflections that children themselves had on the concept of empathy. All
three additional sources of information had surplus value but only one of them could be used as an actual bridge in the analyzes. We will discuss implications of this finding on mixed methods designs.

**The Study of Social Representations by Vignette Method: Qualitative Methods in Quantitative Interpretation**

Zhanna PUZANOVA (Peoples' Friendship University of Russia, Russian Federation) | puzanova.zhanna@gmail.com  
Anastasiya TERTYSHNIKOVA (Peoples' Friendship University of Russia, Russian Federation) | nastysha-88@inbox.ru

Social representations are not only found in the minds of people, but also affect their behavior. They exist on the border between psychological and social fields and reflect the way people perceive and understand events of their life. Sociologists rely on rather wide range of techniques and tools to gather information about the world, but at the same time try to attract a number of specific methods of data collection. One of such methods is vignette method. Originally, vignettes have been understood and developed as short stories that describe characteristics and hypothetical situations to which the respondent should express his reaction. The main advantages of this method are: the ability to avoid shared thinking answers; variation of characteristics in vignettes reveals changes in attitudes or judgment gives the opportunity to study relation between social processes and reality perception. In western tradition in psychology, pedagogy, education, sociology, using analysis of vignettes-stories refers more to the qualitative paradigm. However, we are interested in possibility of converting received information into quantitative indicators. We attempted to develop and test tools for the study of social representations by the vignette method. Vignettes design requires careful working. The basis for its composition can be data resulting from the study with incomplete sentences method. We had aim to evaluate the cognitive capabilities of the vignette method in the study of social representations (with an estimate of the difficulties and constraints) as well as to use logic-combinatorial methods for the data processing received with the use of vignettes.

**Numbers and Words: Reflecting on Quantitizing Processes in Computer-assisted Text Analysis**

Valeria PANDOLFINI (University of Genova, Italy) | Valeria.Pandolfini@unige.it  
Stefano POLI (University of Genova, Italy) | Stefano.Poli@unige.it

The paper presents some methodological considerations on the use of computer-based text analysis to integrate qualitative and quantitative methods in social research, towards the adoption of mixed methods approach. The contribution focuses on the quantitizing processes related to coding procedures of textual data. Showing how the advent of computerized software programs to manage both qualitative and quantitative data have promoted a largely technical view of quantitizing, a plurality of dimensions (theoretical, methodological, practical) are taken into account. The challenges of quantitizing within computer-based text analysis are to decide which textual data (unstructured and qualitative data) will be the objects of conversion in numerical data (structured and quantitative data), which coding procedures have to be implemented, for what purpose and what are the software roles in such processes. Potential risks connected to improper use of software are presented, to guarantee methodological accuracy and the quality of analysis: among them, the paper underlines the propensity to “forced quantifications” according to the “myth of the measurement”, till the excessive simplification of the words count.
as the main criterion for defining inferences about the texts meanings and the senders intentions. The quantitizing requires a continuous cycling between assigning numbers to meaning and meaning to numbers, between measurement and interpretation. Thus, the conception of quantitizing as unidirectional as moving from qualitative to quantitative data is critically analyzed, as well as the conditions under which mixed methods approach can be implemented in computer-based text analysis.

**Analysing Vocational Rehabilitation in Germany - A Multi-Method Approach**
Anita TISCH (Institute for Employment Research, Germany) | anita.tisch@iab.de

The Federal Employment Agency is one of the main providers of vocational rehabilitation in Germany. A variety of measures are implemented to enable disabled people and those threatened by disability to participate in the labour market. We make use of a multi-method approach to analyse these measures and their impact on labour market participation, individual employability and social participation. On the one hand administrative data of the Federal Employment Agency is prepared for analysis. As the administrative data covers the entirety of all persons in rehabilitation since 2006 (n= approx. 280,000), it is possible to make meaningful analysis based on these data. However, only information important for the process of vocational rehabilitation is covered in the administrative data. Information on social contexts, individual health status or individual expectations is not included. Therefore, an additional explorative qualitative study gathers these information conducting biographical personal interviews with 80 - 100 rehabilitants. Based on the qualitative interviews a representative survey will be prepared. This contribution gives an overview of the study approach and some examples how the different methods contribute to the overarching aims of the study.

**RN21S13 - Big Data, Machine Learning and Text Analysis**

**Evaluating the Reliability of Coding for Qualitative Data through the Use of Social Network Analysis and Exponential Random Graph Models**
Iasonas LAMPRIANOU (University of Cyprus, Cyprus) | iasonas@ucy.ac.cy

In mixed methods research, it is sometimes the case that researchers may include open-ended questions in structured questionnaires so that the respondents can express themselves in free speech. This, has the advantage that rich qualitative data are collected which can be used for triangulation purposes etc. Sometimes, the researchers wish to quantify (code) the qualitative data in order to include them in quantitative models, e.g. in a regression model. This, however, is cumbersome, costly and time consuming. The procedure of the coding large volumes of qualitative data usually includes a large number of coders, who often exercise subjective judgments in order to code the responses. This procedure has been "accused" of providing low-reliability data (i.e. low between-coders reliability). This study uses an innovative approach where Social Network Analysis and Exponential Random Graph Models are used in order to monitor the reliability of coding of qualitative data. A large group of coders were trained to code a large volume of qualitative data which were part of a quantitative study. During the training phase, the researcher employed SNA and ERGMs in order to monitor the agreement between the coders. Groups of coders seemed to "cluster together" forming "cliques" and "triangles". Using SNA made it easy to identify coders who were out of tune with the rest of the groups. These coders needed to be re-trained or to be removed
from the coding process. ERGM were used to identify the profiles of coders who best clustered together, so that in future we would know who could be hired and trained to code similar qualitative data.

This is an innovative study which illustrates a new use for SNA and ERGM. Advantages and disadvantages of the methods are discussed.

**Big Data and Social Sciences: Epistemological and Methodological Challenges**

*Fabrizio MARTIRE (Sapienza, University of Rome, Italy) | fabrizio.martire@uniroma1.it*

In these last years, big data capture, processing and analysis have increasingly been experimented in various social science disciplines. Typical examples of big data that are relevant for social sciences are: the user-generated content created on blogs, social network sites and other online services; the tracks (digital footprints) that some human behaviors leave on the web or on other electronic archives. These new kinds of data sources are using to study traditional issues in social sciences: values, attitudes, opinion, decision makings, etc.

The emergence of big data in social sciences seems to update some classical methodological debates.

a. Unobtrusive vs. obtrusive data collection strategies. Big data sources exist independently of the research process; survey data are produced during the research process by interview, that – from the point of view of the interviewee – can be consider a quite artificial interaction process. According to several researchers, this marks a point ahead of big data on survey in terms of veracity.

b. The role of theory in social research. Big data research, some have argued, implicitly assumes that the Web provide so much data that theoretical thinking become irrelevant. Everything, from this point of view, becomes understandable without theories and hypotheses, since the data speak for themselves. Although this idea is not entirely uncontested, it opens the way to new form of inductivism.

c. Representativeness of data and generalization of findings. Some researchers argue that big data are, in principle, exhaustive in scope and, therefore, they allow the scientists to overcome all the vulnerabilities of sampled data. On the other hand, big data for social sciences are typically Web-based, so they bring about the problem of the relation between on-line and off-line activities.

What is the impact of these and similar methodological issues on the way in which big data social researches are concretely carried out? I will try to answer to this question by surveying a sample of big data researches drawn from the areas of social sciences where they are more widespread.

**Analysis of Comments to the Internet Socio-Political News as a Research Technique**

*Shamil FARAKHUTDINOV (Tyumen State Oil and Gas University, Russian Federation) | fshamil@mail.ru*

Nowadays, a number of sociological researches on the Internet are constantly growing, because of virtualization intercourse. The network is becoming a platform for public debate on various issues. Sociologist should be an observer on this platform. That's why he needs appropriate methods. The main Internet feature as the mass-media is the feedback (possibility to leave comments). It is comments which are the material for a sociologist's attention.

The author has attempted to develop such a method as a form of the content analysis. Working with the comments the following steps were defined: a) cleaning the array of extraneous messages; b) synthesis of the full range of views, the allocation of the most characteristic ones;
c) counting of the number of different opinion groups, their percentage comparison. Despite of the seeming simplicity of the procedure, there were a lot of questions to be answered. Are the comments public opinion or peer-review? Statements are often very competent, their professional character is seen, but sometimes – opposite. How representative are the comments under observation? Can we say that the result of our analysis shows the opinion of the whole society? It can be assumed that the comments are left only by the most active people. There are other aspects can be mentioned: the possibility of studying the socio-demographic characteristics, if the comment is an account in a social network; identifying the place and the role of «trolling» when commenting on news.

Now under review method gives more questions than answers. However, the research has shown that the data obtained from the analysis of the comments to the article on education reform in Russia on one of the news sites are almost the same as the results of a poll conducted by the «All-Russian Public Opinion Research Center» on this same problem.

Big Data Methods in Qualitative Text Analysis
Daria IUDINA (Saint-Petersburgh State University, Russian Federation) | dartisimus@gmail.com

The development of Big Data makes social researchers to reconsider traditional methods of text analysis. Invention of the machine learning algorithms, which can code textual information partly or wholly independently from the researchers’ interpretations, give sociologists opportunities to analyze large amounts of texts in reasonable time. This situation suggests that quantitative methods pretend to substitute qualitative text analysis at least at the initial stages of coding. Another advantage of big data methods is the robustness of results provided by these methods what makes qualitative text analysis meeting the rigorous scientific standards of validity and reliability. However, there is not enough evidence of efficiency of text mining in real sociological research.

The paper will present the results of several experiments with the application of methods based on Latent Dirichlet Allocation to the analysis of text data in sociological research. The main purpose was to demonstrate possibilities and limitations of big data methods in facilitating qualitative analysis of text by improving coding systems as well as indicating validity and reliability of researcher’s interpretations of text. Furthermore, the implications of research could set new challenges for engineers in Big Data from the part of social science.

RN21S14 - Web Surveys and Missing Data

Estimating the Correlation between Sensible Behaviours Dealing with Item Missing Data
Alessandra GAIA (University of Milan-Bicocca, Italy) | gaia.alessandra@gmail.com

Recent studies from the UK have shown that “men who pay for sex” engage in more risky behaviours such as bridge drinking, use of drugs other than cannabis, and unsafe sex, than other men. However, both paying for sex and engaging in risky behaviours are sensitive topics in surveys, that respondents may misreport or underreport. Thus, I hypothesize the correlation to be partially driven by a third factor: the willingness to reveal a socially undesirable behaviour. This endogeneity is particularly problematic since data on sex workers’ clients may be used to evaluate policies on the regulation of prostitution; however, policies themselves influence the level of sex workers’ clients stigmatization, and this may lead to increasing misreporting and/or underreporting, making policy evaluation more challenging.
I use data from the National Survey of Sexual Attitudes and Lifestyle (Nasal-2). Using paradata on presence of other people during the interview and interviewers’ evaluation of the respondents’ embarrassment, I show how response pattern differs depending on the privacy of the interview settings. Also, I use imputation techniques to impute item non-response for both risky behaviours and paying for sex, and take the previous research forward by re-estimating the correlation of paying for sex with risky behaviours after imputing item non-response in both sets of variables.

I believe, and hope, that this paper makes an important contribution not only on the measurement and analysis of paying for sex, but also on the analysis of the correlation of different behaviours measured with sensitive questions.

Setting-up a Probability-based Web Panel. Lessons Learned from the ELIPSS Pilot Study
Anne-Sophie COUSTEAUX (Sciences Po, France) | annesophie.cousteaux@sciencespo.fr
Anne CORNILLEAU (Sciences Po, France) | anne.cornilleau@sciencespo.fr

During the last decade, the internet has moved from an attractive data collection mode to a common way to administer surveys. Nowadays, the main issue is the representativeness of these web surveys, especially through the academic world. Since the LISS Panel and the Knowledge Panel, there is a growing interest in setting up probability-based web panel. The ELIPSS Panel is one of such initiatives born in France in 2012 and aims at offering social scientists a service to produce nationally representative surveys. A touchscreen tablet and 3G internet subscription are provided to all panel members in exchange for their participation. Thus, they can answer the research questionnaires even if they did not have an Internet connection at home.

As such a service to collect data for social sciences did not exist in France, a pilot study had to be set up to define the recruitment process, establish procedures for managing the panel and producing surveys, and develop software tools. The ELIPSS pilot started in 2012 and consists in 1039 panel members. This paper focuses on the lessons learned from the pilot to set up the main panel. First, we will give an overview of the recruitment procedure planned for 2015 in the light of the pilot results. Then, we will present the specifications for the management of the panel to maintain monthly participation and limit attrition. Overall, we will discuss the opportunity of offering tablets as an incentive for panel members and as an advantage in terms of survey design.

Comparing Real and Falsified Survey Data: The Example of Political Action
Uta LANDROCK (GESIS Leibniz Institute for the Social Sciences, Germany) | uta.landrock@gesis.org
Natalja MENOLD (GESIS Leibniz Institute for the Social Sciences, Germany) | natalja.menold@gesis.org

Face-to-face interviews are an important mode of data collection in surveys. The interviewer plays a central role in face-to-face surveys. However, data falsification by the interviewer can seriously contaminate the data quality. Therefore it is essential to identify falsified data. The central question is how falsified and real data differ. We analyse differences between real and falsified data. Our database consists of two datasets: In an experimental study interviewers conducted real face-to-face interviews. In a next step the interviewers fabricated survey data in the lab so that a data set of N = 710 falsified interviews corresponding to each of the N = 710 real interviews were obtained. We use both datasets for calculating multivariate causal analyses
and compare the results. The survey uses questions of the ALLBUS, the German General Social Survey. Real and falsified data are compared in terms of the determinants of political participation: We measured twelve political activities and calculate an activity index. The independent variables are values and attitudes, such as political (dis-)satisfaction or self-placement on the left-right-scale. Additionally we include socio-demographic factors. Our intervening variable is political efficacy. We expect that the explained variance of our models is higher and that there are more significant effects in the falsified data than in the real dataset: We assume that interviewers who falsify survey data apply their everyday experience for inventing consistent false cases whereas real interviewees act and respond more inconsistently.

Effects of the Implementation of ‘Forced Response’ within Online Surveys on Response Rates and Validity of Answers

Jean Philippe DECIEUX (University of Luxembourg, Luxembourg) | jeanphilippe.decieux@uni.lu
Alexandra MERGENER (Bundesinstitut für Berufsbildung (Bonn)) | mergener@bibb.de
Kristina NEUFANG (Universität Trier) | s4krneuff@uni-trier.de
Philipp SISCHKA (University of Luxembourg, Luxembourg) | philipp.sischka@uni.lu

Due to the low costs and the ability to reach many people in a short time, online-surveys have become an important resource of data for research. As a result, many non-professionals gather their data through online questionnaires, which are often of low quality or operationalised poorly. A popular example for this is the ‘forced-response-option’, whose impact will be analysed within this research-project.

The forced-response-option is commonly described as a possibility to force the respondent to give an answer to each question that is asked. In most of the online-survey computer software, it is easily achieved by enabling a checkbox. There has been a tremendous increase in the use of this option, however, the inquirers are often not aware of possible consequences. In software-manuals, this option is praised as a strategy that reduces item-non-response. In contrast, authors offer many doubts that counter this strategy. They base on the assumption that respondents typically have plausible reasons for not answering a question (not understanding; absence of appropriate categories; privacy).

Our thesis is that forcing the respondents to select an answer might cause two scenarios:
- Decreasing validity of the answers (lying/random answers).

To analyse the consequences of the implementation of forced-response-option, we use split-ballot-field-experiments. We especially focus on dropout-rates and response behaviour. Our first split-ballot-experiment was carried out last July (n=1056) and we plan a second experiment for March, so that we will be able to present our results based on strong data evidence.

RN21S15 - Quantitative Research on Inequalities Based on Class and Ethnic Group

Ethnic Mover Flows and Neighbourhood Change in Scotland

Gwilym Benjamin PRYCE (University of Sheffield, United Kingdom) | g.pryce@sheffield.ac.uk
Jessie BAKENS (University of Sheffield, United Kingdom) | j.bakens@sheffield.ac.uk
In this paper we describe the role of ethnicity in spatial patterns of mover flows in Scotland. We focus on the ethnicity of movers in relation to the ethnic composition of neighbourhoods. Many cities are becoming more and more ethnically diverse. Within cities however, neighbourhood population composition might not always mirror this diversity as clustering, segregation, but also mixing of ethnic groups predominantly takes place on lower spatial levels. For individual residents, the ethnic population composition of a neighbourhood might therefore become an increasingly distinctive and important feature for the comparative evaluation of residential locations. If the ethnic population composition of a neighborhood plays a role in individual location decisions, compositional preferences are most likely related to one's own ethnicity. Understanding this mechanism in the process of residential location decisions will ultimately help us to better understand ethnic neighbourhood dynamics.

For the analysis in this paper, we use a unique combination of datasets on a very fine-grained spatial level. We link the Registers of Scotland house transactions data between 1990 and 2010 with the Scottish Neighbourhood Statistics. The ethnicity of house buyers is identified by (sur)name analysis. There is a rich literature on using onomastics to identify ethnicity, and this approach can overcome some of the drawbacks inherent in using other ways of identifying ethnicity like, for example, country of birth.

Adapting a gravity model of spatial interaction, we model spatial patterns of mover flows of different ethnic groups in Scotland and neighbourhood compositional change. Spatial interaction models offer a systematic approach to describe the role of neighbourhood population composition in determining location patterns of different ethnic groups.

Analysing Patterns of Recidivism in Chile through an Event History Analysis Model
Ana MORALES (University of Manchester, United Kingdom) | ana.morales@postgrad.manchester.ac.uk

Every year, a considerable number of ex-offenders are released from prison and a high percentage of them re-offend. Reducing recidivism is often quoted by policy-makers and the general public as an effective way to improve public safety. Chile is among the countries with the highest incarceration rates in Latin America (250 prisoners per 100,000 inhabitants). The prison population in Chile is mainly young, they are commonly school-leavers and have had erratic work patterns with long periods of unemployment. Furthermore, most of them come from the poorest areas of the country, which is evidence of a socio-economic gradient. Understanding recidivism in Chile is crucial in the new strategy of public safety; however, most of Chilean-based studies have analysed the phenomenon in a descriptive way.

Recidivism has been often studied by analysing the probability of re-offending over a fixed time period using logistic regression models. These models do not take into account the issue of censoring nor that the effect of covariates may not be constant over time. Event History Analysis (EHA) models address these limitations by accounting for the censoring characteristics of the data and including time-varying variables in the analysis. Using data from administrative records of the Chilean National Prison Service (2000-2010), this study implements an EHA model to analyse how time until recidivism is affected by individual and contextual characteristics, such as prison and localities. These analyses shed light upon the phenomenon of recidivism in Chile and potentially other developing countries.

Ethnic Differentiation and Social Stratification in the South Tyrolean Society. An Empirical Survey
Eike Lars POKRIEFKE (apollis - Institute of Social Research and Opinion Polling, Italy; Michael-Gaismair-Gesellschaft Bozen) | eike.pokriefke@apollis.it

The South Tyrolean (autonomous province of Italy) society is constituted by three ethnolinguistic groups: The German speaking population being a “fragile majority” (McAndrew 2013) - a majority in the region but a minority in the nation state. The Italian and Ladin speaking populations are autochthonous minorities in South Tyrol. Later than in its northern neighbouring regions, South Tyrol is recently seeing growth of the migrant population, currently contributing nine percent to total population. The aim of the study at hand is to analyse social inequalities arising from ethnic differentiation and social stratification in this unique relation between new and old minorities.

The data base results from a quantitative telephone survey (CATI) with a representative sample of 1500 respondents, respectively around 1000 households. Classical approaches to social structure (Blau 1987, Haller 2008) based on social characteristics (age, sex, religion, ethnicity, education, income) are combined with a recent lifestyle approach. This is operationalised in the implementation of international validated instruments, like the European Socio-economic Classification (ESeC, based on the ISCO-88), the EU-SILC concept of “material deprivation”, as well as an in Germany developed and validated lifestyle typology by Gunnar Otte (2008, based on Bourdieu, Hradil, Schulze, Vester) and finally parts of the ISSP developed measurement of “subjective inequality”.

Shedding New Light on Income Poverty: Enriching the EU-SILC with the Census

Petr JANSKY (CERGE-EI; Charles University in Prague) | jansky@fsv.cuni.cz
Matěj BAJGAR (CERGE-EI; University of Oxford) | matej.bajgar@gmail.com
Klára KALIŠKOVÁ (CERGE-EI) | klara.kaliskova@cerge-ei.cz
Pavel HAÏT (CERGE-EI; Tomas Bata University in Zlín) | pavelhait@gmail.com

EU Statistics on Income and Living Conditions (EU-SILC) is the reference source for micro-data on income and living conditions and it is a basis for many indicators designed to monitor poverty and social exclusion in the EU. We re-examine the representativeness of the EU-SILC and focus on people that are in the census data, but not covered by the EU-SILC. These include groups of homeless and institutionalised people who are likely to suffer from higher than average rates of income poverty. We match the census with the EU-SILC data for the Czech Republic and estimate the overall as well groups-specific income poverty rates. These are significantly higher than those based solely on EU-SILC. However, we still consider them the lower bounds of the actual poverty rates since there are a number of factors which we are still unable to consider due to limited data availability even in the census.
RN22 - Sociology of Risk and Uncertainty

RN22S02 - Risk and Health

Diagnosed mistrust and underprivilegedness of the forensic psychiatric patients in Finland
Miisa TÖRÖLÄ (University of Eastern Finland, Finland) | miisa.torola@uef.fi

Forensic psychiatric patients (FPP) are a group of people who have committed a crime and been through a mental state examination which has led them to involuntary psychiatric care. My ongoing thesis examines FPP and their social background, their societal status, and the patterns of the usage of welfare services. My research questions are:
1) How do the forensic psychiatric patients differ from other offenders (in the terms of social background)?
2) In what kind of social position have these patients been before committing a crime?

About half of the FPP have been diagnosed suffering a mental illness featuring paranoia. Paranoia is significantly more prevalent feature among the FPP than among the prisoners in Finland. At individual level, paranoid thinking in adulthood is associated with childhood experiences violating her/his basic trust. Moreover, at societal level, paranoia is linked to underprivilegedness.

The data (n = 218) consists of the reports of the mental state examination, the records of the previous psychiatric hospital treatment, extracts from the criminal records, and the records of the previous terms of punishment. Statistical methods of analysis are applied in this research. Preliminary findings indicate clear evidence that, prior to the criminal act, the majority of the subjects have been underprivileged with long-term substance abuse and serious mental health problems. Only for about half of the subjects this was the first criminal committed. In my paper the preliminary results of the association between diagnosed distrust and societal status of the FPP are presented.

The construction of knowledge on alcohol risk in the era of globalization and its consequences
Michał BUJALSKI (Institute of Psychiatry and Neurology, Poland) | bujalski@ipin.edu.pl

Europeans consume the largest volume of alcohol in the world. Drinking can be a source of pleasure but it is be also associated with several health and social risks. The process of creation and communication of knowledge on alcohol risk can be viewed through the perspective of public health as well as through commercial interests of alcohol industry. As commercial and national interests are at stake, the conflict of interests is imposed. Alcohol producers make efforts to engage public institutions in dialogue to influence the final shape of the alcohol programmes and policies. Changing the debate on alcohol is supported with scientific evidence produced by industry-controlled Social Aspect Organizations (SAO) to promote public-private partnerships, propose self-regulation in alcohol marketing, emphasize the 'normality' of alcohol as an ordinary commodity and introduce policy measures focusing on education and individual responsibility. Yet, public health advocates recognize SAO as an ideological instrument on behalf of vested interests of alcohol industry and emphasize consequences of research commercialization and promotion of partnerships between business and science.
Public health and the alcohol industry can be considered as self-referential systems operating within system-specific range of meaning and protecting their boundaries in the complex environment (Luhmann 1990, 1995). Science as a code of communication facilitates reduction of the environment complexity, although public health and industrial interests are shaping scientific discourse and outcomes. The inclusion of science by the alcohol industry shows the negative consequences of research commercialization and promotion of partnerships between business and science. As the result, prestige and authority of the science can be endangered.

"If we cannot name it, we cannot control it… “; the defensive nursing arrival?
Hana KONECNA (University of South Bohemia, Czech Republic) | hana@adamcr.cz
Ludek SIDLO (Charles University, Czech Republic) | ludek.sidlo@gmail.com

Contemporary medicine can deal with a lot of previously uncontrollable diseases. It brings great hope. If the hope is fulfilled frequently, however, it easily changes into expectations or even claims. This, together with the growing autonomy of the patient and lawyers ready to sue, led to what is called “defensive medicine”. Its important tools are strict and detailed formalization and perfect documentation. Defensive medicine is such a big problem for the quality and financing of medicine, that some experts call for „creating culture of uncertainty“; but it is a huge psychological challenge.

With the hi-tech medicine and demographical changes in developed countries the nursing is becoming more and more important profession. The role of nurses has ever been unappreciated. Now there are attempts to establish the scientific basis of nursing (Evidence Based Nursing) and make nursing more valued. Scientific base means forming separate detailed nursing taxonomies: nursing diagnoses, nursing interventions and nursing-sensitive patient outcomes as well as the separate thorough nursing documentation. Taxonomisations are prerequisites for understanding the life, the world and their management, they promise to bring certainty, control, manageability. But nursing is by its nature more affected by uncertainties than medicine; nurses’ work consists largely of working with emotions, language and it is context-bound. Our goal is to analyse whether nursing taxonomies can bring what they promise. Maybe it is rather a step towards “defensive nursing”. But do nurses have another option if there is no will of societies to accept uncertainty and to “create culture of uncertainty”?

Health professionals and the vaccine narrative: “The power of the personal story” and the management of medical uncertainty
Terra Anne MANCA (University of Alberta, Canada) | tmanca@ualberta.ca

Vaccine risks and uncertainties are a lens through which to observe broader issues of medical knowledge. Some research interprets vaccine uncertainties as a form of public ignorance caused by patients’ online research, failed physician-patient relationships, or inadequate knowledge translation. Nonetheless, these interpretations often incorrectly portray health professionals as homogeneously accepting of all scheduled vaccines for all patients. I analyzed thirty-two semi-structured interviews with physicians (n=27) and nurses (n=7). All health professionals in my study adhered to a dominant vaccine narrative, which maintains that vaccines are essential to population health, yet they also spoke about uncertainties in their daily medical practice. I argue that health professionals manage uncertainty through personal narratives and explanations. They told personal stories about experiences with communicable diseases, vaccine benefits and risks to individual patients, and their reasons for trusting in medical science. When these narratives incompletely resolved medical uncertainties, then the health professionals often explained that either vaccines were outside of their professional
responsibilities or the uncertainties were irrelevant. Even so, some health professionals explained that they distrusted the knowledge base surrounding specific vaccine issues, believed certain vaccines were ineffective, or refused specific vaccines themselves. My findings demonstrate that even with a widely accepted preventative treatment such as vaccination, health professionals attempt to manage their uncertainties with personal stories and varied degrees of trust in medical knowledge.

RN22S03 - Risk and Media

The mediated rainbow of insecurity: Dysphoria in the European metropolitan “heaven” of consumption.
Christian LAMOUR (LISER, Luxembourg) | christian.lamour@ceps.lu

A large number of European cities are now centers of one of the most profitable press products ever: free dailies such as Metro and 20 Minutes. These newspapers are the ultimate level of the commercial journalism which has been considered as putting at risk the utility of the press as a democratic instrument (McManus, 1994). The density of short and light information about the media celebrities and other news inciting readers to consume more (e.g. the life style latest info), could be considered as elements embedding the metropolitan reader into a recreational hyperreality made of “postmodern simulacra” (Baudrillard, 1981). However, does the news agenda of this free press put readers into a Disney-like urban world? Are these newspapers not related to the late modern “risk society” (Beck, 1992) generating constantly new anxieties and new protection systems to calm down these fears? It is hypothesized that these newspapers are connected with an insecure metropolitan civilization whose main issue is to prevent risks associated with late modern global economic flows. Depending on the migration level of the targeted public, this press generates contents symbolizing the fears of nomadic or relatively immobile people. Advertising enables the existence of a truth discourse on risk. But it can also be considered as part of this discourse of truth around a Paradise Lost which can be recovered partly by consumption. Based on a content analysis of three free newspapers located different urban regions (Luxembourg, Geneva, Lille), the objective of the presentation is to look at the interactions existing between information and consumption in metropolitan Europe.

The Risk of an imagined Islamization of Europe and its representation in Mass Media
Daniel Christoph ZIEGLER (Justus-Liebig-University Gießen, Germany) | daniel.ziegler@sowi.uni-giessen.de

Since the end of 2014, thousands of people are protesting about the threat of an Islamization of Europe in several German cities, particularly in Eastern Germany. The organization, which is responsible for the Demonstrations, calls itself “Patriotic Europeans Against the Islamization of the West” (PEGIDA: Patriotische Europäer gegen die Islamisierung des Abendlandes). Besides the fact that PEGIDA is an islamophobic movement, it is also a melting pot for racial prejudice, perceived inequalities, and diversified concerns of the citizens. As a matter of fact, the heterogeneous group of protesters arguing for tougher legislation, higher state authority, an increase in funding for the police, a restrictive immigration policy and protection of Germany's Judeo-Christian shaped culture. On the one hand, the organization is part of several right-wing and islamophobic movements in Europe, who are re-emerging for quite some time. On the other hand, the organization of
PEGIDA points out a risk awareness which is formed by images and representations in mass media. Those representations are strongly charged and dominated by cultural myths, imaginations of fear, criminality, foreignness and social inequality. Thus, the perception of increasing risks in a changing world could result in a call for more state authority and tougher legislation, whether or not the risks are comprehensible.

The submitted paper focuses on the perception and construction of social risks. Therefore it aims at the connection between socially constructed threats in a “risk society” (U. Beck) by analyzing different texts, images and video material from news magazines.

Communicating Unexpected Health Risks: Practices and Ethical Concerns

Külliki SEPPEL (University of Tartu, Estonia) | kelliki.seppel@ut.ee
Kadri SIMM (University of Tartu, Estonia) | kadri.simm@ut.ee

As genetic diagnostics develops, medical research faces a growing number of occurrences of incidental findings: unexpected information that is out of the focus of the research project, but can constitute a health risk for the research participant. In such situation, the research team is caught between two different sets of guiding principles, that of beneficence and avoidance of harm relevant in clinical care, and that of creation of new knowledge and public health values in research. Based on semi-structured interviews with members of medical research teams, the paper studies the practices of communicating such incidental findings to research participants. It discusses how the (initially ambivalent) “risk thresholds” are negotiated when informing becomes necessary; what is the practice of dealing with research participants who refuse to be informed; how well are research and procedural guidelines adapted for such incidents (inclusion in informed consent). Special focus is on the ethical and practical considerations of the members of the research team behind the decisions to inform the research participants. The initial findings suggest that clear guidelines for reporting incidental findings are lacking and the decision when and how to communicate such findings rests primarily with the research doctor. The factors influencing the decision include the nature of the illness (curability, heritability) and the psychological state of the research participant, while patients’ welfare tends to outweigh their autonomy.

Social Connections and Generalized Trust: Exploring the Reasons Behind the Correlation

Sergio LO IACONO (University of Essex, United Kingdom) | sloiac@essex.ac.uk

Social capital theory argues that social connectedness is essential in fostering generalized trust. Though the notion of social connectedness refers to very different types of social ties, the vast majority of the literature has probed this claim by focusing on the role of associational membership. In this paper, using the Social Capital Community Benchmark Survey 2000, I evaluate the role of a wider set of social ties (e.g. friendship and neighborhood relations) in the US context, and explore the theoretical reasons for which they could be correlated with generalized trust. In this sense, by reinterpreting Putnam’s thought, I test two main mechanisms that might explain why interactions with people we know would create trust in people we do not know: the collapse of negative stereotypes about the generalized other through repeated interactions with individuals unlike ourselves; the capability of networks’ reputation systems to encourage the emergence of trustworthy behaviours either inside or outside the networks that originally generated it. Results show that (1) associational membership is a weaker and less stable predictor of trust in comparison to other social ties (in particular friendship relations), (2) cross-cutting ties do not promote tolerance towards the generalized other within associations,
while they do it weakly in the case of friendship relations, (3) the “spillover” or “rainmaker” effect can provide an explanation to why friendship relations are correlated with generalized trust.

Evolution of the representation of the risk problematic in the Russian academic journals
Efim FIDRYA (Immanuel Kant Baltic Federal University, Russian Federation) | efim.fidrya@gmail.com
Olga FIDRYA (Immanuel Kant Baltic Federal University, Russian Federation) | o.fidrya@gmail.com

During the last years there has been risk institutionalization process going intensively in Russia. There was the Russian Society for the Risk Analysis established in 2003, and then the specialized academic journal on the problems of risk analysis in 2004. But were there any increase in the attention drawn to the risk problematic in the Russian science, which is crucial in terms of institutionalization?

This paper provides analysis of the dynamics of the representation of the risk problematic in the Russian academic journals over the last 30 years. Using the content analysis of the articles published in the Russian academic journals gathered in the full-text database of the electronic library “elibrary.ru” we analyzed the dynamics of the number of the papers devoted to the risk published, the number of citations, the relative number of the risk-devoted papers per overall number of the papers published annually, some other indices, and the thematic of these papers. Besides the detailed statistics on the risk-focused papers in the 69 research disciplines during 1980-2014, there were main trends and key points discovered and analyzed, main disciplines most intensively contributing in the risk knowledge were revealed, the evolution of the risk studies in Russia was traced: from the health risks to cyber-risks. Key areas of the risk studies: health risks, economic risks, technological risks, cyber-risks and the protection of the information. The relation between the key risky events and the risk-focused papers published was also examined.

RN22S04 - Comparative National Risk

Environmental and technological risk perception in Europe: structural, cognitive, value orientations and country-specific determinants
Aiste BALZEKIENE (Kaunas university of technology, Lithuania) | aiste.balzekiene@ktu.lt
Audrone TELESIENE (Kaunas university of technology, Lithuania) | audrone.telesiene@ktu.lt

This presentation aims at exploring what are the main structural, cognitive, value orientation factors that determine risk perception variation in European countries at individual level and how risk perception differences at country level can be explained by macro-level factors. Data for the analysis in this presentation is from the International Social Survey Programme (ISSP) “Environment” module that was conducted in 2010. At individual level in European countries we explored if risk perception is better explained by structural factors or by cognitive – value orientations. At country level we explored the relations of risk perception to these macro-factors: affluence, human development level, democracy, pace of societal transformations and environmental health.

The theoretical and framework of the analysis includes classical ideas from risk research that risk perception is structured by such factors as gender, age, income or place of living. The highest levels of risk perception are among women, people of age 25-39, people who self place themselves in lowest social class and people that live in big cities.
However, regression analysis revealed that structural factors are not working well with risk perception, so we also analyzed subjective knowledge, trust and concern as determinants of risk perception. Analysis also revealed that macro-level indicators at country level are significant predictors of risk perception. GDP per capita, non-income HDI and Democracy index have significant negative impact on environmental risk perception and pace of societal development has a significant positive influence on environmental risk perception. This implies that changes in risk perception are to a great extent dependent upon general societal transformations rather than solely dependent upon individual factors.

**Developing Transnational Risk Profiles**  
Adam BURGESS (University of Kent, United Kingdom) | a.burgess@kent.ac.uk

Different cultures, societies and nations engage with similar risks in different ways, with significant implications for risk management and communication. There is increasing interest in developing national risk profiles that allow the comparison of capacities for managing hazards. And there are strands of academic scholarship that have engaged with understanding national perceptions of risk: cultural theory; regulatory studies, particularly of ‘risk regimes’ and US/European comparison; and psychometric studies. But these remain relatively marginal to risk research and with few points of comparison to allow an accumulation of knowledge. Little progress has been made in establishing any more general ‘risk profiles’ that look beyond the capacity for hazard management. This paper will report on work beginning to try and draw together different strands and sources of knowledge. It will map some ways forward such as comparing prevailing definitions of risk in different societies, the extent to which polities engage with it, and the differing extents to which transnational risks dominate national agendas. A key challenge is the variety and range of factors that predominate in different countries. It is here that interdisciplinary flexibility may be particularly useful. A key message will be getting beyond fixed dimensions of risk perception and emphasise the role of more contingent legacies, processes and issues that shape distinctive national risk profiles.

**Civil Regulation of Final Disposal of Spent Nuclear Fuel: Comparison of Finnish and Swedish Risk Regulation Regimes**  
Tapio LITMANEN (University of Jyväskylä, Finland) | tapio.a.litmanen@jyu.fi  
Mika Jaakko Johannes KARI (University of Jyväskylä, Finland) | mika.kari@jyu.fi  
Matti KOJO (University of Tampere, Finland) | matti.kojo@uta.fi  
Barry D. SOLOMON (Michigan Technological University, USA) | bdsolomo@mtu.edu

The paper focuses on risk regulation processes of final disposal of spent nuclear fuel (SNF). The cases studied are the Finnish and Swedish repository projects, commonly seen as success stories in SNF management. In Finland, the nuclear waste company Posiva submitted its construction license application in 2012 and in Sweden the Swedish Nuclear Fuel and Waste Management Company (SKB) submitted its applications in 2011. In both cases, companies have expected that construction could begin in as soon as 2015.

The aim of the study is to investigate the role of civil society organizations (CSO) in risk regulation of SNF management in Finland and Sweden. We argue that, as to be considered as success stories, in these cases, regulation by civil society has to be successfully integrated into risk regulation policies of the regimes and CSOs into decision making processes. We assume that CSOs can press corporations to improve their research, development, and technical design and, similarly, keep an eye on the work of regulators and propose potentially superior ideas for improving waste management.
The question is approached by comparing and contrasting the regulatory regimes in both countries, along with public participation. Our aim is to analyze: 1) institutional SNF management frameworks in both countries, paying special attention to the role of civil society and 2) how lay-people and CSOs have been able to participate and contribute to recent spent nuclear fuel decision-making.

Aspects of social uncertainty in an international comparative perspective
Gyongyver DEMENY (University of Rouen, France) | gyongyver.demeny@gmail.com
Michalis LIANOS (University of Rouen, France) | michalis.lianos@univ-rouen.fr

In this paper we analyze social uncertainty in an international comparative approach on the basis of data from representative surveys carried out in 2002 in the framework of European research “Uncertainty and insecurity in Europe” (Michalis Lianos, Nikos Bozatzis, Michelle Dobre, Lilla Vicsek) in France, United Kingdom, Greece and Hungary. These four countries represent different societies, social contexts in respect of the presence of the characteristics of late modernity. We analyze opinions on different aspects of uncertainty, in one hand concerning the personal experience of uncertainty, such as the frequency of experience of uncertainty or having control and enough knowledge concerning the future of the persons inquired; and on the other hand the presence of aspects of uncertainty in general such as the increase of uncertainty and the presence of risks. We are focusing in the case of each of these four countries on the relations between different aspects of uncertainty and their relations with certain socio-demographic characteristics. Comparisons of research results indicate differences in opinions on aspects of uncertainty in these four countries. The analysis at theoretical level touches upon the question of social uncertainty in the context of differences in the presence of characteristics of late modernity, and at conceptual level indicates specificities of relations between certain aspects of social uncertainty in the case of the opinions of the populations inquired.

Institutional change in flood risk management: factors influencing Flood Risk Governance Arrangements in six European countries.
Piotr MATCZAK (Adam Mickiewicz University, Poland) | matczak@amu.edu.pl

Losses caused by floods have been increasing and are likely to increase in future due to climate change, land use changes etc. In the European countries the five main Flood Risk Management Strategies can be differentiated: risk prevention, flood defence, mitigation, preparation and recovery. Among them, the flood defence one plays the main role. For a more resilient flood risks management a diversified portfolio of Flood Risk Management Strategies would be operational. Particularly, so-called non-structural measures, such as “room for the river”, measures using spatial planning, and other adaptation and mitigation measures have been advocated in last two decades. The research investigating strategies for dealing with flood risks in 18 vulnerable urban regions in six European countries: England, Belgium, France, The Netherlands, Poland and Sweden, show that despite rhetoric the progress in the diversification is limited. Although, several factors inducing the the change of the risk strategies in particular countries can be indicated, there are also factors reinforcing stability. In this paper, it is analysed what contextual factors are responsible for a particular shape of Flood Risk Governance Arrangements and their dynamics in the countries, what are the paths of influence and mutual dependence between factors. Referring to the data collected (via interviews with experts, analysis of documents, media analysis) on the legal and institutional frameworks in the countries the contextual factors (physical circumstances; physical and social infrastructure; structural factors; agency, shock events etc.) impact on the dynamics of Flood Risk Governance
Arrangements is analysed. In particular, we search for patterns of stability and change in comparative perspective.

**RN22S05 - Citizens and Risk**

**Neighborhood Insecurities in Two Cities of Turkey**  
Halime ÜNAL (Yıldırım Beyazıt University, Turkey) | unalhalime@hotmail.com

In the city life, the residents are exposed to various forms of insecurity such as terrorism, crime, unemployment and poverty. One consequence is living in fear. The question is what form do such fears manifest themselves in the cities? What do people think about the level of security in their community? What do they consider as problems in their neighborhood? The main concern and the objective of this project is to understand the insecurity of neighborhood from the perspectives of their residents. The study has been conducted in two cities in Turkey using the standardized questionnaire in order to able to compare the results. One of the cities in where the study has been conducted has the characteristics of metropolitan life style while the other has the characteristics of middle size urban life. One of objectives of the study is to compare whether the residents of these two cities have seen the similar or different things as social problems in their neighborhoods. The other objective of the study is to explore the risky or dangerous locations where the residents do not want to go or they do not want their children to go in their neighborhoods. In order to obtain these goals, the data collected from 1600 residents will be examined in this paper. This project (113K070) is funded by The Scientific and Technological Research Council of Turkey (TÜBİTAK).

**Avoiding risks and uncertainties: citizens’ everyday experience and the politics of cell site deployment**  
Martinus Bertram DE GRAAFF (University of Amsterdam, Netherlands, The) | m.b.degraaff@uva.nl  
Christian BRÖER (University of Amsterdam, Netherlands, The) | c.broer@uva.nl

In this paper we demonstrate how the politics of technology implementation affects citizens’ experiences of scientific uncertainties and health risks. We draw upon mixed method longitudinal panel data on citizens' experience of the deployment of cell phone network antennas in the Netherlands and California, USA. We argue that citizens' experience of, and citizens’ political contribution to, technological development is constituted through localized interactions and mediated by an issue-specific political discourse. This discourse delineates legitimate framings and feelings for stakeholders. In this case we find a process of politicizing and depoliticizing the network deployment. Cell site roll-out is tied to health risks and uncertainty. This medicalization of cell site deployment simultaneously opens the issue up for citizen participation by implicitly legitimizing heath concerns (bio-citizenship), and closes the issue down successfully via authoritative governance which defines protest as illegitimate. In few cases local authorities actively redefine the issue and engage with residents as active citizens. Occasionally citizens find other entry points to influence cell-site deployment and become active citizens in the process. But the localized deployment of cell sites does not interfere much with citizens’ experience of everyday life. The need for cell phone technology is taken for granted and despite limited opportunities created through confrontation with the technology in their living environment, citizens actively define themselves as an improper public to the health issue in diverse ways. These depoliticizing
interactions between technology governance and citizens’ experience of risk and uncertainty ensure the continued deployment of and controversy about the network technology.

Public perceptions of surveillance systems in the context of CBRNE terrorist threats – a UK case study

Irina STĂNÇIUGEΛU (CBRNE Ltd, UK) | irina.stanciugelu@cbrnelt.com
Ștefan STĂNȚIȘIUGEΛU (National University of Political Studies and Public Administration Bucharest, Romania) | stanciugelustefan@yahoo.com
Dave USHER (CBRNE Ltd, UK) | dave.usher@cbrnelt.com
Richard AMLÔT (Public Health England, UK) | Richard.Amlot@phe.gov.uk
Dominic KELLY (CBRNE Ltd, UK) | dominic.kelly@cbnelt.com

The expansion of surveillance technologies is associated with the terrorist threat and is defined by national security policies and strategies. Recent research reveals that there are more than four million surveillance cameras in the UK, although there is no evidence of a correlation between the increase in the number of cameras and a decrease in the crime rate. This study presents data on the UK public’s perception of surveillance technologies and techniques within a specific social-cognitive and emotional context, related to the probability of a Chemical, Biological, Radiological, Nuclear or Explosive (CBRNE) incident within the UK. A representative survey of the UK population was conducted using the online ‘Audience’ service provided by SurveyMonkey. Questions were designed that examined the relationships between:
• cognitive factors - what people know about CBRNE threats and how such information influences their behaviour with respect to surveillance technologies;
• affective response - the extent to which emotions related to CBRNE threats influence social behaviour concerning surveillance technologies;
• demographic determinants - the relationship between education, age, gender, visible minority status and the perception of the surveillance technologies in public spaces within the social-cognitive and emotional context of CBRNE threats.

The study identified the public’s understanding of CBRNE threats and the horizon of public expectations and fears about the deployment of more complex systems of surveillance technologies in public spaces. These findings have important implications for the development and implementation of new initiatives for CBRNE protection at a national and EU level. The research was financed in the context of FP7 Project “End-User Driven Demo for CBRNe” (EDEN), grant agreement 313077.

Dealing with uncertainty: involving citizens in emergency planning in a nuclear municipality

Marlies Kris VERHAEGEN (University of Antwerp, Belgium) | marlies.verhaegen@uantwerpen.be
Anne BERGMANS (University of Antwerp, Belgium) | anne.bergmans@uantwerpen.be

Emergencies are prepared for through emergency plans on different levels and by actors ranging from governments to plant operators and school managements. In the case of nuclear emergencies, the purpose of these plans is to be as prepared as possible for situations that are statistically exceptional and difficult to foresee. However, accidents as the one at the Fukushima-Daiichi plant show that things can and do go wrong and that one can never be prepared enough. Nuclear reactor sites and waste storage facilities can be understood as both prone to normal accidents (Perrow 1984, 1994), and operating as a high reliability organisation (HRO) (Rochlin 1993, Roberts 1990). As Schrivastava et al. (2009) argue, these are complementary concepts, which can be bridged by Turner and Pidgeon’s (1997) theory on disaster incubation.
In this paper emergency planning will be framed as an approach to dealing with uncertainty (Furedi 2009) in the light of risk governance (Renn 2008) and building critical trust (Walls et al. 2004). Emergency planning for incidents that involve radiation and nuclear installations deals with uncertainty in a field of highly stigmatized technology (Gregory et al. 2001). Not only is the source of risk highly controversial but countermeasures also need to be evaluated from a radiological stance and from social, political and economic points of view (ICRP 2007). Such plans become instruments for interaction with neighbours and other concerned actors, and are thus more likely to be exposed to criticism and debate. Drawing from a case in which Belgian citizens were involved as stakeholders in nuclear emergency planning, the utility of this participation and its provisional results will be discussed.

Who supports nuclear power generation? From the results from public opinion survey in 2014  
Midori AOYAGI (National Institute for Environmental Studies, Japan) | aoyagi@nies.go.jp

Using public opinion survey results in 2014, we analyzed public’s support for nuclear power generation in Japan. For measuring people’s “support”, we used three items. One is a) support for resuming operation of current existing nuclear power generation plants in Japan. Currently all of them are not operated. Other two were, b) Anxiety for accidents of nuclear of plants, c) costs and benefits of nuclear power generation. 

The most significant variable was the “Environment versus economy”. Respondents who chose “Economy” over “Environment” are more likely to a) support resuming operation, b) be more anxious for accidents, and c) emphasis risk than benefits. Some other demographic variables are also significant such as gender, age, income, and educational level.

We further explored the background of this result. According to other our survey result, the 2008 financial shock caused by the Lehman Brothers had a significant impact on Japanese society. Before summer of 2008, “climate change” was the national most important topic, but after then, economy has been the most important issues in Japan. Then 2011 disaster happened. All of the nuclear power generation plants had stopped their operation. At local level, people who live in towns of nuclear power generation sites are now facing the risk of unemployment. Costs and benefits mean anxiety for possible accident of the plants and employments for those people. Scientists often discuss about the safety of nuclear power generation. But people matter not only technological risks, but also everyday lives.

RN22S06 - Security and Prevention

Cultures of preparedness: imagining and enacting disasters to come. A brief ethnography.  
Mikael LINNELL (Mid Sweden University, Sweden) | mikael.linnell@miun.se

Knowledge about, and preparedness for, possible future disasters are created through various techniques. Via simulation of imagined events, not yet substantialised disasters can be rendered physically and cognitively accessible as objects of knowledge. Simulations can be theoretical and immaterial, created by way of computer programs, or they can be enacted as material full scale exercises, complete with a backdrop of the complex and disordered reality, and all the sensorial experiences associated with it. In either case, simulation is employed as a technique for reducing uncertainty about possible future harm. Simulation thus allows for imagining potential futures in order to manage their consequences (Lentzos and Rose
The aim of this paper is to critically investigate the “doing” of preparedness, by way of practically engaging with the physical world, in two geographically and culturally very different contexts. In Tokyo, Japan, citizens awaiting “the big one” are requested to practice earthquake preparedness in government sponsored earthquake prevention centres, whereas in Tafjord, Norway, visitors of the local rockslide centre can “design their own rockslide” as a playful way of practicing their disaster imagination. The question posed in this paper concerns how possible future disasters are imagined, represented, and socially enacted in order to enhance individual and collective preparedness supposed to last for decades. A common feature to the two empirical sites is the fact that, sooner or later, they will be destroyed. Consequently, the challenge is to produce a culture of preparedness durable for an unspecified range of time and conveyed over generations.

The significance of security concepts as risk prevention - A German case study of a yearly city festival in Rhineland-Palatinate

Michaela EHBRECHT (Technical University of Kaiserslautern, Germany) | michaela.ehbrecht@ru.uni-kl.de
Annette SPELLERBERG (Technical University of Kaiserslautern, Germany) | spellerberg@ru.uni-kl.de

Incidents with many injuries and even deaths during urban events (Loveparade Duisburg) led to an increased interest in scientific research on security concepts and risk prevention. This study examines a yearly city festival in Kaiserslautern. Our research approach is based on interviews with experts, who are responsible for the event organization and for ensuring safety. The results show that the representatives of key organizations overtake different functions, which imply different objectives. While the festival organizer predominantly hosts the event for generating revenue and for reasons of city marketing, the authorities and organizations with security tasks (BOS) prioritize security of citizens and event visitors. The safety awareness of the BOS is sharpened due to daily contact with accidents and experience of danger. Accordingly, the need for a security concept differs enormously to the organizational background. BOS argue that a documentation of risks improves certainty of action, which makes the organization of events more transparent and independent of routinized operations and established personnel. The organizer and parts of the regulatory authority regard a written security concept as too demanding in terms of time and money with no practical impact for the event. The organization relies strongly on previous experience, informal agreements and a close network between the actors involved. A written safety concept can only contribute to the prevention of risks, if it is realized by the organizer and participating stakeholders. In this contribution it will be discussed, if formalized concepts or informal procedures guarantee more or less security during public events.

21 December (2012) Doomsday Rumours: Late Modern Anxieties or Hangovers from Our Superstitious Past?

Kayhan DELIBAS (Adnan Menderes Üniversitesi, Turkey) | kdelibas@adu.edu.tr

There have been widespread rumours that there will be a catastrophe or even a doomsday related to the Mayan calendar, 21 December (2012) all over the world. For months beforehand many believed that the end of a 5,125-year-long cycle in the ancient Maya calendar was going to be the end of world. Sense of an impending Armageddon and panic even led governments to take action in many countries like the US, China and France. Scientific bodies such as NASA officials took the time to dispel these rumours and even the Vatican appealed to the public not to take the rumours seriously. These fears and rumours were widespread in Turkey, gaining
widespread coverage in mainstream and social media. According to rumour, one of the two places in the world destined to survive the devastation was the Turkish village of Şirince in the district of Izmir. This research is focused on the case of Şirince. The paper will draw on quantitative questionnaire (N 318) and in depth interviews carried out in the field (Şirince and district of Aydın) before the 21 December 2012. One of the key questions is how to conceptualise these doomsday rumours? In particular this paper considers whether rumours are most usefully characterised as reflexive modern/late modern anxieties or as hangovers from our superstitious past? Or indeed are they suggestive of a ‘New Dark Ages”? (Franklin, 1998). The paper suggests that Turkey has been rapidly becoming part of the world risk society, but in quite distinctive ways comparable to how Beck (2010) has characterised the path taken by China to late modern risk and individualization

The relationship between subjective risk perceptions and attitudes towards security measures at airports
Gabriel BARTL (Freie Universität Berlin, Germany) | gabriel.bartl@fu-berlin.de

Within risk societies (Beck 1986) security has become a central value. This development also triggered the emergence of technical solutions for safety and security related challenges. But technological approaches of risk management often produce unintended effects (Merton 1936) and can even turn into risks themselves as the public discourse on surveillance technologies reveals.
Following the example of airport security, this contribution tries to shed light on the question how flight passengers perceive such technical innovations that were originally designed to protect them but at the same time exhibit potential damage. Research in this field indicates that personal attitudes toward technical systems are often characterized by complex, ambivalent and paradoxical patterns of perception and interpretation (Renn & Zwick 1997).
By making use of the triangulation method – problem-centred interviews (Witzel & Reiter 2012) and a quantitative survey (N=1,067) with flight passengers at Airport Berlin Schönefeld – the attitudes of flight passengers toward security measures at the airport are analysed. Results show both paradoxical preferences on the personal level (qualitative approach) and group-specific differences in a comparative perspective (quantitative approach). Group comparisons were calculated for variables such as education, trust, fear of crime or the frequency of travelling by plane. Also significant relations between subjective risk perceptions in general and attitudes towards security measures could be observed empirically.

Benevolent surveillance – a case study of the conceptualization of risk in multi-agency crime prevention work with youth
Kamila BISZCZANIK (Lund University, Sweden) | biszczanikkamila@gmail.com
Carina GALLO (Lund University, Sweden) | Carina.gallo@soch.lu.se

This paper presents an analysis of Community Intervention Teams (CIT), a risk-oriented multi-agency crime prevention program in Sweden targeting youth who are at risk of engaging in criminal gang activities. We have analysed policy documents and information material created by the Swedish government, the Swedish National Police Board and the National Board of Health and Welfare in conjunction with the national implementation of the CIT program. The results show the use of a risk assessment manual is perceived as the only legitimate tool for archiving success in work with CIT, both from an individual and societal perspective. This simplifies the criminological field by focusing solely on the individual as the starting point for crime prevention and ignores the impact of structural factors behind crime and crime prevention. The use of the concept of risk constructs the target group as both potentially dangerous
criminals and as a group of vulnerable youth, which needs to be saved to a better life. This duality creates what we choose to call benevolent surveillance, namely controlling interventions that are legitimized by rehabilitative ideals.

RN22S07 - Risk, Vulnerability and Resistance

Agency, socialization and life course changes evaluation: Personal and socio-historical memories of Mumbai dwellers
Aude MARTENOT (Center for the Interdisciplinary Study of Gerontology and Vulnerability, University of Geneva, Switzerland) | aude.martenot@unige.ch

Cultural norms, specific contexts and individual situations affect the life course development and the way people reflect on it. Thus, in a developing country like India, facing simultaneously major socio-economic changes and the persistence of urban poverty, what is the perception of the main turning points in one’s life and of the socio-historical changes, in terms of risks and opportunities? How did people face the major shocks in their past life and history of their country or city? This presentation focuses on changes in the life course according to Indian people living in two distinct areas: the slums of Mumbai and a formal neighbourhood of this megacity.

The analysis is focused on three topics. First, the concept of agency is used in order to explore if respondents were in control or passively lived personal events. I test here the hypothesis that poverty and daily hardships affect the capabilities, the real freedom to live the life people value (Sen, 1999). Second, I explore the dimension of socialization: Do these events turn around the individual itself, the family circle or encompass a larger social group? Third, are those changes retrospectively evaluated by the individual as negative (as suggests most often the literature) or positive?

The analyses that I draw on for this presentation are based on two surveys conducted in the slums of Bandra East in 2012 and in the formal neighbourhood of Santa Cruz in 2014, both parts of Mumbai. About 1250 men and women aged 20-84 years were interviewed, using questionnaires on the subjective perception of the life course.

Risk mobility in child and family social work
Gemma MITCHELL (University of Leicester, United Kingdom) | gm95@le.ac.uk

The rise of evidence-based practice (EBP) in child and family social work in England has been underpinned by a techno-rational response to risk and uncertainty (Webb, 2001; Broadhurst et al, 2010) which persists despite a robust critique of EBP in both medicine and social work. One of the consequences of such an approach is a narrow definition of what is deemed ‘acceptable evidence’ to support decision making with children and their families (Gray et al, 2009; White, 2013). The paper will explore how social workers respond to the resulting disparity between the messy, uncertain reality of family life and evidence that can help promote change for children and their families. The findings are based on qualitative interviews with 35 qualified and unqualified social workers and document analysis of official rules and guidance. I draw upon the insights of the translation studies literature and explore in detail the various ‘translation techniques’ social workers must use in order to overcome the gap between the experience of direct work with children and families and official conceptions of evidence. Further, I will argue that increased risk mobility – the movement of risk knowledges from one sphere to another – is one of the informal practices social workers must learn if they are to respond to risk and uncertainty effectively. In this way, I aim to introduce the insights of translation studies into the
risk and uncertainty literature and thus help develop new conceptual tools for understanding and theorising risk.

**The Processes of Resocialization and Social Reintegration: Sample of Individuals Under Probation**

Cihan ERTAN (Akdeniz University, Turkey) | cihanertan1@gmail.com  
Meral TIMURTURKAN (Akdeniz University, Turkey) | meralgulkaya@gmail.com  
Gönül DEMEZ (Akdeniz University, Turkey) | gonuldemez@gmail.com  
Elife KART (Akdeniz University, Turkey) | elifekart@hotmail.com  
Selim CANKURTARAN (Ministry of Justice, Turkey) | selim.cankurtaran@adalet.gov.tr

The aim of the study is to analyze resocialization and social reintegration experiences of the individuals under probation and to research the influence of a series of activities which are being carried out in probation service - such as rehabilitation works, counseling, educative activities etc. - on that process.

Being convicted is a situation which leads to reconstruct and interrogate the processes such as social adaptation and social integration in terms both of individual and society. This situation comprises the complete loss of socio-cultural and economic life individual has and reconstruction of them after penalty besides the processes such as being excluded, stigmatized and subjected to othering. Probation service, in this sense, is continuation of conviction in the sense that it contains the situation of both being released and being supervised. Thus, individual is in the position of recontacting to social life by having positioned as the person who is under probation rather the status of confined convict. Along with this line, this study will be focusing on the given concepts such as social interaction, social integration, social adaptation, socialization/resocialization, stigmatization, labeling, exclusion and reintegration.

**“New” Category Among Polish Workers – Working Poor**

Justyna Kinga ZIELIŃSKA (University of Warsaw, Poland) | justynakingaz@gmail.com

My paper proposal looks into the case of the working poor in Poland. In international public discourse Poland is often described as an attractive maket for investors in the new global division of labour because of „a low-cost, high-quality production platform to compete with East Asia“ (M. Orenstein, 2014). However, in Polish media discourse it is widely said that costs of labour are too high and should be reduced. Notwithstanding Poland has one of the highest rates of the in-work poverty risk in the European Union.

Most of employees are employed in the services sector, which attributes are domination of small and middle enterprises and low unionization. I am going to present analysis of the participant observation and the Problem-Centered Interviews that were conducted with the working poor employed in the services in Warsaw. The main research questions are: what factors have influenced people to take up low paid jobs (life course trajectory)? Why are they poor despite working? Can they, and if so, how do they get out of poverty? Additionally, I am going to compare two groups of workers: one employed in the private sector and the second employed in the public sector. I assume employment of working poor in the public sector has attributes of the “core” (D. Harvey 1991) and protects employees from poverty much more than employment in the private sector. The latter shifts the risk on employees and has more in common with the “periphery” labour market.

**RN22S08 - Gambling, Decisions and Ratings**
Problem Gambling in Italy: Socio-economic Conditions and Risk-taking Propensity
Fabio LUCCHINI (University of Milano-Bicocca, Italy) | f.lucchini1@campus.unimib.it

In this research, gambling behaviour is defined by using one of the most popular screening tools, the Canadian Problem Gambling Index (CPGI), a structured questionnaire exploring focal gambling issues, in order to distinguish and classify behaviour of social, low risk, moderate risk and problem gambling. Risk-taking propensity is defined by risk-taking experiences individuals have had in their lives and by the views they expressed in relation to those experiences – that are likely to cause potential harmful physical, psychological and socio-relational effects (consumption of licit and illicit substances, excessive drinking, driving under alcohol and drugs effects, unprotected sex, violence, offenses, crime involvement, etc.).

In order to give an answer to the research question (What is the association between socio-economic status, risk-taking propensity and gambling behaviour?) the data emerging from the Italian Population Survey on Alcohol and other Drugs (IPSAD) will be analysed. The IPSAD survey, conducted in 2014 by the Italian National Research Council (CNR), is a prevalence study on alcohol, other psychoactive legal/illegal substances and risk-taking behaviours in the general population (the residents in Italy between 15 and 74 years of age). It follows the guidelines provided by the European Monitoring Centre for Drug and Drug Abuse (EMCDDA). The writer will have the opportunity to rely on the collected data (roughly 15,000 respondents) to develop an analysis through an appropriate logistic regression model which appears useful to highlight the relations between the phenomena of interest.

Responsibility-Shifting in a Gambling Environment
Cormac Anthony MC NAMARA (Trinity College Dublin, Ireland) | mcnamac2@tcd.ie

Using data that was collected by observing and speaking with customers and members of staff in betting shops in Dublin, Ireland, this paper explores the ways in which regular customers of betting shops deal with the experience of bet related failures while in betting shops. The findings suggest that a process of self-reparation of self-esteem occurs in betting shops after customers experience monetary losses and that this process is facilitated by shifting responsibility for the losses incurred to factors external to and beyond the control of the customers. It is proposed that the process of self-reparation of self-esteem that occurs through responsibility-shifting involves the social construction of a ‘reality’ that removes the idea of failure from the discourse of the betting shop and that this facilitates the continuance of betting shops as places of leisure despite the regular experience of bet-related failure by customers. The customers shift responsibility away from themselves (1) by referencing the general uncertainty of the outcome of races and (2) by attributing blame to jockeys.

Democratization vs. privatization of risk: who makes decisions about risk?
Alessia BIANCO DOLINO (University of Milan-Bicocca, Italy) | a.biancodolino@campus.unimib.it

Over the last decades, scholars have highlighted the role of risk as a powerful organizing category for our (Western) society (Ericson et al. 2003; Power, 2007) influencing ‘the way in which we organize our policy system’ (Hutter, 2010, p. 17), and changing society’s structural cleavages (Beck, 1992; Giddens, 1991: 1994). In this context, the ‘risk society’ theory (Beck, 1992) has been specifically relevant considering the debate it has promoted between social scientists, as well as the influence it has had on policymaking processes (Quilgars and Abbot, 2000; Abbot, Jones, and Quilgars, 2006). ‘Risk society’ theory is a general theory of our society, focusing on the shift from industrial society to...
what Beck has called ‘risk society’. Risk is seen as a distinctive element defining and structuring post-modern society, distinguishing it from the modern one in various ways. We focus here on one of the characteristics identified by Beck (1992) highlighting the differences between post-modern and modern society: the democratization of risk. More specifically, Beck underscores the equalizing effect of risks as a crucial characteristic of post-modernity with reference to the traditional cleavages characterizing modern society such as class, gender, or race. Post-modern risks equally damage everyone whether he/she is poor or rich, the perpetrator or the victim. Thus, risk producers are equally affected by the possible side-effects of their activities such as, for example, the dispersion of radiation as a side-effect of the production of nuclear energy. Consequently, given the democratic distribution of the possible dangerous consequences for health and the environment linked to the production of goods and services, ‘perpetrator and victim sooner or later become identical’ (Beck, 1992: 38). In addition, post-modern democratization of risk considers the position of scientists, technicians, and experts. More specifically, post-modern society is characterized by a loss of confidence in science and technology; science and technology both being producers of new commodities and of new risks at the same time. Consequently, the traditional division between the general public and experts loses relevance, de-legitimating experts’ role in the decision-making processes about risks. As a consequence, post-modernity opens new spaces of discussion in which the public could be involved and could influence risk decisions (Ibid.).

Critics of the democratization of risk trend have focused on the equal allocation of risks in today’s society, highlighting social classes and wealth distribution as still having a role in defining different patterns of risk allocation (e.g. Abbot, Jones, and Quilgars, 2006). Less attention, however, has been paid to other meanings embedded in the concept of democracy that could call into question the democratization of risks trend identified by Beck. The purpose of this paper is to begin to fill this gap by looking at another element defining the concept of democracy: the sovereignty of the people (e.g. Urbinati, 2011). Thus, the aim is to focus on the way in which people and their elected representatives are actually involved in decisions about risks, instead of focusing on the way in which they are affected by the possible negative consequences associated with risks. The main question this paper aims to answer is: who makes decisions about risk? This is achieved by considering the distribution of risk decisions between risk producers, the people affected by the possible negative consequences of risks, and their elected representatives, as well as between risk experts, the general public, and elected representatives.

In order to answer this question, a case study research design has been developed. The case of the regulation of the possible side-effects of the railway transport system in Europe has been selected. The main focus of the study is the European railway regulatory framework and, more specifically, the activities of the European Railway Agency – the organization in charge of regulating the possible side-effect of railway transportation at the European level of government. The research results presented here are based on the analysis of: official documents regarding the regulation of the possible side-effects of railway transport in Europe (e.g. regulations, guidelines, recommendations etc.) – approximately 2,000 pages; 20 in-depth interviews conducted mainly with members of the European Railway Agency; and observation of everyday activities within the European Railway Agency – over a two-month period.

The analysis points out that:
• The regulatory strategies developed at the European level focus on regulating the ‘how’ instead of the ‘what’. Thus, regulators define the process of risk management through which regulated organizations should identify and estimate the magnitude and frequency of the risks they produce. Nevertheless, once this formal process of risk identification and estimation is followed, the decision about risk acceptability is entirely up to the regulated organizations. More specifically, the possible side-effects of railway transport activities are considered by regulators as business risks. Thus, risk is defined as the economic loss the sector could face, instead of
the possible dangerous consequences affecting society as a whole. Consequently, people, elected representatives and regulators are not involved in the risk decisions which are delegated entirely to the private sector. Thus, instead of confirming a trend of democratization of risk, the analysis of European regulation of the possible side-effects of railway transport indicates a trend toward a privatization of risk;

• The regulation of risk is still deeply influenced by the judgement of experts. Through the definition of formal procedures of risk management and cost-benefit estimates, experts deeply influence the political decisions about risk. Elected representatives tend to delegate to experts, confirming the trend toward a blame avoidance strategy highlighted by political scientists (e.g. Hood, 2002). Thus, despite the loss of confidence in science and technology highlighted by Beck (1992), the decisions about risk are still deeply influenced by experts that are not elected and do not formally represent the will of the people.

In conclusion, the analysis of the case of the European regulation of the side-effects of the railway transport, in considering who makes decisions about risks, instead of who is affected by risks’ possible dangerous consequences, calls into question the democratization of risks trend identified by Beck (1992). More specifically, the analysis shows that two important inequalities persist: the one between risk producers, on the one hand, and the people affected by risks, on the other; and the one between experts, on the one hand, and the general public and its elected representatives, on the other.

Liquidity of Social Life and Theory: Questioning Architecture of Risks and Balances
Yury ASOCHAKOV (St.Petersburg State University, Russian Federation) | yasochakov@yandex.ru

Analyzing the phenomenon of increasing contingency of contemporary life brings attention to the system of risks, uncertainties, and stabilizing factors within the underlying relations and structures of digitalized societies. In terms of the subjective – objective orientation, network society creates the situation of virtual/simulated realism where the vision of a metaphorical
subject/agent is focused on neither the subject, nor the object, but the product of its own creation (digital network) which uniquely opens a new territory of the lifeworld without clear demarcation lines of classic subject-object relation. Objectively, this situation produces immense multiplication of chances for variable choices of action in progressively self-complicating and self-accelerating social life, subjectively – a sensation of everything being possible. This new level of possibilities creates a new level of uncertainties and risks at new speeds.

This paper argues that contemporary societies are based on a type of "liquid" stability that implies such a level of structural flexibility and mobility that creates the necessity for inclusion of alternative projects into the legitimate model of their symbolic universe. For social theory it means that it cannot exist in a form of an enclosed self-sufficient complex but needs to become an active self-alternative context of the efficient first response to unlimited possibilities and uncertainties of social dynamic. This involves/demands pragmatic reconfiguration of social science epistemology towards the prospects of its becoming an open-ended, both cognitive and constructive tool matching challenges of liquid, software/app-based social life.

Sociology and the medicalization debate

Jorid ANDERSSSEN (UIT The Norwegian Arctic University, Norway) | jorid.anderssen@uit.no
Trude GJERNES (University of Bodo, Norway) | trude.gjernes@uin.no
John-Arne SKOLBEKKEN (NTNU Norwegian University of Science and Technology, Norway) | john-arne.skolbekken@svt.ntnu.no

Medicalization, understood as a growing number of human problems are defined and treated as medical problems, has been a topic in the sociological literature since the 1960s. Sociology is a critical discipline, and the early medicalization critique was directed towards doctors’ dominance in the field of health and illness. Today there are more actors in this field, and doctors’ dominance has been challenged. Much of today’s discussion about medicalization comes from other groups than sociologists. This includes ethicists, patient organizations and doctors. Since the start of the medicalization debate, there has also been a change in of what constitutes health and illness. New technology and new actors provide new knowledge about illnesses, and risk conceptions and lifestyle changes alter the way we adjust to and understand health and illness.

The present paper discusses sociology’s position in the modern medicalization debate. How has sociology as a critical discipline met new challenges related to health and illness? Has sociology provided the analyses needed in the debate of medicalization in our society? We ask if medicalization is a suitable way to analyze the development in our society. In this paper we also want to discuss sociology’s contributions to the understanding of the relationship between risk, governance and medicalization. We also provide a critical reflection of the current sociological analyzes of medicalization

The uncertainty of social network communication as a risk factor in everyday life.
Elena CHANKOVA (Russian State Social University, Russian Federation) | chev3@yandex.ru

The urgency of the issue is associated with the changing type of social development. The transition of the information type causes systemic changes in the structure of society, which leads to a significant reduction of the role of social institutions. In current circumstances, the regulating function of the relations shifts into the area of personal initiative and responsibility of the communication participants, it is especially manifests itself in network communication. First of all, participants of the postindustrial type of communications base their choice of behaviour on the concept of "life world". J. Habermas highlights the properties of "life world" of
the individual is such that it allowed it to autonomies from culture as a social structure and to consolidate with a partner in accordance with the situation, on the basis of its specificity. Secondly, the changing role of social institutions leads to uncertainty and interaction which manifests itself in a reflexive attitude to it. According to E. Giddens, claiming that reflexivity manifests itself in the ability of self making under uncertain conditions of time and space. Therefore, on one hand the participant of network communication is creative, reflective and autonomous in relation to the existing norm of communication within culture. But communication inherently contains a risk factor in itself. It means that the modern user of networks is at risk of ineffective communication with social consequences unfavorable for life which brings this issue to the level of the social problem of everyday life.

Mediatization, Risks and Antidotes in the Reflexive Modernity
Tilo GRENZ (University of Vienna, Austria) | tilo.grenz@univie.ac.at
Heiko KIRSCHNER (University of Vienna, Austria) | heiko.kirschner@univie.ac.at

Building on our prior research and theory building within the priority program „mediatized worlds“ the presentation aims at the non intended side effects of mediatization for everyday private life and business action. The acceleration of life speed, the exploding number of available options, or the massively grown datification are phenomena, that actually experienced and negatively interpreted by different societal actors as consequences of digital media's spread (so called recent media change) and normalization. Different counter-strategies — grasping a term from Ulrich Beck we call them „Antidotes“ -- are evoked along with these consequences. They range between discourses on and practices of withdrawal, privatization, and anonymization. Taken together they can best be described with our concept of de-mediatization. As will be shown, these phenomena get manifest and disseminated in everyday action and adopted in digital media related business strategy as well. The core argument in the presentation follows the insight, that the widely latent process of mediatization, driven foremost through the interplay of technological and economic developments, nowadays gets questioned and disputed on the background of its unknown effects and produced uncertainties. Or in other words: the dominant and mostly implicit idea of sociotechnological progress today is at stake. Coming from that, we will show the actual need, central arguments and aspects of a theory of „Reflexive Mediatization“.

RN22S10 - Global and Local Risk

Poles in the world of late capitalism: changes of biographical processes in terms of professional careers, social relations and identity at the time of system transformation in Poland
Kamila BIALY (University of Lodz, Poland) | kamila.bialy@gmail.com
Andrzej PIOTROWSKI (University of Lodz, Poland) | kamila.bialy@gmail.com
Anna KORDASIEWICZ (University of Warsaw, Poland) | kamila.bialy@gmail.com
Karol HARATYK (University of Lodz, Poland) | kamila.bialy@gmail.com
Marcin GONDA (University of Lodz, Poland) | kamila.bialy@gmail.com

In our research we look - referring to the conducted biographical narrative interviews with managers and professionals - at biography as a way to examine life-history, i.e. the sense of one's living and existence in terms of professional career, social bonds and identity in the contemporary reality. By this context we mean the time of system transformation in Poland, characterised by a simultaneous clash and co-occurrence of elements belonging to several
varieties of social order, understood in terms of rules relating particular institutional solutions to cognitive, axionormative and emotional orientations. One of these varieties, being at the very focus of our research interest, is most often described in terms of late capitalism (also in terms of late or second modernity, risk society or postmodernity) and the related processes of Europisation, globalisation, multiculturalism and transculturalism as well as the neoliberal economic order; we refer to this order, for the sake of simplicity, as corporate order. The second one are the social order arrangements adopted by Western societies of the modern era, that is, the classic liberal, democratic and market-oriented solutions, while the third one is defined by certain elements of the heritage of earlier times, including, on the one hand, the heritage of the era of the so-called real socialism and, on the other hand, elements of the pre-modern culture. In the paper we would like to draw your attention to the resultant most evident clashes of the three orders: in the sphere of employment / professional career, social bonds and in the sphere of identity.

Security, Risk and the Cosmopolitan City
Elisa PIERI (University of Manchester, United Kingdom) | elisa.pieri@manchester.ac.uk

Scholarship focusing on Western cities increasingly contends that they have become militarised and describes their role in building resilience. The fortification of the built environment, in particular that of affluent neighbourhoods, has been traced in studies which lament the spread of privatised space and gated residential solutions, and which criticise the politics of marginality that they reinforce. Nonetheless, a much debated characteristic of the urban remains its diversity, with the unpredictability and heterogeneity of encounters it allows. While debates over multiculturalism, intercultural relations, migration, cohesion and diversity are always high on the political agenda, there has been a resurgence of interest in cosmopolitanism both within academic debates and in policy discourse. This paper investigates how the process of securitisation and the mobilisation of cosmopolitan aspirations interact to reconfigure urban space. Taking Manchester city centre as a case study, this paper discusses the role of cosmopolitanism and securitisation in place making. It investigates the understandings of cosmopolitanism operationalised by various stakeholders – recovered through interviews, focus groups, ethnography and documentary analysis - and contrasts them with those circulating in contemporary scholarly debates. The paper asks whether securitisation and cosmopolitanism are best thought of as conflicting or as mutually-validating trends, and considers the types of spaces and practices that ensue.

Going global uphill: experience of a Korean family dealing with globalized economic risks
Garam LEE (Yonsei University, Korea, Republic of (South Korea)) | garamish@gmail.com

It is often easier said than done to link global world with one’s life experiences. How does the big, broad term ‘globalization’ permeate everyday life of people, who usually live here-and-now ‘local’ lives? How do globalized societal orders increase risks for individuals and/or a family and how can individuals react to the risks? Through life trajectory of a Korean family, the study aims to depict: how globalization at societal level affects family life and increases economic risks; how individuals perceive and react to those risks at individual and family level; and how life still goes on glocally. The author opts autoethnography, relatively new and thereby sometimes considered controversial method among qualitative sociological research traditions, for two reasons: first, for better understanding of subtle inner-family interaction; and second, as a methodological suggestion for reflective understanding of social structural phenomenon
(globalization) and its relation with individuals. Interpreting a family life trajectory within broader social context shall give a snapshot to society itself as well as revealing connecting lines between individuals and society. How the term ‘global’ has permeated in the family’s everyday life renders an account on its long-term influence and interconnectedness. For example, foreign exchange crisis in 1998 and global financial crisis in 2008, has increased economic risk of the family. The risk is transferred generationally through social psychological and cultural context as well as economic way. Their dealing process shows how life still goes on at local level, yet interconnected with global world.

The influence of risk averted culture on contemporary forecasting - the case of political risk analysis

Ori SLONIM (Herzliya Interdisciplinary Center (IDC), Israel) | oslonim@idc.ac.il

The paper starts with describing the foundations of traditional forecasting methodology. It describes it as a “top-down” benchmark analysis. It argues that the new environment has created a risk-averted culture which is based on “bottom-up” forecasting approach. The text analyses forecasting as a practical product of the intellectual school of modernism, next to operations research and Game Theory. All are practical tools which were designed as a reflection of the environment in the way that it was defined and perceived in the second half of the 20th century.

It shows how change in the global environment - one that was generated by rapid technological development, globalization and the relative decline in the power of traditional state actors - had weaken the validity and the power of forecasts made by using modernist tools and have brought to the development of new type of forecasting which is essentially closer to risk management methods.

My work is focused on Political Risk analysis. Inmature discipline which is found between the well-established quantitative risk analysis and the under developed qualitative analysis. The existed tools and models that have been designed to perform Political Risk assessment provide low added value when compare with both traditional political analysis and with the significant advantages of risk tools and methods in finance, environment, medical systems etc.

My work is aimed to offer a platform which bridges the gaps between the elaborated risk methods and tools which are used today in politics/strategy planning. I discuss and test that possible link by using two anchors:

1. Extracting from traditional political analysis methods elements that can be employed as operative units in a political risk model. In this regard I treat opportunities as a complementary value to risk.

2. Using elements and ideas which are found in the models used by credit rate agencies (i.e. S&P, Moody’s and Fitch) as an inspiration guide for the way which the quantitative risk environment conceives political risk.

I find that scenarios are the key element in that task, where they act as a structured way to manifest analytical narratives. Narratives that if constructed and presented properly can easily be used as an input in a quantitative model. Accurate model can be used for both directions, e.g. arbitrary or random values can be translated into real-world or spoken language.

The accuracy of the model and its scenarios is based on determining the resolution or the granularity of each scenario and setting criteria for defining the sufficient number of scenarios needed for the analysis of pre defined problems. The solution for these two dimensions is found somewhere in the middle between the 3-5 scenarios/long stories system, which characterises traditional political analysis methods, and the multiple numeric scenarios which are the base for e.g. financial risk assessment.
**RN22S11 - Risk, Uncertainty and Inequality**

**Teacher’s beliefs and their representation of risk (factors)**
André EPP (University of Hildesheim, Germany) | eppandre@web.de

The transition from school to apprenticeship is an important instant in the biographies of youngsters. It possesses a fundamental relevance because it sets (to a certain dimension) the course for the future path of life. In modern society this transition seems difficult for a lot of young people due to diverse reasons. Based on the fact that youngsters spend quite an amount of their time in school besides their parental environment, teachers play as well an important role in the process of the transition. On the basis of his profession and the interaction of pedagogical acting, teacher’s beliefs also influence the transition to apprenticeship. If their beliefs about risk factors are poorly developed – on a one-dimensional level – teachers tend to reproduce and reinforce social structures and inequalities. The paper will demonstrate this with the help of two case examples from the current study. Thereby it is especially relevant which risk factors are perceived and represented in the beliefs of teachers and what significance they ascribe to the factors. Furthermore, I will point out how the two different teachers construct the interrelation between the various factors as well as what pedagogical action strategies they pursue in relation to their beliefs.

**Towards a methodology for quantitative intersectional analysis of risk positions**
Anna OLOFSSON (Mid Sweden University, Sweden) | anna.olofsson@miun.se
Susanna ÖHMAN (Mid Sweden University, Sweden) | susanna.ohman@miun.se
Katarina GIRITLI NYGREN (Mid Sweden University, Sweden) | Katarina.Giritli-Nygren@miun.se

The aim of the paper is to investigate risk positions through a quantitative intersectional analysis. Risk, as well as norms of gender, sexuality, ethnicity and class, is socially, performatively, and intersectionally inscribed in our minds and bodies. To ‘do’ risk means socializing normative constructions of risk, anchored in time- and context-dependent beliefs about society and its inhabitants, which influence both how society is organised and governed and how we as individuals live our lives. In this process, it is a process because the notions of risk are constantly negotiated and thus changing, certain groups and individuals are attributed risk and risk positions. Hence, risk is ‘done’ through multiple systems of social stratification, systems that are interlocked, i.e. every individual holds a position in different systems simultaneously. It is recognized that quantitative approaches to intersectionality are lacking or are in development. In line with Bourdieu’s way of linking objective structures to subjective experiences we argue that multiple correspondence analysis (MCA) is well suited to capture the social space where the matrix of domination occurs. This hypothesis is tested on quantitative data composed of a Swedish national survey from 2011 about risk perceptions and risk positions. Preliminary results indicate that MCA is well suited for quantitative intersectional analysis and can enhance knowledge about the relation between social stratification and risk positions.

**Risks in vulnerable ages: Identifying emotional problems in at-risk students through the school guidance system**
Anne-chie WANG (National Tsing Hua university, Taiwan, Republic of China) | anne0806@gmail.com
Due to economic growth rapidly in 1990s, the social structure of the Taiwan society has been changed radically. At the same time, juvenile crime rates also increased sharply. Some scholars have asserted that the social transformation may cause juveniles to be “anomie”, lacking moral guidance. Teenagers who have emotional distress tend to harm themselves or others such as committing to suicide or bullying others. In 2014, the Taiwan government established a school guidance system in order to address this issue more effectively. The system is based on the framework of clinical risk management. The objective of the research is to investigate the relationships between risks and emotions factor of high-risk students and to discuss the issue of “What juvenile behavior would be problematic concerning at-risk students?” The researcher interviewed ten school guidance teachers who participated in guidance work and counseling. Moreover, the researcher observed general counseling sessions in order to understand how the teachers identify and help at-risk students. The major result reveal that the social classification such as foreign born Taiwanese, single parent-hood, low-income family, domestic violence are easier to identify as the at-risk student. Also, student who has the behavior such as lying, bullying, impolite to teachers could be the indicator of the priority list of teacher guidance. In short, the findings indicates the types of the social orders that the Taiwanese society tends to sustain.

What talking about crime and the ‘Others’ can mean – and why it is useful for describing sometimes indescribable feelings of insecurity
Judith ECKERT (University of Freiburg, Institute of Sociology, Germany) | judith.eckert@soziologie.uni-freiburg.de

In the course of my qualitative study of subjective insecurity in Germany, I’ve been repeatedly making the observation of interviewees talking about crime and/or of talking depreciatingly about ‘Others’ like “the Muslims,” “the unemployed” or “the young people.” What does this mean? Based on a microanalytic approach, which is informed by linguistics and aims at reconstructing subjective meaning-making, it will be shown that underneath fears expressed this way feelings of socioeconomic insecurity and uncertainty arise. The latter are partly associated with feelings of injustice and political powerlessness. Consequently, it is suggested that the “generalized insecurity approach” proposed in the context of fear of crime can also be applied to the fear of ‘Others’. Both, crime and ‘the Others,’ can be used as a code for expressing diffuse insecurities. Such diffuse, “liquid” fears are, following Zygmunt Bauman, characteristic of our times – and unbearable. Thus, people seek to find a concrete object which seems to be manageable. Furthermore, talking about crime and ‘the Others’ fits into larger social discourses. By referring to those, interviewees are able to communicate sometimes indescribable feelings of insecurity.

RN22S12 - Risk Governance and Policy

Risk and Grave Digging in Ireland: ‘Our Traditions and Culture Your Respect Required’
Elaine MORIARTY (Trinity College, Ireland) | elaine.moriarty@tcd.ie
Damien BRENNAN (Trinity College, Ireland) | dbrennan@tcd.ie

“Please be advised that from the 1st of March 2011 only approved gravediggers will be allowed to work in Cork Co. Council Local Authorities Burial Grounds. The list of approved gravediggers
is available on www.corkcoco.ie" (Public Notice Palace on the Gate of Moyross Graveyard, Unionhall, Ireland 2011)
“Dear C.C.C. In Moyross we dig for own, we shoulder our own!! And we inter our own!! Our Traditions and Culture Your Respect Required” (Community Response Written on Reverse of above Public Notice)
This paper considers increasing risk governance and policy-making surrounding Irish social life through an exploration of the professionalisation of grave digging in West Cork, Ireland. What was traditionally a community and family matter is currently being constructed as a risk, which should therefore be managed by accredited bodies and agents. Drawing from Illich and Ritzer, qualitative interviews and direct personal experience the development of an Advanced Certificate in Grave Digging is explored. This Certificate is awarded on the completion of a course with the Death Care Academy of Ireland (DCA), accredited by both The Further Education and Training Council (VTAC) and The National Training Authority of Ireland (Solas). Core themes explored include the social construction of risk associated with grave digging, the commercialisation of death, the bureaucratisation of social life and the interface between state and professional bodies. The development of monopolies of practice, the de-skilling of community practice and the creation of professional dependency are also considered.

Unused resource. Municipalities facing heavy precipitation related risk.
Adam CHORYŃSKI (Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland) | adam@swarzedz.net.pl
Piotr MATCZAK (Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland; Institute of Sociology, Adam Mickiewicz University, Poznań, Poland) | matczak@amu.edu.pl
Jakub LEWANDOWSKI (Institute for Agricultural and Forest Environment, Polish Academy of Sciences, Poland) | jakub.lewandowski22@gmail.com

Extreme rainfall is a threat for both, infrastructure and human health. Studies predict an increase in frequency and intensity of extreme weather events (IPCC, 2007) which leads to larger losses.
Although highly urbanised areas are at higher risk (density, infrastructure accumulation), smaller municipalities in Poland also suffer, but they are often omitted when analysing natural hazards impact. Nevertheless, studies point out differences in governance of extreme events in smaller communes (urbanised, less inhabitants). Biernacki (2009) indicate that there is a larger role of local authorities in coping with natural hazards. The familiarity with local conditions and awareness of communities’ needs make them most successful actor in natural risk governance systems (Michałowski, 2006).
Authors are stating that even though extreme rainfalls bring losses, they are not perceived by the main actor (local authorities) as a threat and do not generate adaptive actions. Voss and Wagner (2010) indicate that small events with drastic consequences in small scale are not seen as catastrophes. Biernacki (2009) adds that they are not recognised as being enough dangerous to undertake actions increasing resilience. Potential to improve natural hazard management (including higher level of administration (Voss, Wagner, 2010) is therefore wasted, even though appropriate knowledge exists. Barriers for using of the “window of opportunity” are explained.
The research is conducted by in depth interviews in the Wielkopolska region, Poland. The selection of municipalities is based on fire departments statistics on interventions relating to extreme rainfall (2010-2014). Communes with a high number of interventions are analysed.

Risk and regulation
Henriette VAN WYLICH- MUXOLL (Roskilde University, Denmark) | hvwm@ruc.dk
The study to be presented aims at analysing how statutory fire inspections influences the perception of risk and responsibility in a Danish context. In the presentation it will be discussed how politicians, institutions and inspectors enact the meanings and logics of the political, economic and legal systems, how this is perceived, and how it influences the perception of risk for both the regulated community and the general population. When a political system implements statutory regulation to minimise risk, the language of politics, law and economics becomes more dominant than the language of risk, responsibility and interdependency. In other words, one may characterize risk minimisation through rules and inspections as a colonization of our common language of risk and shared responsibilities. I will draw on research from the traditions of public policy, political science, and the sociology of law since these issues are discussed with regard to regulations and the practise of inspections. Part of the research indicates that the issue of risk is neglected when the regulated become overwhelmed by juridification and that governing and regulation can create a false sense of security within a group and perhaps even a population. It has become obvious that there is a need for an interdisciplinary approach in order to broaden the scope. Researchers of the field are now looking for explanations and solutions within sociology to examine how the system of risk and responsibility can compete with the systems of politics, law and economics.

Transforming Uncertainty as a Means of Legitimating Regulation? Tracing changing manifestations of complexity and uncertainty within the regulation of expensive new medicines

Patrick R BROWN (University of Amsterdam, Netherlands, The) | p.r.brown@uva.nl
Ferhana HASHEM (University of Kent, UK) | F.Hashem@kent.ac.uk
Michael CALNAN (University of Kent, UK) | m.w.calnan@kent.ac.uk

Across European healthcare systems, increasing financial pressures, not least due to the costs of expensive new medicines, create significant administration challenges for policy-makers. In response to these challenges, new regulatory systems have emerged including those assessing value-for-money (VFM). Institutions such as NICE in England were instituted to resolve uncertainty regarding VFM use of medicines, thereby facilitating more rational, consistent and thus legitimate use of limited public/insurance monies. Yet, in England at least, the increased visibility of value-for-money decisions has led to heightening politicisation of access to medicines and legitimation problems for NICE. Within this wider context, we explored decision-making processes of NICE in evaluating the cost-effectiveness of three medicines which were purposively selected. Triangulating observations of NICE technological assessment committee meetings, documentary analysis and interviews with a range of decision-makers and other stakeholders (n=41), this study considers how complexity and uncertainty evolve within regulatory processes. Various forms of complexity and uncertainty, for example due to limited or insufficiently appropriate data, were ‘absorbed’ and then transformed within decision-making processes. It was commonly considered that if all uncertainties were fully acknowledged then decisions would not be possible. Some of these uncertainties were then confronted, while others remained submerged or were more purposively overlooked. Informed by Habermas’s work on legitimation problems amidst late-capitalism, the analysis considers various tensions which exist between processes connected to the pursuit of legitimacy, on the one hand, and processes designed to enhance procedural-rational decision-making, on the other. These tensions were fundamental to the reworking of uncertainty within regulatory.
RN23S01 - Theorizing Sexuality

A History of Researching Childhood and Sexuality
Sue SCOTT (University of York, United Kingdom) | sscott69@btinternet.com
Stevi JACKSON (University of York, United Kingdom) | sf3@york.ac.uk

In this paper we will locate current concerns about children, sex and sexualization in historical context by reviewing the changes in approaches to theorizing and researching in this field since the early 1970s. We will draw on our own past empirical work conducted between the mid 1970s and the mid 2000s as well as our ongoing theoretical analysis. We will explore the continuities and discontinuities in both sociological and public debate. We are especially interested in the highly gendered ways in which sexual risks to the well-being of children and young people are understood and how these are negotiated by the young people themselves. Underlying our analysis is the argument that that these anxieties derive from constructions of sexuality as a special area of life and children as a special category of people, and that the way in which the former is seen to be inimical to the latter needs to be questioned sociologically. We attempt to show how this historical contextualization and the analysis we offer can enable a more useful sociological analysis of the current context in relation to the sexualisation and sexual abuse of children and young people.

The Limits of Sexual Citizenship
Diane RICHARDSON (Newcastle University, UK, United Kingdom) | diane.richardson@ncl.ac.uk

What are the limits to and limitation of ‘sexual citizenship’? This question can be addressed in a number of different ways, both in terms of its conceptual construction and in relation to political activism. This paper maps the literature on sexuality and citizenship and identifies four main areas of critical framing: work that contests the significance of sexuality to citizenship, critiques that focus on the possibilities and limitations of mobilising the language of citizenship in sexual politics, and literature that critically examines how debates about sexual citizenship (re)articulate forms of western imperialism and may be understood as constituting neo-colonial and orientalist practices. To progress the field theoretically, the paper argues for a timely revisioning that includes a de-centering of the ‘western-centric’ focus in order to advance understandings of how sexual citizenship operates both in the global north and south. It addresses the limits to sexual citizenship by focusing on two key aspects of its conceptual construction: the (sexual) citizen-subject and the spaces of sexual citizenship.

Inside the sexuality-assemblage: from pornified bodies to the re-sexualisation of everything
Nick J FOX (University of Sheffield, United Kingdom) | n.j.fox@sheffield.ac.uk
Pam ALLDRED (Brunel University London) | Pam.Alldred@brunel.ac.uk

This paper establishes an understanding of the sexuality-assemblage, informed by new materialist, posthuman feminist and queer theory. Sexuality is not an attribute of a body, but an impersonal, nomadic flux of multiple desires and materialities, involving a mix of human and non-human relations; a vital, rhizomatic jouissance which produces sexual (and other)
capacities in bodies, collectivities and social formations. While intensities and fluxes within the sexuality-assemblage have the capacity to produce unknown and unpredictable manifestations of sexuality, aggregating and ‘territorialising’ forces typically establish strict limits on what a sexual body can do. Human sexuality is consequently both infinitely variable and typically highly restricted, for instance into genitality, limited and exclusive sexual identities, and culture- and gender-specific norms and expectations of sexual conduct. This is not, however, a ‘repressive’ model of sexuality (Foucault, 1981), in which a once-free body submits to the forces of culture. Though this materialist understanding recognises both the inevitability and ineluctability of sexuality’s bodily territorialisation by the panoply of natural and cultural materialities, the sexuality-assemblage also contains within it the potential that can at any moment de-territorialise and dis-aggregate sexuality, and set a body off on a sexual line of flight.

To illustrate the forces that aggregate and territorialise sexualities, we explore data from various sources concerning the ‘sexualisation’ and ‘pornification’ of bodies. This reveals the processes which sexualities are constrained, and establishes a basis for us to consider the possibilities for sexualities that extend far beyond conventional notions of ‘the sexual’.

Sexual Justice and Recognition: A Return to Practice
Paul REYNOLDS (Edge Hill University, United Kingdom) | reynoldp@edgehill.ac.uk

Much of the last 45 years of progress in enabling sexual rights and justice across Europe has been achieved through a politics of recognition. It has been principally characterized by a 'minority rights' approach to sexual politics, based on an egalitarian and humanist discourse. Necessarily seeking to create space for tolerance and safety for different, principally gay and lesbian identities, it has focused on a limited challenge to heteronormativity, the creation of homonormative space and strategies for legal and cultural normalisation of diversity. Identity has been at the core of this politics. It is not what people do - previously pathologised if not genito-centric and penetrative with an implicit connection with reproduction - but that they are people, and deserving of equal rights and justice. Sexual theories have, by and large, elided with this incremental change or being regarded as aspirational, utopian or focused on individual liberties.

Yet this identity focus becomes problematic at the margins, where sexual practices and orientations do not neatly fit into either heteronormativity or homonormative alternatives remain culturally or legally pathologised and prejudiced against. BDSM sexuality for example, remains a challenge to how the sexual politics of recognition manifests itself, as does the limits to the expression of sexual difference in public and in areas such as sex education.

This discussion will argue that with the growing sense of impasse and limit to the politics of recognition, against what queers and transgressors might regard as the need for a more sexualised society, it is necessary to think again about a politics of recognition that is based on identity and explore how a refocusing on practices would take sexual politics forward. Drawing from Bourdieu and a Negri influenced radical Spinozan approach to practice, it is possible to develop a theoretical basis for a politics of sexual practice that rethinks the boundaries of heteronormative tolerance and takes queer and radical perspectives seriously as the beginnings of a shift towards a more transformative sexual politics.

RN23S02 - Researching Sexuality: Ethics and Methods

Ethnography of Non-heterosexual Families in Poland – Remarks from the Field
Joanna MIZIELIŃSKA (Polish Academy if Sciences, Poland) | jmizielinska@psych.pan.pl
"Families of Choice in Poland" is the first multi-method research project on non-heterosexual families in Poland. It is an in-depth study which aims at showing the diversity of intimate and familial configurations of non-heterosexual people in Poland. The project has been designed as a multi-stage research process of many methods (both quantitative and qualitative). One of them was a team-ethnographic study based on participant observation and interviews with families of choice.

The researchers accompanied 20 families living together with the family and working under the supervision of the research team for a month. They kept a specially designed online ethnographic journal describing the life of the family on a daily basis. They also carried out several interviews with the members of the families (i.e. biographical interviews, photo/object elicited interviews, family maps interviews).

It was the first ethnographic research with such a complex methodology used in research on LGBT people in Poland and, probably, in Europe. It gave a unique insight into the interactions and relations prevalent among families of choice.

In our presentation we would like to present the methodology of the research and discuss the process considering methodological, ethical, and psychological dilemmas that it has raised. How to deal with the very sensitive data involving intimate aspects of LGBT life in a rather homophobic society and academia? What are the pros and cons of such a study in comparison to other methods? What are the most pressing ethical issues of privacy and the validity of the data? We will address those questions drawing on particular examples from the field.

Homo/bisexuality in France. Results of a quantitative survey about couple formation
Camille LAMBERT (Institut national d'études démographiques, France) | camille.lambert@ined.fr
Wilfried RAULT (Institut national d'études démographiques, France) | wilfried.rault@ined.fr

In France, the quantitative study of gay men, lesbians and bisexual people is usually based on sexuality surveys such as “Context of sexuality in France” (2006). These surveys distinguish several types of indicators: attraction towards a person of the same-sex and of the different sex, female and male sexual partners, and respondents' definition of their own sexuality. Other surveys – such as the census – are generally of little use as they do not provide indicators on sexuality. Only same-sex couples at the time of the survey can be identified.

In this paper, we explore a different approach using data from a survey that focuses on union formation. The "Study of Individual and Conjugal Trajectories" (EPIC) survey conducted by the National Institute for Demographic Studies (INED) in 2013 on a representative sample of 7,825 persons aged 25-64 includes a specific set of questions on both sexuality and conjugality. The “Current situation” module gives detailed indications of the diverse range of relationships existing at the time of the survey, including same-sex relationships. The survey also offers retrospective information on individuals' trajectories. It covers all of the relationships that have counted in the respondent's life, including same-sex relationships, without any preconceived definition or minimum duration. Last, the most commonly used indicator – have had a same-sex partner – is also available. Thus, in a new context with regard to homosexuality – France opened marriage to same-sex couples in 2013 – the EPIC survey enables us to explore different facets of homo/bisexuality, and the diversity of life courses and individuals.

The Gender Game Frame: Consensual sexual behavior in the workplace
While a considerable amount of research on sexuality in the workplace has placed the emphasis on sexual harassment, little attention has been paid to pleasurable and consensual sexual relationships in the workplace. Taking its point of departure in autoethnographic fieldwork in the hotel and restaurant industry in Denmark, the paper sheds light on the so-called “gender-game” as it is spontaneously played out in everyday work settings as a sexualized form of sociality in collegial relationships. Drawing on an overall theoretical framework based on Erving Goffman’s concept of “frame”, the paper explores and discusses the boundary line between pleasurable and consensual sexual behavior (this including sexual humor, flirting, bantering and touching) and sexual harassment in the workplace. Goffman used the notion of “framing” to describe the process of shifting from one type of interactional logic to another. The paper argues that within the “gender game frame”, sexual behavior is not to be considered as sexual harassment no matter how sexist it might seem, as the frame redefines everything someone does and says, as it is not supposed to be taken “seriously”. Nothing but the pure pleasure experienced by playing the gender game is to be gained. However, the premise for playing the gender game is gender equality, and correspondingly the “gender game frame” can suddenly shift to a “harassment frame” if the basic gaming rule that implies that both men and women are active and equal players is not observed.

'You can't really act gay, you know one of those stereotypical kinds of gay'.

Negotiating sexualities in the context of professional dance
Andria CHRISTOFIDOU (University of Glasgow, United Kingdom) | a.christofidou.1@research.gla.ac.uk

This paper will discuss how professional male dancers’ performances of sexuality and gender are being affected by the context, discourses and different ‘levels’ that co-exist within dance companies and educational institutions in Scotland as well as how these performances influence their progress in the field. Professional dance is an interesting context to be studied in regards to gender and sexualities for numerous reasons. Dance as a social field is female-concentrated (Hayes, 1989), however, it is in its majority male-dominated. Despite that the majority of dance audiences, recreational and professionally trained dancers are females, the key organisational and leading roles are mostly often occupied by males. Also, whilst females outnumber males in the wider field of dance in the context of professional dance companies the numbers of the employed female and male dancers are equal. Lastly and most importantly the context of professional dance in Scotland comprises of equal numbers of heterosexual (straight, mostly straight) and non-heterosexual (gay, bisexual) males which creates very interesting dynamics and power relations that affect their performances and negotiations of gender and sexuality. The argument of this presentation will be informed by the theoretical traditions of symbolic interactionism, queer theory and masculinities as well as data which were collected over a period of 11 months in Scotland. Overall, data comprise of 30 face-to-face semi-structure interviews and 240 hours of observation within the facilities of one educational institution, one medium to large scale ballet company, and two small to medium scale, funding based dance theatre companies. Out of these 30 interviews two were with representatives of funding bodies and arts organisations, nine with male ballet dancers, nine with male dance students and 10 with male free-lance dancers/ performers. Participants ranged in age, from 18 to 67. 13 described themselves as gay, one as bisexual, 13 as straight and one as mostly straight. Data analysis suggests that the field of dance is an environment that enables and even invites men to question and experiment with their felt and/or performed sexuality and gender. Most
non-heterosexual dancers’ sexuality changed after they got professionally involved in dance. Participants suggested that they felt invited to join and experience the strong gay culture that exists in this field which has probably not been the case in many other social and professional environments. However, dance is still a social context that is affected by heteronormativity which Berlant and Warner (1998: 565) defined as the ‘institutions, structures of understanding, and practical orientations that make heterosexuality not only coherent—that is, organized as a sexuality—but also privileged’. Within the context of professional dance heterosexual, masculine male dancers or dancers who have the ability to perform a ‘traditional’ or ‘normative’ hegemonic masculinity which is associated with straightness (Connell, 2005) are more privileged and valued and can more easily progress in the field. Straight masculinity, whether felt or performed, acts as a quality that influences male dancers’ careers. Straight masculinity is especially valued within the rigid, disciplined working cultures of ballet companies mostly because of the performances that they produce which in their majority display romantic heterosexual love and desire. Male ballet dancers need to convince their casters and also dance audiences that they can perform the role of the hegemonic, heterosexual man. Contemporary companies can be more flexible and fluid as projects vary and the performers usually work in short contracts, yet there are still interesting dynamics that need to be revealed.

Data analysis also suggests that there are two different levels within dance companies and institutions. The first one could be described as the ‘informal’ level where these ‘invitations’ to challenge heterosexuality or certain forms of sexuality occur and it involves interactions with co-workers, and friends before and/or after the rehearsals, company classes and audits. The second ‘formal’ level involves occasions such as company classes, rehearsals and audits, contexts where figures of authority such as ballet masters, directors, casters and choreographers are present. In this second level straight masculinity seems to be valued more. As most participants suggested their performances of gender and sexuality influence the roles they are assigned to and therefore, indirectly, their career development. As one of them argued ‘they are being stereotyped by staff members’ because of the way they move, act, talk and present themselves and get roles that ‘fit’ their (gendered) character and sexuality. Most participants argued that regardless their sexuality being too feminine or camp can affect their progress in the field as men who come across as straight and masculine are being preferred for the principal roles. Some even argued that in this formal level they consciously try to not come across as too feminine or camp whilst their majority argued that their (conscious) performances of gender and sexuality vary according to the contexts they act in and the people they interact with. Theories such as symbolic interactionism (Goffman, 1959), ‘hegemonic masculinity’ (Connell, 2005), ‘state of invisibility’ (Williams et al, 2009) and ‘performativity’ (Butler, 1988; 1999) will be used, and wherever suitable challenged, to analyse male dancers’ performances of sexuality and gender within the context of professional dance.

Reference List:
To talk or not to talk about it: researching young women’s sexuality in a small city of contemporary Iraqi Kurdistan
Ana Cristina MARQUES (Soran University, Iraqi Kurdistan; CIEG, Portugal) | anacristina.hmarques@gmail.com

While some researchers talk about the sexualization of western societies, others comment on the difficulties of talking about sexuality and the undervaluation that sexuality studies have in academia until the present day. If this happens in a supposedly individualized and secularized western society, how can we, then, ask about sexuality in a region where influences of western societies coexist with Islamic religious beliefs and a strong sense of identity, exacerbated by the last months events related with the “ISIS threat”? A place where women, even if going to university, still have their mobility and sexuality controlled in order to protect men’s good name; where young people, even if they have their, more or less “secret”, boy/girlfriends, cannot experiment sexuality ‘freely’ before marriage; where sexuality, at first sight, seems to be an unspoken subject, even if curiosity and understanding seem to be present in the small space of a classroom? Based on these and other reflections, this abstract aims to explore the possibilities of studying and talking about sexuality in a small city of contemporary Iraqi Kurdistan, where old spaces coexist with new built ones, urged by the flux of migrants “returning” to the “safe haven” (Mojab, 2004) of their homeland after years of persecutions. It is argued that ethnographic field work, combined with in-depth interviews, and the use of visual methods can prompt a relation of trust and intimacy between the researcher and young women that allows for the communication of sexuality, even if in a more metaphorical way!

RN23S03 - Sexuality, Abuse and Violence

What can Neo-materialism offer the analysis of sexual orientation and gender-related violence?
Pam ALLDRED (Brunel University London, United Kingdom) | Pam.Allred@Brunel.ac.uk

This paper tries to articulate the relation between a feminist research project and the theoretical framing offered by neo-materialism. The GAP WORK Project has delivered training for ‘youth practitioners’ to challenge gender-related violence in four European countries with support from the EU’s Daphne-III Programme (www.sites.brunel.ac.uk/gap). Training in each country has adopted a broad definition of ‘gender-related violence’ that unites violence against women and girls and homophobic and transphobic violence, and views gender inequality and the gender binary system as at the core of each of these types of violence, although they affect different people in different ways. There are unsurprisingly differing findings and indeed specific nuances to the intervention in each location, yet the overall politics of the project can be identified. It was a practical project that implemented actions and drew lessons from the evaluations of these actions. It was driven by the imperative of improving professionals’ ability to intervene to challenge the everyday sexism and homophobia they so frequently hear.

However what difference does it make to think through the project from within a new materialist/neo-materialist perspective? What can articulations of the implications of the work of Giles Deleuze offer for feminist thinking through research on violence? What can feminist readings and developments of Deleuzian thought offer research that is focused on policy and practice in a real world area of pressing concern? In particular, can it support or aid the
implementation of anti-violence training in schools? The next stage of collaboration is to focus interventions in Italy and the UK and so the theoretical work needs to support this.

**Challenging gender related violence: undermining binary and heteronormative cultural and social conceptions of genders**  
Chiara Marcella INAUDI (University of Milano, Italy) | chiara.inaudi@unimi.it

Gender related violence (GRV) is a broad definition of gender based violence which allows to incorporate and acknowledge different forms of violence and inequality, uniting violence against women and girls and homo/lesbo/transphobic violence. This concept was adopted to develop an innovative training experience for ‘youth practitioners’ in Italy (as well as in the UK, Spain and Ireland - “Gap Work” EU funded action research project) and proved itself successful in highlighting the strength gender norms and heteronormative paradigm still have in our society and their role in shaping teaching and educational methods and practises as well as practitioners’ ability of dealing with GRV.

Evidence from the evaluation of training show that generating reflexivity among youth practitioners about sexuality, sexual identity and gender norms allows them to questioning norms and rethinking practises and habits in teaching and education which often reflect the outlook of gender normativity and heteronormative culture. Fostering a critical reflection, beginning from personal history and experiences, activate an empowerment process and promote action, so it may be viewed as the starting point to undermine an enduring paradigm that leads to inequalities and violence and therefore to create a safe and welcoming climate for children and young people and be able to support them in cases of GRV.

The reflection and work will continue with interventions in Italy and UK that aim to have an impact on teachers/education professional.

**Separating 'harm' from 'wrongfulness' and 'sexual innocence' from 'childhood' in contemporary narratives of childhood sexual abuse**  
Jo WOODIWISS (University of Huddersfield, United Kingdom) | j.woodiwiss@hud.ac.uk

This paper draws on research exploring adult women’s engagement with narratives of childhood sexual abuse (CSA) and identifies implications for both child and adult victims. As this research showed, any single story cannot accommodate all experiences. When that single story becomes dominant those whose experiences are not acknowledged are at risk of being silenced and left without a narrative framework to make sense of their experiences, which in turn risk being unrecognised as abuse by others.

The paper looks at contemporary understandings of CSA and argues for the need to move beyond a single damage narrative in which victims are constructed as sexually innocent, weak and passive and seen to be inevitably damaged by their experiences. The paper argues for the need to separate wrongfulness from harm and (sexual) innocence from childhood. This would enable us to recognise sexual abuse in all sexually abused children, including those who do not conform to sexual innocence, and to recognise that CSA is wrong irrespective of psychological damage. In doing so, it is argued, we would all be better equipped to recognise sexual abuse, and victims would be better able to tell their own stories which may, but may not, include psychological damage.

**(Un)trustworthiness and danger: reconfiguring truths about sex, violence, and psychiatric disability**
In this paper, we take up the relations between sex, violence, and psychiatric disability. Drawing on interview and ethnographic data from our distinct projects on sexual assault policing and individualization practices in adult group homes, this paper examines how assumptions about (in)appropriate sexual practice and sexual violence are woven into police and support workers' conceptions of psychiatric disability. In particular, we explore how our participants' discussions of psychiatric disability similarly configured notions of untrustworthiness and danger in relation to sexual practice and violence. Attending to our participants’ pronouncements as both reflective and constitutive of contemporary truths about psychiatric disability, sex, and violence, our analysis seeks to complicate policy and activist debates about sex, rights and safety. To this end, we build on disability studies scholarship by problematizing both asexual and hypersexual archetypes as they relate to sexual practices and violence. This paper aims to contribute a richer, more challenging engagement with the relations between sexual rights, sexual violence and psychiatric disability in policy, activism, and scholarship.

RN23S04 - Trans-sexualities

Trans Masculinities, sexualized bodies and the materiality of gender
Sofia ABOIM (Institute of Social Sciences, University of Lisbon, Portugal) | sofia.aboim@ics.ulisboa.pt
Pedro VASCONCELOS (ISCTE-IUL University Institute of Lisbon, Portugal) | Pedro.Vasconcelos@iscte.pt

Transsexual and transgender men have had less visibility than other forms of gender variance, thus occupying a relatively narrow space in gender, sexuality, masculinity or even trans scholarship. They are neither particularly relevant subjects of Masculinity Studies nor particularly centre-stage in Trans-Studies. Furthermore, the theoretical and political struggles that separate theorization about butch female masculinities and sexuality, and the FTM transitions have contributed to an even higher invisibility of trans-men and even a misconceptualization of their potential as emancipatory subjects in the field of gender as doers of masculinities. Drawing on fieldwork in several European countries (ERC funded project TRANSRIGHTS) with trans-men undergoing processes of gender transition, we will develop two lines of argument. Firstly, from a theoretical standpoint we advocate the importance of building bridges between different areas of gender critical studies. Secondly, and most importantly, such a perspective will enable us to tackle masculinities by exploring trans-men’s subjectivities, sexualities and doings of gender. The transition stories of trans-men might tell us more about what masculinity(ies) is(are). When not naturalized as emanating from the body, what defines masculinity can become clearer. However, as it will be put forward, masculinity cannot be understood without taking into account sexuality and the materiality of bodies regardless of their diversity and transformations. In the end, when the meanings of masculinity and femininity are increasingly diffuse and changeable, the body resists as the focal point of gender performativity, whether self-recognized or perceived by others.

Travesti: an ethnography of transgender sex work
Pedro VASCONCELOS (ISCTE-IUL University Institute of Lisbon, Portugal) | Pedro.Vasconcelos@iscte.pt
Sofia ABOIM (Institute of Social Sciences, University of Lisbon, Portugal) | sofia.aboim@ics.ulisboa.pt
Travesti is a category used in the Portuguese language (as in French and Spanish) to designate female trans sex-workers. Drawing on ethnographic work carried out in Lisbon (Portugal) with trans street prostitutes (Portuguese and Brazilian), we aim to deconstruct views that tend to homogenize travestis as a group of female trans individuals who cherish their ‘masculinity’ (the penis) while pursuing typical standards of sexualized feminine beauty and bodily attractiveness achieved through cosmetic surgery and silicone injections. Contrary to most academic writings, viewing travestis as a category and identity can be problematic. Rather, though united by sex work and the practices entailed, lives and subjectivities are plural, ranging from MtF transsexuals and transgender women to cross-dressed gay men, among other forms of self-identification. Against reification and exoticization, the category travesti (as others) can be a misnomer, hiding the complex entanglements between the diversity found at the intersection of a vast number of factors and the common gendered position in the sex labour market. Travesti can be often taken as just a subjectivist identity when in reality it is more a descriptor of an objective position, which encompasses an enormous diversity. It is not just an identity, not even for the sex workers who tend, in various conjugations, to resort to different terminologies when describing themselves and their ‘job’. As we will show through the ethnographic materials collected within the ERC funded project TRANSRIGHTS, the discourse of travestility is far from straightforward identitarian coherence. Rather, a material approach is needed.

The Impact of Transgender Lifestyle on the Setup of Everyday Postmodern Politics

Barış AYGENER (Yildirim Beyazit University, Turkey) | s.aygener@hotmail.com

AIM: To have an in-depth understanding of social categories studying the characteristics and determinants of the lifestyle put forward by transgender individuals while exhibiting the social identity they have created during their everyday life. METHOD: Besides the use of quantitative and qualitative research in the frame of grounded theory and the positivist hermeneutical paradigms, the mixed methodology has been utilized as a third method. In the research done in the time interval November 2014- January 2015 techniques such as in-depth interview, participant observation, Garbo-logy, focus group discussions and surveys were used. FINDINGS: In the research an analytic, systematic, and in-depth knowledge based on lifestyle determinants of transgender individuals starting from transportation to communication, consumption habits to values, used language to income sources. In the research, the numerical orientation, the problems they face in public relations and ways to deal with these problems, the leisure-time activities, the format and level of the interaction with each other in terms of being a social category were determined. It was established that the institutional forms of gender were pluralized with the change of the definition and values of gender. The participation of transgender lifestyle in the new social movements was revealed to have become one of the determinants of postmodern politics. RESULT: A gender-based produced social identity has a micro-macro pass-through for the individual from everyday life to social reality. With every passing day in the frame of social movement, the social identity created by the transgender individuals is being in a determinant position for the postmodern politics. In the 21st century when the power to meet the needs of the institutions and the ability to represent the values have changed, to address the transgender individuals, to look for the abnormal in the society, to see the asymmetric, to be all ears to the atonal, means to show courage.

Accidental Activists: Parents of Transgender Children
Kristen E BENSON (North Dakota State University, United States of America) | Kristen.Benson@ndsu.edu
Brad VAN EEDEN-MOOREFILD (Montclair State University, United States of America) | vaneedenmobr@mail.montclair.edu

This paper will present a phenomenological qualitative research project that explored the advocacy experiences of parents who are raising transgender or gender creative children in cities across the United States. In-depth interviews were conducted with 22 primary caregivers who were raising children ages 7-17. Dominant themes led to the development of a stage model of how primary caregivers come to be advocates for their transgender and gender creative children. Themes include: 1.) Education, 2.) Professional Support, 3.) Parental Solidarity, and 4.) Advocacy. Parents actively defied dominant constructs of parenting by subverting normative gender expectations through advocacy efforts, even when unintended. Findings support previous research suggesting parents act as agents of social change (Connelly, 2005) in that they educate others to raise awareness (Hill, et al., 2010), are open about their family's experiences in order to serve as role models for other parents, or become politically active (Broad, et al., 2008).

RN23S05 - Sexuality and Critique

Perversion Against Nature Cases under State Socialism
Tamas P. TOTH (MTA TK, Hungary) | ptoth.tamas@tk.mta.hu
Judit TAKACS (MTA TK, Hungary) | takacs.judit@tk.mta.hu
Roman KUHAR (University of Ljubljana) | roman.kuhar@gmail.com

One of the main aims of the proposed paper is to contribute to a better understanding of the social history of homosexuality related social phenomena in Hungary and Slovenia: especially regarding the practices as well as the consequences of state surveillance focusing on same-sex attraction. The paper will examine the different versions of state-socialist body politics manifested in Hungary and Slovenia mainly during the 1950s by using archive material of “unnatural fornication” court cases. Our focus is on signs of the differences in the political systems of Hungary and Yugoslavia in the ways the authorities persecuted these offences. By analysing the available Hungarian “természet elleni fajtalanság” and Slovenian “nenaravno občevanje” court cases we can shed light on how (and in which typical venues) the defendants were caught, how they were treated by the police and the judges; and what kind of language was used to describe the sexual contacts on the basis of which the defendants were arrested. The paper will explore the functioning of social control mechanisms of state-socialist oppression directed at non-normative sexualities that had long lasting consequences on the social representation of homosexuality in both countries.

Sex addiction disorders? A sociological approach
Alessandro PORROVECCHIO (University of the Littoral Opal Coast, France, URePSSS-EA 4110/EA4488 ULCO) | alessandro.porrovecchio@gmail.com

The “hypersexuality”, or “sex addiction”, can be defined as a problematic psychological, behavioural and/or social condition. The hypersexual individual experiences frequent or suddenly increasing sexual urges or sexual activity, which then turn into forms of dependence from sexual activity. In the last 30 years, this condition has become well known by the general public, thanks also to the widespread media testimony of some “stars” who declared to be
hypersexuals. Hypersexuality was then inserted into the so-called “new addictions”, a set of problematic conducts that involve everyday objects or activities (i.e. food, sport, internet or shopping). In the course of time, this contributed to the framing of hypersexuality as a “pathologic” condition.

The “new addictions” are at the core of a constant tension between the attempt to pathologize and then to medicalize them (i.e. the recent attempt to put some of them in the new DSM-V), and a softer approach that tries to contextualize them within the broader framework of the individual biography and his social and cultural environment.

We will focus on this debate providing a purely sociological perspective. In doing so, we will refer also to the data of an empirical study called “Universanté”, which includes an observatory to monitor university students’ health (4,000 students from the Opal Coast littoral, France) and aiming to promote healthy behaviours in the territory. In a subset of this study we put in relation the so-called “sex addiction” with other “addictive conducts” (sports, alcohol, drugs, food and internet).

“The gays tend to gather...” Exploring (mis)understandings and experiences of LGBT communities in the UK
Eleanor FORMBY (Sheffield Hallam University, United Kingdom) | e.formby@shu.ac.uk

This paper will explore UK-wide research funded within the cross research council ‘connected communities’ programme of work. The study investigated understandings and experiences of ‘LGBT communities’, a phrase popularised - but rarely questioned - in (UK) media, policy and practice arenas. The research examined (and critiqued) notions of belonging, collective identity, and ‘sameness’, from the perspectives of 627 survey respondents and 44 participants involved in in-depth interviews and/or discussion groups.

In talking about their families and relationships, participants also identified imagined communities and ‘felt’ connections, but at the same time highlighted differences, inequalities, and ‘multiple positionings’. Their accounts of lived experience and engagement with, and in, communities drew attention to everyday practices of intimacy in public spaces, as well as relationships to, within and beyond physical spaces more broadly. The impact of broader social contexts on LGBT relationships, and constructions of ‘community’, will be addressed.

The paper will explore some of these key issues within the research, and in drawing the data together will offer conclusions about what if anything may connect “people like us” across time or space, and how realistic and/or useful participants felt the notion of ‘community’ was. The importance of issues of both commonality and divergence when considering LGBT identities will be discussed.

Sex backwards. Sexology and intimate life in communist Czechoslovakia
Katerina LISKOVA (Masaryk University, Czech Republic) | katerina@fss.muni.cz

Czechoslovaksians came to sex backwards, achieving gender emancipation long before sexual liberation. Moreover, sexual liberation didn’t come as a result of popular demand from below, but rather came from above. In the early years of communism in the 1950s, women were equal to men not only at work and according to the law, but also in expert discussions of sexuality and marriage. Sex experts discussed sex in connection with love within an egalitarian marriage, and included a woman’s equal right to orgasm. As sexual deviance was not a priority, sexologists even pushed for the decriminalization of homosexuality at this time. But, by the late stages of socialism – when the West was experiencing sexual and then gender liberation – equality disappeared from Czechoslovak sexology. A successful marriage was reframed as hierarchical; family became privatized and was strictly separated from the public realm of work. Individual
therapy replaced public equality. Utopian models of a new and just society disappeared as both individuals and society at large settled for privatized solutions to any and all social ailments. Hundreds of sexually dysfunctional couples came for treatment in new marriage counseling centers or in-patient facilities. Dozens of “sexually deviant” men who could not or did not live up to the family norm were sentenced and placed in the sexological wards of psychiatric hospitals established in the 1970s.

The case of Czechoslovakia shows that histories of sex and gender are more complex and diverse than the narratives of linear advancement most Western theories suggest. In this paper, I analyze the developments of sexology, its prescriptions in marriage manuals and treatment protocols, its internal debates as published in scholarly papers, and its connections to broader political environment. Studying sex during communist rule reveals an alternative modernity as it unfolded in Eastern Europe.

**RN23S06 - Sexual Citizenship I**

**The struggle for sexual rights in the feminine: experiences on Portuguese lesbian activism**
Joana AFONSO (Institute of Social Sciences, University of Minho, Portugal) | joanam_afonso@hotmail.com

The present communication is the result of an investigation on the participation of Portuguese lesbians, considering the identification and analysis of the factors which stimulated and encouraged their involvement in LGBT associations. The overall aim of this study was to describe and analyse de trajectories of life and experiences of these women, as well as the factors underlying their engagement to lesbian associations. To understand how their active involvement in lesbian associations was done, what difficulties were found along this engaging experience and the role that this participation plays in their daily and personal lives were the specific purposes of this study.

The methodology has an eminent qualitative, inductive and exploratory character. In this investigation it has been opted by the realization of a qualitative study by the adoption of the cases study’s method in which Clube Safo is the analysis unit, due to the fact that this is the first and only Portuguese association exclusively lesbian, and its leaders are the empirical object of the investigation.

In generic terms, the results obtained in this work show the existence of a trajectory-type, in which the emergence of a significant personal experience that takes the individual to readjust its priorities, presents itself as a central point catalyst element for the association, presents itself as a central point catalyst element for the association, presents itself as a central point catalyst element to the entrance in lesbian featured associations. It has been confirmed the role of the work related to the associations as a developer of the feeling of being able to participate and the own empowering of the activists who present enhancements at a critical sense level, increase of social and political tolerance, as well as of civic virtues in general.

**Sexualities beyond the limitations of sociological research: the case of polyamory in Italy**
Beatrice GUSMANO (CES - Centro de Estudos Sociais - Universidade de Coimbra - Portugal) | beatricegusmano@ces.uc.pt
As shown by Roseneil (2004), one of the die-hard dogmas of research on sexualities is the taken-for-granted assumption that care occurs only inside families or couples, and everything that falls outside kinship boundaries is a proof of individualization. These limitations produce an incapability of seeing beyond what is expected, namely intimate relationships outside heteronormative cohabitation, long-lasting love and monogamous coupledom. Roseneil called for ‘new conceptualizations concerning the actual heterogeneity of intimate life’ (2008: 174). Taking seriously her invitation, the aim of my presentation is to show the development of polyamory in Italy, a Southern European country where any non-normative relationship (LAT, heterosexual non-married couples, same-sex relationships, etc.) is not legally recognized nor culturally accepted.

The context of this presentation is the 5-year long European project ‘INTIMATE. Citizenship, care and choice: the micropolitics of intimacy in Southern Europe’. INTIMATE’s main aim is to explore LGBT experiences of partnering, parenting and friendship in Italy, Portugal and Spain. Regarding partnering, I will be in charge of conducting the fieldwork on polyamory in Italy (Spring 2015).

Therefore, in this paper I will offer a brief theoretical framework on polyamory in Italy, showing the differences between individual authors and collective knowledge developed by non-mainstream collectives. In addition, I will also present preliminary fieldwork results concerning the daily negotiations on living arrangements, informed choice, and social and political claims by LGBT polyamorous partners living outside the boundaries of heteronormative relationships (and outside the traditional scope of sociological inquiry).

Lesbian activism in Spain: citizenship, sexual rights and impact on lesbian everyday life experiences

Luciana MOREIRA (Centre for Social Studies (CES) - University of Coimbra, Portugal) | lucianamoreira@ces.uc.pt

LGBT activism in Spain started in the 1970s, just before the transition to democracy. It is widely acknowledged within the sociology of sexualities and cultural studies that this young democracy offered the context for striking changes in the sphere of sexual rights over a period of only three decades. In this regard, Spain is a unique example in Europe. The state, in a short time, guaranteed sexual citizenship for people with non-normative sexual orientations, formally combating, at least legally, inequalities between citizens.

This paper is based on interviews with lesbian women in intimate relationships, carried out within the research project Intimate: Citizenship, Care and Choice: The Micropolitics of Intimacy in Southern Europe. First, it provides an overview of Spanish lesbian activism, within and beyond feminist and gay rights movements, claims, achievements but also defeats. Subsequently, this paper moves to recover the memory of the historical and sociological transformations in the context of sexuality taken place at the turn of the 20th to the 21st century in Spain and questions their impact on the biographies of interviewees. Using a discourse analysis, I then explore how lesbian activism and the legal and political achievements accomplished in recent years reverberate in the life experiences of these women. At the same time, I will examine the extent to which activist movements influenced individual identity references, awareness of rights achieved and the degree of acceptance participants in the study feel both in the public and private realms of their lives.

"What am I to do with this desire?" Lesbian and gay identity, sexual plasticity, and heteronormativity in contemporary Italy

Luigi LA FAUCI (Scuola di Scienze Sociali-Università di Trento-Italy, Dipartimento di Scienze Politiche e Sociali-Università di Bologna-Italy) | luigi.lafauci@unitn.it
Responding to accounts of the effects of waning homophobia on the relevance of lesbian and gay sexual identities in personal biographies and in trajectories of sexuality development in Western countries, sociological narrative research has argued that the formation of a lesbian or gay identity supports interactional framing of same-sex behaviour as expression of embodied desire and of same-sex desire as parallel to different-sex desire. Therefore, lesbian and gay identities continue to be potentially beneficial to same-sex desiring individuals’ aspirations to free and positive sexualities. Other sociological approaches to sexual identity have theorized and researched the continued relevance of the heteronormative sexual gender structure in individual lesbian and gay identity formation trajectories, and the continued relevance of lesbian and gay identities in challenging the heteronormative sexual gender structure. Tackling these two issues with a narrative focus on individual engagement with historically changing biographical norms through interactional frames and embodied desire, this paper analyzes historical trends in lesbian- and gay-identified individuals’ trajectories of sexuality development in generations born in the past half-century in Italy. In the Italian sexual gender regime, the centrality of religious cultural authority on sexual matters and of definition of masculinity based on sexual act reinforced inequalities in the social acceptability of female and male sexual empowerment, while also supporting invisibility of female and male homosexual orientations despite relatively wide diffusion of same-sex sexual behaviours in biographies of individuals who did not reject heterosexual identities or biographical norms. Contemporary decades see decreasing homophobia resulting in the growing possibility to link same-sex behaviour to embodied desire and biographical self-direction, but also the modernization of values regarding sexuality lagging behind the modernization of sexual behaviours and sustaining the persistence of heteronormative cultural norms that qualify the connection between individual desire and behaviour by describing male sexuality as biologically driven and female sexuality as biographically un consequential. Data from two surveys of LGB individuals conducted in Italy in 1995-1996 (2905 homosexual/lesbian/gay-identified respondents) and in 2012-2013 (2449 homosexual/lesbian/gay-identified respondents) regarding diffusion, timing, and contexts of first same-sex sexual attraction, first same-sex and different-sex sexual contact, first experience of coming out to self, first experience of disclosure of same-sex attractions, and rejection of homophobic cultural values are used. The analyses of historical trends show that behavioural sexual modernization allows lesbians and gay men to increasingly develop their sexuality in a frame of self-directed behavioural plasticity. As the steps in trajectories of sexuality development become temporally closer, lesbians and gay men experience growing ease in linking desire to behaviour and to identity, while declining homophobia frees lesbians and gay men from the heteronormative necessity of different-sex sexual involvement. In these trajectories of sexuality development, same-sex and different-sex sexual behaviours are rooted in growingly similar desires developed in positive and equal relations and framed in growingly similar interactions based on positive and equal relations. While lesbians’ experiences of first disclosure of same-sex attractions see an increase in the diffusion of experiences in contexts characterized by friendship relations and stability in the diffusion of experiences in contexts characterized by family relations, in line with the effect of sexual modernization and decreasing homophobia, gay men’s experiences of first disclosure see an increase in the diffusion of experiences in contexts characterized by friendship relations and retreat in the diffusion of experiences in contexts characterized by family relations, pointing to diffusion of the embodiment of sexual desire as relationally and emotionally framed. While explicit rejection of homophobic cultural values in gay men’s visions of individual sexual identity continues to be dependent on capacity to distance oneself from homophobic milieux, in line with the differential diffusion of tolerance of homosexuality, explicit rejection of homophobic cultural values in lesbians’ visions becomes less dependent on the capacity to distance oneself from homophobic milieux, pointing to diffusion of the embodiment of sexual desire as biographically crucial and empowering. Traditional visions
of female and male sexuality might link diffusion of self-directed plastic sexuality in the
behavioural aspects of same-sex desiring individuals' trajectories of sexuality development to
interactional frames based on the disconnection of same-sex behaviour from embodied desire,
resulting in the invisibility of the centrality of same-sex sexuality in individual biographies; same-
sex desiring individuals counteract this possibility by framing their embodied desires in
opposition to hegemonic gender norms. Opposition to hegemonic gender norms in the
embodiment of sexual desire might be defied by linking the non-normative embodiment of
sexual desire to a sexual essence unique to same-sex desiring individuals, resulting in the
limitation of same-sex desiring individuals' potential dissidence to heteronormativity; same-sex
desiring individuals counteract this possibility by expressing same-sex and different-sex sexual
behaviours in common interactional frames, advancing the diffusion of the unimportance of
gendered sexual orientations in judgements of individual modern sexual agency. Lesbian and
gay identities are one among the many cultural forms of the relevance in individual lives of
sexuality and of same-sex orientation as behaviour and desire that are contemporarily available
to persons that aspire to counteract the possibility that their sexual behaviours be disconnected
from their sexual desires and be misinterpreted in contexts where structural sexual gender
inequalities are present. Analysis of historical trends of narrative engangement in Italian
lesbians' and gay men's trajectories of sexuality development supports the idea that individual
strategies aimed at linking sexual desire to sexual behaviour by adoption of a lesbian or gay
identity are influenced by the sexual gender structure, and also the idea that lesbian and gay
identities are engaged in dissidence to the sexual gender structure and in counter-
heteronormative change. Lesbian and gay identities might still need to be analyzed in their
interrelation to sexual gender norms and to be considered useful in overcoming
heteronormativity as a social structure.

INTIMATE – The Micropolitics of Intimacy in Southern Europe
Ana Cristina SANTOS (Centre for Social Studies, Portugal) | cristina@ces.uc.pt

Despite significant personal, political and cultural changes in recent decades, the focus of
mainstream sociological literature around intimate life remains the heterosexual, monogamous
and reproductive couple, with little research exploring non-standard intimacy in Southern
Europe.
This presentation stems from INTIMATE – Citizenship, Care and Choice: The Micropolitics of
Intimacy in Southern Europe, a 5 year long research project funded by the European Research
Council. Conducted at the Centre for Social Studies, University of Coimbra, since 2014,
INTIMATE is the first in-depth, comparative study on sexual citizenship in Italy, Portugal and
Spain. Guided by the fundamental sociological question of how law and social policy adjust to
and/or shape the practices and expectations of individuals concerning personal life, this
research investigates processes of transformation of intimacy starting from life experiences of
lesbian, gay, bisexual and transgender people (LGBT), taking into consideration different family
and relational models.
This paper starts with a brief overview of the state of the art regarding sociological literature on
intimate citizenship of LGBT people in Southern Europe. That is a necessary step to move to
the second part of the paper which identifies theoretical and political gaps regarding sexual
citizenship in this understudied but vibrant geographical context. The paper concludes with
preliminary empirically-based results based on fieldwork conducted between April and July 2015
within the first Strand of INTIMATE – the micropolitics of partnering – which includes a study on
lesbian coupledom and a study on polyamorous relationships in the Portuguese context.
LGBTTIQ-Policing: Between sexual citizenship and authority belonging?
Verena MOLITOR (University of Bielefeld, Germany) | verena.molitor@uni-bielefeld.de
Tatiana ZIMENKOVA (TU Dortmund University, Germany) | tatiana.zimenkova@tu-dortmund.de

Since some decades LGBTTIQ police officers in different countries are organised in unions, fighting discrimination and changing the image of police as a homophobic institution. Research so far has been concentrating on the questions of discrimination, diversity management, perceptions of gender within the “police culture”, the expectations and exclusions LGBTTIQ-officers are confronted with.

Some important questions regarding the specifics of LGBTTIQ-police engagement as citizen’s participation are not articulated within the research so far. The activities of the LGBTTIQ police organizations are to be seen, at least partly, as political citizenship activities (Norris 1999) for they promote rights and protect themself as minority. These activities are political in the sense of influencing power relations in the society, and hence they are an articulation of state-individual relationship, the citizenship. Simultaneously these unions originate from within an executive authority, and the individual membership in the authority is a prerequisite of the LGBTTIQ-police officer's union membership. Moreover, the work of the LGBTTIQ officers confronts them as authority members with the problems and conflicts they as sexual citizens (Richardson 2000) try to solve. The question of the possible tensions between these two political identities are relevant from the standing point of theory of citizenship (Gallagher 2008, Zimenkova 2012) and of theory on identity and minorities due to specific interconnection of identities (Tajfel/Turner 1986).

Based on the analysis of the work of European LGBTTIQ-Police officers’ organizations, the contribution discusses the visibility of the tensions between citizenship activities of the LGBTTIQ-police officers and their membership in the executive authority, and demonstrates how the belonging to a minority is being handled with respect to the policing: are the minority-officers expected to be as well sensible to the other minorities, or does their authority-belonging status come to the fore, as soon as they are confronted with non-LGBTTIQ-minorities? Based on theories of citizenship and identities (Díez Medrano/Gutiérrez 2001), the contribution asks, what is specific about LGBTTIQ police organizations compared to other LGBTTIQ-unions and whether LGBTTIQ-policing can be seen as a specific form of political sexual citizenship.

'I don’t want him to die of it’ – Kinship ideologies shaping coming out discourses and strategies in present-day Hungary
Rita BERES-DEAK (Central European University, Hungary) | Beres-Deak_Rita@ceu-budapest.edu

Research shows that many LGBTQ people are closeted from their family of origin in Hungary (Takács et al. 2008, Dombos et al. 2011). A frequent explanation for people not coming out to parents or siblings is the LGBTQ person’s fear of rejection (e.g. Weston 1991). LGBTQ people themselves, however, frequently give other reasons, many of which rely on ideas connected to family, like not upsetting family harmony or individual family members. Other LGBTQ people argue that staying closeted from one’s kin is unacceptable, as it is incompatible with the essence of family. In making these arguments, they rely on various discourses on family circulating both in the LGBTQ community and among the general population.

My presentation is based on ethnographic fieldwork, more specifically semi-structured interviews and analysis of online discourses, conducted in the Hungarian LGBTQ community between 2004 and 2012. I will argue that while discourses about family influence LGBTQ
people’s choices about coming out, the multiple and even controversial nature of such discourses ensures that subjects can choose the one closest to their convictions or strategic goals. In this sense, family discourses both constrain and enable individual agency.

The Last Taboo? Sexuality, Intimacy and Older Care Home Residents
Paul SIMPSON (Faculty of Health and Social Care, Edge Hill University, United Kingdom) | simpsonp@edgehill.ac.uk
Maria HORNE (Faculty of Health, Bradford University, UK) | m.horne@bradford.ac.uk
Christine BROWN WILSON (Faculty of Health, University of Queensland, Australia) | c.brownwilson@uq.edu.au
Laura BROWN (Dept of Psychological Sciences, University of Manchester, UK) | laura.brown@manchester.ac.uk
Tommy DICKINSON (Nursing, University of Manchester, UK) | tommy.dickinson@manchester.ac.uk

Over half a million people aged 65+ live in UK care homes (ONS 2011). Yet, sex, sexuality and intimacy and old people remain overlooked in social policy and professional practice (Hafford-Letchfield 2008). Older people/care home residents are excluded from sexual citizenship. We explore narratives from a study based in Northwest England that consulted on the significance of researching sexuality and intimacy. We draw on narratives generated with two focus groups of professional carers (n = 16) and interviews with three residents, (two male, one female) and four female spouses (n = 7). All three types of stakeholders expressed concern about privacy and environmental impediments to intimacy (e.g. shortage of double rooms). However, distinct concerns were expressed by each group. Residents’ expressed scepticism that the topic was ‘too personal’, that old people were post-sexual or that sex/intimacy were part of range of needs and could be eclipsed by those relating to avoiding isolation and personalization of care. Spouses emphasized the importance of intimacy over sex/sexuality as an indicator of the depth and longevity of a relationship and to normalize their relations but were concerned about unmet needs and loss of influence over their partners’ care. Obliged to meet a complex of legal, professional, ethical and interpersonal obligations, care staff articulated a need for guidance to help them support rather than ‘manage’ residents sexuality. We conclude with practical recommendations that address barriers to enabling intimacy.

Occupying –Sexual citizenship in Hong Kong Umbrella movement
Eliz MY WONG (The Chinese University of Hong Kong, Hong Kong S.A.R. (China)) | weliz1201@gmail.com

Umbrella movement is the longest democratic and occupying movement in Hong Kong and the 79-day occupying transgressed the public/private spheres and opened up new possibilities for inclusion. LGBT issues, once marginalized in society became connected with the democratic movement through the shared commitments of equality and personal autonomy. Against the backdrop of an atmosphere of LGBT-friendliness in Hong Kong as a whole, this study aims to investigate first, how did sexual minorities participate and exercise their civil rights and duties, and also practice their sexual citizenship within the occupying zones; and second, whether and how did democratic and LGBT right movements integrate in Hong Kong. Qualitative approaches, including interviews with sexual minorities and ethnography in occupying-zones, were used to study the exclusion-inclusion process of LGBT individuals and the practice of sexual citizenship within the Umbrella Movement. It was found that different from traditional protests with a single-issue goal, the presence of centralized leadership and exclusion of minority issues, the unique characteristics of decentralization, collaboration and prefigurative alternative communities in the Occupying Movement, provide opportunities for
spatial and social interactions, and eventually make space for inclusion of diversity through individuals’ creativity. On the micro-level, although being fearful of being rejected, LGBT individuals actively participated in the movement, negotiated with and expressed their sexual identities, such as decorating their tents with rainbow flags. On macro-level, heteronormative masculinity of social movements was challenged as two most influential student leaders were framed as Boy’s Love (BL) couples by netizens and gained huge popularity among young activists. And Pride Parade organized within the occupying zones with the slogan, ‘No democracy, No equality’.

This study contributes to a new understanding of the transgression of public/private sphere of sexual identities in occupying-zone and the exercise of sexual citizenship in social movements.

RN23S08a - Sexuality, Families and Relationships I

Families of Choice in Poland – Quantitative Research from Local Perspective
Agata STASIŃSKA (Polish Academy if Sciences/ Warsaw University, Poland) | astasinska@psych.pan.pl
Joanna MIZIELIŃSKA (Polish Academy of Sciences) | jmzielinska@psych.pan.pl

Vast amount of academic literature about queer intimacies has been written from and about Western (specifically Anglo-American) context which confronts us with an inequality in knowledge production on queer kinship. Moreover, Western press and scholars often present a simplified and stereotypical vision of Central and Eastern Europe, usually as an extremely homophobic region, also little is known about non-heterosexual families living there, due to the lack of an extensive research on this topic and lack of credible data. Families of Choice in Poland - the first multi-method research project on non-heterosexual families in Poland – aims to fulfil this lack and sheds light on the diversity of intimate and familial configurations of non-heterosexual people in Poland. In our paper we will draw on the results of the quantitative part of the research concerning the family life of 3085 LGBT people and discuss some aspects of their family practices among others:
1. their cherished values, sense of happiness, and satisfaction with the relationship;
2. their relations with families of origin;
3. their definition of family;
4. their wishes and strategies to formalise their relationship;
5. their everyday lives;
6. their intimate lives;
7. conflicts and violence in the relationship;
8. parenthood

We would like to underline the emergence of studies done from a local perspective and of in-depth/exploratory (rather than comparative paradigm) and we claim that they may be a more fruitful way of getting the knowledge about the functioning of such families in a specific social and cultural context.

Relationship quality and sexuality: Does sexual orientation matter?
Jacqui GABB (The Open University, United Kingdom) | Jacqui.Gabb@open.ac.uk
Priscilla DUNK-WEST (Flinders University, Australia) | priscilla.dunkwest@flinders.edu.au
Jill CHONODY (Indiana University Northwest, USA) | jchonody@iupui.edu

Drawing on cross-national survey data (n=6805) from the UK, Australia and USA, this paper will examine whether sexual orientation is a differentiating factor in how couples experience
relationship quality. Survey data from the Enduring Love? project suggests that LGBTQ couples are more positive about and happier with the quality of their relationship than their heterosexual counterparts. Parenting, however, remains the crucial divider. Parents report that they ‘do’ less relationship maintenance than childless participants. Heterosexual parents are the least likely group to be there for each other, to make ‘couple time’, to say ‘I love you’ to each other, to talk about everything and to pursue shared interests. In this paper we will explore these findings and interrogate in more detail differences between LGBTQ and heterosexual cohorts. In particular how they value the everyday practices associated with relationship quality and the extent to which national context impacts on relationship experience. Through this we will begin to explore the ubiquity of long-term relationships and start to unpick notions of enduring coupledom.

Lesbian couples daily practices in the Italian context
Tatiana MOTTERLE (Centro de Estudos Sociais (CES) - Coimbra, Portugal) | tatianamotterle@ces.uc.pt

Italian law does not recognize any rights to same-sex couples but some jurisdictional decisions are slowly changing the situation. However, public discourse and political debate in Italy are strongly biased by Catholic Church, which is now using the discourse of the “ideology of gender” to hinder not only LGBT people’s rights but also every practice and claim for sexual freedom in general. Such discourse is also influencing the present legislative debate, which is currently focused on a law against homophobia.

The mainstream Italian LGBT movement is currently centred on same-sex couples rights, but many groups and collectives coming from queer and feminist waves add to such discourse more radical issues, as the intersectionality of struggles and the visibility of non-normative sexual practices and intimate relationships.

This presentation stems from my analysis regarding the daily practices of lesbian couples living in Rome, taking into consideration the Italian socio-legal context and the different claims of LGBTQ activism. More specifically, based on original fieldwork material gathered using biographic narrative interviews, I will try to understand whether and how these contextual elements influence the daily practices of lesbian couples and the definition lesbian women give to their intimate relationships.

The research is part of a larger European project called INTIMATE, funded by the European Research Council. One of its aims is to investigate how axes of reciprocal influence coming from private and public dimensions impact upon the micropolitics of partnering.

Main features of sexually open marriage
Ewelina BACZKOWSKA (The University of Warsaw, Poland) | ewelinabaczkowska@gmail.com

In 1970s Nena and George O’Neill suggested that marriage often becomes a prison. For them, it should not only provide safety and intimacy but also grant spouses freedom and chance for personal development. O’Neill’s idea was that sexual exclusiveness is not essential for happy relationship.

Their thought was one of the foundations of consensual non-monogamy. This term refers to all intimate relationships in which partners agree to have other sexual or/and romantic partners. In the last few years more and more attention was paid to consensually non-monogamous relationships. However, researchers focus mostly on polyamory, swinging and gay open relationships. Studies about sexually open marriages were popular up to 1980s, but nowadays interest in this type of relationships has decreased.
The author’s research is based on individual in-depth interviews with people who live or have lived in sexually open marriage. The method of selecting respondents used in the research was purposive sampling. The aim of this research is to understand what is the possible influence of sexual openness on marriage. The paper raises a number of issues like reasons behind the decision of rejecting monogamy, everyday life of the couples and rules they follow. It seeks answers to such questions as: who are people living in sexually open marriages, what are their expectations from marriage, how do they deal with jealousy. Its aim is to study feelings, passions and emotions connected with this type of relationship. Respondents experiences give a view of specificity of polish sexually open marriages today.

RN23S08b - Sexuality, Families and Relationships II

Queerying families of origin: views from the margins
Chiara BERTONE (University of Eastern Piedmont, Italy) | chiara.bertone@digspes.unipmn.it

The paper explores the latest research into heteronormative/heterosexual families of origin, discussing original insights into how families of origin of Lesbian, Gay, Bisexual and Transgender (LGBT) people are involved in negotiating meanings and experiences of sexuality and intimacy, an underexplored dimension of queer family life. Delving into the perspectives of families of origin and showing the complexity and heterogeneity of the ways people with their different gender and sexual identities "do" families across generations, it contributes to querying the very distinction between families of origin and families of choice, and questions the (hetero)normative assumptions about forms and boundaries of family this distinction rests upon. A focus on marginal contexts and subjects is identified as a chief way to challenge the universality of privileged narratives within heteronormativity, homonormativity and anglocentrism, and to reveal unexpected resources families of origin mobilise to make sense of LGBT identities and lived experiences. The crucial question to be addressed becomes then how can alliances along family ties develop on the basis of shared stories of family diversity and marginalised identities, rather than of loving (and normative) support to LGBT people in need and an advocacy in their name from a position of heterosexual privilege.

Development of sexual culture of Russian adolescents and youth: the analysis of European experience implementation and influence
Liliia Sergeevna PANKRATOVA (St. Petersburg State University, Russian Federation) | lilia.pank@gmail.com

During the last several decades there has been an increased growth of attention from a number of social actors towards sexual enlightenment of adolescents and youth in Russia. It was determined by the necessity to react and find solutions on old problems, which has finally become publicly revealed and discussed, as well as new ones appeared as a result of economic and political, social and cultural transformations in the country at the end of the 20th – beginning of the 21st centuries. Sexual rights, sexual inequalities, pluralism of sexual cultures and lifestyles, sexual and reproduction health – just some issues from a huge list of serious challenges Russia faced with. For the last twenty years some social agents in Russia (NGOs, state and private organizations working with teenagers and young people, etc.) managed to establish strong relations with European and international organizations focusing on sexual education and enlightenment. There were developed a number of projects and programs
between European and Russian specialists and authorities in this sphere. On the basis of the case study of the city consultation and diagnostic centers for children and youth of the city of St. Petersburg there were sorted out some key points of the specificity of structure, content, patterns, difficulties, limits and perspectives of such kind of collaboration. Particular attention is also given to political and legal context of these projects implementation in Russia, as it directly and indirectly affects them.

**Sexual Consciousness and Sexual Behaviour in Japanese and German Speaking Culture - Analyses of Interviews with Young Adults**

Alice Luise PACHER (Meiji University, Japan) | alisa.pacher@gmail.com

This research looks at sexual consciousness and behavior of young adults of both sexes in modern Japan and German speaking countries.

Recent researches found out that sexuality has a significant value among couples of modern times. Especially in Europe, emotional intimacy and sexual satisfaction both play major roles for maintaining a good relationship. While the European society seems to focus closely on the sexual dimension of a relationship, the amount of couples without any sexual intercourses has been increasing in Japan in recent years. The Global Survey of Sexual Attitudes and Behaviors (GSAAB) shows that sexual satisfaction and frequency of intercourse in Asia is comparatively low against Europe, and Japan has the lowest score. In my present ation, the goal is to find out the background and the differences between Japan and German speaking countries, mainly Germany and Austria.

Furthermore this research will introduce the results of my interviews aimed at Japanese men and women whose ages range between twenty and forty. To understand the modern Japanese sexuality, I will compare the answers from the Japanese interviewees with the conclusions one may obtain from the German speaking interviewees.

The discussion focuses on the following two main points: (1) the different cultural significance of sexual intercourse in the couple relationship; (2) the causes and the social background of Japanese sexless phenomenon. That can be deduced from the interview research.

In this regard, this research highlights the importance of the cultural differences in sexual consciousness and behavior through showing some cases of Japan and German speaking countries.

**RN23S09 - Open I**

**Navigating identities: subtle and public agency of bicultural gay youth**

Marianne CENSE (Rutgers WPF, Netherlands, The) | m.cense@rutgerswpf.nl

Being simultaneously gay and bicultural can be complicated. Young people who discover that they feel sexually attracted to people of the same sex often go through a period of ambivalence or distress, especially when they grow up in an environment that condemns homosexuality. In this paper, I use an exploration of the different ways young people in the Netherlands from different cultural backgrounds experience and deal with homosexuality to fuel some reflections on agency.

Young people’s strategies to deal with their sexuality range from very subtle to rather public. Youngsters following more subtle strategies are keen not to affront and disappoint their parents and family by maintaining a more or less accepted and ‘normal’ appearance in front of them. Others follow more confrontational and public strategies, for instance by appearing on television, participating in the gay pride parade (boats through the canals of Amsterdam) and making themselves visible as peer educators in school education. They call themselves
frontliners. Their public agency helps raising awareness, and is a source of support to others that are living in isolation. More public forms of agency, however, often have a price as youngsters choosing these strategies risk harsh disapproval or even rejection from their families. To make these forms of public agency possible, the backup of a lively community of bicultural LGBT people is essential.

Conventional stories of emancipation tend to attach greatest value to these more public forms of agency – as these are seen as explicitly challenging constricting norms and social structures and epitomize the free expression of one’s desires and the forms of self-realization of western-liberal ideals. I suggest that more subtle forms of agency may be seen as significant form of agentic power, and as important in bringing about desirable societal transformations.

The choice of strategy, and expressions of, homosexuality can only be understood in the context of the on-going broader social processes of exclusion and integration of so-called ethnic minorities in contemporary Dutch society. In today’s highly charged public debate in the Netherlands, Islam is often presented as incompatible with the values of the Dutch Christian secular societal order. Most strongly articulated by right-wing and populist politicians, but also implicit in the ideas of those belonging to (or identifying with) more moderate or leftish parties, is a discourse that contrasts the enlightened and modern Western civilization of ‘the Dutch society’ with the backward ideas and practices of ‘others’ (including Muslims). Homosexuality, just as gender equality, figure prominently in this debate as iconic achievements of the free and civilized West that must be protected from outside threats. Attempts of ethnic-cultural minorities to resist and challenge this discourse often include investments in forging a strong and recognizable group identity, one that helps emphasizing their ‘otherness’ and using it as a source of pride. This socio-political context makes the expression of homosexual desires for someone with non-Dutch roots complicated and risky, as prevailing schemes of interpretation render the two identities incompatible. Being simultaneously gay as well as bi-cultural, therefore, requires creative and conscious tactics to re-organize loyalties and relations of ‘bondedness’ and re-negotiate the meanings of self and freedom.

Indeed, the notion of agency itself changes in the process. The attempts of the interviewed youngsters to combine their homosexuality with their bi-cultural identity, integrating the two in such a way that important relationships of ‘bondedness’ can be maintained, implies engaging in fruitful – though sometimes painful and difficult - processes of dialogue and contestation that may have the effect of altering dominant discourses by transcending the oppositional dichotomy between sexual and ethnic forms of socio-cultural otherness (reserving the first to those who belong to secular modernity), thereby usefully pluralizing and diversifying the meanings of both thus helping expand cultural possibilities of being.

The Decline of Homophobia Debate (DOHD) and older LGB people
Andrew KING (University of Surrey, United Kingdom) | andrew.king@surrey.ac.uk

In recent years in the UK there has been a debate about the declining significance, or otherwise, of homophobia and/or biphobia, which has been coupled with a concomitant increase in equality legislation and rights associated with sexual diversity. However, much of this debate has focused on the lives of younger lesbian, gay and/or bisexual (LGB) people. Instead, this presentation considers this debate with reference to the lives of older people who identify as LGB. After assessing current evidence concerning the decline of homophobia debate (DOHD) the presentation explores how this may have affected the ‘landscape of ageing’ for current generations of older LGB people. It does so by drawing on data from studies, which invoke two dominant narratives concerning LGB ageing: one that emphasises empowerment, celebration and agency, and one which emphasises constraints, disempowerment and discrimination. The presentation then uses data collected as part of a series of studies by the presenter to argue for
a more nuanced, intersectional perspective towards LGB ageing in the UK. Key themes that are discussed include: ‘sexual identities across the life course’, ‘ageing bodies’, ‘retirement and resources’, and ‘prejudice now’. The conclusion discusses these themes in light of the DOHD and a number of points and recommendations are made.

**Negotiating non-exclusive sexualities: Exploration, disclosure and negotiation**  
Mark MCCORMACK (Durham University, United Kingdom) | mark.mccormack@durham.ac.uk

Research on sexual minorities has tended to focus on lesbian, gay and bisexual (LGB) people's social experiences. Critiques of this body of work contend that the unique experiences of each sexual identity are conflated with problematic consequences, not least in reifying a limited categorical model of sexuality that does not account for the diversity of human experiences (Savin-Williams 2014). Drawing on interviews with 40 men who identify as ‘mostly gay’ or ‘mostly straight’, this research examines the experiences of negotiating sexual desires that do not conform to the traditional model of ‘LGB’. By focussing on the themes of exploration, disclosure and negotiation, this paper demonstrates the strains and stresses of their non-normative, non-exclusive sexualities—while also highlighting some of the pleasures it brings.

Situated within a broader context of decreased homophobia and increased sexualization, this research highlights the sociological implications of the diversification of sexual identity labels in understanding peoples’ lived experiences of sexuality in contemporary society.

**Does Identity Matter?**  
Hanna PELTOMAA (University of Lapland, Finland) | hanna.peltomaa@ulapland.fi

While researching the lives of lesbians, gay men and bisexuals in rural areas in Finnish Lapland, I am occasionally asked: what is the role of identity in your work? Identity has been an important tool in gay and lesbian movements, used to drive forward a certain political agenda. These movements have often presented gay or lesbian identities as an essential feature of a person, unchanged since birth. Queer theorists have challenged the concept of stable identities and instead argued the idea of them as changing and performative. Some even have suggested abolishing the whole concept of identity.

Identity appears to be a complex and controversial issue. In my presentation I will discuss the usefulness of the idea of identity in my research, and if the concepts of identification or categorisation would better describe the similarities and differences that define the life in the small communities that I study.

**RN23S10 - Sex Work**

**Sex work in (Northern) Ireland – do the data support recent legislative changes?**  
Dirk SCHUBOTZ (Queen’s University Belfast, United Kingdom) | d.schubotz@qub.ac.uk

In 2014, following a Single Member’s Bill, the Northern Ireland Assembly passed legislation that makes it illegal to pay for sex. It was argued by Lord Morrow (DUP), the initiator of this bill, that this law would help tackling human trafficking. The government in the Republic of Ireland are proposing a similar measure. To inform the decision making on this Bill, in summer 2014, the Department of Justice (DoJ) in Northern Ireland commissioned a study to assess the extent of sex work in Northern Ireland. Led by Queen’s University Belfast, a mixed methods study was
undertaken, which included in-depth interviews and an online survey of both sex workers and their clients, as well as an analysis of websites advertising escort services. In this presentation I will present key findings of the DoJ-funded study and will explore whether or not the new law is likely to have the effect that it sets out to have. The study and the debate around this new law raises two fundamental questions: the first question is about the place that sex work is occupying in today's society and what effect it has on its actors – both clients and sex workers themselves. The second question is about how empirical evidence on sex work is used (or disregarded) when decisions are made about its place in society. Both are fundamentally linked to our understanding of people as sexual beings and the attached social norms and values.

„We make the colour. And without us divas, Cape Town is not Cape Town“ – The visibility and self-perception of transgender sex workers in South Africa
Carolin Küppers (Bundesstiftung Magnus Hirschfeld, Germany) | Carolin.Kueppers@soziologie.uni-muenchen.de

South Africa is known for its liberal constitution and its extensive anti-discrimination laws. Yet there seems to be a gap between the law and the reality for transgender people living in South Africa. There is a lack of professional medical resources for transitioning and targeted HIV services. Harassment of transgender people on the streets is also widely common, especially if they are sex workers. As sex work is criminalised in South Africa, transgender sex workers seem to be one of the most marginalized and vulnerable populations. Despite the fact, that at least 3% of South African sex workers are transgender, they seem to be invisible in hegemonic discourses. Drawing on qualitative interviews and focus group discussions, I analyse the self-perception of transgender sex workers in South African cities and focus on the difficulties they face in everyday life. Furthermore this paper discusses the interface between queer sexuality, race, urban space and visibility of transgender sex workers in South African cities.

The Full Monty? Representations of gender, sexualities and performative possibilities in media depictions of the male strip show
Katy Pilcher (Aston University, United Kingdom) | k.pilcher@aston.ac.uk

This paper analyses a range of different meanings which can be drawn from media representations of male strip shows. These media depictions are analysed in relation to my own ethnographic fieldwork conducted within two male strip shows in the UK, which utilised a combination of observation, interviews and visual data, to examine experiences of male dancers, management, and women customers. Drawing upon a critical discourse analysis of different media sources (e.g. film, documentaries, print media), combined with a comparative examination alongside my ethnographic findings, I seek to ascertain what is missing, troubling or potentially ‘progressive’ about media depictions of male strippers and their interactions with women customers. In doing so, I examine issues relating to: readings of naked male bodies as ‘sex objects’; the potential for women customers to exercise, or be represented as exercising, a female ‘gaze’; and women’s friendships and communications within these shows. Theorising from a feminist and queer perspective, I argue that both media depictions of strip shows, and the shows themselves, are premised upon a notion of faux female ‘empowerment’ in which women are seen as a collective group - ‘the girls’, united by their (hetero)femininity, at the same time as the shows shape, construct and regulate women’s experiences in a particular heteronormative way. Within this construction, women are required to adopt ‘post-feminist’ subjectivities, and to be seen to perform an ‘active’ (hetero)feminine expression of sexual
desire, and yet very often it is an active male (hetero)sexuality which is valorised and privileged in such constructions.

**Sex workers and outreach workers: Intentions and outcomes of regulating prostitution**

*Stine Piilgaard Porner NIELSEN (South Danish University, Denmark) | sppn@sam.sdu.dk*

The paper applies a socio-legal perspective on the regulation of prostitution in order to examine the intentions behind and the outcomes of this regulation. From a socio-legal perspective, law can be considered a political means to alter behavior or a phenomenon that guide lay people in their everyday life. Combining these two perspectives elucidate why law sometimes fail to generate the intended results.

In 1999 Sweden adopted the Sex Purchase Act criminalizing the buyers of sexual services with the intention of reducing prostitution. The Act was introduced by feminist politicians framing prostitution as male violence against women, arguing that no women sell themselves voluntarily. Yet, an evaluation study from 2011 on the Sex Purchase Act showed that the Act has not generated the intended result: Prostitution is not reduced, instead it has moved off the streets to underground or brothels. The politically framed problem of gender violence is not solved, it has merely moved out of sight.

Parts of outreach workers’ job are to observe certain social groups and offer relevant assistance. Focusing on outreach workers’ ability to assist sex workers when they move out of sight due to law, may help to understand how female sex workers are marginalized as a product of political discourse of gender inequality.

The findings of the study suggest that the discipline of legal sociology contributes to an understanding of the marginalization of sex workers due to the political intentions and actual outcomes of regulating prostitution.

**‘It’s not always about you’: prostitution policy and the insidious allure of the ‘first person narrative point of view’**

*Isabel CROWHURST (University of Essex, United Kingdom) | icrow@essex.ac.uk*

Taking cue from Epstein’s claim that “non-knowing about sex typically is accompanied not by silence but by a voluble proliferation of discourses” (2006:2), in this paper I explore the proliferation of discourses and knowledge claims about prostitution which, despite their dubiousness, underpin many policy approaches to this complex phenomenon.

In particular, I draw from Judith Butler’s reflections in ‘Precarious life’ (2004), and de-contextualise them to advance that in prostitution policy making the frame for understanding prostitution itself often emerges in tandem with subjective experiences and interpretations of it. In other words, the narrative of why we need any particular prostitution policy frequently starts from ‘first-person narrative points of view’, which are those of policy-makers/ politicians/ good citizens harassed and disturbed by prostitution. The emphatic ‘I’ of these selective first-person narratives silences and excludes other narrative perspectives, and specifically those of people who operate in the sex industry. The ‘narcissistic wound’ of policy makers and valued citizens personally afflicted by prostitution functions both as a moral justification for particular forms of intervention, and as a way to dodge more challenging questions and responsibilities about systemic abuse and discrimination in the sex industry, to which states and their dubious policies contribute.

“Why would I make things harder for myself?” Sexuality and concealment among Iranian young women
Reza ARJMAND (Lund University, Sweden) | reza.arjmand@soc.lu.se
Maryam ZIARI (Shahid Beheshti University, Iran) | maryamziari86@gmail.com

Criminalisation of any form of sexual relations outside the institution of marriage in Iran fosters – among other means- use of concealment as one of the safest methods to undermine social and legal impediments. In a context where the normative-based meta-narrative criminalises any alternative practices of sexuality, concealments of sexual desires, orientations, and practices are applied as a strategy for survival. In reading the semiotics and symbolism of the female body in such a normative-laden society as Iran, the present paper uses the notion of “world of experience” conditioned by openness (physical and otherwise) of the female body which makes it a subject of honor for family and kin and core for the management of desire and regulating the intimate for the state and religion. Using an ethnographical method based on in-depth interviews and life stories, with young women with pre-marital sexual relations in Tehran, the paper addresses the notion of body concealment and concealment of desires as the main strategy used by those women. Findings of the study suggest that there is a three-fold model of concealment practiced in various social settings. While body concealment was utilized to reduce the visibility of the body in public during the adolescence, lesbian-like practices were used as strategies to undermine the hetronormative social structure. Concealments of body, desires and sexual practices were applied by young women with pre-marital sexual experiences to “to keep the order of the things in place” and to undermine the repressive policies and practices based on socio-religious normative.

Leisure porn: Using porn for enjoyment, education and exploration
Liam WIGNALL (University of Sunderland, United Kingdom) | liamwignall@gmail.com
Max MORRIS (Durham University, United Kingdom) | max.morris@durham.ac.uk

Pornography is a central site for debates about the regulation of sex in society. It has become a vessel for moral panics around young people’s sexuality and their use of technology. Research has, therefore, tended to neglect the potential benefits it has for young people. Drawing on 65 interviews with young men who identify as ‘mostly gay’, ‘mostly straight’ and ‘exclusively straight’, we found that internet porn consumption was a feature of all participants’ adolescence, and that porn was framed as an ordinary and unproblematic component of their lives. Alongside sexual gratification, pornography was used to facilitate social bonding among straight men, and as a way to further understanding of their own sexual identities for the mostly gay and mostly straight participants. By exploring participants’ everyday engagement with porn, we also show that it is used to develop new techniques for sexual pleasure and investigate diverse forms of sexual expression across sexual identity groups. By applying the concepts of leisure and technosexuality to these findings, we advance empirical and theoretical understanding of the usages and value of porn in young men’s lives and the meanings this has for broader debates about porn use in society.

How Homosexual Minorities Contend with the Hegemony of Heterosexuality in Christian Community
Cheuk Ying FONG (Hong Kong Shue Yan University, Hong Kong S.A.R. (China)) | ivycheukying2005@hotmail.com
How homosexuality is addressed and discussed in Christian churches? An application of identity politics approach on negotiation between homosexual and religious identities.

In Christian communities, the hegemonic and discriminative interpretation of the Bible on homosexuality as a sin constitutes the conflicts of homosexual and religious identities faced by Christian homosexuals. Employing psychological approach, a majority of previous literature put emphases on the systematic classification of strategies to analyze how Christian homosexuals negotiate and resolve identity conflicts under different social and cultural settings. While these studies have contributed to the “inner” dimension of identity negotiation process of homosexual self, they ignore the “outer” dimension where homosexuality are explicitly addressed by Christian homosexuals during the negotiation process based on their interpretation of the context in which they situate. With specific reference to the Hong Kong context which has long been influenced by western cultural values but, as with other Chinese societies, conservative to homosexuality, where most Christian churches are ideologically heterosexual-dominated and pro-homosexual churches are rare, this study employs the conceptual ideas of identity politics and illuminates how Christian homosexuals put homosexuality in the agenda strategically addressed and discussed in routine religious activities. Findings from 30 interviews with Christian homosexuals and clergies of Christian churches conclude that churches with culturally diversified background tend to be open to the discussion on homosexuality. Moreover, while Christian homosexuals interviewed agree and, to a different extent, put efforts to publicize religious right of homosexuals, most of them have low level of perceived self-efficacy, which is defined as the strengths one believes in his/her own ability to achieve the goal, to put the agenda of homosexuality into public arena. It is due to not only the anti-homosexual atmosphere in the churches, but also the lack of support of homosexual activist groups which do not place the religious rights on a high priority in the agenda of the political movement. It turns out that even although issues of homosexuality can be addressed in the church, it does not necessarily attract more public concern. Implications are then drawn on the importance of different dimensions of identity negotiation in Christian churches to the dynamics of identity politics of homosexuality in Hong Kong society.

The incomplete sexual revolution: what keeps Spaniards from having a pleasurable sexual debut?

Giulia MARIANI (Pompeu Fabra University, Barcelona, Spain) | giulia.mariani@upf.edu
Luize RATNIECE (Pompeu Fabra University, Barcelona, Spain) | luize.ratniece@upf.edu

30 years ago, sexual liberation hit the recently democratized Spain with promises of a renewed sexuality, free of the old social sexual stigmas, stereotypical gender roles and conservative values of the national-catholic regime. Since this “gran destape” coincided with the introduction of the contraceptive pill that allowed sexuality to be separated from reproduction, times of sexual pleasure for both men and women seemed to be ahead. However, a closer look at Spaniards’ sexuality throughout the 20th century permits to observe that the country’s sexual revolution has been an incomplete one.

Despite two representative surveys carried out in 2008, little in-depth quantitative research has been carried out about the sexual behaviour of Spaniards. This article looks at the data from the National Sexual Health Survey exploring the factors that have driven the likelihood of having reported an enjoyable sexual debut across the cohorts spanning from 1909 to 1992.

A multilogit analysis permits to find both (a) situational determinants among the characteristics of the debut and (b) wider socioeconomic factors that have been restricting access to enjoyment. Hindered access to enjoyment at the sexual debut is found to be a profoundly gendered issue, disproportionally affecting women. No significant differences are found among
the different age cohorts. This suggests a failure to invest in access to useful information and tools to negotiate an enjoyable sexual debut for supposedly sexually liberated cohorts of women in Spain.

JS_RN16+RN23a - Sexual Health and the Medicalisation of Sexuality I

The Localization of Sexual and Reproductive Health
Thorsten BONACKER (University of Marburg, Germany) | thorsten.bonacker@uni-marburg.de
Judith VON HEUSINGER (University of Marburg, Germany) | heusing4@Staff.Uni-Marburg.de

From the 1990s on reproductive and sexual health has emerged as a global concept developed by institutional entrepreneurs like international organizations and non-governmental organizations. As a concept it is distributed for example through development aid programs and agencies which try to change government policies as well as collective and individual sexual and reproductive practices of the general public or certain population groups in a society. The global concept of sexual and reproductive health contains normative, regulative and cognitive notions of appropriate sexual behavior, legal frameworks for the implementation of reproductive rights in national health systems and conceptions about the functionality of human sexuality or delivery.

This global concept is contested even on the global level and is localized in a social and cultural context with local understandings and constructions of sexuality, femininity and gender which therefore often leads to frictions, negotiations and conflicts when for example reproductive rights are introduced through international development programs.

Based on our work on the emergence of a global institutional field of sexual and reproductive health and on field research on development practices in this paper we want to discuss why in some cases these conflicts do not occur on the local level. Our argument is that development polices in the field of sexual and reproductive health to a certain extent fits quite well into local gender norms and constructions of sexuality because they treat women as responsible for sexual and reproductive rights even for men, e.g. by caring about sexual enlightenment and contraception.

Beyond or within medicalisation? Discussing Viagra and its discontents
Raffaella FERRERO CAMOLETTO (Dept. Cultures, Politics and Society, University of Turin, Italy) | raffaella.ferrerocamoletto@unito.it

In the last decade, a lively debate on medicalisation has developed, with scholars discussing its heuristic value and the need for new conceptual tools (such as biomedicalisation and pharmaceuticalisation) to grasp the complexity of emerging social processes (Abraham 2010; Clarke, Shim 2011; Williams et al. 2011; Bell, Figert 2012). Among these processes, the advent of Viagra and other pharmaceuticals treating erectile dysfunction (ED) has triggered a rich strand of theoretical analysis and empirical research.

Drawing on qualitative data from interviews with medical experts and on-line forums among experts and lay people dealing with male sexual health issues, the paper aims at discussing how the Viagra phenomenon works as a fruitful case-study to assess the actual heuristic potential of the medicalisation framework.

The paper will investigate the way medical professionals and consumers account for uses of ED pharmaceuticals, unveiling plural and ambivalent meanings. On the one hand, medical experts, while complaining a general decline of their professional dominance and the emergence of patients’consumerism, express controversial positions questioning the definition of the disease,
its legitimate treatment and its target. On the other hand, male consumers, while claiming for an active role in defining their sexual discontents, show also compliance with a quick-fix pill culture challenging the boundaries between cure and enhancement.

The complexity of these accounts will be analysed by recalling Conrad and Schneider’s (1980) three-dimensional articulation of medicalisation (conceptual, institutional, relational), showing how the construction of male sexual health in the Viagra culture entails a multidimensional and bidirectional medicalising process.

**Medicalizing masturbation: Danish sperm donors, biomedicine, and affective masculinities**

Sebastian MOHR (Aarhus University, Denmark) | semo@edu.au.dk

The public figure of the sperm donor is one of masturbatory mystique: young virile men enjoy moments of sexual ecstasy and receive cash in return. However, nearly nothing is known about sperm donors’ experience of masturbation. Despite its central role in contemporary reproductive biomedicine, masturbation is not of importance for most researchers interested in biomedical regulation. Based on interviews with Danish sperm donors and ethnographic fieldwork at Danish sperm banks, I want to provide insights into what it means to produce semen samples as part of reproductive donation. Instead of making assumptions about how easy it is to donate semen, since it ‘only’ involves masturbation, and rather than dismissing masturbation as a central regulatory focus of contemporary reproductive biomedicine, I turn the analytical gaze towards Danish sperm donors’ masturbatory practices and experiences of masturbation. I argue that controlling male masturbation is a central mechanism of contemporary reproductive biomedicine, and that the governance of sperm donation happens by ways of regulating men’s gendered and sexualed self-conceptions. It is through a regulation of the affective spaces of male masturbation that contemporary reproductive biomedicine appropriates men and their bodies.

**A critical look at the medicalisation of women’s sexuality at menopause and midlife**

Sharron HINCHLIFF (University of Sheffield, United Kingdom) | s.hinchliff@sheffield.ac.uk

"Without oestrogen, the quality of being female gradually disappears. The vagina begins to shrivel, the uterus gets smaller, the breasts atrophy, sexual desire often disappears, and the women becomes completely desexualized. Actually, it is a little worse than that." (Reuben, 1970: 288)

Menopause has long been medicalised: from the Victorian era where clinicians advised women to rest and avoid ‘over-exciting’ the mind, to the mid 20th century where hormone therapy (HT) was widely promoted to ‘restore’ the femininity that accompanied a decline in the hormone oestrogen. At this time, medical discourses positioned women’s sexuality during the menopausal transition in terms of decline (‘vaginal atrophy’) and loss (of sexual desire). In this paper I explore the medicalisation of sex at menopause, drawing on literature from sociology, (critical) psychology and social gerontology as well as qualitative research carried out with women. Focusing on women’s own perspectives is important because the bulk of research on sex and menopause has been conducted within a bio-medical framework, which often obscures other factors that can influence women’s sexual well-being at this time. I also examine competing discourses around midlife women’s sexuality. In particular, how this representation of the sexually ‘void’ menopausal woman fits with the ‘new’ representation of midlife women as sexually agentic, desiring and desirable: the ‘sexy midlifer’.
**Listening to young people as a strategy to improve sexual education in Poland**

Maria Monika WOŹNIAK (University of Warsaw, Poland) | marysia.wozniak@gmail.com

The debate concerning youth sexuality in Poland is focused mostly around issues of sexual education. Particularly, on trying to answer questions about the 'most appropriate' form which “family life education” should take. The discourse is dominated by the voices of adults belonging to political and symbolic elites (i.e. politicians, teachers, clergy). Hence being a public issue it expresses a great diversity of norms, beliefs and attitudes towards sex. Yet, the actual opinions of young people, which often reflect authentic, personal troubles and generational needs are largely being ignored.

The presentation will be focused on discussing my Phd research project based on qualitative interviews which seeks to uncover feelings, experiences and visions of young people in Poland that are being overlooked in political discourses and are not being studied extensively in scientific discourses. This is especially important when discussing the voices of LGBTQ youth in the discourse concerning sexuality education.

It is hence designed to highlight the essence of the research carried out with Polish youth in order to understand the ways in which young people perceive everyday aspects of sexuality in which they engage, what are the cultural scenarios that are available to them, what is the impact of current sexual education school program, how do the system and the mentioned scenarios effect young people current and future behaviour, beliefs and values. Especially in relation to LGBTQ youth.

All these points are designed to facilitate the construction of a tailor made sexual education program, which will meet young people’s expectations.

**Italian university students: sexual behavior and health risk**

Michaela LIUCCIO (University La Sapienza, Italy) | michaela.liuccio@uniroma1.it
Chiara BORGIA (University La Sapienza, Italy) | kiaraborgia@gmail.com
Benedetta MARTINO (University La Sapienza, Italy) | bene_m@hotmail.it

Sexually transmitted diseases (STDs) account for some of the most serious public health problems worldwide. The WHO (2013) has estimated that STDs have an annual incidence of 333 million cases without including AIDS. Out of those 333 million new cases estimated annually, at least 111 affect young people under the age of 25. The aim of this survey is to identify risky sexual behaviors in young people and to describe the perception / awareness that young people have of the risks they are exposed to.

In line with the aim of our survey, an "Anonymous Questionnaire" was designed in compliance with confidentiality rules which was inspired by Fishbein’s Integrative Model as a reference model (2000). For the selection of the items and the Likert type scale to be adopted, Ajzen was chosen as a reference (2011). For evaluating the perception of the risk associated with sexual behavior, instead, Donizzetti was selected as a reference source(2009). Finally, for the preparation of the items to be investigated in relation to risky sexual behaviors, the use of psychoactive substances and earlier screening, the Behavioral Risk Factor Surveillance System (BRFSS) of the Center for Disease Control and Prevention was selected as a reference model.

The research sample consists of young university students from Rome La Sapienza. A preliminary investigation took place with the involvement of 20 university students from Rome La Sapienza. In its final version, the questionnaire has been turned into a Web Survey and
forwarded via email to all La Sapienza University students through INFOSTUD (an electronic answering system in place at La Sapienza University).

At present 3469 students responded to the questionnaire and the survey is still in progress. The questionnaire aims at investigating risky sexual behaviors both qualitatively and quantitatively, the use of psychoactive substances in association with sexual behaviors, the intention to adopt healthy sexual behaviors, the perception young people have of rules, the attitudes and preconceived ideas about sexual behaviors, self-efficacy, and the perception of the risk to our own health and to that of our peers falling under the same sexual sphere. Data analysis will also take place by cross-checking the above mentioned variables with other relevant variables including: gender and age differences, the university faculty of origin, off-site or on-site student status, the source used to extract information about sexual and reproductive health, the age of sexual initiation, any history of STDs communication, presence or absence of a stable partner.

Sexual orientation and health in England: evidence of health inequalities, and challenges in the method, practice and policy of recording and interpreting data: a multimillion case dataset

Alex POLLARD (Brighton & Sussex Medical School, United Kingdom) | a.pollard@bsms.ac.uk

Tom NADARZYNSKI (Brighton & Sussex Medical School, United Kingdom) | T.Nadarzynski@bsms.ac.uk

Systematic reviews show consistent inequalities in the physical, mental and behavioural health of Lesbian, Gay and Bisexual (LGB) people, but the legacy of stigma and marginalisation has limited investigation into sexual orientation as a social determinant of health.

We present statistical analysis of one year’s data (1 Million GP patients) from the ‘GP Patient Survey’ (UK Department of Health). This data includes self-report of respondents’ sexual orientation (14,142 LGB), which is unique in the world for its extent and diversity.

The ‘GP Patient Survey’ is an annual, anonymous, proportionally stratified, postal survey of 1 million adult GP patients in England each year. Its primary purpose is to evaluate patient experience of General Practitioners (GPs), but including sexual orientation alongside health conditions and European standardised measures of health (EQ -5D) enables internal comparison of health across sexual orientations.

The scale, proportional sampling and diversity of this sample also enable exploration of the use of reductionist categories of sexual orientation (Heterosexual, Lesbian/Gay, Bisexual, Other, Prefer Not to Say); patterns in the disclosure of sexual orientation; and the geographical distribution of respondents.

We present data on:
* bias in the willingness/ability of patients to disclose non-heterosexual identities
* patterns in patients’ response to the available categories of sexual orientation
* evidence of health inequalities between sexual orientations
* the potential application and effectiveness of data on sexual orientation.
We also touch on differences between data from anonymous surveys and data from health services, which could usefully be linked to the health experience and needs of individual patients.

**Large system of sexual education in Russia: why do women want to know more about sex?**

Alexander B. ROSLYAKOV (Znautvse.ru Sociological Research Service, Russian Federation) | karsuh@gmail.com

My report is possible after a long case study of educational centre "Sex.rf" – the largest system of commercial sex-courses in Russia and monthly interviews with its customers on different aspects of their sexual behaviour, predominantly in Moscow. We've got a full picture of social regulators of female sexual behaviour: norms, including tabu, goals, values, etc.

These are the main characteristics of my report:
Firstly, this picture was mainly done from women's point of view and secondly, my object was a specific group of women: most of them were at their fertile age and highly educated. As a result I will answer some questions about their motivation: why they choose a sexual education, what they like and dislike about it, how they see their own sexuality, men and other women.

**Adolescent Girls’ Menstruation Management and Meaning in Rural Kenya**

Molly SECOR-TURNER (North Dakota State University, United States of America) | molly.secor-turner@ndsu.edu
Kaitlin SCHMITZ (North Dakota State University, United States of America) | schmitz.kait@gmail.com
Kristen E BENSON (North Dakota State University, United States of America) | Kristen.Benson@ndsu.edu

Rural Kenyan girls miss up to 8 weeks of school annually due to limited access to reliable hygienic sanitation and sanitary products. This study describes the menstruation experiences of adolescent girls living in rural Kenya with consideration of the context of gender, poverty, and education. Twenty-nine adolescent girls, ages 13-21 years were interviewed in the Kaare Subarea of Tharaka-Nithi County, Kenya. Four primary themes emerged: 1.) Receiving Information about Menstruation, 2.) Experiences of Menstruation, 3.) Menstrual Hygiene Practices, and 4.) Social Norms and the Meaning of Menstruation. One participant stated, “When I have menstruation, I cannot... come to school. When I don't have the pads, I stay at home.” We found that challenges related to menstruation were directly linked to experiences of education and socialization. Global priorities to address gender inequality, especially related to education, need to consider the impact of poverty and gendered experiences, such as menstruation.
The 'Precariat' in and through Social Science. Thoughts on the Power of Interpretation of the Sociological Imagination

Danny OTTO (University of Rostock, Germany) | danny.otto@uni-rostock.de

I would like to propose a triple perspective on the social construction of inequalities in and through social science esp. sociology by addressing 1. the “precariat” as a categorical classification in recent sociological discussions on inequality, 2. the perception of “precarious” working conditions in the field of science and 3. the intermingling of both (in terms like “academic precariat”).

In my ongoing PhD project I am concerned with interpretations ("Deutungen") of social inequality – exemplified by "precariat" – and the power of these interpretations. This inquiry into the fabrication of a “new” sociological concept relies on the viewpoint of science and technology studies to analyze its becoming (the power to interpret), dissemination and effectiveness (power of an interpretation).

Starting from a genealogy of “precariat” in the sociological discourse I outline the career of the interpretation, taking into account the associations that stabilize this concept and fractions within the debate (activist scientific; national international). The link between this depiction of social inequality and perceptions of uncertainty in work and life ties this “knowledge object” (Knorr-Cetina) to the situation of social scientists. The intersection of self-description and description of others points towards an overlap of scientific and political ambition. Both this entanglement and the role of social scientists (and their interpretations) in the construction of social inequality needs further elaboration. Therefore I try to get a closer look on the pictures of society drawn in and through social science.

Network research in Russia: the structure of scientific community

Daria MALTSEVA (Russian State University for the Humanities, Russian Federation; International laboratory for Applied Network Research, Russian Federation) | d_malceva@mail.ru

The paper presents the results of the study of a current state of development of network research in social sciences in Russia.

While the social network analysis in Western sociology is recognized as a discipline from the 1970’s and is characterized by the presence of its own professional community, journals, conferences, knowledge transfer centers and educational programs, the level of the usage of SNA in Russian science is low. Even though during last years the appearance of a community of scientists called “network researchers” and development of institutionalized forms of their cooperation as research sections at universities and organizations can be seen, Russian network researchers community’s structure and its inclusion into the international discourse on networks is needed to be examined.

The research is based on the citation (references) analysis of the publications in Russian scientific journals. With the usage of SNA techniques networks of researchers involved into the network studies in Russia is constructed. The research hypothesizes that the given field is currently fragmental and each group of Russian scientists cite “their own” set of other authors, who are mainly foreign. It can be also expected that Russian-foreign networks of citations would
be dense, with well-identified centers and clusters, while just Russian network would be thin and without clusters.
According to the research data, the conclusions about the gap between scientific communities of network researchers can be made. Overcoming this gap requires some efforts from both the scientific policy makers and scientists themselves.

The Introduction of Structured Doctoral Programs - Any News for Gender Inequality?
Jakob TESCH (Institute for Research Information and Quality Assurance, Germany) | tesc@forschungsinfo.de
Jens AMBRASAT (Institute for Research Information and Quality Assurance, Germany) | ambrasat@forschungsinfo.de

Research systems all over the world suffer from the leaky pipeline problem: women are dropping out of academia over the different stages of academic qualification (UNESCO 2007). Existing data for Germany, where this problem is particularly pronounced, suggest that transition from successful completion of the doctorate into subsequent employment appears to be a phase of substantial drop out of women (Lind and Löther 2007). Research identified gender specific effects of parenthood as the main reason for dropout: While parenthood for men is largely without consequences for their professional development becoming mothers show decreasing intentions to work in research (Goulden, Mason and Frasch 2011; Tesch and Hauss 2013).

Structured doctoral programs were expected to patch the leaky pipeline by introducing standardized selection procedures, structures of family support and improved supervision (Korf and Roman 2013). However, the effect of these programs in reducing gender inequality in science is largely unknown.
Utilizing data from the German longitudinal doctoral candidates and doctorate holders study ProFile (Hauss et al. 2012), we compare men and women's job placement in academia or outside after successful graduation. Thereby, we particularly assess the role of structured doctoral programs in equalizing or solidifying gender inequalities. Our sample consists of 2,800 doctorate holders from all disciplines and various institutions of which information on the candidature, type and pattern of doctoral education, partnership, children as well as subsequent job placement inside or outside of academia is available. First results sketch an ambivalent picture of structured doctoral programs with regard to gender equality.

Free University vs. New Public Management – Critical discourse analysis concerning reform of higher education in Poland.
Krzysztof GUBAŃSKI (University of Warsaw, Poland) | krzysztof.gubanski@gmail.com

In my paper I explore the highly polarized public discussion around the reforms of academia in Poland. Either stuck in the narrow economic context, or focused on the limited affirmation of the autonomy of science as an autotelic value, this discussion reflects how Polish education, in an aftermath of broader structural changes after 1989, was subjected to the logic of the new public management.
Since then, Polish universities, like their global counterparts, are subordinated to the principle of economic efficiency. Accordingly, the educational crisis and its’ subsequent solutions are defined through the lens of market mechanisms. I argue that this can be traced not only to the structural changes, but also to the power play in the field of discourse.
Efficiency, competitiveness and innovation are permanently referenced, like floating signifiers, that seemingly don’t require any justification. Aggressive and patronizing speeches about scientists are aimed to discredit their opposition and their right to question current educational policy. Students are left in an even worse position. Their role as key actors is constantly downplayed. At best, they are portrayed not as subjects, but as passive victims of the system, unable to recognize and express their own interests. The Ministry of Science only reproduces this prejudice.
Since only a few scientists object to such discursive lynching, the negative image of a university is upheld. It is seen as a hermetic bubble, which will burst if not for the common sense of the key business player and the universal laws of the market.

In 2014, we have carried out a questionnaire survey of postgraduate students in St. Petersburg. The main objective of the research was to find values postgraduate assessment of their qualities necessary for a successful scientific career, and general attitude towards scientific work. Respondents were also assessed: the implementation of plans thesis writing, exams, time spent on training during the week, the possibility of obtaining information. The questionnaire asked about the indicators of publication activity of graduate students, participation in research conferences. Identified the main difficulties faced by graduate students: financial, family, a large amount of research load. We also analyzed the relations between graduate students and their supervisors, and so on.
Factor analysis of the qualities necessary for a successful scientific career, has shown that the most important qualities are: hard work (contribution to component 0,780), initiative, flexibility of mind (contribution – 0,750), quick learning (0,742), discipline (0,739), responsibility (0,726), diligence (determined as 0.720). The most valuable in the research work are presented: the opportunity to be creative initiative (77%), the possibility of high earnings (36%), the opportunity...
to work in good conditions (28%), ability to save enough energy for leisure activities (23%), perspectives to achieve a high social status (21%). Overall, 69% of respondents postgraduate remains attractive, and for 21% of the attractiveness of scientific activity decreased. Among graduate students 58% of respondents indicated that they want to engage in increments of scientific knowledge, and 35% – want to get the title as collateral for a career in business and management.
