Francesco SACCHETTI (University of Urbino, Italy) | francescosacchetti@gmail.it

Our research is based on a case study: an university spin-off working in the field of biotechnology. This particular type of firm can be considered the most visible consequence of a process that has led universities to become more entrepreneurial. Many universities no longer simply “do science”, but are becoming the engine of technological innovation. University spin-offs consist of PhD graduates, researchers and professors who remain strongly linked to their university of origin, whilst founding companies with the aim of commercialising some of their research results.

The goal is to analyse how researchers working within a spin-off attempt to reconfigure their role in response to the conflicts and contradictions that arise when they try to reconcile the logic of the market with those of the world of pure science.

Our research was conducted following a qualitative approach. It is based on the observation of work practices and in-depth interviews.

The results show that the transition of the researchers from university to the spin-off was not really a choice as such, but rather a necessity due to the great difficulties encountered in continuing a university career. The prestige attached to their role depends primarily on the ability to obtain partnerships with opinion leaders, and the work of publishing is functional to this goal. The problem of defining the boundaries between academic and market-oriented roles mainly concerns university researchers that work together with the spin-off, because they must adapt to the logics of “usable knowledge” and “protection of results”.

Work and family life balance of doctorate students in the field of engineering
Veronika PAKSI (Centre for Social Sciences of the Hungarian Academy of Sciences, Hungary) | paksi.veronika@tk.mta.hu

The proportion of female researchers in R&D compared to men is still low, especially in the field of science, technology, engineering and mathematics (STEM). There is still a strong need to explore the reasons why STEM careers and training resist trends that point towards the equalization of genders. The academic ‘pipeline’ looses women mainly after they obtain their PhD. During the early tenure track employment family and childbearing related difficulties have the most significant negative impact on career advancement. In our research we aimed to explore the special life period of PhD attendance, when young academics shoulder heavy workloads and often balance more than two life domains. Our paper is based on 20 qualitative interviews with female PhD students in the field of engineering, conducted in Hungary. In our presentation we will show how doctorate students balance their PhD attendance, work and family life and what facilitating and constraining factors they can identify in relation to it; how training delays their childbearing, how conflicting social norms related to the timing of the first childbirth cause serious tensions in their everyday life, as well as what strategies young researchers seek to avoid or ease this conflict; the special characteristics of education in
engineering and of the sector of employment that affect these. Results may give us a better understanding of why women in STEM fields have lower fertility rates than women in other fields and why education-work-family life balance is important even at the very early stages of their careers.

Presuppositions of scientific training inside a laboratory of human genetics
Mariana Toledo FERREIRA (Universidade de Sao Paulo, Brazil) | mariana.toledo.ferreira@usp.br

This presentation aims to discuss the scientific training of new researchers in light of the specialization and division of scientific labour inside a Brazilian laboratory of human and medical genetics. Its research context is marked through the rising preponderance of technological research and the growing speed of data production, which pressure researchers in different manners: through the increasing costs of technological innovation, a necessity of more complex methods of analysis and the diversification of junior researcher's formation. The specific objective consists in looking at the manner through which junior researchers have been socialized inside the discipline of human and medical genetics, verify which skills they consider essential to become good professionals, their conceptions of academic profession and the type of career desired.

Therefore a qualitative research has been taken through at a research center for human and medical genetics at Universidade de Sao Paulo. It stands out that scientific communities of Latin American countries (as elsewhere) are not homogeneous spaces of knowledge production but rather hierarchic organizations under permanent tension. There are integrated groups of researchers that take part of international research programmes and are frequently internationally funded. On the other side there are less-integrated groups, whose degree of internationalization is low and that work in an isolated manner. The laboratory in this case-study is a Brazilian center of excellence, congregating significant amount of financing, high degree of internationalization in its members formation and participation in the human genetics research on a world scale, although in a subordinate fashion.

Nanotechnology Roadmaps: A Case Study on Meta-Regulation by the European Commission (CORDIS)
Pavel KOTLÍK (Charles University in Prague (ISS FSV UK), Czech Republic / Université de Strasbourg (IRIST), France) | pavel.kotlik@etu.unistra.fr

Technology roadmapping is described in the theoretical literature as a flexible method widely used in industry, government and academia to support strategic and long-range planning, including tracking the performance of potentially disruptive technologies. Technology roadmaps are made of actions, interactions and discourses. From another perspective they represent evolving pathways and socio-technical landscapes, suggesting underlying or otherwise supportive metaphorical patterns and structures. As a part of the European Commission's strategic agenda for science and innovation policy, these are also important manifestations of nanotechnology governance. In our study, we explore the topology of roadmapping metaphor and related concepts in an ad-hoc compiled corpus. The corpus is made up of news and information on emerging nanotechnologies as they appeared in the Community Research and Development Information Service (CORDIS) database, between the years 1999-2013 (approx. 200 articles). Despite the existing variability found in its institutional context and over time, the European Commission incorporates nanotechnology into a common narrative about developing mature science policy model. This one is, however, accompanied by narrative of policy frustration, especially with regard to the dilemma of path dependence (control) and cultural lag
(gap). The consistent (and somewhat unquestioned) use of these meta-narratives suggests their role as powerful folk theories. It is argued that 'meta' perspective provides a means for improved understanding of strategic tools, such as roadmaps, along the lines of its generic, dynamic and organizational capacities (regulatory capacities). These are all applicable examples of meta-regulation, or meta-steering activities, with a concomitant shift from the metaphor of nanotechnology to metaphor for nanotechnology.

**The Decision-Making Process on Where to Site a Deep Nuclear-Waste Repository in the Czech Republic**

Daniel ČERMÁK (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | daniel.cermak@soc.cas.cz
Martin DURĎOVIČ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | martin.durdovic@soc.cas.cz
Kateřina BERNARDYOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | katerina.bernardyova@soc.cas.cz

There are currently negotiations under way between municipalities and other stakeholders about where to locate a deep geological nuclear-waste repository in the Czech Republic. This issue represents a highly relevant topic of applied sociological research that involves decision-making at the local level.

The authors of this poster utilise data from both quantitative and qualitative research in order to describe and analyse the progress of negotiations and the background to this process from a sociological perspective. First, several surveys were carried out in the municipalities and at the national level. Second, the findings from in-depth interviews and focus groups with stakeholders were analysed. Another important source of information was the knowledge gathered by members of the research team during their activities as members of the 'Working Group for Dialogue on the Deep Geological Repository'. The aim of the working group is to make the whole selection process about where to locate the repository more transparent.

These sources are used to describe a challenging process that is quite unique in the post-communist era in the Czech Republic. It is likely the first occasion which citizens and their local representatives have had to decide make/influence a decision about such an important issue that cannot be decided at the national level and subsequently implemented against the will of citizens at the local level. The whole process is hindered by such obstructions as NIMBYism and by the opaque policy and ambiguous position of the state administration.

**RN24S01 - Knowledge Production & Science Systems**

**Science Fiction as Heuristic of Inequality**

Dennis Saturno ERASGA (De La Salle University, Philippines) | dennis.erasga@dlsu.edu.ph

As an oxymoron, science fiction poignantly functions as a heuristic of fear. It depicts future realities made possible by science and technology hoping that the mistakes of the latter produce creative fear that serve as precautionary principles for the epistemic lifestyle of the present generation of scientists. The present paper investigates how this heuristic function of sci-fi can be exploited by sociologists in exploring future possibilities of social inequality uniquely engendered by science and technology. Three questions direct the inquiry: How unequal people could be in the future? What are the modalities of such inequalities? What is the exclusive role of science and technology in fostering such inequalities? Using three sci-fi movies – 2012, Inception, and Elysium- the paper will answer each of the exploratory questions and from there generate key sociological principles on the future of social inequality research. The paper
Inequalities in an internationalized scientific community. The case of the United Arab Emirates
Sebastien MOSBAH-NATANSON (Paris Sorbonne University Abu Dhabi, United Arab Emirates) | sebastien.natanson@psuad.ac.ae

Inequalities in scientific communities have largely been studied in sociology of science in the last 40 years, focusing on status and gender inequalities within a same country. The issue of inequalities within a local scientific community may be scrutinized again due to the emergence of new internationalized scientific communities in countries such as the United Arab Emirates, Qatar or Singapore, which have largely invested, in the last fifteen years, in order to build a higher education and research system, creating new universities, importing foreign ones mainly from Western countries (branch campuses), building research infrastructure and favoring a new kind of brain drain. We will focus in this communication on the case of the social structure of the scientific community in the UAE, a country composed of 90% expats and 10% nationals (Emiratis). We will try to show that the internationalization of this scientific community combined with structural inequalities largely based on a national preference system may have led to the anomy of the emerging scientific system. After describing the social characteristics of this scientific community (focusing on the diversity in the origins and education of its members), we will focus on the contradictions of a system where the bulk of the academic work and scientific research is conducted by foreign academics which status can not be permanent while national scientists are only a small minority. We will focus on the consequences of those structural inequalities in terms of intermittent scientific careers, scientific networks’ participation and research productivity.

What happened to the spread of universal ideas?
Reiner GRUNDMANN (University of Nottingham, United Kingdom) | Reiner.Grundmann@nottingham.ac.uk
Cornelia LAWSON (University of Nottingham, United Kingdom) | cornelia.lawson@nottingham.ac.uk

This research discusses how the relation between Western Science and other forms of knowledge has been conceptualised, and what role the university, as one specific knowledge producer, has played in this process. We examine the contributions from two different research traditions that usually have not much contact: the diffusionist framework in the history of science, and the neo-institutional analysis in organizational sociology. The first abandoned the notion of universal science, of linear transfer, and hence of the very concept of Western science in favour of particularistic accounts with no appetite for generalizations. The neo-institutional approach invokes the existence of universal norms when it comes to knowledge production. The expansion of scientific institutions on a global scale is explained through the appeal of a universal ideal, that of truth and universal validity.

But can these approaches explain why certain areas of science spread more than others and which aspects of non-western research have gained visibility? BRICS, especially China, are rising science nations but their performance still lags behind Western nations, especially in the Social Sciences and Humanities, but also in areas of health and clinical sciences. It looks as if these areas have not received the attention or funding which would enable them to embark on their path to a national academic culture that competes on a par with Western scholars. We look
at these additional explanations including the incentives and resource allocation in scientific research. Publication data and national science infrastructure data will be used to evaluate these theories.

**Can collaboration overcome scientific inequalities - research collaborations in the International Partnership Program between Portugal and MIT/CMU/UTA**

Cristina Palma CONCEIÇÃO (CIES-IUL, Portugal) | cristina.conceicao@iscte.pt
Teresa PATRÍCIO (CIES-IUL, Portugal) | teresa.patricio@iscte.pt
Patrícia SANTOS (CIES-IUL, Portugal) | ana.patricia.santos@iscte.pt

In 2006, the Government of Portugal formalized a collaborative strategy with three USA research universities (MIT, CMU and UTA) to promote the modernization of Portuguese higher education institutions. The effort to promote scientific excellence and the internationalization of Portuguese universities was inspired on the model of leading US universities. Increasingly, many universities around the world seek to expand their strategies for international collaborations in order to increase their resources, position and status.

This paper will analyze scientific collaboration between two higher education and research systems in different stages of development (and in specific fields) with an aim to understand if, and how, research collaborations can lead to scientific growth and development. To this end, we explore data collected mostly through interviews conducted with PIs in research projects funded by this Program (n = 34).

First, we compare differences and similarities between academic cultures. Some aspects are deeply rooted in American academic practices – e.g., economic relevance of research, interdisciplinary and the role of graduate students in scientific work – and how these are articulated within the Portuguese academic culture. Second, we analyze the influence of the “American model” on the Portuguese scientific system. We concentrate on forms and ways of working, including networking, coordination, authority and resources relations. Third, we probe the perceptions of the academics themselves regarding collaborations and whether it improves their competitive positions.

**Transdisciplinary model for collaboration between sciences, technology and art.**

Cristina MIRANDA DE ALMEIDA (Internet Interdisciplinary Institute, Spain) | cristinamiranda.de@gmail.com
Benjamín TEJERINA (University of the Basque Country) | b.tejerina@ehu.eus

The objective of this presentation is to explore a theoretical model to analyse and facilitate transdisciplinary dialog and collaboration between science, technology, art and humanities given the fact that interdisciplinary collaboration between these fields reflects an unbalanced situation in the interaction between the main dimensions, agents, resources, contexts and strategies of transdisciplinary action after a little conceptual translation or adjustment. The model is inspired in key concepts taken from sociological Theories of Collective Action because transdisciplinary action can be understood as a form of collective action according to the following definition: Collective action is “the result of a social action (or collective challenge) carried out by the set of formal and informal interactions established between (1) a plurality of individuals, collectives and organized groups (who share, to a greater or lesser extent, a sense of belonging or collective identity among themselves) and (2) other social and political actors with which they come into conflict. This conflict is triggered by the appropriation (of), participation (in), and transformation of relations of power to achieve social goals, and above all, through the mobilization of certain sectors of society” (Tejerina, 2010). When collective action forms groups it is crucial to understand how these collective entities are shaped by means of
discussions, negotiation and re-negotiation processes and not take their existence for granted. The focus will be in the key elements to construct a theoretical model for transdisciplinary action. These elements are: (1) the components of collective action, that is to say, why, where, when and in which way collective action happens (Theory of Collective Behaviour, Smelser, 1963); (2) the relationship between costs and benefits of collective action, that is to say, the dependence of collective action on available resources, group organization and opportunities and on the strategic and political factors involved (Theory of Resource Mobilization, Jenkins, 1983; McCarthy and Zald, 1977); (3) context interaction (Theory of Social Interaction, Turner; Kilian, 1957); (4) the political aspects (Theory of Structure of Political Opportunity, Kriesi, 1992; Tarrow, 1989, 1994; 1998); (5) the collective sense and aims (Theory of Collective Identity, Melucci, 1995), as in collective actions there is a blend of intentions, resources and limits. Collective actions imply intentional decisions and interaction structures inside a system of opportunities and restrictions.

The presentation will contribute to improve the vision on how transdisciplinary actions change knowledge production and how the aims, motivations, and interactions around disciplinary problems synchronize and find resonance (or not) in an environment of limited resources and changing opportunities in which there are collaborators and opponents that need to dialog. This presentation will be developed on the basis of a White Paper co-authored with Benjamin Tejerina for SEAD Network. This material is based upon work supported by the National Science Foundation under Grant No.1142510, IIS, Human Centered Computing, "Collaborative Research: EAGER: Network for Science, Engineering, Arts and Design (NSEAD)".

RN24S02 - Researchers’ Professional Perspectives in Academic Science I

The Social Structure of the Scientific Elite in Germany
Angela GRAF (Technische Universität Darmstadt, Germany) | graf@ifs.tu-darmstadt.de

While several elite studies show that the social background influences the chance to receive elite positions in society, for science a meritocratic recruitment practice is often supposed. Scientific achievement, in fact scientific excellence is regarded as the only legitimated criterion for success and therefore for getting into high positions in the scientific field. However, the scientific elite has not been analysed in detail so far. Taking a closer look at the scientific elite is not only reasonable because the elite members are the most successful participants, but also because they have enormous influence on the scientific structures and therefore on the (re)production of social inequalities.

According to Pierre Bourdieu’s field concept, two elite fractions can be differentiated inside the scientific field. On the one hand, scientists with highest reputation due to their scientific attainments can be identified as members of the prestige elite. On the other hand, the power elite can be determined, namely the holders of the most powerful positions in the institutional structure of science.

Based on biographical data, I will give an overview of the social structure of the German scientific elite between 1945 and 2013. I will point out that the social background is highly important to attain an elite position in science. Nevertheless, there are shifts over time and differences between the elite sections. It becomes apparent that a privileged socio-economic family-background is more significant for joining the power elite, whereas for the prestige elite the familial closeness to the academic field is more important.
Searching for excellence: Academics’ perceptions about meritocracy, mobility and inbreeding in the promotion processes

Manuel PEREIRA-PUGA (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Manuel.Pereira@csic.es
Alberto BENITEZ-AMADO (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Alberto.Benitez@csic.es
Laura CRUZ-CASTRO (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Laura.Cruz@csic.es
Luis SANZ-MENENDEZ (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Luis.Sanz@csic.es

Universities contribute to economic growth and potentially to the reduction of social inequalities. Higher education institutions are expected to pursue excellence, in training of high-skilled professionals and in generating and transferring knowledge. Hiring, promoting and retaining the best talent is central for the success of the university mission. In this context, the mechanisms, procedures and results of academic promotion are central for succeeding in search of excellence.

Academic promotion is a selection mechanism where individuals are selected to perform certain tasks and an incentive to motivate individuals to improve their performance.

This paper address two complementary issues: First, we analyze the promotion process and their aggregate results in the Spanish universities in the last years. Second, we explore the perceptions and opinions of academics regarding the processes of promotion.

Empirical evidence is provided through a survey carried out among science and engineering academics from a representative sample of Spanish universities.

We focus on what kind of dimensions the academics consider that the university authorities should take into account when opening a new position, and what criteria and merits they think should be considered in order to choose the best candidate.

The paper considers the tensions between mobility and inbreeding in the context of meritocratic system. Among other factors the analysis controls for academic category, inbreed and non-inbreed status, gender, age, and region. The later is important because in a decentralized system where universities depend on the regional governments.

The evidence provided is relevant as academics’ perceptions on meritocracy and inbreeding may influence their career strategies, especially regarding productivity, mobility and internationalization.

Career experiences and prospects of postdoctoral researchers: A Dutch case study

Inge van der WEIJDEN (Leiden University, Netherlands, The) | i.c.m.van.der.weijden@cwts.leidenuniv.nl
Moniek de BOER (Online Marketing, Netherlands, The) | moniekdeboer@live.nl
Christine TEELKEN (VU Amsterdam, Netherlands, The) | j.c.teelken@vu.nl

In academic research, postdoctoral researchers are an increasingly important group. They are highly educated, specialized and productive professionals (e.g. O’Grady & Beam 2011), contributing to economic and social growth in countries (Häyrinen-Alesto & Peltola 2006), and responsible for a disproportional share of new discoveries (Davis 2009). However, their academic career trajectories are characterized by invisibility as well as uncertainty. Earlier studies (e.g Bessudnov, Guardiancich & Marimon 2014; Davis 2009; Felisberti & Sear 2014; Fitzenberg & Schulze 2013; Mitchell et al 2013; NISTEP 2008, 2009; Scaffidi & Berman 2011) demonstrated that nearly all postdocs want to stay in academia, but future career perspectives are very limited. The uncertainty of their academic future lowers their job satisfaction.
Given that postdocs seem to be trapped between their own ambitions and a lack of academic career possibilities, we (1) designed a mix method study and (2) used a multi actor approach, involving not only postdocs but also policy makers and tenured staff members, to study this in more detail. Our approach consists of a questionnaire (van der Weijden et al 2015 under review), semi-structured interviews and focus group discussions. We conducted semi-structured interviews with 20 postdocs employed at Leiden University in the Netherlands. In the presentation we will report on the outcomes of the interview study, with a focus on gender and nationality differences.

Characteristics of interviewees:
Gender: males: 10; females: 10
Background: Dutch: 12; non-Dutch: 8
Disciplines: Natural sciences: 8; Humanities: 5; Archeology: 4; Social sciences: 3

Gloomy prospects of the Czech academic science: whom and why it loses
Katerina CIDLINSKA (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | katerina.cidlinska@soc.cas.cz

The contribution deals with the theme of leaving the academic science by early career researchers. Against the backdrop of the present changes of academic environment related to
the rise of academic capitalism (Slaughter and Rhodes 2004) and the specifics of the Czech science policy (primarily funding), I explore who are those people who are leaving the science and which factors influence their exits. Current European and Czech science policies emphasize the need of high quality human resources in order to achieve the research excellence and competitiveness. The excellence should be guaranteed by a system of the funding and an assessment of scientific work based on neutral meritocratic criteria. This system stresses the publication performance and provides mostly short-term contracts. My contribution questions the main idea of the system, namely that only the best researchers will stay in science. My analysis based on my dissertation project draws on an online questionnaire survey and in-depth interviews focused on the persons who have left the Czech academic science in the last 10 years mostly in the postgraduate and postdoctoral phase, their reasons for exit and subjective evaluation of working conditions in science. The contribution argues that current criteria of excellence and working conditions support gender, social and age inequalities in science and the homogenization of research population. Instead of the development of high quality and motivated human resources and excellent research, they lead to burnout syndrome and exits from science of early career researchers, especially those from economically weaker families and women.

RN24S03 - Science & Technology Policy

Policy, Technical Knowledge and Ideational Embeddedness of Technocracy: A Comparative Study of Petrochemical Transformation in Mexico and Taiwan
Florence Fu-Chuan HUANG (National Chengchi University, Taiwan.) | florihuang@yahoo.com.tw

In the mid-1980s, both Mexico and Taiwan made changes from interventionist state to market-led growth strategies. Despite convergence in the market reform policies, divergence is noted in their economic performances. The argument is made that economic outcomes are determined by the policy principles of technocracies, shaped by perceptions of market ideas and development consciousness and constrained by historically specific institutions. The Mexican case shows how a neo-classical economic technocracy can prioritize market ideas, but in a manner that is contradicted and heavily offset by petroleum-centered ideology. In contrast, Taiwanese engineering technocracy remains development-conscious, therefore projecting technical and engineering knowledge to policy-making processes, and using reverse integration history as a niche for forging industrial integration. This is a likely explanation for why Taiwan’s petrochemical industry has outperformed Mexico’s.

Europe needs more scientists? Tensions and inequalities within the scientific community
Ana DELICADO (ICS University of Lisbon, Portugal) | ana.delicado@ics.ulisboa.pt

In 2004, a high level group appointed by the European Commission presented a report in Brussels that highlighted the need to have more 500.000 researchers in Europe by 2010, in order to meet the goal of turning the continent into “the most dynamic knowledge based economy”. Many countries followed suit and statistics show that this target has indeed been met. However, in recent years, the policy focus seems to have shifted from “quantity” to “quality”, with a strong emphasis on the controversial concept of “excellence”. At the same time, there is a growing realisation that in some countries there may be a surplus of human resources in science (unemployment among scientists) and that academia is increasingly unequal, polarised
between a minority that holds tenured positions and a majority that moves between a succession of temporary, precarious posts. This presentation aims to discuss these trends by taking as an example the Portuguese scientific system, based on statistics and policy documents. After two decades of rapid growth in human resources, spurred by governmental policies, a downward drift is noticeable in the past few years. Partly due to the financial crisis, but also to new policy options, PhD students and post-doctoral researchers are beginning to feel the crunch. The perennial problem of lack of research in business companies leaves them little option other than leaving the country or exiting science altogether. In response, social movements of researchers are on the rise. The impact of these changes over science must be assessed and debated.

The Presidential Address: Rhetorics and Emergence of Science Policy in India (1914-1981)
Michel Dubois (CNRS, France) | michel.dubois@cnrs.fr

This talk proposes a sociological analysis of an original empirical material: the presidential addresses produced on the occasion of the opening of the annual conference of the Indian Science Congress Association between 1914 and 1981. In the first part, I'll review the general nature of presidential addresses in the academic life, the rhetorical devices used by scholars, and their degree of specificity in the realm of public discourses. The second part will focus on the origin and the nature of the presidential addresses selected for this study. Once reminded the general role of the Indian Science Congress Association for the development of the Indian scientific community in the colonial but also postcolonial period after 1947 (Krishna V.V., 1997; Dubois M, 2014), the main general features of the addresses and their authors will be detailed. Finally, in the third part, I'll establish how these addresses may be seen as more than mere rituals intended to mark key moments of a scientific community, but as original forms of scientific politicization from which can be reconstructed the emergence and the evolution of a national science policy in India.

Bibliography

Excellence initiatives as inequality instruments
Laurens HesSELS (Rathenau Instituut, Netherlands, The) | l.hessels@rathenau.nl
Elizabeth KOIER (Rathenau Instituut, Netherlands, The) | e.koiert@rathenau.nl

Many science systems witness the rise of excellence initiatives, policies offering selective support for highly performing individuals, groups or research organizations (OECD, 2014 STI Outlook). These policies build on the assumption that the presence of a small number of excellent performers will have positive effects on the vitality, attractiveness or productivity of the whole science system, in spite of the possibly negative effects for the rest of the research community receiving relatively less resources. However, in policy documents and debates these underlying rationales often remain implicit and the risks and costs of the inequality the policies create tend to be neglected.

Our paper investigates the relationship between inequality and system performance by a case study of the Dutch ‘Zwaartepuntenbeleid’, a policy that redistributes existing resources for university research based on high performing priority topics. First, we will explore the motives
and arguments for excellence policies using documents and interviews, and develop a sociological framework to conceptualize this excellence initiative as an inequality instrument. Second, we will survey the science policy studies literature for available evidence supporting these motives: to what extent can the underlying motives and assumptions be supported by empirical data? We will close our paper with a reflection of the viability of excellence policies and a research agenda to support policy learning.

Who is under the sword of Damocles? Science and Technology Policy Making in Turkish Health Biotechnology and Renewable Energy Sectors
Gulsevim EVSEL (Middle East Technical University, Department of Science and Technology Policy Studies, Ankara, Turkey; Yuzuncu Yil University, Department of Sociology, Van, Turkey) | gevsel@metu.edu.tr
Yelda ERDEN-TOPAL (Middle East Technical University, Health biotechnology and renewable energy are two emerging and promising research areas for developing countries, as well as Turkey. Science and Technology (S&T) policies towards these sectors can be used as powerful tools to eliminate the differences and inequalities in the accumulation of S&T capacities between developed and developing countries. However, these two sectors are growing as problematic research areas for S&T policy making in Turkey. Government policies towards health biotechnology sector are loose compared to the rigorous government policies towards renewable energy sector. Despite these structural differences in policy making, the motive of “uncertainty in political interventions and procedures” is common in decision making for the actors in both sectors. This motive compels them to seek for illegal or off-the-record solutions to survive in national and/or international markets. Therefore, in this paper we will examine the main sources of “uncertainty” in actions of policy makers that lead the actors to the same reaction in these different emerging sectors. For this purpose, we will discuss the socio-economic impacts of the political intervention of the Turkish Government in health biotechnology sector and renewable energy sector. We will try to understand whether the problems are embedded in these sectors and reproduced by their structural peculiarities or exogenous to the sectors. We will conduct an empirical analysis of interrelations, similarities and differences between policy making approaches in these sectors by semi structured interviews. In other words, we try to sociologically imagine the “one” sitting under the sword of Damocles. Is it “policy maker” or “researcher” or the “firm owner”? Or are they inseparable and feeling the same fear?

RN24S04 - Health, Bio-medicine & Social Context I

Global genes, global health? International research in rare diseases
Aaro Mikael TUPASELA (University of Copenhagen, Denmark) | aatu@sund.ku.dk

Global research networks in genetics are increasingly dependent on access to samples for all over the world. Theoretically these flows of biological material, samples and information have been conceptualized as tissue economies (Waldby and Mitchell 2006), which are seen from a policy perspective to form an important component of knowledge-based bio-economies (KBBE). Yet, increasing attention has been paid to the disparities of socio-economic standing of the various people and patients from which samples and information are sourced. In many cases the differences that people have to high-tech medical care and treatment (the very goal of KBBE) are vastly different.
This presentation reports on some early findings from a project that has followed the work of geneticists working in Denmark who have set up a global consortium for collecting samples from patients around the world who have rare chromosomal translocations. Comparing and contrasting the collection of samples in Pakistan, Denmark and Finland the paper seeks to shed light on the challenges that global research alliances face in relation to not only collection of samples, but more importantly the return of benefits to patients and communities in different parts of the world. Although global research consortiums bring with them numerous benefits for all research parties involved, there are many challenges which university-based global research consortiums are not equipped to deal with.

**Tracking productive subjects: corporate wellness programmes, self-tracking and control through data**

Christopher Harper TILL (Leeds Beckett University, United Kingdom) | c.till@leedsbeckett.ac.uk

This paper will explore the use of digital self-tracking (DST) in corporate wellness program to consider their potential impact on health and social inequalities. DST has recently become more widespread and it has been suggested that it promotes a neoliberal entrepreneurialism (Lupton, 2013), that commercially valuable user data are being extracted (Till, 2014), that it is being used to monitor and increase the productivity of workers (Moore, 2014) as well as being used for public health interventions (Breton, et al, 2011). The individual and corporate management of health through DSTs has come together in their use in corporate wellness initiatives which conflate the health, fitness and wellbeing of individuals with the productivity and profitability of the company. The rationales for implementation, the relations drawn between health and corporate interests, their cause and effect relations and the subjectification processes enabled through particular arrangements of humans and technologies (Ruppert, 2011) will be analysed. Through a consideration of the techniques used to motivate employees and analyse employee data it is possible to unpick the processes of subjectification involved and the subtle ways in which particular bodies and bodily practices are promoted or marginalised. This analysis of interviews with HR and other senior managers and discourse analysis of relevant literature will provide an assessment of whether programs using DST overcome existing criticisms of corporate wellness which highlight their individualising and paternalistic tendencies and their greater suitability for middle-class employees and those with existing active and healthy lifestyles.

**Health claim regulation in Europe: demanding evidence**

Oliver TODT (University of the Balearic Islands, Spain) | todt@uv.es
José Luis LUJÁN (University of the Balearic Islands, Spain) | jl.lujan@uib.es
Juan Bautista BENGØTXEA (University of the Balearic Islands, Spain) | juanbautista.bengoetchea@uib.cat

We analyze the controversy about the level of scientific evidence that is considered adequate for regulatory authorization of health claims. In the European Union, health claims, which refer to claims about a relationship between consumption of specific food ingredients and desired health outcomes, are subject to an authorization process. Authorizations are issued by the European Food Safety Authority (EFSA) on the basis of scientific evidence. For issuing a positive opinion, EFSA demands primarily evidence from human intervention trials, with other, supportive (but never decisive) evidence supplied by animal or in vitro studies. This demand for a high level of scientific evidence has resulted in EFSA rejecting the vast majority of submissions for authorizations of claims and has led to controversy about the advantages and limitations of different scientific methodologies for data generation for nutrition research and
regulation, as well as the adequate level of evidence for decision making. Several counterpoised interests are involved: on the one hand, there is the European regulation’s aim of protecting consumers from false claims, on the other, the possible stifling of scientific-technical innovation and the further development of this market in the European Union. Our analysis shows that a fundamental issue underlies the debate: the question as to the role of non cognitive values in the selection of scientific methodologies, with the critics of EFSA’s decision making process arguing for a relaxation of the standards necessary for authorization.

Challenges of Whole Genome Sequencing
Bernhard WIESER (STS@AAU - Austria) | bernhard.wieser@aau.at
Michaela MAYRHOFER (STS@AAU - Austria) | michaela.th.mayrhofer@gmail.com

Pointing out possible inequalities resulting from the application of new technologies has become an important task for STS scholars. Especially the introduction of genetic methods into medical research and clinical practice raises important questions regarding the ways in which medical practices have changed along with technological innovation. Genetic medicine promises powerful knowledge about the health status of a person, possible risks, but also about treatment options. Meanwhile whole genome sequencing has become available at cheap rates and has already been introduced into clinical practices. It is clear that with such all-embracing technological capacity genetic examinations not only allow to identify targeted analysis, but they quite likely reveal unsought and unintended results. Dealing with such outcomes is a pressing challenge for the medical profession and the health care system at large. With the dawn of genetic medicine social scientists have addressed the danger of discrimination. Especially the insurance industry has been identified as an important area of concern. Will the identification of genetic health risks lead to the exclusion from coverage? The availability of whole genome sequencing has made these concerns ever more pressing. The outlined development will be discussed in relation to the challenges for the welfare state as a provider of an inclusive and non-discriminatory health care system.

RN24S05a - Science, Technology & Society I

Power of expertise and its challenges
Karel MÜLLER (Charles University, Faculty of Humanities, Prague, CR, Czech Republic) | karel.muller@fhs.cuni.cz

The aim of the paper is to discuss cognitive and communicative aspects of public governance of expertise and to claim that institutional reflexivity is shaping crucial trajectory for mobilization of deliberative and democratic knowledge politics. Conceptual framework will be based on brief reflection on the efforts of two relevant social science thematic fields: (i) field of S and T studies which after wide monitoring of social impact and shaping of technology could understand better evaluative changes within scientific communities and networks (Mode-2 knowledge production) and outline a perspective and context for public assessment of science as well as changing conditions on the side of (science-based) societies (a prospect for Mode-2 society), and (ii) field of innovation studies which offers wider understanding of ways, how expertise is related to different functional resources (national innovation systems) and what strategies are applied to present it in the public arena (strategies of S&T promises and of social experimentation). That said, further discussion will be focused on conditions for social experimentation and its cognitive, communicative and institutional aspects. Empirical support for the above outlined discussion will be related to two my research resources: (a) comparative study of national
innovation systems in the CEE countries, the institutional transformations of which offer a closer insight into role of institutional factors in social experimenting, and (b) the case study of public discussion about energy policy in the Czech republic which followed its cognitive and communicative resources and outlines chances for a strategy of social experimentation in terms of situated actors (including experts) and structural dependencies.

**S&T Inequalities in the Economic South: Can They Be Overcome?**
Jaime JIMÉNEZ (Universidad Nacional Autónoma de México, Mexico) | jjimen@unam.mx
Mónica VELASCO (Centro de Investigación en Geografía y Geomática “Ing. Jorge L. Tamayo”) | mvelasco_lae@yahoo.com.mx
Ramón MARÍN (Universidad Iberoamericana, campus Santa Fé) | rmarins@gmail.com

Opportunities in the economic south to study science and make a scientific career are not as wide as in the industrialized countries. Fellowships and scholarships are scarce and usually insufficient. Many scientific vocations get frustrated because of both lack of proper financial support and inadequate facilities to continuing graduate studies while holding a full time work. To counteract this a number of public university professors take advantage of some features of globalization to help non-conventional students to get a PhD degree in sciences, putting in practice an innovative way of learning and research aimed to prepare new scientists and concurrently, solve specific research problems detected by the students in their own geographic region. They created the Innovation and Educational Development Centre (Centro de Innovación y Desarrollo Educativo, CIDE). The CIDE model is an eclectic amalgam of several advanced proposals that emerge from innovative, new, and alternative education models and tools: open education, teaching at a distance, problem-based learning, individual and group learning, socialization of knowledge, intensive use of ICTs, and communication with scientists at the frontier of knowledge. The institution does not have a physical infrastructure, or laboratories, therefore the expenses for the students are minimal. This learning/research model responds to the need to make scientific research more participative, including social sectors that have a stake in the application of scientific findings. The PhD graduates obtain a good education, contribute to solve local/regional problems, and engage in “mainstream science” research networks. Could this model be expanded for the benefit of other countries?

**Statistics within the relationship between science and society: the emergence of inequalities**
Fabienne CRETTAZ VON ROTEN (University of Lausanne, Switzerland) | Fabienne.CrettazvonRoten@unil.ch

As Robert Rodriguez (2013), former president of the American Statistical Association, underlined “our society is data rich and data dependent”. Statistics are used as authoritative information, i.e. as bits of evidence used to promote a point of view and oppose challenge opponents’ claims. In the academic sphere, quantification becomes a standard feature of scientific practice and the assessment of performance relies more and more on numerical indicators. More generally, it is rare to hear a medical or economic report, to find a policy issue or to open a newspaper without being deluged by an avalanche of statistics, as we live in a statistics-rich society.
For all these reasons, statistics is becoming more and more important in the relationship between science and society. This evolution goes with tremendous hopes (i.e. statistical visualisation as the solution for scientific communication) even if this creates inequalities (part of citizens and scientists misunderstand or mistrust statistical reporting). The aim of this presentation is to document differences in knowledge of, image of and trust in statistics among
society with results of studies in Europe and Switzerland. These differences engender inequalities in health and political issues, to name a few. Awareness of these inequalities is vital to propose adapted tools to improve the relationship between statistics and society, and more generally between science and society.

The Younger, the Wiser? A Reexamination of Age-based Differences in Science Knowledge
Andreea Loredana MOLDOVAN (University of Essex, United Kingdom) | almold@essex.ac.uk

The Wellcome Trust Monitor Survey is fielded to two samples, one of adults, aged 18+, and one of young people (aged 14-18). The survey contains multiple items designed to assess science knowledge and engagement with biomedical science. The nine close-ended items analysed here have the following response options: true, false, and an explicit don't know option. Analysis of the first Monitor Survey yielded a curvilinear relationship between age and high and low levels of scientific knowledge. High scorers were lowest among those aged 65 years and over. The proportion of high scorers for the middle age groups was around three in ten (of those aged 35-49 and 50-64). For low scorers, the reverse pattern holds true, and for young people, 14-16 year olds were less likely to be high scorers than 17-18 year olds. However, these observations cannot be taken unproblematically to indicate true differences in knowledge about science between these age groups. Another possibility is that a given knowledge item has a different probability of generating a correct response from different age groups even if each age group has the same underlying level of knowledge. Moreover, the sum-score approach is the most common approach to constructing the knowledge scale. This implies recoding all the items as correct or incorrect and them summing scores up, ignoring the distinction between incorrect attempts at answering the item and saying one doesn’t know. The aim of this study is twofold. Firstly, it will evaluate the performance of the literacy items and the extent of any age-related bias. Secondly, it will attempt to study whether declared ‘don’t know’ answers to these science knowledge items differ in a substantive and meaningful way from outright incorrect responses. The results will feed into the design of the next wave of the survey but also speak more generally to the question of how to evaluate science knowledge in heterogeneous populations.

Governance of Citizen Science: a Chapter on the Old Weather
Yuwei LIN (University for the Creative Arts, United Kingdom) | ylin21@ucreative.ac.uk
Jo BATES (University of Sheffield, United Kingdom) | jo.bates@sheffield.ac.uk
Paula GOODALE (University of Sheffield, United Kingdom) | p.goodale@sheffield.ac.uk

Crowd-sourcing scientific data has become a popular strategy for solving contemporary scientific questions in recent years. The often-mentioned reasons for adopting this seemingly populist approach are to reduce the time-consuming and laborious data collection activities (economically collect timely scientific data that are otherwise costly or laborious to acquire). Such phenomenon has been termed ‘citizen science’. While there has been a growing literature on citizen science, there remains a lot of open questions regarding how such practices, and indeed ‘cultures’, are initiated, established, governed, sustained to challenge and/or enhance, shape existing cultures, hierarchies, powers in scientific fields. In the field of climate science, for example, more quality data are needed in order to understand ‘climate change’, which is a highly contested topic. It concerns not only politics but also economics. A citizen science project ‘the Old Weather’ has been initiated in order to transcribe the records in ancient ships logs and translate them into climate data. While the data collected
will be utilised for scientific purposes, the practices and surrounding cultures concern something more profound with regard to civic status, collective social actions, and collective memory. This paper will explore this observed phenomenon with regard to citizen science. It will examine the values and attitudes that citizen scientists hold dearly, the characteristics of their practices (instrumental or expressive), how such culture(s) are mobilised and constructed (e.g., how to motivate people to voluntarily participate in citizen science projects), and how they shape, challenge or enhance existing knowledge economy paradigm (focused on science-based industries and profitable knowledge) and broader social objectives already built into the EU's Lisbon Agenda and reflected in recent ERA (European Research Area) policy (e.g., networking and collaboration, gender equality, and greater European research cohesion at both regional and local levels).

RN24S05b - Science, Technology & Society II

The Internet of Things and the Possibility of the Future
Miranda Sarah Cherry BRUCE (Australian National University, Australia) | miranda.bruce@anu.edu.au

Social scientists have the onerous task of identifying inequalities brought about by technologies in the present, as well as anticipating the social impacts of emergent technologies. Though this future-oriented approach can be a critical reminder of the conditions of the present, it can also create a situation where the future is poised as little other than a space of suffering, and the present as a space of failure. This paper explores the role of “the future” in the sociological imagination and how it affects our assessment of new technologies by exploring a developing phenomenon: the Internet of Things (IoT). The IoT is an emerging technological method that promises to allow consumers and producers alike control over the “things” that populate their worlds through sensor networks, internet connection and automation. Its applicability ranges from everyday habits to global systems of industry and commerce. Beyond this, the IoT’s mode of understanding the physical and digital worlds makes radical claims to technological neutrality, objectivity and connectability between previously unconnected things. I argue that the IoT demands a critical appreciation of its capacity to create new forms of understanding, which may reproduce social inequalities but may also bring into being more ambivalent, and even positive, forms of differentiation. This paper uses sociological theories of time and technology to read the IoT productively, exploring its present status and what it can tell us about the role of the social sciences in a rapidly changing world.

Shaping Network Innovation Through Knowledge Transference
Paula URZE (FCT/UNL, Faculdade de Ciências e Tecnologia, Universidade Nova de Lisboa; CIUHCT) | pcu@fct.unl.pt

“Social innovation in the workplace” and its impacts on social, economic and labour markets is widely acknowledged among European policymakers as an important endeavour. The concept of workplace innovation is mainly focused on shaping work organization by combining human, organizational and technological dimensions (Dortmund/Brussels 2012). Furthermore, it aims to persuade stakeholders to commit to process changes with the goal of establishing win-win relationships as a facilitator to promote collaboration, which is able to improve worker autonomy, while adapting to the new models that are emerging as a result of the innovation processes. (EU DG Enterprise and Industry, 2012) As argued by Pot, Dhondt & Oeij, 2012 “workplace innovation is about open dialogue, knowledge sharing, experimentation and learning in which
diverse stakeholders (…) are given a voice in the creation of new models of collaboration and new social relationships”. One possible approach is to consider knowledge as a key support to workplace innovation research as it ranks first in the hierarchy of strategically relevant organizational resources. This paper - based on an on-going project - aims to assess knowledge produced and transferred, and the participation model, considering both a network and stakeholders perspectives. It also considers innovation capabilities and the way work is designed within networks bearing in mind they involve companies, universities and start-ups. The research is based on an extended case study of the largest Portuguese motorway; it is grounded on two main projects developed by the company. Empirical data stems from two main sources: in-depth interviews and a brief survey, applied to all members of the network.

**Regulating the status of contentious science and scientific research. The case of genetic engineering in Poland.**

Iwona ZIELIŃSKA (Academy of Special Education, Poland) | izielinska@aps.edu.pl

Recently a new amendment to GMO Act has been introduced by the Polish parliament, regulating GMO research. It states that all work in the field of genetic engineering, even the one carried out by medicine or biology students in their lab classes, have to be done exclusively in special labs and need to be authorized by the Ministry of the Environment. Scientists claim that working in the field of genetic engineering does not involve any danger. The threat may appear only when genetic engineering is used in relation to pathogenic viruses or bacteria, but even then the risk is not engineering itself (the method), but a virus or bacterium (the material). There are still many controversies regarding GMO, and a lot of public pressure to regulate its status. So the question arise, how scientific activities become regulated in such situations? The main purpose of the paper is to look at the basis on which the new amendment on GMO/ GMM has been introduced in Poland. To what extend was it informed by scientific and expert knowledge (and who were the experts, if so), and to what on insufficient data or deliberate omission of information? Did the anxieties expressed by the public and anti-GMO organizations played a role? Does the new Act function as precaution, used until more certainty is available, or perhaps - ignorance was employed as a deliberate action strategy? The paper aims at providing answers to these questions by re-tracing the course of the legislative work on the amendment regulating genetic engineering.

**‘The household junction’: Households as friction zones in infrastructure transitions**

Harald ROHRACHER (Linköping University, Sweden) | harald.rohracher@liu.se

Urban infrastructures such as electricity, heat and transport systems are becoming increasingly interdependent, particularly under the pressure of moving towards more efficient and sustainable configurations. This integration is related to different factors such as an increasing ‘electrification’ of infrastructures (electro-mobility in transport, heat-pumps in highly energy-efficient buildings, microgeneration), and the increasing capacity of information technologies to manage load shifts, demand and distributed energy generation across different infra-structures. Managing the coupling and interaction of these systems, however, is only to some extent happening at the technical level. Much more, these couplings depend on social practices and activities of infrastructure users in households (and industry, which is not in the focus of this paper). Households thus constitute a critical junction for the interlinkage of infrastructures as they are the sites for coordinating demand (how and when are infrastructures used?) with – sometimes contradictory - requirements of managing the supply-side load of electricity, heat,
electro-mobility and micro-generation. Concepts emerging in this context, such as ‘smart grids’, ‘smart homes’, the integration of private electromobiles into the electricity system and microgeneration, place all kinds of demands and expectations on the practices of infrastructure use by household members.

The main aim of this paper is to think and reconsider the transition, interlinkage and management of future urban infrastructures through the perspective of its users. The hypothesis is that the opportunities and tensions created at this junction of infrastructures are an important source of systemic innovation processes towards future infrastructures and at the same time link infrastructure change with broader socio-political and institutional questions: Are the requirements and capacities of monitoring and control coming along with some concepts of sustainable infrastructures moving us increasingly towards a ‘surveillance society’? Are these new types of infrastructure creating new boundaries of inclusion and exclusion? Is the demand for active users and prosumers at the centre of many of these concepts a new way of enrolling and integrating users into corporate demands? Is the household at the same time a potential arena to resist, negotiate or reframe such requests? Speaking of households as an innovation junction thus not only relates to new socio-technical configurations to manage infrastructure integration (such as ‘smart homes’), but also refers to households as a site of possible reframings and recontextualisation of infrastructure innovations.

Conceptually this paper will build on the work of Ruth Schwarz Cowen on ‘consumption junctions’ (1987) where she takes an ‘inside-out’ perspective on technical networks and choices of artefacts and puts emphasis on the network of social relations consumers and households are embedded in; Onno De Wit, Johan Schot et al. (2002) on offices as innovation junctions due to the collocation of different sets of technologies and the need to find arrangements to coordinate them; and bottom-up perspectives on sustainability transitions (Jorgensen 2012, Jensen 2013 and others) which adopt a social arena perspective where different framings and perspectives on transitions come together in one arena such as households where pro cesses of sense-making and conflict negotiation take place. Empirically I will use interview and focus group data on smart homes and microgeneration in Austria and Sweden.

In the longer term this perspective on infrastructure integration through the lense of households shall also allow a more systematic comparisons of different urban pathways and styles of infrastructure integration, strategies to govern such change processes and the role of conflicts and controversies at the level of households shaping such infrastructure transitions.

**RN24S06 - Gender Inequalities in S&T I**

**Shifting organizational logics, research performance and gender inequality**

Marcela LINKOVA (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | marcela.linkova@soc.cas.cz

At the country level research assessment was introduced in the Czech Republic in 2004; gradually, research institutes and universities, too, have started introducing institutional assessment systems of research groups and researchers (Linkova & Stockelova 2012; Linková 2014). The introduction of these various assessment systems is an attendant feature of growing competition in the research system overall, tied to the growing volumes of funding distributed competitively and changes in the organization of research careers and research groups. These changes in the organization of research teams and institutes have been analyzed in terms of a shift from a dynastic to a dynamic lab and organization, revolving around short-termism, flexibility, mobility, and precarity, with clear gendered impacts (Linková & Červinková 2013; Linková 2014).
In this paper I will draw on two projects I am currently engaged in, aimed to promote gender equality at two academic institutions in the Czech Republic. I will examine the gendered outcomes of the gradual shift toward the dynamic mode of organizing currently underway. While research assessment is contingent, contextual, and serves diverse needs, the shift in the organizational logics, I will argue, creates new gendered imaginaries and necessitates practices which women and men researchers and top management perceive as gendered. I contend that this organizational shift, together with the neoconservative turn in post-1989 social policy, is creating new points of exit, particularly for early-career women researchers. With the paper I wish to contribute to understanding why gender inequality in academia may persist despite actions to mitigate it.

Bibliography

'We are all the same’: Typologies of masculinities and femininities in academic organisations
Pat O’CONNOR (University of Limerick, Ireland, Ireland) | Pat.oconnor@ul.ie
Clare O’ HAGAN (University of Limerick, Ireland, Ireland) | Clare.ohagan@ul.ie

Among academics employed in science and technology it is widely assumed that gender makes no difference (Rhoton, 2011). Thus it is assumed that academic careers are open to talented individuals, regardless of gender (or indeed race or class). O’Connor and O’Hagan (2015) developed a typology of masculinities, using axes of relational and career commitment (with respondents classified as strong or weak on each dimension). While it was possible to identify academic men in each type, all of the types reflect the persistence of an underlying system of male privileging in the changing landscape of higher education. As the typology moved beyond hegemonic masculinity (Connell, 1995) it is at least theoretically possible that it might be possible to locate female scientists on it.

Drawing on a qualitative study (n=29) involving interviews with men and women at early, mid and senior levels in one university, this paper looks at the issues raised by an attempt to locate female scientists on this typology of masculinities. In addition to highlighting the issues raised by doing this, the paper will also explore women’s perception of as well as their attitudes to the persistence of the patriarchal dividend (Connell, 1987). This typology is seen as potentially having implications for theories and practices of motivation and management in academic organizations, while also challenging assumptions about the gender neutral nature of academic organisations and STEM careers.

Doing action research in STEM research and academia: what are the possibilities for addressing gender inequality in higher education contexts?
Sarah BARNARD (Loughborough University, United Kingdom) | S.H.Barnard@lboro.ac.uk
Tarek HASSAN (Loughborough University, United Kingdom) | T.Hassan@lboro.ac.uk
Andy DAINTY (Loughborough University, United Kingdom) | A.R.J.Dainty@lboro.ac.uk
Barbara BAGILHOLE (Loughborough University, United Kingdom) | B.M.Bagilhole@lboro.ac.uk
Higher Education Institutions represent a particular context for advancement of knowledge and contribution to progress at a societal level. As organisations the potential for innovation is immense. However, even with advances in women's academic achievement in education at all levels, women are still under represented and under achieving in academia – particularly when we look higher in the hierarchy - at Professor positions and senior university management. This is exacerbated by an underrepresentation of women in particular disciplines in higher education, especially within the science, technological, engineering and mathematical (STEM) subject areas. There is a will at European and national level to confront this issue, which is apparent in the direction of European Commissions’ focus on gender as a cross-cutting issue in Horizon 2020, and in the UK with the success of the Athena Swan Charter. In both cases, action is encouraged and supported. This paper will outline the progress in an on-going action research project in an engineering school at a UK university that has a focus on supporting and developing female research staff and academics through institutional change. The purpose of the paper is to explore challenges and successes and reflect upon the possibilities for addressing gender inequality in higher education contexts.

Inequality of Educational Opportunity (IEO) and Changing Gender Relations in Expansive Higher Education - Some findings among Finnish university students and professors
Juha Petri Erik HEDMAN (University of Turku, Finland) | juhedman@utu.fi
Osmo Tapio KIVINEN (University of Turku, Finland) | oskivi@utu.fi
Linda Karoliina JÄRVINEN (University of Turku, Finland) | likata@utu.fi

In most countries the expansion of higher education has entailed a shift from a male-dominated elite university towards a mass HE system yielding more opportunities for both ’middle classes’ and women to participate in higher education and, consequently, to enter labour market positions requiring a HE degree (Kivinen, Hedman and Kaipainen 2007; cf. DiPrete & Buchmann 2013: 47-50). As concerns IEO in Finland, the differences in participation in university education between the offspring of university-educated and non-university-educated parents have narrowed from the odds ratio value 19 in 1970 to 7 in 2010; respective change among men from 32 to 8 and among women from 13 to 7. (Kivinen, Hedman and Kaipainen 2012) When non-university sector is included, the Finnish HE as a whole has the lowest degree of IEO (odds ratio 1.4) among OECD countries (OECD 2014).

Women’s university enrolment as well as graduation in Finland surpassed that of men in 1980’s. Today from 25-44-year-old women more than half holds a HE degree, while men’s respective figure is about third. Currently Finland has OECD’s highest gender difference in HE attainment in favor of women (Kivinen, Hedman and Kaipainen 2014).

As concerns professors, in 1980’s less than one tenth from (full) professors were women but in 2010’s the respective figure is one fourth. The paper examines changing gender relations in publishing activities of professors in eight largest disciplines within Finnish universities. The analyses reveal specific patterns in publishing activities of female (vs. male) professors in female (vs. male) majority disciplines.

Gender differentiation in post-socialist commercial R&D
Katarina PRPIC (Independent researcher, Croatia) | katarina@idi.hr

Numerous studies of gender inequality in science and technology (S&T) as well as its well-known meta-analysis (EC 2012) usually find private research sector as the most difficult one for women researchers’ entrance and professional advance. However, social and regional specificities, especially post-socialist contexts of gender issues in S&T are neglected in many
studies (Šidlauskienė, 2009). Moreover, the main approaches to gender issues are criticised for emphasising professional differences and ignoring similarities between female and male researchers (Bernard et al., 2010). A more complex approach should take into account both gender (in)equalities in R&D and their socio-economic, techno-scientific and socio-cultural context. Thus it is worth exploring whether relatively high share (over 40%) of women researchers in Croatian business R&D announces gender revolution in S&T hypothesized by Etzkowitz et al. (2010) or rather conceals deeper gender inequalities. Due to the drastically reduced R&D activity of Croatian economy in transitional period, studies on gender issues were focused on public research sectors (Prpić, 2002, 2009) or at best on the technological activities of female academics (Lažnjak et al., 2011). Recently, broader empirical picture of gender inequalities in Croatian industrial research could be derived from comprehensive online study of a sample of 245 researchers from registered R&D organizations and units. Respondents' professional profile and performance were explored by a web questionnaire, while Pirola-Merlo’s (2000) questionnaire was applied to examine organizational support to innovation. Therefore not only what is similar or different in men’s and women’s achievements can be revealed, but also whether organizational support has impact on gender differentiation in business R&D as often presumed.

RN24S07 - Health, Bio-medicine & Social Context II

Hacking the Self – An Ethnographic Study of Finnish “Quantified Self” Practitioners
Harley Arne Mikael BERGROTH (University of Turku, Finland) | hamber@utu.fi

This paper explores an activity called Quantified Self, which refers to measuring and optimizing the human body through data collected by various kinds of (smart) devices and applications. My main interest is to investigate how self-tracking and self-optimization as therapeutic technologies of the self relate to body politics and contemporary bodily norms in the everyday lives and experiences of Finnish Quantified Self practitioners. Over the past decades it has been noted how individuals in western societies have increasingly engaged in ritualized self-surveillance as a part of health-conscious and efficiency-driven lifestyles. This development has boosted the markets for wearable technology that allows users to track various aspects of their daily lives. For many Finnish Quantified Self practitioners data is seemingly objective means to achieve a better, upgraded body and self in a technical as well as in a moral sense. However, through design technology is necessarily imbued with politics and thus not separate from formations of social inequalities. This paper is a part of my PhD project, which is a multi-sited ethnographic study of biohacking and technology-mediated body modification practices. Theoretically I will draw from foucauldian power analytics, STS and sociology of the body. In addition to the discursive dimensions of social dominance and resistance I am interested in the materiality of therapeutic technologies of the self and the formation(s) of sociality and inequality in and through the “Internet of humans and things”.

Globalization of hyperactivity in Poland. The emerging of psychiatric disorder definition in the semi-peripheral regimes of knowledge.
Michał WRÓBLEWSKI (Nicolaus Copernicus University, Poland) | mich.wrob@gmail.com
ADHD is a psychiatric disorder, one of the most common disorders among children and adolescents, especially in United States of America. During last 20 years it became very popular topic for scientific, medical and popular discourse. Recently Peter Conrad and Meredith R. Begey (2014) showed that the biomedical definition of the disorder is being globalized through several channels: diagnostic criteria, Internet, transnational pharmaceutical industry and advocacy groups. In my paper I want to show how this process works in Poland. In first part, I will focus on areas where biomedical definition of ADHD is being shifted from US context to Polish context, in way that is characteristic to semi-peripheral context, namely the reproduction on knowledge, not the original production. I'll briefly discuss such phenomenon as: popular scientific books on ADHD addressed to parents, Internet advocacy groups which discuss ADHD related topics using expert knowledge, social controversies on ADHD. In the second part I will present results of scientific discourse analysis, namely the Polish psychiatric scientific journals. My research question was: was there the overrepresentation of biomedical definition of ADHD in last 25 years in the field of psychiatry? Do Polish studies on ADHD are original studies or do they just reproduce foreign research? Is Polish psychiatry is a field original and independent to American influence, or the opposite – it adopts US trends?

**Biomedicalized Stratification of Reproduction: Whom can(‘t) be matched with whom in British egg donation**

Priya DAVDA (Royal Holloway, University of London, United Kingdom) | p.davda@rhul.ac.uk

The stratification of reproduction refers to the ways in which reproduction and parenting is differentiated, and differently valued, according to cleavages of sexuality, class, race/ethnicity and disability (Cohen, 1989). In the new reproductive technologies, scholarship has traditionally focused on inequalities in individuals’ access to treatment and parenthood, so that certain categories of individuals are encouraged/enabled to reproduce, while other categories of individuals are discouraged/restricted from reproducing or parenting (Ginsburg and Rapp, 1995). One pertinent area that has received little empirical attention in the UK is that of clinic-mediated matching in egg donation, i.e. matching as a mechanism for clinicians to allocate particular donors to particular recipients, thereby determining whether patients are ultimately treated. Within gamete donation, donor-recipient matching practices can provide another layer to stratified reproduction, by virtue of whom may (or may not) be matched with whom, whereby some types of family are encouraged to be reproduced, whilst other types of families are avoided (Skupinski-Quiroga, 2007). Based on ethnographic observations and interviews with medical staff and patients, I will report preliminary findings from my doctoral thesis in 2 private fertility clinics in England to explore to what extent the theoretical framework of (bio)medical stratification can help to explain beliefs and practices of donor-recipient matching, and what an analysis of matching can contribute to existing frameworks of reproductive stratification.

**The uses of Quantified Self in a society of multiple temporalities: towards human optimisation?**

Julien ONNO (Université de Caen Basse-Normandie, France) | julien.onno14@gmail.com

We propose in this presentation to examine the relationship between multiple social temporalities and forms of human optimisation provided by developments in information and communication technology. Our approach is based on a sociology of social times and a sociology of the uses of technology. Time, although appearing to be a natural phenomenon, is an integration process of a series of activity periods which has become progressively more complex. It is a social construction and a learning process that people use to coordinate their actions. But rapid social change due to technological upheaval underlines the fragility of our
We can therefore identify a social acceleration that is fragmenting social times. Consumption seems to be caught in an accelerating spiral and individuals face seeing everyday objects in their life become quickly outdated. Technological innovations are causing rapid disruption of the social landscape. In this context, individuals subjected to continual pressure to raise their performance, seek to follow, to anticipate, to take ownership of or to surpass this acceleration. We shall therefore be concerned with outlining the practices and uses of Quantified Self. This particular type of data gathering raises questions in several areas and can be viewed as a form of social "self-control" and as a range of practices that aims to objectivise biological data in order to integrate them into a life course. This willingness to optimise health is also linked with sharing personal information on social media.

Rethinking donated blood with an ontological approach: mapping out the flow of Flemish donor-blood and its multiple enactments in practice
Emmeline VANDEPUTTE (Ghent University, Belgium) | emmeline.vandeputte@ugent.be
Lesley HUSTINX (Ghent University, Belgium) | emmeline.vandeputte@ugent.be
Michiel DE KROM (Ghent University, Belgium) | emmeline.vandeputte@ugent.be

While public policies advocate national blood-donation systems based on voluntary non-remunerated donation, current scholarship has questioned the contemporary relevance of this gift-model. Technical innovations, such as blood-fractioning, allow a donated blood-unit to be broken down into different components that can be used for multiple purposes, ranging from transfusion medicine over the manufacturing of plasma-derived medicinal products to human genome research in both public and private bio-industrial contexts. As techno-scientific processing renders blood an increasing bio-value after donation, non-economic blood-donation has been integrated in a global network of bio-economic relations. This has urged scholars to reflect on the shifting meanings and values of blood and blood-donation within a globalized blood-economy.

This paper contrasts different conceptualizations of donor-blood in social science research on blood-donation. While some authors stress the metaphorical, moral or social value of donated blood, others argue that the techno-scientific and partially marketized deployment of donor-blood turned it into a bulk-commodity and that, subsequently, a volunteer-based system for blood collection is outdated. Taking these divergent perspectives into account, this paper suggests an ontological approach towards the materiality of blood and its multiple meanings and values. By mapping out the flow of Flemish donor-blood, we explore where and how different ontologies of blood are enacted in practice. The Flemish Red Cross blood-bank is thereby identified as a strategic site in the co-ordination of different practice-specific enactments of blood, bracketing out conflicting versions of donor-blood in their communication towards (potential) voluntary non-remunerated donors on blood-donation as ‘a gift of life’.

RN24S08 - Researchers’ Professional Perspectives in Academic Science II

How accessible is the Professorship for Social Risers?
Christina MÖLLER (University of Paderborn, Germany) | christina.moeller@uni-paderborn.de

The social origin of Professorship belongs to the inadequately researched topics in international sociological science. So I questioned 1.340 professors in Germany about their social origin. According to the thesis of Pierre Bourdieu about the cultural coherence between the families’
capitals, requirements of higher education and the scientific career the study deals with an analysis of the relationship between the social origin and the location (including discipline and status) of the professorship, as well as the sex and ‘race’.

The results can be related to other findings of the empirical educational research, which confirm a close relationship between the attainment of high education status and a privileged social background. 34% of the professors derive from the highest and only 11% from the lowest background group. Accordingly much more persons from privileged socio-economic families have reached a professorship.

Time analysis shows that self-recruitment has intensified over the last twenty years through the increased appointment of incumbents from the highest society-groups, indicating a trend of social closure. Furthermore a statistically significant relationship between the social background and other variables like the disciplines, the status of the professorship, the sex and the ‘race’ shows that the social origin of the incumbents is very differentiated. F.e. higher concentrations of social risers are found in the Social Sciences. Therefore I come to the conclusion that Universities can be seen as socially highly differentiated organizations offering dissimilar possibilities for social risers.

Research excellence and university differentiation: Institutional strategies and organizational responses in Spanish Universities
Alberto BENITEZ-AMADO (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Alberto.Benitez@csic.es
Laura CRUZ-CASTRO (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Laura.Cruz@csic.es
Manuel PEREIRA-PUGA (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Manuel.Pereira@csic.es
Luis SANZ-MENENDEZ (CSIC-IPP- Consejo Superior de Investigaciones Cientificas, Spain) | Luis.Sanz@csic.es

European Research Council (ERC) grants have become, in addition to a mechanism of funding research projects, reputational assets for researchers and for host institutions. Universities and Research Organizations have started a competition for attracting and recruiting ERC grantees. Organizational strategies and initiatives for attracting and recruiting scientific talent are conditioned by institutional capabilities and organizational features; those factors among others, such as the initial conditions of the competing organizations, influence the outcomes and results of this new type of competition.

The aim of this paper is to explore and analyze which institutional and organizational conditions favour the attraction and recruitment of scientific talent in the context of the European Research Council funding schemes and in that way to analyze differentiation and inequalities in higher education institutions.

First results show that most of the Spanish universities have a limited capability to advance strategic objectives; they lack a coherent institutional strategy to succeed in these new forms of competition for talent and when they have it, in most cases, those strategies are mainly rhetorical. The governance model and the path depend academic coalitions at universities seem to influence negatively on opportunities to develop collectives strategies to compete in the European environment. When we found cases of relative success in attracting and recruiting talent and ERC grantees that seems to be related with the role of some specific scientific preconditions, strong leadership and regional environmental advantages. Then, it appears that transforming the negative feedbacks between interests and institutions can only be locally changed in presence of strong transformative leadership.
“Better not to think about it”? – Some remarks on career strategies of young researchers in Germany

Oliver BERLI (University of Cologne, Germany) | oberli@uni-koeln.de
Julia REUTER (University of Cologne, Germany) | j.reuter@uni-koeln.de

With the current discussion on the legitimacy of fixed-term contracts for researchers in Germany, the working conditions of scientists in general are in the focus of interest again. Most actors in the areas of higher education research and politics agree upon the evaluation that scientific careers are risky and cannot be planned. The fact that there are almost no permanent positions below the level of full professorship makes the situation of young researchers even worse. Of course, many young researchers are well aware of these problems. This raises the following questions: Why are they nonetheless aiming for a career in academia and how do they do it?

In contrast to higher education research and politics that tend to discuss scientific careers in terms of performance indicators, such as publication output, we focus our research on the scientists themselves and the logics of the academic field. Using qualitative data from an empirical research project funded by the German Federal Ministry of Education and Research (BMBF) on job biographies of up-and-coming researchers in different disciplines and career stages, we want to reconstruct (a) strategies for dealing with specific conditions of given career paths. This also calls for a closer look at (b) the interviewees’ own interpretations of relevant career conditions. Finally, a special focus is placed on (c) the role of trust in scientific careers. Specifically, we look at the ways trust may help scientists to get through uncertain phases relating to job security and the low probability of succeeding in academia.

Recently graduated doctors. What does it matter for recruitment in a local-global context?

Carolina PINTO (Universidad de Viña del Mar, Chile) | carolina.pinto@facso.cl
Javiera CORREA (Universidad de Chile, Chile) | javiera.correa.u@gmail.com

The speech about “the knowledge society” produces concrete effects on the labour of states, universities and international research entities. These institutions carry on partial incentive programmes and mark a clear link between professional training, scientific development, and economic growth. To this end, the sociological approach allows restoration to social complexity that characterises knowledge production. Based on this principle, this investigation explores the career of young researchers who have recently obtained a doctoral degree, and are involved in the world of investigation in Chile. Using the theoretical contributions of Michel Callon, Bruno Latour and Pierre Bordieu, among others, the results show the importance of three elements for recruiting: local scientists’ networks or social capital, publications and international collaborations.

Considering that half of the interviewers completed their PhD in Europe or the United States, the article allows to look at the scales of underlying values to the international scientific production from a western order. Using a qualitative perspective, the investigation is based on 27 biographic interviews to young Chilean researchers that finished their studies between 2009 and 2011 in Chilean and abroad universities.
Gender equality in science and research – challenges for policy development and evaluation
Angela WROBLEWSKI (Institute for Advanced Studies, Austria) | wroblews@ihs.ac.at

Gender equality has been a goal in European science and research policies for more than 15 years now. While in the beginning policies focused on the underrepresentation of women meanwhile a complex equality goal is implemented at European level (e.g. ERA, Horizon 2020, RRI) as well as in most European countries. Hence gender equality policies address three main levels:
• Integration of women in all fields and at all levels in research and innovation (reduction of horizontal and vertical segregation)
• Promoting women’s careers in research and innovation through a structural change of institutions
• Integration of gender in the content of research and innovation so that women’s needs and interests are adequately addressed.
To pursue these goals effectively it is necessary to address them simultaneously through policies. This is a challenge for policy development, implementation of programs as well as their monitoring and evaluation. Experiences with equality policies show that even successfully implemented policies in most cases address only one dimension and have only limited effect on the other dimensions. Furthermore established monitoring and evaluation approaches focus on quantitative indicators which allow analyzing female participation in science and research but do not adequately display the other dimensions which call for supplementary qualitative indicators and process oriented indicators.
The presentation starts by discussing reasons for the limited effect of equality policies referring to in-depth evaluations studies. Based on that, requirements for innovative and reflexive gender equality policies as well as their monitoring and evaluation will be discussed.

Academic couples, parenthood and women´s careers in the context of Czech academic environment
Marta VOHLÍDALOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | marta.vohlidalova@soc.cas.cz

Wide majority of academics and especially women academics lives in dual-career partnerships and a lot of them have a partner who is either academic or other professional. Given the nature and demands of academic work dual-career academic couples have to face extreme conflicting pressures and demands of (academic) labour market and private/family life. In my paper I will focus on academic couples and their strategies for combination of work and care. I will ask how these strategies influence career paths of academics, and especially women academics. My analysis is based on 16 joined in-depth interviews with Czech academic couples including couples form different research domains and generations. I identified two types of academic partnerships, which differed in ways of combination of work and care as well as his and her career (including academic mobility): traditional couples and egalitarian couples. I conclude that gender ideologies of academic couples play very important role for women's careers. Regardless of the institutional conditions of academic careers and work-life balance, the analysis showed that parenting has different effects on the careers of women academics living in different types of partnerships.

The unbearable easiness of television? Technology, (smart) TV and gender in Poland
Bogumila MATEJA-JAWORSKA (Adam Mickiewicz University, Poland) | bmateja@amu.edu.pl

The current status of television seems to be particularly interesting because of rapid transformations of the mediascape in the last two decades. In the age of convergence, this allegedly obsolete medium has been undergoing changes regarding technology, business models, contents, viewers’ habits etc. In the proposed presentation the emphasis would be put on the relations between technological changes and the viewers’ reaction to them, based on the qualitative and quantitative research conducted in Poland. As the outcomes of the study reveals, TV’s technological progress has improved the social status of the medium. However, it turned out that the process is also full of ambiguities - three of which are particularly worth discussing. First of all, one may claim that TV’s technological progress embodies the exact opposite of the trends characteristic for contemporary western culture – it is not mobile, it is getting bigger, not smaller, and it is often shared with others (it is not personal in contrast to computers or smartphones). The reasons and consequences of this phenomenon are sociologically significant and worth explaining. Secondly, a large group of people perceive technological advancement of TV rather as a nuisance than a desirable object, rejecting most of the new functionalities. Thirdly, in spite of some criticism towards studying gender and media technology (see: Gauntlett, Hill [1999] about classic studies of Gray [1987] and Morley [1986]), the research in Poland shows that the differences between men and women and their attitude towards new TV technologies are still noticeable.

Gender Inequalities of Young Researchers’ Career Rewarding Networks
Marija BRAJDIC VUKOVIC (University of Zagreb, Croatia) | mbvukovic@hrstud.hr

The paper intended for conference presentation focuses on professionally rewarding young researchers’ egocentric networks. It does so through analyses of differences in network structure and career related outcomes of male and female researchers. Data about professionally rewarding egocentric networks are obtained through the on-line questionnaire on the representative sample of 240 Croatian young researchers (in terms of academic age) from all academic disciplines. Through analysis, this paper tries to discern more about the functioning of disciplines and institutions in which those networks are embedded. Findings of the core-networks structure characteristics are analyzed in the context of productivity and PhD thesis completion of young researchers in order to better understand the “success” or “appropriateness” of the types of networks that support young researchers professionally. All these results are analyzed in the context of gender differences, showing how gender plays an important role in all academic disciplines, not just in terms of network structure but also in terms of network related career outcomes.

RN24S10 - Science, Technology & Society III

Hacking collective as a trading zone
Marcin ZARÓD (University of Warsaw, Poland) | marcin.zarod@gmail.com

Development in computing resulted in creation of various communities devoted to non-formal computer science and engineering practices. The paper examines Polish hackers, defined as legal part of computer subcultures and compares results of studies from domestic and abroad group. It applies actor-network theory [1] as a methodology framework and combines it with other concepts from science and technology studies. In result, “traditional” social studies of hackers
are combined (e.g. Joss Winn’s [2] and Gabriela Coleman’s [3]) with ideas of Peter Galison[4] and Susan Leigh Star[5]. It shows that liberal interpretation of hacking culture could be extended into wider, technopolitical understaning. In other words, it mixes political and technological descriptions, showing hackerspaces and hackers as trading zones, with different interactions on different levels and stabilities.

The paper will discuss results from ethnographical study of hacking communities, done in Central-Eastern Europe, showing how non-formal communities oppose formal science and engineering practices. It will also show how such opposition might contribute to sustaining deficiencies in formal actants.

First type of trading zone is non-required one, where hackerspace only catalyzes already existing routes of translation. Second type occurs where hackers take some of the responsibilities of formal education and engineering networks, both as a form of criticism and stabilization of existing networks. Third type of trading zone is where casual interactions within the hackerspace are translated outside the original collective.

In the last part of the presentation I will show how such translations affect non-hacking institutions. I will also discuss how studies of hackers could contribute to engaged STS programme [6].

Airport security assemblage. Public/private contradictions and techno-organizational change
Chiara BASSETTI (Consiglio Nazionale delle Ricerche, Italy; University of Trento, Italy) | chiara.bassetti@istc.cnr.it

The contribution stems from the ethnographic research I conducted for about two years at an Italian international airport, focusing in particular on security, border control and surveillance. Data include fieldnotes, interviews with security guards and policemen, and video-recordings.

On such a basis, I will first discuss the contradictions in place between public security logics/goals and private business ones. Guards’ job is to be accurate and thorough, yet they should provide a nice, possibly brief experience for airport customers. Detection and flow are two conflicting pressures. Security procedures are differently regarded by airport management, security personnel, and public decision-makers. This is further complicated by guards being employees of a private security firm and yet serving as “public officers” (under the police supervision) in the context of airport security.

Second, taking Threat Image Projection (TIP) as example, I will focus on public/private contradictions with specific respect to techno-organizational change. TIP allows exposing guards to artificial but realistic x-ray images during the routine screening, the purposes being
attention enhancement, on-the-job training and performance assessment. As I will show, the features of the library of fictitious images (number, difficulty, represented object category, etc.) and the frequency of its update are of utmost relevance for TIP effectiveness as well as for guards’ everyday work practices. Yet most of such decisions are taken by the private company in charge of x-ray machines and related software. And the publicly funded studies on such matters have been few and only experimental.

“Access Denied”: Resources and Inequalities in IT Sphere
Lilija ZEMNUKHOVA (European University at St.Petersburg, Russian Federation; Sociological Institute at the Russian Academy of Sciences, Russian Federation) | l.zemnukhova@gmail.com

The professional sphere of information technology deals equally with science, technology, and innovations. IT sphere develops at the interfaces between academy and industry, a potential birthplace of innovations. This is where the main contradiction appears in Russian context: academy-industry interplay transformed inequality in access to the major resources for science and technology at various times. Soviet academy used to be a state monopolist in producing science and technology for a long time. After the collapse of the Soviet Union, many scientists and engineers either emigrated, or left academic careers in search of better facilities and salaries. The establishing of IT market in Russia caused a new type of inequality based on access to technology and innovative production; moreover, IT companies partly became in charge of scientific research. Despite the official policy on IT-development and ecosystem building, the gap between academy and industry still affects professional training and rises inequality in access to technological resources. The question is how professional community self-organises to resolve this conflict and to overcome basic inequalities within the sphere. The research is based on the interviews with Russian IT professionals and Computer Scientists as well as analysis of practical cases of knowledge or skills translation, and technology transfer. One of the major answer is that the community initiates its own education platforms and conducts industry-academy cooperation through personal ties and contacts. These networks help to redefine and to smooth out internal inequality, but reinforce it outside of IT sphere.

The Emergent Regime of Security Technologies: Innovation, Inequalities, and non-intended Impacts
Georgios KOLLIARAKIS (University of Frankfurt, Germany) | kolliarakis@soz.uni-frankfurt.de

The past decade experienced the rise of national and EU-wide security research programmes, not least as a reaction to terrorist attacks in European territory. This development has been premised upon the emergence of a new paradigm for “public” or “civil” security, in analogy to the US “homeland” security. The present paper maps the organisational ecology of that new research strain, and examines how certain influential industrial players have taken the security agenda captive. Firstly, in terms of actors, the traditional defense industry, small and middle-sized high-tech enterprises, as well as big critical infrastructure operators dominate over universities, particularly social sciences, and non-governmental or civil society organisations in setting the agenda of security R&D. Secondly, in terms of agenda, this is reflected in the mismatch between the “technical solutionism” of the research programmes, focusing predominantly upon surveillance, remote recognition, and pattern detection technologies on the one side, and the comprehensive societal insecurities, such as socio-economic disparities and radicalization, addressed on the other. Thirdly, in terms of epistemic frames, research-to-market as well as growth-driven innovation mantras distract from asking whether security technologies are fit-for-purpose, or whether they have non-intended and non-anticipated negative impacts,
such as discrimination of minorities, or infringement of fundamental rights. The paper argues that assessments and evaluations in the exceptionally value-laden and contentious field of security research ought to explicitly align policy frameworks along criteria for more responsible, accountable, and responsive technology R&D in order to minimize long-term misfire and backfire effects in society.

**Challenging Orthodoxies in Digital Inequality: young people’s practices online**

Huw DAVIES (University of Southampton, United Kingdom) | hcd1910@soton.ac.uk  
Susan HALFORD (University of Southampton, United Kingdom) | susan.halford@soton.ac.uk

This paper showcases a comparative study of young people from two very different educational communities: a top private school in central London (with a wealthy multi-ethnic intake) and a vocational college in a white working class area of England’s south coast. A range of uniquely innovative digital methods and traditional qualitative techniques were used to investigate how the research cohort used the Web (particularly its online encyclopaedias, social networks, and search engines) to inform themselves about highly politicised and contested topics such as immigration. By operationalising the sociological youth (a competent social actor who is able to reflect on his/her practices) this research challenges the current orthodoxy in relation to digital inequality which mistrusts young people and divides them into binary categories such as skilled and unskilled. The innovative research methods afforded the opportunity to compare self-reported practices with more objective observational data from web proxy servers, history files, and search engine queries. The data shows how young people’s Web practices intersect with their education, social class, gender, and ethnicity to shape their political views. The analysis reveals the tensions between how young people want to use the Web; how they have learnt to use it; how they have been taught to use it; how they have been allowed to use it; and how these tensions are played-out in context of their contingent social reality. The study’s findings suggest we need to rethink our approach to digital inequality otherwise future technical and educational interventions could be ineffective or indeed counterproductive.

**JS_RN24+RN33a - Gender Inequalities and Differences in (Non)Academic Research Careers**

**Academic and Family-life Careers in a Gender Perspective: institutional, cultural and political bias. The outcomes of a survey at the University of Florence.**

Laura LEONARDI (University of Florence, Italy) | laura.leonardi@unifi.it

This contribution presents original findings from an empirical research aiming at analyzing the gender inequalities in scientific and teaching careers in the Italian Universities, focusing on the case-study of the University of Florence. The research moves from the existence of gender-based barriers to the recruitment, career progression, and imbalances in decision making processes. The surveying technique adopted in the study is the Computer-assisted web interviewing (CAWI). This technique allowed us to collect data from a sample of more than 800 researchers and teachers working at the University of Florence. The methodology chosen for the study is the "Event history analysis". The objective was to reconstruct the characteristics of the respondents, of their partners, and of the meaningful events characterizing their family-life history (marriage, civil unions, fertility, children, care, the management of domestic life), together with the main events which mark individual academic careers.
The standardized questionnaire included questions on the parallel stories of scientific career – family life careers, exploring the causes of vertical and horizontal segregation in academia. Different patterns of gendered work and family-life careers emerge referring to diverse generations of researchers and teachers. In addition, different employment status emerge as meaningful: i.e. the widespread precarious work characterizing Italian Universities shows a strong influence on careers patterns of both men and women.

Recognition vs. self-fulfilment: alternative male career paths in science and research
Thomas BERGER (IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria) | thomas.berger@aau.at
Anita THALER (IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria) | anita.thaler@aau.at

Gender roles are converging all over Europe and career planning seems to be less gendered for younger generations. However, the classic academic career stereotype that is still dominating the life choices of early career researchers requires certain sacrifices and life decisions (high mobility, work time flexibility, postponed family planning etc.) that where formed by decades of male dominated organisational acculturalisation. The masculinisation of women’s careers in academic fields is a well-scrutinised area, but how do men cope with the pressure to align their professional careers if they seek alternative biographical routes? Are there hindrances for male scientists to be recognised as true and ambitious researchers if they, for example, choose to work only half time to invest themselves in volunteer or leisure projects? This paper will therefore explore the interplay of competing factors such as “work-life-balance”, “family planning”, “peer recognition” and “self-fulfilment” in men’s academic career development.

The issue of alternating academic career visions by men will be analysed by drawing on empirical data from a non-university research organisation (with strong institutional ties to the Austrian university landscape) that underwent a self-evaluation program concerning its gender policies. Additional interviews with researchers in classic university career tracks amplify our analysis.

Excellence, Careers and Gender in Higher Education: The Case of Science and Engineering
Andrea WOLFFRAM (Leibniz University Hannover, Germany) | a.wolffram@ish.uni-hannover.de

Careers in higher education evolve within a tension of beliefs in the meritocratic recruitment and promotion of researchers and the subjectivity of the evaluation of “excellence” through the scientific community. (Hadjar 2008; Möller 2014) These evaluations are biased by many social factors such as homosocial cooptation, gender stereotypes, and self-presentation of the researchers who produced the achievement. (Wolffram et al. 2014) From a gender perspective, these factors become even more relevant in scientific fields that are dominated by man like the SET subjects (Kanter 1977).
Against this background, the subjectivity of "excellence evaluations" in promotion and hiring processes in academia and factors for successful careers in SET disciplines will be scrutinized. It will be shown how the demands of gender equality and the concept of excellence are negotiated in the everyday life of “doing science” in SET disciplines. The presentation will draw on empirical findings from a qualitative study that were carried out in 2012/2013 at a Technical University in Germany (RWTH Aachen). The study was conducted in the context of the European project "FESTA -Female Empowerment in Science and Technology Academia".
These findings will be contrasted with another empirical study from 2011 that dealt with the question how female SET-scientists from Eastern Europe who migrated to Germany act successfully within the male culture of their disciplines. It will be analysed if these women who were socialized in a less male dominant culture with regard to SET education, could mobilize specific resources that helped them to reach leading positions in the SET field.

Mentoring relationships and gender equality in academia: a case study
Maria Carmela AGODI (University of Naples Federico II, Italy) | agodi@unina.it
Ilenia PICARDI (University of Naples Federico II, Italy) | ilenia.picardi@gmail.com

In this contribution we discuss the first results of an action research study, carried within the European Project "GENOVATE" and aimed at implementing a Pilot Mentoring Program. The results stem from a monitoring scheme of that program, designed according to realistic evaluation methodology (Pawson and Tilley, 1997). The traditional question of experimental evaluation - does the program work? - is transformed into the one: what is it about the program that works for whom? The last one is a context sensitive research question and, in a gendered research perspective, it also results into an evaluative research strategy consistent with intersectional analysis. Twenty-one couples of mentor and mentees - recruited on a volunteering basis from senior and junior women researchers working at the Federico II University - are formed according to a multi-criteria matching scheme, to interact for a one year time period. Descriptive information about different aspects of the mentor relationship are analyzed and differences in playing the role of mentors are looked for, comparing senior researchers who have identified primary mentors in their careers versus those who have not. The underlying presupposition is that a better understanding of the exchanges embedded in the implemented mentoring scheme can help at better conceptualizing the involved relationships and lead to a better design of an extended mentoring program oriented not just to increase women advancement in academic careers, but also to transform the academic environment into a more gender-equality sensitive organizational field.

JS_RN24+RN33b - Gender Indifferences in (Non)Academic Research Between Precarious Employment and Professional Achievement

Precariousness in Academia: Prospects of employing oneself in university
Kirsti Maria LEMPIÄINEN (University of Lapland, Finland) | kirsti.lempiainen@ulapland.fi

In this paper I will present how men and women working in universities try to get on in academic career. The paper analyses how academic capital, age, gender and class orient prospects of employment. The case analysis bases on auto-ethnography and interviews done in the University of Liverpool, University of Milan-Bicocca and University of Tampere. The question is what sort of differences and similarities there are in precarious positions in these changing universities. As a result I will suggest that in precarious positions of the three locations the opportunities and prospects of employment are partly compensated by the strength and moral of academic agency which smooth out age, class and gender differences. The precariousness is found as the property of the structures of university [employment] and not as a quality of the actor her/himself.

Genderedness of Research in SET and Gendered Scientific Networks
Felizitas SAGEBIEL (University of Wuppertal, Germany) | sagebiel@uni-wuppertal.de
The construction of high output corresponds with high performance defined as having successful projects, numerous publications, successfully securing research grants and (particularly for engineers) patents; all factors are not gender neutral. A German research project (lasting 2009 to 2012) reflected the genderedness of research for successful excellent women in SET in governmental research organizations and universities. With a qualitative methodological design five interviews with women and men in leadership positions and two gender separated focus discussion groups in each organization were collected between 2010 and 2011.

A traditional masculine culture in academia in Germany affords deep professional commitment with virtually no separation between professional and private/family life (Krais, 2010). Results from European Commission tender ‘Meta-analysis of gender and science research’, the author participated, clearly reveal the gendered nature of academic careers. Research which goes beyond universally applicable criteria and strict norms unmasks “power relations, gate-keeping practices and informal networks as a source of tacit knowledge, support and recognition… The definition and assessment of scientific excellence (the recognition of merit) is not independent of gender relations in academia and society at large” (EC, 2012: 18).

Women engineers not integrated as well as men in mentoring and networks’ systems experience structural informal discrimination. As research funding (output) is a function of collaboration and competition combined with exclusion from networks women professors have to overcome barriers to succeed. Women’s networks exist and they are useful, but they are less powerful for research success. These results will be reflected on different gender theories.

Still after the neutrality ideal?

Ivett SZALMA (FORS, Switzerland) | ivett.szalma@unil.ch

Harding (1991) published a paper in which he examined whether science is neutral. In the present research we try to answer exactly the same question: still after the neutrality ideal? We collect all the qualitative publications based on two datasets (International Social Survey Program, European Social Survey) between 2008 and 2014. We make analysis in order to analyze the usage of these databases in gender approach. There are several studies which show that women are under-represented in the academic sphere, especially in (natural) science, technology, engineering, and mathematics (Goulden – Frasch –Mason 2009). However, few studies have focused on the gender gap in social sciences (Le Fleuve 2014) in spite of the fact that women are also under-represented in quantitative social science research (Breuning 2010). Most previous researchers have analyzed journal context (Le Fleuve 2014) or some of them conducted analysis based on membership of some kind of association (Hancock et al. 2013). Our research seems to be pioneering by evaluating scholarly productivity between the two genders by collecting data sets related to publications worldwide. Our findings in this survey clearly highlight the persistence of a leaky pipeline: as well as pointing out a potentially neglected causal factor which strengthens the gender gap publication productivity: survey topics are still not neutral.
RN25 - Social Movements

RN25P01 - Poster Session

The potential of change. Is the LGBTQ movement in Poland able to bring on the social change?
Beata BIELSKA (Nicolaus Copernicus University in Torun, Poland) | bielska.beata@wp.pl

I would like to present the review of theoretical and empirical reflection of LGBTQ movement (sexual minorities movement, gay and lesbian movement) in Poland. In the second part of my presentation I would like to describe the movement existing today – the number and power of organisations, effectiveness of their actions, autoperception of actions, history. The presentation of the movement will be based of my qualitative and quantitative research among different organisations and independent leaders in Poland.
In the third part of my presentation I would like to highlight current actions of the LGBTQ movement (if there is any movement – this is still an opened question in Poland) in the context of the potential to cause social/cultural/political/identity change. In this part I will try to present key macrostructural factors (e.g. political transformation, dominant religion, cultural homogeneity, UE accession) which influence and influenced on LGBTQ movement and which may be observed in different cultural contexts.

Urban Movements and Social Change
Maria Anna ŚRODOŃ (University of Warsaw, Poland) | m.srodon@uw.edu.pl

In the local elections in Poland in November 2014 for the first time since 1989, there has been a large-scale mobilization of urban movements to political representation. Practically in each of the “old” districts of Warsaw, grassroots social movements showed up in elections, next to political parties. Elections revealed as well their social and political force, as their weaknesses. The paradox is that the same factors that constitute the strength of the social movements in the city, in the face of tough political games are their weaknesses. I will analyze these factors in my poster.
Many observers of social life associate with the urban movements hope for social change. Same see them as an opportunity for a revolutionary change of the system, including change of the ownership, others see an opportunity to modify the neo-liberal system, greater democratization of the life in the city, increasing the impact of the citizens on the formation of the city.
The main research question, which I will consider in my poster, is the question of what kind of social change urban movements would like to make in the city of Warsaw. What kind of problems they consider as most important in a city life.

RN25S01 - Social Media & Digital Activism

Umbrella Revolution and New Media Movement in Hong Kong
Chung-Tai CHENG (The Hong Kong Polytechnic University, Hong Kong S.A.R. (China)) | sscct@polyu.edu.hk
During 27th September 2014 to early January 2015 as the “Umbrella Revolution” unfolded, many Hongkongers noticed that the sit-in protests were not only the negotiations between pro-establishment/ pro-Beijing camps and the Hong Kong community towards the demand of democracy, but also they were considered as a paradigm struggle in political communication and social movement in Hong Kong.

After the 28th of September – the teargas attack of Hong Kong police, in addition to the protests on the street, old and new media started another form of war on cyberspace. Broadband technologies are challenging and replacing the dominant power of old media as agenda-setting. One of the obvious and significant examples is that even though the protests were coined as “Umbrella Revolution” by new media and every foreign journalist at the end of September, nearly all local media insisted to term the movement as “Occupy Central”. Until a month later, only a few local newspapers occasionally named it as “Umbrella Movement” because the word, “revolution”, was regarded as a politically sensitive matter to the Beijing government. Some commented that the mass media tended to be self-censored and avoided any mention of link between students’ protests and Tiananmen Square massacre in 1989.

Nevertheless, this might over-generalize the issue, and could not explain why the unabashedly pro-democracy newspaper, AppleDaily, in Hong Kong also tried hard to enframe the sit-in protests in a less critical manner. The dynamics between old and new media reveal several important implications for media-political relationships as well as the complexity of understanding of democracy in the Chinese context.

In particular, from the earliest period of news media research, the rise of the press, radio, television, and other mass media was considered as having potential to contribute to more informed, nonpartisan, and pluralist democratic processes. The emergence of the “Fourth Estate” was once become an important democratic institution (Powe, 1991). But as it became institutionalized and settled, people started to realize the limitations of the mass media in the cultivation of democracy (Gurevitch, Coleman and Blumler, 2009).

First, the myth of freedom of press had been challenged along with the growth of media monopolization. For instance, ten out of twelve Chinese-language newspapers in Hong Kong are known to follow pro-establishment or pro-Beijing stances; Hong Kong, as an international metropolis, has only two free-to-air television broadcasters and a few periodic subscription television services. In other words, the problem with regard to so-called “editorial independence” was indeed largely determined by media owners.

Second, since the politicization of Hong Kong society in 1990s, media and party politics had become complementary, contributing to the formation of media-political alliances. During the negotiation of Sino-British Joint Declaration in 1980s, different stakeholders in Hong Kong started to cultivate their own political machine so as to protect their interests in government policymaking processes (Lai, 2007). The development of news media thus provided a relatively diversified infrastructure to give expressions to the voice of the public. But over time, the ideal role of the news media as professional “primary definers” faced an enormous challenge as the “Fourth Estate” began to lose its critical power.

As long as the news media became more market-driven and profitized, their function for the construction and communication of public opinion was struggling under a tendency towards sensationalism and tabloidization (Lee, 2011). In view of the increasingly competitive market, news media loved to highlight eye-catching and appealing topics as their selling points; while political issues tended to be depoliticized. As a result, different media-political alliances were gradually formed, especially to those political figures who were in line with the medium. For example, Apple Daily head Jimmy Lai was discovered that he had donated millions HKD to pan-democrats and at least four political parties in Hong Kong.

Under the circumstances, more and more young people started to doubt the credibility of political parties as well as the mainstream media. It was not solely because of the accuses
regarding the complex relationship between the ultimate funder and those pro-democratic parties, but because of their stance of “Sinophileac”. This media-political relationship was accused of leading to the deterioration of the civil society in Hong Kong.

However, the prevalence of the Internet and related broadband technologies is creating a matrix for networking individuals, empowering them to become key social actors in political debates (Pierson, Mante-Meijer and Loos, 2011), which starts to challenge the conventional paradigm of political and social movements in Hong Kong, i.e. someone called the trend as the rise of “localism” of Hong Kong society. Especially, during the Umbrella Revolution, while old media were trying to define and direct the agenda of the protests, new media unexpectedly took the lead in information dissemination and resource and social mobilization. It came to seem that the Internet was re-vitalizing the civil society with a stronger sense of political autonomy among Hong Kong youth. Therefore, the whole protests were also regarded as an inter-generational conflict of Hong Kong.

The study discusses how this emerging “Fifth Estate” is possible and examines why the other established sectors of institutional authority are being challenged at a loss during the Umbrella Revolution. It will employ one of the leading new media in Hong Kong, Passion Times (www.passiontimes.hk), as a case study to look at how it influences the roles of government, politicians, old media, and the general public in the whole event. The reason is that Passion Times is the media arm of a young political organization, Civic Passion, which attempts to integrate propaganda, civic education, and social actions with the use of broadband technologies.

Passion Times not only provides news and articles by a large group of popular writers, but also first-hand information and reports during the protests. Its website also hosts archives of online radio shows and Internet television stations in Hong Kong (Law, 2014). On mid-September, nearly two years since the new media platform was founded, its facebook page had 60,000 likes. But two weeks after the protests, it reached more than 210,000 likes. Furthermore, during the first few weeks of the campaign, Passion Times' website suffered from serious DDoS attack: at its peak, the volume of requests reached 200 Gbps, coming from more than 40 countries . These show the significance of Passion Times during the protests as well as in Hongkongers’ defense of their freedom and their quest for democracy. At the end of the protests, Passion Times even broke facebook’s record as the highest number of website facing DDoS attack. Eventually, it was recovered its services under the protection of Google.

The study will use participant-observation (as a member of Civic Passion) and six in-depth interviews, including Wong Yeung Tat, the founder of Passion Times, three frontline reporters from different occupied zones, one editor, and one technician. All interviews will be taped and transcribed.

Mobilization via Facebook and Twitter during the Social Movements in Greece (2010-2012) and Bulgaria in 2013

Ivan STEFANOVSKI (Scuola Normale Superiore di Pisa (sede di Firenze), Macedonia, Former Yugoslav Republic of) | stefanovskiivan@yahoo.com

The social movements in Greece (2010-2012) and Bulgaria in 2013, devoted mostly towards advocacy against anti-austerity measures, government corruption and decline of general living standards, have raised many discussion with in the social movement circles. Experts point out that social media mobilization is one of the key issues regarding whether a social movement will be successful or not.

This paper will focus on several issues regarding the above mentioned movements. Firstly, it will focus on the positive aspects of internet mobilization such as easier mobilization of participants and more efficient “spreading of the word”. On the other hand, the paper will try to shed light also on the negative aspects of social media, such as “backfiring” – conventional media which usually support governments try to dominate social media, and controlling tendencies of governments using expansion of internet and social media to easily follow and control social movement organizers via surveillance. The paper will also give the answer to the questions how did social media actually affect both social movements?

Iranian women’s use of Cyber-space as a battlefield for freedom of expression

Thiago MELO (Coventry University, United Kingdom) | thiagomelos@gmail.com

Since 2014 My Stealthy Freedom, with over 800,000 followers on Facebook, is primarily used by Iranian women as a platform to express their ‘true’ identities. Such outlets are rare in Iran where the state mitigates women’s ability to openly display their bodies – and indeed views towards such control. Iranian state law requires women to cover their heads (wear Hijab) in public and in the presence of non-related males. Refusing to comply with dress code convention is a punishable offence. Using cyber-outlets as a form of cyber-activism, women seek opportunities to momentarily escape traditions and state laws by anonymously sharing photographs without Hijab. The site has become a symbolic movement for those who believe the internet to a space for freedom without fear, and where women come together in their beliefs and goals for empowerment. The photos and stories uploaded to the page have reached over one billion users on Facebook. The number of people who have visited the page are greater than the population of China, thus demonstrating its magnitude of this online movement. As a result of this cyber-activism, Iranian women outside of Iran are able mobilize with peers in their homeland. This study aims to explore the perceptions of such Cyber-activism, more specifically, cyber-feminism, among the Iranian diaspora in the United Kingdom, wishing to know about their participation in the movement as well as understand how the online community influence in their lives.

RN25S02 - The Cultural Consequences of Social Movements I
Good-Life-Religion? Ethnographic insights into cultural change through ‘protest hybrids’
Gregor Jonas BETZ (TU Dortmund University, Germany) | gregor.betz@fk12.tu-dortmund.de

The main objective of social movements is to trigger or to influence social and cultural change with the means of protest action. Protest events usually aim at affecting the public opinion and the decision process of political or economic leaders. Meanwhile, protest happenings impact participants and may become the basis for collective identity and liability. The particular agenda and interpretations of societal problems and solutions (frames) are symbolically staged in diverse forms and may release cultural change.

My paper intends – based on ethnographic research funded by German Research Foundation – to deconstruct an example of a ‘protest hybrid’. The social movement Slow Food combines a hedonism-agenda with political change-utopia and a wide range of modern forms of public collective protest action. The declared aim of all their activities is to influence everyday practices by publically and collectively celebrating idealised practices. Our research shows, that Slow Food highly resembles a modern form of religion: they do not only adopt forms of especially Christian ritual actions. Furthermore, Slow Food constructs and celebrates a holistic ‘theology’ that transcends the individual subject and relates it to nature, human species and intergenerational relations. Using the example of public protest events, I will show, that participants as well as bystanders are affected through means of aesthetics, taste, identity and the idealisation of good life. The paper reveals, that cultural change is intended by changes on the individual level.

Slow Life: passing fad or big change? Cultural consequences of Slow Movement in Poland.
Justyna Małgorzata KRAMARCZYK (Adam Mickiewicz University, Poland) | jkra@amu.edu.pl

Nowadays, social acceleration becomes the key concept of our age (Rosa 2013). The sociological literature emphasizes that the impact of new technologies and global standardization has brought the development of a ‘time-obsessed society’ (Young, Schuller 1988) where time saving, urgency and flexibility are most valued features of modern people. However, permanent increasing pace of everyday life brings a series of negative individual and social effects. Therefore, we could observe the emergence of new social movements that deny speed and create an alternative behavioral patterns.

One of this kind of movements is global initiative called Slow Movement, becoming more and more popular also in Poland. Members of this movement want to find right speed with which to do something in a way that values quality over quantity and well – being of the many over the few. It is worth noting that proclaimed downshifting relates to many areas of daily life such as Slow Travel, Slow Clothing or Slow Food. The list keeps growing and includes Slow Bicycles, Slow Design, Slow Cinema. That is why I would like to ask what is the current scope of the movement’s activity in Poland? What kind of cultural consequences Slow Movement generates? Furthermore, if we are dealing with long - term or short – term changes?

Answers to these questions will be provided by the qualitative analysis, which is a part of doctoral dissertation. Desk research on the relevant topic constitutes an introduction of the presentation.

#WomenAgainstFeminism. Cultural Aftermaths of Unanticipated Consequences of Feminism
Liana M. DAHER (University of Catania, Italy) | daher@unict.it
Women Against Feminism, also known as #WomenAgainstFeminism, is a Tumblr blog, Twitter hashtag, and social media campaign in which women post “selfie” style pictures holding up handmade placards stating reasons why they disapprove of feminism. Most of the posts begin with the statement “I don’t need feminism because”, followed by their reason(s). The campaign has very recently started on Tumblr (July 2013), claiming that American women do not subscribe to opinions of feminists, particularly radical ones. Moreover, since August 2014, the Facebook campaign page that followed has garnered 21,000 “likes.” Some have interpreted this as the ideological collapse of feminism.

Actually, the #WomenAgainstFeminism case suggests several issues for reflection on the unanticipated cultural consequences of women’s movements, as well as on new trends of women’s thought and forms of widespread opinions, beliefs and behaviour through on-line media.

Several unanticipated consequences resulted from the collective action of women’s movements of the two decades 1970-1990, such as the double presence model, the “distorted interiorization” by new generations of feminists and modernization outcomes, and so on. Perhaps these could be considered both as aftermaths of the above unanticipated consequences, and criticisms of radical feminist thought nowadays.

Starting from the above considerations, the paper aims at analyzing this new form of cultural expression both indirectly and directly, i.e. through the analysis of many journal articles and through reading the posted “reasons”. Moreover, it will try to evaluate the European dimension of the phenomenon, particularly in Italy, where the social condition of women seems to be very different from several other countries in various ways.

The cultural consequences of urban social movements in Poland
Katarzyna Barbara ŁUCZAK (University of Lodz, Poland, Poland) | katarzyna.b.luczak@gmail.com

Urban activists from different Polish cities decide to act together not only on the local but also on the national level in order to change their cities into better places to live. Since they want to cooperate with the local and national authorities in developing urban policies, they seek to be able to speak with one voice about the future of Polish cities. They create some virtual or real networks (such as The Urban Movements Congress) to communicate and to work out the common concept of socio-cultural change based on some alternative behavioural norms, new values and ideas. The aim of this paper is to describe long-term purposes of urban movements in Poland (to show the potential consequences of their actions) as well as to propose some hypotheses related to the problem of effectiveness in achieving of these goals. The theoretical background of this paper is the Touraine’s perspective on social movements. I also refer to other representatives of culture-based varieties of the theory of new social movements and to the resource mobilization theory.

RN25S03 - Networks, Transactions and Mobilizations in Central Eastern Europe

Diasporic Environmental Protest: A Connective Action Bridge between Host and Homeland Territories
Dan MERCEA (City University London, United Kingdom) | dan.mercea.1@city.ac.uk
In many corners of the world, protest is being embraced as a vehicle for voicing angst and opposition, most recently to austerity, corruption, environmental degradation, the retrenchment of the welfare state. This project scrutinizes Romanian diasporic environmental activism. Specifically, it charts the utilization of social media by 34 Romanian diasporic groups who mobilized in support of the Save Roşia Montană campaign, the foremost environmental movement in the country. The central aim of the project is to propose an analytical model that builds on the latest scholarship on the deployment of social media in collective action with the intent to extend it to the study of diasporic activism directed at the home country but physically enacted in the host country. For the purpose, it will probe diasporic social media communication in order to understand whether and how it may enable diasporic groups to arrive at a collective interpretation of their external conditions, to articulate their social relations and align individual cognitions and emotions that foster collective action.

Local social action in Czech Republic - groups of individuals, networks or urban social movements?
Jan SLÁDEK (Faculty of Arts, Czech Republic) | sladek.jan@gmail.com

The framework of the paper consists of the "Right to the City" urban social movements debate (Lefebvre, Castells, Pickvance, Howe) and the concepts of transactional activism (Tarrow, Petrova, Císař). The main question is the relation between social movement theories and current local political participation modes. The paper focuses on (1) preferred mode of political action; (2) the relation to media, political parties and other activists; and (3) the use of new social media. This is answered with the use of three main sets of data: statistical analysis of data from three own-designed representative questionnaire surveys (2010,2013,2014), ten in-depth interviews with representatives of Prague’s local protest groups and two case studies of local political action in CR. The combination of data analysis with above mentioned theoretical framework shows limits of the urban social movements concepts and gives empirical evidence to support the transactional perspective as a more effective and comparable analytical tool.

The Success of Sustainable Mobilization. The embeddedness of movements among voluntary organizations and their success in mobilization
Márton GERŐ (HAS-ELTE Peripato Research Group, Hungary) | gero.marton@tk.mta.hu
Pál SUSÁNSZKY (HAS-ELTE Peripato Research Group, Hungary) | pal.susanszky@gmail.com
Ákos KOPPER (HAS-ELTE Peripato Research Group, Hungary) | akoskopper@gmail.com
Gergely TÓTH (HAS-ELTE Peripato Research Group, Hungary) | gergo.toth@gmail.com

There are many studies explaining protest-participation generally, but much less are trying to explain the stability and steadiness of mobilization of particular movements or protests. Resource mobilization theory suggests that this success depends on the movement’s embeddedness in organizational networks. Thus, we examine how contemporary movements and protests-events are embedded in an organizational network and how this factor influences their success in sustainable mobilization. During the past years, a number of anti- and pro-government movements have emerged. Given that the organizing-actors show great stability, thus often the same actors appear as organizers, one would expect that they are able to mobilize a similar number of participants from time to time. But this is hardly the case: While pro-government rallies are able to mobilize tens of thousands each time, the number of participants in anti-government movements is waving from a couple hundred to 50.000. Therefore we examine how the capacity for mobilization depends on these movements' embeddedness in different types of voluntary organizations, e.g. religious and environmental
organizations or trade unions. Our hypotheses are that movements well embedded in networks of voluntary organizations are able to a) mobilize a larger number of people and b) they are able to stabilize the amount of participants. Moreover, we expect that the different types of protests are embedded in different networks of voluntary organizations. We examine this embeddedness through a survey conducted in 2014 among the Hungarian adult population inquiries their participation in certain protest events and their affiliation to voluntary organizations.

**Transactional networks and cleavages: the left-right debate of the Hungarian global justice movement**

Daniel MIKECZ (Hungarian Academy of Sciences, Hungary) | mikecz.daniel@tk.mta.hu

In my paper I want to investigate, the left-right debate within the Hungarian global justice movement in the mid 2000s. Usually, the line of conflict for social movements lies between radicals and reformists, but in Hungary the utility of the left-right categories became a crucial issue. The "green" activists rejected the “left” category, because the ecologist movement has been the opposition of the leftist authoritarian system before the democratic transition. The inconsistent usage of the left-right and the apolitical nature of the Hungarian political culture also makes it difficult to apply those traditional political positions. These ideological debates are also amplified due to the lack of resources and the small number of activists. These are the elements of the Hungarian political context (Hanspeter Kriesi), which I present in my paper in detail. Then I investigate the transactional alliance networks of four major SMOs of the global justice movement with the help of newspaper data from 2005 and 2006. For the network analysis and visualization I use the statistical software R. I conclude, that inspite of the ideological debates, the different SMOs can act together at major protest events of the international global justice movement.

**RN25S04 - Contesting Capitalism and Democracy after Embracing Them?**

Exploring the relation between unions and social movements

Mario DIANI (University of Trento, Italy) | mario.diani@gmail.com

The discussion of the relation between unions and social movements is hampered by some (sometimes hidden, sometimes explicit) assumptions about social change and the importance of “newness,” that are frequently found in social movement literature. One originates from the emphasis that some theories have placed on the diminishing centrality of class conflict and more generally of struggles for the control of material resources. Another is driven by the coupling of Tilly’s polity model with the assumption that unions enjoy routine access to policy making, which would render them ‘members’ rather than ‘challengers’ of the system. The third one has to do with the assumption that unions and social movements represent distinct organizational forms, with the former falling under the bureaucratic model and the latter under the informal, decentralized, participatory model. Recent arguments about the autonomous organizing power of the Internet have taken this line of thinking one step further, positing the gradual reducing role of face-to-face forms of organization for any kind of collectivity. In this chapter I argue that attempts to pitch unions against social movements on the basis of any of these dichotomies are inherently flawed because of (a) their tendency to link either to a specific condition, whether defined in terms of structural centrality of the issues/interests mobilized, of the position in relation to the polity, or of degrees of bureaucratization; (b) their
inclination to approach the problem of unions vs. movements through the comparison of specific organizations, instead of looking at the overall configuration of broader organizational fields. Both flaws are ultimately dependent on an inadequate conceptualization of social movements. I propose a view of social movements as a specific “mode of coordination” (MoC) of collective action, characterized by a distinct coupling of the mechanisms of resource allocation and boundary definition (“boundary definition” being a shortcut for solidarity and identity mechanisms) that involve multiple organizations in a field. I argue that both unions and the groups and associations mobilizing on other issues can, depending on occasion, act following the logic of a social movement MoC, or operate primarily as independent organizations.

Protest in times of crisis, comparing novices and stalwarts in Northern and Southern countries of Europe

Cristina GÓMEZ-ROMÁN (Santiago de Compostela University, Spain) | cristina.gomez@usc.es
José Manuel SABUCEDO (Santiago de Compostela University, Spain) | josemanuel.sabucedo@usc.es
Xiana VILAS (Santiago de Compostela University, Spain) | xianavc@yahoo.es

The measures taken in Europe to face the crisis have provoked an increase in the number of protests and mobilized people who had not been mobilized before. However, Southern countries, as Italy and Spain, have suffered more importantly the impact of anti-austerity measures than northern countries, as Belgium and The Netherlands. We want to know if the reasons that lead people to participate are the same in both regions (North and South) and if there are differences among them. Not only taking into account the context of the country where the demonstration was held, but also the differences that there may be in the reasons to participate if we consider whether they are first timers (novices) or regular participants (stalwarts) in collective protest actions. New demonstrators and stalwarts must maintain differences in the classic motives for collective action, which means, differences in identification with parties, trust in institutions, feelings of efficacy, identity and emotions. And as the economic situation in the southern countries is clearly worse than in northern countries there will be differences also among them.

In our study, we employ a two-by-two design defined by region of demonstration (North vs. South) and the profile of participation (Novices vs. stalwarts). Our sample consists of 872 participants: 423 in Belgium and The Netherlands (33.7% female; mean age of 50, SD=10.69); and 449 in Spain and Italy (42.2% female; mean age of 42, SD=13.62). We discuss the results obtained, comparing our findings with those ones collected in previous studies.

The Strategic Use of Land in Stakeholder Collective Action – Lessons from the Peruvian Mining Industry

Maria-Therese GUSTAFSSON (Stockholm University, Sweden) | maria-therese.gustafsson@statsvet.su.se

This paper analyzes community organizations’ attempts to influence mining corporations. The rapid expansion of natural resource extraction has led to increased confrontations and negotiations between corporations and communities in different parts of the global South. These negotiations often concern land rights, environmental and social impacts or access to the benefits of mining projects. Previous research has demonstrated how corporate-community relations within the mining industry are characterized by profound power asymmetries and unequal access to state institutions. However, there is one important factor that enhances the bargaining position of communities: namely, the control over land. In order to advance natural resource extraction, corporations need to get the permission of local communities to use their
By drawing on resource dependency theory (Frooman, 1999; King, 2007) this study examines local communities usage of resource control strategies in relation to mining corporations. Based on interviews with peasant leaders, NGOs, corporate representatives as well written primary sources, the study shows how communities employ different resource control strategies often in combination with other forms of collective actions for pursuing their interests. This study contributes not only to a deepened understanding of how resource control strategies are employed in different empirical contexts, but also more broadly to growing debates on interactions between social movements and corporations by showing the particular ways that these relations play out in the global South.

From National to Post-National Struggle: Recent Developments in Political Strategies of the Kurdish Movement

Ulrike FLADER (University of Manchester, UK) | ulrike.flader@postgrad.manchester.ac.uk
Çetin GÜRER (Ankara University, Turkey) | cguerer@gmail.com

The Kurdish Movement around the Kurdistan Workers’ Party (PKK) developed in the 1980s as an armed struggle for national independence from the Turkish state. Since around 2000, however, this movement has undergone drastic changes in its political philosophy, strategies and institutionalization.

While in its early years the Kurdish struggle was based on Maoist guerrilla warfare aiming at a final popular uprising, the strategies of the movement today, include civil disobedience, participative decision-making, the proliferation of cultural institutions and activities of a legal political party. In this sense, the movement has undergone a major shift from an armed struggle against the state to a struggle for transformations within the state.

This paper illustrates the core developments which have determined this radical shift in its ideology and analyzes the current repertoire of practices which the movement relies on. It looks at its concept of "democratic autonomy" which has been proposed as a model to decentralize the state and achieve a radical change regarding gender-equality, ecology and direct democracy. The introduction of this model is central to the kind of strategies the movement applies today. On the one hand, it has lead to the erection of direct democratic institutions and decision-making procedures, such as communes and neighbourhood councils. On the other hand, this model promotes specific strategies which work on or within the legal framework of the given State. Hence, as the paper shows, the strategies of the Kurdish Movement have shifted from national liberation towards a post-national transformation of the nation-state.

RN25S05 - The Cultural Consequences of Social Movements II

Dividing outcomes of a social movement

Adam MIELCZAREK (Jagiellonian University, Poland) | adam.mielczarek@sws.org.pl

Involvement in a social conflict is a distinguishing feature of social movements. As a consequence their emergence results in social divisions. Their nature is cognitive: social movements promote specific cognitive schemes opposed to the dominant worldviews of the given society. The strength and durability of those divisions depends on the vehemence of the conflict but they can influence the whole society.

The paper, based on survey data, discusses the outcomes of the “Solidarity” movement from the eighties on the contemporary historical consciousness of Poles. Before “Solidarity”, during the period of relative stability of “really existing socialism” in Poland, even if the regime didn’t
enjoy large support, the society didn’t have an opportunity to crystalize and negotiate the cognitive tools describing the public realm. The emergence of “Solidarity” resulted in the opening of a public sphere and “Solidarity” movement frames shaped the political consciousness of a large part of the population.

The banning of “Solidarity” tightened and strengthened the divide between the part of population influenced by the frames created by the “Solidarity” movement and those driven by the frames created by the powers in charge. That cleavage outlived the system change and is visible as in the electoral behaviour as in the vernacular narratives on history and its influence remains stronger than the influence of the variables resulting from social structure. New socio-political divisions emerge over the existing cleavage because the cognitive tools that people use to describe political issues were created in the period of the conflict around the “Solidarity” movement.

From OM and the Stilling of the Mind to Voga and the Perfection of the Body: How Yoga went from a Contemplative Movement to a Multi Billion Dollar Fitness Market

Deborah Miriam BROWN (University of Cambridge, United Kingdom) | dmb60@cam.ac.uk
Kamal MUNIR (University of Cambridge, United Kingdom) | k.munir@bs.cam.ac.uk
Shazhad ANSARI (University of Cambridge, United Kingdom) | sma31@cam.ac.uk

The transition from social movement to market is one that has generated significant interest from scholars. However, in most cases, market creation focuses exclusively on the underlying social movement at stake. While movements may transform without significant interface from parallel movements, those that are significantly influenced by parallel movements that are already commodified may be significantly more likely to form markets. In our case, we examine the unlikely and dramatic rise of the yoga movement from an identity movement with defined rituals, symbols and beliefs often antithetical to the market to a multi billion-dollar market focused on perfection of the body. Systematic exploration of how movements feed off each other, or even “mine” parallel movements for concepts, arguments and even practices, combined with an acknowledgment of the dynamics of commodification – by means of which cultural practices might be turned into commodities with economic value – promises to yield new insights into the transformation of movements. We show how both infusing a practice with particular values and denuding it of such values may broaden its appeal and promote market creation. In addition, while social movements have often been studied in isolation, we address calls to include the role of the broader environment in which a movement is embedded. Specifically, we explain the role of other social movements and the broader cultural environment without which we would have an incomplete understanding of a particular movement’s dynamics or outcomes.

The legacy of the 1980s’ anti-politics: a missing reference in the contemporary East European social movements’ research

Elżbieta CIŻEWSKA-MARTYŃSKA (University of Warsaw, Poland) | e.cizewska@uw.edu.pl

Drawing on the framing perspective in the study of social movements, in my paper I would like to discuss the possible links between a concept of anti-politics, the concept elaborated by Czech, Slovak, Hungarian and Polish intellectuals and leaders of the 1989 revolution and today’s protests. I argue that the application of this concept to contemporary research is of a very important analytic utility.
As social movements have long-range, both direct and distant in time consequences, very often unintended ones, the frames developed and articulated by a successful social movement, e.g. the Polish Solidarity, not only do shape the cultural and political context for the future movements but also influence these very movements. Due to the fact that the leaders of the 1989 revolution have influenced the public discourse to a great extent, we could expect that the philosophy of the anti-politics has had an important effect on the contemporary East European social movements, when it comes to activists’ understanding of politics and the way politics functions, as well as the role of citizens/protesters, and the repertoire of the protests. Basing on the writings of Gyorgy Konrad, Vaclav Havel and Jacek Kuroń I will show how the idea of the anti-politics served as an interpretive frame for the democratic opposition’s mobilization in 1980s and may be shaping today’s movements’ culture.

The argument of the paper will be supported by the examples of the contemporary Polish research by various authors and the expertise in the East European intellectual history. The potential consequences of focusing on the anti-politics’ legacy in the social movements and civil society research will be enumerated and discussed.

**Shifts in influence: early adopters of the environmental movement and their effect on cultural change**

Amabel HUNTING (University of Auckland Business School, New Zealand) | a.hunting@auckland.ac.nz

Research conducted on sustainable lifestyles found the emergence of a subculture markedly different in behaviour, lifestyle and identity from earlier environmentalists. Utilising Roger’s (2003) diffusion of innovation model, early environmentalists represent the ‘innovators’ of the social movement. Social movement research and theories have primarily focused on ‘innovators’ but there is a lack of understanding of how the strategies shift as there is a diffusion of ideas within the culture. This research explores the emergence of a subculture representing the ‘early adopters’ stage of the environmental movement and offers insight into the distinct strategies used to facilitate change. They rejected previous activist identities and distanced themselves from associations with political affirmative action that had positioned environmentalists as an out-group of society. Instead they created a cloaked identity aimed at normalising green behaviour and becoming an in-group member of society. Rather than being a passive form of resistance they created an active persona aimed at inspiring change in the ‘early majority’. This research provides understanding of an early adopter group in a social movement and how a cloaked activist identity plays a crucial role in shifting cultural values.

Çapuling during and after Gezi. The struggle of a young Turkish generation for a new culture of participation in Turkey

Claudia SCHÜTZ (University of Innsbruck, Austria) | claudia.schuetz@uibk.ac.at

The resistance against the demolition of Gezi Park in Istanbul in 2013 resulted in the formation of a nation-wide upheaval against an increasingly oppressive government. On basis of an empirical qualitative study in Turkey in 2014 with Gezi activists and Gezi movement initiatives such as neighbourhood forums this paper discuses analyses of the reasons for the protest and its societal impact. Here, two particular features are defined: Firstly, the socio-structural examination of a young Turkish generation of protestors as main support group; secondly, the framing process of a culture of Çapulcu as a main explanatory approach of the protest movement.

While Turkey offers a long tradition of protest, the Gezi rebellion was a young protest movement, being formed by a highly educated and secular generation. The young protesters
were reversing the swearword "Çapulcu" (looter), with which the Turkish prime minister tried to
denounce the protestors as dregs of society in the first place, to the central self definition of the
rioters. The word became synonymous for those revolting people in Turkey, who do not feel
attached nor represented by their state and its leading parties. Çapulcu thus does not only
represent a young generations’ new identity but is rooted in their shared notion for a political
culture of participation from below.

The paper argues that the Gezi protests represent a socio-economically lost young Turkish
generation, which was given the opportunity to find and frame a common identity. This identity is
supposed to include a political culture of participation, which was established during - even
more importantly after - Gezi. The guiding question is: What societal needs trigger the identity
and the modes of action of the Çapulcu and what is the movements’ outcome?

**RN25S06 - Before and after Taking the Streets: Social Movement Continuity and Social Movement Outcomes**

**Reclaim, Occupy, Pillowfight! - Leaders' Movement Continuity and Participants' Break in the Budapest Scene of the Urban Playground Movement**

Panka BENCSIK (University of Sussex) | bencsik.panka@gmail.com
Mihály GYIMESI (Humboldt-Universität zu Berlin) | mihaly.gyimesi@hu-berlin.de

A transnational network of mainly first world organizations, identifying themselves as the Urban Playground Movement (UPM), has been creating surprising, playful mass events for a decade to redefine urban public space. Faced by the contrast between the highly ideological discourse of their main movement manifesto and the markedly fun-oriented interactive flashmobs, we sought to identify social conflict-focused mobilization frames to answer the question whether the UPM can be considered a proper social movement.

We conducted interviews with the four leading members of the largest Hungarian UPM organization and surveyed participants of the Budapest event of the International Pillow Fight Day (n=111, randomized selection). Our interviews show that leading local organizers use the movement's internationally dominant ideology: they see flashmobs as tools to reclaim the public space and to fight urban isolation by prefiguring a more social city. They relate unequivocally to Reclaim the Streets, and more subtly to recent international anti-austerity protests in terms of repertoire (occupied spaces) and discourse (e.g. pro-participation). The functioning of the UPM in Budapest heavily relies on social movement continuity: the social movement-experienced leaders are the motors of the initiative, and their motivation originates in an ideology rooted in recent and contemporary social movements. Conversely, the participant level shows a movement break, our surveys exhibit a clear pattern of non-ideological, fun-seeking motivation. The UPM in Budapest is an identity-oriented social movement solely from the perspective of the ideologically motivated main organizers, whose frames are not transmitted to the participants.

**Representational Failure as Opportunity: The Transformation and Prospects of the Gezi Movement in Turkey**

Gözde PELIVAN CEMGIL (University of Amsterdam, Netherlands, The) | gpelivan@gmail.com

The last decade saw mass uprisings with a very diverse participant profile and forms of action sweeping through a number of countries all around the world. The 2013 Gezi Park uprisings in Turkey also proved itself to be a part of this wave of social movements with the diverse backgrounds of its participants and their strategies of contention. While many scholars explored
the reasons and conditions of emergence of the Gezi movement, its continuation in different forms and settings has attracted little scholarly attention up until now. After almost 2 years since its emergence, what is popularly called ‘the Gezi spirit’ still hovers around the country at public park forums, squats, and other gatherings as well as in the form of more institutionalised settings like associations, albeit with a more limited participation. This paper argues that the failure in the translation of Gezi’s popular power and diversity into Turkish parliamentary context has resulted in the continuation of the movement in a spatially and temporally scattered form. Following on the discussion of transformational character of popular movements, this paper primarily seeks to answer the question what Gezi has come to be with its past capacity and present incapacity in realigning the oppositional forces in Turkey, and concludes that present lack of parliamentary representation constitutes the most significant political opportunity among others for this movement’s recursive self-production.

Food Not Bombs: The New Meaning of Food, Waste and Solidarity in Post-Gezi Turkey
Ezgi BURGAN (Mugla Sitki Kocman University, Turkey) | ezgiburgan@gmail.com
Sercan KIYAK (Mugla Sitki Kocman University, Turkey) | sercankiyak@gmail.com

In this presentation the recent emergence of the Food Not Bombs (FNB) movement in Turkey will be analyzed. The FNB emerged as a new social movement based on loosely associated vegan food sharing groups among anti-nuclear activist circles in the USA in the 1980’s. In Turkey about a year ago, activists and volunteers from different social and political backgrounds established a local FNB group in Istanbul. Today they still continue to organize events that manage to successfully attract media and public attention.

Our aim is to analyze this recent socio-political phenomenon in a comparative manner to find its significance within the history of social movements in Turkey. For this purpose we will firstly try to define the conditions and dynamics that created the FNB movement in Turkey. Especially the ascent of neoliberalism in Turkey and the development of ecological and animal rights groups and lastly the effects of the Gezi protests will be highlighted. Secondly we will discuss how the core principles of the movement are understood, re-interpreted and shaped in the Turkish context by activists. We will conclude our presentation by commenting on the challenges and opportunities that the FNB faces in Turkey. The data in this research was collected through focus group discussions with activists, participant observation in local FNB events and from the movement’s own documents.

Alternative World is not Equal: What Factors Create the Hierarchy among Activists?
Kyoko TOMINAGA (Ritsumeikan University, Japan) | nomikaishiyouze@gmail.com

In this presentation, the author makes clear that what factors create the hierarchy among the activists. A lot of researchers have challenged about the non-hierarchical participatory model which has the autonomy and internal democracy. Moreover, they have investigated questions of internal democracy and democratic practices, consensus decision-making, and deliberation. In this study, the author focused on the global justice movement against the 2008 G8 summit with the concept of movement backstage (Haug 2013). Movement backstage means logistics of social movements: meeting, fundraising, negotiation with city government and police, etc. Using the interview data, the author investigated relationship and decision making process among the participants. Drawing on our observations of a variety of movement backstage, we could find two factors which create the activists’ hierarchy: carrier and reputation.
In the movement backstage, some protesters have great influence on other members. Especially, long-careered activists have much resources (e.g. legal knowledge) and play an important role as a specialist in the backstage. Renowned activists (e.g. intellectuals) can mobilize people and they are often respected by other members. Knowledge, experiences and skills are personal and non-transferable. Such resources are sometimes based on attributes of each activists: occupational type, gender, race and educational level. People who own high status are easy to get their position in social movement organizations.

From an eventful protest to social forums: the sustainability of the Gezi network
Baran Alp UNCU (Marmara University, Turkey) | baran.alp.uncu@gmail.com

The sustainability of occupy protests consisting of individuals with diverging concerns, interests and claims is open to question. Similarly, the Gezi protests in Turkey, carried out by a spontaneous coalitional network, lacked a collective identity and commonly constructed frames, which are necessary components for sustained movement networks. My study analyzes the transformative capacity of the Gezi protests as an eventful protest to build movement networks. During the 15 days of protest encampment, the participants of this coalitional network experienced a process of mutual recognition, solidarity and trust building, networking, and experimenting with alternative forms of democracy and social life within the free space of affections, cognition, and relations. Based on in-depth interviews and participant observation, I argue that the Gezi protest encampment provided the grounds for building an inclusive collective identity among protestors, which reflected upon the succeeding social forum period, but that this is an indeterminate and uneven process.

RN25S07 - Economic Crisis and Mobilisation

Dynamics of Extreme Right Protest and the Economic Crisis in Poland, 2008-2013
Daniel PLATEK (Jagiellonian University, Poland) | dplatek21@gmail.com

In the project I focus my attention on the collective actor that plays an important role within the field of Polish social movements: the extreme right. Research on the rise of nationalism in Poland has tended to focus on either macro or micro level explanations, considering it as aggressive reactions to frustrations resulting from a rapid end of political and economic stabilization after 1989. This project pursues an analysis of the Polish radical right as a social at the time of economic crisis which started in 2008, but has its roots few year ago. With the advent of the twenty-first century Polish extreme right wingers suddenly found themselves an important political force which has been reinforced recently by the economic crisis. The political movement not only won seats in the Polish parliament (2001), but also in the European Parliament (2005). Now, they occupy important positions in the public sphere having a huge impact on the political and social issues in the public sphere. Analyzing Polish extreme right movement I would like to answer the question: what was the main social and economic factor transformed by the extreme right into the powerful master frame which allowed it to enter the government and had a Deputy Prime Minister? Drawing on social movement theory and methodology of Protest Event Analysis, I propose a way to conceptualize the specific field of discursive mobilization for the Polish extreme right-wing as a result of political and discursive opportunities. My central task here is to explain variations in nationalist and xenophobic claim making in that field and, more specifically, in the mobilization by the extreme right across two distinctive phases: institutionalization (2001-2005)
and radicalization (2006-2013). Looking at a broad spectrum of actors in the extreme right milieu, I analyze (as dependent variables) forms of action (repertoires) and their framework with the aim of understanding the differential use of economic and social issues in the process of mobilization. By comparing variables in the subsets of distinctive phases, I would like falsify important hypothesis. First, extreme right political movements that operate in the presence of strong discursive opportunities based on economic arguments are more likely to intensify the share of extra-parliamentary mobilization and lead to more radical forms of action. Second, in turn, when the political and discursive opportunity structure are unfavorable to the emergence of a strong extreme right movement, the level of extra-parliamentary mobilization is relatively low and more moderate.

One of the important factor which lead to the emergence of the extreme right in Poland is distrustful towards the European Union. It is connected with the economic and social arguments presented by the extreme right activists. Opposition to accession and prevention of deepening integration have gained a wide support in the society on the eve of accession to the European Union in 2003. Extreme right argued that losing jobs many Poles will lose their economic stability. In the message constructed around economic colonization by the UE I see general frame produced by the extreme right in Poland.

Contentious Politics in an Age of Austerity: Comparing Ireland and Spain
Cristina FLESHER FOMINAYA (National University of Ireland, Maynooth, Ireland, University of Aberdeen) | Cristina.FlesherFominaya@nuim.ie

Two questions arise in the context of analysing collective responses to austerity in the EU countries that were “bailed out” by the Troika. The first is why countries like Spain and Greece had such a sustained strong mobilization against austerity, the second is why countries like Ireland and Portugal did not. Are these two sides of the same question and can we answer them using the same explanations? In this paper I present some preliminary answers to these questions, drawing on secondary macro data (surveys, opinion polls and various economic indicators) and qualitative primary data on social movements in Spain and Ireland. These findings are the result of a two year Marie Curie funded research project comparing collective responses to austerity in Ireland and Spain.

Dynamics of Protest in Times of Austerity: Portugal and Spain in Comparative Perspective (2008-2014)
Tiago CARVALHO (University of Cambridge, United Kingdom) | tmlc3@cam.ac.uk

My paper focus on the comparison of the dynamics of contention during the current crisis in Portugal and Spain. The main objective is to perceive the changes in the forms of mobilization and contention in a period of crisis, namely the main actors, claims and repertoires between 2008 and 2014. Over the last 40 years debt crises around the world resulted in defensive mobilizations against them and changes in the political landscape. In this sense, the ongoing crisis in the Southern European countries seems to unfold a similar logic. Still, the institutions and actors seem to be responding in a quite different way. With this set of problems in mind, the objective of this paper is to characterize the dynamics of protest in times of austerity in Portugal and Spain between 2008 and 2014. A longer time-frame will enable us to have a deeper understanding of how the reaction to austerity unfolded. I argue that one should follow a relational view, which takes into account the role of institutions, context and actors.
For this, I will rely on a comparative dataset of protest event analysis of both countries. These will help to identify the different phases of contention, allowing the analysis of the overall process along different circumstances like the economic conjuncture, austerity measures and elections. The final objective of this paper is to illuminate the different political processes in Portugal and Spain.

Mapping “old” and “new” forms of protest in Greece.
Theoni STATHOPOULOU (National Centre for Social Research-EKKE, Greece) | stathopoulou2@yahoo.com
George DIAKOUMAKOS (National Centre for Social Research-EKKE, Greece) | info@gdiakoum.com
Nikos STASINOPOULOS (National Centre for Social Research-EKKE, Greece) | nicolastasis@yahoo.gr

The Eurozone crisis has triggered a new wave of mobilization and protest against austerity policies thus fuelling social movement research with new paradigms, repertoires and actors. Greece in particular has become a prominent field for testing theories of contention over the last five years. Emerging “new” forms of protest and grassroots mobilization on economic hardship have incorporated attributes of “older” forms of protest in mid nineties, centered along immigration, Europeanization and globalization.

Having as starting point of reference the national elections of 1996 that signaled a change of leadership in the then majority party the paper will present the preliminary results of mapping “old” and “new” forms of protest in Greece. Results are part of an ongoing research program on Social Data Mapping (SoDaMap) combining social and geocoded data in a coherent platform. Using Claims making approach as the unit of analysis, the data were drawn from daily Greek newspapers and analysis has employed the most rigorous techniques in text retrieval. Additional methodological challenges and sampling strategy will also be discussed.

The Financial Crisis Protest Cycle in Iceland, October 2008—January 2009
Jon Gunnar BERNBURG (University of Iceland, Iceland) | bernburg@hi.is

The 2008 financial collapse in Iceland triggered a cycle of protest that eventually ended with huge popular protests bringing down the country’s ruling government in January 2009. I rely on both grounded work (qualitative interviews, discourse analysis) and survey research to examine how the financial crisis triggered these enormous protests. The study cuts across levels of analysis, moving from the broad social context of the crisis through the intermediate role of human agency to protest behavior of individuals. I argue that the crisis led to a protest cycle in the following manner: The crisis undermined the legitimacy of the ruling authorities that were thus unable to provide credible framing of the crisis. Moreover, the crisis disrupted the public’s taken-for-granted reality, creating a shared focus on defining it. Perceiving the situation as a political opportunity, activists and critics organized public meetings and framed the crisis as a moral-democratic crisis calling for reform by means of protest. Both economic strain and political ideations played a role in individual mobilization. Experiencing economic loss is strongly related to protest behavior, but only among individuals who lost more than others in the crisis. Moreover, political attitudes congruent with the emergent collective action frame, and the political-ideological interests underlying it, motivated many citizens to participate in the protests.

RN25S08 - Social Movement Outcomes I
Before and after taking the streets: Social movement continuity and social movement outcomes
Doowon SUH (Korea University, Korea, Republic of (South Korea)) | dwsuh@korea.ac.kr

Since the late 1990s, the consequences of collective action have been subject to an expanded scholarly inquiry. In particular, a growing body of analysis has elaborated on the impact of social movements on policy, coupled with studies dealing with structural, organizational, and biographical changes. On the whole, however, the literature continues to under-recognize how unintended consequences affect the way social movements function. In order to illustrate the unanticipated yet profound impact of unintended consequences on movement dynamics, I examine the Korean women’s movement as a case study. My analysis focuses on establishing the following three propositions. First, unintended results motivate movement participants to make a prompt reaction; this leads them to voluntarily or involuntarily alter their organizational infrastructures, thereby effecting changes in movement dynamics. Second, the impact of unintended consequences is transmitted to movement participants through the process of framing; it is one’s personal assessment rather than a detached appraisal of collective action outcomes that influences movement dynamics. Third, a negative evaluation of the unintended consequences may generate an impetus for reinvigorating collective action.

The power of ad hoc mobilisation: postponing school closures in Sweden
Katrin UBA (Uppsala University, Department of Government, Sweden) | Katrin.Uba@statsvet.uu.se

This paper examines how small ad-hoc protest groups, namely the activists against school closures in Swedish municipalities, achieve their goals. Their protests range from sending emotional letters to authorities to more disruptive such as large demonstrations and illegal school strikes i.e. parents refusing to send their children to school. There is no dominant public opinion in favour or against school closures; neither are there any clear political allies. The multi-level discrete event history analysis of all proposed school closure cases in 290 Swedish municipalities during the period of 1991-2010 demonstrates that less disruptive protests tend to postpone and eventually avoid the closure. In contrast, frequent protests and more disruptive strategies accelerate the process of closure. In general, these results may reflect the characteristic conflict-avoidance-type political culture in Sweden. More specifically however, the phenomena I call the discomfort mechanism plays an important role in these outcomes – it is the burden of dealing with the flood of emotional and angry letters which municipality bureaucrats have to file, or handling outbursts during public meetings. This new mechanism combined with politicians’ interest in re-election and stability allows us better explain the consequences outcomes of social movement mobilization.

People-Oriented Contentious Politics within a Non-Responsive Context: the Case of the Pro-Choice Movement in Derry, Northern Ireland
Marie-Lise DRAPEAU-BISSON (Université du Québec à Montréal, Canada) | drapeau-bisson.marie-lise@courrier.uqam.ca

Despite the 15 years since the official cessation of the sectarian conflict between Irish Catholics and British Protestants, authors observing post-conflict Northern Ireland through a gendered lens (Coulter 1999, Galigan 2013, Deiana 2013, O’Rourke 2014) have shown that the continued social dominance of the ‘two-community’ paradigm overshadows other issues such as women’s rights. For instance, women today in Northern Ireland have a very limited access to abortion as it is still considered a criminal act; indeed the issue of abortion is largely sidestepped or ignored by politicians (Bloomer and Fegan 2013, Deiana 2013, Horgan and O’Connor 2014).
Within such a non-responsive context, what form does the pro-choice movement’s challenge to the status quo take? Data gathered during ethnographic fieldwork with Alliance for Choice (AfC) in Derry in the fall of 2014 lead to three main findings: (1) the group’s culture is a determining factor in shaping what activists will “frame” as opportunities (cf. Gamson and Meyer 1996); however, (2) a group’s culture does not evolve in a vacuum, since AfC’s failed attempts at influencing politicians in previous waves of mobilisation affected the group’s narrative (cf. Polletta 2006); finally (3), elements in (1) and (2) help explain the continuity in AfC’s actions during the fall of 2014. Indeed, activists resorted to previously used tactics, characterised by storytelling and popular education, and targeted at the general population (rather than politicians), as a strategic response to the structural constraints impinging upon them.

Winds of Political Change? The after-moment of the 2011 global protest and local political processes
Lev Luis GRINBERG (Ben Gurion University, Israel) | grinlev@gmail.com

Most social movement literature found that protest movements are cyclical and emerge when there is some opening of political opportunities, producing agency, framing collective identity and facilitating continued collective action of social movements. This paper argues that the mass protests of 2011 have salient distinctions from these features: they emerge when the political opportunities are closed, they don’t necessarily facilitate building social movements, but they do provoke political processes of change, either progressive or reactionary. The salient peculiarity of the 2011 wave of protest was the discontent with the whole political system, both with the government and opposition. The 2011 movements challenged the institutionalized political actors, provoking after the “moment” of mobilization various political processes, either opening political space for representation or closing it. The paper will analyze divergent dynamics in different local contexts.

The "occupy" social protests that started in Tunisia and Egypt sparked global contagion creating a shared framing that criticizes both the growing inequality generated by the neo-liberal economy and its’ anti-democratic implications. The acceptance of economic models imposed by international financial institutions provoked protests in democratic and dictatorial regimes, mobilizing "the people" both against the political and economic elites. This paper refers to mass protests that succeeded to mobilize broad majoritarian support of lower and middle classes. This mobilizing power was directly related to local politics, and the capacity of each movement to coordinate civil society organizations and to frame their demands against the political and economic elites.

I will argue that the most powerful mobilizations took place in the local contexts where the whole political system was considered responsible for the economic situation. The paper analyzes political processes after the moment of mobilization, showing that the existence of democratic rules of the game is not the most important factor in gaining political representation. The most crucial elements are the autonomy of civil society organizations, their capacity to coordinate their activities, to build social solidarity, and to penetrate the political arena. In cases with deeply divided societies the institutionalized political actors succeed to neutralize the protester’s demands and maintain their power.

The paper will focus on different paths of successful representation of civil society claims by political parties like Chile – characterized by participation in existing opposition parties and building a broad popular coalition between them -, Tunisia where the whole political arena was reshaped - and Spain – where new political parties were organized by M15 protesters against the old bi-partisan political arena. The paper will explain how different contexts shape different political processes of representation, and will show how divided societies deteriorated into
reactive repression, like Egypt, Brazil and Israel, maintaining neo-liberal economic policies and the old political actors in power.

**RN25S09 - Gender and LGBT**

**The typology of contemporary men's social movements**  
Katarzyna WOJNICKA (University of Gothenburg, Sweden) | wojnicka.katarzyna@gmail.com

Since over 20 years the issues connected to men's social movement have been an important part of the (critical) men and masculinities studies' discourse (Astrachan 1986, Kimmel 2005, Flood 1998, Clatterbaught 1997, Messner 1997, Gambill 2005, Newton 2005). Research on different types of men's movements in various societal and cultural context resulted in development of several sets of typologies (Kimmel 2005, Clatterbaught 1997, Hży 2006, Astrachan 1986) which supposed to frame diverse men's activism in certain categories. However, as social movements are one of the most dynamic social phenomena, existing typologies does not reflect the whole spectrum of contemporary men's movements anymore. This is especially visible in a non-American context. Therefore, the main goal of my paper is to present the proposal of new, updated typology of contemporary men's movement. The updated typology can be seen as both, extension and merger of theoretical models developed by Michael Kimmel and Michael Messner. The new proposal has been developed on the basis of a) desk research (existing works on men's movements as well as men's movements' leaders and activists' publications), b) qualitative sociological research on three different men's movements in Poland: male feminists movement, fathers rights' movement and male spirituality groups and c) qualitative sociological research on European father's rights movements. The research has been based on in-depth sociological interviews conducted between 2009 and 2011 with 44 members of dozen men's informal groups and organisations in Poland as well as on the ongoing research on European father's rights movements which has been conducted since Fall 2014.

**‘Conscience adherents and constituents’ revisited: Heterosexual Pride Parade participants**  
Abby PETERSON (Gothenburg University, Sweden) | abby.peterson@sociology.gu.se  
Mattias WAHLSTRÖM (Gothenburg University, Sweden) | mattias.wahlstrom@sociology.gu.se  
Magnus WENNERHAG (Gothenburg University, Sweden) | magnus.wennerhag@gu.se

A foundation stone in the social movement theoretical construction that became known as resource mobilization theory was the notions of “conscience adherents” and “conscience constituents” that were first introduced by John D. McCarthy and Mayer N. Zald in 1977. In this paper we will ‘re-visit’ these concepts, which represent an attempt to capture individuals and groups that are part of a social movement, in this case LGBT movements, or are direct supporters of a LGBT movement organization, but who in both cases do not stand to directly benefit from the success of its goal accomplishment. In focus for our study is the relationship between the needs and interests of conscience adherents and constituents and beneficiary adherents and constituents in LGBT movements. On the basis of quantitative data collected during Pride demonstrations in Stockholm, Haarlem, London and Warsaw we will analyze the group of participants who reported that they were heterosexual and compare them to non-heterosexual pride participants. Comparisons of the four country cases will allow us to elaborate on the impact of different mobilizing contexts on conscience adherents and conscience constituents.
Transformation of the Post-Revolutionary Tunisian Feminist Movement and the Role of the Body
Johanna Maria ULLMANN (Ludwig-Maximilians-Universität München, Germany) | johanna.ullmann@campus.lmu.de

Three years after the Jasmin Revolution the Tunisian feminist movement is confronted with ongoing political and social dynamics and unstable shifts of power. The change of the political framework leads to new developments within the feminist movement. Internal conflicts between ‘old’ and ‘new’ feminist activists characterize these movement transformations. This empirical study explores how ‘old’ and ‘new’ Tunisian feminist activists generate commitment and in which way they share common interests and cognitive perceptions of success or failure of the previous mobilisations. Particular attention is paid to ambivalences with regard to the use of the body through veiling. The data explored is collected through ethnographic field research using grounded-theory-methodology. Utilizing a social-constructivist perspective by deploying framing, collective identity and body politics as theoretical frameworks the findings show that post-revolutionary feminist mobilisation goes beyond fault lines between secular and religious orientation. The data proves joint strategies of interventions and shared practices of framing. While ‘old’ activists interviewed continue the pre-revolutionary dominant feminist perception of veiling, ‘new’ activists develop different modes of legitimization of veiling in order to justify their affiliation to the feminist movement. Thus besides factors of diversity like social class, cultural tradition and region future feminist activism and collaboration in post-revolutionary Tunisia strongly depends on internal outcomes of negotiations of body politics. The study contributes to the understanding of continuity and development of feminist movements under post-revolutionary conditions of transformation and democratization by illustrating the role of the body for internal movement dynamics.

RN25S10 - Student & Urban Movements

New inclusive identities and changes of urban space: a study of political activism in Möllevången, Malmö
Christina HANSEN (Department of Global Political Studies, Malmö University, Sweden) | christina.hansen@mah.se

Proposal for general session (1)
This paper is based on my ongoing PhD project on political activism in Malmö, focusing on three extra-parliamentary activist networks that address issues related to antiracism, migrants’ rights, anti-neoliberalism and segregation in the city. They take place in the context of neoliberal urbanism and restructuring, immigration, and a rise of right-wing groups. There is a need for empirical studies on micro-level to show how activists’ experiences illuminate a larger social order and relations of power. This paper addresses this issue, focusing on individuals’ narratives and experiences of struggles for social change, based on ethnographic research methods. I explore the conditions for and the consequences of political activism, with special regard to the creation of new inclusive identities, the role of migrants in these processes, and changes of urban space. How are boundaries and identities imagined, experienced, challenged or reconfirmed by activism? Are new spaces of inclusion created by activists’ virtual and transnational communications, and by acts of solidarity in public space? With the help of the inter-related
concepts ‘autonomous geographies’, ‘counterpublics’, and ‘spaces of appearance’ I try to tease out what comes out of these assemblies of bodies in streets and squares. This paper suggests that activism in Malmö contribute to the social and spatial incorporation of people with different social, economic, ethnic and educational backgrounds, and create space for shared visions and solidarities. It also suggests that activists’ practices in public space are an important resource for the public articulation of new inclusive identities, which challenge existent discourses of ethnic segregation, of diversity as difference and anti-immigrant sentiments.

Countering Hegemony through a Park: The Gezi Protests in Turkey
Kivanc OZCAN (Middle East Technical University, Turkey) | kivanc.ozcan@gmail.com
Nazli SENSES (Baskent University, Turkey) | nsozcan@baskent.edu.tr

This chapter discusses the Gezi Park protests, which has erupted in Istanbul and then spread to other cities in the spring and summer 2013 as a response to the Turkish government’s anti-environmentalist policies in particular and its overall ‘authoritarian’ political performance in general. The discussion flows within a theoretical framework inspired from the Gramscian concept of hegemony while explaining the alliance of various, even previously competing, political and social actors of the protests who are from different walks of life. Particular focus of the chapter however is on the responses of different kinds of ‘immigrant’ groups: As national minorities and ‘internal migrants’ we focus on the involvement of Kurdish and Alevi populations into the protests. Also we focus on the involvement of the Turkish diaspora abroad as ‘international migrants’ in USA, Europe and elsewhere. Thus, the focus will be on how an immigrant identity has been represented in the protests, and how it came into alliance with different political actors who took part in the Gezi Park protests.

No Expo Network: multiple subjectivities and right to the city
Niccolò BERTUZZI (University of Milano-Bicocca, Italy) | n.bertuzzi1@campus.unimib.it
Paolo BORGHI (University of Milano-Bicocca, Italy) | p.borgh4@campus.unimib.it

Technological devices are supporting the convergence of subjects which would never have shared common actions before. These conditions redefine the possibilities of confrontation, organization, dialogue and agreement (Kamel 2014), the definition of a common minimum frame (Tremayne 2014), the dynamics of adhesion to the protest allowing multiple adhesion paths (Bennet, Segerberg 2011) the forms of participation (McDonald 2002). Within this frame the concept of “collective identity” need to be re-discuss (Melucci 1984; 2000; McDonald 2002). Within the Network Society (Castells 2003), individuals react against deindividualisation processes (Touraine 2000), through reflexive paths (Dubar 2000). The main actor is no longer a “us”, but a set of many “I”. If “overlapping membership” (Della Porta 2007) is not new, it’s relevant the emergence of more and more variegated networks of subjectivities. Urban spaces acquire new significances: they becom e sites for meetings and performances (complementary to virtual discussions), sponsors for social and political new realities (Sassen 2011), where re-building existences not colonized by economical and political power (Lefebvre 1996). Claiming the “right to the city” (Harvey 2008) obliges to re-discuss traditional concepts of citizenship and representative democracy.

According with the theoretical framework we'll analyse the No-Expo movement. It began in 2007, but it will know its most significant moments during next months (especially from April 2015). We want to inquire multiple subjectivities and identitites taking part in the (on line/off line) protest, the plurality of critical approaches to the imaginary promoted by Expo and different attempts of urban spaces reappropriation beared by No-Expo movement.
Conflict and change: understanding the role of “critique” within Chilean Student Movement and the current context of transformation in Chilean political and economic system.
Beatriz SILVA PINOCHET (University of barcelona, Spain) | beatrizsilvapinochet@ub.edu

The structuration of neoliberal order in Chile during the dictatorship brought with it the implementation of a series of institutional mechanisms that sought to restrain the possibility of decision making in the political sphere while the market was settle as the only place where individuals could decide. This impulse sought to recondue economy and society to its “normal evolution”, as Hayek would in Chile at 1981. This implied an “objective” and “subjective dispossession” and a “dislocation” -in Polanyian terms- of the social relationships, but also a restructuration of the democratic and political institutions that had characterized Chilean State until that moment. The neoliberal consensus that the dictatorship and the transition period brought with it has recently been contested by several protest of students, workers strikes and movements to resettle de public notion of the state. In that sense, this work will try to understand which role plays the critique -in Luc Boltanski’s terms- raised by student movement, in order to bring transformation in to structures and to carry on with the implementation of renewed consensus, revealing an attempt to “remake” society above new or “neo” foundations. How this process has been provoked specially by Chilean student movement since 2011 and wish are the possible scenarios that the political reforms of the present period will bring, talks about how Chilean but also world institution reshape the self, creating renewed productive models, relationships, social categories, conflicts and social problems, that sociology has to take in account in order to interpret social change.

Toward a new theoretical framework of social movement in contemporary societies: An analysis of Umbrella Movement in Hong Kong
Kwok Fai WAN (Hong Kong Shue Yan University, Hong Kong S.A.R. (China)) | kfwan@hksyu.edu
Ka Yi CHOI (Hong Kong Shue Yan University, Hong Kong S.A.R. (China)) |
gas_choi@yahoo.com.hk

Hong Kong has had an extraordinary year end in 2014. Umbrella Movement, which took the form of street occupation for 79 days in three districts, broke out after the Hong Kong Police Force shot 87 tear-gas bombs to protesters who opposed to the determination by the National People’s Congress of People’s Republic of China to allow only 1,200 hand-picked public figures to nominate candidates participating in Chief Executive Election since 2017. While its impacts were so great as to attract international concerns and media to cover, some characteristics of the Movement deserve more scholarly examination. First, many participants were reluctant to recognize the roles of social movement organizations (SMO) and believed that it is the former’s self-mobilization which sustain the Movement. Second, participants were dedicated to deliberation to devise strategic plans and make decisions. Third, instead of frequent use of confrontational approaches to articulate political demands, participants resorted more to “soft” approaches to educate participants to be reflexive. For example, when there were lots of artistic work created with the theme of universal suffrage, some civil groups set up “Classroom of Democracy” to promote ideas of liberty and human rights. This paper attempts to critically evaluate the extent to which traditional social movement theories in political sociology, such as resource mobilization theory, can explain the causes and development of the Umbrella Movement. Based on the data from 50 interviews with participants and SMO leaders, analysis of coverage of the Movement by 3 local newspapers and personal observation, it is argued that
previous social movement theories are not adequate to fully articulate the dynamics of collective actions in contemporary societies. In the case study, for instance, it is the diversified public discourses flourishly constructed by both traditional and new media which are crucial to the development of the Movement. Drawing also on the experiences of Sunflower Student Movement in Taiwan happened in March 2014, which has widely been regarded as a model to shape the Umbrella Movement, this paper will suggest a theoretical framework to account for the causes of social movement and factors that motivate participants to engage in collective action. Implications on the roles of SMO in future will also be discussed.

RN25S11 - Protest Mobilisation

**Resource Mobilization or Collective Identity? Predicting inside lobbying activities against school closures among Swedish social movements**

Jonas LARSSON TAGHIZADEH (Uppsala University, Sweden) | jonas.larsson@statsvet.uu.se

Providing policymakers with information that relates to the consequences of their decisions is often asserted to be one of the most important means by which professional interest groups influence the decision-making process. Newer research on movement frames suggests that this argument also may apply to social movements. However, it is currently unclear in the social movement literature why some movements are able to persuade elected officials through their technical expertise while others only rely on protest actions and disruptive tactics. In this article, I present a quantitative study of all letters sent to 29 Swedish municipalities from associations and protest networks regarding proposed school closures. New technical information regarding school closures, such as information on unintended economic consequences and alternative proposals that could save costs, have been shown to decrease the probability of closure decisions. The results reveal that highly educated and high income groups are more likely than other groups to present such information in their letters. There seems to be one clear exception to that rule, however: less affluent groups with a strong collective identity.

**Framing Direct Action: Continuity and Change in the 21st Century**

Kevin GILLAN (University of Manchester, United Kingdom) | kevin.gillan@manchester.ac.uk

This paper presents the notion of ‘direct action’ as signalling a complex and enduring interpretative frame, encompassing ideological, attitudinal and strategic preferences that are expressed in a wide range of social movements. It traces the roots of the frame historically before offering an empirical analysis drawing on qualitative data elicited in research projects on alter-globalisation, social forum, anti-war and occupy movements carried out since the early 2000s.

The analysis reveals three lessons that have wider theoretical ramifications. Firstly, treating frames as substantive cultural artefacts to which individuals may be intellectually and affectively committed (rather than as the rather ephemeral collections of slogans often seen in the relevant literature) helps us understand the ways in which particular conflicts unfold. While the identification of interpretative frames is often criticised as a rather thin approach to culture in social movements this paper aims to demonstrate that a full engagement with the nuanced structure a frame can offer a satisfying account of multiple connections between ideas and action. Secondly, exploring the direct action frame in this way reveals both its strengths (in providing relatively robust knowledge to be passed across generations of activists) and its weaknesses (in the form of ideational tensions productive of characteristic practical and political difficulties). Thirdly, by tracing interpretations of direct action in a variety of times and places it is
possible to identify both continuity and change in movement cultures, revealing the degree to which frames can be both enduringly powerful and mutable in relation to specific political contexts.

‘Are you not scared to meet them?’ – research experiences with a study on nationalist movement in Poland
Justyna KAJTA (University of Wroclaw, Poland) | jkajta@wp.pl

The aim of this paper is to present methodological and practical challenges of the research on the nationalist (far-right) movement. Despite the increase in the presence and activity of the nationalist, conservative and right-wing ideas in the public sphere across Europe, there is still pretty little research on them. While there are many studies on progressive movements such as ecological, anti-war or feminist movements, the nationalist movement seems to be passing over or studied only within external perspective (from the distance).

Based on the author’s experience of biographical research on the identity of participants of the Polish nationalist movement, the paper will focus on both difficulties and benefits of internalist studies which involve direct relations between nationalist activists and a researcher (McAdam, Blee). On the one hand, the research involves numerous dilemmas and fears: (1) how to gain entrance to nationalist milieu, (2) how to encourage participants to talk, (3) how to conduct interviews, (4) how to deal with own emotions and, finally, (5) how to analyze the data obtained. On the other hand, internalist perspective enables us to understand motivations and goals of the activists who (re)create the movement and, thus, one of the core mechanisms of the contemporary far-right mobilization. What is more, it is helpful in exploring the influences of the participation in social movement on the members’ language, self-perception, knowledge, worldview and life decisions.

Collective Identity between Inclusiveness and Disintegration: the Fracturing of the 2011 Egyptian Revolution
Jann BOEDDELING (London School of Economics and Political Science, United Kingdom) | j.boeddeling@lse.ac.uk

The concept of collective identity provides one of the primary answers to the question of how social movements ensure cohesiveness (Hunt and Benford 2004). Scholars have argued that shared experiences of struggle like joint protests create mutual trust and solidarity which reinforce such identities (Goodwin et al. 2001). Moreover, jointly confronting repressive force purportedly strengthens collective identification even further (della Porta and Reiter 2006). The fracturing of Egypt’s 2011 revolutionary movement challenges this social movement studies (SMS) account.

The paper suggests that in order to understand developments in Egypt, we need to account for the dynamics of cultural construction which lead to a coalition between sections of the Islamist and “pro-democracy” movements in the lead up to the revolution. Faced with limited participation in their actions, members of these otherwise opposing groups embarked on a strategy of joined actions (El-Hamalawy 2007, El-Mahdi 2009). It is argued that this sustained interaction resulted in the elaboration of an inclusive collective identity which articulated sites of political opposition that appealed to broad cross-sections of the society (Abdelrahman 2012, Singerman 2013). However, standard SMS conceptualizations are insufficient to capture both the mobilizing power and limited durability of the revolutionary movement based on this inclusive collective identity. A neo-Gramscian conception of hegemony which highlights the relevance of leadership and organizational frameworks is shown to capture the limitations of the
Egyptian revolutionary movement more successfully. It provides a thicker description of the successes and failures of the identity work which it carried out.

**Anti-religious mobilization in contemporary Poland**  
**Radosław TYRAŁA (AGH University of Science and Technology, Poland) | rtyrala@agh.edu.pl**

Poland has a reputation one of the most religious countries in Europe. However, it does not mean that it is a country free from organized forms of opposition to the religious culture of Catholicism. Social movement of nonbelievers/rationalists/humanists/freethinkers has been active in Poland from over a hundred years. During this time – due to the complexity of Polish history – one may distinguish at least three phases of its history. Here I would like to focus on the contemporary stage. This movement was reactivated in the XXI century. The two main reasons of this fact, which I would like to mention more broadly, are the development of communication technologies and the emergence of a New Atheism movement in the West. Activists of that movement set themselves both a cultural and structural targets – to provide a secular alternative to the Catholic cultural patterns in Poland. It suggests that this is a new social movement, but it is not so obvious in the light of some of its characteristics. The purpose(s) of my presentation are as follows: i) to illustrate the main ways of resources mobilizing, especially the network-mediated, ii) to characterize the repertoire of collective action, iii) to characterize the current political opportunity structure of the movement. Moreover, I would like to identify some of the sources of the collective activity of nonbelievers in Poland, which lie mostly in the realms of identity and subjectively perceived discrimination against members of this community.

**RN25S12 - Social Movement Outcomes II**

**PODEMOS: a consequence of protests? When grievances bridge electoral and non-conventional borders**  
**Martin PORTOS (European University Institute, Italy) | martin.portos@eui.eu  
Joseba FERNÁNDEZ (Universidad Complutense, Spain) | josebafergon@gmail.com**

This study adopts a dynamic perspective to assess the cycle of contentious performances taking place in Spain during the Great Recession, 2008-2014. The very pressing circumstances have brought social movement scholars’ attention back to the role of grievances in accounting for mobilization. We argue, these influence protest participation if we stress their subjective-attitudinal components (namely, socioeconomic-political dissatisfaction and mistrust in representative institutions). We understand political participation as a continuum, which goes from the institutional-electoral domain to the extra-conventional arena. Our overall argument is that the level of subjective grievances affects political participation, as people seek to express them. Grievances affect the overall level of protest events. This happens until a certain turning point in time, where emphasis moves towards the institutional side of the coin. From then on, grievances account for ebbs and flows of diachronic vote intention of the two majority parties, PP and PSOE. This growing discontent towards the core intermediary institutions of representation is expressed when a credible alternative with success potential emerges and gains media (and public opinion) attention, such as PODEMOS. Its emergence is explained by a combination of factors. Besides organizational strategies, public discourse convenience in a recession-driven scenario and (social) media presence and management, we argue success of
this Spanish party in the 2014 European election would be a by-product of attitudinal grievances at the aggregate level. This is conditional upon a gradual decrease of protest events happening. At a certain point, people start perceiving electoral participation as a more effective channel for goal attainment than non-conventional mobilization due to institutional closure. On the empirical side, we use Protest Event Analysis. Data on protest events are collected from El País for the aforementioned time-period. Covariates for grievances coming from various sources (Eurostat, CIS, Eurobarometer, etc.) complement them. The specific methodological endeavour used is piecewise segmentation with time-series regression analysis. Quantitative analyses are complemented with information from about 10 semi-structured interviews with anti-austerity activists, some of them also involved in PODEMOS.

Bridging protests, democracy and citizen participation in decision-making processes: Analysis of a Portuguese case study in the health domain
Ana Raquel MATOS (Centre for Social Studies, Portugal) | amatos@ces.uc.pt

Over the last years, significant changes occurred in the forms of collective action by protest and in social movements. Protest actions increased all over the world, and the emergence of new forms of collective mobilization is now undeniable. Portugal did not remain indifferent to that and it's now facing changes in the relationship between the State, civil society and political participation. Political participation is still associated to institutionalized forms of citizens' engagement in decision-making processes, relegating to the background the so-called unconventional forms of participation such as protest actions. This is, however, a restricted conceptualization of participation, which results in a too narrow definition of democracy that tends to devalue the impact of this forms of collective action at various levels. The work to be presented discusses the main axes of the theoretical approaches of participatory democracy, and evaluates how collective action through protests has been framed within such theoretical approaches as legitimate spaces of citizen participation in decision-making. In addition, it discusses how protest actions can amount to forms of high intensity democracy. The analysis of one case study in the Portuguese health domain will inform these questions. It refers to a controversy erupted in 2006, that followed the decision by the Portuguese Health Ministry to close a number of maternity wards in several regions of the country, one of the Portuguese cases of protest lasting longest in time. Considering the analytical framework adopted and the core questions this work intends to respond – democracy, studied through citizen participation in decision-making processes – the data to be presented derive from a qualitative approach, namely semi-structured interviews held with key informants, documentary analysis and written media analysis on the abovementioned health protests retrieved from two national newspapers.

Which Crisis, Which Protest, Which Politics? The Public Discourse on the Crisis and Political Outcomes in Southern Europe
Lorenzo ZAMPONI (European University Institute, Italy) | lorenzo.zamponi@eui.eu
Lorenzo BOSI (European University Institute, Italy) | lorenzo.bosi@eui.eu

Southern European countries have been particularly hit by the economic crisis and austerity policies in the last few years. The relatively similar structural context has clearly produced some similarities in terms of political outcomes, both in the institutional and in the protest domain. Nevertheless, significant differences across countries have been identified by the literature in both domains: anti-austerity protests and electoral outcomes of the crisis have taken different forms in each country.
How is the framing of the crisis in the public discourse related to these differences? And what about the presence of specific actors and issue in the public sphere? Are specific political outcomes more likely to take place in context characterized by the prevalence of specific narratives of the crisis?

We aim to answer these questions focusing on Italy, Spain and Greece and drawing both on the existing literature on protest and politics in these countries and on a political claim analysis conducted on the most important newspapers of each country in the last ten years (2005-2014). The political claim analysis, coding 1000 claims in articles referring to the economic crisis published in five different newspapers in each country, will allow us to identify actors, issues, objects and frames related to the crisis, that we will analyse in relationship with the existing scholarship on protest and political outcomes in such countries.

**Technological Mediation in the Emergence of Movement-Parties in Austerity Spain**

Eduardo ROMANOS (Universidad Complutense de Madrid, Spain) | eromanos@ucm.es
Igor SÁDABA (Universidad Complutense de Madrid, Spain) | Igor.sadaba@cps.ucm.es

The Spanish 15M movement (also known as the Indignados) was very critical of political parties and, in general, of the current system of political representation. However, the incipient institutionalization of the movement which is embodied by the creation of new political parties such as Partido X, Ganemos and Podemos, does not seem to have been particularly traumatic for many of the activists who took part in the movement; in fact, many of them are actively participating in the development of these parties. In this regard, one of the results of the 2011 protests appears to have been the emergence of new ways of articulating the relationship between social movements and political parties. In some ways, we are now presented with a hybrid (movement/party) within which the evolution of one form of collective action into another may be observed. This paper examines the role played by new technologies in this evolution. The basic hypothesis is that the extensive use of digital tools (Reddit, Loomio, Appgre and Agora Voting, among others), which encourage participation and deliberation in the creation and development of these new parties, in some ways reproduces essential values and practices of the movement, thus facilitating the identification between the 15M activists and the parties. In this way, the transition between movement and party has been conditioned by, among other things, a component of technological mediation. The use of these tools has been accompanied by the development of a certain technophile frame that stresses the potential of new technologies for social and political change. This, in turn, has had an impact on the organization of these new political parties, turning them into a form of collective action that still resembles the original social movement substratum from which they sprang. This has contributed to the 15M activists having a favourable opinion of these parties and also to their active involvement in them. The creation of mechanisms that facilitate (or at least do not burden) participative and deliberative democracy was, in fact, one of the 15M’s major demands. In this regard, and without ignoring other factors, this paper argues that the emergence of these new parties is the political outcome of the 15M movement, and that new technologies have played a significant role in this.

**RN25S13 - Environmental Movements**

**How many colors does the green contain? Cognitive work and cultural change in the environmental movement**
Compared to other social movements, environmentalism seems to be a very heterogeneous phenomenon. The roots of political ecology, for example, cannot be understood in a Southern European country like Italy without referring to its political space, and specifically to its connection with the anti-nuclear mobilizations and the experiences of the so-called post-68 New Left. Against whom stresses the attention about the totally newness or the innovative post-materialistic aspect of this “green challenge”, some scholars have tried to analyze the many colors of this apparently autonomous and ambivalent culture: the red of the working class, the rainbow of the pacifism are the main examples. Looking at the political biographies of activists engaged in contemporary local environmental or territorial conflicts in Italy I aim to analyze two main aspects of this “innovation through the tradition”:
1) the debates and practices elaborated already in the 1960s during the first anti-nuclear protests – overall, critique of the neutrality of science, popularization of scientific knowledge, democracy from the community and 2) the characteristics and motivations of the participants. These two dimensions will allow me to show the multiple experiences that will merge into the “green issue” and the different political meanings it assumes. I highlight the question of the social movement outcomes in terms of both organizational traits - “practices diffusion” like collaboration between experts and laypeople – and both cultural traits – “identity formation”, at the individual and collective level.

Carrotmob – collective action for a sustainable society
Satu HUSSO (University of Turku, Finland) | satu.husso@utu.fi

The Carrotmob is a community that aims to solve environmental problems, such as global warming and carbon dioxide emissions by coupling consumer power in a particular way. The Carrotmob aims to stimulate consumer behavior on the micro level in order to effect to the macro level. It can be seen as a social movement that mobilizes non-organized consumers and encourages companies for more sustainable business.
Although the activists of the Carrotmob campaigns do not usually see their action as political, my standpoint to study this phenomenon draws from the political sociology, particularly from the theory of political consumerism. Political consumerism refers to the individual or collective choices in the market that aim to affect on societal issues. The citizens-consumers have got a central role in the responsibility-taking for more sustainable future, which couples together the public and private sphere in a way that extends the traditional concept of politics.
My research interest is in the utopia of sustainable consumerism and sustainable society created by the Finnish Carrotmob movement that has been active from 2008 to 2013. I will investigate what kind of utopian narrative of sustainability the movement outlines. The data, that is movement’s website, mainly consists of visual and audiovisual data. I argue that narrative approach and visual analysis are applicable within the studies of new political activism. This study participates the theoretical discussions on political consumerism and understanding the concept of politics.

Bringing Emotions Back in the Study of Social Movements: A Comparative Study of Anti-Nuclear Movements in Three Mile Island and Fukushima
Risa MURASE (Sophia University, Japan) | risamurase25@gmail.com

This paper explores the role of collective emotion in the framing process in social movements. The role of emotions in framing theory has been studied by Schrock, Holden, and Reid (2004), who have introduced the concept of emotional resonance. Emotional resonance refers to a
mental state where strategic emotional messages cast by the movement organizers create to evoke movement participation. In this paper, instead, I argue that emotions go beyond such strategic dimension of framing process. Emotions function not only as a means to win bystanders’ support but also as a constant guide and reminder of participants’ initial motivations that enable participants to start and continue movement activities. By introducing the concept of collective emotion, I attempt to shed light on more crucial roles of emotions in social movements. To attain this goal, this paper compares two anti-nuclear movements that took place in 1979 Three Mile Island and 2011 Fukushima, analyzing the formation process of emotional convergence and the effect it has on the consensus-making process among movement participants. I argue that emotional exposure in a public setting creates a collective emotion, which in turn stimulates convergence of opinions and ideas that were originally diverse and controversial, and thus reinforces the motive to participate collectively in the activities.

When the regulation of conflicts keeps social movements going: the case of environmental policies
Aymeric LUNEAU (Ecole des hautes études en sciences sociales, France) | Aymeric.luneau@gmail.com

This paper examines the role of environmental risk regulation on the emergence of environmental social mobilisations. I will present two French environmental issues that I analysed in my PhD work: the mobilisation of victims suffering health damage caused by perchloroethylene, a chemical used in laundries for dry-cleaning, and the residents’ movements against the pollution around the “Etang de Berre”, an industrial area near Marseilles.

The purpose of environmental policies is to regulate environmental problems and to contain social conflicts. One policy approach is to concentrate polluting activities in “industrial areas” (Massard-Guilbaud, 1999, 2010 ; Sze, 2007). This approach tends to contribute to the environmental injustice, because residents consider that their environment and health have been unfairly sacrificed. Because residents feel that they have not a say, they engage in collective mobilisations.

Participatory processes aim at empowering ordinary people and thereby improving democracy. However, I will show that the participatory processes keep the environmental movements going. On the one hand, the participatory processes can reinforce citizens' feelings of injustice, because these processes categorise citizens into those who can take part in consultation, and those who cannot. On the other hand, public debates can generate a collective dynamic, whereby the actors question facts that were previously taken for granted, take part in research in order to resolve their doubts, and discover problems that have previously gone unnoticed. In so doing, participatory processes help further spread and extend environmental movements.

Narratives and Collectivities in Social Movements: Patterns of Engagement of Climate Change Activists in Finland and Malawi
Eeva LUHTAKALLIO (University of Tampere, Finland) | eeva.luhtakallio@uta.fi
Iddo TAVORY (New York University, US) | iddo.tavory@nyu.edu

Based on interviews with climate-change activists and NGO workers in Finland and Malawi, this paper re-conceptualizes the ways in which collective identity-projects are leveraged to understand social movements. Rather than focusing on "We-Narratives" to operationalize collective identity and "I-narratives" as proxies for personal identities, we juxtapose these narrative-forms to patterns that emerge across interviews. Doing so in vastly different social contexts allows us to see permutations in forms of identity afforded by ostensibly similar participation in a transnational social movement. Finnish activists and NGO workers shared a
We-Narrative that highlighted the social good they pursued, but also related their personal biography to the movement in highly patterned ways. Their Malawian counterparts linked their identity to volunteering and NGO work through narrating a highly patterned individualized mobility project: shared I-Narratives that allowed them to construct their identities as upwardly striving, aspiring-elites. We then show that these different identity-formations matter for actors’ mode of engagement with the organization they participate in and with their fellow activists, and thus for the form that ongoing collective action may take.

**JS_RN25+RN28a - Football Fans, Activism and Social Change I**

**Political orientations of Russian football fans in the context of the 2018 World Cup**

Larisa VDOVICHENKO (Russian State University for Humanities, Russian Federation) | vdlarissa45@yandex.ru

In the 21st century the sociology of football and other spectator sports became responsive to the political and social activism of its supporters. This paper focuses on the public opinion connected with Russian football fans. First, it’s an attempt of highlighting and understanding the views of the football fans on public policy, state institutions and its representatives, political parties and movements, and other aspects of political life. The second goal of this study is to examine the attitude of different groups of Russian population to the football fans and their actions.

Football fan culture has been developing rapidly in Russia for at least the past two decades. Russian football supporters have been engaged in political campaigns as for example elections, meetings, demonstrations and other forms of activism. Some political actors gradually politicized fans by asking them to join protest actions. Each eminent Russian football team (Spartak, Dinamo, Zenit etc.) has its own fandom and supporter culture. Its numerous fans demonstrate heterogeneous, sometimes contradictory, even nationalistic, political orientations. Russian fans travel to their favorite clubs’ matches abroad. Sometimes they have problems crossing state borders. This paper presents a sociological analysis of fan political values in Russia. Case study was conducted in Moscow in 2014-2015 by using such methods as participant observation at the fan meetings, interviews with football supporters, and an analysis of internet fan sites, blogs and public survey data. This research is of strong contemporary significance given that soon Russia will be the host of the 2018 World Cup.

'Donald you moron, your government will be overthrown by hooligans' – evolution of the conflict between the government and football supporters in Poland.

Radoslaw KOSSAKOWSKI (Gdansk University, Poland) | radoslaw.kossakowski@ug.edu.pl

Presentation of the Polish government vs. Football supporters conflict is the main purpose of the paper. The analysis is divided into three parts. Firstly, reactions from Polish Prime Minister, Donald Tusk to incidents of vandalism and hooliganism in Polish stadiums will be presented. The imagery of 'war' appeared in the statements provided by representatives of the government. Secondly, fans reactions and forms of protest against government policies will be described. Supporters prepared street performances, anti-system choreographies at matches. Slogan: 'Donald you moron, your government will be overthrown by hooligans' became the leitmotif
presented at several stadiums. Terms like 'second-class citizens', 'public enemy' are revealed in the discourse of fandom. One of the arrested leaders of the fan movement has become a symbol of repression, called 'political prisoner'.

Thirdly, it is crucial to show all implications of these events. The government consistently implements the strategy of 'civilizing', as a result – football hooliganism was actually banished from the stadiums. On the other hand, the conflict has consolidated fan movement. This is manifested by – most of all – all-Poland involvement in the promotion of patriotic and conservative ideas and strong anti-establishment attitude.

Examined conflict has not led to change of the political system by the subordinate group (fans), and has not yet demolished government's opponent. No form of dialogue or reconciliation appears between both sides. On the conceptual level, Polish case encourages reflections on existing approaches in sociological theories of conflict and their advantage for the analysis of Polish football field.

**Being Politicized of a Football Fan Community: The Case of Fenerbahce SK**
Çağrı ASLAN (Gaziantep University, Turkey) | caslan06@hotmail.com

Football is the most popular sport in Turkey, just as in the world. And football fans are quite fanatic. Football market of the country brighten three club which established in Istanbul. These are Fenerbahce, Galatasaray and Besiktas. Approximately ninety percent of the number of fans in the country, supports one of the three Istanbul clubs. Fans are separated from the Europeans about sense of belonging. Football supporters do not represent any social class, sect, ethnicity or ideology, just like football clubs in Turkey. Therefore can not mention about indigenisation, originality or diversity. Supporter culture in Turkey does not contain any political stance generally, apart from some special supporters groups. While such a football environment in the country, a large scale operation was launched for match-fixing on 3 July 2011 in Turkey. The process named as “Match-fixing in Football Case” which Fenerbahçe SK is located in the center is still continues today. The most striking part of the case is that it has caused the initiation of a social movement, apart from political, financial, legally or sports aspects. Furthermore, wide range of a supporters group has been politicized. This case gave rise that a supporters group come into prominence as a civil movement by build up opposition block. These events constitute a unique example in terms of sociology of sports and civil society movement. I aimed to demonstrate how a supporters group might be politicized in a few years.

**JS_RN25+RN28b - Football Fans, Activism and Social Change II**

**Between Individual and Collective Historiographies: A Critical Analysis of Football Supporters Discourses**
Renan PETERSEN-WAGNER (Coventry University, United Kingdom) | renan.petersen-wagner@coventry.ac.uk

Ulrich Beck claimed that we are living in an age of cosmopolitanisation. Cosmopolitanism for Beck and his different collaborators entails the re-modernisation of modern institutions and structures, the living in uncertainty - risk society -, and individualisation. For Beck & Beck-Gernsheim (2001) the individualisation thesis within a cosmopolitan sociology assumes that individuals are bound to chose and are crafters of their own biographies, in what they conceptualised as the precarious freedom. Departing from those assumptions, based on an 18-month ethnographic inspired research of football supporters in Brazil and Switzerland, I sought
to unveil the discourses supporters created in relation to their historiographies as geographically distant fans of Liverpool FC. The critical discourse analysis showed that supporters used both individual and collective motives to craft their biographies as Liverpool supporters. Falling in love and learning to love were used prominently in supporters’ discourses as an individualisation rhetoric. From where to learn how to love and how to maintain simultaneous multiple loves were used as a collective rhetoric. From those findings I argue that instead of ‘dasein für andere’ as in modernity, or crafters of their own biographies in reflexive modernity, individualisation in cosmopolitan times entails a ‘dasein für gewälthe andere’ being this other the re-traditionalised structures of modernity - namely the nation-state and family. I conclude by pointing out that precarious freedom does not relate to the process of choosing, but to the unintended consequences of those choices.

Struggles for participation: Two case studies from German football fans of Hannover 96 and Hamburger SV

Christian BRANDT (Manchester Metropolitan University (associate member)) | fussballbuchprojekt@googlemail.com
Fabian HERTEL (Manchester Metropolitan University (associate member)) | fussballbuchprojekt@googlemail.com

The short dated past has shown diverse actions of German football supporters against ‘modern football’. Public and science discusses if these struggles might be rated as social movements. In our lecture we want to contribute to this discussion alongside two actual cases by highlighting the dynamics, obstacles and narrowness of such movements. Both cases depict supporters' declining influence as club members.

The first case sheds light on the Bundesliga club of Hannover 96. Its president tries to gain more than 50% of club proportions by dodging the German football law by juristic loopholes. The second involves the HSV. Since July 2014 the first two Teams of the HSV are run under the legal status of a company, that got excluded from the club. This change enables investors to purchase shares of the HSV.

In both cases organized supporters have struggled against these developments of ‘modern football’. In Hannover the fans spared out in the stands on match days but away fans showed solidarity. In Hamburg the organized fans started a campaign against the opening of their club to investors.

By evaluating these two examples we approach to the chances and limits of football supporters as social movement in regard of their aims, the main actors, protest actions that take place, the intern struggles, the graduated organization, communication, and group constitution.

Critical Consumption and the Mobilization of Football Fans: Customers, Citizens and ‘Citimers’

Dino NUMERATO (Loughborough University, United Kingdom) | D.Numerato@lboro.ac.uk
Richard GIULIANOTTI (Loughborough University, United Kingdom) | R.Giulianotti@lboro.ac.uk

Processes of globalization and hyper-commodification have often been associated with the envisioning of football fans as consumers. An active minority of critically engaged and increasingly networked football fans have frequently opposed this framing, and instead have endeavoured to define themselves as citizens. By examining the ways in which fans express their subjectivities and in which they are objectified by football and political authorities, we provide a more nuanced understanding of critically engaged football fans with regard to their position on a continuum between consumer and citizen. In addition to these two categories, we introduce the hybrid notion of “citimer” (citizen-consumer), which may be used to understand the
position and practices of diverse spectators in sport, as well as different individuals and social
groups within other cultural contexts. The data that underpin the analysis are drawn principally
from primary sources, through semi-structured interviews with supporters, football associations'
and football clubs' officials mainly from Italy, the UK and the Czech Republic. Secondary data
sources include newspaper articles, e-zines, blogs, internet discussions and websites. Our
analysis is focused on public debates on the Tessera del tifoso (supporter identity card) in Italy,
ticket pricing in the UK, and the implementation of supporter liaison officers (SLOs) in European
football clubs. The paper is part of the wider FP7 EC project "Football fandom, reflexivity and
social change (FANSREF, ref. number 331097)".

"Reviving Zbrojovka’s Glory": Collective Memory, Fan Engagement and One
Football Stadium
Zuzana BOTIKOVÁ (Masaryk University, Faculty of Social Studies, Czech Republic) |
zbotikova@mail.muni.cz
Michal ŠINDELÁŘ (Masaryk University, Faculty of Social Studies, Czech Republic) |
sindelar.mich@gmail.com

Football stadiums are for many football fans synonyms of their sporting affiliation, moreover also
their local identity. Besides being an important part of the football clubs' trade mark, stadiums
also play a crucial part in the narratives regarding the club, its fan base, however also their
urban neighbourhood. They provide the ultimate space for creating a shared collective memory -
through social encounters, negotiations as well as mutual celebrations. However, those shared
narratives usually change, when the club moves to a new stadium, with the nostalgia overruling
the objective advantages of the new venue. In our paper we want to present a unique case of
reviving collective memory regarding an old and abandoned football stadium Za Lužánkami in
Brno, which is strongly tied to the history of the local club Zbrojovka. The stadium was built in
the early 1950s and for some time it was the largest stadium in the former Czechoslovakia. In
2001 Za Lužánkami was closed due to adverse technical conditions and should be demolished
in the nearest future. However, there is a recent revival initiative that comes from a former
Zbrojovka player, who besides his own nostalgic sentiments wants to allow the local football
community to say farewell to “their” stadium. Through a mixed method approach we observe
and problematize the processes of communal nostalgia as well as memory revival.

Reforming or Replacing the Welfare State? Social Consequences and Trends
Mariusz BARANOWSKI (Adam Mickiewicz University, Poland) | mariusz.baranowski@amu.edu.pl

This paper explores the general trends in the changes of the welfare state institutions from the perspective of debates and disputes including the last four decades. The object of interest will not be limited to purely theoretical discussion, but above all to fully practical implications of changes in the transition from welfare state to welfare society (J. Rodger), workfare state (J. Peck), workfare society (L. Mead), or welfare pluralism and mix (U. Ascoli, C. Ranci). In order to exemplify the empirical evidence I compare the effects of these changes in selected countries in the last 30 years (especially taking into account the recent economic crisis). Empirical data will show the effectiveness and ineffectiveness of the adopted reforms from the point of view of the labor market, labor force participation, socio-economic disparities, poverty level, the level of trust in institutions, etc.

The culture of post-welfare in the narrations about aging
Iwona Ewa MLOZNIAK (University of Warsaw, Poland) | i.mlozniak@is.uw.edu.pl

The aim of the paper is to situate discourses about aging on the frames of changes in (welfare) state policies. The welfare state is understood here as much as political as cultural rooted phenomenon. That means that changes in the conceptualization of the state can be linked with other, nonpolitical, phenomenona and knowladges which submit to “social system”. In the paper focus on the notion of aging and its problemation in the policies of EU and Poland and how they correspond to those of the role of the state. For example responsible and self-managing subjects are one of the types that can be find in activity discourses in the narrations on aging. This is, however, accompanied by discourses based on different kinds of political subjectivities, defined by care for younger generations or local engagement, that also connected with subsidiarity “paradigm” but at the same time creating different social subjects and frames of problematizations. The effect is emerging of (not so) new social actors who seems to replacing in fragmented manner particular protective state's functions. Therefore the paper is an outcome of an attempt to trace those lines, name them and create a kind of map of a nodal points where emerges types of policies and social subjects. First it outlines the diagnosed types of subjectivites included in discourses about aging, then situates them in the context of contemporary changes in welfare state policies. It concludes with the positioning this in the frames of socio-cultural diagnosis of contemporaneity.

What's in an individual care plan? Textual Technologies and the Management Of Care Work
Kjetil LUNDBERG (Uni Research, Norway) | kjetil.lundberg@uni.no

Forms and documents play a significant role in the context of care work. One stream of forms that care workers deal with on an everyday basis is various versions of individual care plans (ICPs). In public reports, ICPs are described as management tools for coordination, intended for
the provision of increased efficiency, accountability and user involvement in the public sector. Thus, ICPs are assumed to have governing powers. But what do the ICPs really do? When do they work and when do they not work? In this paper I investigate the management of care work practices from the perspectives of care workers in four different care settings in Norway. I identify ICPs and how these enter practices in care workers’ accounts of their everyday work situations. I then investigate what these texts do. Empirically, I draw on interviews with 31 care workers carried out in 2013-2014 in four different settings of formal elderly care (care sites) in Norway. Theoretically and methodologically, I draw on insights from Institutional ethnography. The analysis uncovers that although ICPs may coordinate and standardise practices, they may also work very differently in different settings. Grounded empirical investigations are therefore crucial in order to understand how ICPs work.

Understanding welfare state changes through cultural sociology
Janne Mikael AUTTO (University of Lapland, Finland) | janne.autto@ulapland.fi
Mikael NYGÅRD (Åbo Akademi University, Finland) | mikael.nygard@abo.fi

After the ‘golden age’ of the welfare state we have faced not only changes in public policies but also changing moral and cultural assumptions on welfare and social inequality. This has raised discussions on the need for a cultural approach, which – with certain assumptions on culture – helps to understand the ongoing welfare state changes. In our paper we outline the possibilities opened by a cultural approach by asking how studies based on certain ideas of cultural sociology and cultural studies may help to understand the abovementioned changes. The paper examines studies on welfare state and social policy, which apply, for example, starting points offered by the French pragmatic sociology, British cultural studies, feminist theory, and ethnography. As a conclusion, the paper argues that this kind of cultural approach helps to understand the contested, contradictory and situational nature of the changes in current welfare states. It leads to an examination of the changes through power-relations as well as through the varying perspectives and experiences of various social groups. In addition, this approach might help to understand the challenges for current welfare states with means of description, rather than by seeking for straightforward explanations.

The Road to Freedom. Political Imagination and the (re-)emergence of the Welfare State
Bram MELLINK (University of Amsterdam, Netherlands, The) | brammellink@uva.nl

In the wake of the current economic crisis, welfare politics has become immensely controversial. This is striking, as the creation of individual freedom through deliberate welfare policy has long been perceived as the hallmark of sociological imagination and the cornerstone of postwar democracy. But although sociologists have extensively studied the inability of the welfare state to deal with issues such as individual responsibility and diversity, its shifting relation to the democratic ideals of freedom and equality is seldom taken into account. How did the welfare state, once the key to freedom and equality, turn into its fundamental threat? This paper will provide insight in the ideological origins of the welfare state by focusing on political debates with regards to welfare policy in the immediate postwar period. The Netherlands will provide a striking case-study, as the quick and extensive development of the Dutch welfare state was fiercely criticized by a small group of radical self-proclaimed
‘neoliberals’ in the early 1950s, leading to heated debates about the question whether welfare policy would pave the ‘Road to Serfdom’ (Hayek) or the ‘Road to Freedom’, as Dutch Social Democrats claimed in an influential political report published in 1951. Insights derived from this historical analysis will be used to reinterpret the current crisis of the welfare state through the lens of its ideological development. As will be shown, insight in the shifting ideological underpinnings of the welfare state are crucial for our comprehension of welfare politics and the challenges it faces in the 21st century.

The formation of ‘policy truths’: Foucault and social policy discourse
Alex PICKERDEN (University of Lincoln, United Kingdom) | alex2708@live.co.uk
Donna EVANS (University of Lincoln, United Kingdom) | doevans@lincoln.ac.uk
David PIGGOTT (Leeds Beckett University, United Kingdom) | d.piggott@leedsbeckett.ac.uk

The purpose of this paper is to offer a Foucauldian conception of policy analysis. The theoretical contribution of the paper is to attempt to map out aspects of the policy process using Foucauldian concepts. Building on the significant body of work in the field of the sociology of education, which utilises and remains faithful to the Foucauldian canon, this paper argues that the concept of a ‘policy truth’ is a useful tool for understanding the enactment of power-knowledge and Foucault’s wider concern between power and truth. Adopting a Foucauldian inspired approach towards Critical Discourse Analysis (CDA) this paper draws from an analysis of political discourse that relates to the education policy reform context of the United Kingdom (UK). It is through this critical data analysis process that Foucauldian concepts were utilised in order to illuminate a series of ‘policy truths’. The paper presents these truths as part of a wider concept related to social policy discourse. The idea of a ‘language of reform’ which umbrellas and shields ‘policy truths’ relates further to the concept of power-knowledge and Foucault’s work on governmentality. It is contended that these concepts, ‘policy truths’ and ‘language of reform’, offer a different way of interacting with Foucault and Foucauldian approaches to policy analysis. At the very least these concepts offer a simplification of various aspects of the policy process and how to interpret policy discourse through the theoretical lens of Foucault.

Social consequences of conditionality and welfare contractualism in Poland
Pawel POLAWSKI (Institute of Labor and Social Affairs, Poland; Warsaw University, Institute of Sociology, Poland) | polapaw@poczta.onet.pl

The main objective of the presentation is to identify consequences of the welfare policy based on benefit conditionality and individualised contract as the basic tool of social integration. Conditionality and contractualism are treated here as indicators of commodification and de-naturalization processes (that is the processes of market logic penetrating other areas of collective order).
In literature de-naturalisation is associated with changes typical for postmodern societies. It usually means that market logic owning various aspects of group order is treated as a universal feature. However, various studies show that the process in question is contextual. Its flow and intensity is incorporated in the social structure – resistance toward commodification in poor areas is stronger, and relations based on reciprocity are more common. Grey market activities do not equal employment as they are based on personal relationships and trust. Also, data suggest that problems with implementing welfare contracts in Poland are partly based on resistance – both of social workers and recipients – toward de-naturalisation. The very idea of contract is not rated high not only due to excessive formalities and bureaucracy, but for incompatibility of formal contract rules with the social welfare principles referring to needs.
Consequently, my basic thesis says that scope of conditionality and contractualism in welfare arrangements in Poland is contextual, depending for instance on local labour market conditions. I will also show – referring both to qualitative and quantitative data (e.g. Ministry of Labor data base of welfare recipients) that benefit conditionality is the prerequisite for establishing precarious segments of the social structure.

Conditions for modern welfare stateism
Jorma SIPILÄ (University of Tampere, Finland) | jorma.sipila@uta.fi
Anneli ANTTONEN (University of Tampere, Finland) | anneli.anttonen@uta.fi

The main objective of our research is to answer the question of what are the main preconditions for a modern welfare stateism to evolve and mature. Why the idea of welfare state becomes materialized in some historical contexts and not in some others? The aim of our approach is to carefully analyze histories written about welfare state development by paying a special attention to differences between different policy fields, most particularly between social security, education and social and health care. It seems that there are striking differences in the development of these fields. Thus, we should be very careful when attempting to describe welfare state development as one unified process.

There is much variation between different policy fields: how and why they have been evolved, what are the dominant interests behind major reforms and what are the main outcomes? Our particular aim is to search for the order of things that matter in welfare services: how distinct historical situations give birth and transform welfare service policies such as education and social care. We ask, what are the particular conditions and preconditions that give birth to universalism and those that make end of it. Another central question concerns the motives of different socio-economic groups. We suggest that there are situations in which the interests of the rich and poor, for example, meet in a way that developing universal welfare institutions it not only a possibility but even a necessity.

Poverty of Rural Russia: Trends and Mechanizms of Overcoming
Aliye Mustafaevna SERGIYENKO (Siberian Branch of the Russian Academy of Sciences, Institute of Economics, Russian Federation) | a.m.sergienko@mail.ru

As a consequence of market reforms in Russia a concentration of poverty in rural areas in 1990s led to a decline in labor and reproductive motivation, to spreading of alcoholism and to the mass migration of the youth from villages, that is a threat of social reproduction of rural communities. The paper presents findings on trends and mechanisms of rural poverty overcoming in Russia since the early 2000s. The findings were based on the results of sample surveys of rural inhabitants and expert questionings in agrarian regions.

Since the beginning of 2000s radical improvement of economic status of rural residents was manifested in mass reduction of deprivation (three times), in forming about half of relatively poor and in significant expansion of the more affluent groups. In 2011 the scale of deprivation among the poor (when money is not enough even for food) were already low (13%). Such decline of poverty occurred due to the increase of economic activity of villagers and the implementation of state social programs. Education as a channel of social mobility began to work much better: in the group with higher education poverty reduced twice. At present the salaries, income from family farmstead and the social payments are the main incomes of the rural poor. The role of
entrepreneurial income significantly increased. As a consequence of such processes, a mood of
the villagers improved significantly and migration potential considerably "melted".
We found that social policy and economic activity of rural inhabitants are strong mechanisms of
poverty overcoming.

Means as Ends? – Activation and Agency in the Finnish Youth Guarantee Policy
Jaana LÄHTEENMAA (University of Helsinki, Finland) | jaana.lahteenmaa@helsinki.fi
Lena NÄRE (University of Helsinki, Finland) | lena.nare@helsinki.fi
Lotta HAIKKOLA (University of Helsinki, Finland) | lotta.haikkola@helsinki.fi

Youth guarantee, launched in 2013, is the most important policy programme directed at
unemployed youth in Finland. Since 2014 European Union has promoted the Finnish model,
alongside the Austrian model, as a flagship policy in the efforts of tackling youth unemployment.
Inspired by Carol Bacchi’s ‘what’s the problem represented to be’ approach to policy analysis,
our paper examines the hidden presuppositions, definitions, and underlying logics of policy
documents, parliamentary debates, practical guidelines, campaign materials and newsletters
related to the implementation of youth guarantee in 2011-2014.
We focus on the ways in which the agency of young people vs. adult professionals are
constructed in these documents and how these position in relation to a national ‘we’. The
relevant axes in our analysis are passivity vs. activity and collectivism vs. individualism and we
argue that the young people are constructed as inherently passive while the adult professionals
are active. Furthermore, we investigate inequalities within the ‘youth’ according to migrancy and
disability. We argue that migrant youth are constructed as a priori lacking language and
educational capabilities, reflecting the ways in which disabled youth are constructed.
This analysis brings forth the over-emphasis on the various means of activation, while the end-
result of activation remains fairly hidden. Hence, following neoliberal logic of activating labour
market policies which overlook the structural realities of labour markets, also in the youth
guarantee means become the ends of the activation in themselves.

Socio-economic differences in the length of working lives and their impact on
pension levels
Noora JÄRNEFELT (Finnish Centre for Penisions, Finland) | noora.jarnefelt@etk.fi
Susan KUIVALAINEN (Finnish Centre for Penisions, Finland) | susan.kuivalainen@etk.fi

Socioeconomic differences in pension incomes prevail in all European societies. Reforms in
pension policy, such as a closer link between benefits and contributions, have raised concern of
increasing inequalities. How the pension inequalities are related with the previously held
occupational class of the pensioners is not, however, yet fully understood. The length of working
life potentially has a great impact on the pension level. So far, little is known about the
socioeconomic differences in the observed length of working lives, yet some evidence exists on
the expected lengths.
This paper brings new evidence on these aspects by focusing on socioeconomic differences in
the observed length of working lives and analysing the impact of contributory years on the
monthly level of pension. Analyses include also gender differences, which literature shows to be
significant. The study uses Finnish longitudinal individual level administrative data combined
with data on education and occupation received from Statistics Finland. Data consists of 79 649
pensioners who started receiving old age pension in 2011.
Preliminary results indicate that socioeconomic differences in the length of observed working lives are smaller than previously estimated based on working life expectancies and smaller than gender differences. In multivariate analysis the socioeconomic status, gender, income level during the working-years, the route to old age pension, and the observed length of the working life were all strongly associated with the level of pension income.

The promise of proximity in welfare state reform
Loes VERPLANKE (University of Amsterdam, The Netherlands) | l.verplanke@uva.nl
Evelien TONKENS (University for Humanistic Studies, Utrecht, The Netherlands) | e.tonkens@uvh.nl
Femmiianne BREDEWOLD (University for Humanistic Studies, Utrecht, The Netherlands) | f.bredewold@uvh.nl
Thomas KAMPEN (University for Humanistic Studies, Utrecht, The Netherlands) | t.kampen@uvh.nl

Welfare state reform with serious austerity measures and loss of citizens’ entitlements to services is going on in many European countries. In the Netherlands, we witness the most radical change in welfare state provision since the 1960s. Surprisingly, this change hardly meets any protest. How can we explain that drastic reductions of rights and budgets face so little opposition? In this paper, we try to answer this question by both a conceptual analysis of the policy documents and an analysis of the views and experiences of professionals and clients (based on interviews and focus groups).
We argue that ‘the promise of proximity’ is the leading and soothing concept. Policy documents claim that care and support will be both cheaper and of higher quality if they are positioned closer to clients in various ways: government will get closer to professionals and their organisations, professionals will get closer to each other as well as to clients, and family, neighbours and volunteers will get closer and provide more support to clients. This ideal is attractive to all parties involved, as it is successfully contrasted with bureaucratic, overspecialised services and spoiled clients.
In practice, professionals and clients do sometimes experience more proximity but they are also faced with instances of greater distance, more bureaucratisation and lower service provision. However, these are considered ‘childhood diseases’ on the road to proximity while those who raise criticism are put off as reactionaries who refuse to understand where the world is heading.

Assistences Policies in Portuguese Welfare: Institutionalization and Policy-legacy
Cláudia Priscila SANTOS (ISCTE-IUL, Portugal) | cpcss@iscte-iul.pt
Tatiane Lucia VALDUGA (ISCTE-IUL, Portugal) | valduga@hotmail.com

This study aims to build an analytical framework of two institutionalised social protection policies of a country in Southern Europe: the minimum income policy and assistance to students in the context of the Portuguese Welfare State. Based on the typology proposed by Esping-Endersen (1990), both policies have characteristic indicators of the corporatist model due to the use of cohesion mechanisms and maintenance of social order. The lack of access and the need for proof of means-tested are justified by the principle of subsidiarity and familiarization in that State intervention occurs when there is failure in the family instance that has too much weight in the provision of welfare. Policies are developed based on political legacies low budget investment, discontinuity, emergency care and disarticulation with the other policies that make up the social protection system of welfare. To overcome the fragmentation of welfare system it is necessary to overcome the political legacy concerning the limitations imposed by the corporate regime.
The state should value these policies, basing them on right and citizenship, altering their logic and make them contribute to economic growth and provide positive effects on inequality. Thus, it is investment that can have a positive impact, not innocuous spent. However, this requires a denial of the political legacies originating and transforming the institutional and political structures.

**RN26S01d - General Session: Policy Analysis - B**

**Freedom to choose or state interventionism? The politicization of Finnish family policy in the light of election manifestos 2015**

Mikael NYGÅRD (Åbo Akademi University, Finland) | mikael.nygard@abo.fi
Janne Mikael AUTTO (University of Lapland, Finland) | janne.autto@ulapland.fi

The universal provision of public childcare for children under seven has been a corner stone of Finnish family policy since the mid-1990s and has enabled parents to combine family and work. Also the right to stay home with children under three by choosing publicly subsidized home childcare is a central part of the family policy system. During the late-2010s, however, the Finnish government became increasingly sceptical to the right for parents to choose between public and home childcare. In 2013 the Conservative-led coalition proposed a cutback in the universal right to public childcare and an introduction of a gender quota in the home childcare system. Allegedly this would not only save money for a state in economic crisis, it would also create higher gender equality. The reform also boiled down to the question whether or not parents would retain the right to choose the form of childcare that suits them best. In this paper we investigate how the ‘freedom of choice’ principle within childcare policy was debated and (re)negotiated during the Finnish parliamentary election campaign 2015 by analysing election manifestos. The findings show that family policy, and the question of ‘freedom of choice’ in particular, was a highly politicized topic during the campaign. It created a cleavage between conservative family interests and interests supporting gender equality as well as higher maternal employment. Moreover the findings suggest a renegotiation of the ‘freedom to choose’ principle in relation to ideas of higher state interventionism, parental employment promotion and gender equality.

**Challenging community policy for people with intellectual disabilities**

Darren MCCAUSLAND (Trinity College Dublin, Ireland) | dmccaus@tcd.ie
Damien BRENNAN (Trinity College Dublin, Ireland) | dbrennan@tcd.ie
Philip MCCALLION (University of Albany) | pmccallion@albany.edu
Mary MCCARRON (Trinity College Dublin, Ireland) | mccarrm@tcd.ie

Policies of deinstitutionalisation and community living for people with intellectual disability (ID) are today aiming to undo histories of segregation and promote inclusion within the mainstream of society. This is captured internationally in the UN Convention on the Rights of Persons with Disabilities, at EU level in the Charter of Fundamental Rights, and at national level in many countries.

These policies are supported in the ID field by a body literature which is largely positive about outcomes for people with ID moving to and living in the general community. Some have been critical that studies have focused solely on objective rather than subjective outcomes. Others highlight an inconsistency in outcomes depending on personal and other variables, and how people with ID living amongst the general community remain poorly connected within it.
Ideas about community in the ID field remain underdeveloped beyond the central dichotomy of institutional versus community living. The sociological literature tells us that location is only one aspect of community, which is fundamentally more about the reciprocal and interdependent relationships that cultivate human bonding and a sense of belonging. This paper calls for a deeper analysis of community for people with ID and, to this end, proposes a theoretical model based on the universal basic elements of community. This raises a serious challenge in how people with ID can fit within such a model, but one which is important to tackle if community is to have any real meaning for them.

**Challenges of Latvian Social Policy: how to reach greater social security**

Baiba BELA (University of Latvia, Latvia) | baiba.bela@lu.lv  
Līga RASNAČA (University of Latvia, Latvia) | liga.rasnaca@lu.lv

The aim of the paper is to provide an in-depth analysis of the social policy development in relation to post-crisis social problems in Latvia. Researchers have shown that social crises are more difficult to overcome and tend to last longer than economic ones. Latvia is among the EU countries with the greatest income inequality and number of people at risk of poverty and social exclusion. In 2013 only each fourth of Latvians felt secure about their future prospects, while more than sixty per cent felt unsecure (Brigsa S. et al, 2014). However reduction of inequality is set as one of the top priorities for development in Latvia, but there are shortcomings in social policy implementation mechanisms. The current white papers related to social policy lack hierarchical consistency, cross-sectorial coordination, both within social policy field, as well as in a wider perspective.

The tasks of paper are: 1) to focus at the most problematic questions in the context of social security in Latvia; 2) to highlight the problems in social policy and planning; 3) to discuss the methodology for social security index - an evidence based evaluation of social security in order to guide the development of policies and strategies to promote greater social equality, sustainable and balanced social development. The study was developed under the ESF project “Elaboration of innovative diagnostic instruments for regional development”, and as part of the state research programme “Innovation and sustainable development” (SUSTINNO).

**State redistribution and it’s evaluation from 1992 to 2009. A cross-national comparative trend analysis of seven countries**

Anja EDER (University of Graz, Austria) | anja.eder@uni-graz.at

Since the 1970ies and 1980ies the distribution of incomes within most OECD-countries has become more unequal (OECD 2011). From this trend several scholars conclude that inequality follows a “u-curve”, ending the historical phase of equalization (e.g. Alderson/Nielsen 2002, Grusky 2001). The resurgence of inequality has given rise to a controversial debate: On the one hand, the critics demand higher taxes on incomes and assets, the extension of inheritance taxes as well as abolishment of tax havens (e.g. Piketty 2014). Against the background of relatively persistent levels of income inequality across time, scholars on the other hand, warn us not to overestimate its partial increase (Atkinson 2001; Veethoven 2005; OECD 2008).

Since in democratic societies the degree of social inequality cannot be reduced to be the result of hegemonic political elites or economic players, the current lecture takes into account, how the population in varying countries itself judges the degree of income redistribution by the state. Did the preferences for state redistribution change during the last two decades (ISSP-data) parallel to the increase of inequality (measured by the Gini-Index before and after taxes and transfers)?
Are the patterns and trends similar for all of the selected countries? Is there any empirical evidence for an increase in meritocratic values across time which might legitimate less redistribution in people's views? The countries were selected along the line of different welfare-state regimes: Norway as an example of the social democratic welfare state, West-Germany as a conservative welfare state, the US and Great Britain as liberal welfare states and Russia, Poland and Bulgaria as three contrasting post-socialist countries.

**European Integration and Europeanization processes in welfare systems: a comparative analysis with typological purpose**

Gabriella PUNZIANO (University of Naples, Italy) | gabriella.punziano@gmail.com

European Integration and Europeanization processes, who have had their engine in political and economic instances, but with direct effect on social field, are the focus of the analysis here proposed. In facts, starting from the social implications and from the effects that the different European welfare regimes have on them, it will be shown a possible re-arrangement and thematization of the differences within the various regimes, as well as of their relationships and their new characterizations.

The starting point of the proposed reasoning is found in a previous study conducted for my doctoral dissertation: Unique European Welfare or local net welfares? Decision-making process in the social sphere between convergence and autonomy (it. Welfare Europeo o welfare locali? I processi decisionali nel sociale tra convergenza ed autonomia, Diogene Edizioni, Napoli, 2012). With this study it was intended to deepen the dual thrust between Europeanization and decentralization of social policy in some European countries, which are considered as a guidance of specific welfare regimes (Esping-Andersen 1996), in order to understand at what level of governance the decisions that shape this area can be attributed. This objective was pursued through a comparative geographic and policy analysis based on a mixed methods approach intended as a merge of standard and non-standard approaches, techniques and tools. Effectively, starting from the cases of Milan, Naples and Berlin, the above mentioned analysis contemplates jointly the study of supranational, national and subnational directions, but also the study of local dynamics concerning the spread of specific models of implementation, decision of social policies and regimes that these decision generates. This kind of methodological structure is growing both in macro perspective (through multivariate and multi-level analysis of Eurostat and the resulting cluster analysis) as well as in the micro perspective (through the analysis of projects in different local contexts and in particular by applying impact, implementation and comparative network analysis). The conclusion was the realization of a general model of interpretation and classification of the changes occurred in the different European welfare regimes (to be tested further more).

However, while the analysis of original project involved five Nations (Italy, Germany, France, Spain and United Kingdom) and ten local contexts, two for each Nation (Milan and Naples, Berlin and Munich, Paris and Rouen, Barcelona and Vigo, London and Liverpool).

**RN26S02a - Inequality in Post-industrial Times: Employment**

**The Production of a New Social Cleavage: Origins and Outcomes of the New Work Line in Sweden**

Mattias BENGTSSON (University of Gothenburg, Sweden) | Mattias.Bengtsson@socav.gu.se
The work line has since long been a central political principle in Sweden. However, the welfare state arrangements of the new work line, i.e. the former center-right government's (2006-14) incentive-strengthening, work-first approach, entail an increasing dualisation of social status. Thus, as people in need of social protection are attributed a social stigma as benefit dependents, the idea of universal social citizenship in line with the 'social democratic' welfare-regime is contested. The objective of this paper is threefold. First, the origins of the new work line in an era of post-Keynesian welfare state restructuring and liberalization of advanced political economies will be analysed. Second, the major reforms of the new work line will be presented, with a focus on how different conceptions of human needs, social rights and obligations hereby are expressed. Third, the outcomes in terms of social inequality will be analysed. Data on various labour market policy measures, income and social transfers will be analyzed and official documents, such as government bills and public inquiries, will be examined. The results of the transformation of Swedish welfare policy in a time of mass unemployment and fiscal austerity will be important to gain a deeper understanding of the future of the welfare state. If the individual experiences that the state no longer keeps its part of the social contract, as understood in the universal 'social democratic' welfare state, not only is the individual's quality of life at stake but also the legitimacy of the welfare state overall.

Work, worklessness and well-being: a disaggregated analysis of the impact of recession in the UK
David BAYLISS (University of Manchester, United Kingdom) | david.bayliss-2@postgrad.manchester.ac.uk

In this paper the impact of the economic crisis on well-being in the UK is explored through the moderating effect of labour market statuses. The labour market is a central social system which together with corresponding social policies (e.g. employment, welfare, family) is influential in generating inequalities. A social structural view of the labour market suggests structures of inequality select people into different labour market statuses which in turn unequally distribute well-being. The economic crisis had widespread ramifications, providing an opportunity to explore how labour market statuses protect or expose people and groups to the negative well-being impacts of recession. A disaggregated analysis aims to challenge the implied homogeneity of aggregate analyses that currently dominate well-being studies. Eight years of data are used to analyse the UK working age population by comparing pre-recession to recession periods (2003-2011 in total), modelling men and women separately to capture different labour market interactions. Findings suggests that the psychological well-being of the economically inactive was most exposed to the recession, this holds true for both men and women despite different selection processes, and thus expands existing inequalities between labour market statuses. Furthermore, the relative advantage of employment compared to unemployment reduced during recession, narrowing well-being inequality between these two groups. The unequal impact of the recession provides insight into how social policy failed to protect some of the most vulnerable citizens from the inequalities of the labour market and provides an opportunity to reflect on ongoing social policies.

Reproduction of inequalities instead of empowerment. Frontline delivery of activation policy in Poland
Karolina SZTANDAR-SZTANDERSKA (Institute of Sociology at University of Warsaw, Stockholm Centre for Organizational Research) | k.sztanderska@gmail.com
Building on the qualitative research conducted in 5 municipalities in Poland, the paper investigates how the activation policy in a country characterised by residual welfare provision contributes to the reproduction of inequalities. The research takes into account not only the role of national legal framework, but, more importantly, it discusses what is actually done at the frontline of service delivery. Therefore, the attention is paid to how street-level bureaucrats translate official objectives and formal rules into practices and to factors that structure their actions (such as very limited financial and human resources or performance measures). The focus is put on daily practices of public employment services frontline staff reflecting both so-called ‘enabling’ and ‘demanding side of activation’ (Eichhorst et al., 2008). The paper finds out that activation policy itself reproduces inequalities between the registered unemployed by creating distinctions and differentiating intervention according to presumed ‘deservingness’ and ‘labour market performance’ of job-seekers. Drawing on insights from two literatures: the literature on street-level bureaucracies (e.g. Lipsky, 1980; Prottas, 1979; Brodkin, 2007, Brodkin, 2011) and the literature on social reproduction (Bourdieu and Passeron, 1970; Bourdieu, 1993; Wacquant, 2009), the study also unveils how access to ‘enabling’ activation is made difficult for people lacking certain skills, financial resources or other capitals. The results are based on 111 in-depth interviews, short observations, the analysis of administrative documents and daily working tools used during encounters with clients (such as individual action plans, electronic data basis, activation textbook).

Every day practices, struggles and challenges in the provision of inclusive local employment services. A comparative analysis
Lara MONTICELLI (Scuola Normale Superiore, Italy) | lara.monticelli@sns.it
Deborah RICE (University of Oldenburg, Germany) | deborah.rice@uni-oldenburg.de
Paolo R. GRAZIANO (Università L.Bocconi, Italy) | paolo.graziano@unibocconi.it
Serida CATALANO (Università L.Bocconi, Italy) | serida.catalano@unibocconi.it

During the last decade, directives and initiatives at European level concerning employment and social policies have shown the increasing political objective to recalibrate paradigms, schemes and instruments across member countries. The introduction of the concept of “employability” rather than “employment” pushed many European countries to reform their policies and – at least to a certain extent – increase the share of public expenditure devoted to unemployment activation measures. In this paper, we focus on the existing trade-offs between policies – as framed at national or even supranational level – and their effective implementation at local level by frontline staff and case-workers. As many scholars have already underlined, bureaucratic processes and administrative procedures often represent barriers rather than facilitating passages in service provision. In fact, the multiplication of targeted segments of population together with the introduction of complex entitlement systems - like computer-based testing, psychological assessments or online training courses – can trigger processes which may be threatening social inclusion levels of the weakest and most unskilled categories. These individuals, in fact, may find themselves unable to meet the necessary requirements set at national level with the consequence of being excluded from the most innovative and effective activation programs. Through a critical and comparative analysis of organizational settings in employment services delivery in three selected European municipalities (respectively in Italy, Germany and United Kingdom) our aim is to test the hypothesis of ‘bureacratc overcomplexification’ according to which, under specific circumstances, individualization may be a problem and not a solution.

By describing frontline staff’s routinary tasks, responsibilities and subjective data – collected through face-to-face semi-structured interviews – this paper underlines the emerging tensions
between policy design at national (or supranational) level and its partial and often problematic implementation at the local level.

**RN26S02b - Inequality in Post-industrial Times: Family & Gender**

**Gender equality in providing social services for families in Lithuania**  
Jolanta PIVORIENE (Mykolas Romeris university, Lithuania) | jolantapiv@mruni.eu

Gender equality is relevant in all aspects of societal life, but some social institutions have bigger power to support or harm gender equality. Social policy could affect gender equality not only threw conceptual declarations but in everyday life by various social policy implementation means. For example, gender equality is one of prerequisite for general wellbeing of family thus social workers as social services providers could influence positive gender equality changes in families and society.

The goal of the presentation is to find out possibilities for strengthening gender equality threw social work practice. Social workers were interviewed using semi structured interview. Content analysis was used to analyze research data. It shows that research participants see little relation between social work and gender equality issue. According to them, gender equality is a hot question in most of the families and almost impossible in families at risk. The main obstacles are negative attitudes of clients, too big requirements to mother/wife, attitudes of other institutions (police, day care centers), discriminating and unjust social system, competences of social workers, lack of information about gender equality and lack of time for work with clients. Research participants define various possibilities for ensuring gender equality in families: information provision and education of society, cooperation with other institutions, prevention and intervention. However, research data shows that social workers don’t see themselves as important agents in gender equality field. Possibilities for ensuring gender equality are discussed more on theoretical level then based on professional experience.

**Gender and Ethnicity in Social Housing Services: the Impact of Governance on the (Re)production of Social Divisions**  
Roberta SIGNORI (university of Milano Bicocca, Italy) | r.signori1@campus.unimib.it

Purpose: This paper illustrates how gender and ethnic inequalities are addressed in the agenda of local policy makers and how they shape the provision of social housing services. The aim is to assess the influence of the mode of governance on the process of inclusion of most vulnerable social group, such immigrant women, and on the (re)production of social divisions. 

The research: This essay is based on a qualitative research which took place in 2013 in Bergamo (north of Italy, 118.786 inhabitants).

Findings: The research demonstrates that the blurred local governance of social housing services for women (migrants and residents) has affected users’ equal access to opportunities within the local context, while it has shown the priority of ethnicity over gender in the agenda for local social policies.

Value: This discussion is built into a wider debate around new risks of social exclusion in Italy and trends in the governance of social housing services. Precisely, this paper casts light on the discrepancy between the local and the national level. The latter seems to slowly adapt to challenges posed by the economic crisis, while it fails to provide efficient social services for specific target groups. On the contrary, the dynamism of the local context brings to new
configurations of governance that involve both the third sector and public administrations. However, this dynamism is not risk-free as the blurring of boundaries of authority /roles may negative affect the way gender and ethnic inequalities are addressed, (re)producing lines of segregation based on ethnicity.

**Familialism creating social inequalities: the case of Estonia**
Häli TARUM (University of Tartu, Estonia) | hali@ut.ee
Dagmar KUTSAR (University of Tartu, Estonia) | dagmar.kutsar@ut.ee

Ageing societies challenge welfare systems across the developed world, especially in the countries where informal eldercare provision prevails over the formal. It raises a question how to support women’s integration into labour market in the situation where there are few alternatives to family carers. Estonia is not a typical country in welfare state studies however, it forms an interesting case as its values are among the most familialistic in Europe while the labour market participation of women above 50 years is high. The aim of the paper is to explore how social inequalities are created among women with eldercare responsibilities related to the labour market: whether the informal eldercare is the outcome of familialism uphold by policymakers and caring women or is it the consequence of underdeveloped eldercare service provision and lack of accessibility to market-based services. The paper asks (1) how do caring women reconcile employment and caring or justify the need to leave the labour market; (2) what kind of normative understanding policymakers produce in local level eldercare policymaking. The presentation is based on data from the EU 7th FP project FLOWS (focus group interviews with caring women and interviews with local level policymakers). The study demonstrates that informal eldercare provision is the result of familialism by default, however supported familialism in familialistic country like Estonia challenges women’s integration into labour market thus creating social inequalities.

**Extending the use of the intersectional approach within policy research: exploring the uneven effects of austerity on lone mothers in the United Kingdom**
Silvia SORIANO (University of Durham, United Kingdom) | s.j.soriano@durham.ac.uk

Within gender studies, the use of intersectionality as a paradigm has been widely applied to acknowledge multiple complex social inequalities (Walby et al 2012). This paper proposes extending the use of intersectionality within policy research in order to address the uneven effects of the current context of austerity. Drawing on findings from a doctoral research project which applies a mixed method design to explore current economic circumstances alongside welfare and paid employment trajectories of lone mothers in the United Kingdom, three groups are identified to be diversely affected by the context of governmental public services restructuring, welfare reform along with the economic recession. Accordingly, these three groups of lone mothers are characterised by various multiple power differentials which include not only ‘traditional’ social categories such as occupational class, age, ethnicity, disability and so on, but this analysis also ponders dimensions which are deemed significant so as to understand lone mothers in locations of multiple disadvantages such as early motherhood, housing tenure and number of dependent children (Haux, 2011, Zagel, 2014, Stewart, 2009). Thus, by taking into account more categories to explore how the context of austerity is affecting differently to lone mothers, the use of the intersectional approach is extended within policy research and accordingly ‘blind spots’ in the analysis of intersections are carefully reflected upon in regards to the interrelatedness of categorizations (Lykke,2010).
RN26S02c - Inequality in Post-industrial Times: Disability

Disabling barriers in the Romanian labor marked, as experienced by disabled people themselves.
Teodor Mircea ALEXIU (West University of Timisoara, Romania) | teodor.alexiu@e-uvt.ro
Ingrid FYLLING (University of Nordland) | ingrid.fylling@uin.no
Andreea BIRNEANU (West University of Timisoara, Romania) | andreea.birneanu@e-uvt.ro

According to official statistics from 2008, the employment rate among disabled people in Romania was 12 percent, which is substantially below the EU average. Romania has committed to a non-discrimination policy with respect to disability, both through national policies and legislation, and by virtue of being an EU member. Hence, a pertinent question is why Romania still has among the lowest employment rates for disabled people in Europe. What are the major obstacles faced by disabled people approaching the Romanian labor market? Is it in politics or in the labor market that the problem lies, or is there perhaps more fundamental barriers to inclusion in the labor market?

The paper examines the labor market situation of disabled people in Romania, both in terms of policy and legislation and with regard to disabled people's own experiences. Regarding the latter, data consist of 24 semi-structured interviews with disabled people in Romania about their search for, obtaining and keeping of gainful employment. The interviews are conducted as part of an ongoing EEA-funded project on the inclusion of vulnerable populations in the Romanian labor market. In the paper, findings and patterns obtained from the interview study will be discussed in relation to international research and to National and EU disability labor policies.

The Rehabilitation Matrix: Constructing knowledge at the intersections of micro, meso and macro levels of the society
Per Koren SOLVANG (Oslo University College of Applied Sciences, Norway) | per.koren.solvang@hioa.no
Jan REINHARDT (Sichuan University, China) | jan.reinhardt@paraplegie.ch
Halvor HANISCH (Oslo University Hospital, Oslo) | halvor.hanisch@gmail.com

EU policy documents point out that in order to understand the complexity of and the challenges faced by modern health systems, as well as devise appropriate policy responses, considering micro, meso and macro levels is indispensable. This paper aims to develop a micro-meso-macro theoretical framework of interdisciplinary fields in rehabilitation by addressing shifting lines of social relations at these three levels of society.

Three groups of agents in the field of rehabilitation are identified: individuals with disabilities, professionals, and policy authorities. The paper is systematizing how these actors act at micro, meso and macro levels. By doing this, a nine-field table emerges. In the cells of the table, key examples of important social processes to study in the field of disability and rehabilitation are identified. At the micro level, individuals experience a daily life relevant to rehabilitation, professionals ask what works in therapy and policy authorities promote a strong work ethic. At the meso level individuals with disabilities act as service user groups, professionals develop organizational designs and the policy authorities ask for cost effective services. At the macro level disabled people’s organizations are lobbying, professionals negotiate authorization issues and the policy authorities must identify what can count as just distribution of services. These nine cells of the table are elaborated on by presenting relevant current studies exemplifying each cell.

The final part of the paper will discuss how the table can be helpful to further the understanding of rehabilitation as a complex intersection of interdisciplinary knowledge production.
The impact of education for employment among young people with disability in Europe
Ingrid FYLLING (University of Nordland, Norway) | ify@uin.no

In this paper, we explore the impact of education on employment for young people with disabilities in Europe. Previous research has shown that education is a key factor in successful employment for young people, and for people with disability the link between education and employment is shown to be even more strong than for people in general (Eurofound 2012). However, young people in Europe have been hit especially hard by the recent fiscal crisis. EU unemployment reached a record level of 10.9% in the first quarter of 2013, but the level among under-25s was much higher at 23.5%. In Greece and Spain more than half of young people were without work and rates in Portugal (38.2%) and Italy (37.8%) were also extremely high (Eurofound 2014). Recent research suggests that although education has proven important to the education – to work- transition for young people, the fiscal crisis seems to have weakened the impact of education for successful employment. Many of the young unemployed in Europe have higher education and are still not able to get a job. Hence the question for this paper is whether this link also is weakened for young people with disabilities? Using the ESS (European Social Survey) we will use time series analyses to model the impact of education on employment for young people with disabilities at three different points in time (2008, 2010 and 2012). In the analyses we will control for key variables like gender, age (within the 16-30 group), as well as living condition variables. In addition, we will explore possible differences between European countries, clustering countries after a modified version of Esping Anderson’s model of European Welfare regimes.

Research on disability and citizenship: state of the art and ways forward
Marie SEPULCHRE (Uppsala University, Sweden) | marie.sepulchre@soc.uu.se

From a social science perspective, disability research is about the relation between persons with disabilities and their environment. A number of researchers in this field have applied the concept of citizenship to point out and reflect about barriers and opportunities for being a full member of a (national) community. Indeed, the citizenship approach is particularly relevant for understanding disability from a rights-based perspective and studies have e.g. shown how disabled people have claimed their rights to enjoy full participation in society and how disability policy affects people’s access to citizenship rights. In other areas of social sciences and the humanities, the concept of citizenship has been discussed and utilized to analyse topics such as processes of inclusion and exclusion both inside and across national boundaries, identity and community formation, claims for various types of individual and group rights, etc. This paper presents a literature review of articles published in English, referring to both disability and citizenship in their title, abstract or keywords. It is suggested that the link between ‘citizenship’ and ‘disability’ offers a fertile ground for both disability research and citizenship studies at large. Accordingly, the paper provides an overview of the major contributions made by scientific articles combining both concepts and highlights promising topics, questions and methods for future research.

RN26S02d - Inequality in Post-industrial Times: Ethnic Minorities
Individual experiences of factors leading to unemployment among Roma individuals in Romania

Elena Loreni BACIU (West University of Timisoara, Romania) | elena.baciu@e-uvt.ro
Theofild Andrei LAZAR (West University of Timisoara, Romania) | theofild.lazar@e-uvt.ro
Janne Iren PAULSEN BREIMO (University of Nordland, Norway) | janne.iren.paulsen.brei

Unemployment among Roma ethnics is consistently higher than in case of the non-Roma and strongly connected with lower educational attainment levels and higher social vulnerability. Investigations into the mechanisms producing this situation have mainly shown the failure of the social policy in providing the Roma with equal opportunities to access services and programs provided by the institutions that represent and promote the welfare state. Fewer analyses were dedicated, though, to individual experiences and to biographical and social factors, contributing to what has been called the “cycle of poverty” among the Roma.

The current paper explores the interaction between the two categories of factors (individual and social), as they influence the status of the Roma ethnics on the labour market. The main questions that guide this article are: “What make some Roma ethnics succeed in the labour market, while others don’t? What are the main factors explaining variations in employment careers among the Roma population?”

The data was collected through 24 semi-structured interviews with Roma ethnics, which mainly explored the informants’ experiences in accessing the labour market, and is part of a larger research that focuses the institutional mechanisms and steering relations underpinning the difficulties experienced by vulnerable populations from Romania in accessing employment.

The most important individual factors identified, gender and family work-role expectations, are among the least addressed by the Romanian public policies targeting the problematic of Roma unemployment.

Successful strategies of overcoming social exclusion by people with disabilities

Sofia Vladimirovna KORZHUK (Institute of Economics and Industrial Engineering SB RAS, Novosibirsk State University, Russian Federation) | k-sofya-w@yandex.ru

Severe physical or mental impairments can be one of the causes of social exclusion of people with disabilities as well as households to which they belong. In general, the social exclusion is understood as multiple discrimination (violation of the rights of people with disabilities in different areas of their life). Low education and employment chances, financial difficulties, scarce number of social contacts, etc. simultaneously are both characteristics of the objective social exclusion (existing barriers in society) and a cause of the subjective social exclusion (feeling of exclusion from different areas of life).

The purpose of this research is to identify the configurations of qualitative characteristics of the elements of successful strategies in overcoming the social exclusion. From an analytical point of view, strategies of overcoming social exclusion include three components: goals, actions aimed at achieving these goals, and resources. The criterion of successfulness is considered to be the public recognition of the person with disability due to his/her labor, social or other activities.

The main message of the study is the assumption that people with disabilities can become active participants in social relations, overcoming the feeling of exclusion and using the available mechanisms of integration. In this regard, we distinguish between the objective and subjective social exclusion, the latter has remained poorly studied. The objective social exclusion is a set of barriers existing and being reproduced in society that prevent the achievement of equal social opportunities by people with disabilities and people without disabilities. The subjective social exclusion is understood as the feeling of exclusion from
different areas of life; the feeling of having a lesser degree of self-realization in society compared with other people.

To achieve the purpose of this research we chose the biographical method as a qualitative method of obtaining information. Studying of successful strategies of overcoming the social exclusion in our research implies an appeal to the personal experience of people with disabilities, so it is advisable to use a qualitative methodology. This method was also selected because an individual can apply different strategies at different stages of their life. We received ten biographical interviews from people with disabilities who currently lead an active lifestyle, namely, some of them are active participants of disability movements, others are actively realizing their potential in professional area or receiving higher education.

The biographical interviews were analyzed as cases on the base of the following scheme which includes the five key points: 1. the result of overcoming the social exclusion; 2. the agents and resources involved in the result production; 3. the way to access the external resources; 4. types of activities the person uses; 5. a person who initiated the process of overcoming the social exclusion (it can be the person with disability as well as a member of his/her social environment, for instance). Then we generalize the content of the cases. We have identified common elements for labor and social activities and receiving of higher education. The labor activity in all cases includes the following components: 1. availability of knowledge and skills to carry out certain work; 2. psychological support from family members of respondents and 3. respondent's desire to maintain a financially independent lifestyle. The social activity includes the following components common for all respondents: 1. the availability of appropriate personal qualities and skills (for someone it can be charisma, for other it is computer skills but the high level of activity for everyone); 2. the use of social capital; 3. in all cases the respondent is a person who initiated the process of overcoming the social exclusion. And education activity in all cases includes such components as: 1. personal singleness of purpose and undoubted intellectual abilities corresponding to the chosen field of education; 2. assistance in the selection of future profession and support (psychological and always economic) by the family; 3. the choice of university was based on thorough consideration of the university characteristics, aspirations and opportunities of the respondent, as a rule, with the participation of parents.

Next we made generalization on three analytical components of the strategy of overcoming the social exclusion - goals, activities and resources. The respondents use either strategic or tactical planning to achieve the goals. In the interviews the different goals of active lifestyle are called but in all cases the initial goal is «to live» rather than «to exist». Thus the active lifestyle is the target by itself. The family and close social environment play the main role in the process of overcoming the social exclusion of our active respondents. Availability of support (psychological, economic, social - either one kind or in combination); the absence of excessive guardianship; encouragement or approval of an active lifestyle; the choice of inclusive forms of activity, in the case when such a choice took place – all these are typical for behavior of the family and close social environment in almost all cases.

The most important result of this research is that the keys to overcoming the social exclusion are willingness and aspiration of people with disabilities. But a strategy (being recognized or not) stands behind any successful overcoming, including adequate assessment of available resources, careful selection of means and methods of their usage, tactics engaging external structures. This strategy is an alloy of the efforts of the individual with disabilities and his/her close social environment, which is the main ally in extension of the boundaries of the possibilities.

This research shows how people with disabilities are overcoming the social exclusion in the current state of social policy, where conditions for an integrated environment are not sufficient. The ability of such people to overcome the social exclusion main determines the success of their integration into society, so this study can be useful for developing and improving the programs of integrating people with disabilities into society. Also demonstrating successful
examples of self-realization of active people with disabilities can serve as motivation to start overcoming the social exclusion by less active people with disabilities.

Public policies and social change: key factors for the success and continuity of schooling paths of Ciganos (Portuguese Gypsies)
Olga MAGANO (CEMRI-Uab) | Olga.Magano@uab.pt
Maria Manuela MENDES (CIES-IUL, Portugal) | mamendesster@gmail.com

The consolidation of the welfare state that took place after the 1974 revolution, particularly in the 1980s, improved the living standards of Portuguese citizens. The improvements directly reflected in Portuguese Gypsy families and individuals, although the great majority is still at high risk of poverty. In 2012, the European Council proposed the definition of national strategies for Gypsies/Roma integration, opening the door for achieving better living conditions of European Gypsies citizens. The national strategies are centred in four fundamental domains: education, employment, healthcare, and housing. At the present time, Portugal is implementing its National Gypsies Communities Integration Strategy. In terms of education, compared to previous generations, Ciganos children complete more years of education. However, after the fifth and sixth schooling year, the presence of Ciganos children in schools becomes ‘problematic’, marked by high school dropouts and unsuccessful paths. Based on literature review and on survey of policies, programmes and projects, and the analysis of interviews with individual and institutional stakeholders, the aim of this paper is to identify and discuss the importance and impact of public policies on the extension of Gypsies’ schooling.

Who dares to claim the equality of children's chances? Constraints of equalizing measures in Slovakia and Czech Republic
Zuzana KUSÁ (Slovak Academy of Sciences, Slovak Republic) | zuza.kusa@savba.sk

Large families (with 3 and more children) are the only category of households in Slovakia with the risk of poverty and social exclusion exceeding the EU27 average. Despite the very low natality, increasing aging of society and pressure on pension systems, existing family and social protection policies in Slovakia do not improve the living conditions of families with many children substantially and rather contribute to curbing future prospects of children and inter-generational transmission of disadvantages. Paper will try to elucidate this puzzle by focusing on the development of social protection and family policy addressing large families and the political discourse during the period of so called transformation and modernisation. It will show that the interest of the post-1989 political leaders to find the culprit for high levels of unemployment in the country had intensified the tendency (widespread also elsewhere) to blame unemployed and poor people for their situation and to build the line between the taxpayers and those taking social/family benefits. Demands to make the social protection system bound to the meritocratic principle and suspecting large families (identified mostly with Roma families) from avoiding work contribute to moral exclusion of "undeserving" and "inadaptable" and the decreasing support of equalising measures. Paper will end with the conclusion that the getting public support for qualising measures addressing children from disadvantaged Roma communities is hardly possible without the backing from the sociological imagination. However, sociological imagination linking poverty of Roma children with future prospects of society is as scarce as the valuing equality as the pillar principle of sustainable society.
RN26S03a - Understanding and Transcending Fragmentation in Welfare Systems - A

**Bridging the gulf between welfare and economy: collaboration networks between the invalidity insurance and business enterprises**

Eva NADAI (University of Applied Sciences Northwestern Switzerland, Switzerland) | eva.nadai@fhnw.ch

Over the past 15 years inter-institutional cooperation has become a prominent topic in social policy in Switzerland, especially with respect to the labour market integration of the unemployed. In all cantons concrete collaboration projects have been established. However, while these projects may improve inter-organizational collaboration within the welfare system they fall short of addressing the missing link of occupational integration, namely including employers into respective networks. After all, the success of welfare state efforts to reintegrate the unemployed hinges on the decisions of business enterprises to actually employ these people. Especially in the invalidity insurance (IV) the collaboration with employers has become a pressing issue. Following a marked increase in pensions and costs during the 1990s and influenced by OECD recommendations the IV has undergone several major reforms aimed at strengthening the focus on the occupational Integration of disabled workers. Employers are here seen as key players. In my paper I argue that bridging the gulf between welfare and economy poses the twofold problem of establishing organizational networks and of reframing the cultural conventions of social and economic action. On the organizational level the cantonal IV-offices are “translating” cooperation models developed earlier for collaboration within the welfare system to cooperation with employers and other insurers, while at the same time establishing one-to-one contacts with individual business enterprises. Regarding cultural reframing, they have to invoke a complex array of social and economic rationales to persuade businesses to employ workers with “limited productivity”. The paper draws on the theoretical framework of the sociology of conventions and is based on empirical data from an ongoing ethnographic research project on the collaboration between the IV and employers (funded by the Swiss National Science Foundation).

**Partnerships at the social welfare organizations: experiences of social workers**

Patrícia Oliveira RIBEIRO (Faculty of Psychology and Educational Sciences of the University of Porto, Portugal) | pdce11028@fpce.up.pt

The defense of a contractual/partnership approach of public policy became usual in the discourse, documents, public social policies and funding programs of the European Commission since the early 90’s, notably in the White Paper on the Future of European Social Policy (1994); the Anti-poverty programs or the United Nations Human Development Report (1995). In most EU countries, in line with the social policies of activation, a growing trend towards the decentralization of competences and the involvement of local governments, community based organizations and populations in the production of local intervention processes is being felt, in particular in the context of social action/intervention (Hamzoui, 2005). However, it is important to listen to the professionals that work directly on the field. In this paper the analysis of 20 social workers interviews, with diverse institutional belongings and professional roles, that are involved in the social exclusion combat, in the same Portuguese territory, will be presented. The discourses reflect a) their understanding about the meaning of partnership between organizations in the social action field; b) the importance of the partnerships for their social
intervention; c) the obstacles of the partnerships between organizations with the same goals and target population. The analysis of the interviews seems to indicate that the partnerships are often valued by social workers, because they allow mobilizing and monetizing resources, enhancing social intervention with the target population. However, some obstacles are identified, namely the duplication of social intervention and the competition between social welfare organizations to obtain financial and human resources.

Uncertainties in the cooperation of return-to-work professionals in Finland
Jyri Juhani LIUKKO (Finnish Centre for Pensions, Finland) | jjyri.liukko@etk.fi

During the recent years in many countries, there have been efforts to create flexible employment opportunities for persons with health problems and disabilities. Accordingly, there has been a shift from passive disability benefit systems towards policies supporting and requiring several kinds of rehabilitation measures to enhance employment. In Finland, for example, the number of people participating in vocational rehabilitation has rapidly increased since the beginning of the 1990s. However, it is widely recognized that the vocational rehabilitation system in Finland is very fragmentary and the cooperation of different actors includes many kinds of uncertainties.

This paper explores the issue by studying the cooperation of different institutions and grass roots level professionals in Finland involved in vocational rehabilitation and return-to-work practices. The main question of the study is: what kind of uncertainties these professionals face in the cooperation with each other and in the processes of inter-organizational work ability management? The research is an across-domains study using qualitative methods. The empirical material consists of 23 in-depth interviews of professionals from two provinces in Finland including rehabilitation counsellors, social workers, work ability coaches, human resources professionals, and occupational physicians.

The study reveals several kinds of problematics in the cooperation of the return-to-work professionals. These are related to two main themes: daily communication and distribution of responsibility. The study shows how return-to-work practices are moulded by complex organizational and professional factors. The paper affirms that work ability is not only a medical issue but thoroughly a social, judicial and organizational phenomenon as well.

Making Welfare Agencies Cooperate: a Swiss Inter-Institutional Experiment to Overcome Fragmentation
Jean-Michel BONVIN (University of Geneva, Switzerland) | jean-michel.bonvin@unige.ch
Emilie ROSENSTEIN (University of Geneva, Switzerland) | emilie.rosenstein@unige.ch

The Swiss welfare system is characterised by multiple forms of fragmentation, be it vertically (due to its federal organisation) or horizontally (regarding the ten branches that compose the welfare system, supplemented by social assistance schemes). Since the nineties, the growth of unemployment induced activation reforms oriented towards New Public Management principles that exacerbated the compartmentalisation of the welfare system and resulted in ‘roundabout’ effects. As a result, making the various institutions in charge of activation policies working closer together became a major political concern. Various programmes of inter-institutional collaboration were initiated, with the objective to improve welfare system efficiency, and provide a better follow up to welfare recipients.

The aim of our contribution is to discuss the potential and limits of inter-institutional activation policies. It is based on the analysis of a Swiss pilot project, gathering actors from the unemployment insurance, the disability insurance and social assistance, in order to implement a
common, individualised follow up of the so-called “complex cases”, i.e. people with health conditions facing unemployment and other social difficulties. More precisely, we will pursue the following objectives:
- discuss the impact of inter-institutional collaboration on local practices and ask to what extent it provides welfare agents with adequate tools and legal framework in order to answer individual needs and local specificities;
- question the effects of inter-institutional policies on their recipients, as regards access to welfare benefits and capacity to return to the labour market, with specific attention to the issue of equality of treatment.

RN26S03b - Understanding and Transcending Fragmentation in Welfare Systems - B

Transcending boundaries? Child protection at the intersection of social work and law enforcement in Germany and Sweden
Hannu TURBA (University of Kassel, Germany) | h.turba@uni-kassel.de
Susanna JOHANSSON (University of Lund, Sweden) | susanna.johansson@soch.lu.se

Given the differentiation of modern societies, child maltreatment is subject to competing institutional logics in contemporary welfare states: Among other things, it is regarded as a social issue (requiring assistance from welfare services) as well as a crime (demanding law enforcement), which makes tensions likely to occur. While across national borders, interprofessional collaboration and networking are often seen as the silver bullet to overcome these tensions, the process of this 'boundary work' still remains a black box. Drawing on empirical data from two case studies in Germany and Sweden, this paper compares how the handling of child maltreatment is organized in line with collaborative arrangements at the intersection of social work and law enforcement. Building on neo-institutional theory, we refer to regulatory, organizational and professional prerequisites as influencing factors, in order to analyze how the interfaces take shape in each country. Moreover, we highlight the role of organizational actors (on street level) as institutional agents engaging in 'negotiations' around the competing institutional logics stemming from welfare and criminal law. As a result, we observe a ‘blurring’ of boundaries on a general level as a common feature in both countries (e.g. mutual adaptations towards opposite institutional logics). Yet, despite this hybridity, the tension between justice and welfare is balanced differently and depends heavily on the organizational setting as well as 'on the ground' power dynamics of collaboration.

Comparing Local Service Networks Internationally: Stakeholder dynamics and the role of Institutional Frameworks
Janne Paulsen BREIMO (University of Nordland, Norway) | jbr@uin.no
Oscar FIRBANK (University of Montreal, Canada) | oscar.e.firbank@umontreal.ca

The projects main aim is to extend knowledge about the operating of Local Service Networks (LSNs), with an emphasis placed on their internal dynamics and the role of institutional regulation in relation to the latter. Two different human service sectors are investigated, namely child protection and elderly care.
An ‘institutional logics perspective’ informs the project. Accordingly, organizations, and by extension networks, are conceived of as entities embedded within broader regulatory systems, including systems of meaning and culture. This embeddedness activates salient institutional
logics within settings of social intervention (such as LSN), enabling or constraining decisions, practices and actions. Considering both regulation and its enactment in different jurisdictions, the proposed project incorporates a comparative perspective on problems and benefits encountered by LSNs, emphasizing the role of both regulatory factors and local practice. It will illuminate current developments in Norway in light of evidence from countries in which the network agenda has distinctive institutional traditions, namely the Canadian province of Québec and Germany. The project relies on a comparative multi-case study approach, with the investigation focusing on urban settings, namely Hamburg, Trondheim and Montréal. In these settings, diverse service network arrangements exist in the areas under study. Concerning the methodology, most of the research will be based on qualitative tools (vignettes, focus groups interviews, document analysis), centering on how and why questions, but also a limited quantitative content analysis of collected materials.

Inter-organizational learning in a regional employment network
Ulla-Maija KOIVULA (Tampere University of Applied Sciences, Finland) | umkoivula@gmail.com

Organizational learning has been researched since 1960's onwards but during the last two decades the focus has extensively turned into inter-organizational and network learning (e.g. Wang & Ahmed 2003; Argote 2011; Lampela 2009). The so-called wicked problems, complexity of the changing environment with welfare mix-model and governance structures in public service production challenge the bureaucratic structures and silos of knowledge. The learning needs to take place inter-organizationally. (E.g. Stacey 2004; Roberts 2000.) The article is based on literature review on inter-organizational learning as an internal and external process. Networks can be looked as learning environments and/or learning subjects (Knight 2002). Based on the review, a heuristic model is created defining types of learning about, from, within, for and by organizations. The framework is applied to analyse the evolution of inter-organizational learning within agencies working for unemployed in Tampere region from late 1990s up today. The empirical material includes document analysis and semi-structured interviews of agency representatives. The research purpose is to study what kind of inter-organizational learning - if any – has occurred? How inter-organizational learning has effected on development of cross-organizational service processes? The findings support that the theoretical framework is a promising tool to apply in empirical research. It also shows that inter-organizational learning is a contingent process related to organizational structures and their positions and power in the network. The article contributes to theoretical discussion on the forms and processes of inter-organizational learning. On practical level the study offers an evolution description of network inter-organizational development.

RN26S03c - Attitudes to Welfare

Safeguarding the social assistance system in Ireland
Majka Monika RYAN (University of Limerick, Ireland) | majka.ryan@ul.ie

This paper presents results from research which investigated the quality of relations between welfare officers and Polish residents in Ireland. Through in-depth qualitative interviews, with six members of the Polish community, this paper argues that the Irish welfare system remains fundamentally patriarchal and that some welfare officers create obstacles and barriers for unemployed migrants, discouraging them from pursuing a claim. Furthermore, this research
reveals that the attitudes of some welfare staff towards their claimants are negative and include preconceptions of migrants who are unemployed as liars, who are unwilling to work, and as scroungers.

This study contributes to my doctoral research entitled: “Safeguarding the social assistance system in Ireland: A critical analysis of the impact of the Habitual Residence Condition on social welfare policy and practice”. As a precaution against ‘welfare tourism’ on May 1st 2004 Ireland introduced the Habitual Residence Condition (HRC) as an additional criterion for eligibility for social assistance payments. This added measure defines whether applicants, regardless of their nationality, are habitually resident in the state, which in turn is used to infer an applicant's intentions and determine the genuineness of their claim. My doctoral research project aims to advance theoretical understanding of the relationship between emotions, affect and power in micro-interactions with specific focus on relationships between welfare officers and claimants and will offer new insights into the dynamics of the HRC policy through its synthesis of macro and micro level sociological analysis.

Post-Communist Welfare Attitudes: Toward Convergence or Divergence?
Steven SAXONBERG (Masaryk University, Czech Republic; Dalarna University College, Sweden) | sax@post.utfors.se
Tomas SIROVATKA (Masaryk University, Czech Republic) | sirovatk@fss.muni.cz

During the first period of the transformation to democracy, some researchers found that welfare attitudes in the post-communist countries differed from those in the West European countries. Now it is time to reassess the situation with the latest international databases. Using multi-level modeling we will investigate whether there is still some difference in welfare attitudes between those living in the post-communist countries and those in Western Europe. Will will also investigate to what extent possible differences could be caused by country-level factors and to what extent they could be caused by individual level differences. We will also ask the question as to whether the post-communist countries comprise one bloc or whether important differences exist between them, so that they might comprise several blocs or might belong to different groups that include West European countries.

Implementing institutional solidarity: Finnish street-level bureaucrats’ views on immigrants’ social rights
Johanna KALLIO (University of Turku, Finland) | jomkall@utu.fi
Helena BLOMBERG (University of Helsinki, Finland) | helena.blomberg@helsinki.fi
Christian KROLL (University of Helsinki, Finland) | christian.kroll@helsinki.fi

The paper aims at enhancing our knowledge on the boundaries of social solidarity in a Nordic welfare state. Existing research on public opinion has clearly shown that immigrants are considered far less deserving of welfare benefits and services than native born. Less is known about the views of street-level bureaucrats dealing with the implementation of benefits and services while exercising varying amounts of discretion. Should immigrants be entitled to public social security unconditionally, or be made dependent on some special type of conditions (e.g. reciprocity or citizenship), or not be entitled to the same social right at all? Can the views displayed by street-level bureaucrats be explained by institutional context or by individual characteristics?

Survey data (n=2124) on Finnish street-level bureaucrats representing both more universal and more selective welfare state institutions is utilized in order to investigate their views on immigrants’ social rights. Results point at an "institutional paradox" concerning their attitudes: a majority of street-level bureaucrats working in an institution based on principles of universalism
are clearly of the opinion that immigrants social rights should be made conditional, while the view that immigrants should have an unconditional access to the social security system is dominating among bureaucrats in organizations handling selective benefits. Hardly any street-level bureaucrat thinks that immigrants should not be given access to the same social rights as natives under any conditions. Variations in bureaucrats’ opinions are also explained by personal characteristics such as length of work experience and frequency of contacts with immigrant clients.

Perception of inequality by the general public and political elites. Critical reappraisal of existing research and examples from the fieldwork

Wojciech WOŻNIAK (University of Lodz, Poland, Poland) | wwozniak@uni.lodz.pl

The main aim of this paper is to critically reappraise the existing body of research into inequalities, as perceived by the general public as well as by political elites. It offers a brief introduction into social inequality as one of the main philosophical, ideological and political themes debated throughout history. Subsequently, I discuss contemporary research into general public opinions of inequality, and the scarce research into perceptions of inequality by political elites. My criticism is concerned in the first place with some existing studies which do not attempt to draw any general conclusions and the quantitative analysis and interpretations of the same datasets can lead to diverse results. Also discussed is the research into attitudes towards inequality which pays no attention to subjects’ actual knowledge about the issue. There are examples of research into the knowledge of citizens about various social indicators proving that in many countries it is next to none. The concentration on the elaborated quantitative methodology without paying attention to methodological basics can therefore lead to the ‘fallacy of misplaced concreteness’. Examples are given of studies which attempt to overcome this weakness. The significance of the scarce research into the perception of inequality held by political elites is underline. The most interesting examples are described briefly, including my own research efforts. Between 2005 and 2011, I have been conducting research into perception of inequalities by Polish political elite using variety of data (interviews with Members of Parliament, analysis of party manifestos and policy documents, media debates, research among the local political elites).
A crisis of trust: Impact of the economic crisis on interpersonal and institutional trust in Spain
Diego TORRENTE (University of Barcelona, Spain) | diego.torrente@ub.edu
Jordi CAÏS (University of Barcelona, Spain) | jcais@ub.edu

Trust is a key requirement for social, economic and political life. But the fundamentals of confidence tend to deteriorate when socioeconomic conditions also degrade. The abrupt and deep 2008 economic crisis constitutes an exceptional natural experiment to gain understanding of the socio-economical basis of trust. In particular, Spain is an interesting case to analyze. In this country, the present economic and financial crisis has a profound impact in terms of poverty, social inequality, and greater uncertainty in the lives of many people. This context leads to a significant loss of confidence in institutions. However, indicators of interpersonal trust and solidarity reflect some improvement, probably because of the need for mutual aid to cope with the consequences of the crisis. All this happens while social surveys report a strong social discontent over the political parties and local and regional governments due to corruption scandals. The theoretical fit of these phenomena is incomplete. On the one hand, for cultural theory, trust in institutions is grounded on interpersonal trust. However, in the Spanish case, interpersonal trust increases somewhat while institutional trust decrease sharply. On the other hand, for performance theory, trust in institutions depends on its effectiveness and proper functioning. However, it is unlikely that, in such a short period, a meaningful real deterioration of its functioning has been produced. But some of them appears devaluated in social perception. Our research seeks, in light of the recent Spanish experience, to better understand the relationship between socio-economic risks and trust. The presentation discusses the methodological design, and analyzes the first results of a project supported by La Caixa Foundation. The research has two objectives. First, it aims to analyze the effect of the socio-economic risks and uncertainties, caused by the economic crisis, on interpersonal and institutional trust. The “crisis-effect” is measured by comparing the years 2004 (before it started) and 2013 (when it was very severe), and controlling the incidence of other factors that are theoretically relevant. Undertaking the theoretical debate, the second objective is to study how institutional trust, interpersonal trust and the perception of the institutions relate to each other. We propose two related hypothesis. (H1) Socio-economic deterioration in the situation of many people, along with the related uncertainties, significantly explains distrust in institutions, particularly political ones. This effect occurs mainly through dissatisfaction with its ability to solve social problems. (H2) Holding other factors constant, it is precisely among those most affected by the crisis, that increasing confidence in others is greater. The analysis uses data from two waves of the European Social Survey. Two models, one for trust in institutions, and another for interpersonal trust are designed. These models are replicated for years 2004 and 2013, and variations are analyzed.
Portugal has suffered several crises since the late 70's and early 80 so far, and to relieve the latter crisis since 2008 following the collapse of financial markets and when the financial assistance request in 2011 to the Troika composed of the IMF, ECB and EU. Portugal, despite the implementation of successive austerity programs (drastic wage and pension cuts), failed to meet the objectives proposed in terms of reducing the public debt and deficit by lowering tax revenue and GDP decline, which adds the exponential increase in poverty, precariousness and unemployment rates, affecting not qualified as qualified people.

In empirical terms, we will focus attention on the situation of Portuguese agriculture and social actors most affected by the crisis situation, realizing the relative dependence of the Portuguese agriculture to meet the agro-industrial complex. Will be an illustration from the case study of a northwest village in the municipality of Barcelos - Durrães - showing how villagers of this one, in addition to the existing inequalities, still suffer a worsening of their situation in the current crisis. In this sense, based on documental analysis, semi-structured interviews and focus groups, will be sought to analyze the situation of the said village residents show their problems, difficulties and impasses and from socio-anthropological paradigms around the development, outline some analysis slopes of the conditions of objective life, representations and strategies of the residents interviewed in order to reduce the damage of the crisis by the various social groups, particularly the most deprived of resources.

Local contexts and the embeddedness of inequality reproduction mechanisms:

Maria Carmela AGODI (University of Naples Federico II, Italy) | agodi@unina.it
Giuseppe Luca DE LUCA PICIONE (University of Naples Federico II, Italy) | giuseppe.picionedeluca@unina.it
Lucia FORTINI (University of Naples Federico II, Italy) | lucia.fortini@unina.it

This contribution is based on research results about intergenerational mechanisms of inequalities transmission in different local contexts within a Southern Italian region (Campania). Local labor markets and welfare policies play as differential boundary conditions in structuring viable strategies for families with unequal resources and in differentiating life chances according to gender roles. Changes in cultural and consumption models foster individual choice as the dominant subjective representation of life trajectories and gender equality as the general framework for performing personal capabilities. But actual choices are constrained by the reproduction of patterns in the job structure and in family relationships through which inequality is being reproduced through generations. Event Structure Analysis is used as an analytical strategy to work through biographical narratives accounting for access to a Regional Supporting Income Scheme, by people with different family backgrounds and living in different local contexts. Different local conditions contribute to the structuring of individual opportunities and of mobility chances, defining mechanisms though which either intergenerational solidarity becomes an obstacle for social mobility or social mobility is attained through interruption of intergenerational solidarity.

RN27S02 - Sociologists in Turbulent Times: Sociological Imagination and Community Engagement
Community Based Research and worldwide mobilization: an action research experience in Italy

Valentina GHIBELLINI (University of Sassari, Italy) | vale.ghibellini@virgilio.it
Andrea VARGIU (University of Sassari, Italy) | avargiu@uniss.it
Cristina BRAIDA (University of Sassari, Italy) | cbraida72@gmail.com
Angela LACONI (University of Sassari, Italy) | angelalaconi@gmail.com
Rosa Maria MELONI (University of Sassari, Italy) | rmmeloni@uniss.it
Federica PALOMBA (University of Sassari, Italy) | federica.palomba@tiscali.it
Milena PIAZZA (University of Sassari, Italy) | milena.piazza76@gmail.com
Daniela PISU (University of Sassari, Italy) | dani.pisu@yahoo.it

OBJECTIVE: The paper presents the first results of an ongoing action-research project run in a disadvantaged neighbourhood in the city of Sassari (Sardinia, Italy). In order to do so, some preliminary issues are discussed as to the approach that has been used. In fact, the project pursues different objectives: scientific inquiry on social exclusion and cohesion, community empowerment and international advocacy of excluded communities.

METHOD: Methodological issues will be discussed as to the difficulties raised by the action-research project as to data gathering at local level by means of instruments used worldwide in very different settings.

Also, participatory strategies aimed at community empowerment will be discussed.

RESULTS: The main results of the first part of the project will be presented, which concern a general description of the area under study, as well as trends, possible causes and changes needed as perceived by informants.

Also, some issues emerging from work with local population groups will be discussed, notably as to their implications for preventing social exclusion and for promotion of community emancipation.

Promoting labor competitive cultures. A task for sociologists?

Fiorella VINCI (Università degli Studi eCampus, Italy) | fiorella.vinci@tiscali.it

Polanyi identifies in the training and regulations of labor market one of the main causes of the crisis of mature capitalism (Polanyi 1944).

According to the Hungarian sociologist the labor markets are conditioned by specific social morphologies formed by economic actors such as enterprises and trade unions but also by families and public policies locally spread. More recently, the European legislator has provided fundamental instructions for the promotion of competitive labor cultures. The flexibility and market orientation of the labor offer are among them. In giving these instructions the Community legislator ignores the collective legitimations that in the various States feed the effectiveness of the different policies. How to combine the inclinations to the flexibility and the market oriented specializations with the different national and regional labor cultures? And which function plays the sociological research in a similar process?

Starting from the analysis of a specific policy as the benefits for unemployment in Italy and France and adopting the sociology of public action the paper offers a comparative analysis of the ways through which unemployment benefits promote in the different national contexts competitive labor cultures. The analysis will focus on the social mechanism of imitation that the policy is able to activate considering the lever age function exerted by related policies and the consequences of this policy on the career and professional growth of individuals.

Could the understanding of the social legitimacy of the policies be the contribution of sociology to the effectiveness of public action?
Sociological imagination for community based research: lessons and questions from the field
Andrea VARGIU (Università di Sassari, Italy) | avargiu@uniss.it

The contribution presents practices and discusses lessons learnt in social work and social policies courses in Italy, where community-based research initiatives were initiated as part of a European project over the last 4 years (the PERARES project). Such experiences build upon the example of ‘Science Shops’ which are “small entities that carry out scientific research in a wide range of disciplines - usually free of charge and - on behalf of citizens and local civil society”. (Living Knowledge, 2012, p. 1).

The presentation will briefly examine what participatory community-based research looks like when applied to student dissertations and how it contributes to the development of sociological imagination. The process of setting up a ‘Science Shop’ like structure will be briefly presented and difficulties as well as potentialities will be discussed.

Some key issues will be proposed for debate such as: 1. To what extent can students be civically engaged and how can universities promote such engagement? 2. What kind of initiatives can stimulate students’ and practitioners’ sociological imagination and foster their interest in research based practices and policies? 3. In what ways does CBR meet academic research standards and contribute to Higher Educational Institutions’ strategic objectives?

L’emploie des diplômés en sociologie en temps de crise : un état des lieux aux Portugal
Ana ROMÃO (CICS-Nova FCSH; Military Academy, Portugal) | anaromao74@gmail.com
Madalena RAMOS (CIES-ISCTE/IUL, Instituto Universitário de Lisboa) | madalena.ramos@iscte.pt

La crise économique et financière en Europe et au Portugal a entrainée une hausse massive des taux de chômage, ainsi que de la précarisation des situations et des relations de travail. En plus, aux adversités du marché de travail s’ajoute une certaine dévalorisation sociale de l’enseignement supérieur, spécialement focalisés dans les sciences sociales, jugés inutiles, notamment d’après l’argument de l’employabilité. D’un coté, la dévalorisation des sciences sociales sous le prétexte de la faible employabilité s’inscrit dans un univers idéologique utilitariste, ayant une perspective instrumental de la connaissance, tout en oublient les contributions des sciences sociales, notamment de la sociologie, en ce qui concerne l’auto-connaissance sociétal, la concrétisation de politiques publiques soutenables et solides, la participation à la société civil ou encore dans la prévention et combat à des processus d’inégalités et injustices sociales. D’un autre coté, les suspicions vis-à-vis de l’insertion professionnelle des sociologues sont souvent infondues, comme il s’agira de discuter dans cette communication. Comment les diplômés en sociologie font-ils face aux contraintes de l’insertion professionnelle, quels sont ses trajectoires, ses pratiques professionnelles et domaines d’activité ? Serons parmi les questions ici porté à discussion, d’après les données d’une enquête menée en 2013 par l’Association Portugaise de Sociologie.

RN27S03 - Human Mobility and Interculturality: Policies and Integration Models and Practices

Multi-ethnic society, plurality and inter-culture of ‘second generations’: a case study in Italian schools
Rina Manuela CONTINI (Department of Humanities, Arts and Social Science, University of Chieti-Pescara, Italy) | rm.contini@unich.it

The consistency and the complexity of the migration fluxes towards Italy, their degree of stabilization, as well as the increase of migration families and the presence of first and second generations in the Italian scholastic system, requires a consideration on the educational strategies and on the ability to combine articulate cultural models. The sociology of education sets as central the question of the function of the scholastic institution in the perspective of integration, social cohesion and the creation of citizenship. The paper presents a thorough analysis on the topics of the new educational needs expressed by ‘new generations’ that live in multiethninic social and scholastic contexts.

In specific, the research -through the presentation of the results of a research carried out between April and December 2014 on 20 sample schools in central Italy- scrutinizes the school policies for intercultural education adopted in Italy with reference to educational policies implemented in other European Countries (Green,2000; Eurydice,2004; 2009; Allemann-Ghionda,2008): actions for integration, addressed to non Italian students and their families (welcoming, Italian as L2, promotion of plurilinguism...); actions for the inter-cultural dimension, that invest all the school in its duties of equity and justice.

In such a vision, the paper faces the theme of inter-culture of ‘second generation’, that is tightly linked to the concept of school of citizenship in its function to give all students, of any origin and social and ethnic provenience, the equality of formative paths in the perspective of social living together.

Intercultural Mediation in Southern European Communities
Eleni NINA-PAZARZI (University of Piraeus, Greece) | enina04@yahoo.gr
Michalis PAZARZIS (University of Piraeus, Greece) | mpazarzi@yahoo.gr

Intercultural Mediation is an important social Institution in Southern European societies, which are characterized by multiculturalism. Sociological theories and approaches are the basis of mediation models in the Social and Cultural mediation. The discussion on the appropriate model for social mediation and classification of the various models are based on broader social theories. A synthesis of models is necessary for the achievement of the coexistence of social groups with different values and cultures.

Interdisciplinary approach for the practice of mediation is necessary and in this context sociological imagination can provide an appropriate way of designing and implementing social mediation.

The participation in the conference will be funded by the University of Piraeus Research Center.

Welfare, migration and normative irritations in southern europe
Maria Teresa CONSOLI (University of Catania, Italy) | consoli@unict.it

Access to “social” rights is principally the result of the “legal” recognition of categorical status and, therefore, the role of the legal culture, of the legal system and its actors is crucial, but rarely the normative domain in which rights are recognised and formalized (and the ways through which the public administration is involved) are critically analysed. In our approach the role of legal culture is considered as a strategic elements for understanding the content of the “welfare” in this area. In this part of Europe explanatory elements have always been considered the late experience of industrialization, the poor penetration of market mechanisms and the pervasive presence of the state in economic and social life. Together with Spain, Greece and sometimes Portugal, Italy marked similar path to social services provision and entitlements, to
“social rights” that national citizenships have progressively enhanced and affirmed. Recent flows of migrants towards the southern border of Europe have amplified some characteristic inequalities of the welfare and intensified some areas of irritations among social systems. Migration towards Europe has followed the path and the irresolutions already structured in the southern rim, specifying the model according to migrants’ entrance into the receiving societies. According to these changes is there still a southern European welfare model? In which terms the focus on legal culture can offer a deeper understanding of these processes?

RN28P01 - Poster Session

Determination of Social Model Applied to the Understanding of Physical Activity in Youth with Cognitive Disability
Diana Alexandra CAMARGO ROJAS (Santo Tomas University, Colombia) | diana.camargo@usantotomas.edu.co
Sonia GARCÍA BALLEN (Santo Tomas University, Colombia) | soniamgarcia90@hotmail.com
Gloria GONZALEZ ESPITIA (Santo Tomas University, Colombia) | glorygonzalez@gmail.com

The multidimensionality of disability beyond deficiency, recognizing the individual and society relationship, which enables social inclusion. The inclusion is evident in all areas of life, one of these physical activity, allows the development of the capacities of individuals, however presents barriers. Objective: To determine individual and contextual factors affecting the practice of physical activity in people with disabilities (PWD) cognitive. Methodology: Descriptive, mixed Survey, conducted triangulation of qualitative-quantitative methods. Population: young people with cognitive disabilities and their parents. Non-probability sample and purposive sampling. The Brockport Physical Fitness Test (BPFT) was applied and a semi-structure. Results: We evaluated 31 young people with cognitive disabilities the municipality of Cota Cundinamarca, Colombia. Population mostly (65%) men. Low aerobic capacity being better in men than in women. Muscular strength and BMI within expected parameters. Poor flexibility, negative values in sit and reach. Population between layers 3 and 4, this favors that all young people are in school. Parents have a college education related to economic possibilities. 65% know the duties and rights of the PWD and 94% for physical activity is a right and supports rehabilitation. Parents manifest lack of programs in the municipality. Conclusion: The physical condition of PWD is acceptable which promotes physical activity, may be related to socioeconomic conditions of their immediate environment which provides opportunities for inclusion. However it is observed that the barriers to the practice of physical activity are not imposed by parents, but by the lack of opportunities of the medium.

RN28S01 - Diversity, Management and Governance in Sport

The Power of FIFA – FIFA as Example of the Transnational Managerial Class
Ben BEHREND (Jacobs University Bremen/University of Bremen, Germany) | ben-behrend@gmx.de

Refreshed by the recent protests in the wake of the 2013 Confederations Cup and the 2014 World Cup in Brazil, FIFA is particularly criticized for its harsh requirements for potential host countries of FIFA World Cups, which put them regularly in great expense and imply misusage of public funds, whereas FIFA and its partners make tremendous benefits. In other words: Private benefits for a small elite at the expense of tax money from the people. Therefore, to ask following research question seems to be illuminating: How is FIFA able to possess so much power to influence domestic policies of countries in the context of FIFA World Cups, despite all controversies? I argue that FIFA is so powerful because it is a typical example of the currently dominant transnational managerial class (TMC) and since most governments anticipate totally
excessive benefits by hosting the World Cup. The concept of the TMC is an expression of the liberal, capitalistic, commerce generating elite, which determines the global politico-economic relations. It properly facilitates the integration of FIFA’s broad linkages to businessmen, politicians and other functionaries. Thus, it is fruitful to apply this concept on FIFA to elucidate its power and operational structures.

Delivering equality and diversity in sport under the new Equality Act (2010) Local experiences in the UK
John WILLIAMS (University of Leicester, United Kingdom) | jxw@le.ac.uk

The General Equality Duty in the UK Equality Act 2010 requires public authorities to: eliminate unlawful discrimination, harassment and victimisations; advance equality of opportunity between people who share a relevant protected characteristic and those who do not; and foster good relations between people who share a protected characteristic and those who do not. In 2014 ‘Northcity’ in the UK sought evidence and external evaluation on the extent to which its agents for delivering local sport were met the requirements of the new Act. Accordingly, nine focus groups covering 60 employees at different levels and in different sport and cultural services in the organisation were undertaken. Interviews were also conducted with senior Northcity staff and a wide range of local stakeholders.

The findings reveal the complexities involved in balancing the general requirements of leisure and sport provision while also dealing with specific needs around questions of ethnicity, gender and disability. The more ‘targeted’ approach to matters of equality and diversity of the past seems to have been reduced or even to have disappeared, as function areas and priorities within the organisation have changed. Few minority ethnic staff were employed in key positions and many existing Northcity staff viewed key equality issues as something of an ‘add on’ to their main service function not a core objective embedded in delivery. Stakeholders argued that Northcity should adapt much more effectively to working sensitively and strategically at a community level as a sympathetic partner for voluntary groups working on equality and diversity issues. We make a number of key recommendations for change.

Sport and the community: Voluntarism and authenticity in welfare provision
David Gunnar EKHOLM (Linköping University, Sweden) | david.ekholm@liu.se

Sport have in recent decades gained more and more prominence in social policy as a means of responding to social problems. The Sport program (SP) is a social and welfare intervention targeting alleged problems of crime and segregation by means of sport participation in a distinct urban area in Sweden. The SP was initiated by municipal public authorities and is conducted in partnership with schools, voluntary sport clubs and a social entrepreneur. The paper examines how municipal social policy makers conceive of the SP, concerning in specific the assumptions and conditions underpinning and enabling promotion of sport as a suitable response to social problems. Empirical data consist of a variation of statements (in interviews, debates in municipal council, administrative documentation and from newspaper articles). Statements are analysed from a constructionist strand. Preliminary analysis show that policy makers problematize public welfare provision in favour of involving civil society actors and market based social entrepreneurs in social work and that this is facilitated by means of sport. In line, entrepreneurial and sport club partnership provision is associated with voluntarism, authentic leadership and alternative funding opportunities; when as public welfare and social work in contrast is associated with technical and bureaucratic insufficiencies and limitations (e.g. unable to reach out and motivate youths at risk) as well as ever decreasing funding. This is discussed with
respect to the pedagogical and governing techniques enabled by such community mobilization; and moreover, considered in relation to recent transformations in the Scandinavian traditionally upheld social-democratic welfare regime.

**The Symbolic politics of 1988 Seoul Olympiads**

Haenam PARK (University of Tokyo, Japan) | checkitupnow@gmail.com

This study is to examine how the Olympiads was used as a means of symbolic politics in the authoritarian developmental state to govern and discipline (civil) society in South Korea. First, this article reviews the background context of the bid for the Olympic Games. Then, this study shows the aspect that the state’s symbolic politics utilizing ‘Olympic’ to discipline and govern the (civil) society. Lastly, the results of the symbolic politics will be argued, focusing on the responses from the (civil) society.

**Attitudes to organisational diversity in sport: A case study of regional governing bodies**

Jim LUSTED (University of Northampton, United Kingdom) | jim.lusted@northampton.ac.uk

Abstract:
It has become something of a truism to suggest that a more diverse workforce is a more productive one, and that organisational diversity is should be goal of any forward thinking institution. It could also be said that sport is seen as one of the more amenable social spaces in which issues of equality and diversity can be embedded. Given the historic connection between sporting cultures and ideas of fair play and meritocracy, sport provides an interesting place to explore the truism of organisational diversity. This paper draws upon data collected from research funded by a National Governing Body (NGB) of a sport in the UK (which will remain anonymous) which undertook a survey of the current workforce (paid and voluntary) at the (approx. 30) Regional Governing Bodies (RGBs) who are responsible for governing their sport at a localised level, including the grassroots game. The current workforce were asked questions relating to how diverse they felt their organisation was, whether it needed diversifying and what benefits they felt a diverse workforce could bring. Results suggest that, perhaps like other industries, those working in sport fail to recognise the lack of diversity at their organisation. Moreover, the current workforce draws heavily upon particular interpretations of fairness and meritocracy to challenge both the need to make their organisations more representative of their local playing populations. It is suggested that far from embracing organisational diversity, RGBs still need convincing of both the benefits of diversity and also the problems that exist in the homogenous profile of middle aged, white men that continue to dominate this setting.

**Reflections on a thwarted attempt to penetrate the criminal subculture of ticket touts in the UK**

Alessandro MORETTI (University of Greenwich, United Kingdom) | a.moretti@greenwich.ac.uk
Building on Atkinson’s (1997) exploration of “the social life world of ticket scalpers”, and on Sugden’s (2002) investigation into football’s underground economy of illegal ticket sales, an attempt was made to penetrate the criminal network of ticket touts in the UK in order to gain insight into their norms, their knowledge of the law and attitudes towards risk. Ethnographic research methods were adopted, including in-depth qualitative interviews and participant observation through the establishment and maintenance of a relationship with a gatekeeper. A number of important methodological challenges emerged from the rapport that developed. Ethical dilemmas surrounding the “unavoidable” infringement of the law on the part of the researcher (Pearson, 2009) arose when access to the criminal network of ticket touts was negotiated. These issues, and their inherent risks, persisted as the relationship with the gatekeeper developed once trust had been established. Further ethical difficulties transpired for the researcher as a result of the gatekeeper’s decision to avoid disclosing to other members of the criminal network the academic nature of the researcher’s involvement. This decision ultimately compromised the researcher’s position within the group, leading to situations of risk regarding detection and personal safety being perceived by the researcher, the gatekeeper, and other individuals within the extended network of criminal ticket touting.

This paper offers methodological reflections on the risks and ethical issues that may challenge the pursuit of knowledge in the dark sides of sport, an area accessible only through the establishment of true relationships of trust with reliable gatekeepers.

Too tired for sport and exercise? The work and leisure of female cleaners.

Verena LENNEIS (University of Copenhagen, Denmark) | verena.lenneis@nexs.ku.dk
Gertrud PFISTER (University of Copenhagen, Denmark) | gpfister@nexs.ku.dk

Cleaners are an occupational group with a difficult working environment. Many of them are overweight and/or have a high risk of cardiovascular disease. Therefore, physiologists emphasize the need for leisure time physical activity with at least moderate intensity. The aim of this study was to explore the opportunities and challenges of female cleaners with regard to participation in sport and exercise. We gained information about their everyday lives via semi-structured interviews with 25 women, most of them from rural Turkey, who had participated in a fitness project at their workplace.

Drawing on theoretical approaches to intersectionality and work-life balance, we explored if and how female cleaners engage in leisure time physical activity. Results revealed that most interviewees struggled with the high demands of both paid work and domestic responsibilities and therefore had great difficulty exercising in their leisure. However, previous experiences with sport and exercise seem to have a decisive influence on lifestyle: those (few) women among the interviewees, who have acquired a “taste” for physical activity, do not have the same problems to integrate physical activity into their lives as women without “physical literacy”.

Black youth, grassroots football and racism – methodological challenges and revelations

Max MAURO (Southampton Solent University, United Kingdom) | max.mauro@solent.ac.uk

The aim of this paper is to address some methodological challenges in the study of the lived experiences of racism among young footballers of African background. Despite a growing interest in the study of sport practices across different disciplines, young people appear to remain under the radar of most research. The same can be said for issues of inclusion and exclusion among young people that may intersect with manifestations of racism on and off the pitch. This paper draws on the findings of two distinct research projects carried out in Ireland and Italy. Both studies have as their focus the participation in organized football of youth of
immigrant background, in particular black youth born in Africa or born in the country from families migrated from Africa. Both studies were undertook to explore the inclusive potential of football, but ended up highlighting the ways black youth learn how to cope with racist abuse happening in the context of their football practice. The research participants of the Irish case were teenagers aged 14-18. The methodology adopted was a flexible combination of participant observation and visual ethnography. In the Italian case, the participants were aged 18-24 and the methodology used was qualitative interviews (semi-structured and group interviews), and observation. What emerges from both cases is the methodological challenge for a white adult researcher to acquire a comprehension of the lived experience of ‘racism’ by young footballers. Personal accounts and interviews appear to be precarious tools in research with young teenagers, while they are more productive with youth aged 18 and over. Trustable gatekeepers, time, and the ability to build rapport with young participants are decisive factors, but researchers have to accept the fact that their role is uncertain. Only flexibility and humility can allow for a true learning experience.

Health-Related Promotion of Physical Activity. A Critical Analysis of Health Strategies through a Triangulation of Theories
Enrico MICHELINI (TU Dortmund, Germany) | enrico.michelini@gmail.com

Strong evidence associates physical inactivity with an increased risk of non-communicable chronic diseases, which are the leading cause of death worldwide today (Lee et al., 2012). As a consequence, the promotion of physical activity (PA) to prevent the epidemic spread of these diseases and to improve the health of the population is a core objective of health strategies globally. PA is here broadly defined as ‘any bodily movement produced by the skeletal muscles and resulting in a substantial increase over the resting energy expenditure’ (Bouchard & Shephard, 1994, p. 77). From the perspectives of three different theoretical approaches, this paper analyses the characteristics of national strategies for the health-related promotion of PA by focusing in particular on issues which affect the communications’ content.

Through a triangulation of systems theory (Luhmann, 1995), critical theory (Habermas, 1984) and medicalisation studies (Conrad & Schneider, 1980), a code system for the analysis of health strategies was developed. Fifteen national strategies for the promotion of PA were selected and examined by using the interpretative technique of content structuring analysis (Mayring, 2003). These documents were issued or sponsored by the ministries of health of Germany, Sweden, and the USA, countries which are representative of conservative, Scandinavian and liberal welfare typologies, respectively (Esping-Andersen, 1990). As the highest governmental department for health, health ministries were considered the most suited issuing source for documents used in this study. This empirical design was developed to furnish reliable insights on the question: “Which issues affect communications on health-related promotion of PA?”

The following sections briefly summarise the interpretations of the main results of the document analysis through the above-mentioned theoretical approaches. Against the background of systems theory, a peculiar autopoietic closure of the health system was revealed. In particular, the health strategies stress that the cooperative and intersystemic involvement of a large number of partners is crucial for the success of PA promotion, yet the strategies are in fact characterised by a sport-hostile attitude. The rejection of sport as a health medium is correlated with the incommensurability between the operative code of the sport system (win/lose) and that of the health system (health/illness). The critical perspective disclosed various distortions which harm the validity of comprehensibility, sincerity, legitimacy, and truth of the health strategies. At least some of these
distortions are avoidable. In particular, a fundamental discrepancy between the broad goals of health promotion and the narrow preventive aims of the health-related promotion of PA was revealed. As a consequence, the health system ignores its utopic goal when promoting PA and ends up focussing ‘merely the absence of disease or infirmity’ (WHO, 1948, p. 1).

Finally, the framework of the medicalisation studies uncovered various signs of an ongoing process of medicalisation of PA. Indeed, the health system: Treats the problem of physical inactivity as deviant behaviour; redefines in medical terms the concept of ‘healthy physical activity’; creates key functions for the health system’s staff in this area; encroaches on alternative solutions for the problem of physical inactivity.

In conclusion, the analysis of the documents through three different theoretical perspectives disclosed various issues affecting the selected communications of the health system. The engagement of the health system is crucial for success in the area of PA promotion. Yet the identified issues can actually harm the fight against physical inactivity, which is deeply rooted in modern society and difficult to counteract. In particular, the health system’s operational closure, its focus on the prevention of diseases, and its encroachment on alternative solutions do not constitute a sound basis for a cooperative promotion of PA. However, complex social problems can be better assessed by a high degree of intersystemic coordination (Willke, 2007) and addressing the matter of physical inactivity surely requires strategies that include other partners, in particular the sport system. Indeed, while the sport system has proven unable to solve the problem of physical inactivity by itself (Cachay, 1988, p. 9), it still owns a capillary complex of organisations whose main goal is the implementation of programmes for sport and PA. Furthermore, these organisations also naturally aim to actively involve people and offer a broad range of activities suitable for various purposes and (almost) all population segments.

Twitter and the Sports Media: The more things change, the more they stay the same
John PRICE (University of Sunderland, United Kingdom) | john.price@sunderland.ac.uk

This paper analyses the impacts Twitter is having on the roles of sports journalists and their relationships with football clubs, audiences and colleagues. Its empirical material is drawn from interviews with sports journalists and football club media officers, as well as analysis of social media content. The paper takes a case study approach, focusing on the work of reporters in the North East of England covering Premier League teams Newcastle United and Sunderland. The emergence and growth of Twitter has had undoubted benefits for journalists including a glut of stories based on social media content, a challenge to the control of club PR officials, a means of communicating with their readers and the ability to develop personal brands. However, it has also brought numerous drawbacks such as online abuse, a loss of exclusive access to sources, and rivalry from club feeds and citizen journalists. This paper critical discusses the pros and cons of Twitter from a journalistic perspective and attempts to assess the role and value of sports reporting in a social media world. It argues that journalism still has a valuable role to play by offering an independent, well informed and analytical voice. In an era where anyone can be a publisher, people look to journalists to make some sense of the white-noise and be their guide through the online world.

Popularity Differences Among Professional Tennis Players: Does Attractiveness Matter?
Michael MUTZ (Georg-August-Universität Göttingen, Germany) | michael.mutz@sport.uni-goettingen.de
Mara KONJER (Universität Münster, Germany) | m.konjer@uni-muenster.de
Henk Erik MEIER (Universität Münster, Germany) | Henk.Erik.Meier@uni-muenster.de

In todays commercialized and mediatized sports culture professional athletes increasingly compete for media and public attention to attract sponsors and advertisers. One obvious influential factor for explaining popularity differences among athletes is athletic success. The best athletes will receive the most public and media attention. However, the example of the Russian tennis player Anna Kournikova, who has never won a WTA singles title, but was one of the most photographed and best paid sports celebrities thanks to her good looks, is often cited to illustrate that other factors beyond mere performance may be of relevance as well. This talk will address the possible effects of attractiveness for media attention and popularity of athletes. Using the best-performing professional male and female tennis players (according to ATP-/WTA-rankings) as a test case, quantitative analyses will reveal if attractiveness really matters. Furthermore, it will be analysed whether any effect of attractiveness is moderated by gender. It will be argued that attractiveness is more important for explaining popularity differences among female athletes, given that sports audiences are largely males and media routines in sport journalism are guided by the anticipated preferences of male consumers. As outcome variables print media citations and global search engine queries are utilized. Hence, public attention in ‘classic’ and new media is captured and can be compared.

Football kingdom: the media coverage of sport in the Portuguese television and press
Marta LIMA (Faculty of Arts, University of Porto, Portugal) | martammlima@gmail.com
Far from being an exclusive of specialized media, the sport is nowadays a regular presence in general press and television newscasts. This fact becomes particularly noticeable in the Portuguese media. Among the different sports covered in the three national sports newspapers, as well as in the generalist press and television, football is undoubtedly the most mediated one. Based on an analysis of the primetime newscasts of the major channels of Portuguese television and the editions of the three most important newspapers in the country, we tried to find out the relevance of football in Portuguese media and to unveil the features of the media coverage of this sport, especially with regard to the type of news covered and their nature, the dominant journalistic genres, the actors and the context of the news, and the main sources that sustain the news production about football. This research, conducted as part of my PhD, allowed us to conclude that football emerges as the most important theme on the Portuguese major newspapers and the second dominant theme on primetime newscasts, just after the Politics. In this context, can football be understood as something that goes beyond the pitch, emerging as a profitable industry, whose power is amplified by the media? What is the journalist's role in this process of mediatization? With this paper we intend to reflect and enhance the debate on these questions, based on the presentation and analysis of the main conclusions drawn from this research.

Halepmania: thematic and emotional mapping of sport performances within social media discourses
Diana-Luiza DUMITRIU (National University of Political Studies and Public Administration, Romania) | dumitriu.diana.luiza@gmail.com

The symbolic capital of sport events brings out a high level of emotional intensity and engagement in terms of spectatorship experience, allowing for public debates to emerge around sport performances. If this process of (re)defining the social significance of sport performances has been mainly hosted and controlled by traditional media actors, social media came with a "disruptive effect" (Pegoraro, 2014) within both the media landscape and the spectatorship practices.

Discussing the new visibility and interaction space provided by the social media to the general public, this paper addresses the discursive practices that come as a reaction to the top-athletes' performances. Using the official Facebook pages of the two main Romanian sport newspapers, the corpus covered the comments that have been made to the posts related to Simona Halep's evolution at the 2014 Roland Garros and the 2014 Singapore WTA Championships tournaments - two referential moments that fueled up what was generally called the Halepmania phenomenon.

In analyzing the data, the paper brings to the fore the thematic mapping of Simona Halep's performance by correlating two dimensions: the emotional mapping of the discourses and the alternative frames used in defining their symbolic value. Besides the wide spectrum of areas addressed by these discourses, which go from national identity, to moral values or society criticism, social media encourage practices of what I relate to as circumstantial civic fandom. I thus argue that social media can act as a deliberative space were sport performances may become subject to an intense problematization process.

The visibility and the image of female athletes in the Sochi 2014 Winter Olympic Games coverage by French newspapers.
Nicolas DELORME (University of Bordeaux, France) | nico_delorme@hotmail.com
Amy GODOY-PRESSLAND (University of East Anglia, United Kingdom) | A.Godoy-Pressland@uea.ac.uk
The media coverage of sport events in relation to athletes’ sex has been extensively analysed in the scientific literature. The findings of these studies seem consistent in that female participants are systematically underrepresented in sports media coverage, whether in newspaper articles, photographs, airtime, or new media. In addition, qualitative studies have pointed out differences in journalistic reporting between women and men. In this way journalistic comments frequently convey a stereotypical representation of female athletes. However, much of the research in this area relates to North America.

Therefore, the aim of this study was to examine quantitatively (i.e., using a content analysis) and qualitatively (i.e., using a thematic analysis) sex equity in the coverage of the Sochi 2014 Winter Olympic Games by three French newspapers (Aujourd’hui en France, Le Monde and L’Equipe) in order to provide new insights in this research field from a different cultural perspective. Samples of 360 articles and 304 photographs were collected and analysed.

The content analysis shows a significant discrimination of female athletes on most of the variables analysed. The main themes which emerged from the qualitative analysis include: masculinity, national expectations, task-irrelevance, work ethic, friendship and physical descriptions. The coverage demonstrates adherence by journalists to media mechanisms which represent sportswomen as distinct from sportsmen.

**'They're Not Real Fans Like The Men Are': Perceptions of Women as Inauthentic Football Fans**

Stacey Elizabeth POPE (Durham University, United Kingdom) | stacey.pope@durham.ac.uk

Recent changes in men’s professional football in England, including the instigation of all-seater stadia and the England national team reaching the semi-finals at the 1990 World Cup, have prompted an upsurge of interest amongst women. But these changes have raised a number of complex issues regarding women’s authenticity as fans and female fans have been directly implicated in the alleged ‘gentrification’ of football.

Drawing on Glaser and Strauss’s (2008) ‘grounded theory’ approach, 51 interviews were conducted with three generations of female football fans in England. My findings examine how females have been labelled as ‘inauthentic’ or inferior fans. I consider how respondents negotiate gendered stereotypes in football, such as assumptions that they lack sporting knowledge and only attend sporting events because of a sexual interest in male players. I argue such perceptions are the most effective way for men to exclude women as authentic fans, whilst simultaneously enhancing the status of male supporters.

I move on to examine the hostility some women expressed towards other female fans who did not ‘do’ fandom properly. Many female fans were frustrated by women who ‘played up’ their sexual interest in players, especially as they would consequently have to defend their own position as a ‘real’ fan. This hostility to other ‘types’ of female fandom may thus be due to requirements for female fans to continuously ‘prove’ their fan status in a way that is not necessary for most men. To conclude, I call for further sociological research to explore this largely neglected area.

**Trends in the Sociology of Sport: Topics, Theories and Methods**

Ørnulf SEIPPEL (Norwegian School of Sport Sciences, Norway) | ornulf.seippel@nih.no
What does the sociology of sport look like? In IRSS 2014, Vol. 49(6) 645–668 John Dart gives a well founded and illuminating answer to this question through a content analysis of 25 years of articles in three leading sociology of sport journals. In this article I extend these analyses, and give a more elaborate answer to what have been the central topics, theories and methods during the last 30 years of sociology of sport. These analyses add to Dart’s study in four ways. First, whereas Dart uses the article’s title, abstract and/or key word as his data, this study uses the articles as such – the whole text - as data. Second, whereas Dart reports several problems of coding, this study avoids this by going straight to the texts. This gives the possibility of a more direct and thorough investigation of what has been in focus in the field. Third, where Dart looks at 25 years of articles, this study goes back 30 years and it will also put more efforts into showing how the field has developed – trends in the sociology of sport - during this period. Finally, Dart presents his findings in word clouds which supports an immediate understanding of his findings, but makes it difficult to grasp the true content and details of his findings. This study will present the findings in a more informative manner.

The rise and decline of tennis: sport participation in times of (post-)modernization
Koen BREEDVELD (Radboud University / Mulier Institute, Netherlands, The) | k.breedveld@mulierinstituut.nl

Sport is a modern phenomenon. Even tough games and physical activities are of ancient times, sport as a social practice is inherently linked to the process of modernization. Its growth is due to changes in transportation, in broadcasting and communication techniques, in rises in welfare and in free time, and in changing social needs.

Tennis greatly benefitted from the sportification of society . In the 20th century, tennis became one of the leading sports in the world. Its tournaments attract a global player field and audience, its industry is one of the largest sportindustries in the world, and over a 100 million people play tennis on a regular basis (Tennis Europe 2012).

Yet, times continue to change. New sports have entered the field, new practices have started to cater to the need for social belonging and distinction, motives for being physically active have altered, and the changing temporal organization of society has put pressure on people’s agenda’s.

In this paper we will go into how tennis has fared in these changing times. We will rely on historical and statistical data on participation in tennis, on the organizations involved (clubs, courts) and on the tennis-industry (media, equipment), to illustrate how tennis first became one of the leading sports, and now has trouble maintaining that position. Even though most data are on the Netherlands, we expect that this case-study helps shed light on the social dynamics that shape sports - and that in turn, are influenced by sports.

Events & Social Engagement: Considering social engagement pursued in conjunction with the Glasgow 2014 Commonwealth Games
Briony SHARP (Queen Margaret University, United Kingdom) | bsharp@qmu.ac.uk

Recent analyses of major and mega sporting events and their legacies are evident; however, as with wide-ranging evaluations, the examination of these events is inclined to disregard the social dimension (Smith 2009). Literature in this area, much like urban and event policy, recognises the importance of economic impacts (Miles in Paddison and Miles 2007; Hall and Barrett 2012) and, more recently, the significant need for lasting and meaningful social engagement through any regeneration processes (Pratt 2009; Miles in Paddison and Miles 2007). The development of the use of social capital within urban planning literature (Putman and Goss 2002) has potential to aid event managers in increased awareness of community resources, stronger
interactions between organisations and the promotion of social cohesiveness (Lassila et al. 2013). The lack of theoretically informed research perhaps explains why the concept is rarely explored at length within sport policy (Misener 2013; Coalter 2007), which highlights the need for closer collaboration between academics and policy makers (Coalter 2007). In addition to community member and volunteer interviews, elite-level interviews were conducted with relevant industry professionals, chosen by their expertise and organisation; such as GlasgowLife, Volunteer Scotland, Glasgow 2014, Glasgow City Council, Clyde Gateway. Findings suggest that Glasgow’s efforts of creating social change and community development have been well-received. The emergent themes in the data collected provide outcomes aligned with the growing shift in event-led regeneration towards long-term outcomes and social legacy.

From stands – outside the stadium. The forms of use of the social capital generated in polish football stadiums
Mateusz GRODECKI (University of Warsaw, Poland) | m.grodecki@is.uw.edu.pl

The purpose of this PhD project is to understand and describe the mechanism of generating social capital in stands of football stadiums in Poland and to reveal the process of transferring social capital from these stands to the society. On the basis of the present observations it can be concluded that this capital is transferred to the three areas: social (patriotic activities, charity), economic (business) and criminal (hooligan). Furthermore, the production of social capital is the distinctive feature of football stadiums (smaller intensity of the phenomenon can be observed also in speedway games). This is a new approach to issues related to football fans, because so far, research efforts have been focused mainly on fans ethnography, hooligans issues and consequences of commercialization processes. The main hypothesis of the project assumes the existence of such a pattern/mechanism. Football can be considered as having a cathartic function or being a ‘safety valve’ of sorts. During the game strong emotions are being generated that enable the creation of the communal identities (‘we’ versus ‘they’). These emotions are strong enough to form social capital.

Sport Stars in Minor Sports
Arnost SVOBODA (Palacky University Olomouc, Czech Republic) | arnost.svo@gmail.com

The primary goal of the paper is to describe a process of “sport star” construction in scope of a top-level but only partially medialized and professionalised sport (swimming). Based on the qualitative case study realized in a local context in the Czech Republic it seeks to analyse the establishment of stars (well-known and successful athletes) in this type of minor sport which often stands out of the mainstream interest of sports-sociological studies. It further investigates ways and dynamics of construction of these stars from the point of view of swimming sport actors (including swimmers, coaches, and spectators). The paper is theoretically grounded in the Pierre Bourdieu's work on symbolic capital and social fields, supplemented by approach of Howard S. Becker. Further, it draws inspiration from cultural-sociological studies of sport stars and celebrities (G. Whannel, B. Smart, Ch. Rojek). Results outline ways of establishment and representation of sport stars as bearers of accumulated sport capital in the observed field (the swimming sport). The concept of authenticity is introduced as a possible source of this type of symbolic capital and a distinctive feature of the sport field in general. Further, values present in swimming sub-field are described as authentic as they are perceived as such by respondents of
the study as well as reconstructed in star swimmers’ bodies. The paper contributes to the discussion on autonomy of social fields in the context of sociology of sport.

Football and New Social Movements
Ebru AÇIK TURЂTER (Mugla Sıtkı Koçman University, Turkey, Turkey) | ebruacik@hotmail.com

New social movements that have marked the last thirty years are ones that have revealed as a consequence of the demand for equality, diversity, participation and identity. These movements embodying demands both private and public prefer a non-public way of politics. These movements on such a broad ground beyond class boundaries, participatory, pluralistic and involving the private dimensions of human life offer alternatives for decision making processes. Nowadays, new social movements having shown that demonstrations could be performed anywhere; such as streets malls, universities, and etc.

Sports events have become one of the major fields in which new social movements are observed. Football that is widely attracting attention is one of the most significant athletic branches. Football competitions are the areas where both the dominant ideology and the opposition are observed at the same time. But recently the social opposition observed in this area has become much more apparent.

Conclusively, this study will focus on how 'power relations' become visible in, and on how to convert a cultural reading of the overall aims of the football competitions. Furthermore, this study aims to focus on and demand for equality, diversity, the opposition forms of participation, and identity construction in football competitions. For this purpose, it aims to exhibit and discuss the forms of social opposition in football matches played in Turkey in the last five years.

Successful Teamwork in Sport: A Sociological Analysis
Vidar HALLDORSSON (University of Iceland, Iceland) | vidarh@hi.is
Thorolfur THORLINDSSON (University of Iceland, Iceland) | thorotho@hi.is
Michael KATOVICH (Texas Christian University, USA) | m.katovich@tcu.edu

A significant number of sociologists have dedicated themselves to examining small groups in various fields. While many recognize the notion of teamwork in small groups, systematic discussion of this process remains sparse. Aside from Goffman's dramaturgical emphasis on partnership for the purpose of manipulating impressions and the broader theoretical notion of creating a team that represents “a secret society,” it appears that sociologists interested in small groups have virtually ignored teamwork as a prosocial necessity in sport. This paper provides an explorative sociological analysis on successful and prosocial teamwork in sport. As is customary in analyzing small groups, we focus on small group dynamics and build on the work of Goffman. However, as a way of separating our emphasis from Goffman, we analyzed two highly successful and internationally recognized Icelandic sport teams that regarded teamwork as a process of open communication rather than as a method of keeping secrets. In particular, we analyzed Iceland’s men’s national handball team and Gerpla, the women’s equivalent of a national team in team gymnastics. The findings show that successful teamwork is built on a dynamic interplay between the recognition of factors that contribute to group solidarity and an appreciation of individual agency, such as: a team culture, reflected by a tradition of how things are done as instrumental in shaping the athlete’s social environment; collective representations, or shared motivations resembling “a collective conscience” derived from shared pasts and nationalistic based emotions; and skilled agency, represented by individual leadership in the context of “organic solidarity.”
RN28S06 - Society and Sports (Open Session III)

The Perception of The Fans on Football Handicapping in Turkey
Muge DEMIR (Beykent University, Turkey) | mugedemir@beykent.edu.tr
Ahmet TALIMCILER (Ege University, Turkey) | ahmet.talimciler@ege.edu.tr

When the final score is concerned, “The principle of uncertainty” becomes the most appealing feature of football. The elimination of this feature via handicapping actually means the total elimination of the 'game'. Handicapping means making external interference on the game and the manipulating the final score in the aim of getting a specific, desired result. The reason behind the establishment of such suitable grounds on handicapping in football, is the massive size of the game, and the possibility of economic rent leading to great returns. The most important complementary element regarding football in the era we are in is the media. Delivering news of handicapping process is the most important subject to focus on and it is an issue that will be the subject for future academic studies. Handicapping and investigation primarily 'in favor of the window' has been addressed by the media. Such an approach has prevented the topics to be discussed by the public sphere gathered around football in a healthy and proper direction.

In this study, an “interviewing method” was used on the above mentioned concepts regarding the perception of the fans on football handicapping in Turkey that has been coming up frequently in recent years. Originality of this study comes from the analysis made on the supporters of the teams placed in the “Big Four” category in the Turkish league (namely Fenerbahçe, Galatasaray, Beşiktaş and Trabzonspor), that constitutes most of the overall football fans in this country. As a result, a careful analysis will be made on the supporters’ approach to handicapping allocations and the ways in which these are made.

The mirage of equality. Technology and disabled sport
Przemyslaw NOSAL (Adam Mickiewicz University in Poznan, Poland, Poland) | przemyslaw.nosal@gmail.com

The development of technology supplies disabled sport with new solutions. Artificial limbs, maneuverable wheelchairs or adjusted sportswear – all of them are supposed to support the athletes. The application of the hi-tech in disabled sport causes that player’s results are still improving. According to Olympic motto – most of them run faster, jump higher and throw stronger. This kind of score progress brings the disabled athletes’ results nearer the abled athletes’ achievements. Example of Oscar Pistorius or Alan Oliveira (running) blurred the lines between abled- and disabled sport results. It leads to the wider questions: Can technology bring equal chances in sport? Can technological enhanced disabled sportsman compete with abled one? Does technological expansion support equality in sport?

I would like to present my research results which give four arguments against the “technological equality in sport” hypothesis. Firstly, respondents describe the unequal distribution and access to the sport technology. This issue concerns both abled- and disabled athletes. Secondly, the problem is the technological “Matthew effect” – “the 'more technological' get better and the less get worse”. Thirdly, there is a very thin line between accepted support of technology and forbidden enhancement. Finally, there is a great problem with adjustment of technology to specific athlete’s body. The advanced solutions (like artificial limbs) very often do not co-operate with player body.

The basis of my presentation is the research “Technology and social life. The field of sport”. During the project the sport participants (athletes, trainers, sport activists, physiotherapists, journalists) were interviewed.
Football antisemitism: The case of Kraków, Poland.
Bogna WILCZYŃSKA (Jagiellonian University, Poland) | bognawilczynska@wp.pl
Marek KUCIA (Jagiellonian University, Poland) | marek.kucia@uj.edu.pl

The objective of this paper is to describe the main characteristics and to account for the most important causes of football antisemitism, that is, the antisemitism of football fans, and to answer the question whether this is an instance of one of the kinds of antisemitism that have been discussed in literature or whether it is a sui generis phenomenon. Based upon the reports on racism on Polish and Ukrainian stadiums, press papers, internet sources and in-depth interviews with fans of the football team ‘Wisła’ from Kraków, Poland, the paper finds out that football antisemitism is a peculiar type of antisemitism. Although the football fans use the contents characteristic of religious, modern and contemporary kinds of antisemitism that are fairly widespread in Poland, their hatred is not addressed to the followers of Judaism, members of the Jewish people or the State of Israel, but the fans of the ‘Cracovia’ team from the same city who are also of the Catholic background and Polish ethnicity. The antisemitic events in the stadiums occur in Kraków and other Polish cities that have had a long history of Polish-Jewish coexistence and antagonisms that resulted from this coexistence. The fans use available contents in order to offend the rivals; the figure of ‘Jew’ is a showy, historically proved way of expressing contempt and referring to ‘the Other’.

Pilates as Prevention of Ill-Health, Physical Activity or Wellness?
Loredana Maria TALLARITA (University Kore of Enna, Italy) | loredana.tallarita@unikore.it

The evolution of body image in the culture of contemporary physical activity is part of a scenario that pursues the global cultural values of wellness, health and sport. As icons of the body, now obsolete, traditional sports have been superseded by the diffusion of new body styles: healthy and beautiful bodies, commodified images from advertising and framing perspectives that drive the meaning of the message. In the wake of sharing these values is a growing network of services for bodily capital (Bourdieu; 1980). The gym and wellness industry is the other side of the coin in the pursuit of the body cult. The purpose of this research is to analyze, using the qualitative and ethnographic case study approaches (Spradley, 1979; Stake, 1995, Robert Yin, 2013), the relationship that is established between the representation of the body and the narcissistic consumption of free time in gyms, dedicated to a particular practice which has been enjoying great success in Italy despite the economic downturn: pilates. The application of knowledge to practical research begins with the observation of a growing interest in pilates by the managers of gyms, managers of specialized centers, studios, and aspiring practitioners who have become regular exponents. The research which has been conducted in Italy, has taken into account two very different metropolitan areas: Milano and Palermo. A further phase of research will be carried out in England in two cities: one in the south-east, London and one on the south coast, Brighton.

JS_RN04+RN28+RN30 - Sport Participation: Means of Social Inclusion or Social Exclusion?

When sport is helpful. The role of sport in the after earthquake at L’Aquila (Italy)
Geraldina ROBERTI (University of L’Aquila, Italy) | geraldina.roberti@univaq.it
Ariela MORTARA (IULM, Italy) | ariela.mortara@iulm.it
The current economic crisis is having very heavy consequences on young people, causing an increasing risk of marginality and social exclusion; at the same time the connections that allowed the sense of belonging and social bonding are loosening, weakening the same youth social integration. In such a framework sport ends up filling a place as never in the past (Dunning, 1999), fostering the ways of youth growth. Indeed, sport plays an important role in the growth and socialization process of young people, letting them explore new perspective of social relations inside peer group (Horne, Tomlison, Whannel, 1999).

In order to investigate the elements characteristic of young sports training, we carried out a qualitative research by means of semi-structured interviews on a specific target group. Our informants are young athletes members of a sport team from a medium Italian town, L’Aquila. This is a very peculiar framework, because in 2009 the town was hit by a serious earthquake that caused hundreds of victims and destroyed sports facilities nearly thoroughly. Our main aim was not only assessing the role of sport in the pathway of social and identity reconstruction after the earthquake, but testing how much sports training can also increase the capability of young people resiliency.

The preliminary results highlighted that sport has been a mean of social integration for the young in L’Aquila indeed, helping them to reconnect those social links that the earthquake had destroyed.

Anti-radicalisation as aim – social exchange as outcome – an intervention using sport as a means to antiradicalisation
Annette MICHELSK LA COUR (University of Southern Denmark, Denmark) | amlacour@sam.sdu.dk

For decades, sport has been assigned a central role in the promotion of health and social inclusion, in crime prevention etc. Recently, public funding in Denmark has become increasingly directed towards involving non-state actors in welfare policy through sports. Using the perspective of event management and the concept of social exchange this paper describes the ways in which the DGI, an umbrella association for local sports clubs, in cooperation with civil society actors involves itself in an intervention (Playground) enrolling ethnic children and young ethnic people as participants. The DGI uses sports events to activate children and adolescents in so-called socially disadvantaged areas (DGI Playground) aiming at anti radicalism and at reducing crime rates. The article points to the heterogeneous motives of the actors involved in the events, the social exchange processes leading to the establishment of a social exchange relationship, which offer various subject positions for (the predominantly ethnic minority) children and adolescents participating in the event. The data were generated during a three year long process evaluation using qualitative methods including interviews, focus group interviews, observations and document analysis. Further, the paper discusses the social exchange transactions in which the civil and public rationalities intermesh with the private rationalities and create balanced forms of exchange relationships, during which the participants through their own rationalities act in order to meet their own needs. In doing so the outcome of the event is balanced processes of social exchange between the event managers and the participants. For the participants the outcome is meeting their conditions and this leads to an evaluation of the events as being socially beneficial for them, but not for the event managers nor for the DGI. The needs of the event managers are partly met and they are left with an imperfect outcome and a negative evaluation.
Visions of Normality: Body Pictures of Boys and Girls
Nicole KIRCHHOFF (TU Dortmund, Germany) | nicole.kirchhoff@tu-dortmund.de

Boys should be strong, girls should wear skirts - and both should be sportive. In this way I cautiously sum up the first group discussions, which take place within the framework of my dissertation. It is about body pictures of boys and girls in puberty. My question is originated from a project of the TU Dortmund, which is based on quantitative and qualitative data. This research project studies socialization mechanisms that contribute to varying participation rates of adolescents with migrant backgrounds in schools, in extracurricular exercise and in sports practices. The goal is to evaluate how gender, social class, migration and their intersections predict the socialization process of teenagers in school sport as well as extracurricular sport. The socio-somatic cultures of migrants will be investigated with regard to their construction processes, their possible ethnic connotations accomplished in practices of self-attributions and attributions by others as well as their realization in everyday life. Furthermore we ask how migrants perceive, judge and influence physical education, school sport and extracurricular physical activities through their own decisions. In my dissertation project I focus on the field of physical culture and body images of adolescents. First experiences in the field show, that talking about the body is difficult - especially for teenagers. Because of that I expand the group discussion by adding the collage as a visualized approach. In this way, results could be gained, which show an idealized orientation of the boys to “neo-traditional” forms of masculinity and femininity. At the same time the model of the petty-bourgeois nuclear family seems to determine the normality of these boys. In my contribution I foremost want to discuss patterns of body-images which I could find in the collages.

New Alternative Masculinities in Physical Education and school sport
Guiomar MERODIO (Universitat de Barcelona, Spain) | guiomar.merodio@gmail.com
Marcos CASTRO-SANDÚA (Universitat de Barcelona, Spain) | marcos.castro@ub.edu

Research has provided many evidences that Physical Education (PE) and sport have traditionally privileged certain forms of hegemonic masculinities which contribute, through concrete behaviours, practices and conceptions, to build an hostile environment in which violence (bullying, harrassment) is perceived as normal (Hickey, 2008; O’Connor & Graber, 2014). Girls and boys that do not respond to this hegemonic model are mainly the victims of this violence. Gathering the contributions of research on masculinities initiated by Gómez (2004), the meta-research conducted by Flecha, Puigvert and Ríos (2013) revealed the difference between Dominant Traditional Masculities (DTM) and Oppressed Traditional Masculinities (OTM), as the two sides of the traditional and patriarchal model of relationships. In the same vein, the New Alternative Masculinities (NAM) were presented as an alternative model, radically opposed to OTM and DTM, as they are represented by men who are egalitarian, but who are also confident, strong and courageous to confront abuses and inequalities. Here we present the promotion of NAM through physical activity based on the principles of dialogic learning as the cornerstone for creating a safe environment in PE and school sport, thus turning this area into a means of social integration instead of discrimination or exclusion for children and adolescents. As successful educational actions has demonstrated in schools (Flecha & Soler, 2013), initiatives based on dialogic learning are currently contributing to promote NAM, overcome traditional hegemonic models of masculinity and improving coexistence (Gomez, Munté and Sordé, 2014).
JS_RN16+RN28a - Physical Activity, Health & Inequalities I

‘Football Fitness’: Constraining and enabling possibilities for the management of leisure time for middle aged women
Lone Friis THING (Copenhagen University, Denmark) | lfthing@nexs.ku.dk
Maria Gliemann HYBHOLT (Copenhagen University, Denmark) | maria.hybholt@nexs.ku.dk
Laila Susanne OTTESEN (Copenhagen University, Denmark) | lottesen@nexs.ku.dk

The aim of the paper is to generate empirically based sociological knowledge about a ‘Football Fitness’ intervention carried out in associative sport clubs. There is an increased pressure on the voluntary sector, e.g. the sport clubs, to embrace new segments of users and to meet social and health-related societal challenges related to the welfare state.

The empirical material is based on six focus group interviews with female participants (aged between 24 and 53) from different clubs all over Denmark. Approximately 32 people have participated in these focus group interviews.

The manner in which recreational football activities and the ‘Football Fitness’ concept are experienced from a participant perspective is examined. We investigate how the implementation is actually carried out in the local football clubs and identify constraining and enabling possibilities for the management of leisure time. We also examine how Football Fitness as an activity and concept can ‘work’ for the participants in their everyday life. Even though it is a few decades since Elias and Dunning wrote (1986: 93) that leisure remains relatively neglected as an area of sociological research, their statement is still relevant, and inspired by them, we have chosen to analyse Football Fitness as part of a spare-time spectrum. How do grown up women make sense of their new ‘football lives’?

Joint associations of smoking and physical activity with disability retirement and mortality
Ossi RAHKONEN (Department of Public Health, University of Helsinki, Finland) | ossi.rahkonen@helsinki.fi
Jouni LAHTI (Department of Public Health, University of Helsinki, Finland) | jouni.mm.lahti@helsinki.fi
Eero LAHELMA (Department of Public Health, University of Helsinki, Finland) | eero.lahelma@helsinki.fi
Tea LALLUKKA (Department of Public Health, University of Helsinki, Finland; Finnish Institute of Occupational Health, Helsinki, Finland) | tea.lallukka@helsinki.fi

Background
We examined the joint associations of smoking and physical activity with disability retirement and mortality.

Methods
Survey data on smoking and leisure-time physical activity collected among 40-60-year-old employees of the City of Helsinki, were linked with register data on disability retirement from the Finnish Centre of Pensions and mortality from Statistics Finland (n = 6390 67%). Cox regression models were fitted, and the follow-up continued until the end of 2012. No gender interactions were found.

Results
No excess risk of disability retirement was observed among ex-smokers and moderate smokers with vigorous physical activity, while ex-smokers and moderate smokers who were inactive had an equally increased risk of disability retirement. All heavy smokers had an increased risk of
disability retirement irrespective of their level of physical activity. Smokers also had an increased risk of mortality, but the risk was highest among inactive and moderately active smokers. Vigorously active had no excess risk of mortality. Among non-smokers patterns of the associations suggested that inactive non-smokers might have a higher risk of mortality. Risks were, however, lower than among smokers.

Conclusions
Level of physical activity affects the risks of disability retirement and mortality both among smokers and non-smokers. However, among heavy smokers physical activity is likely not sufficient to counteract the adverse effects of intense smoking on work ability. Amount of physical activity affects the risk of mortality among smokers. Vigorous physical activity is associated with survival, while the highest mortality risk is found among physically inactive or only moderately active smokers.

Physical Activity Interventions to Promote Health in a Highly Vulnerable Group? – the Case of Residential Aged Care
Viktoria QUEHENBERGER (Ludwig Boltzmann Institute Health Promotion Research, Austria) | viktoria.quehenberger@lbihpr.lbg.ac.at
Martin CICHOCKI (Ludwig Boltzmann Institute Health Promotion Research, Austria) | martin.cichocki@lbihpr.lbg.ac.at
Karl KRAJIC (Department of Sociology, University of Vienna, Austria; FORBA- Working Life Research Centre, Vienna, Austria) | karl.krajic@lbihpr.lbg.ac.at

Introduction: Users of residential aged care (RAC) have a high prevalence of physical and cognitive functional impairments. There is evidence that even such a vulnerable group can benefit from (predominantly) high frequent/intense PA interventions but it is questionable if such a vulnerable group will/can regularly attend intense programs; in addition documentation on sustainability of effects is scarce. The objective of this study was to examine health effects of a low-threshold (i.e. low demands on health status and discipline) PA intervention in RAC and their sustainability.

Methods: The intervention took place in three RAC homes in Vienna, Austria, using an evidence-based curriculum. The study was conducted as an RCT with an additional assessment in the intervention group one year after completion of the trial.

Results: Program components like variety of content, individualization and exercises’ relatedness to everyday life were found relevant; pro-active recruitment and personalized support were reported to foster participation. The intervention was successful in improving residents’ subjective health status (p=.002). In a one year follow-up mainly those participants initially less functionally and cognitively impaired could be reached. Participants’ subjective health status was still significantly increased, equalling a small sustainable intervention effect (p=0.02, Cohen’s d= 0.38). In comparison to baseline, a significant decline of reported pain/discomfort (p=0.047) was found.

Conclusion: Users of RAC can benefit of a low-threshold PA intervention and health effects can be sustainable. Yet there is need for research on mechanisms which enhance participation, for research on effects and their sustainability.

Time to become physical active? The complexity of everyday life in middle-aged women
Maria Gliemann HYBHOLT (University of Copenhagen, Denmark) | maria.hybholt@nexs.ku.dk
Laila Susanne OTTESEN (University of Copenhagen, Denmark) | lottesen@nexs.ku.dk
Lone Friis THING (University of Copenhagen, Denmark) | lfthing@nexs.ku.dk
Even though it is by now well documented that physical activity has preventive and health-promoting effects recent studies show that a continued significant proportion of the Danish middle-aged women among others are not living their life in accordance to the health advices from governmental institutions based on scientific research. Additionally, international studies have shown difficulties with adherence to health intervention, which underpin the complexity of lifestyle changes not only to be a individual informative matter but rather a highly societal complex concern.

The present study examine how the relations between family, work and leisure activities can influence the everyday life of middle-aged women with focus on time management.

The empirical material built upon a physical intervention, which included former inactive middle-aged women participating in spinning lessons three times a week during a three months period. Nine focus groups and further 23 qualitative individual interviews six months later were conducted with selected women through maximum variation. Additionally, observation of the training sessions and in the dressing room is part of the empirical material.

Therefore, from a participant perspective this paper will bring into focus how time management and the relations between family, work and leisure can be experiences as enabling as well as constraining for a lifestyle change concerning physical activity for women in middle age. These reciprocal relations seem decidedly important as regards the everyday life of these women. Furthermore, the study elucidates how the existing sociocultural norms relating to health are influencing these women’s everyday life but this paper will not elaborate further on the comprehensive health discourse present in the Danish society of today.

**JS_RN16+RN28b - Physical Activity, Health & Inequalities II**

**Physical Activity Counselling by French General Practitioners: Does it Tend to Reduce or to Widen Inequalities?**

Geraldine BLOY (LEDi UMR CNRS 6307, University of Burgundy, France) | gbloy@u-bourgogne.fr
Laurent RIGAL (CESP INSERM U1018, France) | laurent.rigal@inserm.fr

Physical activity (PA) is considered by medical guidelines a lever to improve health and well-being. Social gradients exist both in health and in PA, which is less common at the bottom of the social hierarchy. PA counselling could contribute to reducing inequalities in health... But, if counselling is more delivered to (or better received by) advantaged people, it may have the opposite effect.

We will focus on French General Practitioner (GP) attitudes and practices toward this type of counselling. GPs are consulted by the entire population and supposed to become involved in PA (for preventive purposes or for people with chronic illnesses) but their practices in this matter remain unknown in France. When and how do they promote PA? To every kind of patient? In a manner likely to reduce social inequalities or not? We conducted two studies:

PrevQuanti examined how main preventive cares (including PA counselling) were offered by 52 GPs to 3640 patients. It showed GPs’ heterogeneous, but globally weak, involvement in this type of counselling and a social gradient among male patients, with less counselling at the bottom of the social hierarchy, where less physical activity was also declared by patients.

Based on interviews with 99 GPs on the same topics, PrevQuali explored the construction of one’s practice style for PA counselling. It stressed a common difficulty in considering PA as a valuable medical care, an implicit and social selection of the patients “worth trying” to counsel, and the strong influence of the GP own sport trajectory.
Physical job-intensiveness, time use and health
Jef DEYAERT (Vrije Universiteit Brussel, Belgium) | jef.deyaert@vub.ac.be
Djiwo WEENAS (Vrije Universiteit Brussel, Belgium) | djiwo.weenas@vub.ac.be

There is a wide medical consensus regarding the effects of physical activity on the promotion of general health and well-being. In this paper, the following research question will be addressed: ‘what is the relationship between levels of physical job-intensiveness with patterns of physical activity in free time and health outcomes in the Belgian population?’ Do full-time workers with a heavy physical job have more or less physically intensive patterns of behaviour in their free time? Can we see a sort of trade-off where people with heavier patterns of activity during work compensate with more sedentary or less intense activities in their free time? Furthermore, we will investigate whether these patterns of active behaviour are mediated by other aspects than job-intensiveness and how these are related with general health and mental health.

To answer these questions, Belgian Time-Use data of 2013 are used. All respondents within the household were asked to complete a questionnaire (including health, BMI and detailed job information) and to keep record of their daily behaviour in a diary during two days. Levels of ‘intensiveness’ are studied by linking detailed job information and the registered activities in the diaries with an internationally validated typology of MET scores.

A crucial advantage in using diary data to study time use lies in the fact that respondents usually underestimate the amount of time spent watching television and overestimate the amount of time spent on sports activities, when compared to their own diary registration.

(Un)fitness, moral commitment and unequal reputations: insights from the experience of wounded, injured and sick soldiers
Davide STERCHELE (Leeds Beckett University, United Kingdom) | d.sterchele@leedsbeckett.ac.uk

In a similar way to professional athletes, soldiers’ identity and reputation are highly dependent on physical fitness. Being fully fit-for-duty is a fundamental requirement especially for those armed forces personnel, whose daily routine is based around hard physical training that prepares them to keep up with the pace of the group on the battlefield while carrying heavy equipment and under extremely hard environmental conditions.

Besides this clearly functional value, military drills are also paramount in building and sustaining group cohesion through repeated durkheimian rituals based on shared attentive/emotional focus and mutual rhythmic coordination. As the existence and survival of the group relies on these rituals, the moral status of its members depends on their ability to meet the physical standards which enable their efficient participation.

Since the moral status and professional reputation of these military personnel are so hugely influenced by their fitness, it is not surprising that injuries and illnesses have a massive impact on both the way the soldiers are treated and the way they perceive themselves. Being “medically downgraded” can be a career-threatening situation that often generates uncertainty, frustration, depression and self-stigmatisation. The fear of this occurrence frequently leads to unhealthy behaviours such as concealing physical and psychological pain and pathologies for as long as possible, which aggravate such conditions and eventually impair recovery.

The paper explores these issues, drawing on ethnographic fieldwork and qualitative interviews undertaken during the Battle Back Multi-Activity Course, an adaptive sport and adventurous training programme for wounded, injured and sick British soldiers.

The influences of temporal structures on health
Djiwo WEENAS (Vrije Universiteit Brussel, Belgium) | djiwo.weenas@vub.ac.be
Jef DEYAERT (Vrije Universiteit Brussel, Belgium) | jef.deyaert@vub.ac.be
In this paper, the following research question will be addressed: what is the relationship between time spent on physical or non-physical activities and health outcomes in the Flemish population?
Differences in health outcomes have been closely linked to lifestyles, and in response to this, a public debate started in Flanders on whether or not people with unhealthy lifestyles should pay more to receive medical coverage. In this public debate, certain academics replied that lifestyles, and their consequences on health outcomes are related to social inequalities, and that individuals should therefore not be charged with the costs of their unhealthy lifestyles. The societal relevance of this research is therefore twofold: how do lifestyles or activity patterns affect health, and to what extent do social inequalities play a role in this relationship?
Data from the 2013 Flemish and Belgian time-use surveys will be used. Before recording their time-use in a 2 or 7 day diary, respondents also filled in a questionnaire, allowing us to investigate whether (un)healthy lifestyles are correlated with sociodemographic background variables.
A crucial advantage in using time-use data to study this relationship lies in the fact that respondents provide very exact information on the types of activity, their duration and their embeddedness in the structure of daily life.
These activities can be linked to an internationally validated typology of MET scores, which enables us to differentiate between different levels of physical and non-physical activities, thus taking it further than a division between sedentary and non-sedentary behaviour.

JS_RN20+RN28 - The Body and Embodiment in Sport – Studies on beyond Discursive Knowledge

The implementation of the concepts of the practice knowledge in the sports field.
Honorata JAKUBOWSKA (Adam Mickiewicz University, Poland) | honorata@amu.edu.pl

The aim of the paper is to present and discuss the possibility and usefulness of the concepts of the practice, but also working and situated, knowledge in the sports analysis. Beyond discursive knowledge plays a crucial role in sport and in the process of transmission and acquisition of sports skills. Rare sociologists which study this issue, base their research on the concepts of the embodied knowledge and the theories related to the sociology of body/embodiment. Meanwhile, the other concepts, mentioned above, are actually omitted. The paper will show the theories and methods developed in the other fields, mainly design and craftsmanship, and the possibility to deepen the sports sociological research due to their use. At the same time, the paper's author will present the planned research project concerning the discussed issue.

Learning how to fight - as an ethnographer
Larissa SCHINDLER (JGU Mainz, Germany, Germany) | larissa.schindler@uni-mainz.de

Like many forms of sports, martial arts are not predominatly learned and taught by means of verbal communication. Talk may be present in many classes and yet does not suffice for the knowledge transfer. "I can not explain that to you. You must feel it", my instructor often said. But how is it transferred then? And how can we explore silent knowledge transfer?
Drawing on empirical data of a video-supported ethnography in a german martial arts club I will focus on two forms of 'silent' knowledge transfer, on visual and somatic transfer. The first one
mainly covers the means of showing movements by using one's own body, a "body idiom" following Goffman. The latter is based on contact between (at least) two bodies. Martial arts apprentices not only learn from listening to instructions or watching demonstrations, but also from the feedback they get from a partner's body while accomplishing an exercise. In some way the movement itself gives instructions. In the classes, different forms of knowledge transfer enlance, as I will claim. Thus the embodied experience resulting from somatic knowledge transfer not only leads this learning process. It also helps to develop a practice-specific vis-ability that is necessary for a deep understanding of what is displayed in demonstrations. The challenge for the ethnographer finally is to transfer the relevant aspects of this vis-ability to sociologists who miss the embodied experience.

200 APM, Eyetracking and GoPro Cameras – How technology shapes the (re-)embodiment of eSports
Heiko KIRSCHNER (Universität Wien, Austria) | heiko.kirschner@gmx.de

Technology has always played a major role in terms of observing and understanding bodily movements and the discursive knowledge inscribed into it. Nowadays the possibilities of video recording due to its easy accessibility via mobile or smart devices seems to be the prime technology that shapes the discursive knowledge of bodily practices in a variety of ways. Closely linked to the rise of videoanalysis in sports is the ongoing process of discursive (self-)reflection with the help of video data. Athletes and coaches alike use video data today to shape the way they talk about the on screen represented bodily movements. In some cases like Parcours, Free-skiing or eSports this reaches as far as to that the aesthetics from 'on the screen' even shape future bodily movements as the athletes change the way they arrange their body to fit certain video aesthetics.

In my presentation I would like to present the development in eSports that led as a major factor to its present boom. eSports understood as professionalized videogaming rose from private LAN-parties to stadium filling mega events with enthusiastic audiences around the globe. Since eSports is in statu nascendi mediatized the bodily practice of athletes playing these games are typically not visible 'in game'. I'd like to present how the current state of eSports is heavily relying on the excessive use of merging media to (re-)embody the practice of professionalized videogaming in order to more or less strategically shape and direct the discursive knowledge connected to it.

Pugs in Trouble: Exploitative Symbiosis, Murky Dealings, and Struggle for Honor in Korean Professional Boxing World
Sungmin KANG (Yonsei University, South Korea, Korea, Republic of (South Korea)) | stubk04@gmail.com

This study explicates the peculiar logic on which the universe of professional boxing in South Korea manages to preserve its existence at the zenith of the sport's unprecedented stagnation. Drawing on my own experience in the field as an amateur/professional boxer for the last ten years, this ethnographic report provides extensive demonstrations of (1) how people living in and off the pugilistic field are entangled with complicated webs relations which at once sustain and exacerbate the entire structure of the sport, and (2) which kind of socio-symbolic dimension of action and vision makes them immersed seriously in this play despite their penury. This analysis highlights that agents in the boxing world have no choice but to resort to exclusive social network and unofficial economy inside this relations insulated from the official market and relegated within sociocultural domain; yet underlying principle of this material structure is the symbolic structure of passion and dignity about boxing embodied within pugilists' bodies. In so
doing, I rest on some methodological principles of “carnal sociology” proposed by Loïc Wacquant, which underline the researcher’s bodily incarnation of the phenomenon under investigation so as to understand operative mechanisms and sociological principles from which implicit properties of the field emerges. The carnal sociology of boxing in Korea leads not only to thick description of the sport, but also to a broader analysis of classes, marginality, culture, and social action: a synthesis of “total social facts”, "Erscheinung–Ding an sich” imperceptible and inaccessible to spectatorial approaches.

JS_RN25+RN28a - Football Fans, Activism and Social Change I

Political orientations of Russian football fans in the context of the 2018 World Cup
Larisa VDOVICHENKO (Russian State University for Humanities, Russian Federation) | vdlarissa45@yandex.ru

In the 21st century the sociology of football and other spectator sports became responsive to the political and social activism of its supporters. This paper focuses on the public opinion connected with Russian football fans. First, it’s an attempt of highlighting and understanding the views of the football fans on public policy, state institutions and its representatives, political parties and movements, and other aspects of political life. The second goal of this study is to examine the attitude of different groups of Russian population to the football fans and their actions. Football fan culture has been developing rapidly in Russia for at least the past two decades. Russian football supporters have been engaged in political campaigns as for example elections, meetings, demonstrations and other forms of activism. Some political actors gradually politicized fans by asking them to join protest actions. Each eminent Russian football team (Spartak, Dinamo, Zenit etc.) has its own fandom and supporter culture. Its numerous fans demonstrate heterogeneous, sometimes contradictory, even nationalistic, political orientations. Russian fans travel to their favorite clubs’ matches abroad. Sometimes they have problems crossing state borders. This paper presents a sociological analysis of fan political values in Russia. Case study was conducted in Moscow in 2014-2015 by using such methods as participant observation at the fan meetings, interviews with football supporters, and an analysis of internet fan sites, blogs and public survey data. This research is of strong contemporary significance given that soon Russia will be the host of the 2018 World Cup.

'Donald you moron, your government will be overthrown by hooligans' – evolution of the conflict between the government and football supporters in Poland.
Radoslaw KOSSAKOWSKI (Gdansk University, Poland) | radoslaw.kossakowski@ug.edu.pl

Presentation of the Polish government vs. Football supporters conflict is the main purpose of the paper. The analysis is divided into three parts. Firstly, reactions from Polish Prime Minister, Donald Tusk to incidents of vandalism and hooliganism in Polish stadiums will be presented. The imagery of 'war' appeared in the statements provided by representatives of the government. Secondly, fans reactions and forms of protest against government policies will be described. Supporters prepared street performances, anti-system choreographies at matches. Slogan: 'Donald you moron, your government will be overthrown by hooligans' became the leitmotif
presented at several stadiums. Terms like 'second-class citizens', 'public enemy' are revealed in the discourse of fandom. One of the arrested leaders of the fan movement has become a symbol of repression, called 'political prisoner'.

Thirdly, it is crucial to show all implications of these events. The government consistently implements the strategy of 'civilizing', as a result – football hooliganism was actually banished from the stadiums. On the other hand, the conflict has consolidated fan movement. This is manifested by – most of all – all-Poland involvement in the promotion of patriotic and conservative ideas and strong anti-establishment attitude. Examined conflict has not led to change of the political system by the subordinate group (fans), and has not yet demolished governement's opponent. No form of dialogue or reconciliation appears between both sides. On the conceptual level, Polish case encourages reflections on existing approaches in sociological theories of conflict and their advantage for the analysis of Polish football field.

Being Politicized of a Football Fan Community: The Case of Fenerbahce SK
Çağrı ASLAN (Gaziantep University, Turkey) | caslan06@hotmail.com

Football is the most popular sport in Turkey, just as in the world. And football fans are quite fanatic. Football market of the country brighten three club which established in Istanbul. These are Fenerbahce, Galatasaray and Besiktas. Approximately ninety percent of the number of fans in the country, supports one of the three Istanbul clubs. Fans are separated from the Europeans about sense of belonging. Football supporters do not represent any social class, sect, ethnicity or ideology, just like football clubs in Turkey. Therefore can not mention about indigenisation, originality or diversity. Supporter culture in Turkey does not contain any political stance generally, apart from some special supporters groups. While such a football environment in the country, a large scale operation was launched for match-fixing on 3 July 2011 in Turkey. The process named as “Match-fixing in Football Case” which Fenerbahçe SK is located in the center is still continues today. The most striking part of the case is that it has caused the initiation of a social movement, apart from political, financial, legally or sports aspects. Furthermore, wide range of a supporters group has been politicized. This case gave rise that a supporters group come into prominence as a civil movement by build up opposition block. These events constitute a unique example in terms of sociology of sports and civil society movement. I aimed to demonstrate how a supporters group might be politicized in a few years.

JS_RN25+RN28b - Football Fans, Activism and Social Change II

Between Individual and Collective Historiographies: A Critical Analysis of Football Supporters Discourses
Renan PETERSEN-WAGNER (Coventry University, United Kingdom) | renan.petersen-wagner@coventry.ac.uk

Ulrich Beck claimed that we are living in an age of cosmopolitanisation. Cosmopolitanism for Beck and his different collaborators entails the re-modernisation of modern institutions and structures, the living in uncertainty - risk society -, and individualisation. For Beck & Beck-Gernsheim (2001) the individualisation thesis within a cosmopolitan sociology assumes that individuals are bound to chose and are crafters of their own biographies, in what they conceptualised as the precarious freedom. Departing from those assumptions, based on an 18-month ethnographic inspired research of football supporters in Brazil and Switzerland, I sought
to unveil the discourses supporters created in relation to their historiographies as geographically distant fans of Liverpool FC. The critical discourse analysis showed that supporters used both individual and collective motives to craft their biographies as Liverpool supporters. Falling in love and learning to love were used prominently in supporters’ discourses as an individualisation rhetoric. From where to learn how to love and how to maintain simultaneous multiple loves were used as a collective rhetoric. From those findings I argue that instead of ‘dasein für andere’ as in modernity, or crafters of their own biographies in reflexive modernity, individualisation in cosmopolitan times entails a ‘dasein für gewählte andere’ being this other the re-traditionalised structures of modernity - namely the nation-state and family. I conclude by pointing out that precarious freedom does not relate to the process of choosing, but to the unintended consequences of those choices.

Struggles for participation: Two case studies from German football fans of Hannover 96 and Hamburger SV
Christian BRANDT (Manchester Metropolitan University (associate member)) | fussballbuchprojekt@googlemail.com
Fabian HERTEL (Manchester Metropolitan University (associate member)) | fussballbuchprojekt@googlemail.com

The short dated past has shown diverse actions of German football supporters against ‘modern football’. Public and science discusses if these struggles might be rated as social movements. In our lecture we want to contribute to this discussion alongside two actual cases by highlighting the dynamics, obstacles and narrowness of such movements. Both cases depict supporters' declining influence as club members.
The first case sheds light on the Bundesliga club of Hannover 96. Its president tries to gain more than 50% of club proportions by dodging the German football law by juristic loopholes. The second involves the HSV. Since July 2014 the first two Teams of the HSV are run under the legal status of a company, that got excluded from the club. This change enables investors to purchase shares of the HSV.
In both cases organized supporters have struggled against these developments of ‘modern football’. In Hannover the fans spared out in the stands on match days but away fans showed solidarity. In Hamburg the organized fans started a campaign against the opening of their club to investors.
By evaluating these two examples we approach to the chances and limits of football supporters as social movement in regard of their aims, the main actors, protest actions that take place, the intern struggles, the graduated organization, communication, and group constitution.

Critical Consumption and the Mobilization of Football Fans: Customers, Citizens and ‘Citimers’
Dino NUMERATO (Loughborough University, United Kingdom) | D.Numerato@lboro.ac.uk
Richard GIULIANOTTI (Loughborough University, United Kingdom) | R.Giulianotti@lboro.ac.uk

Processes of globalization and hyper-commodification have often been associated with the envisioning of football fans as consumers. An active minority of critically engaged and increasingly networked football fans have frequently opposed this framing, and instead have endeavoured to define themselves as citizens. By examining the ways in which fans express their subjectivities and in which they are objectified by football and political authorities, we provide a more nuanced understanding of critically engaged football fans with regard to their position on a continuum between consumer and citizen. In addition to these two categories, we introduce the hybrid notion of “citimer” (citizen-consumer), which may be used to understand the
position and practices of diverse spectators in sport, as well as different individuals and social
groups within other cultural contexts. The data that underpin the analysis are drawn principally
from primary sources, through semi-structured interviews with supporters, football associations'
and football clubs’ officials mainly from Italy, the UK and the Czech Republic. Secondary data
sources include newspaper articles, e-zines, blogs, internet discussions and websites. Our
analysis is focused on public debates on the Tessera del tifoso (supporter identity card) in Italy,
ticket pricing in the UK, and the implementation of supporter liaison officers (SLOs) in European
football clubs. The paper is part of the wider FP7 EC project "Football fandom, reflexivity and
social change (FANSREF, ref. number 331097)".

"Reviving Zbrojovka’s Glory": Collective Memory, Fan Engagement and One
Football Stadium
Zuzana BOTIKOVÁ (Masaryk University, Faculty of Social Studies, Czech Republic) |
zbotikova@mail.muni.cz
Michal SINDELÁŘ (Masaryk University, Faculty of Social Studies, Czech Republic) |
sindelar.mich@gmail.com

Football stadiums are for many football fans synonyms of their sporting affiliation, moreover also
their local identity. Besides being an important part of the football clubs' trade mark, stadiums
also play a crucial part in the narratives regarding the club, its fan base, however also their
urban neighbourhood. They provide the ultimate space for creating a shared collective memory
- through social encounters, negotiations as well as mutual celebrations. However, those shared
narratives usually change, when the club moves to a new stadium, with the nostalgia overruling
the objective advantages of the new venue. In our paper we want to present a unique case of
reviving collective memory regarding an old and abandoned football stadium Za Lužánkami in
Brno, which is strongly tied to the history of the local club Zbrojovka. The stadium was built in
the early 1950s and for some time it was the largest stadium in the former Czechoslovakia. In
2001 Za Lužánkami was closed due to adverse technical conditions and should be demolished
in the nearest future. However, there is a recent revival initiative that comes from a former
Zbrojovka player, who besides his own nostalgic sentiments wants to allow the local football
community to say farewell to “their” stadium. Through a mixed method approach we observe
and problematize the processes of communal nostalgia as well as memory revival.

JS_RN28+RN31 - Racial/Ethnic Relations and Sport

Racial stereotypes and high-level sport: a comparative analysis of the "white"
and the "black" athlete’s figure in the Olympic Games's press coverage
Lucie FORTÉ-GALLOIS (Université Paul Sabatier, France) | lucie.forte@univ-tlse3.fr
Vincent CHARLOT (Université Paul Sabatier, France) | vincent.charlot@univ-tlse3.fr

The communication deals with the spread and the banalization of racial and ethnic stereotypes
in the sportive press during the Olympic Games (London, 2012). Thanks to an analysis of the
pictures, metaphors and justifications used in the French sportive newspaper called L'Equipe,
we would like to analyze the strength and the durability of sports skill's naturalization toward
"black" and “white” athletes. Indeed, the speeches produced in the particular context of basket-
ball and athletics constitutes an interesting window for the analysis of the eventual persistence
of racial stereotypes according to which the performances of "black" athletes would recover
from innate and bestial skills, whereas “white” athlete’s successes would be connected to their
value of hard work and their intelligence. We also aim to situate our analysis in a larger point of view including social relationships, social identities and social trajectories in intersection with other dimensions such as gender or social class.

The corpus we plan to study is made of different types of pictures, articles and chronicles published in L’Equipe between July 27th and August 13th, 2012 - representing 100% of the championship’s coverage. The choice of these Olympic events is overall justified by the strong interest that the specialized press reserved to the competition and by the fact that previous studies in athletics and basket-bal in lighted processes of racial/ethnic stigmatization, distinction, discrimination, segregation and labelling/stacking. The choice of L’Equipe is justified by the fact that it is the only quotidian sportive newspaper in France.

Mehmet Aurelio: Race and Belonging in Turkish Football
Murat ERGIN (Koc University, Turkey) | muergin@ku.edu.tr

Mehmet Aurelio, the first foreign-born soccer player to join the Turkish national team, constitutes a litmus test for the limits of race, ethnicity, nationality, and citizenship in Turkey. Aurelio arrived in Turkey as a representative of cheap deals from the Brazil’s large pool of young and talented players. For the Turkish sports scene used to the fuzziness of citizenship boundaries in the global soccer scene, his reception of Turkish citizenship in 2006 and changing his name from Marco to Mehmet was no scandal. However, national team coach’s call to Aurelio to join the team stirred a heated controversy in the media, which carried racial messages. Especially for critics of Aurelio, his blackness seriously marred his claim to Turkishness. Others supported Aurelio’s citizenship on instrumentalist terms, justifying his inclusion in the national team with his potential contribution to the team. The goal of this presentation is to follow the media discourse around Mehmet Aurelio in order to reveal historically constituted and deeply held assumptions about race and citizenship in Turkey. Both the essentialist (objecting to a black man’s ascendance to the national team) and meritocratic (citizenship may be granted for hard work even in the absence of full belonging) arguments attested the volatility of the discourses around race and belonging. The Aurelio case offers important insights into racialization of identities in the Turkish context where historically-fortified beliefs about Turks’ whiteness confront the global flow of racialized difference into the commercialized field of football.

Women in sports: playing and negotiating identities in the Italian fields
Sandra Agyei KYEREMEH (University of Padua, Italy) | sandra.photovoice@gmail.com

“There are no black Italians”, this is one of the several chants directed to Mario Balotelli, a black Italian football player, during the matches he played in the Italian football pitches. He has become a symbol of Italy’s new multi-ethnic identity and a symbol of a generation of children of foreign born parents born and/or grown up in Italy.
Statistics demonstrate that black Italians do exist and play sports in different federations, despite the presence of institutional barriers to their participation. This framework, in particular, leads to think about how racial spatiality (Harrison, 2013) structured by sports regulations and gender discriminations works to secure high level sports’ social space as predominantly white and manly, thereby restricting the participation and representation of black athletes or players with foreign origins.
Using an intersectional approach and drawing from literatures in Whiteness Studies, Sports Sociology, Critical Race Theory, Postcolonial and Cultural Studies the article focuses on predominant ideas of “Italianity” into the organization of Italian sports life by the analysis of institutional, social and individual levels. The article examines racist practises at work into Italian
sport governing bodies comparing a high level female cricket team and a high level female football team. The article also investigates individual and collective strategies for change (De Certeau 2001) chosen by athletes in sporting grounds.

I'll design my research using qualitative methods collecting data resorting to participant observations during trainings and matches, in-depth interviews and focus group.

Racism and Discrimination of Sporting Culture in the age of Social Media
Riikka-Maria TURTIAINEN (University of Turku, Finland) | rmturt@utu.fi

FC Barcelona defender Dani Alves dealt with racial abuse during a La Liga match against Villarreal 28/04/2014. He was targeted with a banana by a racist fan while preparing for a corner kick. The Brazilian picked up the fruit and ate it before taking the corner kick. The action sparked a worldwide social media campaign against racism when his national team colleague Neymar tweeted a photo of himself eating a banana with the hashtag #weareallmonkeys. Professional athletes, politicians, and ordinary people joined the campaign. This Internet meme attracted even more publicity to the anti-racism work in sports than many official campaigns.

This paper will focus on the new ways of racism and discrimination among online sports cultures by studying athletes who use platforms, such as Twitter, for personal private communication as well as engage in a dialogue with their supporters. In many cases, the uses of such social media platforms have involved conflicts between athletes and their sponsors, managers, and sports associations. This paper examines the mechanisms of sports publicity by asking how are stereotypes of race, gender, and sexuality constructed and maintained through conventional ways of media representations and discourses. Are there any efforts to break down those stereotypes by athletes in contemporary sports media culture? The study utilises qualitative methods and research materials such as social media contents and media representations. The objective of this research is to reveal the inner mechanisms of sporting culture causing inequality in media sports still in the age of social media.

JS_RN28+RN33 - Women’s and Gender Studies: Sports, Gender and Sexualities

The inclusive masculinities of Premier League academy footballers
Rory MAGRATH (Southampton Solent University, United Kingdom) | rory.magrath@solent.ac.uk

Association football has traditionally been an institution unreceptive and hostile toward sexual minorities. The case of Justin Fashanu serves as a stark reminder of the alleged incompatibility between football and homosexuality. However, by interviewing 40 academy-level footballers from two Premier League football clubs in the UK, I show that intolerant attitudes are being increasingly challenged. Results show that these young men, who are potentially on the verge of becoming professional athletes, reflect the ethos of their generation more broadly, holding inclusive attitudes toward homosexuality. This was found to be true independent of whether they maintain contact with gay men or not. Participants strongly advocated their support for gay men coming out on their team. This support includes athletes being unconcerned with sharing rooms with gay players, changing with them in the locker rooms, or relating to them on a social and emotional level. Some players – notably those with strong religious beliefs – held some reservations with same-sex marriage, yet suggested they would still support a gay teammate. Others demonstrated concern as to how having a gay teammate might alter homosocial banter, as they would not want to offend that individual. Overall, this research supports a growing body
of literature suggesting that contemporary football is no longer a bastion of homophobia in the UK, and that the next generation of potential professional footballers support equality for sexual minorities.

**Sexual Assault, Exploitation, and Interference in Youth Sport in Canada**
Curtis FOGEL (Lakehead University Orillia, Canada) | cafogel@lakeheadu.ca

This paper critically examines the processes involved in the continued perpetration and tolerance of sexual violence in amateur sport in Canada. Five main types of sexual violence are explored including: i) athlete perpetrated sexual violence against women and girls off the field, ii) athlete perpetrated gang rapes, iii) non-consensual sexual violence against peers during hazing rituals, iv) sexual assaults perpetrated by coaches, and v) sexual assaults perpetrated by sports administrators. The empirical basis of this research includes the examination of over 150 legal case files and documents, interviews with 59 athletes on their conceptions of consent, as well as the review of the existing literature on sexual violence in sport. The central question that guides this research is: why does there appear to be a disproportionate amount of sexual violence in sport according to statistical reports?

**'Born to be a Cowboy': Exploring Masculinity at Star of Texas Fair and Rodeo**
Rebecca FINKEL (Queen Margaret University, United Kingdom) | rfinkel@qmu.ac.uk

This paper explores the commodification and constructions of masculinity associated with the idealised 'American West' through examining current rodeo spaces, specifically the Star of Texas Fair and Rodeo in Austin. Framed in Bourdieu's (1998) and O'Connell's (2005) conceptualisations of male domination and symbolic structures in social life, this research seeks to understand how these constructions are reinforced with regard to issues of identity, sense of belonging to a place and a particular cultural background, and exclusion through potentially 'othering' those who do not fit into this nostalgic narrative. The commercialisation element is explored to discern if the selling of this cowboy ideal has an impact on normalising heterosexual masculine dominance, especially in a family entertainment setting. Also, it also seeks to examine how ethnic minorities, LGBTQ participants, and women navigate and participate in these spaces given the straight white male 'hero' narratives of the 'Wild West'. As Jarvie (1991) suggests, certain dominant groups define 'what sport is' or 'what sport should be like' and how it is actually experienced by various groups within various cultural contexts. Perceptions of women and LGBTQ athletes, especially those who participate in violent or traditionally 'macho' sport, are socially constructed within culture and through cultural discourses (Lenskij 2003). Research methods include semi-structured in-depth interviews with key rodeo stakeholders as well as visual ethnographic approaches. Investigation within a traditional sporting event environment can be an effective case study to discern community norms and ordering, as events most often reflect broader societal discourses and can reinforce collectively held values (Getz 1997). Although based primarily in the US, this research has implications and relevance for comparing and contrasting attitudes and approaches surrounding gender and sexualities with regard to European sport events and informing international sociology of sport studies.

References
Rupturing and Recouping Femininities in School Sport
Majella MCSHARRY (Dublin City University, Ireland) | majella.mcsharry@dcu.ie

The prominence of male sport in many second level schools is often indicative of the unequal position and hypervisibility of men’s sport in wider society. This paper focuses on qualitative data gathered across three second level schools in the Republic of Ireland. These schools are recognised nationally for their success in male dominated sports such as Gaelic football, hurling and rugby. The paper examines the reality of ‘doing’ girl (Butler, 1990) within school contexts that prioritise boys’ performances and achievements in sport. The girls’ participation in non-traditional feminine sports highlights moments of resistance and challenge to hegemonic expectations. It indicates a rupturing of normative feminine discourses. However such ruptures are often fleeting. The data indicate that they frequently lead to a seemingly necessary recouping of more traditional feminine representations of ‘girl’. This paper explores the conflictual dilemmas faced by these girls, as they balance the subversion of hegemony in their quest for empowerment and equality through sport, with a requirement to maintain an acceptable identity through ‘girlie’ performances. Judith Butler’s ‘heterosexual matrix’ (ibid) is proposed as a lens through which to understand how the girls neutralise their association with subversive practices through their insistence upon heterosexual relationships and how they position themselves within these relationships in ways that confirm mainstream notions of girlhood.

Impact of Different Attitudes in Relation in Legal and Economic Aspects in Sport and Sports Organizations from Gender Balance in Republic of Macedonia
Ivan Alaksandar ANASTASOVSKI (Faculty of physical education, sport and health, Macedonia, Former Yugoslav Republic of) | prof.anastasovski@gmail.com
Lenche Aleksovska VELICHOVSKA (Faculty of physical education, sport and health, Macedonia, Former Yugoslav Republic of) | lenchealex@yahoo.com
Tatjana Stojanoska IVANOVA (Philosophical faculty  Skopje) | tanjaosi@yahoo.com
Lazar NANEV (State University Goce Delcev Stip) | lazar_nan@t-home.mk

Gender balance in the part of Balkan and Republic of Macedonia is still a topic that is weakly discussed. Social changes that took place at the end of 2000th in our country caused rapid transition and need for amendments of the policy and adjustment with the European standards in almost all areas of functioning of the society. As a result of this we have to adjust management of sport and sports events with the recent requirements and trends. We are looking for new system solutions, new sources of funding, strong relations between sport, law and economy through sponsorship, marketing and donation, TV right and fair conditions for efficient transformation of the ownership and privatization of sports organizations in the Republic of Macedonia. Our theoretical preassumption that gender of respondents might influence the perception of sport and sports organizations of citizens of the Republic of Macedonia, has been set out by differences between genders and the opinion of citizens about sports and sports organizations in our country. In this paper we surveyed 411 citizens from all regions in the Republic of Macedonia, and analyzed their attitude in terms of gender. Namely, they are aware that on the Balkans the impact of the male population still dominant which is largely confirmed in our study were the majority of respondents being supporters to (and active participants in) the sport as a game of sports organizations as an institution. For this we decided to research this gender balance as phenomena in modern age, and give right opportunity on male population to be involved in management process in sport as a game and sports organization as institution.
RN29S00 - General Session

What makes Relations Social?
Joost VAN LOON (Catholic University Eichstätt-Ingolstadt, Germany) | joost.vanloon@ku.de
Laura UNSÖLD (University of Duisburg-Essen) | l.unsoeld@gmx.de

Social relations are generally considered as a key focus of sociological theory. Deployed as either an independent or a dependent variable (and often both), social relations are understood as both causes of social actions as well as consequences of them. Bruno Latour (2005) has claimed that this may lead to rather confusing and often tautological forms of sociological inquiry that seek to explain the social exclusively through the social. Working through the empirical example of friendship-networks on Facebook, this paper concerns itself with the question “what makes relations social?” because it is by no means sure, that the adjective social adds anything to the noun relation. Surely, one could think of non-social relations, for example in terms of mathematics, physics, chemistry or biology, but what exactly does the adjective “social” add? Considering Facebook, it becomes clear that what is being designated as a “social medium” is a complex assemblage of practices of association involving many mediators. Software specifically designed to investigate the potentially infinite flows of association are never “just” devices that “merely” depict but always also devices that may enact. It is exactly at the intersection between the technical blackboxing of the visual presentation of practices of association that the question of the social nature of relations emerges in its most pertinent form. By invoking Simondon’s concept of transduction, we aim to show that social network analysis software offers us an empirically grounded means to develop a theoretically resilient understanding of the constitutive forces of social relations.

From Social Constructivism to Communicative Constructivism
Hubert KNOBLAUCH (Technical University of Berlin, Germany) | Hubert.Knoblauch@tu-berlin.de

Social Constructivism has been criticized in the last decades by various approaches. If one relates it to its first theoretically comprehensive and systematic formulation, Berger and Luckmann’s Social Construction of Reality, a series of arguments are inadequate and sometimes often even misleading. Mainly driven by a range of empirical studies inspired by the ideas of the Social Construction of Reality, we have witnessed a basic reformulation of social constructivism since the 1990s in terms of communicative constructivism. Communicative constructivism is characterized by substituting the core notion of social action by communicative action, of by extending the perspective on language to a study of objectivations, and by reducing the universalistic anthropological approach by a relational approach on sociality. In this paper I will try to sketch some of the basic aspects of communicative constructivism

Social Theory: Back to Phenomenology and Hermeneutics
Csaba SZALÓ (Masaryk University, Czech Republic) | szalo@mail.muni.cz
Social theory taking seriously the normative dimension of social life has to deal with human-beings sense of self-transcendence. Recurrently the emancipatory potential of modern science is giving way to a new dogmatism of utility. Nevertheless, social theory has a potential to counter the naivety of applied scientific sociology. I will deal with two of the most reflective critiques of modern science, those of Husserl and Heidegger, and try to outline a perspective focusing on recent development in social theory.

Old Structures, New Differences: Bringing Foucault into Inequality Research
Frank WELZ (Innsbruck University, Austria) | frank.welz@uibk.ac.at

At the latest with the rise of Ulrich Beck’s “Risk society” (1986) – in German-speaking sociology – researches on the discipline’s core theme have taken classic Marx-Weber approaches out of service. Surprisingly the replacement of “large-group categories” (Beck) with new key terms such as individualization and lifestyle in inequality research happened at the particular moment when thirty years of welfare state development have been replaced by another thirty years of attack on the latter, and, as we know at least since 2008, growing inequalities. How does both go together? How comes that recent voices in inequality research mainly stem from economists (Piketty, Stiglitz), social geographers and epidemiologists? What went wrong?

My paper will claim, first, that new sociologies of individualization and lifestyle rightly criticized old models of tectonically stratified societies, but, second, wrongly missed identifying and filling the theoretical gap they left when pensioning off classic approaches. Finally, third, I will not only try to figure out the theoretical issue behind their failure. I will also try to reconcile sociology’s classic promise of theoretical explanation and recent researches on proliferating differences and increasing inequalities before and since the Great recession 2008 – by bringing in Foucauldian tools of analysis.

RN29S01 - Strenghts and Limits of the New Materialism

Feminist new materialism: a critical assessment
Luigi PELLIZZONI (University of Trieste, Italy) | pellizzoniI@sp.units.it

Feminist new materialism is a prominent expression of the ontological turn in social theory. Scholars such as Karen Barad, Elizabeth Grosz, Vicki Kirby, Claire Colebrook, take issue with the alleged weaknesses of realism and constructionism, as based on a mind/matter dualism deemed theoretically untenable and inadequate to account for both technoscientific advancement and the oppression of humans and nonhumans. Knowledge and world, language and matter, are claimed to be mutually constituted, and reality comprised of a fluid, incessant becoming. Compared with other post-constructionist strands, for example ANT, matter is given a more foundational character, including the indifference of nature to human presence. Moreover, a stronger case is made for the emancipatory implications of non-dualist, post-humanist ontologies, as entailing a farewell to critique as linguistic deconstruction and a new season of affirmative, embodied, struggles.

My assessment will connect the theoretical and the political side of feminist new materialism. Theoretically, I will focus on emergent problems, including the veridical status assigned to technoscience effectuality, and the assumption that the immanence and fluidity of reality entails the blurring of the ontological and the epistemic. On the political side, building on some examples, I will argue that new materialist ontological politics takes issue with binary oppositions of lessening relevance, while it resonates with a burgeoning understanding of
materiality and human agency where indeterminacy expands, rather than hampering, the dominative reach over nature and the body. These features are arguably not exclusive to feminist new materialism, but extend to other strands of the ontological turn.

**Politico-ethical implications of new materialism**  
Vojtech PECKA (Faculty of Social Studies at Masaryk University, Czech Republic) | vojtech.pecka@gmail.com

Since its very beginning, social theory tended to grasp materiality as a passive agent which is subjugated to agency of humans. But today, materiality fights back against such a role. When the whole biosphere is absorbing huge shocks caused by human activity, social scientists are literally forced to overcome the socio-material separation and look for a way to research sociality and materiality in their interconnectedness with sensitivity to their differences. The proposed work explores the ontology of new materialism which allows us to overcome the nature-society division and grasp the world in terms of distributive agency and human-nonhuman coalitions. Moreover, the ontology of new materialism provides an option for new constellations of ethics and politics challenging top-down hierarchies, global governance, nation states and trans-national corporations.

Highly ephemeral style of writing of Deleuze and Guattari led many scientist to conviction, that it is incoherent "fashionable nonsense". In past years, however, we can see renewed interest in their work, which reveals a robust, coherent ontology profoundly rooted in the insights of natural sciences. The paper focuses on a reinterpretation of the theoretical project of Deleuze and Guattari by Manuel De Landa, Mark Bonta, John Protevi, Levi Bryant and others. It strives to introduce new materialism not just as a social theory but as possible foundation for a politico-ethical project opening new ways towards less oppressive and less environmentally destructive organization of society.

**New Realism in the Theory of Social Differentiation**  
Joachim FISCHER (TU Dresden, Germany) | joachim.fischer@tu-dresden.de

The paper deals with a realistic theory of social differentiation concerning contemporary societies. It presents four theses:  
1) One result of sociological research and theory may be that apart from (classical) vertical differentiation of social classes (social stratification) on the one hand and apart from (modern) horizontal functional differentiation in social subsystems (law, politics, economics, science, art, family and so on) on the other hand contemporary society is obviously structured by further various axes of social differentiations: difference of generations; difference of gender (sex); ethnic differentiation (‘race’); segmentary differentiation of regions, nations etc.; orientation differences via religions or world views.  
2) Sociological research has revealed that these various axes of social differentiation are not reducable to each other; each kind of social differentiation has its own vital logic, source and conflict power.  
3) The New Realism in social theory maintains that in contemporary societies an emancipation of all these unreducable, heterogeneous kinds of social differentiations takes place. One can observe autonomous conflicts and polemics between generations, between sexes, between classes, between ethnic groups, between regions, nations, between religions; one too can observe conflicts between the horizontal social subsystems – they too compete for cognitive and emotional attention and material ressources of the society.  
4) One step further the New Realism in theory of social differentiation in contemporary societies reveals that there is no fixed hierarchy of the axes of social differentiation – neither by evolution
of modernity nor by a natural anthropology or materialism. For observed societies around the world it seems not clear which axis of social differentiation prevails in society. So one can maintain, that there are not only conflicts within a certain kind of social differantion, but that there are too real competions and conflicts between the various axes of differentiation themselves (generations, sexes, ethnic groups, regions, classes, religions, social subsystems) which of the axes will have the primacy in a concrete society. In this special sense contemporary societies are real open societies.

**The normative moods of action: Another way of thinking materialism**

Pedro Jorge CAETANO (New University of Lisbon, Portugal) | caepedro@gmail.com

The problematic of identity associated with the formation of the modern individual has recently received remarkable progress in social theory, particularly from Michel Foucault's work. Indeed, for almost two decades, Foucault tries to highlight the social production of knowing subjects through multiple disciplinary devices. We are in the realm of historical materialism yet. However, in his last years Foucault focuses its efforts in exploring the effects of the techniques of the self. Understanding these techniques as a rules system, Foucault points out that they produce a certain attitude: "the care of the self". Nevertheless, Foucault says also that the "care of the self" is the care with activity and not a concern with the soul as a substance. In this way, Foucault denaturalizes the subject while he naturalizes action as a set of operations that makes up rules of conduct. The "care of the self" is just one of the possible action regimes. So, "the games of truth" lies themselves in action and in its differantiation according with its specific targeted goals. Thus, talking of an effective materialism of action constitutes a step forward regarding the historical materialism. It allows us to account for both the situational reflexivity or the reflexivity of the agent in a new way, especially with regard to its multiple normative effects: technical and social conventions, routines, habits, moods, ways of being in situation. Our main propose in this communication is, therefore, to give visibility to the explanatory power of action regimes.

**RN29S02 - Normativity and its Constraints**

We wish to register a complaint: Exploring normativity in social sciences and in disability studies in particular

Simo Pekka VEHMAS (University of Helsinki, Finland) | simo.vehmas@helsinki.fi
Nick WATSON (University of Glasgow, UK) | Nicholas.Watson@glasgow.ac.uk

Disability is a contested term, both as a concept and as a category. Until recently disability studies has been dominated by a materialist understanding where the inequality experienced by disabled people is seen as the product of social relations, the result of living in a society that excludes people with impairment, an understanding that has come under increasing challenge from poststructuralism. These accounts have challenged the dualism disabled/nondisabled and the norms that support it, arguing for a focus on ‘ableist normativity’ and the regulatory regimes that emerge from it as the source of the production, marginalization and oppression of disabled people. We will argue that these poststructuralist accounts whilst interesting fail to engage with vital ethical and political issues and that as a result their theoretical tools are inadequate to provide guidelines regarding right and wrong, good and bad. In poststructuralist accounts, ‘normative’ has become conflated with ‘normality’ and has been presented as the origin of exclusion. Poststructuralism, particularly that associated with posthumanism, contains...
questionable elements which, without further explication and exploration, unintentionally risk the moral agency and rights of some disabled people. The moral wrong related to ‘ableist normativity’ is insinuated, but not articulated clearly. If disability studies is to challenge the inequalities experienced by disabled people it needs a means of acknowledging which acts of agency or resistance are valuable and which are oppressive; disability politics has to be more than a resistance to discursive norms, it must include organisational, economic, material and non-discursive forms of power.

'The theory of non-rational behavior'. The theoretical reinterpretation of 'voluntary activity' motives
Marek NOWAK (Adam Mickiewicz University (Poznań), Poland) | marek.nowak@amu.edu.pl

The subject of voluntary activity is a vital element of the discussion of the so called third sector (Non Governmental Sector) or mass engagement in big events (world championships, charity actions, concerts etc.). It is partly related to the classic problem of charity (and the phenomenon of "giving"), partly related to the discussion of the welfare regime, and of the systems of financing social services in the different types of societies (see: Gosta Espring Andersen, Yuri Kazepov, Tomasz Inglot). Those two perspectives do not theoretically fit with each other.

The presentation will suggest the need for a transformation of the institutional vision of rational voluntary action (for example: Douglas North, Robert Putnam). This shift is based on the reinterpretation of motives of such action. The author suggests treating a voluntary activity as a sort of "emotional reaction" inspired by the internalized norms and values. Such action is not rational in the traditional Weberian sense, because it is not consciously organized around goals and "side effects" of action. We could call the communication process inspired by such an action 'communication by action'. The results, which could have a form of an institutionalized process of cooperation (in the mode of pro-social activity in the NGO or cooperation in organization of a championship), would in that sense be different from the motivations of actors.

The presentation will discuss the cognitive consequences of the proposed reinterpretation: for theory of voluntary activity as well as for the concept of cooperation.

From Nature to Culture: The Emergence of Normativity
Heinz-Jürgen NIEDENZU (University of Innsbruck, Austria) | Heinz-Juergen.Niedenzu@uibk.ac.at

According to sociological accounts, only human beings are able to develop mentally construed sociocultural forms and worlds, which are stabilized and secured by means of normativity (moral and conventional norms; roles; institutions; etc.). The relevance of normativity as a constitutive element in organizing social relations and societal structures is obvious. But, quite surprisingly, the un-clarified anthropological question concerning the emergence of normativity as a cultural mode of social organization has rarely been posed by current social theorists. For the modern anti-metaphysical understanding of the world, however, the normative constitution of human social forms of cultural organization can only be understood as a successor organization to a natural-historical precursor. That’s why evolutionary biology and evolutionary psychology claim to be able to model both individual actions and the formation of social structures on a more fundamental, evolutionary biological, level. Sociology, on the other hand, allegedly restricts itself in general to culture-centered models of explanation.

The paper departs form the assumption of the compatibility of the phylogenetically constituted heritage and the emergence of normativity as an evolutionary new mode of organization of the social. Thereby, the evolutionary point of departure is taken into account by a reconstruction of the processes of the emergence of human normativity out of non-normatively ordered pre-
human societies. At the same time it is argued that the new mode of social organization follows a logic of its own in its development which requires a specific sociological model of explanation.

Social Positivism: A Normative Account of the Social beyond the Post-Structuralist Impasse
Pedro SAEZ WILLIAMS (University of Warwick, United Kingdom) | p.saez-williams@warwick.ac.uk

In an attempt to explain my position in the simplest of terms I offer the following description: It consists in the proposal of an epistemologically self-sustaining social theory that allows for meta-individual positivity without falling into transcendentalism or epistemic arbitrariness. Phrased in regards to its contributing import to the current state of the social sciences, my work can be read as answer to the following question: Taking seriously the reflective challenges posed to the possibility of socially prescriptive positivity/normativity both in philosophy (i.e. epistemological or “reflective” naturalism) and social theory (i.e. post-structuralism) is there, if any, possibility to account for the capacity of a determined agent (individual, group or institution) (a) to further a proposal of description or action that may have normative import over another agent (b), independently of the former’s volition, and without resorting to transcendentalism? In a manner not dissimilar to Niklas Luhmann’s account of the “social”, my own account of “positivity” departs from notions arrived at within the body of research commonly labelled as Second-Order Cybernetics. The central formulation of my position being that cognition (or epistemic standpoint) may be relative, but it is not arbitrary: agents are situationally constrained. A precise exhaustion of the philosophical consequences of the above, lead to an account of the interplay between cognitive relativity and constraint in which certain cognitive phenomena cannot be reduced to the individual. This collection of inevitably social phenomena, further, is identical to that identified as the “positive” in both epistemological (knowledge) and socio-political (progress) terms.

Power-norm Continuum
Cem DEVECI (Middle East Technical University, Turkey) | dcem@metu.edu.tr

By relying on the distinctions made by Arendt and Foucault concerning violence, threat of force and power, this study aims to develop a thesis of the equiprimordiality of norms and power relationships. Against two opposite one-sided accounts, I defend that neither the prioritization of power in the emergence and maintenance of norms (Nietzschean/Foucauldian approach), nor the prioritization of norms over the arbitrariness of factual validity of power relations (Kantian/Habermasian view) provides an adequate understanding of the specificity of power and the problematic nature of norms. To simplify, an agent might be acting in accordance with a given norm only to avoid the possible sanction that would be realized by power relationship (paying your taxes), yet at the same the agent might be complying to a norm just because she takes this norm morally valid and anticipates that the norm should be empowered (one should be against racism). The former type of conduct does not prove the priority of power, yet the latter does not prove the priority of norm either. Rather, in the encounter with these two sets of power-norm continuums the agent is expected to comply, no matter the degree of reluctance is great or minimal. Power-norm complexes are insensitive to agents’ judgments or afterthoughts and this is their superiority over mere norms: A racist may be prevented from racist attitude or expression not thanks to the norm of anti-racism, but thanks to an already established continuum that is able to give sanctions for non-compliance. Only then, a racist mind (contrary to the above agent) may act in the same manner with the antiracist agent described above. The achievement of the continuum is to protect a norm assumed to be valid, yet the danger of the same continuum lies in the same achievement, because in a little racist community our second
agent may act in comfort, as long as a cosmopolitan, humanist intellectual does not disturb the continuum. This still however does not verify Foucauldian account of power, because, I think, in comparing and judging different continuums, we are not completely helpless. In principle, a power-norm continuum, to save itself from contradicting with another power-norm continuum should isolate itself, yet if the alternative continuum is able to enter into dialogue with the one inclined towards isolation, we may take the side of the dialogical one for moral reasons. At this point, the superiority of more formal, more comprehensive continuums can be expected without any guarantee, because once again, a better power-norm continuum (containing an ethically better norm) also needs power behind it. Thus, there is no norm without power, and no power relation (if we are not confusing it with violence, or threat of force) without mediation (or reference to) of a norm. Demonstrating power behind a norm is both futile and nihilistic, yet expectation from practical reason to judge and decide in an isolated encounter with norms (as if they can be distinguished from their power) is unrealistic and naive. We rather come across with alternative power-norm continuums among which the agents pursue a complex and indeterminate, yet also very limited freedom of choice.

RN29S03 - The Gulf between Social Theory and Empirical Research

The art of theorizing and the crisis of social theory
Mikael CARLEHEDE (University of Copenhagen, Denmark) | mc@soc.ku.dk

We might look back on the last quarter of the 20th century as a golden age of social theory (e.g. Habermas, Luhmann, Foucault, Bourdieu, Giddens and industries of their interpreters, puzzle solvers and critics). However, current sociology seems to be making a “descriptive turn” (Savage) and to enter a “post-theoretical” phase (Alexander). Social theory (especially “Grand Theory”) seems to be losing in significance rapidly. This development might be explained by the fact that theoretical research has remained isolated from empirical research. Joas and Knöbl, for instance, claim that “the modern social sciences are characterized … by an extremely damaging division between theoretical and empirical knowledge”. This gulf might be related to a rather peculiar fact, which can be noticed in the education of sociology students at all levels: We find courses about qualitative and quantitative methods, specific subjects, and classical and contemporary social theory, but we almost never find courses about how to theorize. In theory courses, students learn what the great thinkers thought, that is, the results of their thinking. They do not learn how these great thinkers reached those results. I will therefore discuss the art/craft/method of theorizing in order to get a fresh view on the role of theory in the social sciences. This approach might give us some hints of how to overcome the gulf between theoretical and empirical research and – as a consequence - how to “rehabilitate the theoretical” once again.

Krešimir ŽAŽAR (University of Zagreb, Faculty of Humanities and Social Sciences, Croatia) | kzazar@ffzg.hr

Since the foundation of sociology as a distinctive science, the issue of social dynamics has been one of its central concerns. Already the inventor of the name of the discipline, Auguste Comte, postulated the examination of social dynamics as one of two crucial fields of sociological considerations. The issue of social dynamics has still not lost its actuality and relevance since
societies are not fixed entities, but have been undergoing constant transformation processes. Therefore the question whether a certain society has progressed or regressed has been steadily appearing. However, estimations of the social progress/regress have usually been based on cursory, general impressions and, thus, have lacked reliability and precision in terms of criteria. Having in mind the denoted drawback, in this paper we advocate a development of clear and strict methatheoretical tools which would allow a robust and accurate assessment of a degree of social progress/regress. Furthermore, we propose a rudimentary outline of such tool. The basic underlying idea of this attempt is to convert an abstract concept of progress/regress in an aggregate of particular empirical indicators and, further, to a set of exact measurable variables. Additionally, we underline that it is more proper to relate the idea of social progress/regress to each of particular 6 distinguished realms of social world instead to associate it with society in general terms. In concluding remarks we emphasize that the development of methateoretical instruments, as proposed here, represents an indispensable prerequisite for an accurate sociological examination of the issue of social dynamics.

**Radical Microsociology in search of a research tool**

Lukasz DOMINIKA (Nicholas Copernic University, Poland) | tatooine8@gmail.com

My contribution will focus on examination of the Interaction Ritual Chains Theory (IRCT). I will try to answer the main question: does the IRCT is or will be capable of forming a research tool to provide an instant source of new scientific phenomena. Answering the main question I will compare IRCT cognitive potential with recent mainstream theoretical assumptions such as structuralism/poststructuralism, constructivism/postconstructivism and morphogenesis (social realism). I will also examine the elements of IRCT and its supposed software and hardware feedback e.g. visual data, cctv, face recognition devices, etc. My general presupposition, which I will examine, is moderately optimistic because I find IRCT as a chance for social theory to solve one of its general problem: to find objective measures for constitutive forces of common social relations.

**Inequality and Multiracial Gatekeeping**

Mamadi K. CORRA (East Carolina University, United States of America) | corram@ecu.edu

This paper investigates the impact of racial status on gatekeeper – client relations. Gatekeepers control access to ‘benefits’ they do not own, benefits that are valued by ‘clients.’ Seeking access to those benefits, clients assume obligations which may be discharged by a fee paid to the gatekeeper. Employment agents, car salesmen, real estate agents are gatekeepers because they control access to jobs, cars and housing respectively as well as information about each. When clients are lower status, for example African American, employment agents may steer them to lower paid, less desirable jobs, car salesmen may ask for and receive higher prices, and real estate agents may show only segregated housing. Research reported here extends previous work on gatekeeping to multiracial (Black-White) gatekeeping relations by jointly applying two theories. Network Exchange Theory (NET) models the gatekeeper–client relation and Status Characteristics Theory (SCT) models the impact of racial status on that relation. The result is three theoretical predictions that are experimentally tested in the well-understood context of exchange networks. Results show that 1) where race is not salient, resource divisions favor those structurally advantaged by gatekeeping; 2) when whites are gatekeepers and blacks are clients, the power of whites is not enhanced by their race; and 3) when blacks are gatekeepers and whites are clients, the power of blacks is undermined by their race. Theoretical and practically implications of these findings are discussed.
RN29S04 - Theorizing “Subject”-“Identity”-“Solidarity”

From Social Freedom to Social Autonomy
Craig Alan Richard BROWNE (University of Sydney, Australia) | craig.browne@sydney.edu.au

Honneth’s conceptualisation and historical reconstruction of social freedom are substantial contributions to critical theory. Honneth distinguishes social freedom from two other influential conceptions of freedom: negative freedom and reflexive freedom, although social freedom is an intersubjective extension of reflexive freedom and represents its institutional preconditions. Freedom, Honneth argues, is the one universally accepted value in modernity. The explication of social freedom is integral to his development of this proposition into a normative theory of justice. In this regard, Honneth makes a significant shift towards social theory and away from approaches to social justice that involve the specification of abstract principles and procedures from the perspective of normative political philosophy. As a consequence, he retrieves some of the sociological dimensions of critical theory. However, my analysis implies that Honneth’s construction of social freedom does not fully satisfy its theoretical and practical aspiration. In my opinion, the depiction of genuine social autonomy requires a stronger sense of the structural impediments to its realisation. I propose that an intersubjective conception of the dialectic of control provide a means for better comprehending how social freedom is constrained and resisted. My elaboration of social autonomy draws on the additional perspectives of Giddens, Castoriadis and Boltanski.

Competitive Egocentrism: Individual worth as Stratification
Michalis LIANOS (University of Rouen, France) | m.lianos@free.fr

How is it possible that the most efficiently organized societies in human history produce fragile individuals that often feel inadequate? Building on the distinction between direct and institutional sociality, I address here the question of late modern stratification in connection with conscience and social identity. At a time when public discourses converge towards the existence of a huge, undifferentiated majority of the ‘middle classes’, it is necessary to re-examine the structure of stratification on the basis of the individual subject. The shift from polysemic to monosemic social interactions may shatter the contours of class but gives rise to a socially self-conscious subject that measures herself against a perceived benchmark of social adequacy and classes herself accordingly. Some of the main explanatory lines of this theoretical stance involve:

i. The decline of the modern subject and the emergence of a “modular” subject which builds itself via chosen services provided by institutions and organizations.
ii. The fusion of social belonging and stratification into a single sphere of “social integration” and the consequent rise of “social exclusion”.
iii. The loss of individual control over selfhood and the asphyxiating dependence on work as the decisive criterion of self-validation.
iv. The death of the bourgeois socioculture and the birth of an institutional web via the use of which actors do not socially engage with each other despite fiercely competing for stratified positions.

An extensive basis of empirical research in three areas (social control, uncertainty, conflict) underlies the ideas presented.
The Concept of Homo Sociologicus and the Problem of Individual Creativity and Freedom

Jiri SUBRT (Charles University in Prague, Faculty of Humanities, Czech Republic) | jiri.subrt@fhs.cuni.cz

The study Homo Sociologicus was first published by Ralf Dahrendorf in Kölner Zeitschrift für Soziologie und Socialpsychologie in 1958. Its author asserted that at the very core of sociological thought is a simplified idea of human nature. In this idea, the human individual is seen merely as subject to social forces and unilaterally subordinate to the social order. Dahrendorf related the term „homo sociologicus“ to the conception of social role. He assumes that the individual behaves according to the expectations related to the roles assigned to him or her. If an individual's behaviour fulfils these expectations, they are rewarded and receive social approval. On the other hand, if an individual does not live up to expectations, they are punished and penalized with social sanctions. The construction of homo sociologicus is – according to Dahrendorf problematic especially because it leaves no space for human freedom, creativity and autonomy. In this perspective, the individual has no other dimension than as an actor who plays prescribed roles. Therefore Dahrendorf asks what place freedom has in the world of roles. The intention of my contribution is to revisit the issues formulated by Dahrendorf a half-century ago, and address them with regard to the more recent development of sociology. In the past 50 years the sociological image of man has undergone certain shifts and changes. This has had an influence on the choice of research orientation, theoretical approaches and conceptual apparatus. New problems and issues have emerged. Apart from the notion of social role, there is the increasing importance of such conceptions as actor, agent, habitus, self, identity and individualization. The main concern of this article is how to open up the conceptual apparatus of contemporary theoretical sociology to stimulate such insight into the human individual as may overcome the reductionism that Dahrendorf analyzed in his work several decades ago.

Necessary Illusion as a Model of Subjectivity Formation

Krzysztof ŚWIREK (Institute of Sociology, Warsaw University, Poland) | krzysztof.swirek@gmail.com

The premise of my presentation is a conviction, that both constructivist theory of subject as a product of operations of power, as well as model of rational and conscious agent, need to be theoretically overcome. There is a way out of this opposition, which can be found in dialectical theory of ideology, with its central model, that can be described by a paradoxical formula of ‘necessary illusion’.

The main inspiration for this model goes back to psychoanalytical notion of symptom, as a structure that ‘reveals and conceals at the same time’. That sort of formations, which conceal/negate some social, political or existential predicaments, are to be found everywhere in social life. And subjective engagement itself is not conceivable without some sort of ‘blind faith’, that tries to remain ignorant of everything outside itself.

Central to the model of necessary illusion is the dialectic of subject, that allows himself to be ‘duped’ (Lacan), but at the same time is ‘ortopsychic’ (Joan Copjec): probes the illusions, which he falls prey to. If we consider, for instance, the ideological ‘society-effect’ (Althusser), an imaginary construct that provides social structures with necessary consistency, the dialectic of the subject will at the same time produce endorsement of this construct and a feeling of its inadequacy. Using this model, we can understand both the dependency of subject on illusory constructs, but also his/her ability to transform the surroundings s/he systematically misperceives.
What Do We Mean When We Say „We“? Collective Identity Between Rejection and Self-Evidency
Jakub MLYNAR (Charles University in Prague, Czech Republic) | jakub.mlynar@seznam.cz

Berger and Luckmann (1966) claim that it is „inadvisable to speak of ‘collective identity‘“, and the very term ‘identity‘ had been also questioned. This criticism might be appropriate in the social scientific theories and discourse; nevertheless, individuals often do refer to themselves and others in plural pronouns and group-related categories. Some of the recent influential perspectives on identity – identity as something fluid, fragmented, virtually non-existent – are in striking discrepancy with the reality of everyday life, which is built on the assumption that people and groups (should) maintain certain important characteristics over time. In my paper, I will show that there are two basic sociological perspectives on the collective identity formation. First, collective identity is seen as something growing from within: out of interpersonal relationships on the micro-level, based on empathy, similarity and identification between „I“ and „You“ (e.g. symbolic interactionism, phenomenology, social psychology). Second, collective identity is explained from outside, as something that arises from the inter-group relationships, processes of essentialization and categorization, based on perceived difference between „Us“ and „Them“ (e.g. cultural and political sociology). Although these two strands of thought seem to be divergent, my proposition is that they correspond with two basic mechanisms of identity construction, similarity and difference, and must be seen as interdependent. Finally, I argue that the risks of reification (“self-evidentializing” the collective identity) as well as over-theorizing (“rejecting” collective identity) can be minimalized by focusing on actual linguistic realizations of collective identities (as pronouns, categorization etc.) in social interactions.

RN29S05 - Rethinking the Classics

Interpretations of the Concept of “Subject”: From Classical Traditions to Postmodern Theories
Natalia OTRESHKO (National Pedagogical University named after M.P.Dragomanov, Ukraine) | otreshko71@mail.ru

The opportunity and ability to act, rationality and the autonomy of action in the social space can be defined as essential characteristics of the subject in the project of Western humanism. In classical sociology the subject was the author of his own programs and goals. The act of the activity was the subject’s action which is directed toward the object. Postmodern sociologists pay great attention to new interpretations of the concept of “subject”. The concept of the subject can be some alternative to the concept of personality or individual in the postmodern theories. The “subject” is the process of becoming; the “person” is the result of the socialization process. People become subjects in the process of socialization. But if the “personality” of classic conceptions was seen as a result of socialization, the “subject” never becomes truly complete. In modern theories the consciousness of the subject is ordered internal world, which opposed to the objective reality of the external world. In postmodern theories the consciousness of the subject is the thin shell which hides chaos rash desires and impulses. Power becomes vulnerable when the subject begins to recognize mechanisms of power influence.

From Norms to Values: Re-reading Durkheim’s Sociology of Morality
Rudi LAERMANS (University of Leuven, Belgium) | rudi.laermans@soc.kuleuven.be
It is common wisdom to oppose the sociological views of Max Weber and Emile Durkheim. Whereas Weber advocates an interpretative approach focussing on the underlying meanings or general values that motivate individual human action, Durkheim’s plea for a genuinely positivist study of society stresses the determining role of social facts. However, an in-depth re-reading of the evolution in Durkheim’s different outlines of a sociology of morality, which forms the core of his overall sociology, rather relativizes the differences between the two founding fathers of modern sociology.

Initially, Durkheim tended to restrict morality to imperative rules of conduct. In circumscribing his project for a scientific study of morality, he therefore regularly used the expression ‘physics of customs and law’. However, Durkheim gradually gave more attention to the underlying values or, in his terminology, the ‘social ideals’ that inform constraining norms of action. This not only allowed him to clarify the relation between the desired sociology of morality and moral philosophy, a positive-scientific study of ‘moral facts’ and their assessment from a normative point of view. Durkheim’s re-articulated plea for a systematic study of morality indeed also brings this project closer to Weber’s central idea that sociology is in essence a cultural science that must focus on the motivating force of a culture’s pivotal values.

The ‘Contingent Turn’: Towards a Postclassical Historiography?
Simon SUSEN (City University London, United Kingdom) | Simon.Susen@cantab.net

This paper examines the impact of postmodern thought on present-day disputes in historiography. Critical interrogations regarding the nature of history (‘What is history?’), the development of history (‘How does history evolve?’), and the study of history (‘How can or should we make sense of history?’) have always been, and will always continue to be, vital to the elaboration of research programmes in the social sciences, owing to their paramount interest in the interplay between processes of reproduction and processes of transformation. As explained in this paper, the increasing popularity of postmodern approaches to the study of social developments can be seen as an expression of the ‘contingent turn’ in historiography. In light of the postmodern emphasis on spatiotemporal contingency, it appears that there is no underlying story line that determines the course of history. In fact, such a view suggests that there is no such thing as a ‘course of history’, since it conceives of temporal development as a conglomerate of largely accidental, relatively arbitrary, and discontinuously interconnected occurrences. The following three tensions are crucial for assessing the relevance of postmodern thought to contemporary accounts of history: (i) necessity versus contingency, (ii) grand narratives versus small narratives, and (iii) continuity versus discontinuity. With these antinomies in mind, a distinction can be drawn between ‘reconstructivist’ and ‘deconstructivist’ conceptions of historiography. The paper scrutinizes the rationale behind the gradual shift from reconstructivist to deconstructivist historiographical agendas in the contemporary social sciences. In doing so, it aims to identify the key presuppositional components of a ‘postclassical historiography’ and, more importantly, to evaluate its viability in the twenty-first century.

The effective reality of facts in the sociology of Vilfredo Pareto: perspectives of sociological interpretations in contemporary European societies.
Ilaria RICCIONI (Free University of Bozen, Italy) | Ilaria.Riccioni@unibz.it

Vilfredo Pareto’s work and life counts a number of experiences combined with radical changes of perspectives. As final step of interpretation of reality, Pareto was to turn to Sociology as the “extreme synthesis aiming at studying in general human society”. The way, or methodology, of this “sociological synthesis” has to be guided -according to Pareto- only by “experience and observation”. If on the one side the Paretian approach was seen as the beginning of a
Structural-functionalist sociological analysis, on the other it is also a radical perspective on social facts as essential data for reality interpretation. This paper is the initial outcome of a research on Pareto’s thinking. Is his sociological imagination still debating to contemporary European society development and change? Europe has yet gone through three types of societies:

1) A traditional type of society in which laws are less important than traditions; societies of acceptance and stillness.
2) A type of “elitarian society”, where groups of privileged people rule the society as a monoclass society (Nazism and fascism were born as mass reactions to these elitarian societies).
3) Contemporary society, in which the pressure of citizenship is changing the shape of power. Participation is widening power spheres and the plurality of social classes is changing decision processes.

How does this society find its orientation? The limits of economistic approach to social change interpretation was already clear to Pareto. This paper will go through this debate starting from Pareto reflections on social change and social action.

RN29S06 - Contribution of Social Theory to the Philosophy of Good Life

Common Goods and (pre)Distributive Justice
Bru LAIN (University of Barcelona, Spain) | bru.lain@ub.edu

During the last two decades, the so-called “common goods” have gained an important academic and activist attention. Nevertheless, such an interest often neglects some important elements, emphasizing only the juridical status of commons. By trying to go beyond these boundaries, this paper seeks to stress the relationship between “common goods” and distributive justice. In doing so, it exposes three models of distributive justice –Laborist, Liberal, and Pre-Distributive–. The main goal is to show the normative (desirability) and empirical (applicability) advantages of the last regime over the two former ones due to different sets of characteristics. On the one hand, concerning an economic argument. A commons-based pre-distributive model should be understood as a regime with a minor market dependency; namely, that its distributive policy is performing throughout an “ex-ante” application before the unfair market distribution is done. On the other hand, an argument tackling a political concern: common goods require an important activist and social responsibility. In other words, commons should be seen according their double dimension. First, as their juridical status (non private, and non-public resources); second, as the social mobilization and political organization that they necessarily entail. By exploring both sorts of arguments, the paper tries to display an economic and political agenda to advance towards a fairest (pre)distributive justice regime based on common resources valid by contemporary societies.

Critique and Happiness: Simmel, Honneth and Bauman on the contributions of social theory to a philosophy of the good life.

Jordan MCKENZIE (University of New England, NSW, Australia) | jmcken28@une.edu.au

To what extent can critiques of modernity contribute to a social theory of happiness and contentment? While social and structural elements of modernity can influence forms of
emotional experience (this argument has been made throughout debates in sociology from Durkheim’s On Suicide to Sennett’s Corrosion of Character), critical theories of society are arguably more focused on addressing sources of discontentment in modern times. While the normative contributions of Hegel, Marx, Adorno and Horkheimer can all be associated with discontentment in modernity, it is only through a theory of social experience that these matters can be adequately addressed. Simmel, Honneth and Bauman each offer a version of this theoretical movement through notions of ought/actuality, recognition and contingency respectively. And in each case, characteristics of a Lebensphilosophie are established alongside larger claims about the nature of modernity. In this presentation I am to show how theories of social experience can link critiques of modernity to patterns of personal experience relating to, but not necessarily limited to; contentment, self-understanding and the good life.

Human solidarity, a complexity approach
Bernardo Carlos SPAULONCI CHIACHIA MATOS DE OLIVEIRA (PUC-SP Pontifical Catholic University of Sao Paulo) | bsd2122@tc.columbia.edu
Luis Miguel LUZIO DOS SANTOS (Universidade Estadual de Londrina (State University of Londrina)) | lmig@uol.com.br

The concept of solidarity inhabits the collective unconscious and is usually related to something consensual, linked to the most basic values of human needs, but the expansion of that understanding leads to more complex views. Human solidarity would be conditioned by biological or cultural issues that go beyond any possible biological determinism. This study seeks to analyze the phenomenon of solidarity and its correlation with life in society from the perspective of complexity, through a cross-sectional analysis in order to cover the phenomenon in question from different perspectives. For that, we appealed to sociobiology and social sciences interpretations. We tried thereby to renounce one sole idea and one permanent solution, by approaching the assumptions of complex thinking, which rely precisely on how to overcome a single organizing principle or a single cause in explaining the same phenomenon. It explores the need for new societal experiences, which would block the advance of competitive individualistic paradigm as the sole alternative, highlighting the experiences of solidarity economy and third sector organizations that brings forth a new business logic, a third social force among the state and the market.

This paper is a qualitative-descriptive and bibliographic study which focuses on a discussion of some of the main theoretical currents within biological sciences and humanities, focusing on the understanding of the phenomenon of solidarity and how it is expressed in human and their societal arrangements.

Imagining the good life: Values and theories of situated action
Antje BEDNAREK-GILLAND (Social Sciences Institute of the Evangelical Church in Germany, Germany) | antje.bednarek@gmail.com

Sociological theories can be categorised into one of two categories: on the one hand, there are theories of structure or structuration which foreground processes of social life at the group level such as class, education, labour market structure, regional disparities etc. On the other hand, there are constructivist approaches which emphasise the agentic and meaning-endowing capacities of individuals. Albeit these latter approaches in principle afford an inexhaustible number of avenues for the study of social life at both the individual and group level, they often fail to account for the undeniable influence of structural forces.

In this paper, I want to use the example of value studies to argue for a way in which the common trappings of the structure-agency debate can be avoided. The term value studies
refers to a number of attempts to chart and explain individuals' outlooks and (assumedly) associated action in relation to social and personal life. The most well-known of these is the Inglehart paradigm which underpins the World Values Survey and its smaller cousins (e.g. EVS). I will argue that neither this structuralist approach nor culturalist theories which treat values as a form of cultural capital do justice to the ethical nature of human experience. Drawing on the work of Hans Joas and Andrew Sayer in particular, I want to argue for a pragmatist understanding of values as arising in specific situations (rather than abstractly, e.g. through socialisation) and as being formed and nurtured by the experience of well-being, resp. suffering. It is these experiences rather than social class or socialisation that explain why people form certain values. Using qualitative methods, we can gather rich information on people's experiences and thus learn about their imaginations of the good life. This will, in turn, allow us to further develop our sociological imagination about the kinds of societies we want to live in in the future. A theoretical step forward which overcomes the structuralist-constructivist problem consists of, in other words, a concentrated effort to connect our existing theories with theories of experience and situated action.

RN29S07 - Social Imaginaries and Everyday Life

Shifting Imaginaries of Torture in the War on Terror
Werner BINDER (Masaryk University, Brno, Czech Republic; Charles University, Prague, Czech Republic) | werner.binder@mail.muni.cz

In December 2014, the release of the torture report of the US Senate Intelligence Committee rekindled the torture debate which erupted after the terrorist attacks of September 11, 2001. In my talk, I will argue that the concept of the social imaginary is necessary to understand the changes in the torture discourse. This analysis is motivated by a broader theoretical ambition to highlight the importance of the imaginary vis-à-vis the symbolic, which still dominates much of the theoretical debates in cultural sociology. Culture not only consists of symbols and codes publicly available, but also encompasses collectively shared imaginary significations governed by a diffuse logic of similarity. Only by paying tribute to the social imaginary, we are able to understand how symbols and codes work, when they fail and when they are successful. The importance of the imaginary will be demonstrated with an analysis of the impact of 9/11 and the Abu Ghraib scandal on the American torture debate. The terrorist attacks on the Twin Towers didn't bring up new arguments in favor of torture, but changed the social imaginary by turning the so-called “ticking-bomb-scenario” from a mere thought experiment into a real possibility – from a “dead hypothesis” into a “living hypothesis” to quote William James. The incidents at the Abu Ghraib prison, successfully framed as abuse (and not as torture!), had an opposite effect: The infamous photographs polluted the social imagination of torture and thus strengthened the critics of torture, which eventually resulted in the above-mentioned report.

Analytical Sociology and Ethnomethodology: Social Ontology Reconsidered
Yu-cheng LIU (Department of Applied Sociology, Nanhua University, Taiwan) | ycliu15@gmail.com

Three terms will be appropriated in this research: ethnomethodology, analytical sociology, and social ontology. Underlying these three and unifying them under an umbrella will be the assumption that social order may be better understood through not only social mechanisms theories, but also theories of daily practices. The analysis of daily practices launched repeatedly by laymen presents us the order implied in sociality: the idea of routineness. The notion of routineness constitutes not just visible side of daily life, but also invisible one. The basic
argument concerning the idea of “being-supported-secrecy-in-daily-life” will be completed through the elaboration of “routineness”. This research focuses on a type of empirical observation: social behaviors concerning mobilization via new social media. We have witnessed a radically different form of mobilization from its traditional one that is largely depending on the presence of body. When considering the distinction of routineness and secrecy as two sides of a coin, this research argues the changing meaning of mobilization from offline (the presence of body) to online (the absence of body) and combining both in the most situations in the modern society can be understood differently if being put in the observation that power formed through routineness invisibly supported by secrecy operates not only virtually but also in/to the real world. And this will be a try through examining the daily practices of laymen in the sense of ethnomethodology and the theory of social ontology.

Bernard Manedville’s Turn of Mind – a Major Step towards Modern Sociology
Pekka Juhani SULKUNEN (University of Helsinki, Finland) | pekka.sulkunen@helsinki.fi

Mandeville is today mostly considered as a cynical satirist who scorned the hypocrisy of defenders of the public good, arguing that private vices rather than individual sacrifice serve the public good best. He is recognized, at most, for his influence on libertarian economic theories, often with dubious ideological references to Adam Smith. This paper argues that Mandeville’s true influence on social theory was relevant on two accounts: his critique of “the selfish theory” that founded Hobbesian views of the political nature of social order, and his distance from the “benevolence theory” that dominated Scottish Enlightenment. My argument here is based on a recently discovered change in Mandeville’s work, in which pride and concern for approval by other people gained priority over earlier premises of self-interest. Mandeville’s idea naturally leads to the concept of sympathy in Hume and particularly Smith, on which a new theory of social order is built. Their theories of justice, and respectively, of the political within the social, constitute its pivotal element. Both approach the social order from the vantage point of pride and approval. This is still today a fresh way of understanding the social bond and the political within it in modern society. The critique of the “selfish theory” (cf. Bourdieu’s “anthropological monster”) was handed down to sociology from the Enlightenment itself, often condemned today for the lack of it. The concept of sympathy opens up avenues towards a theory of society, without always recognising the source.

“SOLIDUS”. Research in SSH: making social theory while improving peoples’ life.
Marta SOLER (University of Barcelona, Spain) | marta.soler@ub.edu
Esther OLIVER (University of Barcelona, Spain) | estheroliver@ub.edu
Nataly BUSLÓN VALDEZ (University of Barcelona, Spain) | nataly.buslon@ub.edu

Social Sciences and Humanities (SSH) have been asked to shed some light on evidence-based solutions to face the challenges derived from the economic crisis that Europe has experienced. However, neither SSH nor our discipline have been as successful as expected in this assignment, being academics considered to be caught within their theoretical debates, unable to tackle the daily problems of individuals. This and other similar situations have jeopardized the funding of SSH research in the EU. Drawing from the contributions of contemporary authors such as Habermas (theory of communicative action), Burawoy (idea of public sociology), Touraine (contributions on solidarity and social movements) or E. O. Wright (“real utopias”), and authors from the classical sociological theory such as Durkheim (his models of solidarity), in this paper we present an EU-funded research, “SOLIDUS-Solidarity in European societies: empowerment, social justice and citizenship” (Horizon 2020, 2015-2017). SOLIDUS is an evidence of how with sociological
imagination is possible to respond from a SSH research to the deepest challenges that our societies face nowadays by making both, relevant contributions to the social theory while contributing to improve people’s life. This investigation is aimed at exploring, conceptually and empirically, how solidarity may become a crucial aspect to understand social cohesion in human societies. It will analyze in depth the successful acts of solidarity which are being developed across Europe, the extent to which they respond to dialogic and inclusive processes, and their related outcomes and policy developments.

RN29S08 - Social Imagination and Sociological Theorizing

The Codependence of Sociological Theorizing, Thinking, and Imagination
Sergey KRAVCHENKO (Moscow State Institute of International Relations, Russian Federation) | sociol7@yandex.ru

The sociological metatheorizing, thinking, and imagination are codependent. The positivist theories considered social development as evolutionary and linear, recognizing that nature and society can be interpreted by the same theoretical instruments. Their representatives developed the sociological imagination (though the very term was not yet used) in the form of ‘organized skepticism’ (Merton). The interpretive theories led to the assumption that the human society is not something ‘historically inevitable’. All together they worked out the antipositivistic sociological imagination. The integral metaparadigm interpreted social and cultural dynamics as uncertain fluctuations (Sorokin), choices of actors (Parsons), and ambivalences (Merton). At that historic time Ch. Mills proposed the theory of sociological imagination the essence of which was dynamic-integral thinking in terms of increasing varieties, so scientists were oriented to understand ‘the range and depth of this variety’. The reflective metaparadigm of radicalized/reflexive modernity brought into life the reflexive type of sociological imagination. The essence of it is innovative, reflexive thinking about social becoming (P. Sztompka). The non-linear metaparadigm of postmodernity studies the rhizome development (Deleuze, Guattari). Steve Fuller in The New Sociological Imagination presupposes a new type of theoretical integrity of sociology with sociobiology, evolutionary psychology, and behavioral genetics. U. Beck states that a new sociological imagination is ‘sensitive to the concrete paradoxes and challenges of reflexive modernity’. I argue for a non-linear humanistic sociological imagination that would search for new forms of humanism that is becoming an ethical imperative of the global community of nations.

Religion as a model for welfare
Martti Antero MUUKKONEN (University of Eastern Finland, Finland) | muukkone@student.uef.fi

The role of religion seems to be more complicated that what secularisation theories – as well as previous dominant sociological paradigms – have supposed. Religion has not faded away but is more and more vital part of both domestic and international politics. Samuel P. Huntington’s thesis of the clash of civilizations seem to be more and more evident.

In one way, sociology is back into the classics: In religion the object of worship is the society itself, as Durkheim put it. Later Clifford Geertz combined this with Weberian focus on the outputs of religious thinking in his definition that “religion is a model OF and model FOR the society.”

In this presentation I focus on the question how this Geertzian idea could be applied in studying different welfare regimes. The research model includes three parts: the society is seen as a combination of (environmental-, historical-, cultural-, economic- and political) opportunity
structures. They are not determinants but, rather, like play situations in chess: certain moves are possible but the player makes the decision what to do. Religion conserves and legitimates the deep values of the culture in its dogma and rite while its ethics give model to frame welfare (having, loving and being values)

The Imaginary of Promising Potentialities. On Sociological Imaginativeness and the Rise of Exploitative Essentialism
Denis HÄNZI (TU Darmstadt, Germany) | denis.haenzi@ifs.tu-darmstadt.de

The contribution aims at shedding light on a social imaginary currently gaining ground in western societies: the notion of individual potentials as an essential everyone has to look for, make accessible, and tap into. Hence, the ideal of embodying, unlocking, and exploiting personal potentials is becoming crucial not only with respect to unequal career opportunities but to the reproduction of social differences at large. Thus, the imaginary of promising potentialities perfectly meets the requirements both of the "new spirit of capitalism" (Boltanski/Chiapello) and the "entrepreneurial self" (Bröckling), thereby entailing a new societal dispositif: exploitative essentialism. In order to get to the bottom of this imaginary, the paper aims at retracing its constitutive forces. As will be shown, relevant ideas conveying the imaginary of promising potentialities not only circulate in the fields of psychology, biology, and economics – with their respective conceptions of mind, genetic, and market potential – but can just as well be traced back to distinct traditions of social theory: In 1969, Theodor W. Adorno underscored the emancipatory importance of the modern subject's "unbound potentiality", and in 1972, Pierre Bourdieu defined individual habitus as a structuring structure shaped by "objective potentialities". Hence, the contribution puts up for discussion how far the sociological imaginativeness of classics such as Adorno and Bourdieu had a hand in boosting the imaginary of promising potentialities – and, by doing so, facilitated the rise of an exploitative essentialism. As a concluding remark, the paper encourages to both theoretically and empirically approach social dynamics by the sociological imagination of intersecting imaginaries.

RN29S09 - Public Sociology and Sociological Imagination

From a ‘Disciplinary Bunker’ to ‘Dialogic Complicity’. The Rationality Myth of the Sociological Imagination in Public Sociology
Stefan SELKE (Furtwangen University, Germany) | ses@hs-furtwangen.de

In terms of a disciplinary division of labour, public sociology can be considered an example of a “post-normative” (Funtowicz/Ravetz) science concerned with establishing a dialogue with the general public as equals. Although this mainly refers to a praxeological concept (“doing public sociology”), it’s actually about the question of normative assumptions of this field when applying solutions to so-called “wicked problems” (John Brewer).

It is remarkable that at the interface with the public, one stereotypically refers to a genuine “sociological perspective” (Georg Simmel) or a sociological imagination (C. Wright Mills) as the unique and defining characteristic between sociology and its environment. This article is to be understood as a critique of professional sociology and unmasks the recourse to this assumed analytical competence as habitus typical of this profession and as institutionalised self-deception.

It is helpful to more accurately read Mills’ classic instructions, which have often been misunderstood. He places the sociological intellectual capacity in the minds of the public and
does not regard it as an essential characteristic of sociology as an “authority”. For Mills, it was less about downgrading expertise for laymen than it was about dialogic complicity of the scientific and non-scientific community.

In connection with the theoretical framework of transformative research (Modus-3-Science), this article shows that it is essential to question one’s own normative assumptions and move away from authoritarian sociology as a ‘disciplinary bunker’ in order to arrive at a type of dialogic sociology as a public science; it also discusses how this transition can be made. The features of this public science would consist of a co-design of new value chains based on a collaborative production of knowledge.

A 21st Century Nemesis? The Sociological Imagination and Libertarian Cultural Politics in Northern Europe
Richard COURTNEY (University of Leicester, United Kingdom) | rac16@le.ac.uk

This paper will explore the rise of European libertarian cultural politics as a re-imagination of white ethnocentric identities in a post-imperial/colonial world. The rise of their influence at local, national, and European levels means they are populist identities that conflict with the sociological imagination itself. This is because libertarian politics value an autonomy and freedom that actively reject many tenets of sociology; namely, cosmopolitanism, methodological structuralism, social constructionism, progressive research agendas, and sociological understandings of identity and migration. Libertarian cultural politics imagines a society different from that imagined by sociology. This affects sociologists as it undermines our professional activities, the impact of our work, and our stewardship of definitions of the social.

This paper will argue that the turn to Public Sociology, which has occurred largely to give voice to subaltern identities has overlooked the significance of the libertarian counter arguments to the normativity embodied in sociology. Libertarian politics use narratives of exclusion and marginalisation, usually held for identities of sociological concern, ironically to pursue exclusionist agendas. The paper will explore libertarian politics in Northern Europe in order to understand the nature of sociology’s 21st Century nemesis, which unlike previous sociological ‘others’ is neither ‘natural’ science, state action, nor neo-liberal economics – it is inherently social. This raises interesting questions over our stewardship of the social and how we, as sociologists, theorise the merits of our own definitions of the social.

Public sociology and hermeneutics
Vít HORÁK (University of Ostrava, The Czech Republic) | vit.horak@fsv.cuni.cz

I confront Michael Burawoy’s call for a public sociology with continental European thought, namely with hermeneutic philosophy. While I take a critical view of Burawoy’s proposition, I accept the basic idea of conceptualizing sociology as a discipline inherently engaged with the public. To this end, I draw on Hans-Georg Gadamer’s program formulated in his Truth and Method. While Burawoy understands public sociology as a distinct type of sociological work complementary to professional sociology, using Gadamer’s philosophy I attempt to avoid this division and to conceptualize sociology on the basis of the intersection between professional and public sociology. I understand sociology not as a research field formulating theories that describe society, but as a distinct interpretative tradition from which professional sociology as well as public debate draws. A sociologist then does not have a privileged access to knowledge, but what distinguishes him/her from a layman is the ability to contextualize knowledge within the tradition. As a result, (s)he is able to participate in contemporary debates and demonstrate their embeddedness in sociological knowledge. Rather than giving positive answers to socially
relevant questions, a sociologist uncovers (sociological) questions that reside implicitly in a public debate. This allows sociology to show that there are indeed alternative answers.

Balancing Research and Community Commitment in the Interwar Romanian Sociology: Dimitrie Gusti’s Sociologia Militans as Public Sociology
Levente SZÉKEDI (Partium Christian University, Romania; University of Bucharest, Romania) | szekedi@gmail.com

After the 1st World War the territorially expended Romania had to face additional provocations, besides its already existing problems stemming from the economic backwardness and the thorough rurality of the country. The ethnically diverse, newly integrated regions were slightly more urbanized and had been traditionally lead by non-Romanian elites who tended to portray the enlargement of Romania as a historical tragedy. The creation of a modern Romania - then only conceivable in a nation-state framework - was a foremost mission shared by a large and diverse number of Romanian intellectuals. The so-called “effervescent generation” of the interwar period produced various movements (right-wing extremist groupings, naive, committed socialists, folkish romantics etc.); the most ideologically encompassing and inclusive was probably the Bucharest Sociological School lead by Professor Dimitrie Gusti. Gusti and his colleagues implemented a long-term strategy for the overall reform of the country, mostly directed toward the improvement of the village life and the empowerment of the rural communities, which had been largely disconnected from the modern civilization. The social interventionism of the School was sociologically grounded: interdisciplinary teams initiated and implemented rural reform actions on the basis of field studies. Gusti himself was an adept of the “sociologia militans” as opposed to the purely academic “sociologia cogitans”. In this presentation I am going to argue that the school and movement developed by Dimitrie Gusti should be grasped as an early attempt of public sociology, accomplishing much more than a series of reformist, policy-minded sociological interventions.

RN29S10 - Social Relations and Co-Existence

A successful alternative to continuous consumption of new experiences as a identity builder in the risk society: close friendship relationships
Laura ASO MIRANDA (University of Barcelona, Department of Sociological Theory, CREA, Spain) | laurasomi@hotmail.com
Adriana AUBERT SIMON (University of Barcelona, Department of Sociological Theory, CREA, Spain) | adriana.aubert@ub.edu

The risk society has questioned the systems of reference which supported modern capitalism. New global risks, a new economy based on services and technology, diverse family models and individualization have emerged. A consequence of the risk society is the progressive centrality of the role of consumption in identity construction. This role is encouraged by advertisement and the wide variety of goods and services that the market offers to social actors. Current consumers are still individuals socialized on the desire of raising their status and differentiate themselves socially by conspicuous consumption. However, they increasingly look for self-affirmation in continuous consumption of new experiences from the deceptive precept of freedom and as a result they acquire a fictitious and revisable identity. Close friendship relationships have been identified through critical communicative methodology as an alternative to unconscious adoption of consumption patterns rooted in current society.
The potential of close friendship relationships as an alternative results from personal change processes which fit into the paradigm of reflexive modernity of Beck and exemplify the power of agency as a transformation tool. This alternative paves the way for subjects to freely acquire personal and stable identities. On the one hand, it allows individual particularities to arise to the detriment of the homogenizing traits of continuous consumption of new experiences. On the other hand, it leads social actors to have permanent and meaningful satisfactions opposed to the transitory satisfactions provided by this kind of consumption.

Integration through constitutional patriotism? A discussion of conditional factors from the perspective of the theory of interaction ritual chains
Ulf TRANOW (University of Düsseldorf, Germany) | tranow@phil.uni-duesseldorf.de

Constitutional Patriotism (Habermas 1990; Müller 2010) (CP) is a normative political theory of integration of liberal societies. CP advocates a post-traditional form of integration, based on the universal values of freedom and equality instead of a particular national, ethnic or religious culture. A post-traditional integration is assumed to be the outcome of a widespread participation in “constitutional culture” (Müller) which comprises political activism as well as civic rituals in daily life. It is supposed that this participation produces a cognitive but also emotional commitment toward universal values and the political community. However, this thesis is theoretically unsatisfactory: The concept of a “constitutional culture” remains vague and the question of how and under which conditions a participation in this culture may produce commitment and integration is not addressed systematically. In short: the theory of CP suffers from a missing sociological foundation. In my contribution I will close this gap by referring to the theory of interaction ritual chains (IRC) (Collins 2004). The IRC states that moral commitments, group identifications and collective symbols are produced within iterative interaction rituals which are experienced as emotionally beneficial by the participants. From this perspective, a commitment towards universal values is not primarily produced through rational discourses, but through rituals in which these values serve as “ritual ingredients”. In my contribution I will specify which kinds of interaction rituals (regarding structure, dynamic, and content) are able to contribute to a post-traditional integration in the sense of the theory of CP.

Romanticizing the social. On structural transformation of recognition in the critical theory of Axel Honneth
Martin STEINLECHNER (University of Innsbruck, Austria) | martin.steinlechner@uibk.ac.at

With his objection, that the social theory of Adorno had pursued ”the definitive repression of the social from the social analysis of critical theory”, Axel Honneth laid foundation for establishing recognition as paradigm of Frankfurt Critical Theory. A quarter of a century later, the debate on ‘structural transformation of recognition” undertakes an attempt of renewal. In his contribution I will close this gap by referring to the theory of interaction ritual chains (IRC) (Collins 2004). The IRC states that moral commitments, group identifications and collective symbols are produced within iterative interaction rituals which are experienced as emotionally beneficial by the participants. From this perspective, a commitment towards universal values is not primarily produced through rational discourses, but through rituals in which these values serve as “ritual ingredients”. In my contribution I will specify which kinds of interaction rituals (regarding structure, dynamic, and content) are able to contribute to a post-traditional integration in the sense of the theory of CP.
positive self-assertion not necessarily results from actually fulfilled expectations of recognition, it may also result from compensatory effects. But if social conflict may fizzle in legitimating prevailing order, should the social theory of Axel Honneth not be blamed for romanticizing the social?

Expanding Knowledge about the Constructs of Social Mobilization in the Sociological Imagination
Oleksandr KHYZNIAK (V.N.Karazin Kharkiv National University, Ukraine) | o.v.khyzhniak@gmail.com

Mobilization - a key category of theoretical sociology, and not only the theory of social movements. Now we can see the transition to the study of mass mobilization in the further development of the theory of collective social action.

Mass mobilization of society in crisis due not only to its features (social structure, the mentality of the population, institutional and socio-cultural factors), but also the characteristics of collective action. Analyzing the collective action in the process of mass mobilization in the post-Soviet countries, justifies the theoretical and methodological approach that constructs mass mobilization in a crisis society are, firstly, the collective identity, which sets the limits of collective action, distinguished participants and non-participants; second, collective solidarity, which generates and demonstrates sustainable motivation for collective action; Third, the trust that the collective social action designed to integrate its members. This question is particularly problematized in the Eastern European borderlands (for example in Ukraine), where (1) the collective action in the mass mobilization vary considerably depending on the socio-cultural situation in different societies; (2) collective identity not only becomes a multiple, but also undergoing a profound transformation due to the transition from a collectivist to individualist culture; (3) new types of solidarity (for example, within the virtual communities that are not amenable to traditional methods of study and management); (4) the "radius of trust" (as Francis Fukuyama) in a society of total distrust of social institutions are changing the configuration of the repertoire of collective action in the course of mass mobilization.

Toward a Universal Theory of the Human Group: Applied in the Comparative Analysis of Groups and Organizations
Nora MACHADO JOHANSSON (IUL-ISCTE, Portugal) | noramachado@gmail.com
Tom R. BURNS (University of Uppsala, Sweden) | tommora.burns@gmail.com
Ugo CORTE (University of Uppsala, Sweden) | ugo.corte@gmail.com

A group is conceptualized as a system with three universal subsystems on which any ongoing group depends. The subsystems are bases -- necessary for group “functioning” and performance in more or less coherent ways; a group may be able to realize – with its bases in particular contexts -- not only its purposes or goals but system requisites to sustain the group. The group bases consist of: (1) a rule regime (collective culture with a finite set of rule categories) defining group identity and purpose, defining and regulating roles and role relationships, norms and behavioral outputs, its collectively shared places and times for gathering and interacting; (2) an agential base of group members who are socialized (or partially socialized) carriers of and adherents to the group’s identity and rule regime; involvement factors motivate members to adhere to and implement the rule regime; (3) a resource base, technologies and materials, self-produced and/or obtained from the environment -- essential to group functioning and group performances.
Group multiple production processes (based on sub-complexes in its rule regime) impact on the group itself (reflexivity) and on its environment. These outputs, among other things, maintain-adapt-develop the group bases (or, possibly, unintentionally undermine/destroy them). Thus, groups are action systems producing goods-services-experiences-events-developments, etc. for themselves and (possibly) for the larger environment on which they depend for goods&services-resources-recruits-legitimation, etc. The model provides a single framework for the systematic descriptions and comparative analysis of a wide diversity of groups, several of which serve as illustrations in the paper.

**RN29S11 - Theorizing New Forms of Domination**

**Wrong on so many levels. Dealing with sexual violence in theory and in practice**

Nina POHLER (Humboldt Universität zu Berlin, Deutschland) | nina.pohler@posteo.de
Angelika ADENSAMER (Humboldt Universität zu Berlin, Deutschland) | a_akilegna@yahoo.de

Many social institutions, like judicial systems, are based on the assumption of dealing with autonomous, intentional actors, responsible for their actions and resulting effects. But controversial topics, like sexual violence, can often not be reduced to this idea of causality. Thévenot (2007, 2014) developed a model that incorporates different modes of agency and corresponding modes of establishing social order. This allows an understanding of "what gets lost" if people overly rely on one grasp of reality to establish commonality. All institutions are subject to a "two-sidedness" (Thévenot 2011) - we need them in order to establish order, but we know they are not able to deal with the complexity of reality.

In radical-leftist scenes, the idea of jurisdiction and objective truth is radically negated. The subjective experience of "survivors" is primary, therefore, she has the right to define what sexual violence means to her and there is no need to justify this in front of a public. This shows a high sensitivity for the kind of engagement with reality that Thévenot calls the „regime of familiarity". If a community opts for a negation of institutions and questions the intentional-actor-centered causality, it has to find different ways to deal with uncertainty and disorder.

Using Thévenots framework, we analyse how sexual violence against women is treated in anarchist communities in contrast to judicial systems.

**The Reproduction of Social Inequality in the Discourse of Social Problems**

Elena Sergeevna BOGOMIAGKOVA (St.-Petersburg State University, Russian Federation) | elfrolova@yandex.ru
Ekaterina Aleksandrovna OREKH (St.-Petersburg State University, Russian Federation) | ek.orech@mail.ru
Olga Vjacheslavovna SERGEYEVA (The Sociological Institute of the Russian Academy of Science, Russian Federation) | sergeyeva.olga@mail.ru

The paper is devoted to consideration social problems as a kind of discourse that reproduces social inequality and dominance. The problems of discursive and symbolic measure of inequality are actively developed (T. A. van Dijk, N. Fairclough). Based on the concept of social constructionism (P. Ibarra, J. Kitsuse) we regard social problems (issues) as a specific discourse that is fundamentally different from other types of discourses, for example, from the risk discourse. Producing the discourse of social problems dominant groups installs and reinstalls moral boundaries in the normative sense, indicates what group and what actions are considered as "normal" and what is not. In the logic of this discourse, conditions are referred as social problems, i.e. as disasters that need to change, as a threat to social order. This process
necessarily involves designing appropriate categories and their arrangement relative to each other. We highlight the main features of the discourse of social problems, such "signs" as victims of the problem, the source of the problem and experts. In fact, this discourse divides social groups involved in the problem and not part of it. Social groups may combine many forms of symbolic domination, but marking them as the source or as the victim of the problem is a new form of discrimination. The discourse of social problems may act as an "umbrella" for other types of discourses like medical and legal; it has its own system of notation, differentiation of individuals and groups, delegation of authority and attribution of responsibility.

The Aesthetics of Seduction: The Capitalist Market as the Body of Desire
Ulla KARTTUNEN (University of Eastern Finland, Finland) | ukarttun@student.uef.fi

According to Gilles Lipovetsky and Jean Serroy (2013), contemporary 'artistic capitalism' is marked by the dedifferentiation of the economic and aesthetic sphere. This transaestheticized market society means unlimited expansion of aesthetic seduction. With the artistic capitalism, the aesthetic principle of seduction is no longer a phenomenon limited only to art and luxury, but goes through whole market society. Brands, trends, friends; without ‘likes’ they stay nonexistent. It is no more question of satisfying needs or desires "but about arousing desire for ever more desires", as Zygmunt Bauman (2005) points out. The whole neoliberal liturgy of economic growth is linked with increasing consumption, desire and enjoyment. Max Weber analyzed the rise of capitalism from puritan ethics, contemporary consumer capitalism can be argued to have another basis, that of hedonist aesthetics.

The capitalist market can be interpreted as a grandiose body of desire, a reality where the most intimate actions are linked with economic production structures. When the tactics of capitalism is to speed up the society as a marketized desire engine, does it mean seduction-based ethics? The paper searches the new spirit of capitalism as the economics of seduction, through theory and real contemporary cases. It is already known that a brand, like Apple or Louis Vuitton, must be seductive to get success. But fewer know that in a transaestheticized world an artwork of anti-seduction can bring to trial, or that in the surreal present, millions of internet porn users are addicted to advertisements.

New forms of dominance in current capitalism
Daniel HOUBEN (RWTH Aachen University, Germany) | dhouben@soziologie.rwth-aachen.de

I will make a threefold argument:
(1) To identify forms of domination and inequality is to identify forms of institutionalized organizational reproduction:
Capitalism can be understood as a formally rationalized system of constant externalization. Here, corporations employ people and supply them with opportunities to react to externalities of capitalist social system. Organizations produce structures of domination and inequality by reproducing themselves, i.e. adhering to their own functional needs residing in overarching institutional logics.
(2) Changing forms of domination reside in changing forms of organization:
Ever since Mills, studies on social domination show a persistent coupling of power and organizations. Led by neoliberal ideology, states have transferred sovereign functions to corporations and paradoxically taken themselves subjects to those and enable them to influence political decisions. Hence, Coleman’s notion of the Asymmetric Society needs to be extended to the relations between organizations and states. But lately, the very forms of organizations are in
transition and so are their opportunities to execute symbolic and material power (e.g. financial crisis).

(3) Explaining structures of dominance:
Sociological theory needs to attend more closely to organizations not only as mediums of symbolic and material power but as powerful actors sui generis. Then, a relational perspective reveals (mechanisms of) domination to emerge from the very configurations these actors are embedded in rather than from properties or characteristics of elites. As I intend to argue, the dynamics of capitalism can be explained sufficiently and connected to various branches of (new) structuralism.

Greedy Institutions Revisited
Marianne EGGER DE CAMPO (Berlin School of Economics and Law, Germany) | marianne.egger@hwr-berlin.de

Lewis Coser developed the concept of Greedy Institutions over three decades between the 1950s and 1970s. Greedy Institutions demand undivided commitment; competing social activities such as ties to family or lovers are voluntarily given up in favour of the Greedy Institutions. No coercion is needed to attract members since the Greedy Institution offers access to truth, spiritual revelations, a feeling of wholeness and the status of being among the elect. Coser illustrated his concept with historical examples, such as Eunuchism in Ming China or the Byzantium, the royal mistresses at the court of Louis XIV. and Louis XV., domestic servants, and religious sects as well as political sectarians.

Coser’s concept was developed many years before internet technology even existed, the examples he studied are even older historical cases. I argue, however, that it is worth revisiting Coser’s Greedy Institutions when analyzing present day domination of users by internet companies such as Facebook and Google and the relationships among users. Nowadays the online-life is characterized by the greediness of the company or the collective. The hive mind resembles the totalistic claims of the greedy collective that impedes periodical withdrawal from observability – increasing aspects of our online life are linked, documented and archived. Hackers whose mission is explicated in the hacker ethic exert power with their expertise without questioning its legitimacy. They represent the elite among the greedy collective. Omnipresent advertisement reduce the user to one single role – that of the consumer and instrumentalise all social ties for marketing purposes.

RN29S12 - Systems and/or Networks and/or Contexture

Theorizing Ontological Insecurity: Don Quixote and the Social System
Christopher SCHLEMBACH (University of Vienna, Austria) | christopher.schlembach@univie.ac.at

Ontological insecurity -- the term was invented by (anti-)psychiatrist Ronald Laing in the 1960s - - became an important concept in contemporary sociology. It gained momentum by Giddens' "Consequences of Modernity" in which it was used to understand the late modern condition in terms of a crisis of biographical narrative in a world of shifting and blurring boundaries. Giddens, however, did not fully bring out the implications of the psychiatric interaction context in which the concept of ontological insecurity was developed. This paper brings together two strands of classical social theory, Alfred Schütz theory of intersubjectivity and Talcott Parsons concept of the social system, in order give the idea of ontological insecurity a firm base in the theory of social action. Schütz and Parsons are rarely seen in the same perspective. Although Weberians throughout their life, they are read in different traditions of social theory. The patient, Laing
theorized, cannot defend ego borders when facing another human being interacting with him. It is precisely this question of integration of doctor and patient -- and in another realm of Don Quixote and Sancho Panza -- which Schütz and Parsons elaborated on the highest theoretical level in their works of the early 1950s. Parsons showed how roles must be constituted that interpenetrate personality in order to enable interaction and Schütz showed how a realm of intersubjectivity must be constituted at the intersection of the subworlds of Don Quixote's chivalry and Sancho's everyday life. In both frameworks, however, insecurity is key in order to understand deviance and the breakdown of a social system as well as the end of Don Quixote in terms of his knightly existence.

**Contesting hierarchy: restricted verticality in the research of informal networks**

Małgorzata IREK (University of Oxford, United Kingdom) | gosiairek@gazeta.pl

Informal networks are rare example of horizontal phenomena observable in vertically conceptualised social space, for the whole machinery of academic research is constructed so as to perceive the social in terms of hierarchy, status, class and power. These networks are constituted by open-ended ‘sets’ of ego-centred relationships, which are not regulated by state legislation, are non-prescribed, nor mandated by culture or institutions, and are forming beyond divisions of class, nation ethnicity and kinship, defying the very concept of social hierarchy. They lack structure and they can instantly shrink or expand without formal limitations, making the concepts of SNA, such as proximity, density, activity, centrality or ‘betweenness’, irrelevant. And, although ephemeral, they can perform actions of unpredictable effects and magnitude, as could be observed during the riots of 2011 in Britain. However, scholars could not predict what happened, nor research these events adequately, for there was not enough knowledge about something that was not a group, and yet it was some sort of grouping – something that had no form, no structure, boundaries or direction, but that still manifested itself in social action.

The proposed paper will present a pragmatic approach of restricted verticality, that allows to research and describe such networks, developed by the author basing on the longitudinal fieldwork with over 4000 interviews.

**Towards a de-ontologized sociology**

Till Jansen (University of Witten/Herdecke, Germany) | till.jansen@gmail.com

Within the last decades, sociology has faced multiple theoretical innovations that proposed quite contrary ontologies of the social, regarding it either as founded in bodies, networks, social systems or other entities. Yet, none of these sociological theories managed to include the views of the other, e.g. systems theory being unable to conceptualize material agency, ANT failing to describe what systems theory calls function systems. The problem thus seems to be that a certain ontology always regards others as derived, being unable to integrate them (Bühl 1969). I would therefore like to propose that we should conceptualize sociology not so much by struggling for the right ontology and regard ontology not as foundation of sociology, but rather as a social phenomenon. Accordingly we should develop a de-ontologized “infra-language” (Latour 2005) that allows us to switch ontologies and epistemologies according to what shows in empirical research. Drawing on Gotthard Günther this can be done by conceptualizing the social as compound of different ontological areas (contextures) that are conceptualized as purely logical. These contexts display a positive side (e.g. content, materiality) and a negative side (e.g. reflexivity, behaviour). For example such a contexture could be a subject proposing a certain world-view, a body performing movements or a discourse, structuring topics and contents. Sociology would from this point of view study how the social structures itself by
drawing on different contextures (be it bodies, discourses, things or something else) and relating them in stable compounds.

What We Talk About When We Talk About Social: Comparison of The Different Sociological Approaches
Yury VOYNILOV (Higher School of Economics, Russian Federation) | voynilov@gmail.com

“The social” is one of the key concepts for theoretical sociology. There were various attempts to define this concept in history of the discipline. It turned out that the most famous and influential definition is the interpretation of social reality as a reality sui-generis. For many sociologists, this approach, usually associated with the name of Emile Durkheim, is the sole and uncontested. Actually there are several alternative definitions which is contrary to the established understanding.

However, it is now possible to talk about the tendency to revise established views on this issue. Proposed by Bruno Latour approach to understanding social largely continues the concept of Gabriel Tarde, who was an opponent Emile Durkheim in this matter. Hence it seems urgent to study the history of the emergence of the concept of social and compare different approaches to its definition.

This report will focus on concepts of the social given by Gabriel Tarde, George Herbert Mead and Bruno Latour. The choice of these authors is not accidental. They are united by the desire to bring the concept of social beyond the purely human interactions. These issues will be the core of the report.

RN29S13 - Sociology as a Cosmopolitan Sciences

The European Union and Cosmopolitanism after Ulrich Beck
David INGLIS (University of Exeter, United Kingdom) | D.Inglis@exeter.ac.uk

How cosmopolitan is the European Union? This is a crucial question today, for it asks whether the EU worth defending from the sustained attacks of Eurosceptics across the continent. If the EU is indeed at least partly cosmopolitan, than it would seem to be worthy of defence by people on the Left and Liberal-Left who seek humane and balanced forms of social order. But if the EU is radically insufficiently cosmopolitan today, and in fact promotes non- or anti-cosmopolitan outcomes in politics, economics and social relations, this raises uncomfortable questions about how it can be defended by those who self-identify as cosmopolitans. I argue that the EU in its current form is far less cosmopolitan than its adherents allege. Three different types of cosmopolitanism are at play within it today: a) political-liberal cosmopolitanism, centred around legal structures and norms, the promotion of human rights and the cultivation of cosmopolitan citizenship; b) economic-liberal cosmopolitanism, concerned with the promotion of the mobility of capital, the partial regulation of the mobility of people (primarily controlling the movements of those in working class socio-economic positions), and the necessity of reducing national States’ welfare and social services budgets; and c) Social Democratic cosmopolitanism, which stresses the need for the State to regulate capitalist economic processes in the interests of both social stability and harmony. The EU today certainly involves a mixture of these three cosmopolitanisms, although type a) has gained most scholarly attention. Yet the EU has been from the beginning fundamentally contradictory, for it was constituted out of two different cosmopolitanisms, types a) and b), which in contingent ways have interfaced with each other, but which are also profoundly conflictual and antagonistic. The increasing dominance of neo-
liberal cosmopolitanism over Social Democratic cosmopolitanism has led to an ever-greater neo-liberalization of the EU, as many of its key institutions have been captured by neo-liberal personnel, these helping to emplace neo-liberal ideas as the hegemonic common-sense of EU bodies and policies. Moreover, political cosmopolitanism often serves as a smokescreen behind which neo-liberal cosmopolitanism operates and becomes ever more authoritative and influential. The paper considers the paradoxes produced by the interplay of the three cosmopolitanisms in Europe today, such as the fact that pro-EU Conservative political parties (e.g. Finnish Conservatives) are in fact much less genuinely cosmopolitan than are some ostensibly protectionist, but actually latent cosmopolitan, political entities that are loudly critical of the EU (such as the Finns Party). Through these reflections, the late Ulrich Beck’s political/sociological arguments about ‘cosmopolitan Europe’ and ‘German Europe’ are considered, critiqued and extended.

**Cosmopolitan modernities and Social Imaginaries**

Gilles VERPRAET (University Paris Ouest Nanterre, France) | verp@ehess.fr

Cosmopolitan studies contribute to the ethical dimensions of social imaginaries; as ethic of stranger, ethic of alterity. The sociological analysis insists on the grounding place of ethic inside social interactions, as ethic of reciprocity, ethic of comprehension, by dialogic procedures, by the procedures of recognition (Honneth).

Our paper questions the practical consequences of cosmopolitan studies, within their capacity to frame the expansive imaginary of networks (interconnection, acceleration) by some anthropological pragmatics (encounter, strangerness, alterity). So the figure of black cosmopolitanism is moving between the identity of blackness (“negritude”) to the literacy construction of commons issues (“le tout monde”).

Can be specified different contributions of cosmopolitan studies to European sociology, as the socio-anthropological approach of cosmopolitan encounter, the dialogical sociology of collective identities and political space, the configuration of multiple European modernities and their modalities of dialogue.

**Eisenstadt’s Civilizational Approach and Zionist Historical Imagery**

Stavit SINAI (Konstanz University, Germany) | stavitsinai@gmail.com

The paper lays out a critical discourse analysis of Eisenstadt’s civilizational approach and focuses on its application to the “Jewish historical experience”. The paper starts by tracing the sociographical roots of (1) Eisenstadt’s comparative civilizational approach and (2) his concept of “cultural ontologies” in the crisis Sociology underwent in the 1970’s. The paper then presents a critical reading of “Jewish Civilization” (1992), claiming that this text is a corollary of the evolving tendency to understand Judaism as a culture, predominant among the Israeli secular elite. The paper shows how Eisenstadt’s empirical descriptions of Jewish history grow out of the historical imagery of Zionist historiography. It points to the ways in which Eisenstadt’s “Jewish Civilization” incorporated some of Zionism’s dominant national narratives and reproduced them by employing sociological terminology. Eisenstadt’s claim of “Jewish continuity”, his emphasis of the “Second Commonwealth” period as the charismatic base of the Jewish civilization, and his teleological view of the Jewish history as leading to the emergence of the Zionist state, among other things – all exemplify how Eisenstadt’s “Jewish Civilization” is entwined in Zionist historiography. By examining Eisenstadt’s “Jewish Civilization” as a case study of knowledge construction in an ideological system, the paper aims to attend the to the general and more fundamental problematic riddled in the use of historical accounts in the service of comparative historical sociology.
Foreign Concepts in Western Social Theory: Guanxi, Subaltern, and The Piggy Bank Model of Education
Radu Andrei PĂRVULESCU (Cornell University, United States of America) | rap348@cornell.edu

Western social thought often speaks as if the concepts worth discussing and the vocabulary worth thinking in originate exclusively in the West, and then spread out (Connell 2007) - the worldwide adoption of Marxism is a classic case. This not only assumes that home-grown concepts were developed in geopolitical isolation, but it also ignores the many ideas that Western social theory has imported from overseas. In this paper I investigate the use of three foreign conceptual packages in different branches of Western academia: the Chinese idea of ‘guanxi’ (not unlike the Russian ‘blat’, a particular form of networking) in management theory, the use of 'subaltern' in the school of thought emerging from India, and the 'piggy bank model' (from Paulo Freire) as applied to theories of education. These three conceptual packages highlight the geopolitically interconnected nature of social thought, both drawing inspiration from and inspiring thinkers in the West. I close with a discussion on the possible shapes of a global sociology that reflects neither the haughty cosmopolitanism of global elites nor the chauvinistic nativism of local gentry.

RN29S14 - Rethinking the Classics II

For reflexivity and habitus as working in tandem: towards reconciliation of Margaret S. Archer’s and Pierre Bourdieu’s theoretical approaches.
Łukasz POMIANKIEWICZ (Institute of Sociology at Adam Mickiewicz University, Poland) | lukasz.pomiankiewicz@amu.edu.pl

The aim of the paper is to reconcile Margaret S. Archer’s concept of reflexivity with Pierre Bourdieu’s concept of habitus. Archer’s approach includes understanding of reflexivity as a mediatory process between actors and social structures operating through internal conversations of human beings. She defines it as ‘the regular exercise of the mental ability, shared by all normal people, to consider themselves in relations to their (social) contexts and vice versa.’ (Archer 2007: 4). The paper will briefly present Archer’s typology of reflexivity: (1) communicative reflexivity, (2) autonomous reflexivity, (3) meta-reflexivity and (4) fractured reflexivity. All the types are the ways through which human beings see themselves and their opportunities in the social context.

Her approach will be juxtapose with Pierre Bourdieu’s concept of habitus defined as a set of embodied dispositions of actors providing routinized dimension in their social activities.

The main purpose of this paper is to show reflexive deliberations and routinized dispositions as two complementary factors in explaining social actions and social change. I will show Bourdieu’s approach as not central conflationist and not deterministic but attributing agency to human being.

I will also consider Archer’s reconceptualization of the concept of socialization and her assumption of declining importance of communicative reflexivity in Late-Modernity.

As I see the distinction of reflexivity and habitus not as a dichotomy but as a continuum I will postulate incorporating both the factors into the theoretical level of the agency/structure debate. The core literature:

Beyond macro and micro: a critical discussion of N. Elias’ “figurational sociology”
Angela PERULLI (University of Florence, Italy) | angela.perulli@unifi.it

In the development of social theory one question constantly arises: what is society? Or in other words: What allows human beings to be who they are? What are the mechanisms allowing the formation and transformation of social groupings? What bonds different human beings, and what distinguishes them, in time and space?
This paper deals with the answers traceable in the sociology of N. Elias.
The first part presents the “figuration” key concept: an interconnection of actions taken by a group of interdependent human beings. And it can be applied on a very small scale as on a very large one: from a chat between two friends to relations between States. In any case, with the idea of figuration, power is brought into focus: there is always a “shifting power ratio”, a “changing power unbalance”. Some attention will be devoted to the “survival unit”: a kind of “attack-defense figuration”.
The second part discuss the theoretical implications of the use of “figuration”. In the very different topics treated by Elias, one can observe some constants: 1. The unavoidable and irreducible dynamic of social processes in the lives and relationships of human beings. 2. The rejection of the use of reified concepts. 3. Overcoming the dichotomous approach to social analysis.
The paper concludes by explaining how the figurational approach could help to overcome some impasses of sociology, particularly the dualism that has opposed the social to the natural, the individual to society, the micro to the macro, action to structure, order to change, local to global.

Rereading Late Foucault: from subject to practice to strategy
Sanem GUVENC SALGIRLI (Marmara University, Turkey) | sanem.guvenc@marmara.edu.tr

Michel Foucault’s work in the late 1970s and early 80s has widely been read as a return to 'the subject' that he so blatantly killed in his earlier work. Rejecting the dominant interpretation of this position as a detachment from politics, in the past decade scholars such as Judith Butler, Michael Hardt, Antonio Negri, and Judith Revel have claimed the opposite: each has argued that Foucault's turn actually signals a new politics that would be based upon subjective ethics and on different forms of subjectivation. This presentation shares the view that there has been a shift of interest in Foucault's later works through a different conceptualizing of the subject. However, instead of labeling it as a return to the subject, or a call to create different forms of subjectivation, using Foucault's recently published 1981 Louvain lectures and his 1983-84 Collège de France lectures on parrhesia, I will argue that what we witness in 'late Foucault' is rather the substitution of the subject with practice, action, and constant shift from one strategic position to another.

RN29S15 - Social Knowledge, Practice and Imaginations in the Digital Era
Sociological Imagination of Alan Turing and Artificial Intelligence as Social Imaginary
 Çağatay TOPAL (Middle East Technical University, Turkey) | catopal@metu.edu.tr

C. W. Mills analyses sociological imagination as the ability to relate the most intimate to the most impersonal. There are essential linkages between personal troubles and social issues. The sociologist should be able to trace the linkages between biographies and histories. Sociological imagination necessitates sensibility, commitment and responsibility since doing sociology is a practice of life as well as a practice of work. Sociology is, then, a practice that potentially everyone can perform. The crucial condition is the existence of sociological imagination and sensibility. This sensibility indicates the capacity to picture a social imaginary, however broad or limited.

This paper traces the sociological imagination of Alan Turing, often considered as the founder of modern computing technology. The history of Turing’s scientific endeavors follows (and is followed by) his biography, revealing the strong linkages between his life and work. Turing’s sensible, committed and responsible attitude is clear in several cases. This paper focuses on the case of artificial intelligence in order to assess Turing’s sociological imagination. Artificial intelligence may be one of the most promising paths in science history. This path, which Turing initiated through his research on computing, promises and defines more than it has already been.

This paper asks to what extent artificial intelligence may be seen as the social imaginary of Alan Turing. It simultaneously, and inevitably, questions: to what extent Turing may be seen as a sociologist with the sensibility to imagine an integrated social picture.

Challenges to Social Theory in Digital Era
 Victoria DUDINA (St. Petersburg State University, Russian Federation) | viktoria_dudina@mail.ru

Development of new information technologies and digital tools require reconsideration of the basic aspects of social theory. Digital tools influence social life, transform social reality, and generate social events. Digital world could be considered as a model of social reality that gives sociologists a possibility to use digital data as a proxy for social data. The significance of social theory is questioned by the development of big data: when researchers have excessive amount of data, functions of theory shift from structuring data collection to identifying patterns in available data. Possibility to collect data representing not only experience, opinions and meanings, but transactions, networks, flows of people, images and objects stimulates material turn in social theory. As networks entangle humans with non-humans, people and things should not be considered as oppositions, and social theory could not be any more a theory of humans only. Development of digital tools and methods of data analysis give sociologists possibilities to focus not only on static characteristics but on dynamics and transform explanations of social behavior. Transition from “social as society” towards “social as mobility” implicates transition from theory of systems and structures to more dynamic social theory of networks and flows.

The presentation discusses also possible changes in social theory, connected with the end of predominance of question-based data collection methods; post-demographic reconsideration of sampling and representativeness in social research; democratization of knowledge production; performativity of social knowledge; and new digital totalitarianism.
Revision of theory and methodology in information society concept: paradigm or just a topic?
Viktorija ZILINSKAITE-VYTIENE (Vilnius University, Lithuania) | viktorija.zilinskaite@gmail.com
Dalia ČIUPAILAITĖ (Vilnius University, Lithuania) | ciupailaite@gmail.com

The presentation will be based on research of the project “Information Society Research: a New Methodological Paradigm?” (MIP-072/2014) financed by Lithuanian Research Council. While having no doubt about changes in contemporary societies we still have left question about nature of relation between society and change for sociological imagination. Is change just a transitive position between different types of society? Is change nature of society as such? Is change essential for a particular type of society? Not depending on chosen possibility, following question would be about suitability of methodological approaches to cognition and depiction of society.

One of the long used models of society analysis was information society. Diverse in models and due to this – in application length – information society was widely applied approached. However while having visible and obvious quantitative differences, we may see that most of the researchers while stating about qualitative difference of information society from previous ones, use the same methodology and methods that were applied for previous ones.

The analysis elucidates parallelism and its lack between social theory and methodology in analysis of information society.

Time, Method and Subjectivation: Social Theory in the face of Social Media and Big Data
Carlos FRADE (University of Salford-Manchester, United Kingdom) | c.frade@salford.ac.uk

This paper is an intervention in current debates about the significance of social media and the automated production of data, the use of social media for intellectual and academic practice, and the relevance of social science in the face of the digital world. Recognising the necessity and import of engaging with social media and its productions, the paper has a threefold aim: providing a diagnosis of the digital and its material and immaterial workings; offering a critique of the ways the digital is currently studied in sociology and more generally social science; and expounding an alternative perspective which is meant to be a first step towards a renewed praxis of social theory.

In what concerns the diagnosis, the paper presents a first theoretical move consisting in starting not from the systemic or structural dimensions of the digital world, but (in line with recent theorisations) from the subjectivity, that is, it attempts to capture what attracts, assembles and rallies individuals towards the digital. Secondly, the paper will show that current major debates essentially take the digital as a given and try to find ways of adapting themselves and their disciplines to it; as a consequence, theory is disregarded if not overly disparaged, critique postponed and the political economy of the digital neglected. Finally, the paper argues that only by developing a theoretically and methodologically grounded ability to subtract oneself from the allures of the digital will social theory and sociology be able to renew themselves; thus, to the presentist temporality of running after a supposedly endlessly changing time, it opposes the temporality of subjectivation as thought; to the emphasis on method, it opposes a praxis which comprises a collective dimension as well – a praxis encompassing and appreciative of methodological inventiveness, but involving action in the strong political and sociological sense of agency and not only as agencement or assemblage.

RN29S16 - Sociology of Politics, the Public Space and Democracy
‘Out of which Politics Arises’: On Hannah Arendt and the Worldhood of Political Action and Public Space

Erin Jane CARLISLE (Flinders University of South Australia, Australia) |
erin.carlisle@flinders.edu.au

Hannah Arendt is a central voice in theories of political action and public space. Public space is generally regarded as the domain of political action where citizens gather to debate matters of common interest to the public. The concept thus holds a significant position in debates surrounding deliberative and participatory democracy. Arendt's theory is frequently taken as a ‘nostalgic’ longing for the Greek political experience as her major work The Human Condition (1998 [1958]) is littered with references to the pursuit of glory and the ancient polis. As a consequence, Arendt is often criticized as ignorant to the exclusionary realities of the Greek political experience, and thence seen to reinforce the masculine legitimacy of the political realm (Benhabib, 1992; Dietz, 2010; Pütin, 1981). However, the purpose of The Human Condition is not to expound a normative theory of politics, action and public space. Rather, it is concerned “with the predicament from which politics must start” (Canovan, 1995: 99). For Arendt, politics arises out of the collective activity of peoples in public space. What remains underdeveloped in Arendt's thought and the field more broadly is the relation of such politics to her notion of ‘the world’. Although the world is unevenly presented across her theoretical project, the world is pivotal for politics in Arendt’s view: “for at the centre of politics lies concern for the world” (2007a: 106). While some have noted the presence of the world in Arendt's work (Borren, 2010, 2013; Canovan, 1994; Cioflec, 2012; Janover, 2011; King, 2011), the world as such has not been systematically advanced, nor has the significance of the notion for her understanding of political action and public space been fully detailed. The aim of this paper is therefore twofold: to hermeneutically reconstruct ‘the world’ in Arendt’s thought; and, to elucidate the worldhood of political action and public space as presented by Arendt, as a profound alteration of widespread interpretations of her work.

To this end, this paper draws upon the world-horizon problematic from the phenomenological tradition. The question of the world-horizon, and human encounters with it, is a central motif in phenomenology and post-phenomenological approaches. Early sketches of the world are present in Husserl’s 'Lebenswelt' and Heidegger’s hermeneutic of 'being-in-the-world', yet the question of the world emerged in its own right in Merleau-Ponty’s hands. His formulation of ‘être au monde’ indicated the “deeper sense of the human condition as not only 'being-in-the-world', but also 'of' or 'belonging to' the world” (Adams, 2009: 111; emphasis in original). The world-horizon may be provisionally defined here as a meta-horizon of meaning, forming a context in which human life is embedded. It forms the milieu from which all phenomena can appear as meaningful to human beings, within which ‘things’ are given to us in space and time. This underdetermined world-horizonal context forms both the limits and ground of human experience. It shifts and opens onto other horizons through the activities of those within the world-horizon, surpassing to greater horizons according to spatial and temporal distance. Despite being embedded within this context, the horizons of meaning that intersect to constitute the world remain posterior to objective awareness; however, human beings draw upon or ‘thematize’ commonly-shared horizons of meaning to understand phenomena, attribute meaning to experience, or partake in social action (Habermas, 2004, 2006; Schütz, 1967, 1973). Following Merleau-Ponty, the human encounter with the world involves a synergy of sensuous perception through the body (the ‘flesh’ of the world) with the horizons of language, history, society and culture (Arnason, 1993; Merleau-Ponty, 1962, 1968, 2004). World-horizons form the web of meanings held in common across a socio-cultural group or society, producing imagined modes of coexistence and togetherness, sociality, and solidarity. Yet these horizons of the world
are neither definitive nor fixed, but rather “always open to further progress” and differentiated in their plurality (Arnason, 1993: 95; Merleau-Ponty, 1962). Indeed the open character of the world-horizon attributes human beings a ‘world-making’ capacity: humans are capable of “making and remaking their universe” (Karagiannis and Wagner, 2007), where culture in particular is considered a mode for the continual articulation of the world-horizon, manifested differently across civilizational contexts (Arnason, 1989, 1992, 1996, 2003).

By utilizing the problematic of the world-horizon from phenomenology to hermeneutically reconstruct Arendt’s political project, this paper argues that political activity in public space is a form of collective encounter with the world. Arendt’s vision of public space is not merely the institutionalized, concrete materialization of the polis. Rather, as Arendt writes, “wherever people come together [in political action], the world thrusts itself between them, and it is in this in-between [public] space that all human affairs are conducted” (2007a: 106). Political action then is “the one activity that constitutes… the public part of the world common to us all” (Arendt, 1998: 198). The worldly clearing (‘Lichtung’) that opens between people in political action ‘is' public space, precisely as the world is what is ‘public’ qua common to all (Arendt, 1998). Political action not only manifests public space, as an opening onto the world, but discloses the world as a common view of reality as ‘doxa’, a “comprehension of the world 'as it opens itself to me'” (Arendt, 2007b: 14). This same world “opens up to everyone”, but opens differently for every person “according to [their] position in it” (Arendt, 2007b: 14); this unique horizonal view of the world is disclosed in public space, which intersects with all others to converge into a meta world-horizon, that constitutes ‘reality’ as understood by the public (Arendt, 1998, 2006, 2007a).

It is out of this public space, revealed by political action, that humans can collectively articulate the world, out of which politics arises. Therefore the findings presented in this paper shift not only current understandings of the Arendtian theory of public space and political activity, but also extend to post-phenomenological debates vis-à-vis human encounters with the world, furthering Klaus Held’s emerging project of political phenomenology (1996, 1999, 2012).

Re-imagining sociology after the public university
John HOLMWOOD (University of Nottingham, United Kingdom) | john.holmwood@nottingham.ac.uk

The paper addresses the rise of the public university and its association with a 'citizenship complex' that reconciles, market, bureaucracy and associationalism through an expanded conception of social rights(Parsons; Lockwood). On this understanding, sociology has a particular affinity with an egalitarian societal community and, therefore, the Parsonian emphasis on 'professionalism' has more in common with Burawoy's 'public sociology' oriented to civil society than might otherwise be seen to be the case. A problem arises for each position when we recognize that the university is increasingly marketised and reduced to private rather than public interests as part of a general attack on social rights (especially in the US and UK). How might this attack on social rights be understood and its implications for the university as a site of knowledge and public reason? How might sociology respond to the challenge?

Democratic Imaginaries and a Sociology of Constitutionalism
Paul BLOKKER (Charles University, Prague, Czech Republic) | paulus.blokker@fsv.cuni.cz

Democratic societies and modern constitutionalism are widely understood as intrinsically related, even if also as in clear tension. One widespread way of dealing with this tension is by understanding the relation between democracy and constitutionalism as the latter providing the prerequisites for the functioning and stability of the former. One meta-dimension of constitutions is understood as providing order and stability for society, hence relating to one of the key
questions in sociology and sociological theory. In the contemporary debate on the relation between constitutionalism and democracy, sociological theory has not, however, been at the forefront. The paper argues that this is unfortunate, as a social-theoretical approach has much to offer and can build on important social-theoretical traditions (e.g., the work of Arendt, Castoriadis, and Lefort). A sociological approach to constitutionalism seems also timely in the light of increasing signs of social and political critique on existing constitutional arrangements in democratic societies. The paper briefly discusses, first, the wider normative debate on democracy and constitutionalism. Second, the paper will explore a sociology of constitutions as well as some sociological dimensions of constitutions. Third, the paper will engage with the relation between modern political imaginaries and constitutionalism. And, fourth, the paper will briefly discuss some empirical relevance of a theoretically informed constitutional sociology in the light of social critique, as articulated by inter alia social movements, on modern constitutionalism.

One among the Others. The visibility of difference and the right of indifference in public space.
Valerio D'ANGELO (Universidad Autonoma de Madrid, Spain) | valeriodangelo@ymail.com

In this paper I will show, from a theoretical perspective, the inherent paradox of liberal multiculturalism in its notion of respect of differences and tolerance of diversity. More closely, I will explain how those values actually produce discrimination in daily face-to-face interaction in public space. The lecture is divided in two parts.

In the first part I will stress the turn, in ours multicultural societies, from a biologically rooted racism to the politically correct cultural racism (Kuper). Not so differently from the former, culturalism (Znianiechi) still encapsulates individuals (often in spite of their will) in a specific ethnic group which is supposed to completely determine their both private and public behavior. By actively promoting the recognition of differences (ethnic food, music, rituals, etc.), multicultural politics actually overexpose these individuals. So, the difference is respected as far as it can be clearly visualized and exposed.

In the second part, I claim that cultural differences shape a very different public space for minorities, who actually lose their right to what Goffman called civic indifference, which is the right to go unnoticed and be anonymous. Differences are indeed imprisoned in a fixed meaning imposed by “their” cultural belonging, so that individuals are not free of playing the fundamental social game of appearance and mask which guarantee daily symbolic face-to-face interaction.

I conclude by claiming the need for an undifferentiated public space, where interactions between strangers be free from pre-defined and ordered signifier as it is cultural identity.

RN29S17 - Critical Social Theory

From Constructivism Towards an Action-based Critical Social Theory
Kürşad ERTUĞRUL (Middle East Technical University, Turkey) | ertugrul@metu.edu.tr

Three distinct variants of constructivism can be identified in contemporary social theory; conventional, critical neo-Gramscian and Foucauldian poststructuralist constructivisms. All versions adopt a structure/agency model in that structure constitutes the agents. While the former two share a structuralist ontology, the latter implies a structural closure upon agency. Therefore, the theoretical affirmation of constructivism about the processual, emergent and contingent character of social reality remains unfounded as it is unclear how and why a
structure changes. On the basis of a critical review of conventional and critical constructivism I aim to move from Foucauldian theory towards an action-based social theory. In this move I benefit from the double sense of action in Foucauldian theory as acts of power and as critical acts seeking autonomy. The concepts of action, freedom and intersubjective everyday life in the works of Lefebvre, Arendt and Foucault inform my criticism of the ontology of constructivism. The departure point for an action-based critical theory, it is argued, is not to take structure and agency ontologically and define the various forms of them as effects of the opposition between the two forms of action. Therefore a conceptual shift is suggested: from Foucault's action upon action to action against action.

In the sense of freedom which is common to Lefebvre, Foucault and Arendt looms a glimpse of an action-based critical perspective to historical and social processes of the construction of both structure and agency. In a nutshell, it can be represented as action against action. A prevalent social reality is always already a historical process and an emergent structure in construction in terms of the tension and opposition between the two fundamentally different forms of action. The first form of action seeks to limit the possibilities of behaviors, relations and choices in the arena of inter-subjectivity to integrate and bind them through and in an intelligible construct of normative-discursive system. In the second form, action challenges the closure of the terrain of possibilities and look beyond them in and for freedom. The latter form of action is what transforms the agents of the structure towards new possibilities of construction of agency as this involves both a self-confrontation and an attempt of crossing-over of what appears as “the real” or structure. At a certain moment, both the structure and forms of agency are contingent effects, or consequences one may say, of this dynamic of action against action.

**The aesthetics of disrespect**

Benno HERZOG (University of Valencia, Spain) | benno.herzog@uv.es

For recognition theory, social suffering is the driving force for normative social development. The underlying idea is that suffering from disrespect can emphatically be understood by others and therefore initiate a process of mutual recognition. However, there are many socially produced obstacles that seem to impede the perception as well as the articulation of the suffering of others. These obstacles could be ideologies, impersonal bureaucratic structures or social inequalities.

In my presentation I want to show how aesthetic products can be used to overcome processes of social silencing. Aesthetic products can be intersubjectively understood and do not require high linguistic capital. They can therefore help to overcome some of the problems of discursive understanding.

In my presentation I will first of all point out the problems in Axel Honneth’s theory of recognition, especially with regard to the obstacles of empathic understanding of social suffering and to the articulation of feelings of disrespect. I will then describe how aesthetical products could be used to understand social problems. Here I will also discuss the tension between the analyses of fictional content for understanding social realities. And finally, some examples from different aesthetic productions such as movies, comic, paintings or literature will be given in order to show how such an approach could work in practice.

When critical social theory wants to overcome the multiple pitfalls in which individuals are trapped in the normative interpretation of everyday life situations, it is well-advised to explore alternative forms of approaching social realities.

**The problem of humanity in the sociology of Luc Boltanski**

Daniel CHERNILO (Loughborough University, United Kingdom) | d.chernilo@lboro.ac.uk
An empirical sociologist as much as a social theorist, Luc Boltanski’s works explicitly give shape to a general principle of humanity that in his view is needed in order to make sense of modern societies. In so doing, Boltanski explicitly brings together arguments from moral philosophy, social theory and empirical social research. His more recent work on engendering and abortion, moreover, openly addresses the limitations of various epistemological and normative positions when confronted with the issue of how new human beings become members of collectivities in the social world. In this paper I delineate the main elements of Boltanski’s principle of humanity and then bring it to task on two grounds. First, I take seriously his own suggestion that this research on abortion challenges some core arguments of his earlier work ‘On Justification’ with Laurent Thévenot. Secondly, I unpack some of the uncomfortable presuppositions and implications of Boltanski’s argument: his somewhat naïve faith in neutral character of scientific observations and the troubling suggestion that, while legal, abortion can never be truly justified normatively. Ultimately, this assessment of Boltanski’s work belongs to my wider research programme that coheres on the idea of philosophical sociology: how different normative orientations in contemporary society depend on mostly implicit conceptions on the humanity of human beings.

Weaponised Theory: Cognitive Mapping and Marxist Critique
Colin CREMIN (University of Auckland, New Zealand) | c.cremin@auckland.ac.nz

Fredric Jameson argues that the ‘incapacity to map socially is as crippling to political experience as the analogous incapacity to map spatially is for urban experience.’ Cognitive mapping, he claims, is integral to a ‘socialist political project.’ The presentation underlines the importance of this cognitive mapping in the context of the current political and economic crisis. It stresses the role of critical theory in mapping the material, ideological and libidinal dimensions of current socio-economic and subjective configurations and the problems they pose for a socialist political project. Drawing on my previous work on commodification and apocalyptic capitalism, I argue for the idea of theory as both a tool of critical analysis and weapon for the emancipation of subject and society from the commodity form. The paper concludes by problematising the relationship between sociological theory and critique of political economy.

Critique: only from center to periphery?
Stefan KLEIN (Universidade de Brasilia (UnB), Brazil) | sfkstefk@yahoo.com

The hereby proposed paper intends to address the problem of critique under contemporary circumstances and stems from an ongoing research about the reception of critical theory of society (also known as “Frankfurt school”) in Brazil. At this moment I would like to propose a dialogue between a “transversalist” social science approach and the concept of critique how it was brought forward by critical theory from the 1930s to the 1960s and found some twist and turns in a peripheral context. I aim at advancing a hypothesis that there are indicators in Brazilian intellectualty – from different disciplines – that may help to explain the relative success and importance critical theory was able to develop. Stressing the argument a little, one could almost argue in favor of a kind of “elective affinity” between a peripheral constitution and certain ways of thinking, what should be briefly illustrated citing the reasoning of two examples, Celso Furtado and Walter Benjamin, as empirical-textual-theoretical cases that might allow to establish certain links.

The differences and specificities here lie in the fact that I contrast a Brazilian social theorist and economist, Furtado, who delineated a “theory of underdevelopment” based on the peripheral and subordinate condition Brazil occupied, debating what he called the “dialectic of
development”, with Benjamin's view upheld in his discussion on the thesis on history, allowing us to focus the asymmetries and conditions of possibility of modern and contemporary critique.

RN29S18 - Social Inconsistencies and Paradoxies of Sociological Thinking

Different forms of contradictions, and how spokespersons can deal with them

Agoston FABER (ELTE (Hungary), EHESS (France), Hungary) | agostonfaber@gmail.com

Departing from regularity of contradictions in clinical as well as extra-clinical contexts, our aim here will be to circumscribe those amongst them that are particularly typical of spokespersons on duty.

From an analytical point of view, two types – namely permissive and constraining – and three different – however in reality most often intertwining – layers of contradictions - namely: sociological-structural, phenomenological and hermeneutical-ontological - will be analysed.

Generally speaking, contradictions are part and parcel of our modern lifeworld. Literature in psychology is abundant in this matter. Eric Berne (1964) for instance puts an emphasis on cases where messages consist of two distinct and conflicting layers. In fact, the layer directly accessible for observation differs radically from the substantial message requiring the observer's interpretation: this is the case when through ‘repulsive behaviour’, i.e. sulking, crying or angry outbursts, the child tries to trigger attention, compassion or consolation from the parent.

A phenomenon similar to this one is apprehended in Goffman’s (1972) term of role distancing. Dramatic role performance is often overplayed by children or adolescents when put in situations where discrepancy between their personal skills and those demanded from them by the situation is apparent. Referring to one of Goffman's most famous examples, this is the case for instance when we observe young children of different age-groups riding a whirling carousel (merry-go-round). On a descriptive level, bigger kids’ body language seems to reflect joy triggered by the ride, while on an interpretative level, the substantial message is just the very opposite of this: their generally joyful behaviour, their nonchalant attitude and their overplaying is not more than a pure manifestation of a role distancing effort.

A third important example, derives from the so-called double-bind theory developed in the 1950's by Gregory Bateson and his colleagues in relation to schizophrenia. Double bind theory circumscribes veritable trap situations where all choices necessarily (and tragically) have negative outcomes. The thorough analysis of a mother and child interaction shows that the latter gets easily confused when facing contradictory expectations and/or commands from the mother. In the case depicted in the study (Bateson 1956), the mother being unable to show sincere love towards her child feels compelled to simulate it. However, through his sensitive “receptors”, the child effectively unveils the pretended character of the mother’s behaviour and finds himself in a trap situation: neither neglecting the delusion and seeking thus refuge in self-deception nor trying to face the fact that his mother doesn’t really love him could give him comfort. In addition, the mother tends to keep on playing her delusive game: when the child seeks intimacy, she turns away from him, but when, in turn, he also turns away from her, she punishes him for doing so. As we can see, this game of constant tightening and loosening of intimate ties is almost inescapable and impossible to be dealt with by “victims” on the long run.

The same trap is usually set for immigrants (most often of visible minority). Adaptation and differentiation are in fact two sides of the same coin: be too adaptive and yearn for recognition or, by the same token, be autonomous and stick to your initial cultural background, both will give you the opportunity to be despised. Paradoxically, the question “Why are you so eager to
“assimilate?” differs little or none from “Why do you refuse to assimilate?”, since both are in fact more or less concealed forms of a social judgement or a call to order that help dominant groups maintain the global status quo and hence preserve their all-together dominant position within the web of power relations.

Since contradiction’s coercive force here is entangled in power relations, it could only be resolved through the dissolution of these very relations.

We will also bring up cases where contradiction stems from the fact that the “cure” itself meant to help avoid a negative outcome ironically acts if favour of its realisation. Premarital agreement could be mentioned here as a typical example. Although it is initially aimed at prearranging a conflict that may occur in case of a regrettable divorce, it anticipates divorce by itself by unavoidably creating an atmosphere of mistrust. While on a purely formal and intellectual level, a premarital agreement should be considered as a rational measure to prevent conflict between the two parties, on an informal and emotional level, it necessarily facilitates an outcome that was initially considered as undesirable.

Departing from general insights regarding situations impregnated with contradiction, specific types of contradictions will be discussed in relation to the spokesperson’s duty: three different layers will be analysed here.

The difficulty of coping with respectively sociological-structural, phenomenological and hermeneutical-ontological contradictions tend to put spokespersons into an extremely fragile situation in which they have to constantly face – and in some particular cases, are publicly urged to reflect upon – the precariousness of their existence. Unnatural posture, neutral voice, disciplined gestures, emotionless self-expression, measured sentences, repetitiveness, redundancy etc. and an altogether robotic manner are typical of the way this task is managed. The tragedy of the spokesperson’s duty resides in the fact that while in their case, some contradictions can be transcended, avoided or eradicated, others remain insoluble and thus force them to constantly balance on the thin tightrope between bodily and institutional existence, or, more radically put, between existence and non-existence. The double – not to say: schizophrenic – nature of a spokesperson’s existence will be analysed with recourse to some examples and theoretical apparatus offered by Emile Durkheim (2005), Ernst Kantorowitz (1997), Bruno Latour (1993) Pierre Bourdieu (2001) and Luc Boltanski (2009).

The Inconsistency of Sociology in the Age of Contingency. Some Aspects
Panagiota GEORGOPoulos (Panteion University, Athens Greece, Greece) | pangeorgop@gmail.com
While contemporary sociologists strongly suggest that contingency and discontinuity are fundamental dimensions of (post) modern social reality, sociological theoretical work about contingency and chance is relatively poor and the contingent processes are intractable. First, the presence of contingency is vaguely defined, treated as a tacit recognition or as general condition of the social. Secondly, the vast majority of sociological work and practice doesn't integrate its role as substantive variable of sociological explanations or interpretations. Within this context, the multiple paths, possibilities and unexpected shifts of development of social processes disappear -are out of the picture. Contingency is masked within coherent interpretations. There is always an ultimate reason such as power relationships, capitalism, class struggles, ideology, discourses, language games, the unconscious or gender.

In this respect, there is a significant inconsistency between the acceptance of sociology regarding contingency and the types of explanation or interpretation involved that undermines, in the end, the rationality of sociology and its critical force. Instead of dealing with increasing complexity and contingency of the social world, the critical thinking of sociology provides a kind of irrational behaviour by giving intelligibility and coherence where they do not exist. Robert Trivers defines this cognitive behaviour as self-deception and interestingly concludes that “the more social a discipline (in the sense that its subject of study is more complex, indeterminate and uncertain) the more its development is retarded by self-deception”.

‘… to comprehend the incomprehensible’: On the philosophical actuality of sociology in Theodor Adorno
Rodrigo CORDERO (Universidad Diego Portales, Chile) | rodrigo.cordero@udp.cl

The aim of this paper is to reassess Adorno’s enduring defense of the philosophical actuality of sociology as a challenge to the anti-speculative taboo that fosters new sociological agendas. To this end, the paper draws upon arguments he puts forward in two short essays titled ‘Society’ (1953 and 1963). In particular, I shall examine Adorno’s fundamental yet elusive claim that the task of sociology is ‘to comprehend the incomprehensible’ in social life, that is, ‘the advance of human beings into the inhuman’. The actuality of this task, I contend, supposes reconstructing sociology’s relation to philosophy in a twofold manner. Epistemologically, it means that sociology requires rescuing the speculative moment of thinking in order to capture the increasingly abstract forms of social relations in advanced capitalist societies. Normatively, to come to terms with the ‘incomprehensible’ means to address the contradictory movement of the concept of society itself in order to give voice to human suffering and disclose the conditions that deform human experience. The paper concludes by outlining Adorno’s particular form of philosophical sociology, namely, a kind of inquiry centered on analysis and critique of conceptual forms as real sociological abstractions.

Sociologists in a Hermeneutical Circle
Martin ĎURĎOVIČ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | martin.durdovic@soc.cas.cz

In the late seventies and eighties, hermeneutics was viewed as an epistemologically and methodologically promising enrichment of sociological theory. This can be traced back to the works of authors such as J. Habermas, A. Giddens or Z. Bauman. Hermeneutics also offered concepts for the revitalisation of phenomenological sociology; one of the most important of them was the concept of the hermeneutical circle (pre-understanding).

In my paper, I will apply the concept of the hermeneutical circle to the central sociological problem of understanding of social action and will pursue the question of how sociological concepts relate to the meanings ascribed to social action by actors themselves. The classic
solutions to this problem can be found in the theories of M. Weber, A. Schütz or P. Winch. However, I will argue that these solutions don’t address the question of the pre-understanding of sociological knowledge in a convincing manner. My theoretical proposal will be based on the hermeneutics of H.-G. Gadamer and his notion of the ‘fusion of horizons’. I will argue that the sociological understanding of social action emerges as a pervasion of the sociologist’s and the social actor’s horizon and that it is impossible to exactly distinguish the share of authorship of one or the other. But it is no less important that sociologists themselves work in different horizons, which has epistemological implications. The first such implication speaks in favour of methodological pluralism in sociology. The second one concerns the role of intersubjective sociological rationality in arriving at true knowledge.

RN29S19 - Social Theory and Cultural Sociology

The notion of Culture in the contemporary societies
Massimiliano RUZZEDDU (Unicusano, Italy) | mruzzed@hotmail.com

In the sociological theory, the notion of Culture has so far been an instrument to assess how values and representations affect social actions. Though, nowadays, the relationship Culture-actors is more complex; in fact, this is not just a scientific tool for sociologists: it is so widespread in the society, that each individual uses this world in the every-day-life, especially to provide with sense phenomena of migration and multiethnicity. The point of my paper is that individuals can have different ideas of what a “Culture” is and it is possible to compare each individual idea to the main theoretical approaches that sociological theory provides. For example, an individual can interpret the differences that emerge between Western and Islamic Cultures about the relationships of secularism and religion, or as the outcome of either autonomous process of cultural evolution (structuralist approach) or the combination of a range of social and economical facts (historical approach) or even the result of conscious individual actions (methodological individualism) etc. Generally speaking, each idea of Culture implies, for the related social actors, given self-representations and attitudes towards reality; consequently, a better sociological knowledge is possible if, besides the traditional approaches about culture/society relationship, the observer considers also the individual ideas of Culture. In this paper I will hermeneutically tackle the most common ideas of Culture in order to provide reliable interpretations of a given range of social actions, especially in the domains of migration and multiethnicity.

Event production, interpretive communities and museum representation
Gábor OLÁH (Masaryk University, Czech Republic) | olah@fss.muni.cz

According to Sidney Tarrow we are witnessing an “eventful turn” in social sciences. Marshall Sahlins and William Sewell Jr. in their works related to events are developing a category of analysis from events. In their understanding an event must come with a rupture, with structural transformation. Adam Moore finds this understanding of events too rigid because of exclusion of change and stability. Moore focuses to the social reproduction and asks what makes events socially significant without transformation. Paul Ricoeur points to the correlative relation of narration and events. And finally Jeffrey Alexander in his exploration of cultural pragmatics of a social performance stresses the fusion between the audience and the actors. An event
becomes an event thanks to the story that tells about it. First it must recognize it as event and distribute it socially and culturally.

In my presentation I would like to show on the example of the House of Terror Museum in Budapest the case how a representation of the past can through aestheticisation and mythologization become a socially significant event and public representation. An event can become part of structures through meanings and preunderstanding thanks to cultural autonomy. An interpretive community can build up a change of structure by using cultural autonomy as a strategy. An introduction of a new event acts as a deviation from the structure but through means of symbolic production this event absorbed and immobilized by the reproductive pressure of the structures.

Social Theory, Cultural Sociology and the Concept of Failed Modernity
Mikhail MASLOVSKII (Sociological Institute of Russian Academy of Sciences, Russian Federation) | maslovski@mail.ru

The multiple modernities perspective emerged within civilizational analysis in historical sociology as a part of the cultural turn in social sciences. The relationship between the multiple modernities approach and other aspects of the cultural turn, particularly Jeffrey Alexander's cultural sociology, can be discussed. Thus Johann Arnason argues that civilizational analysis represents one more version of the strong programme in cultural sociology. At the same time there exist important differences between Alexander's school of cultural sociology and the multiple modernities approach. Alexander's neo-modernization perspective focuses on economic and political liberalization and the enlargement of the civil sphere. On the other hand, the multiple modernities theory allows for the possibility of radical reversal of these trends. The concept of failed modernity has been elaborated by Eisenstadt and Arnason. The prime example of such failure could be seen in Soviet-type societies. But it can be argued that the post-communist dynamics of Russian society demonstrate some traits of another version of failed modernity. The paper considers the relevance of that concept for Russia's modernising trajectory and also relates it to the discussion of 'abortive modernization' in recent Russian sociology.

Conflict Theory and Cultural Differences in Contemporary Society
Andrzej SŁABON (Cracow University of Economics, Poland) | slabon@wp.pl

Relation between social theory and cultural sociology in Jeffrey Alexander version I would like to consider on an example differences in sphere customs and morals. An analysis of changes in morality is essentially an attempt to describe transformation in the sphere of values. In this context I will intend points to the co-existence of formalising and informalising tendencies, both in the models of behaviour, and forms of social control. Research on changes in morality usually focuses exclusively on informalising tendencies. It is important to shows that informalisation in some areas is usually accompanied by formalisation in others.

The differences in sphere custom and morals are frequently sources of social conflict. Theory of social conflict have to take into account therefore that conflicts are mainly cultural conflicts. Conflicts over values, symbols, and meanings play successive more important role. Hence Ralf Dahrendorf opposition between integrative and coercion theories in social sciences became less useful nowadays. An illustration of such kind of conflict are so called "cultural wars". I will present in paper main types of differences in cultural area contemporary societies. Conflict over values have been treated here as the effect of different micro-strategies for creating a sense of understanding. This point of view leads to new opportunities to regulate and resolve these type of cultural conflicts.
RN29S20 - Time, Social Dynamics and Evolution

Rethinking Social Evolution Systemically
Andrea PITASI (Gabriele d'Annunzio University, Italy) | profpitasi@gmail.com

Starting from an interdisciplinary perspective this essay is focused on the analysis regarding how the megatrends of demography, technological convergence and world order redesign are shaping a dematerialized global scenario in which a key bifurcation is emerging: on one side the Malthus Trap on the other on the Gegnet, the limitless opening of the possible. The abstraction level of the big data turn into meaningless each local based empirical research that is why the key epistemological challenge of this essay is to evolve the systemic paradigm comprehend big data and the methodological challenge is to draft a deductive nevertheless big data based, theorem of global.

The three micro-dynamics of sociocultural life : a hypothesis for bridge building in social theory
Stephen SHIRLAW (Independent, France) | stephen.shirlaw@gmail.com

A two-step approach to social theory is proposed. First, a convergent description of the sociocultural space is developed. Second, an explanatory gap is identified at the level of the microfoundations for which a three micro-dynamics hypothesis is formulated. The first step convergent framework starts with Mouzelis’s (2008) proposal of an open, bridge building and dimensional framework. This proposal is consolidated using the diverse works of Joas (2004), Desjeux (2005), Elder and Giele (2009), Lahire (2012), and HC White (2008). In addition the work of Archer is integrated using concepts of the meta-self (Mohr and White 2008) or of the meta-reflexive self (Donati 2013). The convergent result is a description of a sociocultural space as constituted by the separate dimensions of the Process/transactional, the Ties/networks and the Intra/inter-Institutional. The second step of the work uses the convergent framework to enable a clear focus on the micro-foundations at a level between the sociocultural space and the cognitive. Here, a new hypothesis is formulated, using research on events and unpredictability (Grossetti 2004, Sewell Jnr 2005) and Sutter’s (1997) three types of events, suggesting that the micro-foundations need to be considered as three types of dynamics: the Dispositional/habitual; the Relational/unpredictable; and the Trajectory/irreversible. Then it is suggested how together, the dimensional sociocultural space and the foundational microdynamics, can be used as an ontology for observing changing social formations. In conclusion, the hypothesis then acts as a bridge building approach, both between different human science disciplines, and between the different traditions of modern and postmodern social theory.

Social dynamics, public sociology, neuroscience and emotions
Mimar RAMIS (Autonomous University of Barcelona) | mariadelmar.ramis@uab.cat
Mar JOANPERE (University of Barcelona, Spain) | mar.joanpere@gmail.com
Ramon FLECHA (University of Barcelona, Spain) | ramon.flecha@ub.edu

In the need to find answers to the constitutive forces of common social relations, most relevant neuroscientists of our time recognise the relevant social dimension of the brain and the genes. Eric Kandel, Nobel Prize laureate and main author in this field wrote: “Even though I had long
been taught that the genes of the brain are the governors of behaviour ... genes also are servants of the environment”. They are willing to collaborate with social theory scholars in an interdisciplinary work that can contribute to improve both, neuroscience and social theory. Authors in social theory have contributed in the study of emotions that have opened new paths, clarifying the complementarity between neurophysiology and social theories for the study of the mind. Among others, Jon Elster (in Alchemies of the Mind. Rationality and the Emotions) analyses social dynamics in this perspective, for instance with his concept of molecular interpersonal mechanisms. Framed within this work, this paper presents a theoretical study about how our field contributes to neuroscience in the clarification of what the social environment (influencing genes) is, mainly through the sociological theories focused on interactions. Elster’s contributions to deliberative democracy are on this path, showing that dialogue transforms preferences, including emotions, which are a key piece in the theorisation of the objective-subjective structure of the constitution of the social world.

Future Imaginaries in Moments of Crisis
Natàlia CANTÓ MILÀ (Open University of Catalonia, Spain) | ncantom@uoc.edu
Swen SEEBACH (University Abat Oliba CEU, Spain) | swen.seebach@gmail.com

This paper underlines the role of the future (our projections and imaginations – individual and collective) as a fundamental part of what holds modern society together. However, this fundamental part (our imaginaries and projections of the future) has become shaken in the context of an on-holding crisis that is not only an economic but a social, moral and political crisis. It is our hypothesis that in the context of the current crisis autobiographical narrations are structured and told differently. Whilst one pictures one’s life increasingly as uncontrollable and insecure, the variety of different others start to appear as figures of constraint and control. Negative emotions such as fear and anxiety (status and existence anxiety) become significant, even predominant, in these narrations. Consequently, collective experiences are increasingly shaped by such emotions and sensations. We believe that these profound transformations of biographical narratives have not only to do with the crisis but with a widely shared sensation that one hardly forms part of society, that one is almost at its margins. In Simmel’s terms we could say that a growing number of individuals does not believe in the existence of a special place for them, a place that interrelates them truly with all other members of society. If this hypothesis were to be true, then our society may have to deal with all kinds of emotion-based resentments, and with possible upheavals that seek to negotiate who is ‘us’ and who is ‘the others’, with all the consequences that such a confrontational mode of seeking for one’s place in society may entail. 20 biographical narratives from 2014 will be compared with findings from 2005.
Youth and job search process: understanding the role played by Social capital in Catalonia.
Mattia VACCHIANO (Universitat Autonoma de Barcelona, Spain) | mattia.vacchiano@uab.cat

This paper is part of a research project financed by the Spanish Ministry of Science and Innovation through grant CSO2012-36055 “Las redes sociales en sus diferentes modalidades como mecanismo de búsqueda e inserción laboral en el empleo y de apoyo social en los jóvenes” conducted by the Centre d’Estudis Sociològics sobre la Vida Quotidiana i el Treball – Universitat Autònoma de Barcelona – and directed by Prof. Carlos Lozares Colina.

The main objective of this paper is to describe differences in the mobilization of different types of contacts during the job search process and labor insertion, among Spanish young adults.

Three aspects of contacts are implicated: the strength of the relationship between the job seeker and the contact, the contact’s position in the network and the similarity in terms of education and professional category between the job seeker and the contact.

From the capital theoretic perspective, we may make the initial proposition that inequality in different types of capital, such as economic and cultural capital, brings to an unequal distribution of social capital across social groups in a population, due the homophily principle.

Therefore, we try to understand how agency is salient in the process of mobilizing social capital. Different class background brings to different types of goals along the job search process, driving us to consider differences in a strategic or pragmatic use of contacts.

We analyzed three groups of young Spanish adults, with different economic and cultural capital, in order to narrate dissimilar use of contacts along the job insertion.

Getting on or getting by? Young peoples everydaylife strategies at the margins of society
Mette PLESS (The Danish Centre for Youth Research, Aalborg University, Denmark) | mep@learning.aau.dk
Noemi KATZNELSON (The Danish Centre for Youth Research, Aalborg University, Denmark) | nka@learning.aau.dk

The financial crisis has hit hard across Europe. Especially young people at the margins of the educational system and the labor market seem to be particularly vulnerable to these (and wider) social changes. Alongside economic crisis we are witnessing other profound social changes. Pedersen (2012) points to a shift from welfare state to competition state. This development entails an increased focus on employability and competition, and education is in Denmark highlighted as the answer to global completion and to social problems of exclusion. The latest social policy-reforms thus marks a significant shift in focus from unemployment to ‘educational readiness’ (kontanthjælpsreform 2014).

This paper draws on a qualitative study amongst Danish young people at the very margins of society. In addition to dealing with unemployment and low levels of education, these young people are often struggling with a number of structural, social and personal difficulties (eg. homelessness, druguse, mental health problems, lack of family and other networks etc).

Statistics show that this group is increasing (Andersen 2012, Benjaminsen & Lauritzen 2013).
We have substantial knowledge about specific issues related to social disadvantage. But we know less about the complex interplay between such issues, which these young people are often forced to deal with in their everyday lives. In the paper we focus on the different strategies these young people apply in their everyday lives and in regards to future hopes and dreams. Furthermore, we ask which role social and structural changes play in regards to processes of social inclusion/exclusion.

**Household capitals and life-strategies of youth in Croatia: the results of a 2015 survey**

Ivan PUZEK (University of Zadar, Croatia) | ipuzek@unizd.hr
Augustin DERADO (Institute of Social Sciences Ivo Pilar, Croatia) | augustin.derado@gmail.com

This paper presents the preliminary results of a nationally representative survey exploring the connections of household capitals, educational capitals and career life-paths of youth in Croatia. The data have been obtained as part of a wider questionnaire designed to survey life-strategies and survival strategies of individuals and households in South East European countries. Taking into account the ‘prolonged adulthood’ framework, in data analysis we have focused on the young people between 15 and 35 years of age. In our interpretation, the results of the quantitative survey have been complemented by various qualitative insights on the life-strategies of youth in Croatia.

The analysis of the obtained data reveals that, as could be expected in a country with the third highest unemployment rate in the EU, many among the youth in the (post) transitional Croatia experience hindered individualisation due to prolonged dependence on the accumulated capitals of the parental generation. It is in this context that we analyze how household economic, cultural and social capitals act as distinctive factors in struggling with existential insecurities. It is concluded that high levels of insecurity and precarisation can both hinder rational anticipation and capacity to plan the future, steering not only youth but also household strategies to predominant presentism and the lack of strategic reasoning, and on the other hand stimulate the usage and conversion of the household and individual capitals in new and creative ways.

**Convenience as a motive in troubled youth transitions**

Tabea SCHLIMBACH (German Youth Institute, Germany) | schlimbach@dji.de

At the threshold to the labour market young people are confronted with an increasing diversity of educational options and pathways, while consequences of related choices and decisions for the life course become less predictable. Against this background the article discusses the particular aspect of convenience decisions in difficult youth transitions to employment in Germany. It is based on the analysis of 21 cases from a qualitative longitudinal study (three waves) about coping strategies of secondary school-leavers in school-to-work transitions in Germany. The analysis finds that transition accounts are characterised by rival narratives that establish different selective perspectives on events, choices, and experiences. We identify seven main narratives related to the topics of: vocational status, self-actualisation, meaningful activity, convenience, money, leisure, and life problems (Reiter/Schlimbach, 2015, NEET in disguise? Rival narratives in troubled youth transitions. Educational Research). The convenience narrative has been identified as a crucial driver in young people’s reflections and strategies. It emphasises the advantages of reducing effort, stress and anxiety and becomes relevant especially in situations when young people face structural barriers or rejections, and have to realise that efforts do not necessarily pay off. Convenience orientation is characterised by retreating to safe options involving low levels of conflict; it preserves the status quo and is often
mediated through social networks and gatekeepers. The article discusses the ambiguity of this phenomenon and concludes with implications for policy and research.

**Generic distinctiveness: self-promotion and the technologies of individualisation**

Clare HOLDSWORTH (Keele University, United Kingdom) | c.m.holdsworth@keele.ac.uk

The subject of this paper is a contemporary oxymoron: generic distinctiveness. This is the expectation that young people need to make themselves distinctive, to stand out and define themselves differently in order to be noticeable to employers, university admission officers, potential partners, friends etc. It is an oxymoron because distinctiveness is required of (almost) all young people. Yet it is a simple truism that it is not logically possible for all young people to be distinctive. If we all stand out from the crowd, then the crowd does not exist. Yet what is intriguing about generic distinctiveness is the hold that it has on young people’s lives, it might be illogical but it is an increasingly core theme of both educational and employment policies in many industrialised economies. It is easy to dismiss generic distinctiveness as the ultimate expression of neoliberalism, yet I argue in the paper that the requirement for distinction is driven by repositioning of the self, the dissipation of the crowd and the onslaught on generational solidarity. In particular the paper considers how the expression of uniqueness is facilitated by development of technology that enables young people to express their distinctive experiences. From social media, eportfolios, co-curriculum transcripts etc expressions of individual distinction are supported by an expanding network of technologies to promote the self.

**RN30S02 - Youth Research and Youth Work Cooperation**

**Bridging the gap: incentives to establish cooperation between youth workers and youth researchers**

Aurelie Aline MARY (University of Tampere, Finland) | aurelie.mary@uta.fi

On the one hand, youth researchers examine the societal structure and the impacts societal fluctuations bear on the youth. However, they do not investigate such effects on specific individuals at the practical level. On the other hand, youth workers deal with individuals through face-to-face interaction, and are aware of contemporary phenomena touching the youth. However, they do not necessarily have the expertise to interpret and link those issues to wider societal transformations.

Both youth researchers and youth workers work with the same target group – young people, and seek solutions to assist the youth. Nevertheless, a link is missing between the two institutions. They rarely communicate, exchange information or engage in cooperative work. Both are experts in their own sector, as well as a source of knowledge, and could easily collaborate in order to find solutions to support the youth more adequately.

This presentation is based on an on-going empirical project conducted in Finland. It investigates the various perspectives youth workers share on what being young today implies, but also touches upon the standpoint of youth workers towards academic youth research. The study also involves youth researchers and examines their viewpoints on youth, youth work and the dissemination of study results. Four workshops are conducted: two with youth workers from two different Finnish municipalities; one with youth researchers; and one bringing the participants from the three previous workshops together. The study involves about 25 participants.
The aim of this practice-oriented project is twofold: 1) to encourage more communication and future collaboration between youth workers and youth researchers; 2) to consider future possibilities for youth research.

The value of youth work – some conceptual considerations
Marti TARU (Tallinn University, Estonia) | marti@iiss.ee

The presentation focuses on conceptual problems of youth work evaluation. Recognition and value of youth work is amongst most pressing issues on the European youth policy agenda. Currently, this issue is approached from the instrumental viewpoint, seeing youth work as a learning environment to support development of certain skills, defined by European political agenda. Though there some evidence that participants in quality youth work indeed develop certain qualities, there is no link from individual level to societal level variables like unemployment rate or youth organisational participation rate, through which the value of youth work is defined.

Examination of history of youth work and youth work practice shows that in addition to its instrumental value, also other virtues of youth work can be identified. Though socialisation remains amongst core values, there are also other aspects to be taken into account when assessing the value of youth work. A general youth work evaluation model comprised of three dimensions is proposed:

• youth work as a transition zone; this aspect has background in socialising capabilities of youth work.
• youth work as a forum, having background in human and children’s rights, youth participation and modern understandings of governance.
• youth work as a site for pleasant experiences. This aspect grows from the concept of well-being as an intrinsic value, not an instrumental value.

The three dimensions combined leads to a complex understanding of the value of youth work in society. As an empirical example, the case of Estonia is analysed.

Youth Work and Inequality: The Irish Case in European Context
Maurice DEVLIN (Maynooth University, Ireland) | maurice.devlin@nuim.ie

Recent years have seen a greatly enhanced focus on youth work (defined as non-formal education concerned with the personal and social development of young people) on the political and social policy agendas of the major European institutions and of individual countries in Europe. Much of the “official” interest in youth work stems from a concern with social order and stability and an expectation that it can help to alleviate pressing social problems such as, in recent times, youth unemployment. On the other hand, the youth work sector also include social movements with a strong focus on social change and on combating social inequality. There is, however, little empirical research on how these contrasting impulses are reflected in the practice and programmes of youth organisations or the discourse of youth workers. This paper draws on a national study of volunteer-led youth work in Ireland. Based on a documentary analysis of reports and application forms prepared by youth groups (n=1111) seeking state funding for their work, the paper explores the range of terms in which such groups describe their aims and objectives as well as their activities and programmes. In particular it focuses on the extent to which, and the ways in which, various dimensions of inequality (e.g. gender, class, ethnicity, sexuality, disability) feature in this discourse, and whether they do so in terms compatible with, or in tension with, “official policy”. Finally, the paper draws some comparisons between the Irish and broader European contexts relating to youth work and inequality.
Misrecognition in activation in practice – young clients, activation policies and employment offices  
Lotta HAIKKOLA (University of Helsinki, Finland) | lotta.haikkola@helsinki.fi

Activation/workfare has been part of European labor market policies as a result of the neoliberal turn in the 1980s, and targeted especially young people. The current financial crisis has again strengthened the morally loaded concern over young people out of work or without a registered activity (“NEETs”), describing them as passive, lacking motivation and in need of active support in finding education and work. In Finland, youth unemployment is also increasingly linked to a risk of permanent social exclusion. Together these concerns resulted in a perceived need for stronger activation policy, leading to a government flagship project “Youth Guarantee”. It included some new measures in training and employment and promises individualized services, while continuing the work-for-welfare policy definitions, which put young people in precarious positions.

Based on participant observation during client-officer meetings in employment offices, this paper looks at how what happens when Youth Guarantee and activation policy in general are put in practice in the public employment service. Activation produces multiple instances of misrecognition when the organizational/policy goals of activation (avoiding passivity) and personal goals of young people (finding an educational program/getting a paid job) clash during the appointments. During the meeting young people’s identities (unemployed vs. searching for education), motivations (willing to maximize benefits vs. confusion over entitlements) and accomplishments (failing in activation vs. having control over choices) are misrecognized, which leads to confusion over the needs of the client. The meetings are framed with a sense of hurry and lack of control. The policy goal of activation and the embedded idea of marginalization frame service provision, but mask the young clients’ individual needs and interests, contrary to the promise of Youth Guarantee. Activation need to be critically examined on the ground.

Affordances of welfare services for agency of young adults on the margins  
Sanna AALTONEN (Finnish Youth Research Society, Finland) | sanna.altonen@youthresearch.fi  
Päivi BERG (Finnish Youth Research Society, Finland) | paivi.berg@youthresearch.fi

In welfare states the notion and indications of social exclusion of young people are responded with implementing measures that aim to include, rehabilitate and bring young people back on the “right” track. While the main emphasis of service development should be on basic public services and on prevention, the remedial services are a vital part of the service sector. The volume of remedial services begs questions on how they manage to (re)include those considered as excluded or at risk of being excluded and how societal norms and ideal are put into practice in welfare services. These questions form the backdrop of this paper that highlights the perspectives and agency of the 18-29 –year old young clients of welfare services. Young people’s relationship to services is explored employing the concept of affordance that has previously been used particularly in environmental psychology. In this paper our aim is to apply the concept to analysis of data consisting of interviews with young women and men and staff of public services in contexts where young people are clients of social or employment services. We will ask how young people perceive the material or symbolic affordances of welfare services, what is their perception on what the service sector can offer and provide for them in
order to get by in and to get out of complicated life situations. Further, the paper asks, to what extend they are listened to and can exercise their agency to further their aims.

**Conflicting participatory policies in youth services**  
Mirja MÄÄTTÄ (University of Eastern Finland, Finland) | mirja.maatta@uef.fi

There is confusion inherent in participatory policies: public initiatives that embrace the notions of youth participation and partnership coexist with the tendency to intensify control measures for ‘at-risk youth’ (Milbourne, 2009). Ideas about participation rights are easily turned into participation duties justified by societal aims, such as integrating young people to the labor force. Activity of young people is often fed by professional guidance and financial sanctions. Rather than integrating young people to society these stipulations can be experienced as bureaucratic, surveillant or dismissive and end up driving young people in the margins away from official support (Määttä & Aaltonen, forthcoming). This mixture of support and control is dilemmatic in all youth services, but especially in the targeted youth services.

This paper summarises the central findings of a collaborative study aiming to develop ethical ways to support young people at the margins of post-16-education and labor market. The study engaged actors from administration, practice and research; and the recommended measures have been evaluated by young people. Under what conditions the measures are accepted and felt useful by young people? How do the professionals and young people deal with questions of mutual trust and voluntary vs. obligatory activities?

**RN30S03b - The Impact and Role of Youth Policies - B**

**Fighting threat of social exclusion of the young people entering the labour market. The policy responses in Poland.**  
Ewa SLEZAK (Cracow University of Economics, Poland) | slezake@uek.krakow.pl

The unemployment rate amongst young people entering the labour market in Poland is above 20%. It is not low, yet it is not as the highest (43%) reported in 2003. The young people entering the labour market compose a very diversified group. They vary in terms of professional expectations, type and level of education, family situation, age, as well as any contact with the labor market. Comparing various cohorts entering the labour market, the young people nowadays are better educated and equipped with socio-cultural experience. However, similarly to other EU countries they young people are faced with the risk of social exclusion, mainly due to lack of work and scarce prospects for future. Some sub-groups are better off than the rest, e.g. the university graduates. Unfortunately, a higher education diploma is no longer a passport to better life, it does not secure employment.

The state, which takes over a dominant role for the policy related to professional activation of young people, is aware of that situation. It formulates various programmes aiming at supporting the young, in acquiring practical skills and experience. Following the policy analyses the Authoress wishes to analyse some selected programmes (eg. "The Young in the labor market") and evaluate whether they really prevent the young from falling in traps of exclusion, not only of no employment, but also extremely low income, work below qualifications and limited prospects for future.

**The discourse of ‘autonomy’: EU policy and youth transitions**
Valentina CUZZOCREA (Università di Cagliari, Italy) | cuzzocrea@unica.it

This paper departs from the centrality that the concept of autonomy has assumed in EU youth policies. In their heterogeneity, the ultimate goal of such policies can be retraced in eliciting conditions through which young people in a variety of situations (whether university students, or NEETs, or from minority background and so on) are able to tackle with the difficulties they encounter in becoming adults and establish for themselves conditions for autonomy living and independence.

The concept of autonomy is far from missing in youth studies literature; however, here the approach is centred on the markers (concluding education, getting established in the labour market, leaving the family of origin and eventually form a new family and become parents): surely, autonomy is an important element entailed in obtaining all of these, but this notwithstanding is not predominant in the mainstreaming discourse of transitions to adulthood, and notably, differently connotated.

This paper, which methodologically draws on a documentary analysis of major EU youth policy documents, seeks to reconstruct the specificity of the ‘autonomy’ discourse in EU youth policy, highlighting the neo-liberal perspective it endorses, and comparing and contrasting the concept of autonomy with some major highlights in the transitions to adulthood studies. In discussing discrepancies, similarities and inconsistencies, it ultimately seeks to foster dialogue between policies and scholarly work in the field.

A typology of young unemployed peoples’ relationships to ALP’s - the case of Finland
Jaana LÄHTEENMAA (Universityof Helsinki, Finland) | jaana.lahteenmaa@helsinki.fi

A typology of the young unemployed people’s relationships to Activating Labor Market Policy Activating labor market policy, with its measures and sanctions significantly influences the life of young unemployed people in Nordic countries as well as in Austria, the U.K., Germany and in some other European countries. It will have an increasing role, as the EU is has launched “Youth Guarantee” program including a package of these measures to its whole area at the beginning of 2015. Most European Union countries are already preparing its implementation. In countries, in which these kind of “measure-packages” for the young have existed for a while (like Finland), one can observe several kinds of relationships to these measures among the young. They reflect not just young people’s attitudes to (wage-)work and education, but also to the whole society as a system.

This paper presents a typology of these reactions drawing on Finnish empirical data (both quantitative and qualitative). Referring to Robert Merton’s classical typology on aims vs. means of citizens the typology includes 5 different ideal-types of young peoples’ approaches to “means” (ALPs) and “ aims” (getting a working place). The model identifies fundamental strategic options for young unemployed persons in their limited space for agency, as they try to have a decent life in neo-liberal European societies. The model also tells about the EU as a system, which is pushing youth to something that does not exist anymore.

Shaping Europe? – Youth on the move
Carsten YNDIGEGN (University of Southern Denmark, Denmark) | cy@sam.sdu.dk
International student mobility has developed rapidly in the recent decades fostered by European Union mobility programmes and international university exchange agreements. This phenomenon runs parallel with an increase in general global mobility. Thereby, a European elite is emerging, and an expectation is that it will develop European identity and – following Mannheim’s theory of generational change – form the mental basis for changing Europe through collaborative integration.

The aim of the paper is in a case study on the societal micro level to analyse how international students reflect on European identity and their role as youth on the move. The key issue to be addressed is whether the international students form new values and priorities that indicate that a new European generation is in the making.

The paper builds on data from qualitative interview studies that have been conducted among a group of international full degree students in a Danish university, and a group of foreign exchange students at a Swedish university.

The results will be discussed against recent survey based analyses being critical towards an impact of educational mobility on development of European identity.

The paper will put the analysis in perspective by discussing the value clash between Europeanised elite and restorative locals, drawing on Merton’s distinction between locals and cosmopolitans and later contributions by among others Bauman, Favell and Fligstein, as well as the rich literature on emerging populism and EU-scepticism.

Trust, participation and inequality amongst young people across Europe

Gary POLLOCK (Manchester Metropolitan University, United Kingdom) | g.pollock@mmu.ac.uk
Helene SNEE (Manchester Metropolitan University, United Kingdom) | h.snee@mmu.ac.uk
Tom BROCK (Manchester Metropolitan University, United Kingdom) | t.brock@mmu.ac.uk

Measures to promote higher levels of civic engagement, more broadly spread through society, may also help to reduce inequalities and promote higher aggregate levels of wellbeing. Uslaner and Brown (2005) suggest that high levels of trust are more likely to result in political participation and that trust is strongly influenced by economic inequality. Political, societal and civic participation varies significantly across Europe, these variations are apparent amongst young people as evidenced in the MYPLACE project (Pilkington and Pollock 2015). We employ a definition of civic engagement which encompasses, firstly, activities between citizens, such as volunteering as well as between citizens and institutions of the state (Foley and Griffiths 2011). Secondly we broaden this to include notions of trust that people have in relation to others and in relation to the institutions of the state (ONS 2014). Research by Li et al. (2008) found that that the ‘stable service class’ had greater levels of civic engagement than the upwardly mobile. They suggest an association between the formal forms of social capital in terms of civic engagement and the informal networks that can be mobilised for advantage. From this perspective, young people in already privileged positions who possess relatively more informal social capital will also be more civically engaged, and will remain so even if their less privileged peers are able to move further up the occupational ladder to join them. This paper contributes to understandings of how, for young people, inequalities in the broadest sense are associated with notions of trust and levels of participation and how these relationships are manifest in a diverse range of settings across Europe.

Family before School? Impact of Education on Youth Electoral Participation
Ales KUDRNAC (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | ales.kudrnac@soc.cas.cz

Turning out to vote is one of the most common and important political activities citizens undertake in a democracy. There is a large literature that shows a positive relationship between level of educational and electoral participation. Most studies implicitly assume that education somehow causes participation. The question is to what extent school environment directly affects individuals’ attitudes towards political participation? Pursuing this goal, this paper answers the question if the effect of school environment on propensity to vote has its origins in the family. Using data from a unique large survey of 17 to 19 years old high school students (n=1,737) fielded in the Czech Republic in 2012, this paper addresses the relative impact of home and school on reported propensity to vote. Study of this youth voting cohort is strategically important in evaluating the impact of the family and school on citizens close to voting in their first election. This paper shows that the primary contextual determinant of young voters’ decision to vote in elections is the family; and the school environment has only a small independent effect on a young Czech voters’ propensity to vote. This paper suggests that it is not the quality of school itself that make the difference in youth propensity to vote, but rather the peers they meet at school whose characteristics probably originate at home. This research is important because it shows that parents primarily influence their children directly and only indirectly by selecting the school their offspring attend.

RN30S04b - Political Participation - B

Youth, Citizenship and Democracy – Findings from a youth survey in two Nordic regions
Carl Jacob KURKIALA (Åbo Akademi University, Finland) | jkurkial@abo.fi
Pia NYMAN-KURKIALA (Åbo Akademi University, Finland) | pnyman@abo.fi
Jan GRANNÅS (University of Gävle, Sweden) | Jan.Grannas@hig.se
Patrik SÖDERBERG (Åbo Akademi University, Finland) | psoderbe@abo.fi
Joni KYHERÖINEN (Åbo Akademi University, Finland) | jkyhero@abo.fi

There are significant differences between young people regarding political interest and engagement because of different social and economic conditions. Further, an active citizenship may be impeded by a societal development where life conditions deteriorate more for some groups than for others. At the same time, the reluctance among economically marginalized groups to participate in the procedures of democracy remains when the meaning of an active democratic citizenship is perceived as limited. Research shows that there is a need for further research in the field, in particular more qualitative studies to complement the various national and international longitudinal quantitative studies such as IEA: Cived and ICCS.
Every third year in the Nordic countries, a comprehensive longitudinal youth survey is conducted which follows up national youth policy. The target groups for the study are young people aged 13-16. The survey focuses on young people’s views on questions concerning democracy and participation, citizenship, health, enjoyment of school, leisure activities, work, and future plans.

This study focuses on young people’s democratic and civic competence in two Nordic regions: Gävleborg (Sweden) and Ostrobothnia (Finland). Based on the longitudinal youth surveys studying young people’s skills, capacities, and opportunities for active democratic citizenship, in order to further assure the quality of education and youth policy work in the surveyed regions, the research study’s overall objectives are to:

a) Compare youth survey results from two regions in Sweden and Finland as well as make comparisons over time, focusing on the importance of social sustainability, particularly gender, age, and diversity aspects; and b) Deepen understanding of young people’s opportunities, circumstances, and knowledge of active democratic citizenship.

The samples are 2,207 students (14-15 years old) from Sweden and 1,718 students (15-16 years old) from Finland.

One example from the initial analysis is: if the students want to have a say in what they learn in school. They answered 70% (SWE) and 46% (FIN) want it, but only 37% (SWE) and 7% (FIN) answered that they get it. The result is interesting in terms of PISA results, but also for how the pupils enjoy school.

Politics of participation. (De)constructing the understanding of young people's politics?

Andreas HUDELIST (Alpen-Adria-Universität Klagenfurt, Austria) | andreas.hudelist@aau.at
Daniel WUTTI (Alpen-Adria-Universität Klagenfurt, Austria) | daniel.wutti@aau.at

This paper focuses on how memories about WW2 and national socialism are passed on to today’s youth in multilingual Carinthia (Austria) and how these grandchildren of witnesses nowadays influences collective memory.

Memory in Carinthian field is the result of a run for several decades past discourses, which was characterized by highly polarized positions in Carinthia. Several communities of (shared) memory shape the field of remembrance, while boarders of these communities often represent boarders of ethnic or national groups in the region. In classical, as also in contemporary memory discourse, a reference between memory and identity is always given. Certain concepts for collective identities are combined with theories of collective memory to overview this development. Theories of transgenerational transmissions (from grandparents to grandchildren) of psychotrauma widen the topic. An analysis of current memory initiatives shows who were (is) active in Carinthia’s memory field. We will discuss one or two case studies to illustrate the range of youth’s agency.

This paper considers the variety of understandings of the “political” of young people within their ordinary everyday (media) culture. It will provoke binary concepts as “public and private”, “high and low media culture” as well as “active and passive political participation”. We will draw a clear picture of the role of these “remembrance initiatives” in public media, as well as the acceptance of their work by the youth. Our Analyses does not present the debate about young people's disappointment with politics, but tries to portray their political participation in everyday (media) culture.

Is there anything interesting on the other side? Religious and political thoughts in Mexico’s young politicians.

Edgar ZAVALA PELAYO (Freie Universität Berlin, Germany) | ezavalap@zedat.fu-berlin.de
Heterogeneity, diversity, transition, transformation are nouns usually included in descriptions of the youth in Western contemporary societies. The youth in European and North American regions is usually referred to as a complex population aggregate which embodies ideological change almost intrinsically. In terms of the religiosity and/or spirituality of the contemporary youth, concepts like change, as well as rupture, estrangement and individual choice are even more ubiquitous. Is the extent of religious changes/ruptures in Western youth groups similar to the extent of religious changes/ruptures in the young population of non-Western geographies? What can the youth of countries like Mexico tell us about the ruptures and continuities between adults' and younger generations' religiosities and/or spiritualities? More specifically, what can particular groups such as young politicians in Mexico tell us about the degree of change in religious beliefs and practices? Drawing on my research work in progress and findings from semi-structured interviews to rightist, centrist and leftist young politicians in Mexico, I will present preliminary evidence about the ruptures and continuities that these future senior politicians see between their religious beliefs and practices and those from older generations. I will highlight the ruptures and continuities they report as well as the ruptures and continuities that are not necessarily acknowledged yet would seem implicit in some instances of their secular political thoughts. I will present these preliminary findings as a small contribution towards potential comparisons between the European and the Latin American youth and the degree of religious change across these two macro regions.

Croatian youth and populism: the mixed methods analysis of the populism ‘breeding ground’ among the youth in Zagreb

Augustin DERADO (Institute of Social Sciences Ivo Pilar, Croatia) | augustin.derado@gmail.com
Vanja DERGIĆ (Institute of Social Sciences Ivo Pilar, Croatia) | vanja.dergic@gmail.com

Short abstract:
We aim to explore the inclinations of youth in Croatia to populism and to understand their sources. Drawing on the results of the MYPLACE project in Croatia, a research with a combined methodology, we used the data obtained with a social survey undertaken on the sample made of 1216 individuals between 16 and 25 years and a qualitative analysis of 61 in-depth interviews. The relative lack of (radical) populist actors in Croatia compelled us to use a proxy variable for our quantitative demand-side analysis of populism. We choose the variable on the attitude towards political systems with a strong leader who is not constrained by parliament (around 55% of respondents held that political system to be good for Croatia). Regression proved the connection of the anti-elite and anti-systemic attitudes with the preference for a strong leader not constrained by the parliament, as well as a few more right-wing political attitudes. Qualitative analysis searching for analogies to three main core concepts of populism: the good people, the bad elite, and the general will (Mudde, 2004) and two common populist core ideological features – nationalism/nativism and radical egalitarianism, proved that there exists a solid potential ‘breeding ground’ for populism.

Extended (junior scholar grant) abstract:

Extended (junior scholar grant) abstract:
In this paper we aim to explore the inclinations of youth in Croatia to populism and to understand their sources. The contemporary debate on populism could be more important than ever, with 2014 European parliament elections results which can be seen as the herald of the ‘new strength’ of populist forces in Europe. At the same time, populism is a rarely researched phenomenon in Croatia (Miliardović 2004; Zakošek, 2010; Šalaj 2012), and to our knowledge our paper is the first comprehensive demand-side analysis. Drawing on the results of the MYPLACE project in Croatia, a research with a combined methodology, we used the data
obtained with a social survey undertaken on the sample made of 1216 individuals between 16 and 25 years and a qualitative analysis of 61 in-depth interviews, conducted in 2013. Populism is a complex phenomenon which must be analysed in relation to the broader political system and cultural context. Thus, it is important to emphasize that our results are situated in the context of Croatian youths’ general discontent with politics and politicians and strikingly low trust in institutions. The qualitative analysis showed that attitudes like these grow deep - the young are mostly alienated from the political system. They hold the political elites as highly corrupted and incapable for pulling Croatia out of the economic crisis. Our respondents recognised and condemned (mainstream) populist strategies among the main political parties, mostly on the basis of politics without real substance, and politicians giving promises they know they can’t or even don’t intend to keep.

In our search for the ‘breeding ground’ for (radical) populism, we focused on finding analogies with three core concepts of populism: the good people, the bad elite and the general will (Mudde, 2004), as it would be helpful for the populist actors if the electorate shares their values. The perspective that the elite is corrupted (the bad elite), was almost undivided among our respondents, and quite strong. Interviewees often stressed the need for a political system where people would be listened more, would have more influence on politics and expressed the opinion that public referenda should have a more important role, which brings us to the other two core concepts of (radical) populism: populist emphasis on the general will and the perception of ‘people’ as good/righteous political actors. Given the (relative) lack of radical populist actors in Croatia, in an effort to understand the potential ‘breeding ground’ for populism in Croatia, we tried to understand the main radical ideologies which have been proven as related to populism. Qualitative analysis showed our respondents’ perception of a wide spread of usual suspect ideological features of populism among Croats - nationalism/nativism and radical egalitarianism.

Since less than 2% of our respondents have ever voted for a more radical political option, it was very interesting to see that a small majority of the survey respondents expressed a positive attitude towards a system with a strong leader who is not constrained by parliament (responses fairly or very good - 55%). Interviews also showed that a part of the youth desire strong leadership from few people or even from one ‘strong leader’ unconstrained by democratic procedures, and we believe that in Croatia that path dominantly leads to populism and not some kind of elitism. We choose the strong leader variable as a proxy for the regression analysis of populism because of the great importance of strong leaders for populist parties. Much has been written on populist aim to function unconstrained from the institutions and rules of the democratic process, and from the political elites who both construct and follow the liberal democratic rules.

Regression results indicate that two predictors – attitudes towards politicians’ corruption and justification of political violence had an important unique contribution in explaining the criteria of preference for a strong leader not constrained by the parliament. The importance of criteria of politicians’ corruption for the explanation of preference for a strong leader is in line with the importance of anti-elitist and anti-systemic attitudes for the definition of the construct of radical populism. Every radicalism and populism in particular, above all, thrives on anti-elitist and anti-systemic attitudes (e.g. Canovan, 1999; Meny & Surel, 2002; Arditi, 2002; Mudde, 2007). Justification of violence for various political purposes (e.g. to overthrow a government, to protect jobs from being cut, to protect an ethnic/racial group etc.) has shown to be the second strongest unique contributor for the explanation of preference for a strong leader. Using violence as means for achieving the end is an important part of radical nativist, anti-immigrant and xenophobic ideologies. Attitudes which correspond to those ideologies were shown as important predictors of populism in previous research (eg. Mudde, 2007; Flecker et al., 2004, Norris, 2005; Turner, 2009; Kymlicka, 2003).
Regression results show a slight skew on the ideological spectrum of youth who are more inclined to support strong leaders. They tend to place themselves more on the right-wing of the political spectrum \((r=0.12; \ p<0.01)\). The right-wing voters in Croatia usually have stronger nationalist/nativist feelings, stronger religious identity (Zakošek, 2010) and reduced tolerance towards ethnic minorities (Henjak, 2005). Significant negative correlation of attitudes towards minorities with preference for a strong leader \((r=-0.16; \ p<0.01)\) was also established.

In conclusion, this research has found that the ‘breeding ground’ for populism in Croatia definitely exists among the youth. It appears as a part of the youth is willing to accept any change to give them hope for better political leadership and a better life, even if it means rejecting the representative democratic system and choosing a strong leader to govern the country. Still, for a long time there were no relevant radical populist actors and parties in Croatia. We hold that as an ‘supply-side’ explanations issue, perhaps the most important factor being the institutional and the political influence of European Union. Newest political developments, primarily the fast success of Ivan Vilibor Sinčić, a 24-year old populist presidential candidate who advocated a return to semi-presidential system and strongly rejected political and economic elites should be viewed in that framework.

**Risk Factors of Perceived Poor State of Health Among Finnish Children and Youth**

Piia-Kaisa AF URSIN (University of Turku, Finland) | piia.af.ursin@gmail.com
Leena HAANPÄÄ (University of Turku, Finland) | lehaan@utu.fi

Perceived state of health predicts mortality rate and the use of health care services. Those who perceive their health as good use less health care services and live longer (DeSalvo et al. 2006; Heistaro 2002). The Finnish School Health Promotion study shows, that one fifth of Finnish youth experiences their health only fair or even bad. Girls (19%) report more often than boys (13%) that they belong to the group of perceived poor state of health. Health experience consists of physical, psychological and social dimensions, which further on include several indicators (Välimaa 2000). Understanding of risk factors and their relation with perceived state of health, as well as chances in these relations, enhances our knowledge about how subjective health forms and what kind of qualitative changes can be found in children’s and youth’s state of health. Therefore, to promote children’s health and preventative health care, it is crucial to identify such risk factors, which at most endangers children’s perceived state of health.

The present study analyzed the connection between poor state of health experiences and physical, psychological, and social health factors, as well as selected demographics in Finnish children and youth. The younger cohort was 6th and the older one 9th graders. Altogether 7656 pupils took part on the survey carried out in the autumn 2012. 52 % \((n=3953)\) of them were 6th graders. Perceived state of health was measured by asking the children to assess their own health. The response scale varied between 1 = My health is good… 5 = My health is bad. This item is equivalent to an indicator of subjective health applied internationally (cf. e.g. www.who.int). The explanatory variables (the physical, psychological and social dimensions of health were measured by several five-point scales identical to the scale presented above. A small number of respondents, i.e. 5 % \((n = 377)\), perceived their health as bad. Next, the effects of altogether 12 independent factors were tested to explain bad state of health experience, of which six items were socio-demographics and six scales represented different dimensions of health. From socio-demographic factors only grade explained perceived bad
state of health, whereas it was strongly related to different physical, psychological and social risk factors. The strongest predictors of perceived poor health were low physical activity, lack of close friends, monthly alcohol consumption, low self-esteem, and perceived negative appearance. The latter was the strongest predictor. The consequences of the results will be discussed.

RN30S05 - Youth on the Margins

French hikikomori, a typology of social withdrawal among youth
Maia FANSTEN (Université Paris Descartes, Cermes3, France) | maia.fansten@parisdescartes.fr

Hikikomori is the Japanese term referring to young people who withdraw from society, most often within their own bedroom, for months or years at a time, removing themselves from every expected social interaction. At first considered as a strictly Japanese issue, it has now been identified as an international phenomenon. This paper presents on-going research on French hikikomori. The growing number of hikikomori in modern societies is a challenging problem: neither truly anti-establishment nor claiming an alternative lifestyle, nor exactly ill, these reclusive young people leave their relatives, as well as the professionals, bewildered. What are they rejecting in such a passive and silent way? To what extent does their experience of withdrawal from society is a form of worrying social exclusion or constitute an alternative modality of learning and self-building?

We argue that hikikomori is a radical expression of the difficulties of contemporary societal conditions and conforming to strong social injunctions. Social withdrawal may seem like a way to express and address these difficulties or contradictions. Therefore, it has to be understood examining both the defective aspects (e.g. difficulties, maladjustment, distress) and the innovative and constructive aspects (e.g. the maturing of one’s life project). Based on the analysis of the trajectories and narratives of hikikomori and their families, this paper will propose a typology of four hikikomori’s withdrawals, each of which being a way of responding to social expectations and family dynamics on the path to adulthood.

Young Girls of Seasonal Agricultural Work: Whether seasonal work is letting them to combine work and school or not?
Kezban ÇELIK (Ondokuz Mayıs University, Department of Sociology Turkey) | kezban.celik@omu.edu.tr
Yasemin YÜCE TAR (Ondokuz Mayıs University, Department of Sociology Turkey) | yyuce@omu.edu.tr

Every year between April and November, hundreds of thousands of seasonal agricultural workers in Turkey leave their permanent residences and migrate to agriculturally intensive areas for jobs such as planting, harvesting and hoeing. Many take their young members. According to the Ministry of Labour and Social Security, there are around 300,000 registered seasonal migrant workers in Turkey. However, many others are likely to be unregistered: in reality, including children who travel with their families, the number of seasonal migrants may be at least a million. This paper presents an analysis of young girls’ involvement in seasonal agricultural work. The importance and necessity of the seasonal work in their lives and its consequences for their schooling are examined. The girls interviewed were between the ages of 15 and 24, single, living with their family, and not engaged in fulltime employment and some cases education. Dimensions of their experiences including levels of education, duration of seasonal work, rural/urban divide, socialization, adherence to traditional family values of
obedience, loyalty to parents, and the like and drawing on quotes from interviews, the study describes the ways that the experiences of these girls are constrained by traditional gendered expectations and absolute poverty. We thoroughly believe that studying these girls as a youth category is an important task because they constitute a “silent youth category” which has been studied rarely.

Outcomes of Adolescence and the Transition to Adulthood in Romanian Socially Excluded Youth
Paul Teodor HARAGUS (Babes-Bolyai University of Cluj-Napoca, Romania, Romania) | tpharagus@gmail.com
Mihai-Bogdan IOVU (Babes-Bolyai University of Cluj-Napoca, Romania, Romania) | iovu_mbogdan@yahoo.com

The transition from adolescence to young adulthood can be seen as a multifaceted process where social and individual factors shape young people's lives. In order to fully understand and explain the outcomes we need to follow the suggestion of Diewald & Mayer (2009) or Settersten (2005) and to integrate the interactional life-span perspective and the life course perspective on the transitions from adolescence to young adulthood.

Outcomes of adolescence can be seen as individual and social developmental tasks that prepare one to become a productive, healthy, responsible, well-functioning adult. This includes a minimal level of personal competence, personal relationships, personal well-being, the capacity for intimacy and social bonding, a healthy lifestyle and the avoidance of problem behaviour.

We intend to present the outcomes of adolescence for the socially excluded youth and to assess if the worsening of specific outcomes can be attributed to the material deprivation.

The Romanian sample of 3509 nationally representative high school students in their final school year (12th grade) was surveyed in Nov 2012-Jan 2013 in the first wave of "Outcomes of Adolescence. A longitudinal perspective on the effect of social context on successful life transitions" project. The 2nd wave of the longitudinal study took place in Dec 2014-Jan 2015.

The first wave questionnaire evaluated the educational situation (results, the intention continuation of the studies), the orientation toward the labour market (the entry on the labour market, their long-term work-related aspirations as well as their representations regarding career possibilities), their social capital (relations with family, peers from neighborhood, friends), their well-being, health and risky behavior. The second wave is oriented toward measuring specific outcomes of adolescence and toward taking into account life-course events and other social circumstances that could influence young people on their path to adulthood. The study is trying to evaluate if unsuccessful transitions are most likely to be found amongst socially excluded.

RN30S06 - Scarring Effect in the Life Course and Across Generations

“If you cannot get what you want, you have to want what you can get”. The life course of young unemployed as causality of the probable
Martti SIISIÄINEN (University of Jyväskylä, Finland) | martti.siisiainen@jyu.fi

Uneducated, long-term unemployed young people have often been described as irrational, dangerous and unmanageable group in established media and by actors applying the code of the economic sub-system. In this paper I am challenging these misapprehensions with the
assistance of life course analysis of twelve young long-term unemployed. The main theoretical repertoire draws on Pierre Bourdieu’s relational sociology. The anchor concept is the causality of the probable (Bourdieu 1974). It is based on the critique of the rational choice theory. The choices directing agent’s life course are understood as reasonable (to be distinguished from rational), practical logic (to be distinguished from economic logic). Agent’s tend to choose such alternatives which on the basis of their life experiences (internalized in the habitus) seem most probably to lead to a good or at least tolerable result. Depending on the level of the agent’s level of knowledge this can be more or less “rational” from the point of view of the economic sub-system. The method of analysis, in addition to established repertoire of life course analysis, adapts ideas developed in Claude Lévi-Strauss myth analysis (e.g. 1955). Thus at the first phase the constituent units of twelve life course interviews (saturation level) are defined (capital initiale, family and conditions of primary socialization; compatibility of habitus with the requirements of school; agents of secondary socialization [school; peer networks; etc.] turning points of life course [early years; phases of education; transition from home; (non)success in working life; dating & relationships with partners]. At the second phase these stories (their constituent units) are written one under the other so that they form a whole analogous to score of a composition. Distinct life courses reveal variable versions of how unemployed, marginalized young people make their choices. But - as is the case with score of a composition - when these are understood comprehensively as a whole the picture of agents making reasonable choices in conditions (Marx) and by symbolic categories (Bourdieu) which they have not chosen and thereby being able get by and create meaningful and personal lives of their own.

Welfare Regimes and Inequalities between and within Generations, a 16 Country Comparison
Louis CHAUVEL (University of Luxemburg, Luxembourg) | louis.chauvel@uni.lu
Martin SCHROEDER (Philipps-Universität Marburg, Germany) | martin.schroeder@uni-marburg.de

Do some birth cohorts monopolize lucrative positions and social transfers, so that they are unduly advantaged over others? In a world without such intercohort-inequalities, a cohort born into an economy that is, say, two percent richer, should have two percent more disposable income over its life-course. In reality however, increasing prosperity could have bypassed some birth cohorts, while others disproportionately reaped the fruits of economic growth, appropriating lucrative positions and social transfers, thereby disadvantaging other birth cohorts. We measure whether this happened for birth cohorts of the 20th century in 16 western countries. We complete this inter-generational transformation with an analysis of intra-generational inequalities: are some generations clearly more unequal than others, polarised between richer and poorer strata? We show how much belonging to a certain birth cohort influences average incomes and distribution and whether welfare regimes advantage some birth cohorts in interaction with social classes while disadvantaging others.

Extreme disadvantage and youth transitions to adulthood
Tracy SHILDRICK (University of Leeds, United Kingdom) | T.Shildrick@tees.ac.uk

This paper draws upon a research project conducted in Teesside and Glasgow which explored the idea, popular in the UK, that there are families living on welfare who have never worked. In-depth interviews with members of different generations in multiply disadvantaged families were undertaken in the two fieldwork locations. Whilst the aim of the research was not to directly locate multiply troubled families, the nature of our search for families who had never worked, led us to families who were deeply troubled and disadvantaged. This paper concentrates on the experiences of the younger generation within the families. The paper examines the
consequences of growing up in deeply troubled families and the implications of this for young people’s transitions to adulthood. The paper concludes that whilst experiencing serious, multiple disadvantage in childhood has important implications for young people’s transitions, the young people we studied showed resilience and fortitude and by and large they retained conventional and largely unremarkable aspirations and hopes for their futures. The paper locates the findings of the study within a wider context where opportunities for all young people are declining rapidly and where disadvantaged conditions for young people are permeating further and wider than perhaps ever before.

Social origin and employment attachment of young people and their siblings in Europe
Tiziana NAZIO (University of Torino, Italy) | tiziana.nazio@unito.it
Marianna FILANDRI (University of Torino, Italy) | marianna.filandri@unito.it
Jacqueline O’REILLY (University of Brighton, UK) | J.O'Reilly@brighton.ac.uk

Literature on intergenerational reproduction of inequalities suggests that (dis)advantage tend to cumulate across individuals’ life courses and/or generations, increasing social inequalities between individuals or groups. This should apply especially to those contexts, like larger families, were the amount of available familial resources have to be spread across a larger number of children. However, under certain conditions, young adult siblings may also constitute resources multipliers in terms of additional vehicles to transmit information, attitudes or connections to employment opportunities. This paper compares youth occupational status in several European countries by focusing on social class of origin and on number and employment status of working age siblings. We believe that the variance in young adults’ employment status by household’s social origin and family size (regardless of co-residence in the parental household) could provide further insights about the cumulative advantage/disadvantage hypotheses stemming from the analysis of intergenerational reproduction of inequalities. We expect to find that young people coming from wealthier families benefit from an initial advantage through easier access to higher education, more chances to develop soft skills and inherit social networks or business, and thus being employed. However, siblings already in employment may contribute to counterbalance the family of origin by supporting young people’s entry and permanence into employment, offering themselves support and ties to employment. We test this hypothesis with SHARE data, testing the mediating effect of the number of (employed) siblings on that of social class of origin on youngsters’ employment status.

The relational side of the scarring effect: personal networks and (un)employment of the young over the life course
Mireia BOLÍBAR (University of Bremen, Germany) | bolibar@uni-bremen.de

The paper aims to study how the weak presence of young people in the labour market (in the form of unemployment and/or underemployment) at the beginning of their career path affects their relational resources for job-seeking. The novelty of the research project is based primarily in the junction of social network analysis and the life course perspective in approaching the process of cumulative disadvantage in young people’s transitions into the labour market. The analysis is based on the ‘Personal networks of the youth in Barcelona’ survey. Carried on in the Metropolitan Area of Barcelona in 2014, it interviewed 250 young individuals (20-34 years old) following a quota sample strategy. It has very rich information on the events that make up the interviewees’ labour trajectory and the structure and use of their network of contacts. The results of the paper delve into: (1) The impact of (long-term) unemployment and precarity on
young people’s process of creating and developing their personal network; (2) Its effect upon the ability of networks to produce returns in the labour market and its consequences for the development of the ensuing labour trajectory; (3) The social class differences on (1) and (2) that may reinforce or mitigate the “scarring effect” of unemployment. The paper seeks to explain how social inequalities come into play by shedding light on how social capital contributes to exclusion, mobility and social stratification in the labour market in the context of the current economic crisis.

RN30S07a - Life and Future Aspirations - A

Definitely maybe. Navigating changing aspirations in Norwegian clerical vocational training
Kaja REEGÅRD (Department of Sociology, University of Bergen, Norway; Fafo Institute for Labour and Social Research, Norway) | kar@fafo.no

The prevailing discourse on school-to-work transitions depicts youth transitions as increasingly complex and non-linear. In the wake of economic crisis and rising youth unemployment in Europe, there has been an upsurge of interest in youth programmes and apprenticeship schemes considered a vehicle for facilitating smooth transitions to skilled employment. However, such programmes are equally criticised of entrapping youth in vulnerable labour market positions. Drawing on a qualitative longitudinal study of students in the Norwegian Office and Administration vocational education and training (VET) programme, the paper analyses the ways in which young people experience and exercise agency as they pass through VET as a rite of passage. The paper involves three interlinked levels of analysis: (i) the young people’s self-understanding as basis for action and aspirations, (ii) mediated by group-level interaction in the classroom and workplace, and (iii) structured by the capacity of the occupational field to socialise its newcomers. The temporal analysis demonstrates how the students enter open-mindedly, yet with faith in forthcoming labour market advantages, however, complete open-endedly facing poor job prospects within a line of work favouring higher education credentials. The paper focuses on how the process of re-navigating one’s aspirations is lived and justified. How does young people’s belief in future employment opportunities determine what they perceive to be ‘choices’? How does this change over time, and within changing social landscapes? Policy implications and contentious aspects of spurring young people into unknown labour market destinations are critiqued and discussed.

Magnetic field of young people’s new dream jobs: contrasts and continuities between idealised and realised work values in youth transitions to labour market
Vitor Sérgio FERREIRA (Institute of Social Sciences - University of Lisbon, Portugal) | vitor.ferreira@ics.ulisboa.pt

Young people’s dream jobs are no longer necessarily about prestigious professions ratified by academic diploma, such as physician, lawyer, engineer or architect. Other occupations – demanding other kind of training, skills and qualifications – have included the professional aspirations and expectations of an increasing number of young people, such as being a model, a DJ, a football player or a chef. Looking at these activities further than hedonistic and consumeristic leisure practices, many young people today face the possibility of making a living out of them. What does attract
contemporary young people towards these professions? Which work values does structure their symbolic “magnetic field”, and how is it socially produced?

Exploring in-depth comprehensive interviews with young people in both conditions of training beginners and established professionals, this paper aims to identify social constrains, cultural meanings and individual motivations underlying the pathways of young people’s transitions to work within the scope of those “new dream jobs”.

Conceptually, it will explore the contrasts and continuities between ideal(ised) and real(ised) work values: Does the symbolic magnetic field of those occupations change along the pathway towards labour market? Is there a mismatch between the work values idealised by young beginners, and the work values really lived in the everyday practice of their young professionals?

This paper is presented within the scope of the research project Making dream jobs come true: transitions to new attractive professional worlds for young people, funded by Portuguese Foundation for Science and Technology (PTDC/CS-SOC/122727/2010, for more details see http://dreamjobs.pt.to/).

**Dreams of ordinariness. The missing middle of youth aspirations.**

Giuliana MANDICH (University of Cagliari, Italy) | mandich@unica.it

As recently argued (Roberts 2011, 2014; Woodman 2013), youth studies have shown a tendency to focus either on “problematic” or “successful” youth transitions, creating a “missing middle” in youth research. This proposal endorses the idea that paying attention to the ordinary in young people’s lives better allows us to trace the different tensions that pull young people in different directions today (Thomson and Taylor 2005). In the specific case of this proposal, the missing middle is that of youth aspirations.

The research is based on a narrative analysis of 341 essays collected among 18 year-old students in two Sardinian cities, who were asked to write an essay imagining to be 90 and tell how their future (in the past) would be. Despite the at times emphatic narrative form of the essays (the ‘genre’ is often similar to fiction and talent show) and the occasionally unrealistic accounts of their imagined future (as in the case of imagined mobility cfr. Isabella and Mandich 2014), most of the times young people simply aspire to an ordinary life, very similar to the one their parents have lived: getting married, having kids, a house, a job, and enjoying retirement. How do we account for these dreams? Do we contribute to close the imagination down (Latimer and Skeggs 2011) dichotomising young people’s reactions to uncertainty into either protest or exit, resistance or compliance? Or assuming young people to be drivers of social change (as in the EU rhetoric)? This paper assesses these issues within the frame of Appadurai’s concept of capacity to aspire (Appadurai 2004).

**The World of Internship: Hopes, Fears and Expectations**

Fundan KARAPEHLIVAN ŞENEL (Sociology Department, Marmara University, Turkey) | fundakarapehlivan@gmail.com

This paper aims to look at the world of internship by drawing on an ongoing research conducted among university students and recent graduates who are doing or completed internships in various fields in Istanbul, Turkey. The growing sense of insecurity and fear for future drive young people, especially university students and recent graduates to do internships with the expectation of gaining experience and guaranteeing jobs. The internship has become a widespread form of precarious employment among young people. It is mostly an unregulated world which is often used by employers as a means of obtaining cheap labour. An internship might take many different forms and qualities. It might involve cleaning offices or doing
secretarial duties and it can last for a few weeks or a year or two. Interns are generally very poorly paid or unpaid workers which means that interns are generally in need of either familial support or external funding. This fact turns the world of internship into, as Ross Perlin says, a "curious blend of privilege and exploitation". In this paper I will try to explore this world of internship by raising these questions: Why do young people prefer to do internships? Why do they consent doing it under existing unfavourable conditions? What are the impacts of internship on nature of work and regular labour? What do internships tell us about the culture of capitalism and the society we live in? I will attempt to answer these questions by presenting the initial findings from my research.

RN30S07b - Life and Future Aspirations - B

Russian students' life plans, expectations and concerns in the professional field: the results of an empirical study
Nikolay NARBUT (Peoples' Friendship University of Russia, Russian Federation) | narbut.n@mail.ru
Irina TROTSUK (Peoples' Friendship University of Russia, Russian Federation) | irina.trotsuk@yandex.ru

The authors believe that the concept ‘fears’ can be used in representative sociological surveys to identify the fundamental values and behavioral patterns of the youth and the routinized optimal strategies to overcome socially and psychologically uncomfortable situations. The authors propose a format for the operationalization of value issues in the professional field by ‘measuring’ youth fears, expectations and concerns. The results of the survey on the sample of students in the Peoples’ Friendship University of Russia show, in particular, that the students' worldview seamlessly combines quite diverse considerations: prestige-image orientation and substantive arguments while choosing a specialty and educational institution; pragmatic and idealistic assessments of their own skills; adequate perception of the situation on the labor market and commitment to the ideals of personal achievements in the spirit of an ‘American Dream’; focus on learning and confidence that even without any professional experience they can easily and quickly find a job; fears of a professional failure, loneliness and poverty and the belief that their personal qualities do guarantee them from becoming losers. As the data of national surveys in recent decades show, the Russian society manifests itself as a stereotypical and traditional one in gender questions, especially when it comes to the positions of men and women in the labor market, that is why the authors focus on gender differences in students' responses to the survey questions, but mention other significant distinctions as well.

Dreams, plans and realities. Expected and experienced transitions from university to work
Eriikka OINONEN (University of Tampere, Finland) | eriikka.oinonen@uta.fi
Lea HENRIKSSON (Institute of occupational Health, Finland) | lea.henriksson@ttl.fi

Europe 2020 strategy presumes a lot from the higher education graduates. They are expected to bring Europe back to the global map by enhancing their employability above all through education. Education is underlined as a key factor in making Europe competitive again. Education is also seen to guarantee individuals’ social integration, working careers and upward social mobility. The Europe 2020 strategy offers a normative career model, but how does it match with dreams, plans and realities of the university graduates?
Our approach gives voice to those targeted in policy recommendations, the university graduates by utilizing and developing visual and narrative methods. The data is gathered among Finnish and Spanish university students about to graduate and it comprises of: (1) pictures and photographs chosen and narrated by the informants, and (2) empathy-based stories written by informants. The data reflects informants’ thoughts, feelings and experiences concerning finishing their studies and their transition from university to work. The data is gathered during Nov. 2014 – Feb. 2015 in Finland and in Apr. 2015 in Spain. We cross-reflect the Europe 2020 strategy’s normative model with the university graduates’ own accounts. In the analysis, we read out the possible elements of the normative model in informants’ narratives and potential ‘counter models’ they produce. We contemplate what the role and place of education and work are in ‘decent life’ and what kind of life is realistically attainable for contemporary European higher education graduates.

Adolescents and Parents’ Educational Aspirations and Future Worries in the Context of Late Modern Uncertainty
Jenni Emilia TIKKANEN (Centre for Research on Lifelong Learning and Education (CELE), University of Turku, Finland) | jenni.tikkanen@utu.fi

In late modern societies, adolescents and their parents’ images of the future are affected by increased uncertainty, competition, complexity of educational choices and consequences as well as a strong emphasis on success and individual responsibility. By directing choices, motivation, and behaviour, one’s perception of the future affects the way it will actually unfold; for example, educational aspirations are connected to the level of eventual educational attainment. The focus of this study is on the educational aspirations and future worries of 15- to 16-year-old adolescents and their parents. The study aims at combining two theoretical approaches, structural perspective and social learning theory. Hence, future aspirations and worries are viewed as dispositions affected by both structural forces and social-psychological factors rather than being products of completely conscious and rational economic considerations. There are two main research questions 1) what kind of differences are there between adolescents and parents’ educational aspirations and future worries, and 2) how are structural and social-psychological factors (such as gender, parental education, family interactions, and sense of agency) related to these differences. The survey data was collected from lower secondary school ninth graders and their parents in three Finnish cities in 2010. The sample includes 318 adolescent-parent pairs and is stratified according to the socio-demographic status of the schools. Confirmatory factor analysis (CFA) is used together with more basic statistical methods, such as ANOVA and paired samples t-tests. The results will be discussed within a framework of ‘late modern’ discourses of individualised risks, plurality of choice, and competition.

Realization opportunities of gender-atypical occupational aspirations
Henrik PRUISKEN (Bielefeld University CRC 882, Germany) | henrik.pruisken@uni-bielefeld.de

Possible differences between young women and men in the opportunity to realize their occupational aspirations during the school-to-work transition can be seen as a dimension of social inequality in line with the “capability approach”. In a still strong gender segregated labour market like in Germany young people with gender-atypical occupational aspirations are often confronted with obstacles like fixed gender-norms and statistical-discrimination by the employers. This may lead to a rejection of their gender atypical occupational preferences to more gender-compliant goals.
Therefore the paper focuses on the question whether women and men differ in their capabilities to achieve gender-atypical goals and how individual resources and the social context facilitate or complicate a realization of gender-atypical aspirations during the school-to-work transition. The analysis is based on household panel data from the German Socio Economic Panel (GSOEP). In the GSOEP adolescents are interviewed at the age of 17 to many aspects of their lives including questions on their vocational goals. Due to the panel structure of the study, these young people are also observed during the phase of career entry, so that a comparison between the desired occupation and the actual achieved occupation is possible. The results of logistic regression models show that the capability of women is lower than men's to achieve their gender-atypical occupational goals. The lowest probability is find in the manufacturing industry. The probability for women is higher when the mother is working too.

**RN30S08 - Political Activism**

**The Social and Demographic Contexts of the Arab Spring in North Africa**
Ken ROBERTS (University of Liverpool, United Kingdom) | bert@liverpool.ac.uk

This paper sets the 2011 uprisings (in all of which young people appeared to be strongly represented) in their country contexts: the ‘demographic surge’ throughout the region, which was accompanied by youth migration into cities and increased enrolments in higher education, all amid job deficits in which higher education graduates had become the group at greatest risk of unemployment. Meanwhile, huge sections of the populations in all age groups remained rooted in traditional ways of life, especially in rural areas, in which gender divisions remained strong, and rates of female labour force participation remained very low. In both rural and urban areas, in the years preceding 2011, most employment was ‘informal’. The trigger that ignited the Arab Spring was sustained demonstrations in Tunisia, which led to the flight of President Ben Ali whose security forces had become unreliable. This signalled throughout the Arab world that change was possible. But to what? It is argued that young people’s circumstances alone do not provide a causal explanation of the events of 2011. The actors’ political orientations need to be added. Also, cultural divisions among young people need to be taken into account. Survey evidence from the preceding years permits the development of plausible hypotheses explaining how and why the Arab Spring erupted, spread, and led to different outcomes in different countries, none of which, as yet, bear much resemblance to democracy in its Western sense, but correspond more closely to the demonstrators’ stated aims.

**Keywords:** Arab Spring, North Africa, political mobilisation, youth.

**Young activists in the making**
Nuno ALMEIDA ALVES (ISCTE-IUL, Portugal) | nalmeidaalves@iscte.pt

The economic crisis and austerity measures taken by the Portuguese government (backed by the European Commission, European Central Bank and International Monetary Fund) in the last few years motivated a cycle (2011-2014) of contentious politics led by several groups of activists and socio-political platforms in which young people had a significant role. Precários Inflexíveis - (Inflexible Precarious), a group of activists formed in 2007 to fight against the rising precariousness in the Portuguese labour market - has been one of the most active groups in this process, either autonomously or integrated in wider platforms such as the ones that organised massive demonstrations in Lisbon and elsewhere. In a scenario of general disaffection and cynicism of young people towards politics it is relevant to enquire into the specific features drive this set of young activists to engage in an enduring
intensive political mobilisation. Which particular combination(s) of elements - between personal traits, family and friends influences, activist trajectories, political engagements, professional statuses, identity issues, and personal rewards and losses – may contribute to answer the question ‘what makes and maintains a mobilised activist?’

The answer to this question will be brought by the analysis of qualitative empirical data gathered through semi-structured interviews and ethnographical research with Precários Inflexíveis. All the material used in this paper was collected for MYPLACE (Memory, Youth, Political Legacy And Civic Engagement) research, funded by the European Commission (7th FP).

**University Students and Politics: Contextualizing Student Political Activism in the Czech Republic and Germany**

Daniela GAWRECKÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | daniela.gawrecka@soc.cas.cz

Young people’s political involvement is essential for the future of our democracies. Nevertheless, there is not much attention paid to this issue from comparative perspective. The goal of proposed paper is to fill this gap and describe and compare political engagement of Czech and German university students. The paper aims to contextualize (1) forms of student political participation, (2) motives for engagement or vice versa for political passivity, (3) students’ understanding of politics, (4) their value orientations and (5) political socialization in families and schools.

Both qualitative and quantitative research methods are used for the analytical purposes. The main emphasis is placed on qualitative methods. The paper introduces results of the 45 in-depth qualitative interviews with politically active and non-active students conducted in the cities of East, West Germany and the Czech Republic in 2013 and 2014. The respondents of research were active in the “old” (political parties, trade unions) and “new” (new social movements, NGOs) types of political and civic organizations or they were politically non-active. The qualitative analysis is combined with the findings from quantitative surveys (European Social Survey, Eurobarometer, data from the German Youth Institute and the Czech Public Opinion Research Centre).

The contextualization of student political involvement covers following dimension (a) INTERNATIONAL: comparison of the Czech Republic and Germany, (b) NATIONAL: differences between the cities from East (Jena, Dresden) and West Germany (Cologne, Mannheim, Trier) and (c) “CENTRUM” versus “PERIPHERY” (the capital city Prague compared to the Czech industrial city of Ostrava).

**A return on youth cultures in Arab Mediterranean countries. Trends and comparative developments of the scholarship**

Ilenya CAMOZZI (University of Milan-Bicocca, Italy) | ilenya.camozzi@unimib.it
Daniela CHERUBINI (University of Milan-Bicocca, Italy) | daniela.cherubini@unimib.it
Paola RIVETTI (Dublin City University, Ireland) | paola.rivetti@dcu.ie

This paper examines the ‘state of the art’ of the scholarship on youth cultures in Arab Mediterranean countries, with the goal of identifying gaps and new developments for the discipline. In order to do so, we aim to put into dialogue studies that have dealt with the issue from a comparative perspective. We contend that youth agency, and specifically the issue of youth cultural practices and identities are central to the understanding of the current processes of social and political reconfiguration going on in contemporary Arab Mediterranean societies.

The paper presents preliminary findings of the FP7 research project “Empowering the new
generation: towards a new social contract in South and East Mediterranean countries (SAHWA)"

The first part of the paper defines the conceptual framework for the study of youth agency and cultures. We focus on the trends and gaps of contemporary studies on youth and youth cultures as carried out in social sciences both in European and Arab Mediterranean countries. The second part of the paper outlines the research questions and analytical dimensions that stem from the contrast of youth conditions in Europe and the Arab Mediterranean area. We conclude by elaborating on the seemingly convergent dynamics in youth conditions across the Mediterranean, which also suggests the hypothesis of a convergence of broader structural elements that frame the contemporary transformation of youth.

**RN30S09 - Political Extremism**

**Youth against inequality: anti-capitalist and anti-fascist movements across Europe**

Darya LITVINA (National Research University Higher School of Economics, Russian Federation) | litvina.darya@mail.ru

The paper presents the findings of a meta-ethnographic synthesis of 8 ethnographic case studies conducted in 5 European countries (Spain, Croatia, Germany, Estonia, Russia) within the framework of international MYPLACE (Memory, Youth, Political Legacy and Civic Engagement) project. The synthesized cases refer to a wide spectrum of political parties, solidarities, (sub)cultures, grassroots movements and organisations, which ideologies and activities relate to the anti-capitalist and anti-discrimination agenda: from centre-leftists to separatists and ultra/radical/far left.

The ultimate aim of anti-capitalist movements is the abolition of classes and any forms of discrimination which are caused by the hegemony of capitalism. The struggle against fascism, racism, sexism, homophobia and other discriminatory manifestations is frequently incorporated into the anti-capitalist agenda. Among all forms of discrimination the main leftist critique is addressed towards discrimination based on ethnicity: fascism, racism and xenophobia. The paper explores the peculiarities of youth activism within the anti-capitalistic and anti-fascistic field through the key questions, revealing 1) the way young people inhabit, interpret and own their organisations; 2) how they understand and experience their own activism; 3) their perceptions of politics/the political; 4) the ways young people’s activism, attitudes and everyday lives shaped by the past and the present; and 5) how they articulate, adopt and put into practice anticapitalist, anarchist and new left ideologies.

**Contemporary Hungarian far right and the anxious youth**

Balázs BÖCSKEI (HAS Centre for Social Sciences Institute for Political Science, Hungary) | Bocskei.Balazs@tk.mta.hu

After the far-right party (MIÉP) spent only one period in the Hungarian Assembly in the 1990s, a new generation extreme right party (Jobbik) gained significant public support in the 2000s. Although there are many similarities between the two far right movements in their ethno-nationalism, racism, anti-communism, anti-liberalism, xenophobia, revisionism and establishment-criticism, there are even more differences. For instance while MIÉP was a historical formation with narrow social basis, Jobbik became a significant political subculture from a youth movement. Jobbik can be interpreted both as an „institution” of turning into the past or as the
answer given to the uncertainty coming from the postnational constellation. The new Hungarian extreme right does not only deal with ethnic issues, but reacts to the uncertainties created by the transformation and globalization with political answers. The composition of voters also differs considerably: while for MIÉP voters sympathy with the authoritarian leadership was a strong reference point, most of Jobbik voters became such through the roma issue and because of their anxiety of globalization. The contemporary Hungarian extreme right gives a special Hungarian answer to the postnationalist constellation, which can be deducted from the contradictions of the decades after the transition. In our talk we will compare the characteristics of Jobbik voters with the supporters of the far right belonging to the 1990s, in focusing on the explanation of the differences. We will also make an attempt to explain Jobbik’s expansion in the light of modernization processes and of the crisis-symptoms of the past 25 years of Hungary.

Correlation between fragmented political socialization and attraction to political extremism
Zoltán BERÉNYI (University of Debrecen, Hungary) | zoltan.berenyi@arts.unideb.hu
István MURÁNYI (University of Debrecen, Hungary) | istvan.muranyi@arts.unideb.hu

Our paper examines whether a correlation between the index numbers of fragmented political socialization and the signs of attraction towards political extremism could be detected among young people in 14 countries of Europe. The concept of fragmented political socialization claims that when the connection between the formal, (that is, the family and the education system) and less formal (that is, the peer groups, the media, the various subcultures and political movements) agents of socialization is weak, occasional and contradictory, it significantly increases the degree of ambiguity of the person towards politics. As a result, the theory claims, a person subjected to this form of socialization is more likely to accept the simple narratives, simple explanations of the artificial reality, artificial memories, artificial past and artificial history offered for consumption by extremist political parties.

By building on the empirical database collected in the EU 7th Framework international research, MYPLACE and using the theoretical concept of fragmented political socialization we examine the correlation between the level of personal interest, activity and attitudes towards politics; the level of diversity of media sources used in acquainting information about politics and current affairs; the level of discussion of political issues with key individuals (peers and family members); the level of interest towards public affairs and activity in voluntary organisations and associations and one of the most important base of political extremism, the attitude of prejudice towards external social groups.

Young Europeans as a target of IS (Islamic State) propaganda
Karolina WOJTASIK (University of Silesia, Poland) | karolina.wojtasik@gmail.com

Islamic State (IS/ISIL/ISIS/) in a relatively short time has become a major political force, threat in the Middle East and a global problem. This is an organization that terrorizes, and continues to expand its territory and sphere of influence. This is an organization that is constantly looking for new soldiers and has a lot of money as well as access to advanced technology and propaganda. It is estimated that in the last year several thousand Europeans, mostly young people joined the ranks of IS soldiers. They are not just children of immigrants, but also those who have made the conversion to Islam. The decision to abandon the relative stability in Europe and come to Iraq/Syria is a complex process. My research project attempts to answer the following questions. 1. Why young Europeans join the IS army? 2. What kind of propaganda
activities are directed to young Europeans? 3. What means does IS use to reach young people who previously lived in a consumer society, watch MTV in secular Europe? 4. Why IS is so “attractive” to young Europeans? To answer these questions I lead a broad analysis of the official media of IS - newspapers, magazines, videos, profiles and social media accounts and any text / image / video published by media agencies belonging to the organization. IS uses modern technology and speak young people’s language. Promises valuable life, a life that has purpose and meaning, an alternative to consumerism. Women are promised a stable family life. Men - brothers in arms, the opportunity to check themselves out, good job and participating is governing. IS propaganda campaigns are very well prepared and thought out. These are not random materials. I want to show this phenomenon.

RN30S10 - Social Media: Risks, Attitudes and Socio-political Role

Everyday activism and internet
Airi-Alina ALLASTE (Tallinn University, Estonia) | alina@iiss.ee

Youth activism today is partly perceived to have transitioned into spheres of everyday activity that have previously not been considered ‘political’ in the conventional sense of the term. In this paper, I go in a way back to Carol Hanish’s statement from the 70s and claim that personal is political, by using the contemporary approaches such as everyday maker and subactivism. The Internet facilitates communication and enables easy access to information, so personal matters, interest and beliefs are more easily connected to making sense of society and politics. On the other hand, recent debate about social participation on the Internet asks if it should be seen as virtual activism or rather slactivism, perceived as behaviour that makes activists feel good rather than addresses political matters and the decreasing level of (offline) participation. However, the key challenge here is how the participation is defined. An in-depth micro-level analysis is based mostly on interviews with young people from Estonia, contextualized with data from other European countries according to MYPLACE survey. According to MYPLACE survey in Estonia the number of young people who spend time in internet is relatively higher than in neighboring countries – while conventional participation and intentional grassroots activism was lower than in other countries, especially Finland and Denmark, the online activism was roughly on the same level. Our claim here is that it is possible to interpret signing petitions, sharing, commenting or ‘liking’ as participating in public life and talking about politics as an expressive participatory act in itself. That topic should not be defined only in terms of which kind of effect Internet activity has on political participation with successful goals. It is part of diversification of how citizens take part of political matters, and this applies especially in the case of Estonia, where civic engagement has been low and ‘activism’ has had negative image, and where everyday social participation engages new people.

Online harassment among young adults: A four country comparison of the perceived experiences
Matti NÄSI (University of Turku, Finland) | matti.nasi@utu.fi
Atte OKSANEN (University of Tampere) | atte.oksanen@uta.fi
Markus KAAKINEN (University of Tampere) | markus.kaakinen@uta.fi
Pekka RÄSÄNEN (University of Turku, Finland) | pekka.rasanen@utu.fi

Different forms of harassment have been examined relatively extensively in the past, although much of its focus has been on various elements of sexual harassment. Non-sexual harassment research tends to be less common, and it is often presented in association with other forms of
negative behavior, such as bullying. However, as a result of the emergence of Internet and other new ICTs, the boundaries between online and offline world has become increasingly blurry. This has also meant new aspects on harassment related research, as much of the present day communication and forms of social activity takes place online. The increased possibilities of ubiquitous communication, along with faceless and often anonymous nature of the online interactions have also paved a way for new means of potentially negative behavior online. In this article we will examine online harassment in a cross-national context. There are only very few previous cross-national studies focusing on negative online behavior and their focus has been restricted on children and young adolescents. Our data from the four countries, Finland (n=555), Germany (n=978), the UK (n=999) and the U.S. (n=1,033) consist of respondents aged between 15 and 30 years old, thus providing more extensive scope of the phenomena. Our first aim is to examine how common online harassment actually is in the four countries, and whether there are notable differences in victimization between the countries. We then examine some the potential characteristics of online harassment victimization by including different socio-demographic (namely age, gender, living arrangement, and economic status) background variables, along with past experiences of both offline victimization as well as Internet use activity, in the analysis.

**Socio-economic factors behind the problematic internet use among Hungarian girls**

Dora Katalin PRIEVARA (University of Szeged, Hungary) | dora.prievara@gmail.com  
Bettina PIKO (University of Szeged, Hungary) | pikobettina@gmail.com

The internet has a central position in everyday life and takes an effect on youth social relationships (Milani, Osualdella and Di Blasio, 2009), physical health (Kelley and Gruber, 2012) and academic performance (Lin and Tsai, 2002). The aim of our research was to get information about the internet using habits of Hungarian youth. The participants (N=386) answered an online, anonymous questionnaire about their socio-economic status, internet use habits (what are they doing online and how much time) and the instrument also included the Problematic Internet Use (PIU) Questionnaire. According to our results, the persons who still live with their parents achieved higher points at PIU (F(6)=2.497; p | 0.05). They typically neglect other tasks and can hardly control the amount of the online time. This control of the use is harder for teenagers than university students. The PIU was more frequent among youth without a relationship (F(4)=5.562; p | 0.01), they spend more time online to watch films or visit social websites. The children of professionals also use the internet for a longer time. These findings suggest that youth are at special risk for spending problematic amount of time online. This underlines the important role of the parents who should take more attention to their children and help them with developing a healthy internet use. On the other hand, romantic relationships seems to be a protective factor against the PIU for youth which may help keep in contact with the real life.

“I've always preferred a computer to a television because I could do there what I wanted to do, not--as in case of television--what they told me.” The role of information and communication technologies in the socialization of teenagers.

Kateřina SVATOŇ GILLÁROVÁ (Charles University in Prague, Czech Republic) | katerina.gillarova@gmail.com

Adolescence is a specific time of human life: one is not a child anymore, however is not an adult yet. It is a period when the teenager is intensively building her/his own identity differentiating it from the parents’ one and reproducing the stock of knowledge gained in the primary
socialization. Adolescents are searching for the spaces free of parents’ regulations. They are trying to escape the territories where the formal distribution of power disadvantages them, such as school institution. Peer-to-peer group and media represent the important “hideouts” where the young people can act and express themselves to certain measure liberally. Indeed, during last decade the every day set of media and communication channels has changed. Information and communication technologies (ICT) have established themselves as axiomatical and ubiquitous elements of young people’s everyday leisure lifestyles and school-based experience. They became the tools of identity development and management, the means of facilitating the social relationships with peers and the family and the sources of entertainment or information. Thus, how has been this revised media toolkit shaping the socialization in adolescence? There is still little evidence in the Czech context.

This paper will try to shed some light on this problematic based on the results of PhD research project. In this research two natural social groups of teenagers born in 1992 and 1993 were studied from 2010 to 2012 using qualitative methods such as focus groups, in-depth individual interviews or media diaries. The methodology was enriched of some aspects of participatory research and netnography. The data analysis was approached from the conception of grounded theory.

The text will describe how new technologies empower the studied teenagers in building their own autonomy and identity different from the one of their parents. It will show that the socialization of late adolescents’ carries the same principles and aspects it used to have in the time of the so-called traditional media dominance but it occurs in slightly reconfigured contexts. ICT strengthen the research participants’ control over their activities enabling them so to reduce the parents’ or other opposing institutions’ surveillance. The studied young people use it actively and strategically for fulfilling their needs so characteristic for adolescence such as “surviving” school duties and mainly peer-to-peer socialization. This way these technologies have been on one hand facilitating the weakening of the socialization effects of such agents as parents or school and on the other hand they have been empowering the teenagers to mobilize their agency and thus have been strengthening the self-socialization and peer-to-peer socialization.

The Future Through the Eyes of the Young: Rethingking the Italian Public Broadcasting Service

Mihaela GAVRILA (The Future Through the Eyes of the Young: Rethingking the Italian Public Broadcasting Service) | mihaela.gavrila@uniroma1.it

Public Service Broadcasting has certainly not been unaffected by the radical changes and numerous crises at both national and global levels, and in order to avoid excessive disruption and disintegration of society in such times of crisis, the PSB is tasked with the restoring of normal social rhythms and sense of community. In Italy this task has been even more difficult since the profound current economic crisis is accompanied by a severe legitimacy crisis for the RAI, the Italian Public Service Company since 1954.

Moreover, we also need to add another issue concerning the RAI: on May 16, 2016 the public service concession expires and the renewal of its RELATIONSHIP with the public will be due. Following the model of other European public services (BBC but also France and Germany), this will become an opportunity for a genuine public consultation aimed at rethinking both the content and services of the RAI.
The time is also ripe for to consider the long-neglected issues concerning the RAI’s relationship with the younger audiences, the ones that, at least in Italy, have moved away and have difficulty in recognizing themselves in the public service television.

It seems indeed plausible to say that the time has come for Rai to think about the procedures and contact strategies to be implemented to intercept the young public, especially when these are beyond its reach and increasingly find refuge in the free zones of the web, pay-as-you-go television, and the various solutions that use IP-based audio-visual content.

On the basis of these considerations, which are confirmed by the listener/viewer data and field studies, we have considered it appropriate to investigate the TV consumption practices and activities aimed at the younger generations.

This paper proposes, therefore, to point out some of the key issues identified the first results of a study sponsored by the Department of Communication and Social Research of the University of Rome “La Sapienza”: the reputation crisis of of the PSB among young audiences; the old and new media practices and behaviors of young people aged between 14 and 29; the expectations the young people have vis-à-vis the RAI; content and technology platforms through which they would like to watch public service TV; issues they would like the RAI to address; the importance of a multi-platformed PSB could take in accompanying Italy towards the exit of the current economic, cultural, moral crisis.

The investigation which is still on-going, is carried out through web surveys and focus groups and involves young people aged between 14 and 29. The goal is to provide evaluation guide lines to allow for a better programming and business conduct definitions which correspond to the demands and expectations of the young audience by, combining entertainment expectations, availability of technology and quality of products.

It is also through this initiative that RAI could increase its value as a public service. This implies a shared, open, dialectical, and transparent debate with all of its users, particularly with the young people, the part of the viewers forgotten by the new liberal politics, by the society, by the disseminating media.

“The history of income and wealth inequality is always political, chaotic and unpredictable; it involves national identities and sharp reversals; nobody can predict the reversals of the future” (Piketty, 2014)

RN30S11 - Civic Participation

Differences and inequalities in civic mindedness and participation among Bulgarian youth

Siyka Kostadinova KOVACHEVA (Paisii Hilendarski University of Plovdiv, Bulgaria) | siykakovacheva@gmail.com

This paper addresses the question: what explains the differences in young Bulgarians’ civic values and experiences of informal volunteering, participation in associations and civic protests twenty-five years after the regime change. The explanation is based on the results of a representative social survey with 1030 young people aged 14-27 in the summer of 2014, funded by the Friedrich Ebert Foundation.

The data show that both attitudinal and behavioral measures of civic engagement are influenced, albeit in different degrees, by structural factors such as gender, education, family background, ethnicity, locality and socio-economic status. A very important intervening variable is trust which in this survey is measured towards a variety of social groups. In general, young people in the country tend to express high trust in family and friends and low trust in people outside their immediate milieu. This kind of social capital mobilizing closed horizontal ties
ensures support in uncertain times but does not enable more enriching, even if uncertain, contacts with members of wider communities. It also influences the types of voluntary actions young people engage in: more often personal assistance for people they know or see directly and much less often involvement in organized activities. Having higher education, middle to high socioeconomic status, living in large cities or the country’s capital provide opportunities for the young to recognize the benefits of membership in civic associations. The expanding access to the Internet acts as a relative counterweight to the differentiating effect of the rising income inequality.

Social inequality and youth civic participation
Laerke BONNESEN (Roskilde University, Denmark) | lbonnesen@ruc.dk

Across Europe, youth volunteering has been put on the political agenda. Civil society organizations are increasingly looked to as platforms for the participation of young people, and as influence channels through which adolescents and young adults can become familiar with democratic processes and influence decision-making in their communities.

Concerns over the civic integration of young people are, though, voiced regularly. It is frequently stated that youths are disengaged with community life and politics. In Denmark, a recent population study revealed that youths aged 16-25 years are less likely to volunteer than older adults, and similar results have been found in other Western countries.

The aim of the present study is to look beyond overall patterns of youth participation and investigate potential differences among groups of young people. The well-established fact that volunteering is dominated by societal groups rich on human and social capital highlights the dangers of treating young people as a homogenous group with similar opportunities for civic participation. In this study, I will attempt to account for potential inequalities in volunteering among youths along the lines of social and educational resources.

A resource perspective on civic participation informs us of the risk that growing inequalities in European societies might 'spill over' into volunteering patterns. Rich panel data from two waves of the Danish Voluntarism Survey allow me to assess not only static images of present-day volunteering among youth, but also dynamic developments that has taken place in the past decade.

Social capital and civic engagement in transition to early adulthood: a cohort study
Barbara Barbosa NEVES (University of Toronto, Canada; CAPP, ISCSP, University of Lisbon, Portugal) | barbara@bbneves.com
Diana CARVALHO (CAPP, ISCSP, University of Lisbon, Portugal) | dianadiascarvalho@gmail.com
Fernando Humberto SERRA (CAPP, ISCSP, University of Lisbon, Portugal) | fserra@iscsp.ulisboa.pt

In times of economic crisis and socio-economic changes, individuals can use their social capital to cope with harsh financial and social environments. Sociological research evinces that social capital is as important as economic, cultural, and symbolic capital in contemporary societies. Following a Bourdieusian approach, we define social capital as the resources that are potentially available in our social ties and that can be mobilized for instrumental (e.g., help finding a job) or expressive (e.g., emotional support) reasons. Those with higher levels of social capital seem to have greater social and economic opportunities, since social capital predicts social support, status attainment, employment, and well-being. But how is social capital accrued and maintained by young people in transition to early adulthood? Using data from the EPITeen cohort study of young people in Portugal, we examine social capital and civic engagement of
individuals surveyed at ages 17 and 21 (n=1602). We use collective forms of civic engagement to explore formal networks. The preliminary findings show that at age 17, 78% of respondents have three or more close friends and the majority meets with their ties frequently. Respondents receive more emotional (65%) than financial support (37%) from their networks. Most respondents (86%) were never part of a political/civic organization or involved with religious activities (69%), but 27% participated in sports or leisure-related organizations. At age 21, they report similar patterns although indicate receiving more emotional (87%) and financial (59%) support from their networks than at age 17. Implications of descriptive and multivariate results are discussed herein.

**Mental and social maps of young adults civic activity**  
Monika KWIECINSKA-ZDRENKA (Nicolaus Copernicus University, Poland) | monika.kwiecinska@umk.pl

There is no doubt that both youth and young adults differ as far as the level of civic activity (or broader: engagement in public sphere), but also as far as mental and social basis for it are concerned. We observe a deliberative turn in young people political behavior that manifest especially in the will to engage in unconventional forms of action for the common good, as well as in defining what it is. It is worth concentrating on two aspects of this turn. First, the different forms of the turn: varieing from the formalized forms of deliberation (such as referendum or citizens’ law initiatives) to agonistic ones (Ch. Mouffe) or populism (E. Laclau). Secondly, it is interesting to see what is the role of political socialization on the level and form of youth engagement. The paper aims – based on empirical observation and desk research (both international statistics and media analysis) draw a mental and social map of young adults activity – what are the sources of engagement, what are the catalysts and what is the future (both directions and subject of) engagement of youth and young adults in public sphere.

**RN30S12 - Rural and Urban Space**

**Creatively Reworking the Everyday: Rural Youth Visualizing Rural Space**  
Raili NUGIN (Tallinn University, Estonia) | nugin@tlu.ee

In recent years, there have been calls for more nuanced understanding of the everyday contexts of rural youth. Several rural youth researchers have pointed out that a number of critical social problems affecting young people’s transitions (out-migration, unemployment, marginalisation) are studied mono-dimensionally, treating young people as victims of social change and offering macro-perspective rather than giving voice to young people themselves. Besides their own reflections on their life perspectives of the future, it is also important to study how young people make sense and negotiate the challenges in their everyday practices. This paper aims to contribute to fulfilling the gap by revealing how rural young people creatively rework and negotiate their daily space and contexts. For this purpose, along with interview data, visual material will be used. The presentation will be based on photo-diaries of the young rural people of two different localities (Vastseliina and Pühalepa), where they contextualise their favourite spaces and the ones they dislike, combined with in-depth thematic interviews based on the photos they have taken. This methodology enables not only to open the contexts of the everyday lives of rural youth, but also provide insights into their creative thinking and how they make use of their daily spaces for constructing their identity.
Suburban Youth in Madrid and Paris. The Role of Intermediate Structures in the Integration of Children from Muslim Background

Cecilia ESEVERRI MAYER (Ecole des Hautes Etudes en Sciences Sociales, France) | ceciliaeseverrimayer@yahoo.es

LOCAL YOUTH (Marie Curie project) is a comparative research about the socialization of youngsters (16 to 29 years old) from Muslim background in two banlieues of Paris and two barrios of Madrid. Through a methodology that combines case studies, comparative-historical perspective and sociological intervention (Touraine, 1978), a critical evaluation has been performed on the results of community social work and the role played by intermediate structures (families, ethnic networks and civil associations). A particular attention has been given to the gender dimension.

The main results of this research can be classified in three sections: 1) In the suburbs of Paris we are witnessing a re-traditionalization of the customs and norms, but at the same time a youth re-interpretation of the Muslim rules. By contrast, the lowest ethnic segregation in Madrid generates young people’s resistance to follow norms and in consequence intergenerational conflict arises. 2) In both cases, the support of the ethnic community has ambivalent effects. It is positive only when these ties are strengthened by a solid social capital. Otherwise, ethnic norms could be a barrier for youth seeking to gain access to education and employment. 3) The community social work in Paris and Madrid is changing, but in a different way. In Paris, the institutionalization of the civil associations has increased integration opportunities, but has also broken the link with the Muslim community. In Madrid, the lack of state presence encourages the collaboration between secular and religious associations, giving young people a new place of belonging and new tools to the accomplishment of a new urban citizenship.

Jeanette ØSTERGAARD (SFI - The Danish National Centre for Social Research., Denmark) | jea@sfi.dk

The city at night is a place of consumption, play and hedonism (Featherstone 1991). But it is also characterized by contradictions, tension, competition and risks. Young people are both regulated participants, but also active users of these urban playscapes (Chatterton & Hollands 2003). However, little is known about young people’s disparate experiences and emotions evoked by these different and segmented urban places (Massey 2009, 1998; Malbom 1998). Methodologically, the paper draws on nine photographic images of urban playscapes (Chatterton & Hollands 2003), shot in different Danish and English cities/towns by the London-based, Swedish photographer Maja Daniels. These different images of urban places are presented and discussed in 30 in-depth interviews with young people aged 18-30 in the United Kingdom and Denmark respectively. The young people interviewed were encouraged to reflect on the visual material as clues, microcosms and provokers (Törrönen 2002) of playscapes. The young people’s experiences and emotions evoked by the images are discussed within recent theories of emotional geography (Hubbard 2005, Thrift 2004) and theories of the nighttime economy (Chatterton & Hollands 2003).

Growing up poor in austerity Britain: multiple deprivation and poor transitions in one super-diverse East London borough

Anthony Donovan GUNTER (University of East London, United Kingdom) | a.gunter@uel.ac.uk
Official UK Labour Market statistics since September 2011 (and up to August 2014), have consistently shown that employment is continuing to rise whilst unemployment is continuing to fall, and that London and the South East are performing particularly well. These buoyant UK Labour Market statistics unfortunately mask a number of key issues that are contributing to firstly increasing numbers of people in work poverty and secondly entrenched worklessness and labour market disadvantage; both issues are disproportionately affecting particular regions, localities and demographics such as the 16-24 year old and BAME populations. Consequently, whilst London as a region is economically vibrant, research evidence indicates that youth unemployment and poverty are at crisis point particularly within the Eastern boroughs of the capital. This paper will firstly examine the various New Labour Government regeneration and other initiatives, tasked with tackling youth exclusion in East London. More significantly, this paper will review the current austerity climate of Conservative-Liberal Coalition Government cuts to public sector expenditure; and in particular present a case study outlining how these cuts have impacted upon young people’s transitions in one East London Borough. The case study includes empirical data gleaned from a five year ethnographic study of two East London neighbourhoods and comprises semi-structured interviews with key community stakeholders and practitioners as well as biographical interviews with young adults aged 14 -24.

**RN30S13 - Transitions to Adulthood**

Pathways and transitions to adulthood during the economic recession in Finland: Developmental tasks, financial resources, and agency

Mette Aino Maria RANTA (University of Jyväskylä, Finland; University of Helsinki, Finland) | mette.ranta@helsinki.fi

The transition to adulthood is characterized by frequent and often simultaneous changes in life situation, such as leaving the parental home, finishing secondary education and moving to further education and/or working life, forming a romantic partnership, and becoming a parent. Many of these transitions are related and rely on gaining financial independence. However, recent structural changes in labor market opportunities, economic turbulence, and increasing youth unemployment have had significant effects on young adults’ transitions to financial independence, the overall transition to adulthood and timings of achieving developmental tasks. Overall, pathways into adulthood have become less standardized, and more flexible, heterogeneous and differentiated. Failure or radical postponement in normative key developmental tasks during the transition to adulthood may predict, in turn, problems in well-being and attaining further developmental tasks. Furthermore, the instable nature of the transition phase and complexity of the society can lead to uncertainty, ill-being and maladaptive functioning in different life domains. Inevitably, young adults are expected to manage constantly changing circumstances, increase flexibility and tolerate insecurity as they are seen as the most economically vulnerable in times of societal economic turbulence. However, young adults also adapt and become active agents in their lives, this portraying the constant agency versus structure debate in developmental research.

This presentation examines young adults' transitions to adulthood in Finland during the global economic recession taking place from 2008 onwards. The specific focus is on gaining financial independence and life management through individual agency and pursuing personal goals across young adulthood, and their concurrent and longitudinal effects on attaining key developmental tasks related to career and social relations as well as life satisfaction development. The key theoretical perspective on examining contextual definitions of development during young adulthood is the life course perspective and multidisciplinary
frameworks on the notion of agency, integrating psychological and sociological perspectives, and analyzed as personal goals and use of achievement and social strategies. The study conceptualizes young adults as active agents, and explores their ways of improving their objective financial situation by acknowledging the presence of a realistic risk in order to be protected from financial distress. Due to the fact that several life events occur at a relatively similar time period but to a different extent and timing for each individual, this study focusing on transitions allows examining individual variety in adopting adult roles as well as personal experiences reflected through life satisfaction. The theoretical perspective on the changing transitional, holistic and prolonged nature of young and the newly defined emerging adulthood in relation to attaining normatively identified key developmental tasks in Finland are also discussed.

This presentation focuses on findings from a recent doctoral dissertation (submitted January 2015) which had three general aims: to examine underlying mechanisms on how financial resources influence youth development and life satisfaction; to give an overview on life situations and the multifaceted transitions in midst of a prolonged and challenging life course phase of searching for independence and drastic societal change; and to explain the role of agency in managing financial issues and developmental tasks. Finally, current research interests on the financial situation of 25-30 year old young adults will also be introduced. The data is from the ongoing Finnish Educational Transitions Studies (FinEdu) longitudinal research project with questionnaire data from young adults from ages 18 to 25 from years 2004 to 2011. The quantitative analyses used both variable- and person-oriented approaches to investigate longitudinal developmental processes and variety in adopting adult roles and differences in life satisfaction.

The results showed that agency, indicated by use of achievement and social approach strategies, was especially important in shaping life course transitions, life satisfaction and success and satisfaction regarding developmental tasks at age 25, especially concerning social strategies. Young adults' financial situation improved from an objective level from age 20 to 25 but the subjective perception on sufficiency of income did not rise and financial situation did not have an effect on success and satisfaction concerning developmental tasks. Life satisfaction, in general at the mean level, did not change during the educational transition from upper secondary high school to further education and/or employment although the analyses revealed significant heterogeneity among young adults in life satisfaction development, resulting to the division of young adults into five life satisfaction trajectories. A high level of agency at age 19 was related to high life satisfaction trajectories as was higher subjective financial situation at age 22. Third, the results showed that the highest frequency categories and profiles of personal goals and concerns at ages 20 and 23 were in the career domain; education, work, and finances, with education being prioritized at age 20 and work at age 23, and less dominantly related to romantic relationships. The goal profiles were associated with related life situation cross-sectionally and longitudinally and with personal concerns especially concerning the career domain, reflecting the current socio-economic climate. All in all, the results also portrayed the heterogeneity of life situations and multifaceted transitions in midst of a prolonged challenging life course phase of searching for independence and drastic societal change. The published articles composing the doctoral dissertation give insight on how supportive societal infrastructure, sufficient social networks, personal goals, and financial resources are all crucial for healthy youth development. Likewise, forming action reflecting life management through employment and education as supportive mechanisms protect from economic stress and promote a smooth transition to financial independence. Young adulthood should not be seen as a contrast to adulthood but as a process, a transition, between the life phases of adolescence and adulthood in which multiple life domains cross as individuals gradually shift between education and work and thus engage in multiple tasks and responsibilities. Furthermore, the social and economic policies and the universal support of the Finnish tax-funded welfare state
provide an example on how socioeconomic structures interact with personal aspirations, accomplishments and agency regarding developmental tasks, promoting individualistic choice-making and young adults’ need for autonomy but simultaneously “buffering” against the negative impacts of the global and national economic uncertainty regardless of the financial concerns young adults cope with.

**Youth Transitions to Economic Independence**

Melanie BOEWING-SCHMALENBROCK (German Youth Institute (Deutsches Jugendinstitut e.V.)) | boewing@dji.de  
Tilly LEX (German Youth Institute (Deutsches Jugendinstitut e.V.)) | lex@dji.de

Compared to other European countries, which are currently affected by high rates of youth unemployment and precarious processes of job entrances, transitions from school to vocational training and (adequate) employment in Germany seem uncritical, as German economy is growing and complains about skills shortage. Hence, adolescents living in this country on the one hand face supportive occupational possibilities. On the other hand, a reformed tertiary educational system as well as structurally changing job markets or increasing labour migration also impose new challenges upon contemporary youth in Germany on their way to economic independence. In addition, educational performance and job chances in this country still undeniably depend on young people’s socio-economic and migration background. As a result, the access to vocational education and employment underlies socially unequal conditions. Considering this context, this research traces youth transitions to economic independence, focusing on steps from school to work referring to longitudinal national data. Deciding questions are:
- “How do those between school and employment make use of the given opportunities and at the same time manage corresponding challenges (who profits, who struggles)?”
- “Which students do actually implement their former aspirations concerning future education and employment?”

The empirical analyses are based on the first (2009) and second (2014/2015) wave of the quantitative DJI-Survey AID:A (“Growing up in Germany”, Survey of the German Youth Institute – DJI). The survey provides representative longitudinal data of children and adolescents in Germany (altogether 25,000) relating to – among other aspects – detailed information on educational and vocational biographies and decisions.

**Early transitions to adulthood: where does the rush come from? Evidence from a longitudinal study in Portugal**

Diana CARVALHO (ISCSP, Portugal) | dianadiascarvalho@gmail.com  
Diana MACIEL (ISCSP, Portugal) | maciel.diana@gmail.com  
Anália Maria Cardoso TORRES (ISCSP, Portugal) | atorres@iscsp.utl.pt

The prolonged nature of the transitions to adulthood has been emphasized on youth studies, framed by the theories of de-standardization of the life course. This paper intends to have a critical approach to this trend by focusing the attention on the young people who make earlier transitions.

Some evidence shows that these early starters are mainly from disadvantaged backgrounds, presenting more vulnerable and risk trajectories, largely associated with poor investment in school and less skilled jobs, and seem to be reproducing their parents’ transitional patterns. Using a longitudinal dataset (EPITeen) of young people born in 1990 in Oporto, Portugal (n=1716), the aim of this paper is to socially characterize the young people that have made early professional, housing and/or family transitions. We intend to explore and explain those who by
the age of 21 had left school (8.5% only completed until the 9th grade and 26.8% more until the 12th) and were working full-time (15.1%); had already married or were in civil partnerships (5.2%); who were living with their spouse or alone (4.9% and 0.7%); and/or the young girls who already had children of their own (5.8%). Additionally, a couple of case studies taken from qualitative interviews will be used to illustrate the ambiguities of these pathways.

**Young, free and independent? A discussion of the transition to adulthood and intergenerational relationships**

Ann NILSEN (University of Bergen, Norway) | ann.nilsen@sos.uib.no

The transition from youth to adulthood is thought of as a sequence of events of which the outcome is associated with becoming an autonomous individual independent from the family of origin. The prominence of the terms autonomy and independence varies over time and according to gender and social class as well as between countries. The paper discusses these notions and relates them to the transition to adulthood in the context of intergenerational relationships. An overarching question is whether ideals of a ‘free and independent’ individual impact on young people’s way of thinking about if and how family and kin are important during this transition. Are there differences between men and women, between generations and across social class on this dimension? Empirically the paper draws on biographical data from three generation families in Norway and compares the transition to adulthood across generations with reference to intergenerational transmission.

**RN30S14 - Work Values and Volunteering**

**Intergenerational transmission of job insecurity: Linking parents’ job experience and children’s work preferences and expectations**

Christiane LÜBKE (Universität Duisburg-Essen, Germany) | christiane.luebke@uni-due.de

As the labour market becomes increasingly flexible, a growing part of workers has to cope with precarious work arrangements and the experience of job insecurity. Aside from the causes of this trend, questions concerning the societal and individual consequences of self-perceived job insecurity have attracted great attention. It is therefore well-known that besides others job insecurity affects the ability to make long-lasting decisions. Thereby, it should be noted that these consequences may not be limited to workers who are exposed to insecure working conditions. Rather, it can be assumed that the experience of job insecurity will be passed on children and will therefore also influence the life of the next generation. However, the intergenerational transmission of job insecurity has rarely been addressed so far.

To fill in this gap, this paper explores the relationship between parent’s self-perceived job insecurity on the one hand and occupational preferences and expectations of their adolescent children on the other. How does the perception of job insecurity affect adolescent preferences for stable jobs? How do children who see their parents suffering from insecure working conditions rate their own employment opportunities? The descriptive and multivariate analyses are based on household panel data from the German Socio-Economic Panel (SOEP, 2000-2013) which provide information on parents and their adolescent children. The findings will encourage a debate of how self-perceived job insecurity contributes to reproduce social inequality as they clearly show that expectations concerning labour market participation are transmitted from parents to children.
Intergenerational transmission of volunteering. Socialization and status transmission effects disentangled?
Belit SAKA (University Duisburg-Essen, Germany) | belit.saka@uni-due.de

Volunteering has been considered as highly socially desirable due to its benefits for the society and for the volunteering person itself. However, volunteering is also an indicator of social inequality as it is limited to a certain group, and can reproduce social inequality if it is transmitted from parents to children.

In order to examine the role of volunteering in the inheritance of social inequality, this paper focuses on the extent and mechanisms of intergenerational transmission of volunteering in Germany.

First descriptive results suggest a clear positive correlation between parental and children's volunteering. However, the mechanisms behind this correlation are still unclear. A possible explanation of intergenerational transmission of volunteering is based on the influence of parental socialization during formative years of adolescence. Respectively, intergenerational transmission can be carried out directly either by internalized norm and values inculcated by parents which foster volunteering in the later life, or parents can set role models by volunteering themselves which can be observed and imitated by their children due to social learning process. However, social, cultural and financial resources provided by parents can also facilitate or impede volunteering and are of particular interest. The social status of parents can influence the volunteering of parents as well as the children, and serve insofar as mediator of intergenerational transmission processes and respectively may overlap the socialization effect.

Drawing on the German Socio Economic Panel Data (1984-2011) this study aims to disentangle socialization and status transmission processes and thus answer the question whether and to what extent each model accounts for explanation of intergenerational transmission of volunteering in order to discuss different strategies for volunteer recruitment.

Inequalities and Volunteering: Who gets to work for free?
Bryony HOSKINS (Roehampton University, United Kingdom) | Bryony.Hoskins@roehampton.ac.uk

In the context of the economic crisis and the subsequent austerity formalized volunteering experiences have been identified by national and European policy makers as a tool to enable access to employability in particular for youth e.g. UK Vtalent. The purpose for policymakers to advocate a formalized volunteer experience are multiple and include the opportunity to enhance skills, the possibility to add experiences of work related activities on young people’s CV’s and the possibility for young people to develop networks with people and organizations that may enable future offers of paid employment (Newton Joy Oakley Emma Pollard 2011 and Patrick McCloughan, William H. Batt, Mark Costine and Derek Scully 2011). Scholars have argued that a formalized voluntary experience can give a young person the competitive ‘edge’ (Heath 2007 p.89) when applying for employment or higher education. However, if volunteering experiences are now recognized as a credit that can open access to employability and higher education then questions regarding equal access to volunteering need to be addressed.

In this context, this paper will explore how young people describe their opportunities and experiences of volunteering and the extent to which these experiences have been used towards successfully gaining paid employment. The data drawn from for this research is from the ESRC LLAKES center project on the Crisis of Contemporary Youth that includes a total of 100 interviews completed in 2013/14.

The paper will draw on Bourdieu’s concept of cultural capital and his theory of reproduction of social class and privilege. In terms of cultural capital we draw predominantly on the aspect that
Bourdieu calls institutionalized cultural capital. This concept is described as the acquisition of certain experiences that enable the transmission of social class (Bourdieu 1986). The example of this type of cultural capital that Bourdieu (1986) used was education qualifications. However, in recent years, when education qualifications become more common and employment has become scarcer then formal experiences of volunteering could be considered as an additional credit. These theories will be explored in relationship with the voices of the young people.

‘I just don’t want to connect my life with this occupation’. Working-class young men, manual labour and social mobility in contemporary Russia.
Charlie WALKER (UNIVERSITY OF SOUTHAMPTON, United Kingdom) | charlie.walker@soton.ac.uk

A key strand in the Western literature on working-class masculinities focuses on whether young men are capable of the feminized performances apparently required of them in the new service economy. However, the wider literature on processes of neoliberalisation – emphasizing the ‘hollowing out’ of labour markets, the cultural devaluation of lower-skilled forms of employment, and the pathologisation of working-class lives – would suggest that it is not a gendered, but a classed transformation that is demanded of young men leaving school with few qualifications. This dimension of neoliberalisation is highlighted by ethnographic data exploring the experiences and subjectivities of young workers in post-Soviet Russia, where manual labour has not given way to 'feminized' work, but has become materially and symbolically impoverished. Although traditional forms of manual labour and the performances of masculinity surrounding them thus continue to be available, they are perceived as incapable of supporting the wider transition into adult independence, and are therefore emasculated. In this context, young workers attempt to emulate new forms of ‘successful masculinity’ connected with new service sector professions and the emergent higher education system, despite the unlikelihood of overcoming a range of structural and cultural barriers. These acquiescent, individualized responses indicate that, while ways of being a man are apparently being liberated from old constraints amongst more privileged young men, neoliberalisation narrows the range of subject positions available to working-class youth.

Understanding Migrant Self-Employment and its implications for Economic Adaptation: An Investigation of Three Generations of Turks Settled in Europe
Sebnem EROGLU (University of Bristol, United Kingdom) | S.Eroglu@bristol.ac.uk

This article focuses on three generations of Turkish migrants who are currently living in Europe (i.e. settlers) in order to understand a) whether generational differences exist in the nature and extent of their involvement in self-employment and b) what these differences imply for their economic adaptation into the host societies. The research base for this study is a large-scale, innovative survey that draws parallel samples of migrant and non-migrant families from their origins in Turkey and follows them up across Turkey and Europe over three generations. The data is drawn from personal interviews performed with 2,346 settlers nested within 922 families. The results pose a challenge to the assimilation theory by demonstrating a significant tendency for the well-educated settlers across all generations to enter into low-status, small businesses regardless of their language proficiency, citizenship status and country and duration of residence in Europe. They rather lend support to the discrimination/disadvantage theory, casting doubts on the successful economic adaptation of three generations of Turks into the European labour markets.
RN30S15 - Violence and Deviant Behaviour

Everyday Life Conflicts or Crimes? Framing and naming violence and victimization in schools
Johannes LUNNEBLAD (Department of Education, Communication and Learning, University of Gothenburg) | johannes.lunneblad@ped.gu.se
Thomas JOHANSSON (Department of Education, Communication and Learning, University of Gothenburg) | Thomas.johansson@gu.se
Ylva ODENBRING (Department of Education, Communication and Learning, University of Gothenburg) | Ylva.Odenbring@gu.se

Sweden has been pictured as distinct from other Europe countries’ in the way of handling crime committed by children and youth. This is now about to change and more schools tend to treat violence in schools as a crime. More students are categorized, as victims of crime, which means that different types of violent acts in schools have become a police matter, rather than a social and pedagogical problem. The aim of the present study is to explore how a number of secondary Swedish schools categorize and support students who have been exposed to different forms of violent or abusive acts. We are interested in how the category of “the victim” is narrated in school practices. We are primarily studying the narrative level through interviews and observations with school officials. The focus is on how and if the category of “the victim” is present in the talk on violence, harassment and bullying. Analytically, we are interested in how categorizations and forms of explanations, used in the schools by the professionals, emanates from institutional and professional discourses. These discourses are also interpreted in terms of class, gender, ethnicity and place. The results indicate that there are contradictory discourses on school violence. Another finding is that there is dissatisfaction with how things are “solved” among the officials. Categorizing “the problems” in terms of diagnosis or as acts of crime can be seen as a temporary solution, but in fact the identified “problem” seldom leads to satisfactory solutions, according to the school professionals.

“I would never start a fight but…”. Masculinities and ‘the right amount’ of violence
Signe RAVN (SFI - The Danish National Centre for Social Research, Denmark) | shr@sfi.dk

This paper explores how young men negotiate and try to live up to norms and expectations for being a ‘real man’ and how this plays into their attitudes towards physical violence such as street fighting. Drawing on classic and more recent developments in gender studies and sociological theory, I explore the boundaries for presenting oneself as a ‘proper young man’. Empirically, the paper is based on a qualitative focus group study of risk-taking among 52 Danish students in high school and vocational training. While the majority of the interviewees distance themselves from using violence as a solution to conflicts and view this as mere ‘stupidity’, they nevertheless also describe concrete situations, which have required or would require them to act violently. In the descriptions of such situations, notions of comradeship, pride and self-respect are central. What comes forward is a complex relation between physical violence and masculinity: accomplishing masculinity for the young people in the study involves the ability to balance the fine line between being capable of acting violently if required, but without actively seeking out violence as such. Not being able to respond violently when
encountering violence carries the risk of being viewed as unmanly. For the young interviewees then, performing the right amount of violence, in the focus groups as well as in their everyday life, is crucial to accomplishing an identity as a ‘proper young man’.

**Italian Young men and women’s Representations of Violence**  
Sveva MAGARAGGIA (University of Roma TRE, Italy) | sveva.magaraggia@uniroma3.it  
Ilenya CAMOZZI (University fo Milan-Bicocca) | ilenya.camoZZi@unimib.it

This present ation is based on a qualitative research (participant observation, narrative interviews and focus groups) conducted in Milan in 2011 (within a PRIN research) with two different age cohorts:  
a) 16-18 years old – in the final years of upper-secondary school;  
b) 22-24 years old – in the period in which experience of the social world is acquired with increasing autonomy.  
The research focused upon the representations of violence within the relational world of young people in school and, consequently, to analyse the possible new thresholds for the attribution of legitimacy to violent behaviour.  
The main research question that is discussed here is whether, and how, the features of uncertainty, de-standardization and redefinition of youth influence the meanings attributed to violence and its representations among young men and women.  
The results presented focus mainly on two dimensions: intergenerational relations with teachers and parents and gender relationships amongst peers.

**Deviant behavior – increasing or decreasing the social status among peers?**  
Marie Christine BERGMANN (Criminological Research Institute of Lower Saxony, Germany) | marie.bergmann@kfn.de

Adolescence is characterized by a relatively higher willingness to violate behavioral norms. Keeping this in mind, it seems logical to assume that those adolescents who do not behave in a conform way are more popular compared to peers who follow societal norms. However, this might not hold true for all forms of norm violation. Especially severe violent disorder seems to be rather status limiting. Using complete network data of 145 school classes of the 9th grade, this presentation aims to reveal which deviant behaviors reduce or increase popularity. Popularity is measured by the number of classmates who denounced a fellow pupil as a friend. Deviant behavior is captured by school absenteeism, consumption of alcohol, carrying a gun and school related aggressive behavior. The results indicate that predominantly the consumption of alcohol increases the popularity among peers. Regarding the other forms of deviant behavior no or a negative relationship with the number of friend denominations is found. Analyses regarding gender differences confirm the results.

**RN30S16 - Social and Professional Mobility**

The role of training firms in explaining transitions to higher education  
Ines TREDE (Swiss Federal Institute for Vocational Education and Training SFIVET, Switzerland) | ines.trede@sfivet-switzerland.ch  
Irene Susanna KRIESI (Swiss Federal Institute for Vocational Education and Training SFIVET, Switzerland) | irene.kriesi@ehb-schweiz.ch
Many studies highlight the role of firm characteristics and work rewards in explaining work satisfaction and career trajectories. Whether such structural aspects also matter for young people in firm-based vocational education and training (VET) has rarely been investigated. We attempt to fill this gap by analyzing whether structural characteristics of the training firm influence educational choices of VET learners after completion of upper-secondary VET. This question is of particular relevance for countries with a large VET sector, such as Switzerland, where the majority of young people enter upper-secondary VET.

Segmentation theory posits that the labor market is divided into segments, which differ regarding product markets, average firm size or qualification level of the staff (Sengenberger, 1987). These structural differences result in varying working conditions (e.g., task quality) and opportunities for further training. We hypothesize that young people who trained in firms with higher resources and better educated staff are more likely to pursue a tertiary-level education than those who trained in firms offering less favourable training conditions.

Our analyses are based on a longitudinal full sample of Swiss healthcare apprentices, representing one of the largest groups of VET learners. They were surveyed in the last year of their apprenticeship (2010) and one year after completion (2012). Descriptive and multivariate results show that structural characteristics of the training firm matter.

Youth, social mobility, education and depression
Helena SANT'ANA (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | hsantana@iscsp.ulisboa.pt
Diana MACIEL (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | maciel.diana@gmail.com
Anália Maria Cardoso TORRES (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | aторres@iscsp.ulisboa.pt
Rui BRITES (ISEG/ULisboa) | rui.brites@outlook.com
Elisabete RAMOS (ISPUP, University of Porto) | elramos@med.up.pt
Henrique BARROS (ISPUP, University of Porto) | hbarros@med.up.pt

This paper discusses results from a longitudinal study combining social sciences with public health theoretical approaches. The research followed the trajectories of a cohort of youngsters of both sexes born in 1990, in the city of Oporto, a universe of 2943 individuals, and it was launched by the Institute of Public Health of the University of Oporto. They were inquired at 13, 17 and 21 years old. The survey in now again on the field (youngsters with 24/25 years old) with the collaboration of the Institute for Social and Political Science of the University of Lisbon, and qualitative interviews are also being carried out.

Our topic of research developed herein will be basically concerned with the relationship between youngster’s social and educational background, social mobility, educational success and feelings of depression.

The five profiles of social mobility identified in the research show that the type of social mobility has a strong relationship with gender and depressive symptoms. Girls tend to have higher levels of depression feelings. However, they differ with age group – being higher at 13 than at 17 – when they have lower levels of educational attainment and a history of school retention. For boys, the trend remains, though always with lower baseline values.

Using a theoretical approach combining life course, social class and social mobility perspectives, gender studies and epidemiology we will try to explain these findings.

Social mobility profiles in the transition to adulthood. Results from a longitudinal study
Anália Maria Cardoso TORRES (CIEG/ISCSP/University of Lisbon, Portugal) | aторres@iscsp.ulisboa.pt
The literature has shown that there is a close interconnection between different dimensions of individuals' life-courses, such as education, work, family ties, health, self-identity, sexual experiences, attitudes, and values. In this regard longitudinal datasets are particularly relevant to study change concerning major sociological features of transitions from adolescence into adulthood.

Drawing on data from a cohort study of young people in Portugal (n=1707), this presentation seeks to explore five social mobility profiles: (1) Upward (26.5%); (2) Social reproduction in disadvantaged sectors (24.1%); (3) Social reproduction in advantaged sectors (19.0%); (4) Social reproduction in intermediate sectors (16.6%); (5) Downward (13.8%). Using descriptive and multivariate analysis the preliminary findings show some important profile differences (but also similarities) related to parenting styles, networks of sociability, leisure-time, subjective well-being and physical and mental health, body image and risk behaviors.

EPITeen, the study on which this presentation is based, was launched in 2003-2004 by the Institute of Public Health of the University of Oporto and collects data from individuals who were born in 1990(n= 2943). When the study began, respondents were 13 years old and attended all the schools in the city of Oporto. They were interviewed again at 17 and 21 years old. With the collaboration of the Institute for Social and Political Science (ISCSP) of the University of Lisbon, a new wave is now being carried, the youngsters having 24/25 years of age.

Dissenting Youth in Hong Kong: Perceived Social Mobility, Value Orientations, and Local Identity

Hang LI (The Chinese University of Hong Kong, Hong Kong S.A.R. (China)) | lihang@cuhk.edu.hk
Stephen Wing Kai CHIU (The Chinese University of Hong Kong, Hong Kong S.A.R. (China)) | stephenchiu@cuhk.edu.hk

In the past few years, young people in Hong Kong have not only participated actively in different protests but also played a leading role in some social movements, for instance, the Umbrella Movement in 2014. Commentators have suggested two different perspectives to account for the political unrest among youth, namely, that their discontent is a result of the lack of opportunities for social mobility in the younger generations, and that the rise of youth activism is actually driven by a rather deep-rooted change in values and attitudes. Based on the data from two telephone polls conducted in 2010 and 2014 among the young people, this paper attempts to answer the following questions: (1) how does the younger generation perceive their own position and opportunities in the socio-economic system? (2) does the younger generation have unique political attitudes, value orientations and identities vis-à-vis the older cohort? (3) how strong are the associations between their perceived opportunities for upward mobility, and different value orientations (post-materialism, national identity, and local identity) on the one hand, and their dissenting attitudes on the other hand? Through multivariate analysis, this paper also evaluates the relative merits of the two explanations about the recent surge of youth activism in Hong Kong. We conclude that dissatisfaction with blocked social mobility has only a very slight effect on youth’s negative orientations towards major policy decisions, while systemic relationship between value orientations and social unrest among youth is found irrespective of their demographic backgrounds.
Delayed Educational Sequences in the Life Course of Young Adults in Germany
Oliver WINKLER (Martin-Luther-University Halle-Wittenberg, Germany) | oliver.winkler@soziologie.uni-halle.de

Starting in the 1970s, a growing decoupling between educational tracks and educational degrees can be observed in the German educational system. Institutionally, increased educational openness favoured greater reversibility of educational decisions. This development led to advantages especially for students with intermediate secondary school degrees. They could easier access higher secondary educational tracks or “second-chance-education” which is a requirement for university education. Life course theory suggests that participation in subsequent education is highly determined by structural conditions in the historical time that frame opportunity structures for biographic decision-making among different cohorts. It is expected that educational expansion, changes in occupational structures, business cycles, demographic change and transformation processes impact the early career patterns of young adults originating from various birth cohorts differently. Using data of the National Educational Panel Study (NEPS) combined with methods of (quantitative) sequence analysis, the empirical findings suggest that the studied career patterns show strong orientations for academic educational activities if worsened economic situations decrease chances to transition into vocational training. This is also true for persons that were born within smaller birth cohorts. Furthermore, the expansion of higher secondary education system corresponds with reduced educational activities for younger cohorts but to enhanced participation for older cohorts. German reunification appears to have promoted obtaining higher secondary school degrees but without necessarily pursuing higher education afterwards. In general, students with intermediate secondary school degrees appear to be “cautious ascenders”. However, the intermediate degree maintains a conductive function leading mostly into advantageous pathways during early career.

‘Dropout’ and age-normativity in school-to-work transitions
Kristoffer Chelsom VOGT (University of Bergen, Norway) | kristoffer.vogt@sos.uib.no

Drawing on a sub-specialty in life course research, the study of age-normativity (Settersten and Hagestad 2006, Hareven 1978), this paper discusses questions relating to the ‘timing’ of transitions from school to work. These questions are addressed with illustrative examples from Norway. Since a major reform in 1994, completion of upper-secondary has been expected of young people before the age of 20. Those who do not complete within this formal age-deadline are defined as ‘dropouts’. The last two decades have seen a great increase in concern over what have in fact been stable dropout rates. Dropouts from upper secondary are now considered, by leading policy actors, to be ‘one of the greatest challenges’ confronting contemporary Norwegian society. In this paper, the case of concern over dropout in Norway is used to illustrate a more general phenomena: increased age-normativity in school-to-work transitions. This development is clearly class-biased. As much previous research has shown, the protracted and linear transition patterns which more and more young people (in Norway, as elsewhere) have been expected to follow, are modeled after a middle class transition pattern. Increased age-normativity in school-to-work transitions can be seen as period-specific (and class biased) form of restricting the structures within young people act. The last section of the paper discusses some of the implications of stricter age-norms in school-to-work transitions, and asks if a development in this direction is ‘inevitable’.
Transition from primary to secondary schools among immigrant youth in Europe.
Aigul ALIEVA (Luxembourg Institute of Socio-Economic Research (former CEPS/INSTEAD), Luxembourg) | aigul.alieva@ceps.lu

The transition from elementary education to secondary is most crucial in educational systems which channel children at an early age into different educational streams. The decision to refer or place a student into particular education streams is often made based on student’s previous achievement. Immigrant children in Europe are most likely to attend vocational schools and graduating from these schools usually precludes pursuing tertiary education (or a higher education). However, very little is known about how socio-economic inequalities in primary school shape the probability to be placed into specific programmes in secondary school, controlling for earlier achievement.

Stratified educational systems are more likely to generate higher segregation alongside the socio-economic lines: with students of wealthier and better-educated parents being enrolled into academically-oriented schools and programmes, and students of poorer background being pulled into low-level vocational programmes. Immigrant students are more likely to be placed into lower-track programmes, which in reality implies that they are more likely to find themselves in schools with higher concentration of disadvantaged students. The paper aims at answering the following question: "Does the individual background of an immigrant student determine the probability to attend more socially segregated school controlling for previous school performance? And if it does, to what extent?"

We use pseudo-panel data from matched PIRLS 2006 and PISA 2009 surveys for 12 EU countries and estimate the probability of immigrant youth placement into specific programmes based on propensity score matching method.

The importance of youth activities and class origin for entering tertiary education
Erica NORDLANDER (University of Gothenburg, Sweden) | erica.nordlander@socav.gu.se

The main objective if this study is to empirically investigate the significance of class origin, school grades and youth activities during upper secondary school for entering tertiary education. During the last decades in Sweden, social mobility has increased and children from working class origins have to a higher extent entered tertiary education. However, youths from advantaged class origins move on to university studies to a higher extent than youths from more disadvantaged positions. Due to these two parallel features and, as variation within classes still exists, we need to further explore the mechanisms of social mobility by exploring to what extent the practices or conditions of youths, extends or reproduces class differences in tertiary studies. By examining how youths from different class origin engage in activities and the importance of these activities for an entry to tertiary education, we can better understand the process of social mobility and the variability of outcomes within different social groups. However, doing so, places high demands on data. With a unique combination of survey data from both youths themselves and their parents, together with registry data, this study has extensive information on the lives of youths. Data used derives from the Swedish Child Supplement of the Survey of Living Conditions (Child-ULF) conducted in 2002-2005, in combination with the Survey of Living Conditions (ULF) and registry data from the University and College registry (Statistics Sweden).

'Who are you to know who I am'- how to reduce dropout-rate in England, Denmark and Hungary
Szilvia SCHMITSEK (University of Warwick) | s.schmitsek@warwick.ac.uk
My PhD work, which will undertake a comparative study of strategies to reduce dropout-rates in three European nations: England, Denmark and Hungary. This research will contribute to the literature by highlighting the controversies of rigid education systems and discussing the potential in services targeted to individual needs of the students to raise productivity and performance.

The rationale behind sampling three European countries is to compare and contrast substantially different support systems and national strategies. By analysing procedures, my study will explore successful institutional strategies of reintegrating students into education and training or employment. By listening to the voices of young people, my analysis focuses on the relevance of personal support with special regard to positive relationships.

The target group of the research is former students, who were in need of intensified guidance efforts and/or participated in second chance provisions in secondary education. From a constructivist stance, early school leavers can be considered as social constructs and the three -country -contexts as social contexts, which influence the terminology and understandings of ‘early school leaver’. The way early school leaving is defined plays a crucial role in the development of policies to prevent or to reduce it.

In order to explore the complexity of the process, a qualitative investigation has been carried out. For the analysis of my data as an approach for my research design about what have helped students retain in schools, I use grounded theory as a methodology to generate or develop a theory from first hand data.

RN30S18 - Agency and Socio-political Change

Youth through social sciences. A kaleidoscopic view
Andrea PIRNI (University of Genoa, Italy) | andrea.pirni@unige.it

This is a theoretical paper and it deals with "Youth as social agents". The paper's intention is to stimulate the identification, among the scientific literature that covers youth, of coordinates of synthesis. Different trans-disciplinary paths of research, that are partially overlapping in scientific reflection, are synoptically presented to offer some elements for the elaboration of a perspective that sees in youth not only a field of research, but a starting point to contribute to the study of social change. This paper tries to stimulate the elaboration of these coordinates while suggesting a map of paths of research that, in retrospect, can be identified in the scientific literature of reference. These paths are very clearly distinguished to present some of their characterising factors as they are often overlapping and interconnected in sociological reflection. Four paths of research shall be identified in the attempt to highlight the research question that stimulates each one’s development and initial disciplinary and conceptual texture. This – illustrative and incomplete – exercise’s objective is to move towards an autonomous research perspective, inspired by the Research Network on Youth and Generation of the European Sociological Association, to allow the production of more resources, to better acknowledge an understanding of a social change that is capable of surpassing the uncertain limits of youth. It is strongly believed, in fact, that the moving from a field of research to a research perspective consists of one of the fundamental steps towards the affirmation – and further structurisation – of Youth Studies within the European scenario.

‘Having To’ as a culturally defined part of agency in the youth
Tarja JUVONEN (University of Helsinki, Finland) | tarja.juvonen@helsinki.fi
This article discusses agency in the youth from the perspective of cultural expectations, namely from the modality of ‘to have to’. Even though the modern society emphasizes an agency which is autonomous and able to make choices, the themes of necessity, obligations and responsibilities that frame the individual freedom are important. Especially the phase of life of youth is bounded by various structural, social and cultural restrictions. The article draws on research, which data were collected in the Helsinki metropolitan area during the years 2010-2011 in the context of an outreach project targeted at young people who are outside of education, employment or training (NEET), and who cannot find or get the social, health or employment services they needed to. The audiotaped data consists of (1) 11 interviews, (2) 11 meetings between the youth and the outreach workers and (3) 10 meetings in which young people in the company of an outreach worker ran errands to different institutions such as Adult Social Services, the Unemployment Office and the Housing Offices.

In this article the focus is targeted to young people’s, outreach workers’ and social workers’ speech in their shared encounters. Especially the strategies of outreach workers to deal with the necessities and obligations that young people are facing in their lives are explored. The data is analyzed using Modality theory and the Voice-centered relational method as a heuristic device from the point of view of ‘to have to’. The preliminary understanding was that different authorities have plenty of culturally and socially defined tasks that are linked with young people’s responsibilities and obligations. In a way it can be argued that the culturally defined ‘to have to’ is an integral part of the agency of young people, that part, which indicates the limits of an agency that is free to make choices. The styles of worker’s speech that were found from the data were 1) setting boundaries to youths’ agency, 2) appealing to youths’ moral sense of duty and 3) bringing new viewpoints to the youth.

Divergent patterns of trust in East-Central Europe. The case of youth in Hungary.
Bence SÁGVÁRI (Hungarian Academy of Sciences Centre for Social Sciences; Indiana University, Bloomington) | sagvari.bence@tk.mta.hu

Countries of East-Central Europe are still often considered as a single unit in terms of their basic social characteristics. However in a closer look this assumed unity is rather questionable. Using data from the consequent waves of the European Social Survey (ESS), I argue that regarding social trust of young people these differences increased in such an extent that divide East–Central Europe into distinct blocks and thus provide explanatory power for understanding diverging paths of economic and social development. In accordance with the theories of trust and generational values, the permanent erosion of social and institutional trust in some countries of the region could be a major obstacle for the future success of these societies. Low levels of trust also have a major implication for both national and European politics by strengthening disappointment and passivity or extremism on both sides of the political palette. Based on the ESS data and my qualitative research on youth, it seems that there is no real rupture between certain social-economic values and attitudes of younger and elder generations. Therefore – in terms of their values – the generations that gained their primary experiences under socialism and after the change of regime do not constitute well separable social groups. Moreover, the level of trust towards various institutions among young people is even lower than compared to older generations. In this paper I analyse and interpret these results in the light of the prolonged economic crisis and the growing level of uncertainty and international migration of young people in Hungary.

3. Youth in (post)communist space - a driver of social change or a big social problem? Some remarks based on an international project covering several European and Asian countries
Krystyna SZAFRANIEC (Nicolaus Copernicus University, Poland) | krystyna.szafraniec@umk.pl

The youth of Europe cannot be understood as one large homogeneous group not only because of structural factors that operate in each country or inherent characteristics (like socio-economic background, education level, gender and so on). There is another, very important differentiating factor - the political past. Young people living in North-West Europe and those living in postcommunist countries live in two different spaces. Understanding this can be crucial not only for describing possible ways of social changes taking place there, but for the perspective of coherent, sustainable Europe as well.

This paper refers to the international project covering 9 postcommunist countries from Europe and Asia, where the analysis of young generation in the context of transition processes is the main object. It is observed that young people living there are influenced by values and patterns similar to those addressed nowadays by global culture to the whole young generation. What is more, the logic of transition in their countries stimulates their aspirations and life expectations even more, although in poorer and slower transforming countries the aspirations are lower and expectations are not so demanding. Nevertheless, in all those countries the level of youth’s aspirations moves borders of life satisfaction beyond the past standards and becomes both the source of tensions and the pressure on changes. The question put here is, can the young generation living in postcommunist space be suspected of being a driver of social changes or - rather - of being a big social problem? How to answer this question - how far-reaching can be sociological imagination when existing data are not rewarding enough? This methodological reflection will be located among some observations made in the study.

RN30S19 - Structural Conflicts and Inequalities

The dynamics of the socialization of the Russian youth in a changing world
Olga Alexandrovna URZHA (RUSSIAN STATE SOCIAL UNIVERSITY, Russian Federation) | olga.urzha@gmail.com

Today we live in a globally changing world. Adults who know the history, understand in what future they want to live. Youth is the social group, which determines the future. But it is not equally ready for this future, as every young person goes through their socialization under the influence of the factors that are determined by the environment.

Over the past 30 years, as a result of political and economic changes in the country, Russian youth has experienced a complete rejection of the old values, which had underlied the upbringing of their parents, and the formation of market relations, which on a certain stage gave rise to negative traits: for many young people only the values associated with material goods and financial well-being have become vital. Social values came to the background or ceased to have any value. Political activity, participating in elections, involvement in the affairs of state and municipal government was not prestigious.

New factors in the socialization of young people were the attempts, carried out by certain media, to rewrite the Russian history and conduct the revision of national values and sources of pride. The opening of the ‘iron curtain’, which had separated Russia from the outside world for many years, had both positive and negative consequences for young people. The processes of globalization in the world have also become factors of the socialization of youth in Russia. Significant changes are taking place among youth in Russia today. Today the study of the state of modern Russian youth, the dynamics of its development, the formation of interests and values are of great interest for sociologists. These issues are in the focus of the author's research and report.
Youth on Croatian islands: Double institutional dependency and local reproduction of structural inequalities

Sven MARCELIĆ (University of Zadar, Department of Sociology, Zadar, Croatia) | smarceli@unizd.hr
Valerija BARADA (University of Zadar, Department of Sociology, Zadar, Croatia) | vbarada@unizd.hr
Željka ZDRAVKOVIĆ (University of Zadar, Department of Sociology, Zadar, Croatia) | zzdravko@unizd.hr

Due to many societal risks in general and extremely high unemployment rate in particular, Croatian youth are faced with many biographical restraints or, in Beck’s terms (1986/1992), with many institutionally dependent individual solutions. In this paper we discuss Croatian youth living on the islands, empirically relying on 2014 research designed for surveying geographically scattered and scarce populations. The results are triangulated from 8 focus groups conducted on islands, 3 expert interviews and on-line survey (N=293). Research topics encompassed Croatian island youth’s social and living conditions considering employment, quality of life and perception of their and island’s future. Although island youth is economically provided for rather well by their parents who provide a safe climate in the time of economic recession, youth is not entering adulthood since other institutional mechanisms are not present. Without parents’ participation they would be completely socially excluded, living in poverty. This means that island youth is faced with double institutional dependency. On the one hand their life is framed by traditional family relations and geographically isolated island community way of living. On the other hand, local island institutions (local government, education, labor market, transport) are barely functioning, even in non-crisis periods, permanently failing to provide societal framework for individual solutions. Double institutional dependency forces youth to live within the boundaries of traditional societal solutions and not to make their own individual biographies. It can be concluded that, due to local reproduction of social inequalities, the youth on Croatian islands is lost between these two institutional frames.

Human potential of Russian youth: structure and forming methods (the case of a big city).

Anastasiia SAIKOVA (Novosibirsk State University, Russian Federation) | 7175000@mail.ru

This paper illuminates features of human potential of Russian youth, living in big cities. The main accent is made on structure and forming methods of human potential. The relevance of this topic conditioned with the fact of importance of human potential for the social development, as well as emphasizing young generation as main resource of the functioning of society. The subject matter is to reveal particular methods of forming the human potential of the Russian youth.

Information data base consists of:
- data array obtained from the study "Youth of the new Russia: lifestyle and value priorities," which was conducted by the Institute of Sociology in collaboration with the Friedrich Ebert Foundation
- eight depth interviews with respondents from 22 to 26 years old, living in the big city.

The main outcomes of the research are:
- identification of the structural features of the human potential of Russian youth
- description of the socio-demographic characteristics inherent to the representatives of different features of human potential
- analysis of methods of forming the human potential of the Russian youth.
Young People Between Generation Location and Generation Unit
Karolina MESSYASZ (University of Lodz, Poland) | karolina.messyasz@gmail.com

The paper considers the problem of the social position of young people, especially in Poland, and reflects on whether young people as a social category (or certain subcategories) are characterized by at least one generation unit. In the time of the last economic crisis, it can be assumed that there are objective conditions to go beyond the generational community of fate, perhaps even in the European context. There are signs of intentional participation in movements aimed at restituting a broadly defined concept of the common good. They took the form of social movements such as Occupy Wall Street that allowed us to suppose that the rebellion of young people can create a new social context. Is excess of educated young people out of work but the future, armed with new technology, who shares the lack of access to material resources and the inability to implement symbolic aspirations and achieve adequate social position, more than Mannheim Generationslagerung? Whether, despite the far-reaching individualization and commodification of all aspects of social life, there is a chance for inclusive society and politics? Do hope to achieve them can be placed in youth? In an attempt to answer the above questions, I make a critical overview of the processes, research results (by me and others) which, in my opinion, make it difficult to go beyond the current and immediate actions.

RN30S20 - Uncertainty, Precarity, Economic Recession

The impact of the crisis on the Spanish labour market: an effect of the age, gender, generation or personal characteristics?
Pilar ZUERAS (Centre d'Estudis Demogràfics, Spain) | pzueras@ced.uab.cat
Pau MIRET-GAMUNDI (Centre d'Estudis Demogràfics, Spain) | pmiret@ced.uab.cat

Six years have gone by since the economic crisis began, and in this time lapse it has heavily hit the Spanish society. The unemployment rate has multiplied by 2.5, from 9.60% in the first quarter of 2008 to 23.70% in the fourth quarter of 2014. Has it been harder for younger than for older workers? For men than for women? Contrary to previous crisis in Spain that had stronger affected men, it seems that labour market hardship has spread throughout all workforce sectors, and the gender gap has narrowed. In the period 2008-2014, 20% men in the labour force (aged 16 to 64) were unemployed and 22% of women. While beyond age 48 unemployment affects around 15% of men and women, among younger workers the unemployment rate decreases across age from 55 to 23% for male and female in their twenties. However, has unemployment homogeneously increased for other subpopulation groups? Has it hit equally lower and higher educated workers? We will use the Spanish Labour Force Survey (EPA) to shed light on differences and potential inequalities in the impact of the crisis on the population. We will particularly analyse the effects of age, gender, generation and personal characteristics, such as educational level or family arrangements, on the evolution of unemployment rates between 2008 and 2014.

The Transitional Phases of Greek Youth In The Time of Economic Crisis
Sotirios CHTOURIS (University of the Aegean, Greece) | htouris@aegean.gr
Dionysis MPALOURDOS (National Center for Social Research, Greece) | htouris@aegean.gr
DeMond S. MILLER (Rowan University, United States of America) | millerd@rowan.edu
The recent economic and social crisis, which has affected been particularly hard on the South European countries, raises the urgent question about the ways of achieving economic and social sustainability in both national and regional economies. In Greece, as well as in other South European countries, during the past decade, we witnessed a series of precursor phenomena to the current crisis. We present findings of an ongoing national survey (In4Youth National Survey) on youth transition from education to employment and entrepreneurship. The study is designed to present a typology of unemployed youth and their transitional trajectory, namely, from different status and educational level to employment and professional identity. Common analysis on the issue of youth transition normally focuses on transitional phases taking place after the completion of compulsory education. In recent times, these transitional phases are extended in time and number beyond specific milestones. Young people are involved in more complex trajectories and transitions in the areas of precarious employment, professional education, family life, peer relations, as well as political participation. The complexity of this transition depends largely on transformations taking place at the foundation of economic and social integration of young people in Greece and Europe. On the one hand, this situation is combined with a liquid social identity for the majority of young people while on the other hand there is a growing extreme right political radicalization of certain clusters of Greek Youth. We consider social, cultural and human capital an important prerequisite of the young people to cope with the extremely high unemployment and the bankruptcy of whole economic sectors and social services.

**Early Careers on a Segmented Labour Market: Who Can Escape the Precarity Trap?**

Anna Kierszryn (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland; Institute of Sociology, University of Warsaw, Poland) | chaber@is.uw.edu.pl

The way that globalization and increasing economic uncertainty impact the young and their transition to adulthood has become an important and policy-relevant subject of inquiry. In particular, much attention has been paid to the potential effects of the growth in atypical employment on the career prospects of labour market entrants. The question is whether such employment serves as a stepping-stone to stable jobs or leads to successive spells of short-term jobs separated by periods of joblessness. If the latter is the case, it is important to determine which factors increase the chances of escaping precarity traps and successful labour market integration. In Poland, these issues are of particular significance: although the Polish economy has done quite well throughout the economic crisis, the rates of youth unemployment and temporary employment remain disturbingly high, and precarity for young workers appears to have become the norm. This paper addresses both questions through a quantitative analysis of career data for a cohort of respondents aged 21-30 from two waves of the Polish Panel Survey (POLPAN), conducted in 2008 and 2013. POLPAN data include rich and detailed information on the respondents' educational and employment history since the beginning of their careers. This study adds to existing research on youth career patterns in the following ways: it covers a longer time span for those who entered the labour market at an early age, differentiates employment spells according to the type of contract held at each successive job, and takes into account NEET status rather than unemployment.

**RN30S21 - Scarcity and Economic Poverty**

Young people's experiences on scarce financial resources
The paper examines how young people experience limited financial resources: how lack of money is perceived to form and limit life choices?

In Western welfare states absolute poverty is rare but relative poverty and social polarization, on the contrary, are very actual and even increasing societal problems. In Finland the risk of poverty is most likely faced by young people 18-24 years old and also unemployment is significantly more common than among other age groups (Statistics Finland 2012 & 2014). Often it is stated that the poverty of young people is not such an important issue as the incomes tend to increase later in life along improving education and professional development. However, it is also known that poverty is often transmitted from parents to children and for certain people it tends to be permanent. One explanation for this are the various ways in which lack of financial resources restrict the life choices that are possible and available. Relative poverty means incapability of attaining the standard of living which prevails in the society. Lacking financial resources exclude material and social assets that are available for the majority of people.

Social inclusion of young people is one of the critical questions for the future well-being of European countries, Finland included. Yet, surprisingly little is known about how young people experience the lack of money. In this paper young people’s experiences are examined from interviews collected in one socially deprived neighborhood in Tampere, Finland. Especially three aspects of deprivation come up from the interviews: residence & housing, moving & travelling and social relations.

**Literary production: young people in Favela da Mangueira, Rio de Janeiro**

Regina ANDRADE (Universidade do Estado do Rio de Janeiro, Brazil) | reginagna@terra.com.br
Ligia ALMEIDA (Universidade do Estado do Rio de Janeiro, Brazil) | almeidaligia@hotmail.com

The aim of this study is to examine how the practice of literary interfere positively in the trajectory of individuals who are in a situation of social vulnerability. The research took place at the Centro Cultural Cartola topper, located in the community of the hose in the city of Rio de Janeiro, a space that fosters individual and social experience of children and young people through educational and cultural tools: dance, orchestra of violins, music, capoeira, judo, ballet, workshops, literary readings and text compositions, which enable the creation of cultural values of the community and the individuals through the process of identification. The workshop "Literary Production: Weaving the Imaginary" began in May 2011 with proposals to stimulate the creation and reading of fictional texts, allowing the narrative as a vector of (re) construction of the subject and the collective, under the ethically and aesthetic. The investigative phase consisted of workshops literature presented in two ways: Reading and Writing in groups - small - or individual. The field work of our qualitative research, participatory requested that we make a spatial area of our experience so that we could enter from there to the theoretical framework that was feasible our research object. Matter dynamics of the action of social actors. The research, structured on the action, proved holds numerous possibilities where imagination presents itself. The interaction through speech that stimulate the imagination and reflection influences the group and the individual in the building itself and its world. Since the goal of the research is not only suited to the practice of oral telling and listening to stories, but stimulate them to invent and write them realize that this mode prevailed. By requiring that the child somehow mastered this type, mainly because the act of writing the stories invented by validating them and arranged by others in books. Since orality can disperse the entry of the child in their imaginary world, with greater importance for very young children who have not yet
entered the world of language. The way we conducted the research was always to stimulate the imagination, capturing it, and from that place it in the world of language, symbolization. To MINAYO (1992), "The method is the very process of development of things ...". In this sense, arose from that practice, a text / subject, whose words were a trunk from which spread a multitude of creative ideas. The result of the investigation found that the fictional creation, stimulates and develops the imaginary and the symbolic representations impoverished. Demonstrating just how rewarding and enjoyable for children and youth in their participation activity that make the educational and therapeutic one "adventure camp". Observe the repairing effect of literature on the individual, and consolation in times of grief and crises of all sorts was evident in border situation, the use of the internal world of this powerful tool Psychopedagogical as strengthening psycho.

Youth transitions in Spain: a broken social promise for middle classes
Marta GUTIÉRREZ SASTRE (University of Salamanca, Spain) | magusa@usal.es
Eva MARTIN COPPOLA (Universidad Nacional de Educación a Distancia, Spain) | evamc79@gmail.com

This paper analyzes youth transition to adulthood in Spain from a micro perspective. The context of deep economic changes and rigorous budget cuts in social policies allows us to inquire how middle class young people are facing their uncertain socio-economic and political integration.

The research team followed a qualitative methodology to give voice to youth. 35 semi-structured interviews were made among young men and women aged 24-30. All of them had university studies though they had different degrees of emancipation. Five of them had recently migrated to other European countries due to hopeless social and labor conditions.

The results reflect the perceptions of the crisis, the strategies developed by young people and their hopes of integration into adulthood. Different pathways induce the development of dichotomous young profiles in terms of winners and losers with the idea of a "broken social promise" and the decline of collective and state responsibility. The findings suggest that young people overestimate their individual choices given throughout their lives but place less emphasis on social determinants that negatively affect their transition to adulthood.

Bending the Rules for the Children's Sake – Young Parents in Poland and the Problem of Quality Early Childhood Education and Care (ECEC)
Piotr BINDER (Polish Academy of Sciences, Poland) | pbinder@ifispan.waw.pl

Young parents understand the importance of quality early childhood education. Polish regulations do not guarantee a legal right to ECEC to each child. Attendance is compulsory for one year before primary education starts, however according to Eurydice and Eurostat Report 2014 before that moment as much as 37% of children in Poland stay home with their parents.

Our study, funded by National Science Centre (Poland), investigated this problem by a combination of quantitative and qualitative methods on the example of four communities (two urban and two rural) in the central region of Poland. The study documents in detail how in process of satisfying social need for ECEC the three main actors in the field – local authorities, headmasters and young parents – struggle with centrally created rules. The shortage of places in public kindergartens (run locally, supported by central subventions) is a sensitive issue for all of them.

Although the paper concentrates on the perspective of young families from various-income backgrounds (some of them decide to increase their chances by bending or breaking the formal rules of recruitment process), the phenomenon of flexible attitude towards official regulations,
applies to all the actors in the field creating this way a peculiar environment, where everything is
done for the children’s sake.

**RN30S22 - Health, Risks, Well-being**

**Patterns of leisure experiences and its relation to leisure time activities: A study among teenagers in the Brussels-capital region.**

Hans BERTEN (Childhood & Society, Belgium) | hber@k-s.be
An PIESSENS (Childhood & Society, Belgium) | api@k-s.be

Most leisure research to date is embedded in a health discourse and focuses on patterns of
leisure activities and its various multifaceted determinants or health benefits. In this study we
make use of a lifeworld orientation to leisure, and focus attention on the different ways children
experience and give purpose to the temporal and spatial aspects of leisure time. Using data
from the Brussels Leisure Research Project, which collected data from a sample of Flemish
students aged 11-18 years old (N = 2,448), we were able to distinguish three underlying
dimensions of leisure experience (outdoor-orientation, boredom, and lack of time) and three
clusters of youngsters with similar patterns on these underlying dimensions. We further discuss
how this typology of leisure experience is linked to different choices of leisure activities on the
one hand and socio-demographic background characteristics on the other hand.

**Social mobility, education and risk behaviours in youngsters. A longitudinal study**

Fernando SERRA (CAPP, ISCSP, University of Lisbon, Portugal) | fserra@iscsp.ulisboa.pt
Helena SANTANA (CAPP, ISCSP, University of Lisbon, Portugal) | hsanta@iscsp.ulisboa.pt
Anália Maria Cardoso TORRES (CAPP, ISCSP, University of Lisbon, Portugal) | atorres@iscsp.ulisboa.pt
Diana MACIEL (CAPP, ISCSP, University of Lisbon, Portugal) | maciel.diana@gmail.com
Diana CARVALHO (CAPP, ISCSP, University of Lisbon, Portugal) | dianadiascarvalho@gmail.com

Literature shows a close relation between social mobility and health related behaviours as a part
of an explanation of social class differences in health. Young people risk behaviours are more
frequent among downwardly mobile and less frequent among upwardly mobile and the achieved
social position is more strongly related to risk behaviours than class of origin. Education proved
to be a determinant factor in the health values and risk behaviours as well as in the future social
position.

Longitudinal studies are particularly relevant to bring new evidence to this issue and to clarify
the specific factors that explain the relation between social mobility trajectories, education and
risk behaviours over time.

This paper discusses preliminary results from a study following the trajectories of a cohort of
youngsters of both sexes born in 1990, in the city of Oporto, Portugal (n= 2943). They were
inquired at 13, 17 and 21 years old. The survey is again on the field (youngsters with 24/25
years old).

Five social mobility groups were obtained by the comparison of the youngsters’ educational
attainment with their own parents’: upward; disadvantaged reproduction; advantaged
reproduction; social reproduction in intermediate sectors; downward. The results show that the
probability of the youngsters to adopt risk behaviours (e.g. drugs addiction, alcohol abuse,
stealing, physical fighting…) is higher in the downwardly group than in the upwardly group. Data
also indicates the way school experiences and study habits facilitate the prevention of risk
behaviours and healthy life styles.
Gender differences in attitudes towards health and appearance of young Polish women and men
Emilia GARNCAREK (University of Lodz, Poland) | emilia_garncarek@poczta.fm
Ewa MALINOWSKA (University of Lodz, Poland) | ewamal@uni.lodz.pl
Julita CZERNECKA (University of Lodz, Poland) | jczernecka@uni.lodz.pl

Within the same culture the definitions of femininity and masculinity are differentiated in relation to people who are in different stages of life. Youth (as well as other cultural concept of age as middle age or old age) plays a significant role in formulating social expectations towards men/women and experiencing his or her femininity/masculinity. Among other factors it also affects the attitudes of individuals towards their health and appearance. Those human capital resources are recently of great importance in terms of an individual's functioning in various areas of social life, especially for young people. (According to stereotype of youth being young means to be attractive, healthy, vital etc.).

In our paper, based on qualitative research (individual and focus group interviews conducted with young women and men) we reconstruct the cultural concepts of femininity and masculinity in connection with the cultural concepts of youth, which are functioning in Polish society. We determine how young women and men perceive and evaluate their health and appearance; how and why they care about their health and appearance or not. As mentioned gender and age diversifies the attitudes of individuals towards the health and the appearance. But it can be assumed that modern cultural concept of youth reduces the importance of gender. Gender poorly differentiates the attitudes of young people. They are largely androgynous, also with regard to the attitudes towards the health and the appearance.

RN30S23 - Ethnic Minorities, Identity Negotiation

Success Factors of Youth with Double Minority Status in Romania
Rita PÁSZTOR (Partium Christian University, Romania) | ritapasztor@gmail.com

Romania is one of the poorest countries in the EU and faces considerable challenges in managing growing poverty and social disparities, especially when vulnerable groups such as children and youth are considered. One in two children and youth in Romania are living at risk of poverty, which impacts on all segments throughout their life. Social exclusion, on the other hand, significantly damages their socio-economic, psychological and physical status. Moreover, poverty and social exclusion produce a vicious circle, out of which children and youth can hardly escape.

In this paper we present characteristics of a selection of Y and Z generation representatives who can be considered successful despite their condition. We aim at revealing the key factors of the success, as well as dimensions such as the identity and values, of youth with double minority status, using qualitative research methods. The target group consists in Hungarian Roma youth living in Bihor County, in Romania, who come from socially deprived family backgrounds.

The results supports the hypothesis that success is only possible when the family and the school sustain these young people. Also, the research outlines the characteristics of the successful type of these youngsters, as well as the self-sustain schemes that lead to success.

Transnational Home of European Third Culture Kids in Shanghai
Sakura YAMAMURA (University of Hamburg/Maastricht University) | syamamura@hotmail.com

Globalization brought about wide-ranging movements of especially Western and European highly-mobile professionals. It is suggested that they create a ‘borderless’ transnational space and culture differing from the local people. Their families and particularly their children, however, have been under-researched. Third culture kids (TCK) spend significant parts of their developmental years in this floating world of different cultures and places, moving between Europe and other continents. Thus, in contrast to their parents, they create a different relationship and sense of belonging to the societies and have a special perception of their “being home”.

This paper presents the results of an investigation into the dual meaning of “home”, i.e. the physical home of residence and the emotional tie of “feeling home”, of German-speaking European youth between 14 and 18 years of age in Shanghai. Shanghai, as one of the most vibrant and rapidly changing cities in the world, can be regarded as exemplary for the development of the highly fluid world which nurtures the creation of such transnational identities and homes. It gives answers to how such mobile lifestyles in and out of Europe affect the identity of European TCKs. Using data from a survey conducted on spatial mobility as well as on their socio-cultural identity and self-perception on their mobile lives, complemented by mind maps of “home” in abstract terms and mental maps of their world, it provides unique and valuable insights into one of the recent social phenomena affecting an increasing number of European youth in the globalizing world.

‘Being Modern and Modest’: South Asian Young British Muslims Negotiating Multiple Influences on their Identity
Michela FRANCESCHELLI (UCL Institute of Education, United Kingdom) | m.franceschelli@ioe.ac.uk
Margaret O'BRIEN (UCL Institute of Education, United Kingdom) | m.obrien@ioe.ac.uk

With the rise of multiculturalism in Britain the visibility of religion, in particular Islam has increased. This growing religious diversity has created new contexts and affected young people’s identity and transitions to adulthood. This article applies and extends Bourdieu’s theory of habitus and social fields to a new area which is the study of how South Asian young Muslims living in England negotiate between the Muslim and British aspects of their identity.

The set of individual dispositions (habitus), which originates in the family field under the influence of South Asian cultures and Islam, changes and it is transformed when it comes into contact with non-Islamic fields. As with to the concept of habitus, identity involves reconciling individual dispositions and structural conditions. Based on qualitative insights emerging from 25 semi-structured interviews with South Asian young Muslims, the article presents different strategies of identity negotiations exemplifying the constant and complex interplay between individual agency and the social world.

RN30S24 - Family Formation, Housing Transitions

The financial conditions of young people’s housing transitions in Switzerland
Caroline HENCHOZ (Université de Fribourg) | caroline.henchoz@unifr.ch
Boris WERNLI (FORS, Switzerland) | boris.wernli@unil.ch

Youth sociologists usually note different stages of transition to adulthood, which are often understood as access to autonomy and financial independence (Galland, 2009; Harnett, 2000).
We focus on a particular stage of the passage to adulthood – leaving the parental home, which is often described as a way to gain autonomy – and we examine the impact of this emancipation process on youth living conditions. We use the waves 1 to 15 from the Swiss Household Panel, a representative longitudinal annual survey of the general Swiss population, to study the economic impact of leaving the parental home for several hundred young people aged 18 to 29. Some objective and subjective indicators of financial situation, as well as debt and material conditions, are used as dependent variables. Our analysis shows that for a number of young people access to autonomy through leaving their parents’ household induces a decrease in material well-being. In a second step, we develop a typology of the impact of this emancipation process on young adults living conditions and we link it with their personal, educational and professional trajectory.

The Construction of Romantic Relationships by Youth in Germany and Kyrgyzstan
Ekaterina CHICHERINA (Bergische Universität Wuppertal, Germany) | chicherina_e@mail.ru

The article presents the results of the comparative qualitative study of romantic relationships of youth in the context of two countries – Kyrgyzstan and Germany. Romantic relationships take a special place in young people’s experiences in their transition to adulthood. It is interesting to study how modernization and globalization makes impact upon this sphere. The research makes an attempt to investigate how young women understand romantic love and construct their romantic relationships in different modern societies. The study explores what kind of changes young women are experiencing in this sphere in contemporary conditions, and how the realization of romantic relations varies in different cultural and social contexts. The findings of the study are consistent with the view that individualization process characterizing the modernity, has caused dramatic shifts in the understanding of romantic relations. The influence of this process is increasing at the present time. The research showed some similar shifts in Kyrgyzstan and Germany. These changes could be caused by dramatic social transformations of the latest decades in such countries like Kyrgyzstan. At the same time some other results of the research indicate that there are still many differences between the perceptions of romantic relationships by young women in these two countries. And the conclusion about the continuing influence of cultural traditions and national values on this sphere goes in line with the perspectives which consider romantic love as a culturally specific phenomenon.

Romanian Adolescents’ Expectations to Cohabit and Marry
Mihai-Bogdan IOVU (Babeș-Bolyai University Cluj-Napoca, Romania) | iovu.mihai@socasis.ubbcluj.ro
Paul Teodor HARAGUS (Babeș-Bolyai University Cluj-Napoca, Romania) | tpharagus@yahoo.com

Adolescence is often discussed as an important period for adolescents in their transition to adulthood. To date, there is a quite extensive literature providing theoretical understanding and empirical data on the timing and occurrence of significant life events as cohabitation, marriage and parenthood. The current study examines factors associated with teenagers’ expectations to cohabit and their expectations to marry. Our analyses draw on recently collected data from the project Outcomes of adolescence. A longitudinal perspective on the effect of social context on successful life transitions. Data from the first wave (n=3,524) allowed us to conclude that upon exiting formal education, 25.3% plan moving with the partner and 12.1% plan getting married, girls being more likely to construct such expectations. High levels of support from peers and family is related to the likelihood of cohabitation and marriage. Because most young adults are
not replacing marriage with cohabitation, but instead cohabit and then marry, it is important to study teenagers’ expectations of family plans and how these plans are associated with psychosocial factors (e.g. interactions with the opposite sex, traditional values, risk and resilience factors, and parents influence adolescent’s union formation expectations).

RN30S25 - Socio-economic Intergenerational Inequalities

Time as resource: Applying time-related categories in studying intergenerational inequalities
Veronika KALMUS (University of Tartu, Estonia) | veronika.kalmus@ut.ee

The post-socialist transition in Estonia has been described as extremely radical, characterized by highly liberal transformation policies and economic reforms, and rapid technological changes. The speed of the adoption of new information and communication technologies has led to the acceleration of social time and further intensification of transformation. The speed of social and technological changes, however, has affected different social groups to a varying degree, bringing about emergent patterns of social stratification. As generations differ, due to dissimilar locations on life span, in their speed of adapting to rapid social changes, age has become one of the most significant markers of social inequality. In this context, time as resource and commodity, and control over time, are especially meaningful.

Although the importance of time-related concepts has been widely acknowledged in contemporary sociology, little empirical research has focused on personal and social time, and time use and time perception as related to social stratification. This paper will present a methodological contribution to researching time-related categories quantitatively in population surveys, by introducing a novel set of indicators for studying time use and time perception (besides more conventional indicators of lifestyles, media use, etc.), used in the 5th round of the representative population survey “Me. The World. The Media” (N=1,500), conducted in the fall of 2014 in Estonia. The paper will also present the first findings regarding the main differences and similarities between generational groups in time perception and time as resource, analyzed in the context of social stratification and subjective well-being.

Subjective assessment of the impact of the economic crisis: generational differences
Ritma RUNGULE (Riga Stradins University, Latvia) | ritma.rungule@gmail.com
Tana LACE (Riga Stradins University, Latvia) | tana.lace@rsu.lv

It can be assumed theoretically that overcoming the crisis required mutual assistance and support as well as generated necessity for more assistance and support from public and municipal institutions which, on the whole, testifies to the growth of social consolidation during the crisis. However, the analysis of statistics and research data reveals that during the crisis income inequality has increased in the society of Latvia. It confirms the opposite assumption that overcoming the crisis has rather split than consolidated the society that everyone has relied more on himself/herself than on collective and public solutions for problems caused by the crisis. The Report analyzes data of the survey conducted among inhabitants of Latvia, aged 18 – 74 (N=1000), focusing on the subjective assessment of the impact of the crisis and its differences in 3 age groups.

The economic crisis has affected the majority of the population in Latvia. When assessing the impact of the crisis, 28% of respondents have recognised that the crisis has had a very
significant impact on their own life as well as the life of their family, 49% of respondents assess
the crisis impact as moderate, 16% have felt only a slight impact of the crisis while 4% have the
feeling that there has been no crisis at all. The elderly population is more inclined to assess
the impact of the crisis as very significant and they also point out the decline in the living standards
over the recent years. The majority of the elderly recognise that during the crisis inequality has
increased. The middle-aged population emphasizes more frequently the deterioration of mutual
relations during the crisis. In summary of lessons gained during the crisis, the majority of
population has pointed out three most important lessons: more caution in handling money,
reliance only on oneself – this has been more often stated by representatives of the older
generation while representatives of the younger generation have more often mentioned
readiness for change. More active participation in politics is the lesson more often gained by the
youngest inhabitants while the need to improve public administration has been more often
emphasized by the elderly population.

In the opinion of the population, on the whole, the crisis has not stimulated consolidation of the
society in Latvia; it has strengthened individualism and reliance on oneself and on the support
of the immediate family. Growth of social inequality is one of the main factors that have influenced
the split in the society that has increased under the impact of the crisis. Representatives of the
younger generation are more satisfied with their life in general; they have a more optimistic
assessment for the impact of the crisis than representatives of the older generation.

Generational differences have been explained by the influence of socioeconomic factors and
differences in values.

Wellbeing, inequalities and life course: qualitative evidence from a study with
children and young people in Portugal

Magda NICO (CIES-IUL, Portugal) | magdalalanda@gmail.com
Nuno de Almeida ALVES (CIES-IUL, Portugal) | nalmeidaalves@iscte.pt

Children and young people should have a say about their own views on wellbeing. Through the
development of a qualitative working package of the MYWeb project (Measuring youth
wellbeing, funded by the EU), not only they did, but they also had the opportunity to subscribe
this case. This WP was carried with 18 individual interviews, and four focus groups in the Lisbon
area, within a socially heterogeneous sample.

Two sorts of conclusion stood out. Methodologically, we identified several challenges that have
to do with the specificity of the interaction with “younger” young people, such as the nature of
the topic of the interview, the structure of the script, the composition and heterogeneity of the
sample, etc.), and also to the ever-changing nature of the feelings of well being through time.

Substantively, we strongly suspect - with the support of life course questions included in the
script - that the differences found between the answers of the children and the ones given by
young people are a matter of age effect, and not generation. This alone justifies the further
development of a longitudinal study on wellbeing. While children tend to define well-being in a
dichotomous way (well-being from within vs. from the surrounding) and to overlook less extreme
forms of inequality (instead mentioning war or epidemics); young people give more
heterogeneous definitions (“holistic”, “situated”, “self-evident”, “layered”) and point out the
economic conditions as the major predictor for both differences of well-being among the youths
nowadays, and for their future changes.

JS_RN04+RN28+RN30 - Sport Participation: Means of Social Inclusion
or Social Exclusion?
When sport is helpful. The role of sport in the after earthquake at L'Aquila (Italy)
Geraldina ROBERTI (University of L'Aquila, Italy) | geraldina.roberti@univaq.it
Ariela MORTARA (IULM, Italy) | ariela.mortara@iulm.it

The current economic crisis is having very heavy consequences on young people, causing an increasing risk of marginality and social exclusion; at the same time the connections that allowed the sense of belonging and social bonding are loosening, weakening the same youth social integration. In such a framework sport ends up filling a place as never in the past (Dunning, 1999), fostering the ways of youth growth. Indeed, sport plays an important role in the growth and socialization process of young people, letting them explore new perspective of social relations inside peer group (Horne, Tomlison, Whannel, 1999).

In order to investigate the elements characteristic of young sports training, we carried out a qualitative research by means of semi-structured interviews on a specific target group. Our informants are young athletes members of a sport team from a medium Italian town, L'Aquila. This is a very peculiar framework, because in 2009 the town was hit by a serious earthquake that caused hundreds of victims and destroyed sports facilities nearly thoroughly. Our main aim was not only assessing the role of sport in the pathway of social and identity reconstruction after the earthquake, but testing how much sports training can also increase the capability of young people resiliency.

The preliminary results highlighted that sport has been a mean of social integration for the young in L'Aquila indeed, helping them to reconnect those social links that the earthquake had destroyed.

Anti-radicalisation as aim – social exchange as outcome – an intervention using sport as a means to antiradicalisation
Annette MICHELENSEN LA COUR (University of Southern Denmark, Denmark) | amlacour@sam.sdu.dk

For decades, sport has been assigned a central role in the promotion of health and social inclusion, in crime prevention etc. Recently, public funding in Denmark has become increasingly directed towards involving non-state actors in welfare policy through sports. Using the perspective of event management and the concept of social exchange this paper describes the ways in which the DGI, an umbrella association for local sports clubs, in cooperation with civil society actors involves itself in an intervention (Playground) enrolling ethnic children and young ethnic people as participants. The DGI uses sports events to activate children and adolescents in so-called socially disadvantaged areas (DGI Playground) aiming at anti radicalism and at reducing crime rates. The article points to the heterogeneous motives of the actors involved in the events, the social exchange processes leading to the establishment of a social exchange relationship, which offer various subject positions for (the predominantly ethnic minority) children and adolescents participating in the event. The data were generated during a three year long process evaluation using qualitative methods including interviews, focus group interviews, observations and document analysis. Further, the paper discusses the social exchange transactions in which the civil and public rationalities intermesh with the private rationalities and create balanced forms of exchange relationships, during which the participants through their own rationalities act in order to meet their own needs. In doing so the outcome of the event is balanced processes of social exchange between the event managers and the participants. For the participants the outcome is meeting their conditions and this leads to an evaluation of the
events as being socially beneficial for them, but not for the event managers nor for the DGI. The needs of the event managers are partly met and they are left with an imperfect outcome and a negative evaluation.

**Visions of Normality: Body Pictures of Boys and Girls**
Nicole KIRCHHOFF (TU Dortmund, Germany) | nicole.kirchhoff@tu-dortmund.de

Boys should be strong, girls should wear skirts - and both should be sportive. In this way I cautiously sum up the first group discussions, which take place within the framework of my dissertation. It is about body pictures of boys and girls in puberty. My question is originated from a project of the TU Dortmund, which is based on quantitative and qualitative data. This research project studies socialization mechanisms that contribute to varying participation rates of adolescents with migrant backgrounds in schools, in extracurricular exercise and in sports practices. The goal is to evaluate how gender, social class, migration and their intersections predict the socialization process of teenagers in school sport as well as extracurricular sport. The socio-somatic cultures of migrants will be investigated with regard to their construction processes, their possible ethnic connotations accomplished in practices of self-attributions and attributions by others as well as their realization in everyday life. Furthermore we ask how migrants perceive, judge and influence physical education, school sport and extracurricular physical activities through their own decisions.

In my dissertation project I focus on the field of physical culture and body images of adolescents. First experiences in the field show, that talking about the body is difficult - especially for teenagers. Because of that I expand the group discussion by adding the collage as a visualized approach. In this way, results could be gained, which show an idealized orientation of the boys to “neo-traditional” forms of masculinity and femininity. At the same time the model of the petty-bourgeois nuclear family seems to determine the normality of these boys. In my contribution I foremost want to discuss patterns of body-images which I could find in the collages.

**New Alternative Masculinities in Physical Education and school sport**
Guiomar MERODIO (Universitat de Barcelona, Spain) | guiomar.merodio@gmail.com
Marcos CASTRO-SANDÚA (Universitat de Barcelona, Spain) | marcos.castro@ub.edu

Research has provided many evidences that Physical Education (PE) and sport have traditionally privileged certain forms of hegemonic masculinities which contribute, through concrete behaviours, practices and conceptions, to build an hostile environment in which violence (bullying, harrassment) is perceived as normal (Hickey, 2008; O’Connor & Graber, 2014). Girls and boys that do not respond to this hegemonic model are mainly the victims of this violence.

Gathering the contributions of research on masculinities initiated by Gómez (2004), the meta-research conducted by Flecha, Puigvert and Ríos (2013) revealed the difference between Dominant Traditional Masculinities (DTM) and Oppressed Traditional Masculinities (OTM), as the two sides of the traditional and patriarchal model of relationships. In the same vein, the New Alternative Masculinities (NAM) were presented as an alternative model, radically opposed to OTM and DTM, as they are represented by men who are egalitarian, but who are also confident, strong and courageous to confront abuses and inequalities.

Here we present the promotion of NAM through physical activity based on the principles of dialogic learning as the cornerstone for creating a safe environment in PE and school sport, thus turning this area into a means of social integration instead of discrimination or exclusion for children and adolescents. As successful educational actions has demonstrated in schools
(Flecha & Soler, 2013), initiatives based on dialogic learning are currently contributing to promote NAM, overcome traditional hegemonic models of masculinity and improving coexistence (Gomez, Munté and Sordé, 2014).

JS_RN05+RN30a - Youth and Risky Consumption

Drugs as an element of life style
Martin STANOEV (Silesian University in Opava, Faculty of Public Policies in Opava, Czech Republic) | martin.stanoev@fvp.slu.cz

The paper presents the main findings of the research focused on the social aspects of drug careers in Czech Republic. The aim of the research was to capture the changes in the social environment and its normative aspects of individual drug careers of those individuals whose process of addiction begins in adolescence and do not come from socially marginalized environment. Design of concerned research is case study, and draws mainly on in-depth interviews with informants who became drug addicts. The sample includes eighteen informants. The findings are conceptually based mainly on Irwin’s concept scene and Erickson’s conceptualization of adolescence. It emphasized the role of environment labelled as pro-drug scene as a bridge between conventional peer-group environment and socio-excluded group of drug addicts (drug subculture) within the three-stage sequential model of inclusion into the drug subculture. Then it shows the identification with anti-hero of drug addict in early adolescence as one of possible motives of drug experimentation. In conclusion, the author tries to relate research findings in a broader socio-cultural context. Context of society, which lacks widely shared perspective which could facilitate identity achievement in adolescence.

Risk, addictions and rituals. A sociological interpretation of the Opal Coast students’ anomaly
Philippe MASSON (University of Lille 2, France) | philippe.masson@univ-lille2.fr
Alessandro PORROVECCHIO (University of the Littoral Opal Coast, France) | alessandro.porrovecchio@gmail.com
Isabelle CABY (University of Artois, France) | i.caby@wanadoo.fr

The aim of this paper is to describe the social health condition of the university students of the French Opal Coast littoral. In particular, we will focus on risky and addictive behaviours (alcohol, drugs, sex, internet and sports).
This work moves from a research called “Universanté”, started in 2008. This research includes an observatory to monitor students’ health and aims to promote healthy behaviours in the territory. Our analysis has been carried out on a sample of approximately 4,000 students, both at regional (Nord-Pas de Calais: University of the Littoral Opal Coast and Artois University, University of Lille 2), inter-regional (University of Rouen) and international level (University of Chicoutimi, Canada and University of Balamand, Lebanon). The aim of this study is to define a “global health” profile, through the analysis of some usual determinants (biomedical, social, psychological, etc.). As concerns this paper, we mixed the epidemiological approach of Universanté with some in-depth interviews and some focus groups.
One of the most important evidences emerging from our data is a widespread condition not so far from Emile Durkheim’s idea of “anomy”. This sociopathic condition includes some alarming situations of isolation and brings a new conception of risk, that takes the shape and the meaning of a sort of (collective or individual) ritual and in some cases can transform itself in a set of
addictive behaviours (alcohol, drugs, sex, etc.). This brings also a new conception of risk: it seems clear that young people are switching from safety objectives to more flexible conditions.

"Psychonauts”, “healthneers” and those between; Preferences and consumption of illicit drugs among youth in northern rural Sweden.
Mats JAKOBSSON (Lulea University of Technology, Sweden, Sweden) | mats.jakobsson@ltu.se

The paper presents and discusses results from two survey studies, 2012 (N=5608) and 2014 (N=6211) among youth, 16-19 years of age in the county of Norrbotten in northern Sweden. The studies reveal changes in preferences concerning consumption of cannabis towards normalization in terms of less restrictive attitudes in favor of liberal or neutral attitudes towards cannabis. Risk factors for using drugs (tobacco, alcohol, cannabis, spice and other narcotics) is related to different social backgrounds and the sociocultural context. Applied logistic regressions shows that gender, class and social control have significant effects; age, males, attending school in another town away from family, growing up in economic poor and/or vulnerable conditions, youth from working class homes, liberal or neutral attitudes towards cannabis, regular use of tobacco and alcohol and having friends that use drugs occasionally increase the risk. MDS-analysis revealed four specific clusters of positions regarding drugs; psychonauts who regularly use alcohol, cannabis and experiment with other drugs and have pro-drug attitudes and socialize with drug liberal friends. The opposite position is the healthneers who have not tried or used any drug and have strong antidrug preferences and only socialize with like-minded. The first group represents 8 %, the second group represent 28 % of the population in the study in 2014. Between these two clusters there are different combinations of attitudes and use of drugs that correspond to findings in an earlier study where these clusters are described as ambivalent position and transitional position.

Alcohol Use in Young and Middle Adolescence: Influences of Family Structure and Parenting Behavior
Eva-Verena WENDT (German Youth Institute (DJI), Germany) | wendt@dji.de
Christine ENTLEITNER (German Youth Institute (DJI), Germany) | entleitner@dji.de
Sabine WALPER (German Youth Institute (DJI), Germany) | walper@dji.de

Early alcohol use of adolescents is an increasing problem in Europe. Data from Germany indicated that, at age 14, around 70% of the adolescents have experiences with alcohol and nearly 15% consume alcohol regularly or frequently (Bergmann et al., 2011). Empirical findings proposed family factors, such as parental separation and supervision, as important socializing parameters for alcohol consume in adolescence (e.g. Kask et al., 2013). This paper aims to examine how factors such as family structure, parenting behavior, parent-child relationship, as well as economical and educational deprivation, influence adolescents’ alcohol use in two representative studies from Germany.

Data 1 comes from the child interview of the fifths wave of the “German Family Panel” pairfam (2012/2013). The sample comprises answers from 454 young adolescents, aged 12-15 years, on with their prior experiences with alcohol and frequency of alcohol consumption. Data 2 comes from the study “Growing up in Germany” (AIdA, 2014/2015), which include responses from 1200 adolescents, aged 16-17 years.

Results from the pairfam sample revealed that, for young adolescents, perceived parental emotional warmth and monitoring are associated with lower, and negative communication with higher likelihood of early experiences with alcohol. However, these factors are not related to the frequency of alcohol consumption. Besides family factors, further analysis will include influences of economical/educational deprivation, age and gender, and the results will be compared with
patterns in the AID:A-sample. These findings will be discussed in the context of the development of early drinking and practical implications for effective prevention work.

**JS_RN05+RN30b - Building Young People’s Identities in Media**

**Online Exposure to Pro-Eating Disorder Content among Young People in the UK, Germany and Finland**

Atte OKSANEN (University of Tampere, Finland) | atte.oksanen@uta.fi  
Markus KAAKINEN (University of Tampere, Finland) | markus.kaakinen@uta.fi  
Matti NÄSI (University of Tampere, Finland) | matti.nasi@utu.fi  
Pekka RÄSÄNEN (University of Tampere, Finland) | pekka.rasanen@utu.fi

The Internet is the most widely-used form of media among teenagers and young adults and as such can encourage participation in unhealthy behaviors. The online setting provides a platform for pro-anorexia (pro-ana) and pro-bulimia (pro-mia) sites along with associated online communities, allowing users seeking such material to access a variety of resources and user-generated content. Our paper examines how exposure to pro-eating disorder material varies among British, German and Finnish Internet users aged 15 to 30 (n = 2,532). We expect offline social support and involvement with traditional offline groups to act as buffers against searching for pro-eating disorder material online. In this paper, our analysis focuses on social belonging to both offline and online social groups. The results indicate that 22% of Finnish, 21% of British and 7% of German respondents had been exposed to pro-eating disorder content online during the past 12 months. Those encountering such material were likely to have a strong sense of online social belonging and low offline social belonging. Furthermore, female gender, younger age, active usage of online services, not living with parents and living in an urban area were all associated with exposure to pro-eating disorder content. Country differences were found to in terms of the strengths of detected associations. Our results indicate that pro-eating disorder material is widely accessed by the young European users and that exposure to it is especially high among young females who report a strong sense of belongingness to online communities.

**Consuming food media, building dreams among Young Portuguese Chefs**

Mónica TRUNINGER (University of Lisbon, Portugal) | monica.truninger@ics.ulisboa.pt  
Vitor Sérgio FERREIRA (University of Lisbon, Portugal) | vitor.ferreira@ics.ulisboa.pt

The entertainment industry around cooking television programmes has boomed in recent years (Rousseau, 2012). Programmes such as Master Chef among others contributed to building the profession of chef as iconic, helping to reconfigure its symbolic and social status, and inspiring hedonistic and consumerist lifestyles. The celebrity chef culture has fueled career plans and consumption dreams of many young people. But does the image of chefs and their practices medialized on TV programmes and consumed by young audiences match the enacted lives of real chefs in a professional career? Informed by a practice approach in sociology of consumption (Warde, 2014), this paper contributes to addressing this issue drawing on a qualitative analysis of in-depth interviews with professional young chefs in Portugal. The analysis shows a mismatch between the ‘dream’ (carefully built by generalist producers of TV food programmes) and the everyday life practices of professional chefs in restaurants or hotels kitchens. However, the real lives of young professionals would not be enacted without the power of food media, which helped to reconfigure the professional practices of young chefs. Medialized dreams and enacted lives feed off each other, and the relation of professional young chefs with the media (e.g. TV, Press, blogosphere) is paramount to the survival of their careers of practice. This paper is supported by the FCT project Making dream jobs come true:

Habitus on social media: College students’ different approaches to identity construction on Facebook
Liang-Wen LIN (University of California, Los Angeles, United States of America) | liangwen0626@gmail.com

Youth identity that explores the relationship between self and society is a central concern of youth studies. The very question whether there is still as much influence of social background on identity construction or identity is more individually achieved has aroused debates in youth studies. Nowadays young people live in a world of social media where they utilize multimedia resources to express themselves in different ways. Facebook has become the most popular social network site among college students and has begun to play a substantial role in their college life.

The purpose of my research is to reveal how college students in Taiwan construct their identities regarding impression management and cultural consumption on Facebook. Based in Taipei, Taiwan, this research applied methods including in-person interviews, online observation and a visual approach of photographic analysis inspired by P. Bourdieu and R. Chalfen. I refer to the conceptions of distinction and habitus proposed by Bourdieu and arguments provided by visual studies as the primary theoretical frameworks in this research.

I suggest that individuals demonstrate unifying and consistent practices of identity work between online and offline activity through different cognitive structures of identity work, which are socially produced, exercised by habitus, and different from socio-economic status. Two different principles of perception and construction of identity are unveiled. My argument contributes to the debates on identity in youth studies for it provides the real-world evidence and connects the logic of identity work practices online to the ones offline.

‘Charlie is so cool like’: Authenticity, popularity and inclusive masculinity on YouTube
Max MORRIS (Durham University, United Kingdom) | max.morris@durham.ac.uk

On the world’s most utilised video-sharing social networking site, YouTube, Charlie McDonnell (Charlieissocoollke), Dan Howell (Danisnotonfire) and Jack and Finn Harries (JacksGap) are Britain’s most successful video-bloggers (vloggers). With more than two million regular subscribers to each of their channels, along with millions of casual viewers, they represent a new form of authentic online celebrity. These young men, whose YouTube careers began as teenagers, do not espouse a traditional form of masculinity; they are not sporty, macho or even expressly concerned with being perceived as heterosexual. Instead, they present a softer masculinity that embraces emotional openness, homosocial tactility, male femininity and homosexuality; eschewing the homophobia, misogyny and aggression attributed to boys of previous generations. These behaviours are theorised using Anderson’s inclusive masculinity theory. Drawing on analysis of 115 video-blogs (vlogs), along with an in-depth interview with Charlie McDonnell, this paper examines how these young men developed and exhibit their inclusive masculinities and attitudes, which I postulate are a reflection of dominant youth culture.
JS_RN05+RN30c - Youth and Consumption Styles

Credit and debt as the ‘new normal’. Conceptualizing the risk of ‘overindebtedness’ as part of emerging financial practices in contemporary consumer society.

Pernille HOHNEN (Aalborg University, Denmark) | hohnen@cgs.aau.dk
Malene GRAM (Aalborg University, Denmark) | Gram@cgs.aau.dk
Turf BÖCKER JAKOBSEN (The Danish Consumer Council) | tbj@fbr.dk

Along with the global deregulation of financial markets and the introduction of new forms of money and credit, most European countries have witnessed an overall change in financial practices in recent years. Among young people in particular, credit based consumption has become a common way of consuming related to increasing digitalization of money and easy access to credit (McNeill 2014, Poppe and Böcker Jakobsen 2009). In addition to this, ‘overindebtedness’ has become an increasing problem among young adult consumers both in Denmark and in other European countries (Christensen 2014). The present paper aims at discussing ‘overindebtedness’ as closely related to changes in ‘mainstream’ practices and imageries of financing and consumption in contemporary ‘access economy’. In doing so the paper disembarks from prevailing literature focusing on debts problems as an outcome of individual irrational behaviour. More specifically, we relate the increasing risk of ‘overindebtedness’ to three central patterns in contemporary markets: easy access to credit; changing practices of savings; and an increasing consumption of ‘social necessities’ (Hjort 2004). Empirically, the paper draws on individual interviews with young adults (18-25 years) who have experienced problems with indebtedness as well as focus groups with young adults who do not have financial problems. Embarking on these empirical insights the paper proceeds to conceptualize the forms of credit and debt that seems to be developing in contemporary globalized European markets.

“I love these Shoes” – Shopping as a Practice of Legitimization and Presentation

Steffen EISENTRAUT (University of Wuppertal, Germany) | eisentraut@uni-wuppertal.de
Alexandra KÖNIG (University of Wuppertal, Germany) | akoenig@uni-wuppertal.de

If young people are asked about the criteria for buying clothes, they mostly refer to their “individual taste”. Clothing is understood as a material presentation of self. In this sense, fashion artifacts are symbolic representations of identity that display belongings to specific groups, or distinguish from others. Searching for an outfit is not just a matter of finding something “nice” but to perform a successful and consistent self-presentation. Being both young individuals’ own claim and social expectation, choosing the “right” clothes is a meaningful and challenging practice. Based on an empirical study, the paper investigates processes of selection, presentation and legitimization in the context of young people’s consumption of fashion. With the help of different data types – observations in clothing stores, interviews as well as fashion blogs and YouTube channels (“shopping hauls”) – we ask for the implicit rules that structure practices of buying clothes. How are certain choices justified in front of familiar peers or even in front of an anonym audience? Which ascriptions, classifications and demarcations can be found within the presentation of purchased goods and what are relevant categories for constructing individuality besides “classical” sociological dimensions like age, class or gender?
The paper contributes to the research of youth consumer culture and sheds light on concrete practices. In order to understand how young people select and present “fitting” fashion items and legitimize purchase decisions, they are not only studied as customers but as creative entrepreneurs producing self images for and in interaction with an audience.

The effects of socializing agents on youth consumption styles
Leena HAANPÄÄ (University of Turku, Finland) | lehaan@utu.fi
Terhi-Anna WILSKA (University of Jyväskylä, Finland) | terhi-anna.wilska@jyu.fi

Youth consumerism is a theme under a constant interest since, indisputably, the consumer role of children and adolescents has become more active in the last few decades (e.g. Ironico 2012). One of the main interests regards the way youth are socialized in consumerism, i.e. how they learn to be consumers. According to theories of consumer socialization (e.g. Moschis 1987), young people develop their consumer related skills, knowledge and attitudes through interacting with socializing agents: family, friends, media, celebrities, school etc.

This paper focuses on Finnish youth consumption styles and the socializing agents affecting it. The data are drawn from a survey called Youth in Focus which targets adolescents at school grades 5, 7, and 9 (N = 1803) mainly in Southern Finland. The data are collected in November 2014 during school lessons using an online questionnaire. The findings regarding youth consumption styles are part of a wider survey that aims at gaining understanding of the living conditions of youth (http://www.utu.fi/cyri).

The results of a statistical analysis made by explorative factor analysis (EFA) proposed five consumption styles labelled as ‘brand-conscious consumption’, ‘price-conscious consumption’, ‘recreational consumption’, ‘anti-consumption’, and ‘status consumption’. The following linear regression analysis conducted for each consumer style revealed diverse effects between different socializing agents and youth consumption styles. On one hand, media had effect in all but anti-consumption. Interestingly, TV commercials had no effect on any consumer style. Peers had a significant effect on the other consumption styles except anti-consumption, respectively. Parents’ role was significant especially to price-conscious and anti-consumerist youth.

Social inequalities and symbolic boundaries in a local club and discotheque market
Gunnar OTTE (Johannes Gutenberg-University Mainz, Germany) | gunnar.otte@uni-mainz.de

In many contemporary portraits of young people’s leisure time practices and consumption patterns the impression prevails that adolescents are free to choose from a “supermarket of styles”. Youth is often seen as a moratorium in the life-cycle that dispenses with the status hierarchies typical for adult life in class-based stratification systems. This paper uses the under-investigated case of the urban nightlife economy in order to study processes of symbolic boundary-construction and structures of social inequality in young people’s music scenes. Two components of a comprehensive mixed-methods design are systematically combined in the investigation of a local market of clubs and discotheques in the city of Leipzig, Germany. On the one hand, quantitative audience surveys are used to compare the social audience composition of twelve clubs and discotheques varying in size, organizational form and musical genre. On the other hand, the drawing of symbolic boundaries is studied using ethnographic methods and group discussions with cliques of typical visitors. The paper shows how traditional bases of social inequality (especially class, gender, and age) and scene-specific forms of capital (especially music and bodily capital) interact and, together, produce a market of urban nightlife that is hierarchized along multiple lines.
RN31 - Ethnic Relations, Racism and Antisemitism

RN31P01 – Poster Session

Minority young people’s defence strategies against language abuse by majority young people – young people’s stories about tense ethnic relations
Pia Elisabeth NYMAN-KURKIALA (Åbo Akademi University, Finland) | pnyman@abo.fi
Linnéa STORSVED (Åbo Akademi University, Finland) | linnea.storsved@abo.fi
Henrik KURKIALA (Åbo Akademi University, Finland) | henrik.kurkiala@gmail.com

The aim of this poster is to describe minority young people’s experiences of conflicts and strategies to defend themselves against abuse from majority young people. These conflicts arise due to the different languages of Finland-Swedish (the minority, whose mother tongue is Swedish) and Finnish-speaking (the majority) young people in Finland.

Data have been collected at three different times at ten-year intervals (at the end of the twentieth century, in 2004 and in spring 2015) which makes it possible to study similarities and differences over time.

The empirical material consists of essays written by ninth-grade pupils (15-16 years old) in Swedish-speaking upper-level schools in Finland. The respondents represented five cities: Nykarleby, Ekenäs, Vaasa, Helsinki (two schools) and Tampere. The cities were chosen taking into consideration different language environments and geographical distribution.

Conflicts existed according to the respondents everywhere except in Nykarleby, where only few Finnish speakers live. Verbal abuse was the most common form of conflict described, but also threatening physical advances and fights were described in the essays. In the cities where Swedish-speakers form a minority, Swedish-speaking young people felt abused by Finnish-speaking young people and had developed a range of strategies to defend themselves against the abuse.

The Finland-Swedish young people used five different kinds of defence strategies against abuse from Finnish-speaking young people. These defence strategies are as follows: the ignorance strategy, the code-switching strategy, the silence strategy, the escape strategy and the fight strategy.

The conflicts seem to be related to the identity work and ethnic identity of the young people.

RN31S01 - Dynamics of Difference: Understanding Difference Intersectionally

Germany as a “post-migrant” society? Examining a new paradigm
Sina ARNOLD (Humboldt University, Germany) | sina.arnold@hu-berlin.de

In recent years, the term “post-migrant” has emerged in research on migration and racism through authors such as Erol Yildiz, Regina Römhild, Naika Foroutan, Marc Hill and others. Originating in art and activism, it has inspired a critical evaluation of key terms of analysis such as “integration”, “migration”, “mobility” as well as notions of national identity.

In the German case, the term not only forms an answer to a crisis of academic analysis, but also a response to changing demographics, social realities and self-understandings: Around one fifth of the population living in Germany has a so-called “migration background,” and in recent years Germany has finally begun to acknowledge at the policy level that it is a country of
immigration. However, racism and exclusion towards those with a migration history are still the norm.
The "post-migrant" paradigm tries to understand the paradox of a society that has moved "beyond migration" despite its constant presence in everyday discourse and persistent stereotypes. It accounts for the subjectivity of those second and third generation "migrants" who are German but are still constantly excluded from the national collective.
The term poses its own unique analytical blindspots – for example the danger of reinforcing ethnicizing categories or ignoring issues of power. Nevertheless, the talk argues that the "post-migrant" concept enables the social sciences to overcome some of the shortcoming of traditional migration research and opens up new possibilities for understanding the significant demographic and social changes facing many European societies.

“Divide and conquer?” The effects of public sector retrenchment on anti-racist organising
Bethan HARRIES (University of Manchester, United Kingdom) | bethan.harries@manchester.ac.uk

Public sector retrenchment has allowed for the renunciation of policies and discourses on race and equality. This is exemplified by the considerable changes to equalities frameworks in the UK (and elsewhere). The most significant of which has been the shift from representation of specific groups with ‘protected characteristics’ (including racialised groups) to a more universal understanding of need. The move away from racism as a distinct form of marginalisation has contributed to the silencing of race and a failure to recognise institutional and structural racial inequalities (Kapoor 2013). Changes have also flattened out the concept of need by ignoring protection for particular marginalised groups, emphasising instead equality for all individuals. This has considerable effect on how anti-racist community organisations can operate. The paper draws on research conducted with community organisations in four cities in the UK. It explores experiences of working in the context of a changing language and disappearing emphasis on race in equalities agendas. Community organisations are under pressure to become more ‘resilient’ and respond to changes by seeking finance from non-State sources and to start targeting all people that fall across multiple protected characteristics. In addition to the increasing financial pressure and policy shifts that make it difficult to target services towards those most in need, organisations describe how this context has a fracturing effect on the potential for collective organising around common cause by enforcing an unproductive language of difference and producing a counter-intuitive competitive environment.

The Missing ‘wave’ of Mixed Race Research
Karís CAMPION (University of Manchester, United Kingdom) | karis.campion@manchester.ac.uk

Over the past two decades there has been a proliferation of research on mixed ethnic identities (Caballero, Puthussery, & Edwards, 2008; Mahtani, 2002; Song & Aspinall, 2012; Twine, 2004). It is suggested that this is a ‘new wave’ of research which often seeks to normalise and celebrate mixedness (Caballero 2005). This ‘wave’ of research has marked the move away from the ‘first wave’ of research on mixed race in Britain, which pathologised mixed race people and communities (Caballero 2005). These earlier attempts at researching mixedness at the start of the 20th century were concentrated in British port towns such as Liverpool and Cardiff (Christian, 2000; Edwards & Caballero, 2011). The suggested threat of the ‘half-caste’ and arguments for mixed race leading to degeneracy found currency in the eugenics movement. There is little coverage of the period in which this shift from the first wave to the second wave took place. This paper seeks to discuss how mass migration post- Second World War, dramatically changed the demographic of Britain and the implications of this for mixed race
identity. It will particularly focus on the period of the 1970s and 1980s. Through these decades the colour Black was utilised as a form of political resistance for ethnic minorities in Britain, whilst in the same instance the white majority sought to assert a British identity in more mainstream political projects. The paper will discuss how mixed race groups were racialized within this political climate. It will question how mixed race groups positioned themselves within or between ethnic categories as the identities of both majority and minority groups were increasingly polarized.

Beyond ethnicity – British and German citizenship legislation in historical comparison
Sophie Elisabeth BADENHOOP (University of Glasgow, United Kingdom) | s.badenhoop.1@research.gla.ac.uk

The acquisition of British citizenship is commonly assumed to be based on the legal principle of ius soli (territory) as opposed to German citizenship based on ius sanguinis (descent), the former facilitating immigrant descendants’ full legal inclusion while the latter restricting access to citizenship for “foreigners”. The British nation is thus categorised as “civic” while the German nation is regarded as “ethno-cultural” (cf. Brubaker 1992; Koopmans 1999; Diez and Squire 2008; Hansen 2000; Dummett 1994). The aim of this paper is to review and question the historical accuracy of this normative distinction still prevalent today, praising one nation-state as racially inclusive and reprimanding the other as racially exclusive. The paper draws on existing historical analyses of British and German naturalisation practices between 1815 and 1945 (Fahrmeir 2000; Gosewinkel 2001) and adds a discourse analysis of categories and acquisition modes in the original acts, when admission to citizenship for “aliens” was first statutorily codified in the 18th and 19th centuries up to the present. This paper argues that the distinction between the supposedly inclusive territorial British and the exclusive ethnic German nation is not as clear cut as is widely assumed. For British nationality law today no longer contains (unconditional) ius soli and German citizenship law included naturalisation provisions already when first codified in 1870. Moving beyond the problematic “civic” versus “ethnic” nationalism distinction (Brubaker 2004), this paper attempts to demonstrate that both British and German citizenship legislation have a shared origin in the right to hold property. Seen this way, citizenship as legal status of national membership initially constituted a state tool of inclusion and exclusion on the axis of class, not ethnicity.

RN31S02 - Distance and Difference, Segregation and Stigmatisation

White European migrants in Japan – unavoidable differences or obscured inequalities?
Milos DEBNAR (Doshisha University, Japan) | mdebnar@mail.doshisha.ac.jp

Experience of white subjects as migrants has been recently approached by growing number of researchers and besides the reproduction of the ‘white privilege’, its limits have been increasingly acknowledged as well. I further scrutinize the limits of the white privilege by focusing on the case of white Europeans rather than variously defined ‘Westerns’ found in previous studies and the settings of Japan as highly developed yet non-Western country. In the analysis of interviews with 57 subjects from all parts of Europe and of various background, I focus on how everyday practices and encounters with the majority population reveal social norms and how these norms shape the opportunities of white Europeans in Japan especially in
terms of labor market. I argue that these opportunities tend to be limited to occupational niches characterized especially by cultural skills. Whereas the “racial grammar” of white hegemony (Bonilla-Silva, 2011) implies an interpretation of such tendencies within the framework of ‘unavoidable differences’, particularities of the subject of this research allow us to further explore apparently grammatically incorrect alternative frameworks such as ‘obscured inequalities’. As I argue, this can be achieved without necessarily following an explanation based on the East-West dichotomy but rather by exposing and articulating limitations of the white privilege. Such discussion prompt us to reconsider what are or can be regarded as practices leading to inequality in the societies increasingly affected by diversifying migration and complex patterns of social interactions emerging from it.

**Turkish Residents' Responses to Stigmatization – Frustrated and Bullish Strategies**

Nils WITTE (BIGSSS/ Universität Bremen, Germany) | nwitte@bigsss-bremen.de

In recent years the concept of ethnic boundaries has been revitalized superseding primordial understandings of ethnicity. In parallel Michèle Lamont and her colleagues promote a research agenda that analyses ethnical minority members’ responses to stigmatization. The concept of ethnic boundaries underlines the interactive and dynamic character of these social categories. The analysis of responses to exclusion spotlights the agency of stigmatized minority members and helps to decipher negotiations of boundaries. Analysis of 16 in-depth interviews with Turkish residents of Germany reveals two dominant response types at agent-level that are described as (1) bullish and (2) frustrated respectively. At action-level, a range of particular responses is identified including (1) confronting, (2) deemphasizing, (3) avoiding, and (4) passive strategies. Also minority members’ share in (5) boundary work is accounted for. The general response types are differentiated by their resort to combinations of particular strategies. Persons of the bullish type are more likely to confront stigmatization and less likely than persons of the other types to choose passive strategies. Frustrated persons are often helpless causing them to opt for passive strategies. Further, they engage in boundary work making new boundaries while struggling to blur others. Among the frustrated only Muslims confront stigmatization. Irrespective of the agency-type Turkish residents resort to deemphasizing strategies. Their modalities are the relativization of stigmatization and the assumption of individual responsibility for prevention of and dealing with stigmatization. The cultural scripts Turkish residents of Germany refer to most often are Islam and the ‘decent citizen’ including a strong work ethic.

**“Would you mind if a close relative married a Muslim?” Reciprocal social distance and ethnic hierarchies in Britain**

Ingrid Kristinsdatter STORM (University of Manchester, United Kingdom) | ingrid.storm@manchester.ac.uk
Maria SOBOLEWSKA (University of Manchester, United Kingdom) | maria.sobolewska@manchester.ac.uk
Robert FORD (University of Manchester, United Kingdom) | rob.ford@manchester.ac.uk

Most existing literature on racial prejudice deals with the racial attitudes of the ethnic majority and ethnic minorities separately. This paper breaks this tradition by looking at the two as interrelated phenomena. Using data from the British Social Attitudes Survey (1983-2013), The Fourth National Survey of Ethnic Minorities (1993-4) and the Ethnic Minority British Election
Survey (2010), we examine white and non-white British residents’ attitudes to a close relative marrying someone of a different ethnicity or religion. We have three main findings. Firstly, we show that social distance from other ethnic groups declines over time for both white and ethnic minority Britons. Secondly, we find evidence of particularly widespread hostility towards Muslims among British residents of all non-Muslim backgrounds, including a large number who do not express hostility to any other groups. Finally, we find that ethnic hierarchies are shared between minority and majority groups, with Muslims placed at the bottom of the hierarchy for all non-Muslim groups. However, these attitudes are not reciprocal. Muslims express no higher levels of unwillingness than non-Muslims to accept people of other ethnicities as in-laws.

The importance of class and other identity-neutral mechanisms for understanding segregating practices: A comparative study of segregating practices in different social classes in Sweden
Mikael SVENSSON (Uppsala University, Sweden) | mikael.svensson@soc.uu.se

The paper is based on an ongoing research project, focuses on the relationship between people’s class positions (based on their work, employment relations and income) and their practices towards racialized ‘groups’. The empirical findings depart from analysis of qualitative interviews with (1) people with working class positions living in a working class area, and (2) people with higher class positions living in a more socioeconomically favorable area. Both areas are located in one of Sweden’s largest cities.

The analysis points to a range of segregating practices, and, amongst these, the interviewees’ choice of accommodation and leisure activities. There are examples of practices of ‘white flight’ in both of the studied areas, i.e. the interviewees avoiding racialized suburbs. However, these practices cannot merely be understood as mechanisms linked to perceptions of ‘race’, ‘ethnicity’, ‘immigrants’, racialized ‘groups’ or racialized suburbs. Based on the interviews for instance educational strategies for children in relation to changes in the Swedish school system, class related differences in experiences from racialized suburbs and conditions in the Swedish housing market seem to be significant. In line with Andrew Sayer, I suggest that the distinction between identity-sensitive mechanisms and identity-neutral mechanisms is of importance to explain how the segregationist practices may be due to various kinds of mechanisms, although these often are tightly interconnected and in many cases also interact with each other.

RN31S03 - National Ideologies

Political sociology and the national identity concept of Edvard Beneš (1884 – 1948), transfer of Germans from Czechoslovakia after WWII and problems concerning ethnicity based social exclusion in the Czech-Polish border area today
Dušan JANÁK (Silesian university in Opava, Czech Republic) | janak@fvp.slu.cz

The paper is divided into two parts and connects historical sociology of knowledge with empirical research. The first part describes the problem of national identity in the work of Edvard Beneš, Czech University professor of sociology and the highest-ranking politician (the Prime Minister, Minister of Foreign Affairs and the President of Czechoslovakia). Beneš wanted to do politics on a scientific basis, to him policy was practical sociology. Using examples of the political project of Czechoslovakism and the Beneš Decrees related problems, the paper shows
how Beneš’ (theoretical) sociological views influenced practical policies focusing on national groups in Czechoslovakia, mainly the coexistence of Czechs and Slovaks with Germans and Hungarians. The Beneš Decrees provided the basic legal norm justifying resettlement of three million Germans from Czechoslovakia after WWII and directly impacted property restitution following 1989.

The second part is based on empirical research into social exclusion and ethnic conflicts in one of these evacuated regions (Osoblaha). The present social exclusion and ethnic conflicts are interpreted as a result of a series of unintended consequences of different types of the state public policies. The transfer of Germans is interpreted as the starting point of the genealogy of these unintended consequences. The paper thus shows the contradictory role of the state regarding the mechanisms of social exclusion and ethnic conflicts.

**National ideology - the creator of differentiation and division.**
Ireneusz KRZEMINSKI (Warsaw University,, Poland) | krzemire@poczta.onet.pl

My main question is: why and in what ways nationalistic ideology creates a hostile image of "strangers" and divides the own, national society? The division consists of differentiating between "true" members of the national group (for example: "true Poles", "true Slovaks" and so on) and "not-true" members whose affinity to the nation is only “formal” at best. In the Polish case, that usually means people of Jewish origin, less often – of German extraction. Poland will be the main point of discussion, as our third study of anti-Semitism, xenophobia and national stereotypes has just been completed. The first study was done in 1992, at the beginning of the great transformation of the post-communist state and society. We repeated the study 10 years and then 20 years later in order to gather good material for analysis. The empirical results show that democracy created the possibility to study the past and the revitalization of the pre-Second World War political traditions and ideologies, something that was impossible during the communist regime. The nationalistic tradition became attractive for people holding certain views. Firstly, as a useful, ideological tool in the field of political struggle and social-political mobilization. Secondly, nationalist ideology was attractive for people as a populist mobilization against the “bad state”: the process of market-economy transformation produced a lot of dissatisfied groups. The “strangers” became responsible for the failure to fulfill the great expectations and hopes of the Solidarity movement for a better life in a democracy. Anti-Semitic element, present in the nationalistic ideology of the beginning of XX century, is actualized and reinforced. What is more, the Catholic Church, which played a very important and positive role in the battle for freedom and democracy, changed its strategy and started playing the privileged role as a social and political actor. Some important currents inside of the Church enhanced the nationalist – catholic tradition, also strengthening the anti-Semitic and xenophobic tendencies. Thanks to the three studies, we were able to describe the process and also to show how the youth attitudes are changing in the process of growing-up and entering into adult social life. I will also try to compare the Polish case with the other, neighboring societies of Central-East Europe.

**The Construction of Turkish Nationhood: the rule and the exceptions**
Mesut YEGEN (Istanbul Sehir University, Turkey) | mesutyegen@sehir.edu.tr

The established view in the literature on Turkish nationhood is that Turkish nationhood has been civic or ethnic in different contexts, at different times, and in relation to different identities. According to this view, while Turkish nationhood had been civic in texts, at the time of the foundation of the Republic, and in the case of Turkish citizens of Muslim origin, it became ethnic in practices, once the regime had become consolidated, and in the case of Turkish citizens of non-Muslim origin. This entails that Turkish nationhood constitutes yet another example to the
effect that all nationhoods have been civic and ethnic - a fact proving once more that an either/or understanding of nationhood, a dichotomous application of the civic – ethnic distinction, is obsolete.

Although I share the view that the attempt to classify Turkish nationhood as either civic or ethnic is futile, I have two fundamental disagreements with this established position in the literature. First, I argue, in this paper, that the civic or ethnic distinction is redundant not because Turkish nationhood has sometimes been civic and at other times ethnic, but rather because it has mostly been neither civic nor ethnic, but cultural. Second, I demonstrate, through an event-based examination of the evolution of Turkish nationhood, that the Turkish nationhood has been ethnic both on paper and in practices, at the time of the foundation of the Republic as well as after the regime had become consolidated, and in the case of Turkish citizens of Muslim origin as well as those of non-Muslim origin.

My paper concludes with the argument that that loyalty has been the super-principle for Turkish nationhood while deciding who may and who may not become Turkish.

Moments of subversion and resistance: Unintended consequences of nationalist/imperialist ideas in the Japanese Empire
Atsuko ICHIJO (Kingston University, United Kingdom) | a.ichijo@kingston.ac.uk

Nationalism, and nationalism applied in an imperial setting in particular, are generally regarded to be a set of totalising ideas which contribute to domination by homogenisation, a tool of oppression in other words. The paper examines this widely-held understanding by investigating some of the ways in which ideas produce unintended consequences. In particular, it examines three intertwined ‘moments’ when the oppressed and subjugated by Japanese imperialism/nationalism appeared to succeed in taking advantage of imperial/nationalistic ideas to subvert or resist Japanese imperial rule. The three moments are: the world-historical standpoint, the East Asian Community initiative and the idea of the unity of Japanese and Korean races. The world-historical standpoint, an approach developed by the Kyoto School of philosophy, aimed to achieve a more comprehensive, therefore, truer way of capturing the reality of the world and is often seen as constituting an intellectual backdrop to Japanese imperial expansion in the first half of the twentieth century. However, because of its appeal to ‘true’ universality, it necessarily contained rejection of the particular in the form of self-expanding nationalism and the nation-state framework. The short-lived East Asian Community initiative, largely supported by intellectual frameworks based on the world-historical standpoint, also contained similar contradiction that its emphasis on the universality/commonality amongst Asian peoples necessitated acknowledgement of the equality among the imperial subjects, which could be used by the subjugated as a tool of resisting homogenisation and of protecting their particularity, their rights. As the paper shows, a small number of left-wing Korean intellectuals saw an opportunity for overcoming imperialism in the East Asian Community initiative. They also saw the idea of the unity of Japanese and Korean races that accompanied the initiative as an opportunity to preserve Korean nationality rather than a sign of elimination of Koreanness. Their attempts were limited, cerebral and short lived and did not lead to tangible outcomes. The fact that these attempts existed does not compensate for the brutality of Japanese imperialism, either. However, by examining the ways in which the oppressed and subjugated tried to mobilise the ideas of the oppressor to subvert and resist oppression, the paper presents a more-agency centred understanding of workings of nationalism as a set of ideas.
Debating circumcision in Germany, Israel and Turkey: the negotiation of bodies and differences
Irit DEKEL (Humboldt-University, Germany) | iritdekel@gmail.com
Ibrahim EFE (Kilis 7 Aralık Üniversitesi, Turkey) | ibrahimefe@hotmail.com
Bernhard FORCHTNER (Humboldt-University, Germany) | b.forchtner@hu-berlin.de

Bodies have long been sites signifying shared identities and struggles over symbolic boundaries. The circumcision debate that originated in Germany in 2012 (and continued in Israel and Turkey) is an exemplary case of such struggles. This debate, which called to outlaw Jewish and Muslim boy circumcision, became a site for the negotiation of practices by ethnic and religious minorities vis-à-vis the state-Christian majority. Against this background, we claim that while the majority’s boundary work scrupulously avoided traditional anti-Semitism and racism, it has, following liberal-democratic assumptions, framed the criminalization of circumcision as a clinical, enlightened and humanistic response that can preserve the bodily integrity of innocent children.

We thus ask, first, how the majority’s clinical gaze constitutes bodies of others. Second, we inquire into the practice of ‘writing around’ the body, showing how proponents and opponents of circumcision made the debate’s centre, bodily integrity, meaningful through analogies to, e.g., other bodily harming (secular) practices such as ear piercing and similar practices in other times/places such as baptising. Third, by comparing Germany, Israel and Turkey, we reveal the interdiscursive dynamics of a debate that transgressed national and religious boundaries, a fact affecting all sides of the debate.

We analyse the coverage of the circumcision debate in broadsheets and tabloids in the three countries, drawing on discourse-analytical tools. We thus show how a subtle type of ‘otherness’ is constructed (but also opposed), and how the articulation of minority rights in terms of religious difference remains intact even in (self-perceived) modern, secularised societies.

The ‘Islamization of the stranger’ and its impact on public opinion. An empirical analysis of the dispersion of anti-Muslim feelings compared to general ethnic prejudice among the public at large
Bram SPRUYT (Vrije Universiteit Brussel, Belgium) | bram.spruyt@vub.ac.be

In the past few years quite a number of scholars have assessed whether anti-Muslim prejudice is more widespread when compared to prejudice towards other religions, cultural or ethnic groups or general ethnic prejudice. These endeavours relied on different methods and yielded mixed results.

In this paper our aim is twofold. First, we critically review the methodology used to compare the spread of anti-Muslim attitude with other forms of ethnic prejudice. This leads to the conclusions that an empirical test which combines the strengths of the different research methods that have been used so far is lacking. Therefore, we subsequently provide new data from Flanders (the Dutch speaking part of Belgium; N=1577) that allows us to (partially) fill the blind spots in the existing literature. A split sample experiment in which half of the sample evaluated statements about strangers and the other judged statements about Muslims is combined with an open question that allows to distinguish people who spontaneously associate ‘strangers’ with ‘Muslims’. This design enables us to disentangle the effects of the contextual versus chronic salience of Muslims for public opinion on prejudice. Moreover, by including measures that not only tap into general ethnic prejudice but differentiate prejudice according to the specific content of their justification (in terms of economic threat, cultural threat and reasons of security), we are able to assess the spread of anti-Muslim feelings in public opinion in much greater detail than what has been done so far.
Social Inequalities and Temporal Differences - Citizenship-Bildung in the Context of Anti-Semitism and Islamophobia

Sultan DOUGHAN (UC Berkeley, Germany) | sultan_doughan@berkeley.edu

This paper will provide an intersectional analysis into contemporary Germany’s effort to foster integration for Muslim citizens through Holocaust-education. The German government’s official claim is that “Auschwitz is part of German identity” and that every citizen living in Germany should come to terms with the Holocaust. This claim is realized in historical-political Bildung (informal education) by providing a ‘pedagogy of recognition’ when it comes to Muslim participants, the educational programs seek to establish a presentist identification with German history and a differentiation from past Jewish victims. Difficulties arise for the German majority when Muslim participants identify with Jewish victims, social inequalities and temporal differences notwithstanding. This paper will make an argument for the ‘ambivalence of integration’ of the Muslim minority in contemporary Germany in relation to the socially imagined historical Jewish minority. The paper will demonstrate the arrangement of social inequalities and temporal differences between the Muslim and Jewish minority in the domain of informal education in particular and in national discourse in general. The performative and discursive ordering of these two minorities is threatened in moments in which legal rules discriminate against both minorities or when current legal restrictions resemble past discriminatory laws as will be exemplified. The aim of this paper is to tie together different historical and social sections within an administrative-legal space in order to shed light on the shifts and continuities that produce inequalities between majority and minority in Germany today.

RN31S05 - Black Europe: Other Cosmopolitanisms

Jewish Othello/Black Shylock: Imagining European anti-Semitism and Racism in Caryl Phillips’ The Nature of Blood

Linda WEINHOUSE (Community College of Baltimore County, USA) | LWeinhouse@ccbcmd.edu
Efraim SICHER (Ben-Gurion University of the Negev, Israel) | sicher@bgu.ac.il

Caryl Phillips’ Color of Blood should be read in the context of the race discourse in Britain, where the author grew up, but it also relates to the larger perspective of European identities seen from the “Black Atlantic.” We show how the inversion of the Shylock myth in the novel engages in a construction of the “jew” familiar from postcolonial discourse and the writings of Frantz Fanon but updated to new political realities. Drawing on the work of British sociologists Paul Gilroy and Stuart Hall, we suggest that this text is fairly representative of shifts in thinking about diaspora, hybridity, and globalization which are shaping theories of anti-Semitism and racism in Europe today and their inscription in the social sciences. Moreover, the way in which European Blacks imagine Jews after the European Holocaust looks to a complex history of identification of Black slavery with Jewish persecution, solidarity of Jews in the American civil rights movement, and anti-Zionism.

Cosmopolitan Europe and Austerity: Eurocentrism and the Spectre of Coloured Cosmopolitanism

John Christopher NARAYAN (University of Warwick, United Kingdom) | j.c.narayan@warwick.ac.uk
The on-going Eurozone crisis has garnered distinct cosmopolitan responses, such as those offered by Ulrich Beck and Jurgen Habermas. Within these responses the problems of the Eurozone and the rise of austerity are seen as a crisis of politics rather than economics. The solution to the Eurozone crisis is thus said to hinge on the reaffirmation of a more integrated and socially democratic ‘Cosmopolitan Europe’. This paper will endeavour to highlight, however, that cosmopolitan accounts of the Eurozone crisis are inherently Eurocentric. This Eurocentrism stems from how cosmopolitan narratives of the Eurozone crisis start in Europe and predominantly end in Europe and have very little to say about anything else but Europe. As such, the idea that the Eurozone crisis is symptomatic of a crisis of global capitalism and democracy is seemingly lost in translation. To push beyond these limitations the paper will present an alternative ‘Coloured Cosmopolitanism’ offered by writers such as Aime Cesaire and Frantz Fanon, which not only offered a new vision for the post-colonial world but the whole of humanity; Europe included. This form of cosmopolitanism not only offers a historical retrieval of the colonial origins of the European project but also highlights how the moment of decolonization has been largely forgotten by accounts of Cosmopolitan Europe. The paper will conclude by suggesting that such Coloured Cosmopolitanism offers both a better assessment of the Eurozone crisis as a global crisis, and a far more radical democratic agenda for the future of Europe as a Cosmopolitan project.

Racism, black stereotypicality and alienated bodies in the Early Enlightenment: The case of Angelo Soliman
Iris WIGGER (Loughborough University, United Kingdom) | i.wigger@lboro.ac.uk

Charles W. Mills reminded us in 1959 that the Sociological Imagination is a historical imagination and that “every well-considered social study... requires an historical scope of conception and a full use of historical materials”. Racism and the social exclusion of racialised ‘others’ is, as a transnational problem, deeply embedded in European history and remains a central challenge to contemporary world society. Against this background, my paper argues for a greater historical reflexivity in contemporary European racism analysis. It uses the case of Angelo Soliman to explore early discursive roots of black stereotypicality and anti-Black racism within the academic elite of the early European Enlightenment.

Soliman was born in Africa in 1720, sold into slavery to Europe as a child, and arrived in Austria to work as a royal ‘moor’, valet, and tutor at the Vienesse court. He established himself as a prominent citizen and intellectual of Vienna, joined a freemason lodge, married into the Vienesse aristocracy and lived well as a pensioner after retirement. After his death, his associates within the Enlightenment circles of Vienna, snatched his body, skinned and stuffed him, and turned him into a zoological specimen to be exhibited in the Royal Natural Collection. As an exhibit, he was dressed to represent a ‘savage’, in a loin cloth, decorated with a feather crown, and placed among taxidermied exotic animals in a wild landscape.

I discuss this case in the context of emerging race theories of the Enlightenment, which formed the core of a new ‘scientific racism’. This scientific racism has for centuries tried to ideologically justify global white domination and is at the heart of what another Charles Mills has convincingly termed ‘The Racial Contract’. Soliman, as a case study, illustrates the inhumanity of racism as a negative mode of societalisation based on the exclusion of ‘racialised others’.

RN31S06 - Indigeneity, Resistance, Settler Societies
A Preliminary Theory of Cycles of Resistance and Control: A Glimpse into Canada’s Colonial Continuum of Silence and Inaction

Davina ROUSELL (Carleton University, Canada) | davinarousell@gmail.com

Utilizing tenets of grounded theory, this paper analyzes the phenomena of Chief Theresa Spence’s 44-day hunger strike that took place in Canada’s capital, Ottawa, through an examination of extent data that was systematically gathered from Indigenous (Alberta Sweetgrass & Windeepaker Contributor) and non-Indigenous (Edmonton Journal & Canadian Press) media outlets. This study uniquely brings together LaRossa’s (2005) coding process with Snow’s (2001) principles of symbolic interactionism and de Certeau’s concepts of tactics and strategies to critically analyze the data and develop a preliminary theory termed Cycles of Resistance and Control. These findings illustrate a theoretical story that identifies a colonial continuum and the emergence of non-Indigenous allies. This paper concludes by examining the conditions necessary to effectively challenge and transform the current relations between the Government of Canada and First Nations peoples, thereby adding to the dearth of literature using grounded theory to critically examine and identify the necessary conditions for challenging dominant discourse and inequality experienced by many Indigenous peoples across Canada and abroad.

Decolonizing conviviality in a settler society

Avril BELL (University of Auckland, New Zealand) | a.bell@auckland.ac.nz

Paul Gilroy argues that everyday cross-cultural conviviality is a countervailing force to the anti-multiculturalist tendencies within British and European cultures. In convivial culture, racial/ethnic/religious difference becomes ordinary, neither a barrier to relationship nor subject to difference-blind denial. In this paper, analysis of interview data addressing indigenous/Maori-settler/Pakeha relationships in small town Aotearoa New Zealand exemplifies Gilroy’s argument, but with specific settler society twists. I argue particularly for the power of the embodied encounter, which is implicitly significant in Gilroy’s concept but not developed in his work. Face-to-face, embodied experiences across lines of difference are crucial to learning about cultural difference and the possibilities of decolonizing (and anti-racist) conviviality. In this moment of growing disquiet about the possibilities of multiculturalism, this argument is a reminder of the ordinariness and the importance of cultural difference itself and of the importance of opportunities for everyday cross-cultural encounters that cut across ‘lines of difference’ (Pratt, 1999). In the paper I theorise the importance of the face-to-face drawing on the work of Emmanuel Levinas and also Maori philosophy. This point of connection between European and indigenous philosophies meet.

Nigerian, Dubliner, One and the Same: Nigerian Incorporation in Dublin’s Cityspace.

Vanessa Theresa STOUT (Trinity College Dublin, Ireland) | stoutv@tcd.ie

‘Nigerian, Dubliner, One of the Same,’ is a view of how Nigerian immigrants incorporate in Dublin’s cityspace. This presentation explores the cityspace of Dublin from the black and immigrant perspective. The past research reveals the change of view towards Africans in Ireland and how ‘Fortress Europe’ denies the opportunities of the welfare state to non-E.U members. However, this presentation will exhibit main difficulties for Nigerians based in Dublin
such as discrimination in housing and employment, isolation, and racism, and also how they navigate through these obstacles. It is important to examine the strategies, goals, and expectations Nigerian immigrants have about Dublin city and what the cityspace offers to them. Moreover, by focusing on one specific nationality within the African Diaspora can bring a more refined understanding of unique cultural experiences within this Diaspora. My study contributes to the existing body of research by examining the influential role space plays on incorporation. Dublin is an attractive setting because, as White (2012) states, it is a unique opportunity to study the cityspace because 'Ireland’s new global presence offered an unprecedented ‘social laboratory’ in which to examine the persistence of race-based inequalities in perceived modern global societies,’ (White, 2012; 1). This presentation will show a glimpse of what Nigerians have to embrace presently in Dublin, however, it is important to note that space is consistently changing and will continue to do so.

Indigenous Peoples in a Post-transitional Scene: The Cases of Argentina and Chile
Dana BRABLEC SKLENAR (University of Cambridge, United Kingdom) | dab70@cam.ac.uk

This paper presents a unique comparative perspective upon the relationship between indigenous minority politics and democratisation processes in Argentina and Chile. The research analyses the influence of democracy on the expression of indigenous political and land ownership demands and on the state responses to these claims in post-transitional Chile and Argentina. In this manner, the investigation adopts a broad analysis of political processes and explores the political and sociological factors that have affected the decisions made by indigenous and public actors.

Two main research questions will constitute the guidelines of this investigation: (1) how has the new democratic context affected the organisation and expression of indigenous peoples' demands in Argentina and Chile? And (2) have the Argentinean and Chilean states responded realistically and appropriately to these claims?

It is argued that, despite the undeniably positive results achieved under democracy in terms of indigenous organisation and improvement of conditions as a consequence of state action; the bureaucracy's response has been less effective than expected. This is particularly true for Chile where authoritarian legacies have played a negative role in the improvement of the political participation and representation areas as well as in the situation of ownership of ancestral lands of indigenous peoples, despite Chile having a stronger and more stable democracy than Argentina.

RN31S07 - Old and New Racisms and the Space of Europe

The racialized boundaries: Anti-Gypsyism in Europe
Alfredo ALIETTI (University of Ferrara, Italy) | ala@unife.it
Dario PADOVAN (University of Turin, Italy) | dario.padovan@unito.it

Roma are the most discriminated minority in Europe. Many reports from European agencies, NGO's, academic studies show as the Anti-Gypsyism is widespread and strong in large part of European countries. This phenomenon is not new, the aversive attitudes towards Roma groups have a long history of persecution, segregation and extermination (the Nazi genocide). Moreover, the persistence of Anti-Gypsyism needs to some explanations for understanding this social process of construction of racialized boundaries in Europe.
Our reflections analyze the spectrum of racism and discrimination againsts Roma people in order to compare Anti-Gypsyism with other expression of racial discourses and practices as Anti-Semitism or Islamophobia.

Political education and Anti-Gypsyism
Holger KNOTHE (Munich University, Germany) | holger.knothe@soziologie.uni-muenchen.de

Focusing on a current qualitative study, this paper aims to explore the linkages and tensions in a school setting between political-historical education about the genocide against European Roma on the one side and present Anti-Gypsyism on the other side. Given firstly a wide societal acceptance of resentments against Sinti and Roma, secondly the lack of communication about this genocide within public discourse and thirdly an increasing diversity within the education system the paper tries to analyze the communication between teacher and students when teaching about the genocide against European Roma and Sinti. Accordingly the methodological framework as well as first results of an ongoing research regarding the resonance of novel teaching materials “The fate of European Roma and Sinti during the Holocaust” within the Bavarian Educational System will be presented and discussed. Thus the paper’s contribution is twofold: firstly in the production of sociological knowledge regarding classroom communication about racisms and memory politics and secondly in its efforts to identify working strategies against Anti-Gypsyism in an educational setting in order to contribute to anti-racist strategies in the public sphere in general.

Discrimination of Ethnic Minority in Europe: Case of Silesia
Maria SZMEJA (AGH University of Science and Technology Krakow, Poland) | maria.szmeja@agh.edu.pl

Silesia is a borderland between countries, nations and cultures, where mainly Polish and German influences clash. For ages, the Silesians themselves have manifested their ethnical (Silesian) identity, while the national identity – Polish or German – was demonstrated only when it was forced by the administrative body. The feeling of distinctiveness had developed by the end of 20th century. The Germans realised this when Silesia was still within their country’s border (until 1945). Later in Poland, people in the National Censuses were not asked about their national identity to, in accordance with the policy, build the new national state. After 1989 in the independent Poland, the problem of a different national identity emerged quite quickly. This issue has become especially visible in the National Censuses since 2002. In the first Census from 2002, 173.000 of Polish inhabitants claimed to be the Silesians, whereas in 2011, this figure rose to 840.000. The Polish authorities not only ignore the feeling of distinctiveness, but also they make it difficult to formalise this status. This situation can be explained in terms of post-colonial theories – domination over the border group (E. Said, H. Bhabha), political domination (M. Hechter), as well as significant cultural differences. When I mention the Silesians in Poland, I would like to underline the consistent policy of the Polish authorities marginalising the identity needs of minority groups. This policy is characterised by typical forms of rejecting others, forced assimilation, the negation of the right to a different than the dominant identity. Because of this discriminating state policy, the Silesian group takes more radical steps: the policy of historical memory of the group is carefully rekindled, the leaders stress the cultural differences where the discrepancies are emphasised and the similarities with the dominant group are mineralised. Both parties, Polish and Silesian, cannot find common ground. The one who suffers most because of this is the minority group, as the weaker one.
Do Poles like Germans? Social differentiation of ethnic conflicts in collective memory
Barbara PABJAN (University of Wroclaw, Institute of Sociology, Poland) | bpabjan@uni.wroc.pl

Social differentiation of ethnic relationships in collective memory is the subject of the study. I present the results of empirical research of Wroclaw population. The results uncover that attitudes towards Polish-German relations are heterogeneous. The collective memory of these relations is still under the influence of the history, particularly WWII. There are two distinctive groups: those who accept the idea of reconciliation with Germans, are open to other ethnic groups and support the European integration, and those who are intolerant to other ethnic groups, and still interpret the contemporaneity from the perspective of past conflicts, moreover they reject the European integration, and multiculturalism. Based on the data I explain how local and national framework of interpretation shape ethnic relations.

Main findings are:
1/ The founding myth of Polish settlers in the former German city supported by the fear of the return of the Germans reinforce negative attitudes to Germans,
2/ Stereotypes are the frame of interpretation of ethnic relations: Germans are seen as invaders and Poles as victims.
3/ Data show how historical policy influences the dominant narratives of ethnic relations. Leftist and centrist politicians support and right-wing oppose to reconciliation with Germans.
4/ the level of education, economic deprivation, and age differentiate attitudes to Germans.

The analysis is based on qualitative and quantitative research: the public debate on the idea of commemoration Georg Bender - former German city major - and a survey on the representative sample of Wroclaw population on collective memory of Germans).

RN31S09 - Critical Theory and Intersectionality, Racism and Antisemitism

Arendt's Jewish Writings: reading against the grain
Robert FINE (University of Warwick, United Kingdom) | robert.fine@warwick.ac.uk

Arendt's Jewish Writings, written from the mid-1930s to the mid-1970s, raise difficult questions concerning the borderlines between the particularity of Jews as Jews, the universality of Jews as human beings, and the singularity of Jews as unique individuals. Arendt addresses three archetypal responses to antisemitism: assimilationism, Jewish nationalism (or Zionism), and cosmopolitanism. They show us the peculiar difficulties Jews have faced in finding a home in the modern world: whether by conformity to the norms of an antisemitic society; or by an act of belonging to the Jewish nation; or by self-presentation as ‘citizens of the world’. I draw from Arendt elements of an analysis of the contradictions of Jewish political identity, which has continuing relevance for contemporary relations to antisemitism, Zionism and cosmopolitanism. I take issue with both dominant interpretations of Arendt’s approach – one critical of her alleged ‘lack of love’ for the Jewish people; the other endorsing her allegedly universalistic critique of Zionism – in an attempt to take further her developmental response to the ‘political failures’ of assimilationism, Zionism and cosmopolitanism. I maintain that assimilation, nationhood and universality were all elements of Arendt’s political thinking and that her aim was not to turn any one into an ‘ism’ – be it assimilationism, Zionism or cosmopolitanism – but in a spirit of what we might call ‘moderation’ to realise their inter-connectedness.
Critique of Intersectionality
Björn MILBRADT (University of Kassel, Germany) | bjoernmilbradt@uni-kassel.de

Intersectionality is probably one of the most widespread and contested concepts in current debates on the interdependency of different ideologies like racism, antisemitism and sexism. Simultaneously, most followers of the concept admit that it is virtually impossible to give concrete definitions as well as to come to an agreement on the phenomena to be included in the concept. Thus, the “success story” (Kallenberg et al.) of the research on intersectionality is accompanied by disorientation and a certain conceptual arbitrariness. I will develop a critique on intersectionality based on an interpretation of the ‘Authoritarian Personality’ (Adorno et al.). Understanding ‘critique’ not as a mere rejection of a concept, but as an inquiry into its genesis and validity, I will argue that the authors of this study – with their notion of a ‘syndrome character’ of prejudice – already fleshed out a theory that includes a clear view on the social roots of this syndrome. Adorno et al. as well as Horkheimer/Adorno in the ‘Dialectic of Enlightenment’ identified a disintegration of language – mediated by social developments – as a basic cause for a disintegration of human perception in general. It is this disintegration of perception that shows itself in the diverse intersecting ideological phenomena. I will conclude the presentation by advocating including critical theory in contemporary research on intersectionality because it can be shown that it is exactly this critique of a social disintegration of perception that is able to overcome the conceptual arbitrariness and to link our notions of social inequalities and differences.

Genocide, crimes against humanity and apartheid? - reflections on contemporary anti-Zionism from an Arendtian perspective
Philip SPENCER (Kingston University, United Kingdom) | p.spencer@kingston.ac.uk

Criticism of Israel in recent years from anti-Zionists in recent years has focused on three sets of charges: that Israel has committed genocide and crimes against humanity and can be compared to the apartheid regime of South Africa. Each of these charges, if valid, would make the state of Israel guilty of the worst crimes recognised by the international community since each of these charges form much of the remit of the International Criminal Court, which was set up in the aftermath of the ad hoc tribunals for Yugoslavia and Rwanda to deal with the gravest kinds of crimes. In several of her writings, particularly the Origins of Totalitarianism and Eichmann in Jerusalem, Hannah Arendt also explained why the first two of these crimes were particularly grave and it can also be argued that of her argument about racism and imperialism could be extended to include apartheid as a crime of a similar order of magnitude. However, Arendt also argued that great care needed to be taken with making claims of this kind. In this paper, I look at how Arendt’s concept of political judgment in particular may be used to evaluate the arguments put forward by anti-Zionists in recent years

Intersectionality and critical theory
Christine Elisabeth ACHINGER (University of Warwick, United Kingdom) | C.E.Achinger@warwick.ac.uk

This paper examines concepts of intersectionality in the context of my current work on constructions of Jewishness/Germanness and gender in modern German culture. During the 1990s and 2000s, the question if intersections of categories of gender, sexuality, class and race should be imagined as additive or as mutually modifying and mediating was an issue for debate within feminist theory and theories of racism and ethnicity. By now, this debate seems to have
been more or less settled in favour of the latter approach. The related question, however, if these intersecting categories originate in ontologically different, but interacting systems of power and domination (such as, e.g., ‘patriarchy’ and ‘capitalism’ in dual systems theories within Marxist feminism), or if they have to be understood as different moments or dimensions of the same social totality still seems to be an issue for debate. With reference to a number of case studies on images of femininity and Jewishness and their configurations in German texts of the ‘long 19th century’, my paper investigates the contribution that approaches from within a tradition of critical social theory (Adorno, Marcuse, Guillaumin, Knapp) can make to this debate.

**RN31S10 - Hate and Enmity: The Right-wing Personality and Out-groups**

**How do offline and online social capital associate with online hate production?**
Markus KAASKINEN (University of Tampere, Finland) | markus.kaakinen@uta.fi
Pekka RÄSÄNEN (University of Turku, Finland) | pekras@utu.fi
Matti NÄSI (University of Turku, Finland) | matti.nasi@utu.fi
Atte OKSANEN (University of Tampere, Finland) | Atte.Oksanen@uta.fi

Hateful, threatening or degrading content is apparent in online interaction. Given the growing importance of the Internet as the key communication medium, online hate is a problem not only for the well-being of individuals but also for societal relations in more general. In this paper we analyze the online hate content production and its associations with perceived social relations, i.e. cognitive social capital in offline and online context. Our data is derived from British, Finnish, German and American online users aged 15–30 (N=3565). We found that hate content production is a rare phenomenon (only 3% of British, 1% of German and 4% of Finnish and American respondents reported having produced such material) and it has an inverse relation to cognitive social capital in offline and online context. Those respondents with high offline social capital had decreased risk of producing hate material, whereas online social capital was associated with a higher risk. In addition, male gender and living alone were positively associated with online hate production. Social capital has been widely reported to facilitate social integration and abate social conflicts. Our results suggest, however, that traditional offline social capital serves as a source of social integration in online interaction but the formation of online social capital appears to lead to increased conflicts.

**Group-focused enmity in Belgium: a sociological approach**
Bart MEULEMAN (Institute of Social and Political Opinion Research, University of Leuven, Belgium) | bart.meuleman@soc.kuleuven.be
Koen ABTS (Institute of Social and Political Opinion Research, University of Leuven, Belgium) | koen.abts@soc.kuleuven.be
Koen SLOOTMAECKERS (Queen Mary, University of London, UK) | k.slootmaeckers@qmul.ac.uk

Classical social-psychological theories -such as Sumner’s ethnocentrism concept, Allport’s theory of prejudice or Adorno’s authoritarian personality- predict that persons holding negative sentiments towards one out-group will also harbour hostile attitudes towards other out-groups. The recent group-focused enmity-literature shows empirically that attitudes towards various out-groups are strongly related indeed (Zick et al. 2008; Davidov et al. 2011; Wagner, Christ & Pettigrew 2008). However, while this body of literature acknowledges that processes of attitude formation do not take place in a societal vacuum, little efforts have been made to study the impact that concrete contexts have on how attitudes towards various out-groups are
interconnected. This paper attempts to fill out this gap by approaching group-focused enmity from a sociological perspective. Concretely, this paper studies attitudes of Belgian residents towards four out-groups that are prominently present in societal debates: homosexual persons, persons with an immigration background, Muslims and Jews. Theoretically as well as empirically, we investigate how social-structural (age, gender, education, social class) as well as cultural (authoritarianism, relative deprivation, anomie) characteristics affect attitudes towards the four out-groups differently. For this purpose, a postal survey among a random sample of Belgian adults is analysed by means of structural equation modelling. Our results show that it is possible to discern a group-focused enmity factor indeed. At the same time, however, structural and cultural antecedents affect attitudes towards the various out-groups differently in a way that reflects the current societal debates and conditions.

Personality, status beliefs and right-wing extremist attitudes
Conrad ZILLER (University of Cologne, Germany) | ziller@wiso.uni-koeln.de

This study examines whether and how personality traits (Big Five) predict right-wing extremist attitudes. Building upon previous research, I examine indirect effects of personality via the status-related beliefs opposition to equality and relative deprivation. In addition, I apply a person × situation approach to explore whether the individual-level relationships are moderated by regional factors that indicate resource scarcity (unemployment rates) and intergroup competition (proportions of immigrants). The results from (multilevel) structural equation models on representative survey data from Germany reveal substantial direct and indirect effects of personality traits, in particular of agreeableness, openness and conscientiousness. Contextual conditions moderate the indirect effects of personality to some extent and largely in line with arguments derived from conflict theory.

Anti-Roma Marches in Czech Republic: Fear, Anger and Shame Fuelling Collective Action
Michal ŠINDELÁŘ (Masaryk university, Czech Republic) | smichaal@gmail.com

Czech Republic witnessed unprecedented ethnically motivated collective action during 2011 to 2013. The media news reporting the physical attacks of Roma against ethnic Czechs ignited mobilization which resulted in a series of anti-Roma marches through the country. Using a case study of anti-Roma marches and focusing on two units of analysis, a Breclav’s march in 2012 and a Duchcov’s march in 2013, this paper unveils framing of the events resulting in mobilization of ethnic Czechs. Departing from Gamson (1982) the analysis describes how the image of Roma out-group as an aggressive, numerous and exploiting social benefits was transformed into a story of injustice resulting in suffering of ethnic Czechs, who perceive themselves as the cornered, innocent victims of Roma. Framing the events as the plain instances of long-term injustice allowed to generate a feeling of righteous anger necessary for a march mobilization. Emotions of fear, anger and disgust felt toward Roma are seen as a raw emotional material, which was by march organizers from radical nationalist groups utilized and transformed into a fuel of the collective action.

RN31S11 - Xenophobia, Institutional Racism and Everyday Racism

Racism in Everyday Life. Challenges and Difficulties in Adressing Racism
Wiebke SCHARATHOW (University of Education Freiburg, Germany) | wiebke.scharathow@ph-freiburg.de

Racism is a societal imbalance relationship which structures social order, with social practices of difference, the construction of social groups and social meanings and inclusions and exclusions. Studies show that racism today is institutionalised. For example in state employment agencies with regard to social security allotment or in institutions of education and social work and in the actions of professionals (Melter 2006, Flam 2007, Gomolla/Radtke 2007). When looking at the mechanisms, attributions and manifestations of racism in Germany, its specific expressions and effects, the history of racism in Germany has a powerful effect and needs to be taken into consideration.

The focus of this paper will be on a reconstruction of a racist normality in Germany, constantly present as a societal relationship in the everyday life of people to whom a migration history is attributed, as everyday occurrence and manifested in normalised practices of differentiation and exclusion. The analytic perspective of this paper will be on the subjective experience and interpretation and consequent strategies of action and negotiation of young people, whose everyday life is negatively impacted by racism.

The research presented in this paper is based on group discussions, and problem-centred interviews with eight young adults (age 14-20). Part of the data was collected during a 4-day workshop, where reflections and discussion about experiences and strategies among participants took place.

In the international context of the conference it will be interesting to discuss with other researchers different discourse lines of racism and their influence on today's understanding of and acting on racism in the world.

Examining Ethnic Minority Relations and Politics —A Cultural Studies Approach
Yoshie NIIJIMA (Keio University, Japan) | yoshieniijima@gmail.com

This research examines the question of minority representation and discourse expanding Stuart Hall's identity theory. Representation of identity changes the surface through articulation to different signification and sometimes expands the range which connote in the course of history. In this research, this importance of the changes in minority representation will be discussed. Stuart Hall, a theoretical leader of Cultural Studies who introduced neo-Marxism to mass communication research, set his focus on this articulation process. His research questioned why and how specific articulation was accepted as unswerving and others were not. Today this articulation of identity cannot separate from the mass media that preferentially format more and more.

Analyzing the articulation or re-articulation process of discourse between social forces, especially over the representation of ethnic identity is in need to pursue theoretical development in Ethnic Studies. In many studies on ethnic groups, this systematic view on minority representation and its interwoven relation with neo-conservative wave are overlooked due to convergence to the actual racist experiences of minorities.

By looking at the process of discourse formation and the changes in actual presentation, we will be able to see the identity as generated in a form which is always collated to representation; "subjected self." Because identity is a suture point of discourse practice inviting specific discourse socialized subject and the process of construction of self by calling (Hall 1996:5=2001:15), though it is not Inevitable articulation, unification is sustained under certain circumstances.
Dialecticity of power and racism: Effects on those who dominate and those who are dominated
Maria José Manso CASA-NOVA (University of Minho, Portugal) | mjcasanova@ie.uminho.pt

Power relations serve as the basis for the structural domination existing in societies. These power relations, based mainly on so-called “structural invariants” such as class, gender and “race”, appear naturalised in society (and are hence more difficult to deconstruct). Studies carried out and theories produced in the context of critical sociological theory, concerned with social injustices, have examined the production of racism in the aspect of the powerful over those who are dispossessed of the different types of power that are valued in society. Based on ethnographic field work carried out among Portuguese Roma communities, this paper explores the dialecticity of racism and the social consequences of racism originating in groups that wield power structurally, as well institutionalised racism. It simultaneously reflects on the contextual racism of socially powerless groups and the impact of this contextual racism at the level of confirming stereotypes and socio-cultural segregation of the latter.

The field data made it possible to conclude that when there is an institutionalised racism that cuts across institutions and mentalities (these also being understood as an institution in their sociological sense) and a racism of powerless groups (in this case the Roma socio-cultural group), within the aforesaid groups the consequences of the institutionalised racism and the mental racism naturally internalised by the majority socio-cultural group (considered to be the group of the powerful here) on groups bereft of power, result in the latter being kept at the lowest levels of the social hierarchy, relegating them to the “borderlines” of exclusion, while the racism of the powerless - which does not affect the social position of the powerful - reinforces their situation of being at a disadvantage and their social vulnerability.

Measuring Xenophobia in Adolescence
Gloria DOMÍNGUEZ ALEGRÍA (Complutense University of Madrid, Spain) | gdalegria@ucm.es

Racism and xenophobic attitudes of immigrants has been widely studied in the last decades. More specifically, immigrant adolescents or the so called second generation (in those countries with longer history of strong immigration flows) have received particular attention given the importance of education and experiences in this stage of life for the integration of immigrants. Nevertheless, indicators developed for this purpose are mostly structured through an adult centric point of view. In order to measure prejudice in adolescence and getting to know what their particular problems and perceptions of discrimination are we propose a mixed-methods approach that will allow to develop a survey that measures accurately both xenophobic attitudes and experiences of discrimination, attending to their own perception and worldview. 

This communication will discuss the benefits of using mixed methods in order to build a quantitative questionnaire that may provide researchers with a realistic and accurate photograph of the situation of immigrants in relation to prejudice and xenophobic attitudes in adolescents that may be used in comparative studies. In summary, the presentation will enquire into the benefits of using qualitative methodology for the development of quantitative tools. It delves into the techniques that may allow to compile information on prejudice and discrimination rooted on the adolescents’ worldview and expressed in their own words and the ways in which this information may be translated into a closed questionnaire in order to measure inequalities across countries.
RN31S12 - Citizenship, Belonging, the Nation: Xeno-racism and National Others

Cultural Differences or Enemy of the State? Demand from Different Perspectives: Policies and Our "Guests" in Taiwan
Yi-wen HUANG (Birkbeck, University of London, United Kingdom) | yhuang07@mail.bbk.ac.uk

Communication between Taiwan and other nations was initiated after the abolishment of the Martial Law in the 1980s for ‘opening’ of the state and democratization. Three transformations derived from the population mobility has took place from the 1980s till 2010s and influenced on the policy system. These transformations made changes to the social structure and the way to preserve the unique of culture and values. This research will focus on the transformation caused by the political conflicts between the communist party of the PRC and the nationalist party of the ROC (Taiwan). The legalization to open the labour market for low skilled migrant workers to work for the national infrastructure project since 1989 has two main reason, firstly, the policy avoiding to open the job market for the labour from China in order to against the “United Front” to Taiwan. Second, the job market therefore accept the migrant workers mainly from the southeast Asia. This is also a strategy for the Taiwanese government to implement “Pragmatic Diplomacy” to strengthen the international position. This paper will first discuss the problem can be caused by the redefinition of the “role play” in the Taiwanese society between the migrant workers and Taiwanese. I will argue the culture pattern of the migrant workers shaped by the mass media is resulted in stereotype. The second part of the paper will analyze how does the limited living space for the migrant workers has changed the way of them to represent their cultural character and identity.

United in Racism? Anti-Europeans’ discourse as an aspect of integration of second-generation South Asians in Britain
Marta BOLOGNANI (University of Bristol, United Kingdom) | martabol@gmail.com

While in Britain public debates on multiculturalism and integration processes are still controversial, research among minority ethnic groups shows that they generally feel integrated and British (Moosavi 2012). Generally minority groups resent having their integration questioned at regular intervals, as shown by many British Muslims’ refusal to apologise (while condemning) the Charlie Hebdo attacks, for example, as demands in such direction would single them out as ‘special’ kind of citizens. The present research shows that British Pakistanis and Sikhs in 2014 tend to see themselves as integrated (comfortable, able to work and enjoy life, and feeling they belong), in spite of what are seen as pockets of resistance both at an institutional level and among the majority population. This paper explores the double-bind condition of feeling integrated citizens and its direct consequence- the manifestation of the right to express outrage wherever one is not treated as an equal citizen. Interviews excerpts show how one’s citizenship right is often argued and shaped by talking about immigration, both as current concern and as a part of family history. In particular, strong concerns about immigration from Eastern Europe seem to corroborate one’s identity as British, thus having a positive impact on the feeling of belonging. The paper highlights the forms and functions of the anti-immigration feelings, and how colonial history is being re-digested so that South Asian migrants are closer to Britishness than Eastern European ones.
What shapes the occupational Identity of British born African - Caribbean registered nurses?
Beverley BRATHWAITE (University of Hertfordshire, United Kingdom) | b.brathwaite@herts.ac.uk

For Christiansen (1999, p. 551; Huot and Rudman 2010) identities (occupational) provide an important central figure in a self-narrative or life story that provides coherence and meaning for everyday events and life itself. ‘Hall (1996) and Brah (1992) argue that as ethnic identities lack fixed meaning the actual content of an ethnic identity is dependent on the context’ (Kenny and Briner 2013, p272).’ This highlights the importance of two issues, that of context and identities being ‘fixed’. Firstly for nursing work / occupation is both context sensitive and a social category / group. Being a nurse is ‘doing’ a job of work (skills, competencies) and an occupation (Christiansen 1999; Huot and Laliberte 2010), the relationships with others (patients and other healthcare professionals) to provide nurses with a sense of purpose (Christiansen 1999).

The past for British born African- Caribbean nurses (BBAFCBN) is one of colonialism from cultural imposition, the British ‘motherland’ in parts of the Caribbean, to nurses being asked to come over and ‘help’ the new National Health Service. This acknowledges a ‘power identity nexus’ of white dominance and supremacy as (Marsh and Macalpine, 2002, p.8) have theorised. “Whiteness” propagates a negative and unequal and less powerful ‘other’ assumption of Africa- Caribbean women’s gender, ethnic and cultural identity (Mirza and Sheridan, 2003, p. 11-12). This can have a significant bearing on multiple identities of the BBAFCBN. There is a theoretical space to use nursing as an environment where BBAFCBN Identity (ies) can be theorised.

Caught between Humanitarianism and Exclusionism? Attitudes of the Danish public towards asylum seekers
Adi HERCOWITZ-AMIR (University of Haifa, Israel) | adihe@hotmail.com
Rebeca RAJMAN (University of Haifa, Israel) | raijman@soc.haifa.ac.il

Immigration has been a highly politicized issue in Denmark since the end of the 1990’s, following the increase in migratory flows to the country, especially asylum seekers and the rise of far-right political parties voicing anti-minority sentiments. So far, studies examining attitudes of the majority population in Denmark towards out-groups residing in the country have focused on the general group of migrants and not specifically on asylum seekers. In light of Denmark’s long standing humanitarian ideology, the topic of attitudes towards migrants seeking asylum seems of particular interest and relevance. In this paper we aim at filling this gap by relying on a national survey of 500 respondents among the adult population, carried out in September 2013. This study offers for the first time an Integrative model examining the effect of (1) social contact, (2) perceptions of socio-economic threat, (3) Humanitarian values and (4) perceptions that asylum seekers are “bogus”, on exclusionary attitudes towards asylum seekers.

Our findings reveal that Danes display moderately exclusionist views towards asylum seekers, advocating for a “meager” examination of asylum applications, rejecting family reunification and opposing the right to work and receiving financial support. Negative social contact, high levels of perceived security threat and threat on welfare resources, combined with views that asylum seekers are “bogus” (i.e. not in real fear of persecution) significantly increase exclusionary attitudes. Left-wing political orientation, positive social contact and holding humanitarian views were found to decrease exclusionism. Explanations and implications of these findings are discussed in light of existent theories.
RN31S13 - Postcolonialism, Post-genocide: Nationalism, Zionism and Anti-Zionism in Europe and MENA

The Impact of the "Arab Spring" on the Image of the "Jew" in Arab Public Discourse
Esther WEBMAN (Tel Aviv University, Israel) | webman@post.tau.ac.il

Hopes that the upheavals in the Middle East in 2011, known as the "Arab Spring", would usher a change in the negative image of the Jews, Zionism and Israel were soon dissipated. Although the volume of antisemitic articles in the Arab press somewhat diminished, and the unrelenting struggle between the nationalist and the Islamist forces averted the general attention from the Palestinian issue as well as from the Jews and Israel, it became clear that the Zionist, the Jew and the Holocaust are so entrenched in Arab thinking and public discourse that they are repeatedly invoked. However, in addition to the widespread antisemitic perceptions, there was a persistent usage of the term "Jew" to define non-Jewish adversaries by Judaizing them and attributing to them certain supposed features of Jews, and denouncing them for doing so. It is this aspect of the discourse that I would like to highlight.

My major contention is that the "Jew" is constructed as a functional metaphor, an all-purpose villain, to explain the changing circumstances and catastrophes. It is an authentic perception defined by common popular prejudices on the one hand, and theological polemics. To borrow from Shulamit Volkov's vocabulary, I suggest that the metaphor "Jew" has become a "cultural code" – "a sign of cultural identity, of one's belonging to a specific cultural camp," "a short-hand label of an entire set of ideas and attitudes."

The Postcolonial Jew
Efraim SICHER (Ben-Gurion University of the Negev, Israel) | sicher@bgu.ac.il

This paper looks at representation of the 'Jew' as a construction in the sociological imagination, as reflect in the ideology of postcolonial discourse. It shows that the figure of the 'Jew' can be both hostile and sympathetic in the social sciences and in cultural texts as an archetype of hybridity and migrancy, but it also reveals latent stereotypes of global power and world conspiracy. The 'Jew' occupies an ambiguous place in the racial hierarchy as White European but also as perennial Other and marginal outsider. The figure is often conscripted to political agendas, particularly in the debate over the Middle East conflict, in which the Holocaust victim is transformed into a racist perpetrator. The conclusion is that predetermined terms such as "anti-Semitism" are not always useful in establishing a balanced view but that stereotyped thinking and hate speech can feed into the anti-Jewish violence that has resurfaced in Europe.

Ethnic Map and Memory of Violence: Dersim Armenians in Turkey
Mehtap TOSUN (Middle East Technical University, Turkey) | ezo.cemre@gmail.com

The model of nation-state that is type of dominant political organization of modern era draws attention to an ideology which assumes an integrated nation envisagement in cultural meaning or an overlapped political and cultural border. In this ideology context, construction process of the Turkish national identity corresponds to a national integration in cultural meaning. Thereby, homogenization of the society in formation of Turkish national identity can be thought as an application area of both political and cultural project. In Turkey, this process can be observed as suppression of collective identities, cultural values and world-sense of individuals that exists in society. Collective identity is inherently included a perpetual transformation and helps
comprehension/interpretation and transposition efforts of collective memory. The collective history of Armenians that has been settled in varied areas of Turkey and has tradition of living together with other peoples bases on a long history in Dersim that has majority of Alevis Zaza/Kurds population.

The existence of collective history and memory of Armenians in Dersim based on both 1915 when Armenians living in Turkey were eliminated from their historic homeland through forced deportations and massacres and 1938 when a military, systematic and “disciplinary campaign” took place against parts of the province of Tunceli, formerly Dersim and resulted in a particularly high death toll that is known as 38 Dersim Massacre. As a result, Dersim’s informal autonomy and, in part, its ethno-religious habitat was suppressed and Armenians had lived two historical violence in Dersim. This research is an effort to comprehend and interpret violence processes of 1915 genocide and 1938 massacre above integration of the memory of violence in Dersim. Based on this, the study at least aims to contribute to knowledge of social history via collective memory and oral history of Armenians in Dersim.

Antisemitism and Strategies to Combat Antisemitism in a Muslim-Arab Dominated Society. Morocco as an example
Kim Robin STOLLER (Free University Berlin/ IIBSA) | robin.stoller@iibsa.org

An escalation of antisemitic incidents in 2014 and beginning of 2015 in Europe and the antisemitic terror attacks in Brussels, Paris and Copenhagen put on the forefront of the European intellectual debate on Antisemitism a largely in the past ignored topic: How to combat antisemitism among people auto-identifying as Muslims and arguing to act against “the Jews” and “the Zionists” in the name of Islam.

In Europe, the discussion tends to be arising around the topics “integration”, “assimilation”, “new needed approaches” or the claim to “acknowledge the problem of Muslim antisemitism”. But how is the problem discussed in Muslim countries? What are approaches to combat antisemitism in Muslim dominated societies? And, what could be learned from these debates? This paper examines, with the example of Morocco, how civil society activists debate the problem of what they call “antisemitism” and “hatred against Israel”: How they describe the problem? Who they name as (part of the) antisemitic actors? What are their practical approaches? And, what they think should be done in their society? The empirical data being discussed in this paper are based on indebt analysis of semi-guided and problem-oriented qualitative interviews with activists in Morocco, as well as participating observations of events claiming to combat antisemitism in the years between 2011 and 2015.

RN31S14 - Changing Antisemitism/Comparative Antisemitisms

The Bolshevik Response to Antisemitism in the Russian Revolution, 1917-1919
Brendan MCGEEVER (Birkbeck, University of London, United Kingdom) | bmcgeever@hotmail.com

This paper seeks to make a fresh contribution towards long-standing debates over Marxism and its ability to capture the nature of racism and anti-racist formations. It proposes to do so, however, through a unique and empirically driven analysis of the Bolshevik attempt to confront antisemitism during the October Revolution of 1917.

The Russian Revolution of 1917 was the high point of class struggle in the twentieth-century. It brought about a profound explosion of political mobilisation around issues of class exploitation
and other related forms of oppression, which remains unprecedented even today. In the very moment of revolution, however, the Bolsheviks were almost immediately forced to come face-to-face with mass outbreaks of antisemitic violence in the shape of pogroms, which spread across the vast regions of the former Pale of Settlement in the western and south-western borderlands. The pogroms posed fundamental questions for Marxist theory and practice, particularly since they revealed the nature and extent of working class and peasant attachments to antisemitic and racialised forms of consciousness. Beginning in the early weeks of 1918, the pogroms peaked in 1919 but continued well into 1922. Although it is impossible to state the scale of the violence over this period with any precision, there is no doubt that the Civil War pogroms represented the most extensive phase of anti-Jewish violence in pre-Holocaust modern history: the most conservative estimates put the number of fatalities at roughly 50,000-60,000 (Gergel 1951; Levin 1990), but the true figure may well have reached 120,000 (Heifets 1921, 180) or perhaps even as many as 200,000, as speculated by Soviet officials in the late 1920s (Larin 1929). During this unprecedented wave of violence, at least 2,000 pogroms took place, over half a million Jews were displaced and many more left injured and bereaved.

Based on extensive fieldwork in Russian and Ukrainian archives, this paper has two broad aims. First, it sets out to offer the most comprehensive analysis to date of the articulation between antisemitism and the revolutionary process. Antisemitism traversed the full spectrum of politics in revolutionary Russia, and no political formation, the Bolsheviks included, stood outside of this process. By moving beyond neat, categorical distinctions between ‘antisemites’ and ‘non-antisemites’, ‘revolutionaries’ and ‘counterrevolutionaries’, this paper aims to uncover the complex processes through which antisemitism could articulate with revolutionary politics, and Bolshevism in particular. It does so by offering an extensive discussion of the role of antisemitism and pogromist violence within the Red Army. The brutalities of the Civil War pogroms in general - and the White Army pogroms in particular – have been covered extensively in the existing literature (Shtif 1922; Cherikover 1923; Shechtman 1932; Gergel 1951; Cherikover 1965; Kenez 1992; Budnitskii 2001; 2005; Miliakova 2008; Dekel-Chen et al. 2011; Buldakov 2010). Within this literature, however, the complicity of the Red Army in anti-Jewish violence has been noted (Gergel 1951, 248; Budnitskii 2005, 118–121; Kenez 1992, 294), but not subjected to serious examination. This paper will address this oversight. The Red Army was among the least prone to pogroms of all the military forces in the Russian Revolution. According to Gergel (1951, 248), Soviet troops were responsible for approximately 8.6% of the Civil War pogroms, with the bulk of the atrocities being carried out by the Petliura and Denikin armies (40% and 17.2% respectively). However, although marginal to the overall picture of anti-Jewish violence during the Civil War, the Red Army pogroms will be placed centre stage in this paper by virtue of the fundamental questions they posed of the Soviet government and its anti-racist strategy. Indeed, the paper reveals that in regions such as Ukraine, antisemitism was endemic in the Red Army, even in those that did not carry out pogroms. A key aim of the presentation will be to offer a sociological explanation for the extent to which antisemitic representations of Jewishness could articulate so powerfully with revolutionary mobilisation in the Red Army.

Second, this paper offers the first in-depth analysis of Bolshevik attempts to arrest these articulations between antisemitism and the revolutionary process. Based on an exhaustive analysis of the antiracist political formations within the early Soviet state, the paper sets out to bring into sharp focus the various types of individual and collective agency that actualised the struggle against antisemitism during the Revolution and Civil War. Contrary to existing understandings, the paper reveals that the ‘anti-racist agent’ in the Soviet response to antisemitism was not the Bolshevik party leadership, as is often assumed, but a small grouping of non-Bolshevik Jewish socialists who coalesced around the peripheral apparatuses of the Soviet state during the revolution. Although Bolshevism was predicated on an anti-racist ‘promise’, after the October insurrection it took, significantly, the presence and agency of
Bundists and Left Zionists in the Soviet government to actualise that promise and translate it into a concrete anti-racist politics. The paper uncovers the various attempts by non-Bolshevik Jewish socialists to eradicate the problem of antisemitism within the Party and Red Army. It shows, for example, that when faced with inactivity on the part of the Party leadership, these activists took it upon themselves to establish special institutions within the state apparatus dedicated specifically to the cause of combating antisemitism.

In recovering this hitherto unrecognised anti-racist praxis from a moment of world historical significance, the paper sets out to make an original contribution to not only the history of the Russian Revolution, but to ongoing and contemporary debates about the nature of the anti-racist project as well.

Different antisemities

Lars Tomas DENCIK (ROSKILDE UNIVERSITY, DENMARK; HVC, UPPSALA UNIVERSITY, SWEDEN) | lade@ruc.dk

Karl MAROSI (MAROSI MARKETING, DENMARK) | marosi@marosi.dk

Based on re-analysis of the database of two large-scale international surveys, one on antisemitic attitudes in the general population carried by ADL 2013, the other one on the perception of antisemitism by the Jewish population of the same country carried out by FRA 2012, paradoxical results on the connection between level of antisemitism and sense of anxiety and belongingness among the Jewish populations in the investigated European countries are found.

A further analysis show that the content and sources of antisemitic attitudes vary between western and former east–European countries as do the cultural and political position of those that are attributed to be the persecutors of the antisemitic attacks.
In the paper these paradoxes, differences and variations are explained with reference to empirical data.

Theoretical reflections and empirical data on the rise of global Antisemitism
Heiko BEYER (University of Wuppertal, Germany) | hbeyer@uni-wuppertal.de

The presentation discusses the main explanatory concepts of modern Antisemitism and examines their empirical validity using global data from the PEW population surveys. On the individual level three functions of Antisemitism are reviewed: the mental rationalization of confusing social processes, the projection of denied traits, and the construction of a national collective identity. Further it is argued that cultural opportunity structures play a vital role for the growth and thriving of Antisemitism in a specific society. Empirical multilevel analyses show that on the individual level especially Antisemitism’s function to offer a rationalization of social change is an important factor. On the context level I found that especially persons living in Muslim countries and in comparatively poor regions report strong antisemitic attitudes. The presentation concludes with a discussion of those findings.

Do we study Antisemitism anyway? Critical Insight into studies of Antisemitism in Central Europe after 1989.
Michal VASECKA (Masaryk University, Czech Republic) | mvasecka@fss.muni.cz

Proposed paper offers methodological reflection of researching of antisemitism within Central Europe after 1989. Author argues that antisemitism in Central Europe has been studied one-dimensionally, conventionally, and in fact - most of researchers did not study antisemitism at all. Paper suggests that antisemitism immediately after revolutions of 1989 started to serve a function of exclusion and disqualification of liberal elites fostering liberal pluralism and multicultural society, and plays a role in the political battle over open society and liberal-democratic regime.
Article critically analyses approaches that Central European sociologists have been using in their analysis of antisemitism after 1989. The article describes quantitative methods used by sociologists and suggests need of a complex approach to research of antisemitism. Author argues that modern antisemitism is de-judaized, while Central European researchers focus more on a research of prejudices and stereotypes toward Jews. The research of antisemitism in Central Europe is fully dominated by a Bogarduss scale of social distance while different relevant research methods are not used. Moreover, in the process of interpretations of public opinion surveys experts do not take into account the so-called escaping answers of respondents and attempts to run away from answering sensitive questions. Socio-psychological research, reflecting authoritarian personality, anomy, alienation and ontological insecurity of common people as sources of anti-Semitism, is rather rare within Central Europe. Consequently, quantitative research of antisemitism in Central Europe can be evaluated as insufficient. De-judaized perspective of anti-Semitism and even of Jews themselves in a Sartre’s sense is remaining one of the greatest challenges for sociologists researching antisemitism in Central Europe.

RN31S15 - Changing Antisemitism/New Antisemitism and Israel-critique, Conspiracy Theories
Anti-American Prejudice as Discriminatory Rhetoric – Examples from a Mixed Methods Study on Current Anti-Americanism in Germany
Felix Benjamin KNAPPERTSBUSCH (Justus Liebig University Giessen, Germany)  | felix.knappertsbusch@sowi.uni-giessen.de

In current research anti-Americanism is often conceptualized as a prejudice (Beyer/Liebe 2013; Katzenstein und Keohane 2007; O’Connor 2007). Although this approach is a productive response to the conceptual problems of distinguishing anti-Americanism from legitimate criticism of the USA, it is not free from conceptual issues itself. Its common definitional components (aversion, irrationality/propositional falseness, and cognitive schema) do not provide satisfactory criteria for classifying utterances as prejudice. Especially when analyzing utterances of everyday speech, applying these criteria can be a difficult interpretative task for which said definitions provide little conceptual guidance. Furthermore, the criteria can be argued to neither provide necessary nor sufficient conditions for the classification of anti-American prejudice.

Such conceptions of anti-Americanism underrepresent a crucial characteristic of prejudiced speech acts: their functionality in the reproduction of discriminatory social relations. To describe any aversion, cognitive schema, or form of irrationality as prejudice necessarily implies that its expression leads to the discrimination or persecution of individuals or groups. A speech-act-theoretical or rhetorical notion of anti-Americanism (Knappertsbusch 2013; Wetherell/Potter 1992) incorporates this aspect of language use: the rhetorical application of certain America-stereotypes as a means of reproducing and reinforcing discriminatory symbolic boundaries. Drawing on the results from a mixed methods study on current anti-Americanism in Germany different functional uses of anti-American speech are presented: reinforcing ethnocentric national identity constructions, deflecting anti-racist criticism, bridging or concealing fractures within national identity (normalizing the Holocaust). These analyses also provide new insight into the correlations between anti-Americanism, racism and anti-Semitism.

References

Postone revisited
Ilka SCHROEDER (TU Berlin/ Birkbeck, United Kingdom)  | i.schroeder@jpberlin.de

As M. Postone’s essay on “Antisemitism and National Socialism” is still a much referred to theoretical point of reference in antisemitism theory albeit its age of more than 30 years, this presentation will discuss the main idea of antisemitism as a form of fetishism. The leading question is how much the analogy with Marx’s fetish helps to understand and correctly depicts antisemitism. It will draw on input made over the last decades to firstly show where Marx'
analysis of the commodity is presented differently than the version Postone bases his theory on and secondly to discuss where the analogy of the money fetish and the Jews in the antisemitic imagination are not fitting. Finally, the underlying analogy of the commodity as the strict basis which reappears in the way people in a capitalist society think, will be questioned. Additionally, U. Enderwitz for example claims that Postone is wrong in ignoring history by wrongly separating essence and historical development of antisemitism, respectively of any ideology. Hence, the presentation will raise also the more general question of the critique of ideology, in particular the critique of critical concepts of social relations and their relation to history and thereby clarify the claim against “Antisemitism and National Socialism”, that it deciphers antisemitism in an ahistorical manner.

“If you criticise Israel you’re labelled as anti-Semitic.“ Exploring the genesis and function of a popular rumour

Michael HÖTTEMANN (University of Marburg, Germany) | michael.hoettemann@staff.uni-marburg.de

The rumour is widespread that it would be impossible to criticize Israel without being generally stigmatized as an anti-Semite and it is a reoccurring conviction that accompanies debates about the Arab-Israeli conflict. A classical explanation of this phenomenon is that camouflaged anti-Semitism is the root-cause of such perception. Thus, by scandalizing ‘political correctness' individuals dismiss the dissonance between their anti-Semitic views and social norms against anti-Semitism. This paper will, however, argue that this explanation does not fully explain the popularity of the rumour. It will explore its’ genesis and function by analysing group discussions and follow-up interviews that were conducted in the context of a PhD project with 27 student participants at the University of Marburg. The paper will analyse how a variety of convictions and their interplay in the context of social interaction can play a role in the social production of the popular opinion that there is a dominant 'taboo' regarding criticism of Israel:
- Assumptions about the German-Israeli relationship and the role of the Holocaust for non-Jewish Germans,
- Assumptions about forms of political courtesy and politeness vis-a-vis Jews and Israel in the public sphere,
- Perspectives on the Arab-Israeli conflict and Germany’s role in the conflict,
- Lay-theoretical conceptions of anti-Semitism and forms of denial of anti-Semitism.

In a final section, the paper will discuss the implications of these findings for a communicative strategy against this rumour, especially in the context of holocaust-education.

The Role of Antisemitic Conspiracy Theories in the 2013 Czech Presidential Elections

Zbyněk TARANT (University of West Bohemia, Czech Republic) | persi@centrum.cz

The year 2013 has seen the historically first direct presidential elections in the Czech Republic. What was originally considered to be a victory for the more direct democracy, has brought a significant polarisation into the society. As it turned out, the candidates were prepared to invoke topics of historical memory to support their campaign. The antisemitic scene actively participated in the election campaign. Some movements sent their own candidates like Tomáš Vandas or Petra Buzková others have, from some reason, chosen to support a candidate that initially seemed very unlikely for the antisemites - the pro-Israeli, socialist 1990s Prime minister Miloš Zeman. But, this was not the only paradox of the first Czech presidential elections. While there was one Jewish candidate, Jan Fisher, who was considered to be the favourite from very start, he failed, but not because of antisemitism, but because of his communist past. However,
antisemitism was an important weapon against the non-Jewish candidates like Jiří Dienstbier or Karel Schwarzenberg. In my paper, which is a case study of an extreme example of “antisemitism without Jews”, I would like to document, how the antisemitic conspiracy theories became a tool of political struggle in a country that was left nearly without Jews and how are the “Jews” being “invented” where they are not present. The paper is based on primary sources - mostly on analysis of Czech language antisemitic websites. Short introduction about the Czech antisemitic cyberspace will be provided for scholar from abroad.

RN31S16a - Reconceptualising Discrimination I

**Can ethnic minority strategies reduce the effects of ethnic penalties?**

_Tariq MODOOD (University of Bristol, United Kingdom) | t.modood@bristol.ac.uk_
_Nabil KHATTAB (University of Bristol, United Kingdom) | Nabil.Khattab@bristol.ac.uk_

Some social scientists are sceptical of the explanatory power of ethnicity and seek to explain ethnic differences by references to non-ethnic factors such as discrimination. We challenge this scepticism by considering two theoretical objections: there is no such thing as ethnicity and ethnic categories are unable to explain social processes, and by showing how ethnic strategies affect outcomes that cannot be captured in standard ethnic penalty analyses. We then offer a new way to examine ethnic-penalties in unemployment. We calculate the net ethnic-penalties then we analyse UK longitudinal labour-force data to examine how do strategies such as self-employment change ethnic-penalties in unemployment amongst six different ethnic-groups. The results show that self-employment reduces the ethnic penalty for Indians, Pakistanis-Bangladeshis and others, but not for Blacks, White-others and White-British. This supports the argument that ethnicity can provide an explanation for some of the ethnic differentials in the labour market.

**Discrimination as an unintended consequence. The significance of social skills**

_Jon ROGSTAD (Fafo/NTNU, Norway) | jon.rogstad@fafo.no_

This article examines the importance of discrimination of ethnic minorities on the labour market in Norway. While previous work on discrimination has predominantly focused on the frequency of discrimination based on employers selection with regard to formal skills, this study analysis discrimination on the basis of both formal and non-formal skills. The data consists of two randomized field-experiments in the Norwegian labor market, documenting discrimination based on formal education in four Norwegian cities. Using typical Pakistani name and a typical Norwegian name, we have sent pairwise identical job applications (in total 1800) to publically advertised jobs, and the call-backs from the employers’ show systematic discrimination in favor of the applicants with Norwegian name, yet the overall level of discrimination is lower than found in a previous study.

In addition to the data based in the field experiments, we have conducted detailed qualitative interviews with 59 employers who have been part of the field experiment. The qualitative data reveal details with regard to how employers reflect upon applications and applicants with ethnic minority background. A particularly important finding is related to how the employer emphasizes the relationship between formal qualifications and assumptions about social knowledge and how well a person might fit into a workplace. We can distinguish between employers assumptions about whether an applicant's productivity correspond with the organization's needs (person-job fit) on the one hand, and on the other, assumptions about the applicant values, and if they
correspond with the ideals for business (person-organization fit) (Horverak et al. 2012, 2013). This distinction reflects the difference between fit to do a certain type of job versus the fit in a particular workplace.

Thus, the unique part of the study is that we in addition to the test have included qualitative interviews with 56 employers who was part of the field experiment. The preliminary analysis indicates that social skills often trump formal qualifications. An important aspect is that considerations about a social skills often ends up at consider if the applicants ways of being harmonize with typical Norwegian manners. Consequently it is often difficult for ethnic minorities to get a job, despite equal formal education. That is not to say that the employers have a “preference for discrimination”, as Becker (1971) suggest. On the contrary, discrimination appears as an unintended consequence of the importance of social skills.

**Ethnic inequalities in social mobility**

Yaojun Li (Manchester University, United Kingdom) | Yaojun.Li@manchester.ac.uk

Much research on social mobility has been carried out in Britain, and the debates centre on whether mobility in the absolute and relative rates has declined or stayed constant. Most of the studies are, however, conducted at the general population level without considering the ethnic differences in the mobility processes. In this paper we focus on the latter issue by exploring processes of ethnic mobility in Britain. We look at the classical OED (origin, education and destination) relations among both the majority and the minority populations and, amongst the latter, the first- and second- generations for specific ethnic minorities, which is complemented by two moderating effects drawing on insights from Hout (1988) and Goldthorpe (2008): the OD variation with E, and the ED variation with O, as illustrated below:

<table>
<thead>
<tr>
<th>E</th>
<th>Origin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination</td>
<td></td>
</tr>
<tr>
<td>Migration</td>
<td></td>
</tr>
</tbody>
</table>

Notes: the dotted lines indicate weakening and the solid line indicates strengthening associations.

Using data from the General Household Survey (1982-2005), the British Household Panel Survey (2005) and Understanding Society (2009-2012) (N=165,661 for respondents with valid data on father’s and own social position and ethno-generational status) with harmonised variables on ethnicity and generation, and with father’s and respondent’s social class coded into International Socio-Economic Index of Occupational Status (ISEI), we assess the relations employing the SEM techniques. We find little change in the OE and ED associations but declining OD effects. The OD association with higher education has been strengthening whilst that for low education has been weakening. The ED association with different origins has shown little change. The patterns for the first generation are inconsistent reflecting their very different circumstances of immigration, the warmth of reception, and the different channels into employment (such as black Caribbeans coming in the 1950s with men employed in London transport and women in the NHS) but the patterns for the second generation largely mirror whites’ profile although Indian men are found to have made the greatest and sustained social progress of upward mobility (we also carried out conventional analysis of absolute and relative mobility). The ‘problem of race’, as Duncan noted decades ago on the US situation, applies to black and Pakistani-Bangladeshi groups, especially among first-generation men. Overall, we find that class matters for minorities as for the majority, that there are signs of progress and that there are specific ethnic penalties for some groups.

**Statistical visibility of diversity? Towards a European collection of equality data**
Several EU member states have been called upon by the Fundamental Rights Agency of the EU to provide statistics to help secure protection against discrimination of people living in the EU. Of the older EU member states (EU 15), only Britain and Ireland collect data on the Ethnicity of their populations, as do the most of the newer eastern and middle European member states. Though official statistical practices of making ethnic diversity visible in the EU is very diverse, this paper is going to contrast the British and the German practice as two examples of contradictory ways of conceptualising diversity inside a national territory. Human Rights and Non-Discrimination experts suggest for all EU member states to collect data on self-identified ethnicity on a voluntary basis. In most western European states, a concept comparable to that of the “ethnic group” in British statistics does not exist. In addition, in the German debate on anti-discrimination law and politics, a position became quite influential that suggests a postcategorical approach to fight discrimination and disadvantage. Regarding racist discrimination, this would have the adverse impact to strengthen the dominant approach in Germany and other EU member states to either silence the socio-political relevance of racialized difference, and to deny racism as structural phenomenon. I argue that the postcategorical approach has much to offer regarding legal strategies and argumentations. But this does not mean that categoriality of ‘race’/ethnicity could yet be entirely overcome.

Genomics and child obesity in Mexico: the resignification of race, nation and gender
Abril SALDAÑA TEJEDA (Universidad de Guanajuato, Mexico) | abrilsaldana@gmail.com

The presentation aims to explore medical discourses on genetics and obesity and how these work to contest or reinforce current notions of national identity, gender and race. The project will draw on semi-structured interviews with scientists who are currently involved in genomic medicine research in Mexico; pediatricians in public and private practice; and mothers whose children suffer from obesity or overweight. It will explore how geneticized explanations of obesity play out and are interpreted in the Mexican context, where past and present structural conditions shape people’s food practices and access to resources linked to health and wellbeing. The project will explore how social and genetic causes of health inequalities are being balanced in public health and medical genetics discourses as well as perceptions and expectations on race, nation, health and genomic medicine.

Perceived Discrimination and Self-Rated Health among Czech Women: A Cohort Study
Irena STEPANIKOVA (RECETOX, Masaryk University, Czech Republic; University of Alabama Birmingham, United States of America) | irena@uab.edu
Lenka ANDRYSKOVA (RECETOX, Masaryk University, Czech Republic) | andryskova@recetox.muni.cz
Jan SVANCARA (IBA, Masaryk University, Czech Republic) | svancara@iba.muni.cz

This study investigates the relationship between perceived discrimination and women’s health in pregnancy and later life. We argue that discrimination acts as a stressor that may undermine health. To evaluate the hypothesis that perceived discrimination is negatively related to self-
rated health we use the Czech part of European Longitudinal Study of Pregnancy and Childhood (ELSPAC). The study followed a cohort of Czech women who were pregnant during the early nineties and gave birth at the Masaryk University Hospital. Over 4,000 women were surveyed during late pregnancy. About 2,700 of them were surveyed again seven years after the birth of their child. Women reported perceived discrimination based on skin color, language, gender, religion, the way of dressing, and other characteristics. Almost one in five (18%) of pregnant women reported having experienced discrimination during the past 12 months. Perceived discrimination based on gender was most common (11%). Perceived discrimination based on language and skin color was rarer ( 3% and .5%, respectively). Perceived discrimination was more common among women of non-European ethnic backgrounds; women who spoke languages other than Czech at home; smokers; women with more education; and women with less social support. To conduct hypothesis tests, we estimated multivariate ordinal regression models of self-rated health by the survey wave. In both waves, we observed a significant, negative relationship between perceived discrimination and self-rated health. In supplementary models in which different types of discrimination were entered separately, discrimination based on skin color did not relate to self-rated health, while discrimination based on language negatively related to health at seven years after birth. Discrimination based on other characteristics negatively related to health in both waves of the survey. These effects were robust after controlling for socio-demographic characteristics, including ethnicity, language spoken at home, education, marital status, household size, and number of children, as well as social support, smoking, and physical activity. The results provide partial support for our hypothesis and suggest that the effects of discrimination on women’s health may vary by the type of discrimination as well as by the stage of life.

**Experienced racial discrimination and its possible effect on job search**

Andreas SCHADAUER (ZARA - Civilcourage and Anti-Racism-Work, Austria) | andreas.schadauer@zara.or.at

The negative consequences of experiencing moments of racialisation and othering during job search on the job seekers and on how they organise and undergo job search is a little noticed and addressed topic within the academic literature and beyond. Correspondence tests offer reliable numbers on the existence of racial discrimination in recruiting and its effects on the invitation rates. However to address the impact of racial discrimination beyond this, the perspectives and experiences of the job seekers has to be taken into consideration. Within the project G@together – Get together without barriers, we therefore conducted 17 problem-centered interviews with job seekers with an (ascribed) migration history on the ways they organise their job search, their experience with racial discrimination and how it influences their job search in Vienna, Austria. Within the interview narratives, job search unfolds as a complicated, routinised and time consuming socio-technological activity. Experienced racism of different kinds and intensity are interwoven into the majority of the interview narratives. The job search of several interviewees is affected by these experiences in several ways which we illustrate and discuss by means of three aspects distinguished within the research literature: organisation of and motivation for job search and the assessment of the own role and possibility on the labour market. In this light I argue that the steering potential of anti-discriminatory measures isn’t its only value but also its signalling effect for job seekers potentially countering the negative consequences of experienced discrimination at the labour market.

**Discrimination in five life domains in the Brazilian Longitudinal Study of Adult's Health (ELSA-Brasil)**
Brazil has historically promoted the image of a “racial democracy”, but this concept has been widely criticized by scholars and others as it sharply contrasts with the country's lasting racial inequalities. Empirical evidence of the particularities of Brazilian racism has grown, but little is known about how the experience of discrimination is borne at the intersection of identities of race, gender and class.

We analyze discrimination using an intersectionality framework, and responses from 12475 participants in the Brazilian Longitudinal Study of Adult's Health (ELSA-Brasil). Respondents self-reported their race using the categories of Brazilian Census (Black, “Pardo”, White, Indigenous, Yellow). Using an adaptation of the Everyday Discrimination Scale, participants reported perceived discrimination on five dimensions (work, public spaces, school, place of residence and interaction with the police) and for up to ten motives (race, economic condition, gender, physical appearance, age, political activity, religion, sexual orientation, sickness, other). We analyze race-by-gender groups, descriptively and using logistic regression.

Black men reported more overall discrimination than any other group (50%). Black women and men reported significantly higher frequency of discrimination by race but also by economic conditions and physical appearance. Both Black and “Pardo” men reported high discrimination perpetrated by the police (50% and 39% respectively). The logistic regression results show a strong interaction between gender-by-race identities and education, with odds of reporting discrimination higher for College-educated Blacks. We discuss how discrimination is experienced differently according to one's position in the “matrix of domination”, and how race and gender relations mutually construct each other.

Urban Space and Racism: policing patterns in Drug Policy in Brazilian Cities (Brasilia, Curitiba and Salvador) and the perception of the Young on the Right to the City

The text uses the collected data from a research conducted under the Brazilian Ministry of Justice’s Project “Thinking Public Safety”, also realized under the support of the United Nations Development Programme (UNDP). The object is the institutional dynamics of the definition of the suspected condition, precisely in law enforcement actions of the military police force (in three important cities, Brasilia, Salvador e Curitiba) as its relations to social prejudices against the frisked person, especially those related to class and race/color attributes of the black group. It is questioned the role of policeman “instinctive guess”, “street code” and others policing activities in law enforcement policy on drugs as its relations to the reproduction of economic and racial prejudice patterns. It is shown a prevailing subjectivism in police stops and frisks, which is based on signs of belonging to particular social class and particular race/color groups. Similarly, analyzes how the police institutions tend to endorse discriminatory perceptions on policemen, supporting a management of race relations. In a multiracial country like Brazil, it tends to
immunize repressive institutions from criticism and changes. Eventually, the research focuses on the speech of young people about discrimination and the limitations, determined by police, on the Right to the City.

**JS_RN28+RN31 - Racial/Ethnic Relations and Sport**

**Racial stereotypes and high-level sport: a comparative analysis of the "white" and the "black" athlete's figure in the Olympic Games's press coverage**

Lucie FORTÉ-GALLOIS (Université Paul Sabatier, France) | lucie.forte@univ-tlse3.fr  
Vincent CHARLOT (Université Paul Sabatier, France) | vincent.charlot@univ-tlse3.fr

The communication deals with the spread and the banalization of racial and ethnic stereotypes in the sportive press during the Olympic Games (London, 2012). Thanks to an analysis of the pictures, metaphors and justifications used in the French sportive newspaper called L'Equipe, we would like to analyze the strength and the durability of sports skill's naturalization toward "black" and "white" athletes. Indeed, the speeches produced in the particular context of basketball and athletics constitutes an interesting window for the analysis of the eventual persistence of racial stereotypes according to which the performances of "black" athletes would recover from innate and bestial skills, whereas "white" athlete's successes would be connected to their values of hard work and their intelligence. We also aim to situate our analysis in a larger point of view including social relationships, social identities and social trajectories in intersection with other dimensions such as gender or social class.

The corpus we plan to study is made of different types of pictures, articles and chronicles published in L'Equipe between July 27th and August 13th, 2012 - representing 100% of the championship’s coverage. The choice of these Olympic events is overall justified by the strong interest that the specialized press reserved to the competition and by the fact that previous studies in athletics and basket-ball in lighted processes of racial/ethnic stigmatization, distinction, discrimination, segregation and labelling/stacking. The choice of L'Equipe is justified by the fact that it is the only quotidian sportive newspaper in France.

**Mehmet Aurelio: Race and Belonging in Turkish Football**

Murat ERGIN (Koc University, Turkey) | muergin@ku.edu.tr

Mehmet Aurelio, the first foreign-born soccer player to join the Turkish national team, constitutes a litmus test for the limits of race, ethnicity, nationality, and citizenship in Turkey. Aurelio arrived in Turkey as a representative of cheap deals from the Brazil's large pool of young and talented players. For the Turkish sports scene used to the fuzziness of citizenship boundaries in the global soccer scene, his reception of Turkish citizenship in 2006 and changing his name from Marco to Mehmet was no scandal. However, national team coach's call to Aurelio to join the team stirred a heated controversy in the media, which carried racial messages. Especially for critics of Aurelio, his blackness seriously marred his claim to Turkishness. Others supported Aurelio’s citizenship on instrumentalist terms, justifying his inclusion in the national team with his potential contribution to the team. The goal of this presentation is to follow the media discourse around Mehmet Aurelio in order to reveal historically constituted and deeply held assumptions about race and citizenship in Turkey. Both the essentialist (objecting to a black man's ascendance to the national team) and meritocratic (citizenship may be granted for hard work even in the absence of full belonging) arguments attested the volatility of the discourses around race and belonging. The Aurelio case offers important insights into racialization of identities in
the Turkish context where historically-fortified beliefs about Turks’ whiteness confront the global flow of racialized difference into the commercialized field of football.

Women in sports: playing and negotiating identities in the Italian fields
Sandra Agyei KYEREMEH (University of Padua, Italy) | sandra.photovoice@gmail.com

“There are no black Italians”, this is one of the several chants directed to Mario Balotelli, a black Italian football player, during the matches he played in the Italian football pitches. He has become a symbol of Italy’s new multi-ethnic identity and a symbol of a generation of children of foreign born parents born and/or grown up in Italy. Statistics demonstrate that black Italians do exist and play sports in different federations, despite the presence of institutional barriers to their participation. This framework, in particular, leads to think about how racial spatiality (Harrison, 2013) structured by sports regulations and gender discriminations works to secure high level sports' social space as predominantly white and manly, thereby restricting the participation and representation of black athletes or players with foreign origins.

Using an intersectional approach and drawing from literatures in Whiteness Studies, Sports Sociology, Critical Race Theory, Postcolonial and Cultural Studies the article focuses on predominant ideas of “Italianity” into the organization of Italian sports life by the analysis of institutional, social and individual levels. The article examines racist pratices at work into Italian sport governing bodies comparing a high level female cricket team and a high level female football team. The article also investigates individual and collective strategies for change (De Certeau 2001) chosen by athletes in sporting grounds.

I’ll design my research using qualitative methods collecting data resorting to participant observations during trainings and matches, in-depth interviews and focus group.

Racism and Discrimination of Sporting Culture in the age of Social Media
Riikka-Maria TURTIAINEN (University of Turku, Finland) | rmurt@utu.fi

FC Barcelona defender Dani Alves dealt with racial abuse during a La Liga match against Villarreal 28/04/2014. He was targeted with a banana by a racist fan while preparing for a corner kick. The Brazilian picked up the fruit and ate it before taking the corner kick. The action sparked a worldwide social media campaign against racism when his national team colleague Neymar tweeted a photo of himself eating a banana with the hashtag #weareallmonkeys. Professional athletes, politicians, and ordinary people joined the campaign. This Internet meme attracted even more publicity to the anti-racism work in sports than many official campaigns.

This paper will focus on the new ways of racism and discrimination among online sports cultures by studying athletes who use platforms, such as Twitter, for personal private communication as well as engage in a dialogue with their supporters. In many cases, the uses of such social media platforms have involved conflicts between athletes and their sponsors, managers, and sports associations. This paper examines the mechanisms of sports publicity by asking how are stereotypes of race, gender, and sexuality constructed and maintained through conventional ways of media representations and discourses. Are there any efforts to break down those stereotypes by athletes in contemporary sports media culture? The study utilises qualitative methods and research materials such as social media contents and media representations. The objective of this research is to reveal the inner mechanisms of sporting culture causing inequality in media sports still in the age of social media.
RN32S01 - Aspire for Membership: Democratization through Europeanization and Post-communist Legacy

Distant Souls: the Post-Communist Emigration and Voter Turnout
Filip KOSTELKA (Sciences Po, Paris, France; College of Europe, Bruges, Belgium) | filip.kostelka@sciencespo.fr

Central and Eastern Europe has experienced a strong emigration in the second post-communist decade. The present article studies its impact on voter turnout, which has been dramatically decreasing in the region since the 1990s. Drawing on political science literature on residential mobility, the theoretical section explains why emigration is likely to be detrimental to migrants’ voting rates and which specific factors may affect transnational electoral participation. The theory is then put to the test using original datasets on emigration, legal provisions for external voting and external voting rates in ten Central and East European post-communist democracies (CEE-10). The results confirm that transnational voting rates are much lower than the domestic ones and reveal that their cross-national variation can be, to a large extent, explained by different legal provisions for external voting. The low transnational voting rates implies that emigration contributes to the post-communist voter turnout decline. It accounts for approximately one tenth of the phenomenon.

Corruption and Political Participation in Hungary: Testing Models of Civic Engagement
Tatiana KOSTADINOVA (Florida International University, USA) | kostadin@fiu.edu
Zoltan KMETTY (Eötvös Loránd University, Hungary) | zkmetty@yahoo.com

Does public outrage over corrupt elected officials mobilize citizens for action? If yes, does it propel some forms of political action more than other? Extant scholarship has revealed the harmful impact of malfeasance on economic growth, on states’ ability to attract foreign direct investment, and on public trust in representative institutions. These negative effects can be even more serious in post-conflict societies and in contexts of transitioning from a totalitarian system to democracy, where citizens can easily lose faith in the newly emerging political system. What remains unclear so far is what kind of resistance capacity do societies develop towards the endemic practices of abuse of public office. This paper undertakes an empirical investigation attempting to establish whether corruption stimulates citizens to engage in political life, especially in non-electoral activities.

The data for our empirical analysis come from Hungary, one of the post-Communist transitional democracies in Eastern Europe. This country provides an interesting case, because it has been undergoing a process of transformation since 1989, was hit hard by the European economic crisis, and has been challenged by a semi-authoritarian style of leadership nowadays. Also, Hungary has already experienced a series of anti-government demonstrations against the lies of corrupt administrations in the past. Respondents’ answers to a new survey, conducted in May of 2014 following the parliamentary election, will be used to test our arguments. We expect to conclude the project with findings that will cast more light on the link between corruption and political behavior during democratic transition.
Local government in Russian cities: new challenge of the regime
Kirill MALOV (Institute of Economics and Industrial Engineering of Siberian Branch of Russian Academy of Science, Russian Federation) | malov@academ.org

Political and economic instability in Russia forced the government to pass to the manual control mode. The power vertical created by president Putin lowered from above to the level of cities and towns. If the president operates heads of the regions, governors now can operate heads of the cities in their regions. It became possible by carried-out reform of local government that established submission of administration of a city to a governor. This reform changed a local political landscape significantly. Inhabitants stopped being full participants of political management in their own city. Now in absolute majority of regions not inhabitants of a city, but deputies of local parliament elect the mayor who only directs the parliament. City administration is directed by a city-manager, who is appointed by a governor commission. Only in 14 (from 82) capitals of the regions inhabitants can choose mayors. The government is afraid of protests connected with a bad social situation and they don’t need local leaders who could lead inhabitants after them.

At the end of 2014 sociological laboratory of Association of Siberian and Far Eastern cities together with scientific institute of Russian Academy of Sciences conducted a big sociological Russian research about consequences of the reform. Hundreds of heads of the cities were interrogated, the adopted regional laws were studied and the picture of the current situation in local government in Russia was drawn. Increase of social tension in cities, protests and other sad consequences, which are presented in the conducted research, are possible.

The Changing Landscape of Political Participation: A Quantitative Case Study of the Czech Republic
Jaromír MAZÁK (Charles University in Prague, Czech Republic) | mazak.jaromir@gmail.com
Kristýna CHÁBOVÁ (Charles University in Prague, Czech Republic) | kristyna.chabova@gmail.com

The political scene in many European countries has been going through intensive transformations over the past years. Traditional parties are losing their strength and new parties are getting more prominence. Voter turnout is dropping and especially young people do not consider voting as an essential part of political participation. On the contrary, individualized forms of participation, very often connected to social network sites, proliferate. Our paper is based on ten waves of regular monthly cross-sectional quota survey on representative sample of the Czech population. It presents a quantitative case study of the changing landscape of political participation in the Czech Republic, which, however, can be considered an illustrative example of the above-mentioned changes. Using the party preference data we show that the fastest growing party does not have to be exclusively left or right wing, as is often the case in other European countries these days, but it can be a catch-all party surpassing traditional cleavages along age and education. Moreover, the article shows that the traditional Milbrath (1965) concept of political participation as a set of hierarchical activities forming a skalogram with a basis in electoral participation ceases to be a valid conception. Even though the electoral and non-electoral political participation are still correlated to some extent, non-electoral political participation often takes place in the absence of electoral participation. The last part of our paper analyses which political attitudes and opinions in the Czech Republic are under-represented due to low turnout.

Repertoires of Political Culture
Petra A. BERÁNKOVÁ (Faculty of Social Sciences at Charles University in Prague, Czech Republic) | p.a.berankova@gmail.com
Miroslav GRZNÁR (Faculty of Social Sciences at Charles University in Prague, Czech Republic) | Grznar.M@seznam.cz
Tomáš SAMEC (Faculty of Social Sciences at Charles University in Prague, Czech Republic) | samec.tomas7@gmail.com
Lucie ČERNÁ (Faculty of Social Sciences at Charles University in Prague, Czech Republic) | lucka.cernaa@gmail.com

Post-communist democracies are being depicted as weak, with a low level of civic participation and trust in political institutions. Yet, there is not enough evidence about the ways the post-communist political culture is constructed. Studies of local political culture usually investigate patterns of values, focusing solely on quantitative analysis of questionnaire responses. Drawing upon a recent study of political culture theory by Winch, we conducted ninety in-depth autobiographical interviews with non-politicians and thirty in-depth autobiographical interviews with politicians who have been active in national or local Czech politics since the 1990s. We then analyzed the cultural repertoires used by the narrators when talking about politics. In our contribution, we will briefly describe the semantic regularities of the four repertoires we have identified: interested, objective, evasive and alienated. The results of our narrative analysis suggest that there seems to be an imaginary symbolic boundary between politicians and “ordinary” people; two separate worlds are therefore constructed with two corresponding sets of mutually exclusive expectations. Even some of the interviewed professional politicians were alienated from politics and perceived themselves as “ordinary”. An image of politics as a realm of moral corruption is therefore often reproduced by politicians themselves.

RN32S02 - EU Enlargement and the Inclusive Logic of Integration: Rupture or Continuation?

The European Union and the integration without enlargement
Tatjana SEKULIC (University of Milan-Bicocca, Italy) | tanja.sekulic@unimib.it

The European Union was constantly challenged by its own goal of democratization and Europeanization in a specific case of the ‘Western Balkans’ transitional societies, as a kind of a specular reflection of its ‘deepening’ deficit. Although many goals have been achieved in a number of CEE countries, a large part of ‘what remains of the Balkans’ still does not fulfil all membership criteria. It is thus legitimate to ask why in these cases, including Turkey, the EU device of conditionality as a basic means of the accession process has not been effective. In that sense, and after years of ‘enlargement fatigue’, the five year moratorium may be interpreted as a kind of admission of failure in regard to the applicant states. Botta and Schwellnus have demonstrated that the effectiveness of EU conditionality decreases during the accession end-game, when the date of accession is fixed, in terms of an effect of relaxation (Botta&Schwellnus 2014) Other empirical evidence shows that the widening of the EU has had a ‘catalyst effect on deepening’ in terms of the paradox of unattended consequences (Heidbreder 2014). The problem concerns the risk of removing the commitment to the applicant countries as if the moratorium could (or should) freeze the present political, economic and social (bad) conditions of those societies. More, what consequences would it have for other aspirant countries deeply involved with EU, as Ukraine? And, what will this ‘five years break from enlargement’ mean for the European integration process and for the EU28 as such?
**Explanations for the transfer of trust to the EU level: A multilevel approach**

Debora EICHER (Johannes Gutenberg University Mainz, Germany) | debora.eicher@uni-mainz.de
Katharina KUNIßEN (Johannes Gutenberg University Mainz, Germany) | katharina.kunissen@uni-mainz.de

This paper examines trust in the European Parliament (EP) from an interdisciplinary point of view. We combine theoretical approaches from the political sciences (Easton) with sociological (Luhmann; Putnam) and social-psychological (Schwartz) ones. Our premise implies a congruence between trust in different institutions: citizens transfer their (positive or negative) evaluation of national political performance to the European level. However, we expect that individual perception and reality might differ in this case. This leads us to include indicators of national-level performance as well as their individual-level evaluations in our model.

In addition to the above mentioned aspects of political performance we expect individual value preferences to influence citizens’ willingness to transfer trust. Political institutions are linked to basic values since they either restrict them (e.g. values promoting freedom) or correspond with them (e.g. security). Thus, we expect conservative values to enhance trust in the EP and vice versa.

Our theoretical model is tested by applying multilevel analysis to data of the fifth and sixth wave of the ESS. The analyses yield two results: First, individuals indeed transfer trust to the European level if they are content with national political performance. The country-level however shows the opposite: factual higher economic and political performance on the national level decreases trust in the EP. Second, the explanatory contribution of value orientations on the individual level is almost zero which leads us to conclude that the assumed relationship between value orientation and trust in political institutions is not applicable to the European level.

**Does the date of accession matter? Perception and self-perception of Brussels-based journalists from New Member States**

Alena SOBOTOVA (Université libre de Bruxelles, Belgium) | asobotov@ulb.ac.be

Brussels press corps plays a central role in communicating the EU to its citizens. By doing so it may contribute to the birth of a European public space. More than a thousand of journalists of various nationalities are present in the European capital.

The successive waves of enlargement processes could have pluralized the EU and its press corps. Ten years after 2004-enlargement, the newcomers are formally fully integrated into the EU. But is it so also cognitively? Social representations and stereotypes are known to have long-lasting effects. By focusing on the cleavages and hierarchies in the Brussels press corps the aim of the paper is to contribute to the study of representations about actors from New Member States. How do Old Member States’ correspondents see their New Member States’ counterparts and vice versa? Is Old versus New Member States (still) a relevant cleavage in the Brussels arena? The paper is based on a series of semi-directive interviews with both Old and New Member States’ journalists in Brussels, completed by some interviews with Brussels communication professionals. The data is analyzed using both content and discourse analysis. The results suggest that the (self-)perception of exclusion is much stronger within the New Member States’ journalists than it is in the representations by their Old Member States’ colleagues. Other cleavages seem however to structure the correspondents work in Brussels, mainly the one between small and big member states and between prestigious and unknown media outlets.
Govern Thy Neighbour: A Governmentality Analysis of EU’s Neighbourhood Policy
Ondrej DITRYCH (Faculty of Social Sciences, Charles University Prague, Czech Republic) | ditrych@fsv.cuni.cz

Using Michel Foucault’s analytical toolbox and drawing upon the burgeoning literature on governmentality in political studies, the paper will propose to inquire into the complex assemblage of practices that are assumed to form a strategically oriented “European neighbourhood dispositif” (END). With no garrisons and few outposts (embassies and delegations) EU power is one that flows and shapes rather than coerces and breaks. It is actualised through an arrangement of practices by a multitude of actors the subjects of which are acted on through different technologies transforming by extending EU’s own policies and norms of liberal government (e.g. internal market or Schengen acquis). The paper will open with a theoretical discussion of the concept of governmentality and dispositif. Second, it will demonstrate how the governmentality perspective may be deployed in diagnostic studies of concrete practices by presenting an inquiry into sanitary and phytosanitary measures (SPS) and technical barriers to trade (TBT) programmes in one of EU Eastern partner countries, Georgia.

RN32S03 - Mediating Cultural Diversity: Understanding New Challenges for the Accommodation of Difference and Diversity in Europe and the World

The challenge of Diversity in the Virtual Sphere. Social Media as a Platform for Multicultural Encounters
Hans-Joerg TRENZ (University of Copenhagen, Denmark) | trenz@hum.ku.dk
Raquel SERTAJE (University of Copenhagen, Denmark) | rolli2006@hotmail.com

Today, online social networking media play a paramount role in the mediation of cultural diversity. While traditional print media, and, in particular television have been built on a form of one to many communication that addresses their audiences as members of a national community, the internet has become for many users the facilitators of new and unique transnational experiences that embrace individuals of different national origins and background. This capacity of social networking media to represent cultural spaces of diversity adds a new dimension to our perception of locality, belonging and citizenship. The question to be analyzed in this paper is how social networking media provide platforms for cultural encounters that represent diversity in the local space. How and under what conditions can social networking media become the media of complex diversity? The paper discusses the socialization and cultural self-representation of mobile foreign citizens (so-called expats) in Denmark through social networking sites. As will be argued, the social networking media are not only used by established ethnic groups and diasporic communities to affirm their identity and maintain group relationships.

The role of social media in mediating diversity in Denmark
Deniz DURU (University of Copenhagen, Denmark) | rhv338@hum.ku.dk
Hans-Joerg TRENZ (University of Copenhagen, Denmark) | trenz@hum.ku.dk
Following the EU enlargement in 2007 and the economic crisis in 2008, the EU countries have been dealing with the accommodation of intra-EU migration; Eastern Europeans from new member states and crisis-hit Southern Europeans have been moving to wealthier Northern European countries in addition to the management of the non-EU migrants (such as labour migrants, asylum seekers, spouses and dependents). Within the context of Eurocrisis, increased transnational mobility and crisis of multiculturalism in Europe, this paper takes Denmark, a Nordic model of Welfare state with an oxymoronic relationship with multiculturalism (Ulf Hedetoft 2012), which has become one of the popular migration destinations for mobile European citizens, high-skilled non-EU migrants, students of higher and postgraduate education. The paper explores the ways in which the integration and socialisation of the new comers are facilitated by their active and creative use of Social Media platforms, where the digital online communication facilitates offline socialisation. Hence, rather than being excluded or marginalised, these new immigrants depict a socially active profile building new networks via the use of social media. In terms of methodology, we use mixed-methods: quantitative survey answered by 1034 respondents, followed by 70 semi-structured interviews.

Contested Diversity? The issue of EU mobility online and forms of political (dis-)engagement during the Eurocrisis
Verena Katharina BRÅNDLE (University of Copenhagen, Denmark) | zsh121@hum.ku.dk

This paper investigates the potential of online media for forms of political engagement contesting the issue of EU diversity. A special focus will be put on user comments in Danish newspapers as a form of political engagement over the central European issue of diversity and migration. Citizens' withdrawal from conventional politics and political participation has been observed with concern in the last decades. With the rise of the internet, more and more scholars shift their focus on citizens’ new, more online-based activities and increasingly consider those as unconventional forms of political engagement. Following the literature on the described changes in political engagement, the aim of the paper is to scrutinise in how far political engagement and contestation become visible around the issue of European diversity in national online and social media. This paper will focus on the case of Denmark, where public debates are often accompanied by a heated debate about the capacities of the Danish welfare state during the Eurocrisis. Drawing from a data sample of user comments on the online presence of the five most established Danish newspapers, a qualitative web content analysis will be conducted in order to investigate how public online debates in Denmark raise the issue of EU transnationalism and diversity and what forms of political engagement become visible.

Freedom of Everyday Interactions: Youth and Democratic Culture in Hungary
Gyöngyvér PATAKI (University of Debrecen, Hungary) | pataki.gyongyver@gmail.com

Several recent studies on youth culture have demonstrated the way an antidemocratic political culture may emerge in a late modern democratic setting(Verena 1995; Holmes 2000; Feischmidt – Glózer – Illyés – Kasznár – Zakariás 2014). Within recent discussion about political socialization there appears to be a tendency to analyze the fast expansion of non-democratic activity patterns in stable democracies (Minkenberg 2000). Some would argue, it is in part indicative of the major reorganization of cultural and social dimensions after the implementation of the neo-liberal reform initiatives (Ferge 2002; Halmai – Kalb2011;). In this sense the paper aims to contribute to the critical analysis of modernization by evaluating the democratic quality of a society from the perspective of the freedom of the everyday interactions which reproduce the everyday interpretation of the world (Habermas 1996). The core part of this reflection is to expand sociological imagination to think beyond democratic institutions and
follow the process of institutionalization in the micro milieu of communities (Meyer 2003; Pye 2003; Rohrschneider 2003; Schwartz 2003)

While many rely on macro perspectives in their account of how higher educational institutions impact political behaviour in post-socialist countries, social scientists have rarely looked at how the seemingly irrelevant micro processes of the evolution of democratic culture adds up to significant outcomes. To see more clearly in respect of democratic processes in youth cultures it is illuminating to reveal how the changing forms of connectivity and privacy contribute to civic education. Specifically, the paper addresses the institutionalization process of democratic communities in a higher educational institutional setting.

In an attempt to understand whether apathy, love of comfort or inactivity lies behind one of the lowest participation rate of young adults in Europe (ESS 2010), the Campus-life project (http://campuslet.unideb.hu/) aimed to identify factors of civic education that structure and organize Hungarian students’ activity patterns beyond the formal agents of civic socialization. It raises the question whether young adults consider themselves to be part of the nation state and under what circumstances they are able and ready to contribute to it.

After the political transition in a country with definite collectivist priorities there was an elementary need to redefine private and public boundaries and rebuild existing models of civic and political socialization. Therefore, political and civic behaviour is considered in this paper to be action in this ever-changing strategic field which involves civic and political engagement, but also participation in communities. Parallel to the “rise of privacy”, the forms of connectivity and the notion of communities has also altered. As classical communities has turned to be communicative communities (Weintraub –Kumar 1997; Bauman 2000, Delanty 2003; Halft –Krah 2012), the level and way of commitment to institutions has changed and different identification strategies and institutionalization processes have emerged.

In order to explore the process of institutionalization within student communities a mixed method with the combination of quantitative and qualitative methods was employed.

First, students’ value preferences, institutional commitment and activity structure was analyzed by means of regional and national databases. The low participation rate in formal and informal institutions, the discrepancy between the value system vs. life-style indicators and the strong reflection on the individual carrier strategies encouraged us to enrich our quantitative data by qualitative methods. A new category – the category of the perception of the private and the public –, was introduced to deeper our understanding on students’ high institutional conformity and low institutional commitment.

In order to explore the public views, needs and forms of participation of students at University of Debrecen the combination of three different qualitative methods was proposed: 1.) 38 group interviews; 2.) 9 semi-structured interviews 3.) 15 Narrative interviews. The interviews were carried out in 2012. To guide students to the verbal visual communication level where they can comfortably utter their public notions projective methods (story cubes, cognitive mapping and cards) were used as “story triggers”. Narrative stimulating story cubes revealed the representation of the surrounding public environment, the cards helped to detect the categorization of public issues, cognitive mapping informed us about attitudes towards public spaces and finally narrative interviews uncovered the way the public –private distinction integrated into personal life stories.

The private rooms of two residential hall at the University of Debrecen, as institutional private spaces, offered an ideal opportunity to ask students about their attitudes to public institutions. Residential halls, therefore, made it possible to investigate the evolution of the civic and democratic communities. The underlying assumptions guided me to choose these contrasting institutions were the following: a.) their community initiatives; b.) their intention to be hotel or home; c.) their notion on the satisfactory level of surveillance.

The analytical aspects introduced in the study were the following. First I analyzed how public views and values translated into forms of active participation and then I looked at the way these
activities are discursively and institutionally embedded and shape the institutional settings of their surroundings.

Data show that the low affinity and activity of young adults only holds if we focus on students' participation in the existing institutions of the current late modern democratic setting. The argument that this generation suffers from political apathy, and does not have the necessary ability and power to form existing political systems appears to be a deceptive simplification. The results of the quantitative study declared that the peculiar evolutionary development of youth culture has led to a paradoxical situation in which institutional dependency and cultural independency coexist. In the light of the interviews the reason for students' low involvement but also the low institutional influence on political socialization seems to lie in the fact that students do not tend to identify themselves with institutions and even stay away from processes of institutionalization (Rosen 2001). Rather, they wish to take advantage of the discrepancies in the different levels of the system. This argument is further underpinned by the fact that there is an essential frustration and disappointment with elites and forms of democratic culture as a corollary of the structural deficits of new capitalism. The argument advanced in this paper is in accordance with Utasi's findings that point to the process of the individualization of private communities rather than the alteration of public or semi-public communities. This process may be characterized by the fact that, under the circumstances of increasing institutional dependency and control, individuals paradoxically avoid integrating into macro groups and advocate for career opportunities. The public sphere and spaces are only understood through the lens of the private. The private/public distinction gains a specific action theoretical perspective. This new form of generational orientation leads to new ways of perceiving connectivity and communality but also new forms of civic and political involvement. These include high level reflection, communication and orientation, as well as the reconceptualization of reality; the creation of alternative realities. All of these forms of post conventional actions erode political systems and question its legitimacy from an external perspective.

Populism: The Performance and Perpetuation of Crisis
Michael Joseph BOSSETTA (University of Copenhagen, Denmark) | michael.bossetta@gmail.com

Advocating the recent turn in conceptualizing populism as political ‘style,’ this paper explores how leading populist politicians from Denmark, Sweden, and the UK perform populism by making representative claims on behalf of economically, politically, and/or socially marginalized groups – i.e. the perceived ‘losers’ of globalization. Populist politicians claim to represent a ‘people’ by drawing upon crises and making them salient. By claiming to represent a given people, populist politicians create new identities with which citizens associate. Populists thus construct and attempt to reify the ‘people’ they claim to represent.

This paper looks at exactly how populists cover the representative gap between rulers and the ruled through their speeches, where anti-establishment discourses meet charismatic performances. By analyzing the most viewed speeches on YouTube of Nigel Farage (UKIP), Kristian Thulesen Dahl and Pia Kjærsgaard (Danish People’s Party), and Jimmie Åkesson (Swedish Democrats) from 2011-2014, the study aims to explore the discursive content used by the politicians in tandem with their aesthetic style. While discursive content refers to what issues the politicians make salient in their speeches, their aesthetic style refers to the specific repertoires of performance they enact. The former will be analyzed through a qualitative coding of the salience of crisis-related issues in the politicians’ speeches, while a typology of populist style is constructed by borrowing elements from social anthropology and theatre studies, e.g.: scripts, actors, rituals, symbolic production, staging, settings and audiences. The results will be discussed in terms of the consequences of populist performance for Western liberal democracy.

The support for populist attitudes. Is it caused by personal or societal threat?
Petrus TE BRAAK (Vrije Universiteit Brussel, Belgium) | ptebraak@vub.ac.be
Mark ELCHARDUS (Vrije Universiteit Brussel, Belgium) | Mark.Elchardus@vub.ac.be

Research on populism usually focusses on the populism of political parties. In most research, one or more parties in a specific electoral system are labeled as ‘populist’ so that their
electorate can be considered as ‘populist’. In the present study we explore populist attitudes on an individual level and attempt to explain the support by applying two different perspectives. The first perspective links the populist support to the concept of ‘modernisation losers’. From this perspective, people are populist due to their uncertain socioeconomic position. The second, cognitive, perspective states that populist attitudes are merely the result of the perception on the evolution of society. Populists, in this view, share a feeling that society is declining and blame established parties for this. The evaluation of these perspectives is based on a paper-and-pencil survey conducted during the last months of 2013. The representative random sample consists of inhabitants of Belgium (Dutch and French speaking), aged 25 to 35 (N=1,951). The results indicate that the support for populist attitudes is primarily a consequence of a negative perception on how society is doing. Someone’s personal socioeconomic position turns out not to be effective in explaining the support for populism.

Nature and ‘counter-modernity’: reproducing ideas of national purity and sovereignty in radical right discourses on ecological crises
Bernhard FORCHTNER (Humboldt-University, Germany) | b.forchtner@hu-berlin.de

Research on the radical right has focussed on their opposition to cultural, ethnic and religious difference but has seldom investigated meanings conveyed in their discourses on ecological crises. Relevant research has looked at their ‘counter-modern’ (Beck) reactions to the destruction of the countryside and the effect of overpopulation on the national space, issues which could be dealt within/ at the border of the nation. The full-blown transnational character of present-day ecological crises provokes similar reactions – while posing severe ideological challenges to actors who view nations as ‘limited and sovereign’ (Anderson). Against this background, I ask, firstly: how do radical right actors position themselves vis-a-vis transnational, ecological crises, in particular the exemplary cases of endangered biodiversity (non-stoppable foreign species threatening the nation’s purity) and climate change (international regimes versus national sovereignty)? Which meanings emerge and how do they relate to their core topics, e.g. nativist stances towards immigration and the rejection of the European Union? Secondly, I compare how radical right stances are conditioned by different degrees of ideological rigour (from ‘populists’ to neo-Nazis)?

Analysing a wide range of party- and non-party magazines published between 2000 and 2013 in Austria and Germany, I argue that although differences exist between ‘populist’ and more radical actors, environmental crises are instrumental in (re)producing core, nationalist principles. I do so through a quantitative discourse-network analysis and a qualitative analysis of relevant ties.

I thus analyse a rarely researched dimension of radical right meaning-making, illustrating culturalist or even racist implications of their responses to ecological risks.

The far-right voter: social bases or ideas? The predictors of voting for radical right parties in EU countries
Tadeusz SZAWIEL (University of Warsaw, Poland) | szawiel@uw.edu.pl

The paper will address two problems: the social characteristics of voters who identify themselves as „far-right” and vote for radical right (populist) parties. Secondly, what are the factors that are conducive (or are good predictors) to voting for radical right parties in distinction to all others? Beginning with H. Kitschelt’s (1997) and P. Norris’ (2005) seminal works we know that social bases, i.e. changes in social structure and economy are not sufficient conditions for the appearance and stability of radical right parties. Kitschelt and Norris identified the party
system and the electoral rules as two additional factors for radical right parties' electoral successes. The analyses in this paper will concentrate on 4 types of factors. In designing different models of logistic regression it will be shown to what degree 1) social and demographic factors, 2) attitudes toward immigration, 3) satisfaction with institutional performance, and 4) ideological factors, contribute to casting a vote for radical right parties. The analysis will include 9 Western European democracies (Austria, Sweden, Finland, Norway, Netherlands, Denmark, Belgium, France, Switzerland) and 4 Central European countries (Czech Republic, Slovakia, Hungary and Poland). The analyses will be based on the cumulative ESS data set (2010-2012); a more detailed analysis of the Polish case will be based on additional recent (2014) national surveys.

Anti-immigrant parties and political participation of immigrants
Tim IMMERZEEL (Vu University Amsterdam, Netherlands, The) | t.immerzeel@vu.nl
Arieke RIJKEN (Vu University Amsterdam, Netherlands, The) | a.j.rijken@vu.nl

The success of anti-immigrant parties in Europe has urged research on the consequences of these parties on policy outputs, policy stances of other political parties, and on attitudes regarding immigration. This research focuses on how native institutions and actors react to the politicization of the issue of immigration. It remains understudied whether and how immigrants themselves are influenced by the success of such parties. Immigrants could speak out against this anti-immigrant rhetoric in various ways (electoral or non-electoral), or they could develop negative attitudes towards political parties and 'exit' politics. Since Western-European anti-immigrant parties and citizens often interpret Muslim immigrants as the most important threat to Western civilizations, we investigate whether and how the presence of anti-immigrant parties affects the political participation of first- and second-generation Muslim immigrants in 19 Western-European countries. Using six rounds of the European Social Survey, we first test whether the popularity of anti-immigrant parties discourages or encourages Muslim immigrants to participate in electoral and non-electoral politics. We study both forms of participation as immigrants are often faced with legal restrictions to participate in electoral politics, and because immigrants might prefer to engage in movement politics which requires less human and political capital. Furthermore, we investigate whether specific groups of immigrants are differentially affected by anti-immigrant parties. We anticipate that second-generation, higher-educated and younger immigrants are less hindered by language issues and lack of political knowledge than their first-generation, lower-educated and older counterparts and therefore are more likely to participate in both non-electoral and electoral politics.

RN32S05 - Social Resilience and/or Social Resistance in Times of Political and Economic Crisis

The case of the recovered factories in Italy as a strategy of social resilience and resistance
Fabio DE NARDIS (University of Salento, Italy) | fabio.denardis@unisalento.it
Luca ANTONAZZO (University of Salento, Italy) | luca.antonazzo@unisalento.it

The aim of the proposed paper is to analyze and interpret the concept of socio-economic and political resilience within the master-frame of social movements' dynamics. For doing this we will focus on the case study of recovered factories, a phenomenon which could be considered as a new form of bottom-up economic activism, that emerged in Argentina during the economic crisis
of 2002 and later in Europe as a consequence of the global crisis of 2008. According to data released by the Italian Legacoop, in Italy there are currently 32 recovered factories for a total of 657 work places saved and activated investments for 30 million and 471 thousand euro. Glavovic (2003) argues that the social resilience is fundamentally influenced by institutions and networks that provide access to resources, the capacity of learning from experience and developing constructive ways to deal with problems. The idea of social resilience implies that critical events can be seen as opportunities and elements of discontinuity that can lead to innovation and development (Bohle et al. 2009). The case study of recovered factories will be considered as a specific socio-economic and political resilience strategy related to the Alter/New Economy movement, whose aim is to create a greener and socially responsible economy based on the rethinking of property and the growth paradigm that guides conventional economic policies (Alperovitz 2011). In this perspective our work will include the mapping of recovered factories in Italy, the conceptual definition and classification of prototypes and the analysis of their connection with the new economy movement by investigating the frame of references of their workers.

**Everyday Life and Resistance Practices in the Prisons of Turkey**

Sibel BEKIROĞLU (Middle East Technical University, Turkey) | sibelbekirolu@gmail.com

Prisons are mostly considered to be the places where pessimism prevails. However, the object of analysis of this paper is the counter one: the side of the hope and resistance. Thus this study attempts to explore the relationship between resistance and power and how this occurs in prisons where there is a total segregation from the society. Consequently, this qualitative research mainly seeks to answer the question “how everyday resistance is lived/experienced in the prisons of Turkey and what the results of this experience are with respect to power relations. To do so, this research examines that how the prisoners perceive and experience the resistance and power within those places. Through this investigation, the paper mainly explains how resistance is (re)generated in the prisons of Turkey. There are two dimensions of the study: resistance dynamics and power mechanism in the prisons. The first one can be expanded with a question as such: how resistance is possible within such places? Instead of looking at how the oppressor use force over the subordinated ones, we will deal with exactly opposite question: how the people challenge their oppressors? The second one is a query about whether it is possible to resist without becoming the power or being always the subordinated. In other words, is there an ethical limit to swearing at the power?

**Urban resilience and new public spaces: community gardening in the city of Rome**

Maria Cristina MARCHETTI (Sapienza University of Rome, Italy) | mc.marchetti@uniroma1.it

In the last decade globalisation and the economic crisis have changed the way social relationships and political participation are conceived. New phenomena are emerging - community gardening, co-housing, co-working, sustainable mobilities (car sharing, bike sharing), sharing economy, “Occupy” movement – that recover a sense of “Us” and a new way to intend the public spaces in a material and virtual sense. A new sense of belonging arises and it meets the need of sharing experiences together at local level and taking care of commons goods. Can we talk about “urban resilience”? Is the economic crisis responsible for these changes? Are we facing a long term change that involve values, lifestyles, world views and political participation too?
When we refer to “social resilience” it all depends on how we conceive this notion: resilience is not a form of resistance to adversities, but it implies the ability to successfully cope with them. Maybe we are facing a new phase of de-politicization that redefines the relationship among citizens, politics and society: a “new public space” arises, neither public (State) nor private (Market), but common. Within this conceptual framework the paper moving from the experience of community gardening in the city of Rome, will focus on the following topics:
- Community gardening in Rome: new public spaces and urban resilience
- New public spaces and model of (active) citizenship: the strength of local
- Resilience vs. Resistance: is it a matter of crisis?

Citizenship through consumption: the case of boycotting in Spain and its comparison to Europe
Inmaculada DÍAZ (Universidad de Málaga, Spain) | inmaculadiazlopez@hotmail.com

In the last ten years, Spain has experienced an important rise in what refers to boycotting products for ethical, political or environmental reasons: in 2002 6% of the population stated that they had boycotted some product in the previous year; in 2013, it was 21.6%. This work begins with a brief theoretical overview, trying to explain this rise in non-conventional political participation; after this, the features of a boycotter will be investigated by defining the typical boycotter in Spain. Finally, after descriptively analyzing the boycotting frequency in Europe, the qualitative differences between regions are analyzed. Between the main results of this investigation, it has been seen that boycotting is not an isolated action, but appears in consonance with other patterns of political action.

In this investigation it has been shown that there are differences between countries when it comes to boycotting. The results Ferrer (2010) obtained with the data from 2002 are once again confirmed: Scandinavian and Western Europe countries present high participation rates, while Central and East Europe societies (with the exception of Czech Republic) as well as South Europe countries are characterized by low participation rates. In most cases, a positive relationship is shown between this phenomenon and political interest and action patterns (especially individual activities). This fact confirms the individualistic theses that conceive politics as personal actions taking part of an individual’s daily life. Investigation is not able to determine whether this new ways of participation complement or displace traditional participation mechanisms; however, in the German case, these political tools have been proven to maintain a significant positive relationship with the polls.

In what refers to postmodern theses signaling a consumer concerned with equality and respect to the environment, the association could only be confirmed in some of the countries studied. Values relating to security and rule compliance also show a link to boycotting activities. Significant differences have been detected between the Spanish case and the rest of the countries. As for the sociodemographic profile, neither sex nor educational levels are weighty in Spain despite other investigations considering the last one to be the most relevant variable when it comes to explaining the model. Political left or right wing positioning also reveals interesting differences: while in the countries where this variable is significant most individuals feel identified with the left wing, it is those identified with the right wing the most likely to boycott a product in Spain. A possible explanation for this, attributed to the circumstantial nature of the phenomenon, could be the popularity of boycotts within the country in the last few years. Taking into account the fact that, in 20061, almost half of the survey respondents could recall some boycott campaign against Spanish products and companies, and that these were cava (61%) and other Catalan products and companies (34.7%)2, it could be induced that this circumstantial effect is what causes this tendency. The same study showed that coming from a specific region

1388
was the reason for boycotting a product in 24.7% of the cases. The study of this result’s evolution, together with the predicting variables of the model, is left to be addressed in future investigations.

The link between consumers who use ethical or political criteria when purchasing or rejecting a product and the ‘sustainable’ citizen aware of global impact and the future of nature and animals (Micheletti et al, 2012) should also be observed. Also left to be analyzed in future studies is the difference between this kind of citizen —perhaps more associated with the ‘civilized consumer’ defended by Gil de Zúñiga et al (2012) and related to solidarity and cooperation values— and people who take action in political boycotts —those who intend to penalize certain companies or regions for political reasons (as are the previous example of boycotting France or the current boycott campaign against Israel)— perhaps more associated to security values.

In the Netherlands, Switzerland and Sweeden, the results of other studies (Micheletti, 2005; Ferrer, 2010; Sha, 2012; Acik, 2013) about a more active role of women have been confirmed. Inquiring which thesis (socialization, situational or structural) better explains these results would also be interesting.

Finally, as some researchers already began to study (Gil de Zúñiga et al, 2013), it should also be investigated how the use of social media and the Internet influences the rejection and the purchase of products for ethical, political or environmental reasons, controlling the phenomenon including other variables that have been used in other investigations such as social class (Caínzos, 2010; Acik, 2013); religion (Ferrer, 2010); incomes (Ferrer, 2010); or living in urban areas (Acik, 2013).

Boycotting is an old —and very wide— phenomenon which has awoken a recent interest in sociological investigation, together with its positive version, the purchase of certain products according to ethical criteria. There is still a long road until the finding of a robust model able to explain these and other ways of political participation.

Field Evidence of Social Influence in the Expression of Political Preferences: The Case of Secessionists Flags in Barcelona

Jordi TENA-SÁNCHEZ (Universitat Autònoma de Barcelona, Spain) | jordi.tena@uab.cat
José A. NOGUERA (Universitat Autònoma de Barcelona, Spain) | jose.noguera@uab.cat
Antonio PARRAVANO (Universidad de Los Andes, Venezuela) | parravan3@gmail.com
Paula HERMIDA (Universitat Autònoma de Barcelona, Spain) | paula.hermida@uab.cat

Different models of social influence have explored the dynamics of social contagion, imitation, and diffusion of different types of traits, opinions, and conducts. However, few behavioral data indicating social influence dynamics have been obtained from direct observation in ‘natural’ social contexts. The present research provides that kind of evidence in the case of the public expression of political preferences in the city of Barcelona, where thousands of citizens supporting the secession of Catalonia from Spain have placed a Catalan flag in their balconies.

We present two different studies. 1) In July 2013 we registered the number of flags in 26% of the the city. We find that there is a large dispersion in the density of flags in districts with similar density of pro-independence voters. However, we find that the density of flags tends to be fostered in those electoral district where there is a clear majority of pro-independence vote, while it is inhibited in the opposite cases. 2) During 17 days around Catalonia’s 2013 National Holiday we observed the position at balcony resolution of the flags displayed in the facades of 82 blocks. We compare the clustering of flags on the facades observed each day to equivalent random distributions and find that successive hangings of flags are not independent events but that a local influence mechanism is favoring their clustering. We also find that except for the National Holiday day the density of flags tends to be fostered in those facades where there is a clear majority of pro-independence vote.
RN32S06 - Welfare State Transformation at the Grass Roots: New forms of Social Solidarity, Social Resilience and Citizen Activity in Europe

From formal to informal volunteering? Social change of civic engagement in Germany
Claudia VOGEL (German Centre of Gerontology, Germany) | claudia.vogel@dza.de
Christine HAGEN (German Centre of Gerontology, Germany) | christine.hagen@dza.de
Julia SIMONSON (German Centre of Gerontology, Germany) | julia.simonson@dza.de

Volunteering is defined as an individuals’ activity that is uncoerced, unpaid and directed toward a community concern, within or without a formal organisation. The ongoing debate on the structural change of civic engagement in modern welfare states guides the assumption that the share of informal or self-organised volunteering will increase over time while the share of formal, that is institutionalized, volunteering in clubs, non-profit organisations and religious associations will decrease. We investigate a) how clearcut the empirical differences between formal and informal volunteering are; b) how prevalences have developed in the past decade; c) which social groups choose which type of volunteering.

Data come from the German Survey on Volunteering, a representative survey among individuals aged 14 and older. The survey is the basic instrument for social accounting on volunteering in Germany and is funded by the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth. Data is currently available for 1999, 2004 and 2009. Besides providing detailed information on volunteering, the strengths of the survey are large sample sizes and the trend character: Social change can be captured on the basis of the repeated cross-sections.

Results regarding the differences between formal and informal volunteering show that informal volunteering is less time-consuming and more strongly directed to represent one’s own interests. The prevalence of informal volunteering has increased slightly between 1999 and 2009. Finally, the effects of socio-demographic and socio-economic factors on formal and informal volunteering differ, which raises new questions on both, solidarity and inequality.

Probing participatory urban development: new venues of urban politics in a social capital perspective
Katalin FÜZÉR (University of Pécs, Hungary) | fuzer.katalin@pte.hu

The paper argues that European urban politics outside the growth regions (Bohle-Greskovits 2012) is more and more predicated upon projectification (Sjöblom et al. 2006, 2012), a process in which traditional local political and economic elites, assisted and at times overwhelmed by the local project class (Kovách-Kucerova 2006, 2009, Füzér 2013), find themselves in search of project funds to assist a number of vital dimensions of local development from economic growth, through social services, to infrastructural investment and community building. Project proliferation impacts urban politics all the more in the wake of the participatory turn in European urban development policy. Empirical evidence from Pécs, South Transdanubian regional centre in Hungary is offered in three concrete settings: the planning and implementation of European Capital of Culture 2010 project(s) (2004-2011), urban development strategy planning (2011-2014), and urban social rehabilitation (2005-2014). The latter is highlighted as an urban lab for participatory urban development due to the UNDP inspired method of community coaching.
applied in the segregated neighbourhoods of Pécs East. The paper contributes a case study on the issue of how mainstream and socially excluded groups are empowered and participate (or fail to do so) in urban planning, development and politics. The bonding, bridging and linking social capital of elite, project class and socially excluded groups are examined as a prerequisite, a resource and a vital area of impact of urban development.

Social Rights and Regulation of the Public Sector
Antoinette HETZLER (Lund University, Sweden) | antoinette.hetzler@soc.lu.se
Colm FLAHERTY (Lund University, Sweden) | colm.flaherty@soc.lu.se

One of the biggest dilemmas facing the modern welfare state is how to advance and guarantee social rights for citizens while developing distributive models that incorporate cultural diversity. No where is this challenge more prevalent than in regulating institutions within the public sector charged with guaranteeing rights, particularly the right to equal education in a safe environment. Charged with the role of regulator, nation states attempt to mitigate local conflicts and dampen discontent as growing inequality in access to and in distribution of social services takes a decided cultural profile mirroring growing cleavages within the population.

This paper focuses on a comparison of regulating the quality and safety of education in Sweden and in the United States. Sweden, a welfare state, has over a sixty-year history of legislating equality and safety at school for all students yet truancy rates are high and children born outside of Sweden have lower school results than their Swedish peers. The United States, a liberal state with a history of race segregation, relies on federal and state legislation for bettering its school system, while Sweden has put into place an intensive National Inspection system. The paper presents an analysis of the differences and the consequences of the two systems and concludes that a type of principle-based self-regulation seems to be at work as an ad hoc solution in both systems although not formally acknowledged. The paper suggests that both systems, in differing degree, suffer from regulation failure.

Civic engagement and social inequality: tensions between participative and representative democracy
Evelien TONKENS (University of Humanistic Studies, Netherlands, The) | E.Tonkens@uvh.nl
Margo TRAPPENBURG (University of Humanistic Studies, Netherlands, The) | M.Trappenburg@uvh.nl
Menno HURENKAMP (University of Humanistic Studies, Netherlands, The) | mennohurenkamp@gmail.com
Jante SCHMIDT (University of Humanistic Studies, Netherlands, The) | J.Schmidt@uvh.nl

In many areas in Europe, we can witness the rise of new forms of civic engagement, ranging from grass-roots groups engaged in urban farming, sustainable energy or long term care, to new forms of citizen participation in local decision making, initiated by local governments in cooperation with citizens. These new forms of participative democracy generate a lot of enthusiasm and energy, but they also give rise to pressing questions concerning social inequality and the relationship with representative democracy. Research has repeatedly shown that citizens engaged in these types of activities tend to be higher educated and better off than average citizens. Poorer and less educated citizens are often informally excluded.

If participative democracy gains influence in setting the political agenda and in realising its aims, this occurs at the expense of political influence of representative democracy and thus of poorer and lower educated citizens in a constituency. How do politicians, active citizens and citizens who are not engaged in these activities feel and think about this? In this paper we address
these questions by presenting an analysis of six case studies of participative democracy in the Netherlands. Our analysis is based on observation and interviews with local politicians and active citizens, combined with a Q-sort analysis among citizens who are not engaged in such practices. We argue that both citizens and local governments need to put in more effort to include the views and voices of all citizens and develop some proposals on how this can be done.

The experience of meaningful youth participation
Georg BOLDT (Helsinki University, Finland) | georgmboldt@gmail.com

This paper examines youth participation in public decision-making, through a case study on a participatory budgeting pilot organized by the city of Helsinki. Processes of participative democracy are oftentimes criticized on the basis of being tokenistic. That is, the participation has a decorative purpose rather than actually being a channel of influence. A growing body of research tackles the structural requirements for achieving meaningful participation. Yet, micro-level analyses of the experience of participatory democracy are less numerous. This paper addresses this void through an ethnographic analysis of the ways in which youth experienced their participation in the process that was arranged by the city youth department.

This study shows that there are other factors that need to be accounted for than those traditionally associated with meaningful participation. Clearly factors such as selection of participants, the level of actual influence and how the possibility of participation is communicated are still relevant. However, the ways in which the method of participation has been made “youth friendly” and what kind of prior knowledge is necessary in order to participate are equally important.

Participative democracy is increasingly offered as a catch-all policy solution to increase active citizenship. However, the study presented in this paper found that, while the experience for many of the participants reflected the “ideal type” of participation, for others it offered sanctions such as accusations of truancy and an reinforcement of existing hierarchies in terms of the young versus the adults and the successful versus the nonachievers.

RN32S07 - Conceptualizing Power: Is there a Crisis of Political Hegemony?

Analysis of daily press as a tool for discovering the political
Lukasz BLONSKI (University of Warsaw, Poland) | l.blonski@is.uw.edu.pl

In my paper I would like to present how thanks to media research it is possible to reveal the core of the political. In order to grasp it, I am using a method of discourse analysis, carrying out research on daily newspapers, based on the assumptions of Essex School of discourse analysis. I assume that discourse not only has descriptive functions, but most of all performative, especially in authoritarian regimes, where every media expression is being controlled by authorities and it almost always serves as expression of their will. Media at the same time serves as doxa, but also creates the very border of conflict – space where powers of heterodoxy (society, free press) and orthodoxy (the authority) are fighting for their legitimization.

Area of my research is People’s Republic of China - state of a growing importance, which institutional and structural solutions are being implemented in more and more countries all over the world. Media in that country is fully dependent upon Communist Party of China (its central and local committees). Press communiques and content are to a great extent controlled and
manipulated by party’s authorities. It means that actual events which take place are not really important, emphasis ought to be put on their description as the description and communication themselves serve as the performative. By analyzing the discourse on central and local levels it is possible to see what different techniques particular Chinese top leaders (Jiang Zemin, Hu Jinatao and Xi Jinping) adopt and how they try to construct narratives around certain events that later on allow them to translate them to institutional solutions. As a result political, social, cultural and economic structures are influenced and remodeled. These narratives also serve for highly contextualized Chinese society as a reference point and source of guidelines regarding state’s functioning.

Such research should be enriched with an analysis of the personal network, factions, interest groups, “princeling” connections, and individual backgrounds of the highest authorities. Such research not only provides amazing insight into the dynamics of elite politics and reaffirms the importance of personal networks in PRC politics. Provided that it is backed by discourse analysis, it allows to observe and describe the change which takes places in Chinese politics. It also enables to see why discourse changes (it is not so static as scholars often claim), how it is being influenced and influences politics, and what might be the reason for it.

My initial data research is revealing that there have been great differences between mentioned leaders. They have resulted in country’s functioning – not only on central level, but most of all provinces (local level) have been influenced. What’s more, changes which have been implemented on lower levels are longer lasting and harder to eradicate. That is why Chinese leaders focus on them and surprisingly they often fail in yielding effective control over them as old structures and institutions are prevailing. Therefore, in my paper I would like to present how entanglements between actors and institutions are displayed in media and why (and how) it affects the sphere of the politics and country’s functioning. Thanks to it, it is possible to trace the political in China not only post factum, but also portray the moment of change as well as describe the conflict in doxa.

Is The Coming Crisis of Liberal Democracy?: A Consideration on Authoritarianism in the light of Hegemonic Power System Perspective
Emre ÖZTÜRK (Adıyam University, Turkey) | ozemreozturk@gmail.com

The tension between liberal democracy and authoritarianism has a long past. Based upon various dynamics, it is probable to observe a tendency of authoritarianization at some levels, in every period and distinct regions. As for today, although they have different area, dynamics and agency, it can be said that there exist a similar authoritarian tendency in some democracies, too. In the last years’ Freedom in the World 2014 report, Freedom House presented data such as to verifying this concern and preferred to describe the attempts to establish dominance on media, judiciary, civil society, economy, and security forces as “modern authoritarianism”. But the question whether this situation must be perceived as a restricted regional problem or, in the presence of liberal democracy, an indication of global crisis has not found a satisfactory or explicit answer yet. In this paper, we aimed to present the “authoritarianism tendency”, arising from some democracies, in association with global power network rather than as a regional situation, and also aimed to present more extensive perspective about it’s causes. In this regard, in order to point out the “situations where a decentralized power, based on its complicity with different power focals, reducing democracies to means of reveal that power itself” we made use of the notion “hegemonic power sytstem”. With reference to the qualifications of “hegemonic power sytstem”, we aimed to present a common aproach to reflect both the local and the global causes of authoritarianism tendency.
Conceptualizing Social Power: Multiple Modalities and Meta-powering with Illustrations
Tom R. BURNS (University of Uppsala, Sweden) | tomnora.burns@gmail.com
Peter M. HALL (Colorado State University, Colorado) | Peter.Hall@colostate.edu

This paper presents and illustrates a social power paradigm based on a new approach to causation, action processes, and social construction. It aims to overcome several of the major limitations of earlier social science power conceptions of, for example, Dahl, Lukes, Barnett and Duvall, Foucault, Guzzini, Mann, and Weber. The paradigm distinguishes agential, social structural, and material/ecological modalities of power (and underlying causalities) and illustrates these. Moreover, neglected modalities such as meta-power (power over power, transformative power) and relational control are conceptualized and exemplified.

Following an introductory section, the paper briefly presents causal power theory, identifying multiple causalities and powering mechanisms based on concrete processes and actions. The different modalities of power typically make up complexes of regulatory processes. Intentionality/non-intentionality and agential/systemic are critical dimensions. Five key points are made:

1. Social powering based on multiple interdependent causal mechanisms pervade all social life.
2. Social power systems (for instance, institutional arrangements, infrastructures, socio-technical systems) are complexes of causal mechanisms and potentialities.
3. Many, if not most power relations and systems are intentional human constructions.
4. Major complex systems of power and meta-power are found not only in the arrangements of capitalism and the modern state but in built environments and socio-technical systems. These are briefly illustrated in the paper.
5. The mechanisms (and therefore modalities) of power multiply as new types of causal and control technologies and new socio-technical systems are constructed.

Khutsong: An evaluation of power relationship dynamics in a community facing risk challenges.
Johan ZAAIMAN (North-West University, South Africa) | johan.zaaiman@nwu.ac.za

This paper reports on research conducted in the Khutsong municipality, North-West Province, South Africa. In 2004 a presidential project was announced to resettle the Khutsong township because it was built on a dolomite hazardous area that causes sinkholes. For this purpose the biggest town redevelopment programme in South Africa was undertaken. As the project unfolds different socio-political processes run concurrently. The town planners professionally assessed the risk problem and provided a grand solution. For this they obtained political buy-in from national government. The local politicians on the other hand are careful to be involved in the demolishment of the old houses or shacks of people moving to the new houses. They tend to protect their power bases. The people on the other hand are informed about the hazards of dolomite but renegotiate the outcome of the project. They use the new housing scheme to lesson household density with only a part of the family moving to the new houses and the rest remaining in the original house or shack. Or they use the original house or shack as a source of income by renting it. Poor households use this risk scenario as a tool to enhance their disadvantageous position by profiting with regard to housing. Richer households resist resettlement because the government is not in a position to replace their houses and businesses. In fact the businessmen use this to expand their businesses. This paper evaluates this power dynamics in view of power theorising and concludes that it contributes to a broader understanding of Steven Luke’s third dimension of power.
Public Engagement in Times of Crisis
Liv SUNNERCRANTZ (Lund University, Sweden) | liv.sunnercrantz@soc.lu.se

In times of crisis, strategies of political engagement, communication and argumentation become central to negotiations around meaning, ideology and opinion in public debate. Instead of analysing the mere content of political shifts, we need to study the conditions and practices involved in the creation of interpretive privilege, dominance and hegemony in public debate. Post-structuralist perspectives enables such studies and can together with historical sociological analyses of past crises shed light on the present.

This paper discusses the roles/functions of intellectuals through an empirical example, namely the debate on privatisation of the public sector in Sweden where there are remarkable shifts in the public opinion from 1988 to 1993. This is a time of financial, social, economic and ideological crisis characterised by mass unemployment, austerity politics and increased poverty. Fundamental reforms and related debates mark the 1980s and the early 1990s’ crisis became the worst in Swedish history since the 1930s. The prevalent social democratic hegemonic formation was disrupted to, as often argued, be replaced by a neoliberal hegemony. Not only the welfare state was in crisis, but as I argue, so was the political left while right wing politics gained ground as both sides opposed the social democratic state.

Through a discourse analysis of main debate fora and alternative projects in print and broadcast media I analyse formations of left and right wing intellectual positions. I argue for the need to examine how mediated public debate is structured by arguments and positions – and the roles/functions of intellectuals in this.

RN32S08 - Political Attitudes: From Country Case Studies to Cross-country Analysis

Synchronizing fields – understanding the success of European social science projects. The case of the European Value Study and the European Social Survey
Kristoffer KROPP (Roskilde University, Denmark) | kkropp@ruc.dk

This paper analyses two European social science surveys and their relative success. Some twenty years apart two groups of scholars launched two European social surveys. In 1981 the first round of the European Values Study (EVS) took place and twenty years later in 2001 the first round of the European Social Survey (ESS) was launched. Both surveys were from the outset closely connected to national and European social scientific elites and had strong ties to the EU and used the most sophisticated survey techniques of their time addressing urgent contemporary political and social problems. However, only the ESS has managed to exploit these connections to European political institutions in order to obtain symbolic and monetary resources. The paper argues that in order to explain the trajectory of two social surveys we need to understand not only the scientific and organizational qualities of the two surveys, but just as important the configuration of the European field of research policy and especially role of the social sciences with in EU research funding. In the twenty years separating the EVS and the ESS, social sciences and not least classical issues like social cohesion and political participation had become a part of issues funded through the EU research policies. Furthermore, a European field of social scientists had been formed connected to the field of EU research policy. In this way the paper argues that just as important as the scientific and organizational qualities of the two projects are the synchronization of the two fields.
Between scepticism and support: a cross-country analysis of young people’s attitudes towards Europe
Mark ELLISON (Manchester Metropolitan University, United Kingdom) | M.ellison@mmu.ac.uk
Robert GRIMM (Manchester Metropolitan University, United Kingdom) | r.grimm@mmu.ac.uk
Gary POLLOCK (Manchester Metropolitan University, United Kingdom) | g.pollock@mmu.ac.uk

Euroscepticism is a persistent phenomenon that has been gathering support during the last two decades (Usherwood and Startin 2013). The European sovereign debt crisis and austerity policies have further undermined public support for the European Union and the single currency. Negative sentiment towards Europe is not equally distributed throughout Europe such that attitudes towards the EU must be understood within national political, cultural and historic contexts (Hartleb 2011). Some literature suggests that support for European integration is largely driven by utilitarian rational choice and the question of what individuals or nations can gain through membership in the EU (Hix 2007). If so, attitudes toward the EU may fundamentally differ between established European democracies, new member states and countries seeking EU membership.

Across the EU, populist radical right anti-establishment parties gained substantial electoral support with ‘hard Eurosceptic’ programmes (Taggart and Szczerbiak 2002) during the 2014 European Parliament elections. Euroscepticism is often used interchangeably with right-wing populism and it appears plausible that a strong opposition to European integration is a pan-European characteristic of the radical right (Hartleb 2011). Others (Mudde 2013) have questioned the link between populist radical right parties and Euroscepticism. While according to Mair (2007), Euroscepticism is closely linked with cynicism towards national institutions and modes of governance. The declining significance of democratic institutions and processes is part of a general depoliticisation that is characteristic for most Western democracies. Lack of opposition may either result in withdrawal from participation or a mobilization against the polity in form of opposition of principle (Mair 2007).

This paper is based on survey data from the MYPLACE research project which involved young people aged 16-25 in 30 locations across 14 European countries. Using survey measures of interest in issues to do with Europe and interest in the European Union, trust in the European Commission as well as the importance and benefits from membership in the European Union we firstly explore the fluidity of positions towards Europe among the respondents. Secondly, we explore the variation in attitudes towards the EU within the broader economic and political contexts of the specific locations where the survey data was collected in order to identify clusters which reflect these circumstances. Finally we test the hypothesis that there is an association between general satisfaction with democracy, trust in national political institutions and attitudes towards Europe.

Attitudes towards legal authority from 1975 to 2012: assessing intergenerational transmission and change in the British Cohort Study 1970

Gabriella MELIS (The University of Manchester, United Kingdom) | gabriella.melis@postgrad.manchester.ac.uk
Nick SHRYANE (The University of Manchester, United Kingdom) | n.shryane@manchester.ac.uk
Maria PAMPACA (The University of Manchester, United Kingdom) | maria.pampaka@manchester.ac.uk

Individuals’ worldviews, values and attitudes are said to be acquired early in life from the family environment. Nonetheless, little has been said about individual-level mechanisms affecting intergenerational (in)congruence and individual conversion over time. My on-going PhD work aims to assess intergenerational transmission, as well as life course change/stability of attitudes towards legal authority. The research uses the sweeps in years 1975 (parents), 1996 (cohort members, CMs), 2000 (CMs) and 2012 (CMs) of the British Cohort Study 1970, and allows for the observation of patterns of change at both the intra- and inter-individual level of analysis.

I apply longitudinal item response theory models within the structural equation modelling framework in order to assess the effect of parental authoritarian worldview as measured in 1975 on the CMs’ patterns of change in attitudes towards legal authority from 1996 to 2012; the results shown by the models are conditional upon theoretically relevant covariates, such as a) parents’ age, gender and social class; b) CMs’ gender, educational level, employment status, interest in politics and voting behaviour.

At present, and in line with the literature, the results show that parents’ authoritarian worldview significantly predict their offspring’s attitudes to legal authority in adulthood. However, the measurement model for the CMs’ attitudes to authority posits analytical challenges when looking at intra-individual change over time; these challenges and solutions will be discussed as part of the substantive interpretations of the models proposed.

The local and the national in European citizens’ political discussions: a multilevel analysis of 31 countries

Joao CANCELA (Universidade Nova de Lisboa, Portugal) | joaocancela@gmail.com

Background:
Political engagement differs within and across societies, and the literature proposes multiple explanations of variables like interest in politics, political sophistication and electoral participation. Usually these explanations follow one of two strategies: 1) referring implicitly or explicitly, to the national level of politics – for instance, assessing interest in national politics or turnout in national elections – or 2) being “generalist” in the sense that differences across different territorial levels are not taken into account and are subsumed into a single dimension. However, in recent years it has been observed [1]–[3] that among some groups of the citizenry (e.g., women, minorities) patterns and explanations at the national level do not hold at other territorial scales, namely the local level. Existing approaches to this subject have so far focused on a single country, leaving unaddressed country variations.

Objectives:
Departing from prior studies about “generalist” political interest [4], [5], this paper analyses the reported levels of discussion about “local politics” and “national politics” across a set of 31 European countries. Its first goal is to assess whether there is an overlap between levels of reported discussion about local and national matters. Secondly, it examines whether the covariates of engagement have a different performance depending on the territorial level of
politics at stake. Three hypotheses at two levels of analysis (the individual and the country) are tested:
H1: The more extreme the ideological position of the individual, the higher her levels of interest in national rather than local politics
H2 – The higher the GDP the higher the interest in national politics as opposed to local politics
H3 – The higher the degree of decentralization of the polity the higher the interest in local politics
Data and methods:
Data employed (n = 30216 from 31 EU members and candidate countries) are from Eurobarometer 73.4 [6] in which respondents were asked how often they discussed national and local politics. Responses are aggregated into a new variable (“engagement profile”) with four possible values: “does not discuss politics”, “discusses local and national politics equally”, “discusses national politics more often”, “discusses local politics more often”. Since ours is a non-binary categorical variable, a series of three logit multilevel models with a baseline outcome were fitted to the data using country and individual level covariates. The country level variables are Gross Domestic Product and an index of decentralization developed by Hooghe et al [7]; the individual level covariates are gender, socioeconomic status, organizational membership, ideology, occupational status, education, and type of community.
Results:
"Engagement profile" is distributed as follows: 13% report a higher level of interest in national politics; 14.5% discuss local politics more frequently. 18.5% report not discussing either level; 54% discuss both with the same frequency. The proportions vary considerably across countries. The results corroborate the hints of previous research at the individual level: inhabitants of large towns are more prone to discussing national politics, whereas individuals from rural areas are more likely to discuss local matters; higher levels of education and socioeconomic status are associated with a higher likelihood of discussing national rather than local politics, while being a female signals the opposite.
Our hypotheses have mixed results. H1 has the least satisfactory performance, since a more peripheral ideological self-placement is not very relevant in explaining involvement in national rather than local politics. H2 and H3 have a better performance: living in a country with a higher GDP is linked with a more intense involvement in national politics, while decentralization Discussion:
Two main implications can be drawn from the analysis. A classical thesis about political change in developed countries asserts that a process of “nationalization” would dilute local peculiarities and their role in fostering political engagement [8], [9]. Our analysis suggests that political engagement is not merely one-dimensional. It also shows that political behaviour is not only a matter of individual level but that it is also contingent on contextual settings. Citizens from a polity with a more decentralized architecture tend to be comparatively more engaged in local politics.
The second implication is of a methodological nature and is related to the underlying assumptions that members of the public may hold when answering questions about their political engagement. The comparison of the performance of our model with those that refer that assess a "general" interest in politics hint that there is an underlying understanding among the public that identifies politics essentially with the national scale.
Future research can consequently gain from taking territorial levels into consideration in the study of political behaviour, and by offering respondents the possibility of reporting their attitudes towards different levels of the political realm.

The Effect of Socio-Political Attitudes on the Voter-Party Interaction under the Proportional Electoral System: A Case Study of New Zealand

Araz AMINNASERI (The University of Melbourne, Australia) | aaminnaseri@student.unimelb.edu.au
Irma MOOI-RECI (School of Social and Political Science, The University of Melbourne, Australia) | irma.mooi@unimelb.edu.au

Soskice and Iversen (2006) propose a model for interaction between voters' economic class and their voting decision under proportional electoral systems. Their model assumes parties to represent economic classes in the parliament. They also assume voters to be individualistic profit-maximizing agents in the fight over the extent and shape of the government redistribution of wealth. Using the New Zealand Election Study (NZES) survey data on New Zealand's 2011 general election, we show that their proposed mechanism is not supported by evidence. Instead, through our alternative modelling we propose that controlling for demographic and other contextual factors, what matters most for voters’ decision making is their more established socio-economic attitudes towards the economic inequality and the role of government in mitigating these inequalities.

RN32S09 - Citizenship and Political Participation

Local democracy in the process of transformation: Has the call for citizen participation reached the city councilors? The case study of Turku in Finland.

Ritva SALMINIITTY (University of Turku, Finland) | ritsal@utu.fi

In recent years, local democracy has been challenged by the major changes in municipal operating environments such as market-demanding provision of services, new management styles and, especially in the Finnish context, the consolidation of municipalities. These trends have challenged citizen participation and driven participation into discussion in substantially new aspect. Coincidently academic discussion about democracy has emphasized the participatory
character of democracy. This tendency has strengthened the interest for deliberative democracy theories and has manifested in expressions like “new democracy” and “participatory turn”. Nevertheless, these approaches have so far led rather to theoretical constructions than concrete proposals for action.

This research attempts to shed light on the current discussion focused on the “participatory turn” and the state of local democracy from the perspective of decision-makers. It is based on two surveys, which were conducted in Finland in the city of Turku in 2005 and 2013. In addition the research data contains the interviews of city councilors. Results indicate quite clear polarization in councilors’ attitudes towards citizen participation. In these results positive general attitude towards participatory democracy is indicated simultaneously with the diminishing amount of supporters for participatory democracy. Presumably the general positive attitude towards participatory democracy is explained by the growing intensity of support of some councilors. It is to say, that the support has strengthen among already positive councilors, but the support has not spread among other councilors. In my presentation I evaluate this polarization by gender, age and political party.

European Parliament Elections 2014: The Role of Interpersonal Communication in Primary and Secondary Groups

Paulina TABERY (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | paulina.tabery@soc.cas.cz
Jiri VINOPAL (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | jiri.vinopal@soc.cas.cz
Martin BUCHTIK (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | martin.buchtik@soc.cas.cz

Voter turnout in the elections to the European Parliament 2014 in the Czech Republic was the second-lowest out of all EU member states and Czech citizens' attitudes are traditionally considered eurosceptic. In this paper, we examine the role of communication in the decision whether to participate in elections. The media may be one source of information influencing the formation of and changes to opinions about the elections to the European Parliament and affecting voter turnout. Another key source is communication within social groups or networks, which act as an essential source of information or a filter through which the attitudes and opinions of members of the network become reinforced, polarised or adapted to the social context. Therefore, in addition to the individual level, we also focus on the group level, or more specifically on how the issue of the European elections was discussed within groups and how the intention to vote varied on the individual and group levels.

In addition to exploring the effects of characteristics such as education, age, standard of living, political efficacy, level of political knowledge and civic activism, we also test how the communication habits of individuals and the communication and influence patterns within groups, especially opinion leadership, affect the intention to vote.

For this analysis, we conducted a panel survey in late 2013 and early 2014. The sample consists of 609 respondents in 176 primary and secondary groups. The group size varies between three and seven members, with the average of 3 to 4 persons.

Competent Citizenship: The New Imperative ‘Turn’ in the 21st Century

Peter OZONYIA (Trinity College Dublin, Ireland) | ozonyiap@tcd.ie

Trends in citizenship policies and practices have been analysed consistently from the ‘sociological’ turn (Marshall) through ‘restrictive turn’ (Joppke) and to the ‘cultural turn’ (Delanty; Stevenson; Ong). However, a critical ‘competency-turn’ that emerged since 1990s remains
under-discussed in contemporary literature. I argue that existing dominant approaches continue to limit citizenship theorising, and that the competency-turn perspective provides a more useful analytical tool in post-industrialised Western democracies, which have become increasingly multicultural and knowledge-based. This paper examines this new imperative turn not just as something uniquely 21st Century but that which has historically defined also the parameter of active and participatory democratic citizenship norms even in the Aristotelian ancient Athenian city-state. The institutionalisation of Lifelong Learning (LLL) policy since the mid-1990s, together with the proliferation of Education for Citizenship in 2000s and the subsequent introduction of Citizenship Test and Civic Integration conditions for naturalising immigrants in many Western countries today, are key ‘points of reference’ for our competency-turn argument. An important question underpinning this paper is whether the competency turn perspective can actually help in addressing endemic ‘inequality of citizenship’ in contemporary Western democracy? With increasing globalisation since the 1990s, most Western governments have been orchestrating persistently the empowerment of their ‘citizens’ in the belief that ‘competent citizens’ are the key to achieving good citizenship, participatory democracy, societal cohesion and economic competitiveness agendas in the 21st century. This paper introduces ‘competent citizenship’ as important analytical tool to help us transcend the current controversially classed, gendered, racialised and rights-based Marshallian citizenship discourses.

KEYWORDS: citizenship, competency-turn, LLL, civic/citizenship test

1.1. Introduction: After decades of falling ‘out of fashion’, the 1990s saw a dramatic revival and ‘explosion of interest on the concept of citizenship’ among social scientists (Kymlicka and Norman, 1994) as issues of citizenship took centre-stage politically and socio-culturally in Western societies. This period coincided with increasing tendencies of globalisation, mass (im)migration, securitisation, multiculturalism and Europeanisation processes that have challenged radically the traditional conceptualisation and practices of citizenship and naturalisation within the EU.

By problematising naturalisation policy, we consider the implications of a competency-based citizenship policy framework ‘through which senses of political membership, allegiance, and identity are formed and transformed’ (Smith, 2004: 42); given that ‘policy levers are easier to change than individuals’ attributes or structural features of national societies’ (Bloemraad and Wright, 2012: 78). Research also indicates that public ‘policies make citizens’ (Campbell, 2003) and that active democratic citizenship and ‘active citizenship’ are developed through educative learning and not naturally given (Honohan, 2010; Veldhuis, 2005; Mettler and Soss, 2004). However, what has been extolled increasingly in the naturalisation policies for TCNs across Western societies in the form of citizenship tests is akin to the kind of ‘citizenship education’ that ‘is reduced to memorizing names, dates, laws, institutional structures and governing procedures’, which unsurprisingly ‘has not resulted in more active citizens’ (Schugurensky, 2004: 4). Thus, this paper questions and challenges the politicisation of naturalisation and integration of TCNs that is not necessarily based on the institutionalised competency-based citizenship agenda, but is rather based on the mere passing of citizenship tests that is not bringing about responsible, active and patriotic naturalised citizens as wishfully expected by the dominant group.

1.2. Competent citizenship within the EU: Policy and Practice and Limitations

Apart from the problems of mass immigration and poor integration of TCNs, Western European governments have been very wary of the growing ‘democratic deficit’ (Ross, 1995) and the declining ‘social solidarity’ (Habermas, 1998) among European citizens both youths and adults. Citizenship learning has been seen as a panacea for addressing political apathy, civic disengagement and also for boosting individual’s capacity for active citizenship in the 21st century. Schugurensky (2004) argues that ‘the cause of democratic deficit is that most educational systems (from elementary schools to universities) pay little attention to the development of active, critical and engaged citizenship’ (2004: 3). Indeed, many research
findings have consistently indicated a growing ‘apathy’ towards social, political and democratic participations among the citizens of Western societies (Hix, 2003; Schugurensky, 2004), suggesting the urgent need for governments and the education system to address this growing endemic issue. In response, Western governments are now rigorously implementing ‘education for citizenship’ policy initiatives in order to empower their citizens (Birzea, 2000).

In the mid-1990s following Delors Report (1996), the EU institutionalised LLL as the overarching policy paradigm for both educational and social reforms. Since then, LLL has come to be revered as ‘the panacea to all problems’ in the 21st century (Medel-Anonuevo et al, 2001: 7). Education for Democratic Citizenship (EDC) project was also set up in 1997 and has been firmly posited as an important political objective of the EU (Birzea, 2000). EDC is defined as ‘a set of practices and activities aimed at making young people and adults better equipped to participate actively in democratic life by assuming and exercising their rights and responsibilities in society’ (Council of Europe, 2002). Birzea (2000) informs us that EDC is not just about schooling but ‘a major educational aim’, ‘a semantic cluster with a broad range of implied meanings’ given its integrated generic dimensions: ‘education + citizenship + democracy’; in fact, ‘a multi-dimensional term in the sense that involves political and civil rights as well as social and cultural rights’ and, very importantly, ‘it implies certain key competencies’ (2000: 63). The research of IEA on the ‘International Civic and Citizenship Education Study (ICCS) studied the way in which countries prepare their young people to undertake their roles as citizens’ (Schulz et al, 2010b: 15). The IEA report also went on to state that ‘ICCS was based on the premise that preparing students for citizenship roles involves helping them develop relevant knowledge and understanding and form positive attitudes toward being a citizen and participating in activities related to civic and citizenship education’ (Schulz et al, 2010b: 15).

It has now become axiomatic or self-evidential that being a ‘competent citizen’ is indispensable and imperative in the 21st century. That an European citizen must be competent enough to compete economically and politically in the 21st century led to the increasing proliferation of education for citizenship policies and the emphasis on the notion of responsible citizenship based on ‘active citizenship’ capacity (Hoskins et al, 2006; Taskforce on Active Citizenship, 2007). Consequently, ‘the European Commission has placed the promotion of active and responsible civic behaviour from school onward high on the political agenda … emphasized by the new Europe for Citizens Programme (2007-2013), which aims at bridging the gap between the citizens and the EU’ (Georgi, 2008: 110).

With increasing number of immigrants and the Muslim issues, Western governments have also implemented a ‘muscular liberalism’ civic integration for immigrants to learn dominant national values, norms and cultures. Many policies such as multiculturalism in Britain, interculturalism in Ireland, and assimilationism in France have been adopted. Likewise different types of citizenship have been suggested such as Marshallian right-based ‘social citizenship’ (Marshall, 1950), ‘differentiated citizenship’ (Young, 1989), ‘cultural citizenship’ (Rosaldo, 1994), ‘multicultural citizenship’ (Kymlicka, 1995), ‘gendered citizenship’ (Yuval-Davis, 1997), ‘constitutional patriotism’ (Habermas, 1996), and ‘global citizenship’ (Boli, 1998) or ‘transnational citizenship’ (Babcok, 1994). However, none has ever solved the deep problem of marginal groups (e.g., immigrants) who are constantly positioned in ‘second-class’ citizenship in capitalist and multicultural societies. The main goal of the paper is to provide alternative sociological argument predicated on ‘competency-based citizenship’ approach to naturalisation as more robust and effective in addressing such issues that are linked to patriotic citizenship argument. Some of these issues include issues of social inclusion, social cohesion and active citizenship; as well as cultural politics; politics of difference, identities and belonging. The next section will attend to some of these issues especially the contested nature of citizenship concept and offering a definition that best finds currency with our competency epistemology. This will then lead us to analyse the concept of competence and competency and how this link to educational citizenship pedagogy and issues of civic and cultural competences.
2.1. The concept of citizenship: contested and controversial
As a theoretical or empirical concept, citizenship is best understood as having multifaceted meanings because of its intricately interrelated multidimensionality: legal-status, rights, participation and belonging (Bloemraad et al, 2008). Historically, it is an ‘essentially contested concept’ (Lister, 2003: 14), which tend to be interpreted differently depending on the specific context and one’s philosophical view and agenda. From a liberal view, British sociologist T. H. Marshall defines it as ‘a status bestowed on those who are full members of a community. All who possess the status are equal with respect to the rights and duties with which the status is endowed’ (1950: 28-29). Ironically, having full citizenship rights as Marshall’s thesis portends do not grant the holders the ‘competence’ (i.e., ability or capability) required for active citizenship (Ulrich, 1998). This competence/competency must be acquired or developed by citizens and never a given. While corresponding obligations were highlighted, this was simply in principle and very superficial because Marshallian rights-based citizenship was more about citizens' equality of status and access to state provisions than citizens’ capacity to contribute to society (Powell, 2002). Hence, Marshall failed to ‘ground his conception of citizenship in such notions as agency, capability, autonomy or responsibility’ (Bulmer and Rees, 1996: 276). In other words, Marshallian social citizenship rights tended to describe mostly ‘passive’ citizens by emphasising ‘politics of entitlement’ rather than ‘politics of contribution’ (Powell, 2002).

Bryan Turner's (1993: 2) views citizenship as ‘a set of practices … which define a person as a competent member of society’. This definition is essential in our understanding of the notion of ‘competent citizenship’ articulated in this paper as a critical dominant discourse in an increasingly knowledge-based economy of modern multicultural Western European liberal democracies. Thus Turner’s definition is alluding to issue of ability or capability that individuals need to possess or acquire in order to operate/compete in modern stratified political statehoods, where people’s existential or ‘lived citizenship’ is dependent on their ability to mobilise social, cultural and material resources. This capability ‘approach leads us to see LLL as a crucial factor to convert individual resources into functionings’, which leads to effective ‘active citizenship’ capability (Lodigiani, 2010: 59). We can now see why it is very crucial and indispensable to reconceptualise naturalisation policy within a competency-based citizenship perspective in the hope that this offers a better solution to immigrants’ development of capacities for patriotic, responsible and active citizenship ideals. However, how this issue of competency has been analysed and discussed in the literature and in practice, especially within the sociological literature of citizenship and naturalisation policies of modern nation-states remains spurious, elusive, controversial, biased and ambiguous.

2.2. Competence and competency: some conceptual clarity
According to the dictionary definition, competence or competency refers to ‘a specific range of skill, knowledge, or ability’.

Social dimensions of citizenship norms, political orientation and participation in Sweden
Ylva BERGSTROM (Uppsala university, Sweden) | ylva.bergstrom@edu.uu.se

Focusing on the case of Sweden this paper critically examines the argument (Ingelhart) that there is a shift from materialist to post-materialist values, and scrutinize the shift from allegiance towards a more assertive civic culture. Using the 1981, 1996, 1999, 2006 and 2011 data for the Swedish part of World Values Surveys, in a geometric data analysis this paper disclose how different attitudes are related to each other and visualized by portraying them in a multiple-dimensional space. Here the organization of cultural values is complex, whereas the materialist – post-materialist dichotomy need to be recognized as libertarian and authoritarian values. In a similar vain the distinction (Welzel) between allegiance and a more assertive citizenship norms
corresponds closely with different political orientations. A range of sociodemographic variables (age, gender, educational level, occupation) are superimposed as supplementary variable due to analysis of how the structure of attitudes correspond with structure of specific sociodemographic positions. Highly educated and qualified professionals occupy a similar location to those who support collective protest values, while the working class tend towards more materialist values.

Language of contemporary media and its recipient towards organizing society.

Marcin KOTRAS (University of Lodz, Poland) | mkotras@uni.lodz.pl
Konrad KUBALA (University of Lodz, Poland) | suspeso@o2.pl
Karolina MESSYASZ (University of Lodz, Poland) | karolina.messyasz@uni.lodz.pl

S.M. Lipset and S. Rokkan thesis assumed that society is characterized by relatively fixed cleavages. These cleavages are reflected in the relationships between political parties and influence dynamics and institutionalization of the party system. Therefore parties possess definite social identity. They build up their support and position using already existing socio-political divisions which concern the following questions: socio-economic, religious (including religiosity level and the role of the church in the state), support for the political system (e.g. democratic solutions), in the line city countryside relationships understood as juxtaposing different life styles, e.g. cosmopolitan versus traditional or liberal versus conservative.

What is important, which conflicts emerge as first and which ones are secondary. Moreover, how long the divisions can stay. The key issue for the analysis of the problems is the comparison of how the concepts used for the description of these social divisions (such as religiosity, national identity, individual human rights, morality, community, lifestyle) were defined in the past and how they are defined today. What was regarded as the correct way of thinking and behaviour in the past and how it is changing today in more and more multicultural, differentiated societies.

Assuming that contemporary society is divided into the so called practice communes, we think first of all that the answer should be found how the individuals making up the communes describe the surrounding reality and the conflicts taking place around it Do they use new or old definitions concerning problematic questions. And last, but not least, are they interested in reaching compromise, and how much do they care about sustaining conflict and intensification of the argument?

We want to present our research outcomes concerning political discourse in Poland in the fields of the market and regime transformation, the labour market, the post-material values, the chances of youth.

The basic aim of the research is to reconstruct media activities which are undertaken to control and transform political environment, and also to reproduce narrative strategies which can be observed in Polish press discourse, including the so called new media. We assume that political actors together with the media are organizing permanent, secondary socialization of citizens, who are media recipients. That is why our research aim will be concentrated on the in-depth analysis of the reality descriptions created in this process and their acceptance or rejection by media recipients. In this project we will aspire to reconstruct and describe:
• political communication patterns used in/by media
• collective political identities
• relations between media expert discourse recipients and their political attitude

The specified field, where we plan to reconstruct the mechanisms and processes of reality creating by applying definite communication patterns, is: discourse understood as a sphere of public communication. The choice of public discourse as a research object was brought about by the fact, that: discourse is a proper, and actually the only, area of power exercising by symbolic elites. The grantees understand "symbolic elites" as: feature writers, journalists,
editors, writers, clerics, scientists, experts, businessmen, intellectuals, politicians presenting themselves in media, in other words: these groups and individuals, who have direct control on: public available knowledge, public legitimize beliefs, form and content of political discourse. Symbolic elites play substantial role in establishing the hierarchy of important and non important social issues, moral or esthetical values or even they can influence patterns of scientific truth reception. In the sphere of symbolic elites discourse we will be interested especially in the domain of political issues, which can be described as a so called, political discourse. We include in this area: sociopolitical journalism and commentary, public statements connected with political issues delivered by artists, intellectuals, scientists, experts, journalists, businessmen, clergymen as well as politicians' statements present in the media.

In the methodological dimension our aim is to work out the research path using interdisciplinary tools of discourse analysis used so far outside sociology of politics. Working out suitable for sociology of politics analytical format should become a new methodological research proposal for all sociologists of politics.

In the theoretical dimension the aim is to enrich the subdisciplinary sociology of politics in the aspect of empirically oriented reflection over the trends in political communication development, considering the new media and their relationship with the institutional reflexivity processes. The final outcome of our analyses should be the models of discursive reality creation administered by politicians as well as the media in Polish public discourse, more precisely, the exemplification of political identities of the main actors in the political sphere, as well as the specification of the sphere itself. Another outcome should be the reception of the reconstructed media representations by the recipients in the form of their opinions or attitudes. This type of research reflection undertaken so far over a limited scale should also offer the enrichment of reflection on the basis of subdisciplinary sociology such as sociology of politics. Therefore another essential research aim should be establishing innovative research path useful for problem analysis in the range of political communication management.

RN32S10 - Social Inequality and New Forms of Protest

The exercise of institutional participation in health: an analysis from the voice of their community actors

Bernardo CASTIBLANCO TORRES (Universidad Nacional De Colombia, Colombia) | bcastiblancot@gmail.com

This work is an investigation on the exercise of institutional participation in health from the perspective of their community actors. As such, the research aims to analyze the concept and perception of participation in a group of community leaders linked to the participation forms of an public hospital in Bogota city, in Colombia and recognize the main strategies developed during the period 2008 - 2012. From a hermeneutical historical paradigm and an approach research qualitative, was held a group interview a targeted community leaders. Outcomes found that participation is conceived as a means and as an end always built from the individual. The process of social participation in health is determined by the interaction with the institutions and to that extent is instrumentalized by them. The development of autonomy determines the legitimacy of participatory processes that are not favored in practice and although democracy and participation go hand in hand, we need to analyze more closely the latter before assigning a savior place in Colombian society.
Therapeutic politics: Conceptions of welfare and citizenship in the Finnish political discourse
Suvi SALMENNIEMI (University of Turku, Finland) | sutusa@utu.fi
Arttu SAARINEN (University of Turku, Finland) | arttu.saarinen@utu.fi

The paper analyses how political reasoning concerning welfare and citizenship has transformed in the Finnish political discourse. It draws on the analysis of government programs and platforms and electoral materials of the major political parties during 1979-2014. The transformation of political reasoning is analysed from four analytical angles: (1) the moral values the political documents appeal to; (2) the vocabulary they use in order to render reality amenable to political deliberation; (3) the chains of problematisations, i.e., the issues they raise as problematic and requiring political intervention, and (4) the subjects they envisage. We suggest that Nordic welfarist rationality has been articulated with neoliberal rationality in Finland from the 1990s onwards. This articulation produces a novel interpretation of welfare and citizenship. The welfare state emerges as a reward for adhering to the logic of the competition state. The tensions between neoliberal and welfarist rationalities are resolved by articulating them in a causal relationship: welfarist values of social justice, equality and social solidarity are portrayed as an outcome of neoliberal policies of market efficiency, productivity and national competitiveness. This articulation gives rise to a new conception of welfare emphasising subjective wellbeing and an increasing individual and “community” responsibility. It also crucially re-defines citizenship, framing it increasingly in therapeutic terms. Re-calibration of citizens’ psychic life is seen as a tool for both individual and social transformation. The paper concludes by contemplating what this political reasoning can tell us about the reconfiguration of the relationships between the state, economy and populations.

Bolsa Familia in Brazil: masked social inequalities and votes secured
Jayane MAIA (University of Brasilia (UnB), Department of Sociology, Brazil) | jayane.maia08@gmail.com

Bolsa Familia, implemented in Brazil in 2003, is considered a world example of cash-transfer program. Studies show that improving income levels and education in the Brazilian context in recent years has the program as one of the causes. To the proposal study investigates the influence of Bolsa Familia on state levels of education and income as well as on the vote received by the elected candidate for president. Between 2000 and 2014 were analyzed in the Brazilian states the municipal human development index (IDHM), the annual volume of cash transfers to poor families and the proportion of votes for the presidential candidate elected. The data show that although the state indexes of education and income have increased in the past decade, their correlation with the annual value of the Bolsa Familia is negative and weak. Indeed, twelve states remained with low education levels, despite the increase in transfers. It is inferred that the Bolsa Familia does not contribute to the empowerment of poor Brazilians through education to the same extent that transfers income, collaborating with clientelism (Piattoni, 2001). Even without attacking the social precariousness and poverty in proportion to the volume of transfers, the Bolsa Familia stimulates, especially in poorer states, the uptake of votes for the presidential candidate of the party that implemented it. The vote does not happen in a sociocultural vacuum and the hypothesis is that families have fear of losing the benefit if the political party that created it leave the power.

Incomplete post crisis paradigm shifts in the EU? New tactics for transnational equality actors
Alison E. WOODWARD (Institute for European Studies, Vrije Universiteit Brussel, Belgium) | alison.woodward@vub.ac.be

While the financial and austerity crises can be argued to have led to a rightward paradigm shift in governmental budgets and policies in many places in Europe, the argument that it also led to new paradigms for civil society actors is still open. Although research in 2013 with Brussels based transnational social policy platform organisations indicated that organisations were regrouping and retrenching to adjust to the new policy landscape, the results were inconclusive. Follow up interviews with these actors carried out in early 2015 explore the extent to which the new European Commission, new conventions for funding, and the continuing climate of austerity have led to lasting changes in the approaches and targets of European transnational interest organisations in the field of equality including gender, sexual orientation, disability, race, religion and age. To what extent have the continuing economic constraints led to changed approaches to the European institutions? To what extent are organisations consciously shifting their discourse in response to the neo-liberal logics that seem to be dominating European civic dialogue? Do some equality issues fare better than others in making adjustments?

Inequalities of Political Protest: Resources and their Influence on Political Strategies
Hanna-Mari HUSU (The University of Jyväskylä, Finland) | hanna-mari.husu@jyu.fi

My presentation focuses on inequalities of political protest. Research on political action and social movements do not pay sufficient attention to the question of how the access to certain forms of political protest is itself unequally distributed among different groups. In recent years, the emergence of the populist right in Western Europe has drawn attention to controversial features of political action in which certain groups’ ways of doing politics are seen to be undesirable and deviant. I examine how social positions of actors, resources and class-specific ways of experiencing and acting play a role in political and social protest. I explore whether the lack of resources such as the low level of education and marginalization has come to restrict the ways of doing politics so that certain strategies can be understood to be arising from the necessities of the everyday environment of actors. I suggest that unequally distributed resources manifest itself in protest action by providing possibilities or by setting limitations and restrictions for less resourced groups. I argue that the resource- and position-based cognitive and emotional dispositions are likely to appear as a sense of limitation, feelings of discomfort, inferiority and apathy, for example, guiding actors to choose those (political) strategies over others that tend to reduce cognitive and emotional dissonance. These processes have a tendency to limit the scope of possible forms of political action leading to strategies that are characterized by the distance of middle-class ways of doing politics and the likelihood of attracting negative attention.

RN32S11 - With or without EU: Democratic Institutions and Civic Agency in Turkey and Western Balkans

Party Regulation in Turkey: A Comparison with Modern Europe
Pelin AYAN MUSIL (Anglo-American Univesity, Czech Republic) | pelin.ayan@aauni.edu

Ingrid van Biezen's research on “Party Law in Modern Europe” has vastly contributed to the literature on state-party relations. Yet, Turkish party regulations were originally not included in...
Biezen’s database of party laws even though Turkey can be considered as one of the discontinuous democracies in the region. This study codes the Turkish party law using the same methods as van Biezen and shows that the level of regulation over party organisation and activity is close to Eastern European countries as well as to Germany and Italy: Just like the communist parties in Eastern Europe as well as the neo-fascist parties in Germany and Italy, pro-Islamic and Kurdish parties in Turkey have been perceived as threats to the constitutional order. On the other hand, the inclusion of Turkey to the universe of cases has an additional asset: It shows that the level of state control over parties is not limited with the content of laws, but also with their interpretation at the judicial level. Despite the similar content in their laws, the degree of state control over party organisations is much higher in Turkey than in Eastern Europe, Germany and Italy, as the higher frequency of party closures shows.

The role of the political parties in emphasizing the differences between the Christian and the Islamic community as a factor of disintegration of societies of the western Balkans

Duska MATEVSKA (SEEUniversity, Tetovo, Macedonia, Former Yugoslav Republic of) | d.matevska@seeu.edu.mk
Zoran MATEVSKI (SEEUniversity, Tetovo, Macedonia, Former Yugoslav Republic of) | matev@mt.net.mk

After the fall of communism and the rise of pluralism in the field of politics, religiously oriented parties arise in the Western Balkans which can be divided in two major groups: parties with a name which demonstrates a connection to a certain religion and parties the name of which cannot be directly connected to a certain religion, but through their programs or activities in the field, they demonstrate that the realization of the religious objectives is a highly important part of their ideology and practice.

In this paper, the emphasis shall be placed on studying the programs and the activities of the political parties in the Western Balkans, especially due to the fact that the political parties which dominate within this geographic region accept the members of a certain ethnic, i.e. religious group, and consequently, their practice and ideology are directed towards the realization of the interests of such groups. In this context, this paper will attempt to provide answers to several key questions.

- To what extent does this exclusiveness of the political parties influence the emphasizing of the religious and cultural differences and the deepening of the gap among the various ethnic and religious groups living in the same society?
- Do such actions increase ethnic tensions and encourage religious fundamentalism? (especially due to the fact that in the Western Balkan societies the link between religion and nation is especially strong)

Democracy in Turkey Without the EU Anchor: 2014 Local Elections in Turkey

Cenk AYGUL (Attilim University, Turkey) | cenkaygul@hotmail.com

This paper will examine the effects of the stagnation in the Turkish-EU relations with reference to the 30 March 2014 local elections in Turkey. Turkey’s EU candidacy which was initiated by the Helsinki Summit in 1999 seemed to bear fruit when the accession negotiations started in 2005. Nevertheless, as soon as the negotiations started, the stalemate in the EU-Turkish relations became visible. The paper will first discuss the piece of literature that examines the rising authoritarian tendencies in Turkey, as seen in the amendments made at various institutions such as High Council of Judges and Public Prosecutors and Higher Education Board. The ruling Justice and Development Party in Turkey seems to be committed to installing
a presidential system in Turkey, and to continue to ignore significant opposition voices arising from the society as seen in the Gezi Park events in May-June 2013. Then the paper will examine the 2014 local elections in Turkey and the law no 6360, which was legislated by the ruling party fifteen months before the elections. The law created fourteen new metropolitan municipalities and greatly expanded fourteen of the already existing ones in Turkey. By way of analyzing how the new law altered the elections results, it will be argued that the target of the law was to lower the weight of the urban electorate, which traditionally tend not to vote for the ruling party.

Citizenship, State, Trust and Confidence in Turkey: E-Government and the Changing Patterns of Citizen-State Relations
Ali Erdem AKGÜL (Adnan Menderes University, Aydin, Turkey) | alierdemakgul@gmail.com
Kayhan DELIBAS (Adnan Menderes University, Aydin, Turkey) | kayhandl@hotmail.com

The transforming power of new technology, especially in regard with the Information Technology, all become visible in recent years. These changes were inescapable followed by the states and they had to redefine their positions against their citizens. In Turkey too, the advancement of e-government has come to replace the traditional governmental practices. However the wider impact of these changes has not been thoroughly studied with a sociological perspective. It is fair to argue that the bulk of the existing, current literature on the development of e-government has explored it from a supply-side perspective leaving the citizens’ perceptions unexplored. Consequently, this study designed to examine relatively unexplored citizens' perceptions, daily interaction, trust issues and changing nature of state-citizen relationship with the e-government applications in Turkey. One of the key question that this paper is seek to answer is that how e-government practices effecting the citizens perceptions of the state authority, trust and confidence? The paper will draw on quantitative questionnaire (N 650) and in depth interviews (N 50) carried out with civil service workers in Aydin, (South West Turkey).

RN32S12 - The Populist Radical Right in Europe: Theoretical Concepts

Banal Legitimacy: Bridging Nationalism Studies and Organisational Institutionalism
Anders Ravn SØRENSEN (Copenhagen Business School, Denmark) | ars.mpp@cbs.dk
Benedikte BRINCKER (Copenhagen Business School, Denmark) | beb.dbp@cbs.dk

With the publication of Michael Billig’s Banal Nationalism in 1995 scholars of nationalism turned attention to the ways in which everyday symbols and practices reinforce nations. However, symbols and practices, which are at the heart of Billig’s study, not only delineate national communities. Symbols and practices also serve to legitimate actors and organizations. Despite the common interest in how social organization and cultural practices become normalized and taken-for-granted, ideas from nationalism studies and organizational institutionalism are very seldom combined. In this paper we propose a theoretical bridge between organizational institutionalism and the concept of banal nationalism in order to conceptualize the mutually configuring relationship between everyday banal nationalism and organizations’ claims to legitimacy. In so doing, we advance an approach that conceptualizes the nation as an
institutional logic. To illustrate this relationship between identity construction and legitimacy seeking we use the British Royal Warrant system as a short exemplary case study.

**POPRRCEE: Populism/s East and West: A Theoretical Examination of the Rise of Populism in Europe**

Emilia ZANKINA (American University in Bulgaria, Bulgaria) | ezankina@aubg.edu
Boris GUROV (Bulgarian Academy of Sciences, Bulgaria) | BorisGurov@gmail.com

This paper offers a new theoretical approach to populism that allows for more suitable comparisons between populism/s in the West and in CEE and between radical-right and other types of populist parties. It argues that populism is a political strategy to reduce the transaction costs of politics by increasing the use of informal political institutions, which have an association with “direct” and “immediate” action, and decreasing the use of formal political institutions, which have connotations of slow or non-action. This “transaction-cost framework” has several advantages: 1) it takes into account informal institutions (including the media and social media mobilization, quasi-political entities and actors with stakes in political outcomes, etc.), 2) it allows for better understanding of voter behavior and voter support for populist parties (unlike studies that focus primarily on populist leaders and parties), and 3) provides a dynamics-based component which helps understand the rise and evolution of populist parties and changes in their voter support, further linking them to changes in the political and economic context. Moreover, highlighting the strategic aspect of populist political behavior, this approach allows for examining the effects of populism on institutions (the transaction cost framework constituting the core of institutional economics), business and the functioning of democracy. This paper is designed to be a theoretical foundation on which an empirical project will be built.

**The Alternative for Germany: ‘Soft’ Eurosceptic Professorenpartei or radical right**

Robert GRIMM (Manchester Metropolitan University, United Kingdom) | r.grimm@mmu.ac.uk

The Alternative für Deutschland (Alternative for Germany, AfD) is Germany’s first Eurosceptic party to attract substantial electoral support in local, national and European elections. During the local election campaigns in 2014 in the Eastern German states Brandenburg, Thuringia but particularly in Saxony, the AfD extended its electoral offer to broader communitarian, nativist themes reminiscent of xenophobic PRRP ideology. AfD Saxony drew on popular fears about uncontrolled migration, European ‘welfare tourism’, bogus and criminal asylum seekers and trans-border crime, dual citizenship and demanded public referenda to decide on the building of mosques and minarets. Perhaps most indicative of the AfD’s increasing right turn is its positive evaluation of the Patriotic Europeans Against the Islamisation of the West movement (PEGIDA). PEGIDA is a radical right xenophobic social movement that gathered popular support particularly in the East German city Dresden in late 2014 / early 2015. The article firstly presents a brief summary of the AfD’s European politics. It then traces the party’s ideological roots back to ordoliberal critiques of the Maastricht Treaty and argues that there has been a deep scepticism towards European integration among Germany’s conservative elites well before the introduction of the Euro. The sudden surge in German Euroscepticism has to be understood within the context of broader cultural changes and a lack of political choice. An unprecedented moral panic about European bailouts and the ECB’s monetary policy created a sense of emergency that paved the way for the AfD’s success. Finally the article argues that the AfD has increasingly moving away from its core critique of the Euro and is becoming a populist radical right party.

**Populist Radical Right Parties in Europe: Similarities and Differences**
Dietmar LOCH (University of Lille, France) | dietmar.loch@univ-lille1.fr

This proposition wants to contribute to the comparative dimension of the panel topic. How can we analyse, first, the relations between the social and cultural change in European societies (impact of modernisation, cultural differentiation, immigration, recent economic crisis, etc.) and the success of populist radical right parties since the 1980s, in order to find their similarities? We use cleavage theory to link the electoral success to these structural changes of European societies, which are embedded in the process of globalization. Cleavage-related protectionist positions of the populist radical right parties towards globalization allow examining their economic ("modernization losers") and cultural (ethnic competition, cultural differences) similarities. Furthermore, they can show that - even when during the economic and financial crisis the radical right has criticized global capitalism - its dominant characteristics continue to be linked particularly to the cultural (national identity) and also to the political sphere (national sovereignty, populist democracy). Second, these similarities, which we can observe all over Europe, are accompanied by regional and national differences existing in the electoral success of these parties and its explanations. Beyond the different degrees of globalization, these differences can be explained by the persistence of national political cultures and by political opportunity structures. The comparison of selected cases (France, Austria, Germany, Hungary, et al.) will demonstrate these similarities and differences. The aim of this contribution is to bring empirical evidence in this comparative framing.

Analyzing Populism with Figurational Sociology
Erik JENTGES (University of Zurich, Switzerland) | jentges@gmail.com

Populism is not a new phenomenon. Populist dynamics, and issues related to it like charismatic leadership in political and social movements, have already been approached by Norbert Elias in the 1960s. His political sociology is outlined and then brought into correspondence with today's highly mediatized populist movements on the left and the right. The argument is that these fringe movements gain influence at the expense of established parties, creating uncertainty within the public and a sense of crisis, thereby opening up windows of opportunity for charismatic leadership. Populist dynamics can be plausibly approached as processes of social advancement of outsiders and hence as variants of an established outsider figuration (Elias & Scotson 1965). The paper re-addresses Elias's theoretical model to integrate media dynamics that influence populist movements in several aspects.

RN32S13 - The Populist Radical Right in Western Europe: Case Studies I

Populist parties between protest, institutions and interest groups. The case of the Ticino League
Carlo RUZZA (University of Trento, Italy) | carlo.ruzza@unitn.it
Oscar MAZZOLENI (University of Lausanne, Switzerland) | oscar.mazzoleni@unil.ch

In recent years, there has been an expansion of forms of political participation in several Western democracies. For instance, voting behaviour has been supplemented by an expansion and diffusion of forms of political protest, the widening and institutionalization of political deliberation in an expanding set of fora ranging from local and regional levels to supranational contexts. Political formations have been often supported by likeminded civil society groups and
have established durable alliances with a wide range of interest groups. This de-centering of politics has seldom been documented for the family of populist and nationalist formations. Although some initial research has showed their entrenchment in a complex system of political exchanges with citizens and business interest groups, only limited empirical evidence of this system has been provided until now.

The aim of this presentation is to show the role of political exchanges and illustrate how they occur across different fields, notably between a protest stance, institutional integration within political and state institutions, and entrenchment in interest groups. This perspective allows us to explain patterns of duration of populist parties in relation to the role of ‘charismatic’ leadership and transitions after the disappearance of such leadership.

The Paradox of Conservative Protest: Understanding Germany’s New Right-Wing-Populist Movements
Jasmin SIRI (LMU Munich, Germany) | j.siri@lmu.de

Referring to recent case studies on the new German Party "Alternative für Deutschland" (AfD) (Berbuir et al. 2015) and anti-islam movement "Pegida" (Siri 2015) I would like to discuss the paradoxical situation of conservative protest in a modern European society.

Since its foundation in February 2013, the character and the electoral success of the AfD are controversially discussed in German public. The even newer anti-islam movement "Pegida" which was founded in winter 2014, unites conservatives, right-wing populists and right-wing extremists under the flag of "protecting the occident". What do these movements and organizations have in common? How do they relate to populist movements in other European societies? And how do they influence public discourse in a civil society that is based on openness and tolerance?

At first, I would like to present the results of the empirical studies, focusing on the creative moments in the movement's communication strategies. 'New' conservatives like AfD or "Pegida" are inspired by evangelical christians as well as leftist movements and ideas of guerilla organizing. They use creative forms of political communications that transcend the habits of old conservatism. For example, they hate the established press ("Lügenpresse") but work hard on a creative media strategy. Or they call for a strong nation, but yet organize supranationally, etc.

In a second part of the presentation I would like to discuss these paradox findings leaning to a sociological perspective of party ideology (Mannheim 1973). Whereas some interpret the newcomers as some kind of 'missing link' between the extreme right and established conservatism, some aspects strengthen the consideration, that they may even more transcend old narratives of the political like the seperation of "right" and "left". The new movements/organizations can then be described as symptom of a crisis of what Mannheim called "old conservatism".

Winners versus Losers of Globalization. Evidence of a new cleavage in Belgian politics?
Ronan VAN ROSSEM (Universiteit Gent, Belgium) | ronan.vanrossem@ugent.be
Henk ROOSE (Universiteit Gent, Belgium) | henk.roose@ugent.be

Many authors link globalization to the decline of traditional cleavages in Western societies and to the emergence of a new cleavage that opposes winners and losers of the globalization process which lead to the success of extreme right and populist parties. Globalization has opened national borders, facilitated de-localisation of economic activities, fostered migration and extended the political influence of the EU on its member states. This paper examines and challenges the existence of such a cleavage among the Belgian population.
Using the Belgian sample of the European Social Survey (round 6, 2012), we identify two axes of political conflict in Belgium and relate these axes to people’s position with regard to the globalization process, i.e. whether one is a winner or a loser and in what way. The first axis mainly captures trust in and satisfaction with the functioning of political institutions in combination with one’s attitudes towards migration, while the second dimension represents attitudes towards government’s redistributive role and towards democracy. The relationships of these ideological axes with various indicators of statuses related to the globalization process prove overall relatively weak and inconsistent. Moreover, we do not find a strong relationship between these attitudinal axes and party preference.

The results do not support the notion of a new globalization-related cleavage. Globalization generates various issues but both winners and losers are very heterogeneous groups, which are internally divided and have different, sometimes conflicting interests, making it unlikely for them to organize around a single conflict dimension.

RN32S14 - The Populist Radical Right in Western Europe: Case Studies II

Populist performing of intersectional differences: A comparative study on the representations of ‘us’ and ‘other’ in Finland and Sweden

Tuuli LÄHDESMAKI (University of Jyväskylä, Finland) | tuuli.lahdesmaki@jyu.fi
Ov Cristian NOROCEL (University of Helsinki, Finland) | cristian.norocel@helsinki.fi
Tuija SARESMA (University of Jyväskylä, Finland) | tuija.saresma@jyu.fi

Finland and Sweden share the ideal of a Nordic welfare state whereby gender equality is a central tenet of the system. In both countries, a new kind of parties promoting populist or even radical right views has gained prominence in the last elections. While there are similarities in the agendas of the Finns Party and the Sweden Democrats, the parties differ with regard to their political histories and agendas, and modes of expressing discriminatory or even racist views. While ethnicity and racialization are broadly discussed in the research on populism, gender and sexuality often remain under-researched, although in populist reasoning, views on nation, ethnicity and migration, social class, culture and language, gender and sexuality are interdependent in complex ways. In this comparative study, we examine how the distinction between ‘us’ and ‘others’ is articulated in terms of gender, class, ethnicity and race in the party newspapers: Perussuomalainen (Finland) and SD-Kuriren (Sweden).

More specifically, we analyse how the meanings of various identity categories are performed intersectionally, whereby intersectionality refers to the interrelations of hierarchically organized and constantly negotiated social categories and subject positions that are performed in order to construct the ‘us’ and ‘others’ distinctions. The aim is to compare the representations of gender and other intersecting categories of power in the discourse of the Finnish and Swedish populist parties, and to find out how the cases differ, considering the two slightly dissimilar societal and cultural discussion climates.

Nordic Populism - changes over time and space. A comparative and retrospective analysis of populist parties in the Nordic countries from 1965-2015

Bjorn FRYKLUND (Malmo University, Sweden) | bjorn.fryklund@mah.se

The objective of this paper is to improve the understanding of the development of populism within the Nordic countries as part of the European context. The point of departure is a Nordic
comparative perspective combined with a retrospective analysis of the Nordic populist parties of yesterday and today. The history of Nordic populism can be described as a process, where different types of populism have been present at different periods of time. In the early 1970s the focus was on taxation issues in combination with populist appeals of political discontent. From the beginning of the 1980s up to today, populist appeals have evolved around aspects connected to concerns about immigration. Popular dissatisfaction can also vary in content over time and space, regardless of whether it is based on “too high taxes and increasing bureaucracy and the public sector” (=the tax issue) or “too high refugee- and asylum immigration” (=refugee- and immigration issues), although a common denominator is that popular discontent is channelled via a single dominating (hegemonic) political issue (=organising principle) that whips up criticism in other political and social areas. The aim of the paper is therefore to interpret the development of populism in the Nordic countries. Here the development in Sweden is of interest, especially as a successful populist party only appeared on the Swedish political scene at the beginning of the 21st century. Understanding the development in Sweden could therefore be a key to identifying central aspects that either promote or block populism. This could, in turn, be essential for a more general understanding of populism as a political phenomenon in the political discourse of today.

Neoconservatism and the Populist Radical Right in the Netherlands
Merijn OUDENAMPSEN (Tilburg University, Netherlands, The) | merijn oudenampsen@gmail.com

The last decade saw the rapid emergence of the Populist Radical Right in the Netherlands, leading to a significant break in Dutch political culture. The nature of this break remains contested. Some argue it should be seen as a conservative restoration, an attempt to turn back time; others stress the progressive nature of the revolt, depicted as an attempt to bolster Dutch progressive values with respect to conservative Muslim immigrants.

In this case study, an alternative interpretation is offered: analyzing the texts of prominent figures such as Pim Fortuyn and Geert Wilders, I argue that the Populist Radical Right has developed a new, mutated form of conservatism in the Netherlands. It has done so firstly by borrowing and adapting ideas from American neoconservatism and secondly by absorbing in its programme some of the most important progressive attainments emanating from the Dutch sixties and seventies.

This 'progressive conservatism' can be reduced to two elements: 1) a paradoxical incorporation of a select set of progressive values – mainly women’s rights, gay rights, secularism and individualism – which are subsequently culturalised and historicised as Dutch values that need to be protected from the immigrant threat; 2) a concerted conservative attack on the progressive consensus on a range of other terrains, such as environmental policy, internationalism, cultural policy, the economy, labour relations and the work ethic, development aid, terrorism, crime, immigration and social policy.

RN32S15 - The Populist Radical Right in Central and Eastern Europe: Case Studies III

Tomasz RAWSKI (University of Warsaw, Poland) | t.rawski@is.uw.edu.pl

The paper concerns the political dynamics of Bosniak nationalism in Serbian part of Sandžak, the historical region in the border between Serbia and Montenegro inhabited mostly by people
of Muslim faith, who today consider themselves members of one of the constitutive nations of Bosnia and Herzegovina, namely – the Bosniaks.

From an empirical point of view, the paper identifies and exposes the dynamics of power (2000-2013) between two main factions of Bosniak-minority political and religious elites: Sarajevo-oriented ‘defenders’ of the Bosniak nation (organized mostly around Party of Democratic Action of Sandžak and the Islamic Community in Serbia) and Belgrade-oriented Bosniak ‘cooperationists’ (organized around Democratic Party of Sandžak and the Islamic Community of Serbia). Following the evolution of this fundamental tension, the paper points at the distinct rise of Sarajevo-oriented Bosniak-minority nationalism actively backed by intellectual circles from Bosnia and Herzegovina after 2008.

From a theoretical point of view, the paper is an attempt to overcome methodological nationalism – a widely-shared research approach reducing the analytical focus to processes occurring within nation-state boundaries – by focusing on Bosniak-minority nationalism that evolves in an inseparable relation to two local centres of state-power: Belgrade and Sarajevo. Thus, the paper contributes to a better understanding of how the supra-state political interrelationships can influence and shape contemporary nationalisms.

„I am one of you“ – self-presentation of Tomio Okamura and Dawn of Direct Democracy, nationalist populist party in the Czech Republic
Kateřina KŇAPOVÁ (Faculty of Philosophy and Art, Charles University in Prague, Czech Republic) | knapova.katerina@gmail.com

Dawn of Direct Democracy of Tomio Okamura was established as one of the various reactions on austerity policies of the Czech right-wing government at the beginning of 2013. Its main figure is businessman in tourism of Czech-Japanese-Korean origin Tomio Okamura. Party itself is of quite unusual structure having only 8 members but lot of supporters and being present in the Czech parliament right now after 2013 early election. Author of this contribution would like to examine how Tomio Okamura presents himself in media, on social media and also through his ideas about ideal governance caught in his books. Main focus will be on construction of basic political identities (people versus elite) in his communication and also on his construction of the politics and democracy. Analysis of these constructions will be using Laclau’s notion of populism and political identities.

Populist Perceptions of Representation: Case Study of Lithuania
Jogile ULINSKAITE (Vilnius University, Lithuania) | jogile.ulinskaite@tspmi.vu.lt

Although Lithuanian society is characterized by low levels of trust, civic and political engagement, the mobilization of public intellectuals and advocacy organizations is becoming more apparent since 2011. The anti-establishment activists claim to address malfunctioning of representative democracy: they demand for wider inclusion into decision-making process and develop alternatives to political parties. On one hand, the movement developed into the citizens initiated referendum in Lithuania (only the second successful citizens’ initiated referendum since independence) with a goal to make referendum into a more accessible citizens’ participation tool. On the other hand, the activists create alternatives to political parties such as populist movements and non-party political organizations to mobilize the electorate. The populist activists do not reject political representation as such; however, they claim for changes in political representation and in the model of representative democracy. In order to be able to assess the significance of populism for representative democracy the perceptions of representation should be studied first. The case study on the populist activism for changes in the model of representative democracy in Lithuania has been conducted. The analysis consists of media content analysis, participant observation and in-depth interviews with the activists. The
qualitative research is aimed to answer the following questions: how political representation is understood by the activists and what these perceptions imply to representative democracy.

Symbolic Roots of Populism. Exploring the Romanian Case (POPRRCEE)
Andrei ŢĂRANU (National School of Political Sciences and Public Administration, Romania) | ataranu@gmail.com
Valentin Quintus NICOLESCU ("Nicolae Titulescu" University, Romania) | valentin_nico@outlook.com

The vast majority of the literature on populism describes this political phenomenon as one which is very difficult to explain and to analyze due to its discursive versatility and behavioral chameleonism. Populism covers more political and social realities than one single term would normally concentrate from a semantic point of view. This is why many analysts of this phenomenon, such as Guy Hermet (2007) or Gianfranco Pasquino (2008) propose the use of the plural populisms instead of the singular populism, which would permit the formulation of a clearer definition of this ubiquitous phenomenon. On the other hand, in view of the new dynamics of populism in the period preceding the debut of the 2008 economic crisis, some authors (Mudde, 2004:541; Touraine, 2007:38) have defined the phenomenon as a system of “post industrial” parties and thus, “post-classial”. Others (Taguieff, 2002; Knight, 1998; Viguera, 1993), trying to give an interpretative unity to a process which is hard to classify, have defined populism as a certain style of making politics varying in discourse from one society to another, but similar through its intimate structures of behavior and ideas.

Our paper focuses on the Romanian case, particularly aiming at identifying the specific populist discursive patterns emerging in the social media. The first step of our research consists in framing the dimensions and actors of the populist discourse, and secondly, to identify the specific forms they take in the virtual environment.

RN32S16 - United in Anti-Europeanism: ‘Old’ and ‘New’ Europeans between Nationalism and Populism

Sexual Nationalism: „I Love Lithuania” (POPRRCEE)
Nida VASILIAUSKAITĖ (Vilnius Gediminas Technical University, Lithuania) | nida.vasiliauskaite@vgtu.lt

In 2011, a major Lithuanian commercial television channel LNK TV produced and broadcasted a notorious reality show, named "I Love Lithuania". Unlike similar local entertainment projects, this one was based on a particular political vision and had a strong political message behind. Moreover, it aimed at social engineering, providing some models of "being exemplary Lithuanian", "good and normal citizen", with the intent to change people's minds inspiring them to feel national unity and pride, and to "revolt" against the obscure Enemy. The article deals with the political message of the show, reconstructing it from different subtexts and surrounding circumstances, and puts it as a kind of aggressive militant ethnocentric nationalism, potentially directed against the "West", i.e. against Lithuania's membership ("subjection to") in the ES, going back to pop-romanticism of the 19th century. The show, however, has one more, "unofficial", but nonetheless developed topic – namely, "love" in a plain sense of (heterosexual) "romance", articulated in sexist, hetero-normative terms. The article analyses this kind of "love" as well, asking what are its functions in the show, what does it mean on political level, and claiming that nationalist "love", as the only way to relate
oneself politically to the state in this "order of things", reveals the same sexist presuppositions: the two regimes are interdependent, they confirm and maintain each other.

**POPRRCEE - Multi-faceted populism in attack (the case-study of ATAKA)**
Yannis SYGKELOS (DEI College, Greece) | yannissygkelos@hotmail.com

During the last decade, Europe witnessed a resurgence of far-right populist political parties and groupings, media and blogs. This paper explores the core populist discourses and discursive strategies of the Bulgarian ultra-right political party of ATAKA related to nationalism, euro-scepticism, anti-elitism and religion. It relies on the official website of the party, its official newspaper, and the discourse of politicians and journalists affiliated to ATAKA. My survey focuses on the aftermath of Bulgaria’s accession to the EU (2007-2008), a period distinct of euphoria and seemingly unpropitious to the success of far-right discourses. In the elections of 2007 and 2009, ATAKA gained from 9.4% to 14% of the vote. Its core slogan “to take our Bulgaria back for the Bulgarians” suggests that for some reasons Bulgarians were devoid of their homeland. It rather implies a call for a national liberation movement against those who plundered and ruined Bulgaria; against those who had committed genocide against the Bulgarian people; against separatists and those who impose aggressive forms of Islam by coercion and deception; against impoverishment, misery, and corruption. ATAKA combats the so-called Bulgarophobic treacherous ruling establishment. Not only does ATAKA conceive of itself as the guardian of the Orthodox religion but also as the spearhead in the battle against the Islamisation and Turkification of the country and Europe. ATAKA fiercely criticised the EU as a globalised, elitist, highly bureaucratised institution that has deprived Bulgaria of its national sovereignty.

**From Cleavages to Fields: Towards a Broader Understanding of Political Conflicts in Central-Eastern Europe**
Ondrej CISAR (Charles University in Prague, Institute of Sociology - Czech Academy of Sciences) | ondrej.cisar@soc.cas.cz
Katerina VRABLIKOVA (University of Mannheim, Institute of Sociology - Czech Academy of Sciences) | kvrablik@mail.uni-mannheim.de

Studies of political conflict have traditionally been focused on party competition supposedly expressing clashing interests of conflicting groups. This paper intends to broaden the concept of political conflict by incorporating also a non-electoral (protest) field. Although often overlooked, in addition to differences in the pattern of party competition, there is a large cross-national variation in issues expressed through extra-institutional contention. For instance, while 52 percent of protest events in Poland in the last 20 years were related to economic issues, the Czech Republic displays only 5 percent of such protest together with a generally much more diversified portfolio of issues. Our working hypothesis is that the structure of party competition determines what issues are articulated in the protest field. If the party field’s main conflict line is economic left-right, extra-institutional collective action driven by economic issues is crowded out. If social-cultural dimension (social conservatism vs. liberalism) mostly defines the party field, economic issues are more represented in the protest field. For our analysis we use four similar countries that differ in the structure of their party field: the Czech Republic and Slovakia (dominated by economic left-right) vs. Hungary and Poland (dominated by social-cultural cleavage). To examine the issue composition of protest we use data on all protest events in the four countries between 1990 and 2010 reported by the national news agencies.

**The Most Populist 90's Remix**
Valida REPOVAC NIKSIC (Faculty of Political Sciences, University of Sarajevo, Bosnia and Herzegovina) | valida.repovac@gmail.com

After a decade long unprecedented trial, in December 2014, the Hague Tribunal temporary released Vojislav Seselj, head of the Serbian Radical Party for a sake of his terminal illness. Being the most notorious and allegedly the most radical right-wing leader and ideologist in the entire present-day Europe, he came back to Belgrade and immediately engaged in politics. His release and subsequent statements caught media attention and sparked various political and diplomatic reactions in the Western Balkans countries.

Freshly elected Croatian right-wing candidate Kolinda Grabar Kitarovic considers the whole case almost an international scandal and certainly a diplomatic priority for she, in her first official address as the new president in January, 2015, demanded United Nations to intervene in taking Seselj back to prison, where he truly belongs.

Suddenly, the same radical right-wing discourse that flamed and marked the beginning of the 1990s was back in the mainstream media.

In my paper (case study) I will report and analyze this trend as well as how and to what extent the renewed radical populist aspirations affected everyday life of the society in Bosnia and Herzegovina.

Rising of Extremist Parties in Europe as Function of Drag Effect of the Social Habitus of a Great Number of Europeans

Behrouz ALIKHANI (Westfälische Wilhelms Universität Münster, Germany) | behrouz.alikhani@uni-muenster.de

Europe experienced especially from 2014 an obvious swing to the extreme right and left wings parties. Such parties are commissioned by their electorates to reduce the power of European Union or even to eliminate this institution. How could such political behaviour be explained?

The European Union has been suffering from public illegitimacy from the beginning. The creation of this institution is the best example of ‘non-simultaneity of developments’ (Ernst Bloch) at different functional, institutional and habitual levels. Although different individuals and groups of people in different European societies may vary in the manner and the degree of their identification with this new ‘unit of survival’ (Norbert Elias), it seems that the national and regional survival units still continue to enjoy the deepest emotional anchor in the majority of Europeans. The crisis of this institution, mainly perceived as a creation of elites within a relatively short period of time, is not only an economical but also an identity crisis. Out of this non-simultaneity of developments can be explained, among other things, why this institution is perceived by many Europeans as something alien, outside the scope of their identification.

In this presentation, based on the example of European Union, I would like to demonstrate the connections between developments on these three dimensions of democratisation and de-democratisation, which could take place at the same time with different paces.
In the proposed paper we explore the emergence of the second shift in post-war Czechoslovakia (1945—1948). In this period, the Czechoslovak society had to deal with a lack of workforce caused specially by the Second World War and the expulsion of German inhabitants. This new situation led to the mobilisation of workforce which didn't include women but they were encouraged to take up paid jobs. Suddenly, the women found themselves in the double position of being a mother and wife (responsible for the care and domestic work at home) and being a worker. The women’s organization came with a quite progressive solution—to delegate the domestic work to another woman. To institutionalize the supply of domestic work and to ensure its qualification and professionalism, the women's organization called for the collectivization of domestic service and promoted the formation of “Liberated Household”. Drawing upon the analysis of the journals published by the women’s organization between 1945—1948, we look into how the institution of Liberated Household was represented and what discourse was created around the delegation of domestic work. We put this discourse in the particular social, historical and political context and reveal quite progressive rhetoric around the domestic work and its recognition.

Young Children’s Gender Socialization in Modern Urban China
Xuan FAN (China Women's University, China, People's Republic of) | Fan_xuan1985@163.com

The Family Planning policy practiced in modern China from 1980s, known as one-child policy as well, has profoundly changed the structure of the population and the relationship in family, on which scholars did countable researches. However, there is less research on other aspects influenced by the policy and gender socialization, which is a necessity for individuals to establish their gender identity and acquire the gender norm, is one of them. Thus, it can be a significant and interest question for scholars in gender study that how young children’s gender socialization in urban China operates under both influences of traditional gender culture and the family planning policy. The purpose of this study is to describe the progress and dynamics of children’s gender socialization in China in a comparative perspective. By interviewing children’s parents and other relatives and participant observation in parks and kindergartens where interactions of children happen, the author has these following findings: (1) Different social attitude to the genitals of boys and girls is a critical element for children to understand their gender, which resonates the Freudian Penis Envy theory. (2) Children are encouraged to involve into a gendered semi-kinship with other children when they interact, which contributes to the acquirement of the gender roles. (3) The routine in kindergarten is gendered-intended to discipline children’s bodies and the teachers in kindergarten play a decisive role for children's gender socialization in many ways.
Changes to gender regimes in state-socialist and post-socialist Czech society: Explanation of gendered re-familialist trend
Hana HAŠKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | hana.haskova@soc.cas.cz
Hana MAŘÍKOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | hana.marikova@soc.cas.cz
Marta VOHLÍDALOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | marta.vohlidalova@soc.cas.cz

Studies on post-1989 welfare states in Central and Eastern Europe have emphasized the gendered re-familialist trend or the “remasculinisation” of post-socialist societies. Recent studies have shown that there are considerable differences in gender regimes across Central and Eastern Europe though, and that some of these differences existed already under the communist rule. Moreover, there are studies suggesting that there were indeed distinct periods of real socialism in the region not only in terms of political and economic situations but also in terms of gender relations. This paper takes the Czech Republic as a case study to show the interplay between ideologies, policies, important political actors, and gender inequalities in work-care practices. Inspired by the feminist institutionalist approach, the authors aim to explain mechanisms that significantly contributed to ingraining gendered re-familialist trend in the country long before the collapse of real socialism there, and that have strengthened or weakened the trend recently. Doing that, they contribute to the knowledge of changes to gender regimes in the region from gender blind continuous dual earner model, through gendered full-time dual earner model with women’s interrupted work career, to privatization of care and gendered and socially stratified pluralization of the life course.

RN33S01 - Gender Relations in Public and Private Spheres

The Challenges that Women Face at Local Level Politics in Turkey
Ahu SUMBAS YAVASOĞLU (Hacettepe University, Turkey) | ahusumbas@yahoo.com

Women face inequalities in all level of political relations starting from local through national and international level. Nevertheless, it is assumed that women can be stand more and easily at local level politics rather than national level due to its local, small-sized, face-to-face, less-politicized characters. As the primary school of democracy, it is also expected that women participate into politics more at local level. Actually, the number of women politicians at local level is always higher than the national level in all developed-democratic countries. However, Turkey’s case is different than these cases. The number of women, as candidates or elected-politicians, has been relatively less, around 0,1 %, than the national level since the women had gained the right of suffrage at 1930 in Turkey. It is agreed that there are various variables behind this fact such as symbolical role of women at national level and the influences of New Turkey’s Republican Elite on the involvement of women into political life. However, this research argues that women may experience different social and political challenges at local level politics in compare to national politics due to its unique local character. For this reason, this research aimed to investigate the reasons why women are less willing to participate into local politics and what are the challenges they face in the local political process in Turkey. Thus, in the case of 2009 local elections in Turkey, this study aims to find out to what extent female mayors face challenges during their candidacy, in election process and after they are elected as a woman in local government. In that regard, this research tries to examine the challenges and obstacles of
local politics that female mayors faced who were elected in 2009 local elections in Turkey by in-depth interviews.

Technologies of the self: understanding veiling as both a personal and a social process of self-realization
Asli CIRAKMAN DEVECI (Middle East Technical University, Turkey) | casli@metu.edu.tr

This study is based on a research conducted among veiled women who are employed as sales representatives in retail sector in five big cities in Turkey. The main concern of this paper is to see how veiling or wearing the headscarf becomes an issue in terms of reconstruction of a self-image. I aim to understand the practice of veiling in Turkey throughout the 2000s by engaging with Michel Foucault’s concept of “technologies of the self”. Foucault defines technologies of the self as a form of truth regime or rather telling the truth about ourselves. The question is what do veiled women think they are doing when they are veiling? In other words how do women reflect on or interpret their own veiling. The literature on veiling treats the act of veiling either as an act of submission of women to tradition and patriarchal relations or as an act of resistance against secularism, and western way of life. However, this research revealed that the veiled women do neither protest anything nor feel misguided or manipulated. My point is that the process of veiling can be understood as a technology of the self in the Foucauldian sense. Women revise and update their position in terms of respectability, freedom, autonomy, modernity and vis-à-vis existing relations of domination, gendered disciplines and discourses.

Women in Uprooted Community - Gendered Perspective of Transgenerational Cultural Transfer
Aleksandra HERMAN (University of Warsaw) | olaherman@tlen.pl

In my presentation I schedule to present main hypothesis and research goals, as well as first results of research in progress realized as part of the research grant of Polish National Science Center „Women in uprooted community. Agentic perspective in adversarially conditioned structure” [2013/11/D/HS6/04643]. The main scope of the project is the revealing of women’s agency in conditions of uprooted communities, with reference to the case study of the Ukrainian community forcibly displaced by Polish communist authorities in 1947 during the operation “Vistula” from south-eastern Poland to so-called Recovered Territories, which became part of Poland subsequent to the 1945 Potsdam Conference. In my presentation I will focus on transgenerational transfer of Ukrainian culture and identity among women, which is in my opinion the main factor of maintenance of this ethnic and religious minority in Poland. Gendered perspective in my research was chosen in response to deficiency of such prospect in minority research in Poland, what leads us to believe that they captured “asexual”, and in practice – merely the masculine perspective.

Institutionalization of public gender relations in Central and Eastern Europe
Paulina SEKULA (Jagiellonian University, Poland) | paulina.sekula@uj.edu.pl

Enhancing gender equality in public life has become nowadays one of the central goals for many actors including international organizations, national governments and civil societies. It is motivated by the argument that „women’s equal participation in decision-making is not only a demand for simple justice or democracy but can also be seen as a necessary condition for women’s interest to be taken into account” (Beijing Platform for Action 1995).
While institutionalization of public gender relations in Central and Eastern Europe (CEE) proceeded during the communist era, it became a neglected issue when the societies of the region entered the democratic transformation. The pressure from both civil society (including women’s movements) and international organizations (including the UN and the EU) re- evoked public discussion on gender relations, however patterns and scope of re-institutionalization of public gender equality varied throughout the region.

The aim of the paper is to re-construct the ways in which institutionalization of public gender relations in CEE has been taking place since the beginning of democratic transformation. What are the similarities and differences between the CEE countries in the advancement of public gender equality? Who are the actors taking part in this process and what are the strategies used by both its’ proponents and opponents? To tackle these problems, a comparative study of four countries – Bulgaria, Hungary, Lithuania, and Poland – will be undertaken, including analyses of documentation of the reporting procedure to the UN Committee on the Elimination of Discrimination against Women and debates on introducing quotas to electoral laws.

On the way to gender equality - negotiating gender relations in public and private spheres
Ewa KRZAKLEWSKA (Jagiellonian University, Poland) | ekrzaklewska@gmail.com
Marta WARAT (Jagiellonian University, Poland)
Aleksandra MIGALSKA (Jagiellonian University, Poland) | olka.migalska@gmail.com

The paper will discuss the results of the project “Gender equality and quality of life - how gender equality can contribute to development in Europe. A study of Poland and Norway”. Within the qualitative part of the project, 10 focus groups has been conducted within diverse groups and in diverse settings, both with men and women. The FGIs on one hand concentrate on exploring the definitions and meanings of the concept of gender equality, on the other hand they allow us to explore if the gender equality can function as a project and an individual aim in private or public sphere. We analyse when, how and why gender equality is born and become an idea to be implemented in one’s life, as well as in public life and how it can transform gender and social power structures. Two terms are crucial for our analysis: “agency” meaning for us capacity for individualized choice and action, and “empowerment” which is a foundational process that enables women and men to construct their own agendas and form struggles for achieving fundamental and lasting transformation in gender and social power structures. Based on our research we will show in Polish context the trajectories of empowerment processes on three levels: personal, relational and collective. We will not only show women and but also men empowerment processes, addressing men as well as women as active makers of their own “gender future”, redoing gender yet acting under constraints.

RN33S02 - Gender in Comparative Perspective

Opt Out or Push out? Mothering and Identity of mothers in Taiwan and in USA
Wen-hui Anna TANG (National Sun Yat-sen University, TAIWAN) | wenhuianna@gmail.com

Adopted institutional ethnography perspective, I explores the identity construction and the accounts of middle-class Taiwanese mothers when they faced work-care conflict. I found that mothers identified their choice to opt out from labor market is a voluntary one, while I argued that it is a choice gap conditioned by mothering identity and structural constrains. These opt out mothers would practice intensive mothering to avoid traditional housewife stereotype and win “good mother” social image. They would also work part-time or as a volunteer which helps
establish positive self identity. My research include immigrant Taiwanese mothers in America into my research for comparisons. Aim to examine if those immigrants in USA have different self identity and mothering practice from those mothers who raised children in Taiwan. I would like to explain why and how the migration and social environment influenced mothers’ identities, mothering and employment decisions for Taiwanese women in USA.

“Timing of claims-making: differences and similarities among Southern European women”
Constanza TOBIO SOLÉR (University of Madrid Carlos Tercero, Spain) | ctobio@polsoc.uc3m.es
Rossana TRIFILETTI (University of Florence, Italy) | rtrifil@unifi.it

Italy and Spain are usually perceived in the academic debate as very similar countries as concerns their welfare regimes, their labour market structure, their traditional heritage (especially their supposed familism), but also as concerns the practices of their political systems. And yet, important differences are to be seen in last decades in the two countries in female participation to official labour market, in the strength of feminist claims-making and in the recognition of gender equality objectives and of the soundness of women’s and minorities’ rights. All this seems to suggest that - beyond any methodological nationalism - divergent gender orders arose in the two countries, whose empirical proof could be also seen today in the different way women reacted to the economic crisis. The paper seeks to investigate some hints at a general explanation of such divergent paths, based on timing of the emergence of feminist movements and their access to public discourse, as well as on the possibility to obtain a sound support from social policies. The paper is intended as a case study investigating connections whose explaining power could be applied to other countries and to a general critique of what gender mainstreaming has become nowadays.

Convergence of Gender Role Attitudes in East and West Germany?
Torsten LIETZMANN (Institute for Employment Research Germany, Germany) | torsten.lietzmann@gmx.net
Arne BETHMANN (University of Mannheim) | bethmann@uni-mannheim.de

As a result of a different social, political and cultural framework in the two former German states family life, family formation, female employment and the corresponding attitudes do still differ between the two German regions (East and West). Despite a slow trend of convergence female employment and the proportion of small children in non-familial child care facilities are still higher in Eastern Germany and families are to a greater extent made up by single parents and unmarried couples. One possible explanation for this are differing attitudes towards gender roles, which are assumed to be more egalitarian in Eastern Germany.

In our analysis we take a closer look at these differences in attitudes towards gender roles in the two German regions and between men and women. Since gender role attitudes are a latent construct, measurement equivalence of this construct between regions, genders and over time is a prerequisite for the understanding of trends in gender role attitudes and using them as explanatory factors for family behaviour. Using data from the German General Social Survey (ALLBUS) for 1992-2012 we test for measurement equivalence. We will show that it is possible (in a statistical sense) to compare scores on the latent gender attitude variable when using measurement models that adjust for partial inequivalence between East and West and between men and women. In the proposed paper we will apply this model to evaluate if there indeed is a convergence of gender role attitudes in Germany.
The Divisions of Labour and Responsibilities in Business and Home among Women and Men Copreneurs in the Czech Republic and United States

Nancy Carol JURIK (Justice & Social Inquiry, School of Social Transformation, Arizona State University) | nancy.jurik@asu.edu
Alena KRÍŽKOVÁ (Institute of Sociology, Czech Academy of Sciences, Czech Republic) | alena.krizkova@soc.cas.cz
Marie DLOUHÁ (Institute of Sociology, Czech Academy of Sciences, Czech Republic) | marie.dlouha@soc.cas.cz
Gray CAVENDER (Justice & Social Inquiry, School of Social Transformation, Arizona State University) | gray.cavender@asu.edu

We compare divisions of labor and responsibilities in the business and family lives of copreneurs in the Czech Republic (CR) and United States (US). Copreneurs are romantic couples who own/operate small businesses together. Such businesses constitute a significant economic component of many nations’ economies. Copreneurs provide a good point for unpacking the interplay among family life, work/business, and gender. We analyze interview narratives from 12 CR copreneur couples and 12 US copreneur couples; each partner was interviewed separately. We conceptualize gender and entrepreneurial identities as ongoing constructions that emerge in couple interactions and within the context of the interview and the larger culture. The US has a long history of entrepreneurship. In the CR, business ownership was prohibited between the 1950s and 1990, but it has a longer history of women's full, mandatory labor force participation.

Czech narratives revealed that women provided leadership roles in establishing businesses but were often not defined as owner-managers. These narratives suggested that despite non-traditional divisions of labour in several businesses, there remains a tendency to describe responsibilities in gendered ways. Among US couples, we found more recognition of women's business leadership roles. Yet, both CR and US couples tended to adopt traditional gendered divisions of labor in the home.

Stressing the need to incorporate both copreneurs' viewpoints into the research design, we find both complementary and contradictory views about the division of labor. We unpack the process whereby gender inequalities and the invisibility of women’s home and business contributions may be reproduced.

Harassment in the workplace: Portuguese and Norwegian situation in perspective

Bernardo COELHO (CIEG/ISCSP/University of Lisbon, Portugal) | bernardosoarecoelho@gmail.com
Anália Maria Cardoso TORRES (CIEG/ISCSP/University of Lisbon, Portugal) | atorres@iscsp.ulisboa.pt
Dalia COSTA (CIEG/ISCSP/University of Lisbon, Portugal) | daliacosta@iscsp.ulisboa.pt
Helena SANTANA (CIEG/ISCSP/University of Lisbon, Portugal) | hsantana@iscsp.ulisboa.pt

The interest in harassment at the workplace has increased over the years, forcing to rethink sociologically gender and power relations among different social groups worldwide.

This paper discuss findings from a research project (“Moral and Sexual Harassment in the workplace" financed by EEAGrants, 2014-2015) which has as main goals the diagnosis of moral and sexual harassment in the labour market in Portugal with a comparative approach to Norway's experience.

The methodological design combines quantitative and qualitative approaches (1) a survey to find out prevalence, actors involved, methods of reporting incidents and reactions towards sexual and moral harassment in the workplace, replicating questions from a survey carried out in 1989; (2) in-depth interviews, to understand how harassed women and men perceived their
experiences (3) a case study comparative approach to reported cases in Norway and Portugal to assess different type of procedures and reactions in both countries. Research results show that policy-level actions are most often addressing individuals, pushing sometimes organizations to take action, but keep structural ways of organizing social relations untouched. Thus, results reinforce the importance of power relations to understand gender and hierarchical inequalities, forcing to rethink gendered practices.

**RN33S03a - Post-Feminism and NeoLiberalism: The Challenges of Young Women’s Activism, of New Masculinities and of Queer Movements to Women’s and Gender Studies I**

Norm critical pedagogy and gender neutrality. The cutting-edge developments in post-feminism and queer theory in Sweden  
*Anna ODOMOWAZ-COATES (The M. Grzegorzewska Academy of Special Education in Warsaw, Poland) | acoates@aps.edu.pl*

Feminist thoughts of Rosi Braidotti and Donna Haraway that reaches out towards post-humanism go hand in hand with the new developments in Swedish pedagogical concepts. The author discusses norm critical pedagogy originating from Swedish Universities and born from advanced queer theory. By the use of an interpretative paradigm with a variety of qualitative field research tools, author gains a deeper understanding of how gender neutrality works in practice at school and nursery in Sweden. The author argues that gender neutrality may be perceived as a post-human construct and therefore should be examined within the post-human socio-pedagogical reflection embedded in the norm critical discourse. These ideas are amongst the most advanced concepts on how to improve gender equality.

“I’m not the queen of feminism”: Contradictions between feminist identification and collective action among young New Zealand feminists  
*Julia SCHUSTER (Johannes Kepler University, Austria) | julia.schuster@jku.at*

In the mid-1980s, New Zealand's Labour Government introduced significant social and economic reforms as solutions to the economic recession. The resultant shift towards a neoliberal agenda has received much international attention for its rapid and radical character. Since then, the neoliberal direction further solidified, making New Zealand an ideal setting for case studies of neoliberal environments. Taking the argument that neoliberal values of individualism have corroded feminism’s potential for collective action as a starting point, this paper investigates how deeply neoliberal thought has imprinted itself on contemporary feminist ideology. It presents findings of qualitative interviews with young New Zealand women, who are often accused by the older feminist generation of not identifying as feminists and not demonstrating a shared feminist agenda. By unpacking the reasons for young women’s apparent resistance to collective identification, I argue that they, in fact, share fundamental feminist values. However, increasingly high expectations within feminist circles to acknowledge intersectional differences between women, paired with an appreciation for individual agency generated a feminist culture in which young women are too anxious to express ideas of unity. Because they do not want to be perceived as imposing their personal ideas on others, feminist representation and the concept of “speaking for others” become problematic. Yet, there seems to be a difference between articulating a shared feminist agenda and actually sharing feminist
values. Thus, this paper concludes that despite an observable hesitation to make collective feminist claims and to universally define what feminism is, New Zealand’s young women do not regard feminism as a redundant ideology but value and live feminism, if in somewhat different ways than their mother’s generation.

**Post-feminism in the shadow of post-colonialism in Europe: the case of Muslim women’s activism in the European public sphere**

Monica MASSARI (University of Naples “Federico II”, Italy) | monica.massari@unina.it

During the past twenty years, gender and sexuality have started to play a crucial role within debates on migration and integration in multicultural societies. Thanks to the feminist thought and, in particular, the intersectionality approach as well as postcolonial studies, we have made significant steps in understanding how categories such as gender, class, race, ethnicity, religion play a role in shaping lived experiences. This has strongly contributed to overcome essentialised images of the concept of “woman”, mostly based on the experience of white, Western, middle-class women, while fostering critical accounts of the variety of women’s experiences, practices, and discourses.

In this regard, Muslim women, with their bodily/symbolic evidence, play a crucial role within the debate where the issues of religious signs and gender equality have become emblematic political nodes of the tensions between the West and the Rest, Islam and European political cultures.

How can the recognition of cultural differences be conciliated with the guarantee of women’s rights? This paper aims at addressing the challenges posed to contemporary feminist theories by the emergence, on the European public sphere, of new expressions of women’s social agency which consider religion a space of freedom, instead of a source of subjugation as usually stated by Western feminists. The analysis of transnational Islamic feminist movements active in Europe may offer an interesting case-study of the multiple trajectories followed by women in search of recognition and respect and an opportunity to reposition our eyes and dismiss those ethnocentric habits which sometimes affected feminist debate.

**Girls’ feminisms and the Nordic welfare state**

Elina OINAS (University of Helsinki, Finland) | elina.oinas@helsinki.fi

The paper explores Nordic girls’ thinking about feminisms, gender equality, neo-liberal individualism and, especially, the state. The welfare state has been both celebrated as the guarantee for equality and social support, and ridiculed as the authoritarian control mechanism that kills individuality. Does subjectification in the allegedly girl-friendly state apparatus mean sameness and adherence to homogenizing normative expectations? Can state be imagined without notions of borders, nationhood and othering? Is there an interest in politics and the state among young feminists? What does “politics” mean for young feminists?

The welfare state citizen is wrought by ambiguous expectations of autonomy and relationality, of personal achievement ideology and commitment to a collective nationalistic anthem of belonging and passing. These expectations can be especially heavy on young girls balancing between ideals of freedom of self-expression, yet longing for recognition, acceptance and being “just normal” (Oinas 2001). The state is also seen as a cherished platform for rights, individuality and freedom for all girls – or only some girls? Does it enable only certain ways to perform gender and citizenship? What kinds of girlhoods does the context enable and demand? The paper focuses on girls’ experiences of health related public services and will discuss a remarkable feature in Nordic research on girls and the state: the absence of a contextualizing theorization about the specific subjectification processes that the welfare state context enables.
Feminists fighting intimate partner violence in Russia: an emerging social movement?
Ksenia MESHKOVA (Humboldt University Berlin, Germany) | ksenia.meshkova@gmail.com

Intimate partner violence is very widespread in Russia: up to 50% of Russian women experience severe physical violence in their relationships. In the 1990s and 2000s various Western organizations invested more than 10 million dollars in Russian civil society sponsoring various programs, sharing the American experience of shelter organization, educated personnel and provided help in the development of shelters and consultations for women (Johnson 2009). However, as a result of the global financial crisis and changes in Russian law, most of the programs were terminated. Shelters were also either closed or had to rely on state support and therefore changed the direction of their work.
At the same time, protest movement and feminist movements started gaining power, and activists in various Russian cities started organizing against domestic violence. Their activism has taken various forms: NGOs dealing with domestic violence, various blogs, forums and online communities, feminist art against violence, street protests etc. The movement has an impact on individual women’s lives, as well as on the system of support for victims of domestic abuse in general.
The presentation will be based on the results of expert interviews with activists of the movement and with female survivors of domestic violence. Various forms of feminist activism against IPV in Russia will be analysed, as well as difficulties they confront and their role in combatting the violence and breaking the societal taboo. Interaction between the movement and state actors and impact of the new laws on the movement will be discussed as well.

RN33S03b - Post-Feminism and NeoLiberalism: The Challenges of Young Women’s Activism, of New Masculinities and of Queer Movements to Women’s and Gender Studies II

New feminist body politics? The body and the rise of (new?) feminist social movements
Imke SCHMINCKE (LMU Munich, Germany) | imke.schmincke@soziologie.uni-muenchen.de

The body played a pivotal role in western feminist movements of the second wave. One of the major claims was bodily and sexual autonomy. Body politics then meant both the critique of the female body’s medicalization as a form of biopolitics as it meant the production of new bodily practices from below which helped shaping a political feminist subject. By and by feminist claims have been integrated and embraced by a neoliberal rhetoric and lost its cutting edge. McRobbie speaks of the ‘undoing of feminism’: feminism had to be rejected for younger women to emerge as successful agents in the public sphere.
However, in recent years we have witnessed the emergence of different feminist and queer protests. In many of them the body plays a crucial role. In my presentation I will analyse and compare selected feminist protest forms (my sample includes Slut Walks, Femen, and Uprising-of-Women-in-the-Arab-World) and highlight in what way actual feminist protests differ from second wave feminism and also why and how body and sexuality still remain prominent arenas of political contest. Is body politics still constitutive for feminist protest? And if so how has it changed in form and content and what do these changes tell us about gender relations and
social change? Last not least I would like to address the question what kind of feminist/queer critique we might see and need in the future.

**Speaking feminism in austere times**  
Vicki DABROWSKI (Goldsmiths College, University of London, United Kingdom) | sop01vd@gold.ac.uk

This paper explores the way in which young women discuss their relationship with feminism during a time of rising uncertainty, precarity and deepening social inequality in the UK. Contrary to earlier research, in which feminism was assumed to either provoke unease, bewilderment, overt hostility (Scharff, 2012; Aapola 2005; Griffin, 2004) or more recently understood within a post-feminism logic (McRobbie, 2009), in the light of economic collapse and austerity measures, we are currently witnessing a resurgence of interest in feminism, affirmed within mainstream media as well as other social and political spheres (see Dean, 2010). Drawing on on-going research qualitative research with young women (18- 35) from different class backgrounds in three cities in the UK (Leeds, London and Brighton), I argue that the type of feminism that is being adopted takes a ‘neoliberal’ form. Such feminism consists of free choice, individualism, opportunity and success, in which the female subject accepts full responsibility for her own well-being and self-care (Rottenberg, 2014). Such a neoliberal feminism thus helps to disavow the current social, cultural and economic forces producing inequality. Young women acknowledge the impact austerity is having on their lives (citing issues such as the gender pay gap, childcare costs and pregnancy discrimination), however individual creative solutions are used to appease such structural problems and are presented as the way out of such a situation. Such findings will contribute to understand how feminism is both spoken and ‘allowed’ to be spoken within the current economic and political context of the UK.

**The Postfeminism Discourse in Romanian Online Media. A content analysis of specialized media headlines**  
Delia GAVRILIU (Alexandru Ioan Cuza University) | delia_gavriliu@yahoo.com

Media discourses play a crucial role in the representation, evolution and development of this new feminism. In recent academic literature, ‘post feminist media texts’ are often studied and referred to. Post feminism pleads that every woman must recognise her own personal mix of identities. Seen as response to feminism, postfeminism is quite different by its sensibility markers. This kind of sensibility is not only a backlash, but a more complex movement because of the tendency to entangle feminist and antifeminist discourses. This is our first hypothesis that we will try to see in what amount confirm. The sensibility of postfeminism is made of contradictions: autonomy, self-improvement, strong self-surveillance (and not only self-surveillance), discipline and action while their bodies are powerfully re-inscribed as sexual objects.

The main focus of the article is to identify the trends that postfeminist media discourse promotes as the new values of today’s women. Postfeminist discourse is not simply a response to feminism but also a sensibility partly constituted through the pervasiveness of neo-liberal thoughts. The synergy is even more significant in popular cultural discourses where women are called upon to exercise to self-management and self-discipline, to a much greater extent than men. This call for self-management which is articulated in postfeminist popular cultural (our second hypothesis) texts such as reality make-over television shows, television fiction series and films, but also in magazines and ‘chicklits’. In doing so I chose to analyze the contingency of the terms found in Romanian online magazines dedicated to women. The selected units were the issues dating from September 2014 to January 2015.
RN33S04 - Convergences in Gender Roles.

Male teachers in kindergartens – construction of masculinity in the feminized environment
Nina FÁROVÁ (University of West Bohemia, Czech Republic) | ninafarova@gmail.com

This research focuses on the topic of men working in feminized jobs, specifically male teachers in kindergartens. Male teachers in kindergartens are in a specific position due to their low number in this environment. This position implies several advantages for them - they are accepted with enthusiasm and with the expectation of change, they are not exposed to animosity like their female counterparts in jobs where men dominate. This treatment gives male teachers the opportunity to construct their own and relatively "elite" version of masculinity that is not superior just to the femininity of female teachers but also to the other versions of masculinity. This "elite" version of masculinity is also supported by female teachers and it contributes to maintaining a dichotomous and hierarchical approach to men and women in kindergartens. The purpose of this article is to identify the main strategies that male teachers use in the construction of their version of masculinity in this feminized environment. The research was based on qualitative research, which included the participant observation in several kindergartens and interviews with male and female teachers in kindergartens.

Converging toward assimilation. Italian Military Women witnesses from Afghan Front
Fatima FARINA (University of Urbino, Italy) | fatima.farina@uniurb.it

This paper concerns with policies encouraging implementation of gender perspective and female participation in Peace Keeping Operation. The paradox between gender convergence and divergence is evident and unsolved, especially at political level, where Gender value and Perspective represent the main (also contradictory) framework of peace negotiations, peace building, peacekeeping, humanitarian response and post-conflict reconstruction, processes. Within the "New International Gender Regime" of global society, military institutions have a significant part in building International relation (UNSC 1325 Resolution) but also in keeping alive a gender system based on egemonic role of male protector, being women in same ranks and files as men. The focus is on gender dilemma and on the effect of gender convergence by presenting the results of a field research on the Italian military women participating in ISAF mission in Afghanistan. The analysis is based on the views, opinions and experiences of female veterans interviewees from june to september 2013. The paper explore the gender model from inside the male institution by definition, starting from their experience and (self)representation of femininity and masculinity. The sense of being a (female) soldier is not far from the traditional warrior model and the participation in missions even works as accelerator of female assimilation, described in terms of «females becoming like males». “Helping (afghan) women is a lost war”, says one of the interviewees: the gender gap is wide inside and outside the military. More than a new gender regime maybe we are in presence of a new gender colonialism.

Transitions in Parenting: Challenges Met by Partners of Men on Paternity Leave
Gerlinde MAUERER (University of Vienna, Austria) | gerlinde.mauerer@univie.ac.at

In my contribution I will firstly present results of my empirical research on “Transfer situation in parental work: a qualitative analysis on challenges met by partners of men on paternity leave –
modifications of motherhood?” (Vienna 2014). Secondly, I will combine these results with international qualitative research findings on maternal and paternal leave and fulltime/part-time work in Europe. Based on my former studies on paternal leave (“Men on paternity leave – qualitative research focusing on activities of daily life”, 2013 and “Bridging constructions of masculinity and fatherhood”, 2013-2014), I am in my ongoing research conducting interviews with (female) partners of men on paternal leave. In parallel to qualitative international research (e.g. Magaraggia 2013, KELA 2013), I am focusing on quantitative data about the participation of women in the labour market.

Furthermore, I am discussing consequences of the private-public divide and social inequalities in industrialized welfare states. Though there is a huge challenge in performing traditional gender roles, according to a gendered labour market division (“breadwinner of a family”, private re/productive “home-base”), these working conditions evoke new challenges to be met by both men and women. I will finally conclude with reflections on intersectional analyses (Iancu 2010, McFerree 2012) beyond the paradigm of the nuclear family and reproductive “home-made” performances of women and men: thus transferring public tasks into private households.

Deciding to be a parent. Convergences in gendered cultural repertoires within the couple facing parenthood choice?
Paola TRONU (Università di Sassari, Italy) | p.tronu@gmail.com
Elisabetta CIONI (Università di Sassari, Italy) | cioni@uniss.it

The declining differences in life courses between men and women in last century Europe have regarded also the transition to fatherhood and motherhood. Important processes of change, related to work and welfare systems, involved gender roles both in the family (dual earner model), and in the fathers’ participation to the childcare and household labor. The diffusion of the intimate nuclear family, the pluralization of family formation patterns, the radical innovations of the women’s life conditions and the modifications in masculinity lead scholars to debate whether the increasing emotional engagement and interest of men in fathering has reduced gender differences.

In our paper we analyze values, cultural representations and signifying practices, emotions and attitudes involved in parenthood choices. Given the increasing number of women and men who think having more agency in the decisions about parenthood (choosing whether, at what time and how many children to have), parenthood has become a privileged field to observe how the discourses about gender equality and equity evolved. We also aim at exploring, in the perspective of culture in action, gender similarities and differences in the cultural repertoires used by women and men to motivate their actions.

The paper analyzes in-depth interviews to each partner of 31 couples and the data collected by a CATI survey (sample of 525 men e 637 women aged 18 e +), both carried out in 2014 in Sardinia (Italy). The context in focus provides an optimal case study: indeed available research shows that Sardinia has been recording for the last 30 years very high unemployment rates and a sharp decline in fertility. Literature suggests also the presence of a relative gender equality in Sardinian marriages.

RN33S05 - Gendered Relationships in Everyday-Life

Masculinities and femininities of drinking in Finland, Italy and Sweden: doing, undoing and redoing gender in focus groups in relation to meal drinking, wine tasting and intoxication
The presentation deals with masculinities and femininities of drinking from a comparative perspective. It examines how gender is done, undone and redone in focus group material from Finland, Italy and Sweden. In the research setting, Finland and Sweden represent the Nordic intoxication-oriented drinking cultures, whereas Italy, in turn, represents the Mediterranean meal drinking cultures.

The data was collected in a similar way in Sweden, Finland and Italy between 2007 and 2010, covering four different age groups (20 years, 25–30 years, 35–40 years and 50–60 years). From each country we selected eight male and eight female groups, i.e. two male and female groups from each age groups, one representing higher and the other lower social status professions. All focus groups interpreted a set of pictures representing different kinds of drinking situations, such as meal drinking, couple’s moderate wine drinking, heroic heavy drinking among men and playful heavy drinking among women.

In the presentation we analyze how Finnish, Italian and Swedish men and women are doing, undoing and redoing masculinities and femininities of drinking while interpreting the pictures of drinking situations. Our analysis presents a mosaic repertory of masculinities and femininities that oppose, interlace or intermingle with each other and that change shape depending on the situation, drinking company and on the perspective of the viewer. These masculinities and femininities are not reducible to any single hierarchy of dominant and subordinate masculinities and femininities. Rather, they vary regionally and intersect in specific ways with class, age and generation.

Gender in the individual biography: Between reproduction and defiance
Diana MACIEL (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | maciel.diana@gmail.com

This communication aims to look at the preliminary results of my PhD thesis, supervised by Professor Anália Torres, which aims to understand the way in which an individual develops and experiences her or his life course in a heteronormative and patriarchal society and the ways in which gender shapes this process.

This research is underpinned by an understanding of gender in which the individual is considered as an active agent (West e Zimmerman, 1987 e 2009; Butler, 1990), without however neglecting the constraining effects of social structures (Connell, 2009; Martin, 2003; Messner, 2000).

Thus, and to understand the influence of gender on the life course, not only in terms of decisions and actions but also in terms of opportunities, resources and constraints that are structurally assigned to the gendered individual, I conducted 44 biographical interviews with men and women, from 30 to 60 years old, living in couple.

Although the research is still in the preliminary stages of analysis, there are already some trends, heavily influenced by individuals’ social position and situation. There are individuals, men and women, who conduct their lives with an agency that reproduces gender representations, norms and practices that were internalized throughout the life course. There are other individuals guided by an agency that challenges the gender representations, norms and practices in which they have lived and interacted. Finally, there are individuals with a life course marked by individual actions, rituals and social practices that are just pragmatic, not always conscious and reflective, acting without questioning gender representations, practices and norms internalized throughout the life course.
Food, Families and Gender Reshaping of Biodiversity
Franca BIMBI (University of Padua, Italy) | franca.bimbi@unipd.it

Between emotional ties and caring work, conviviality and conflicts, the activities of food preparation, cooking and consumption mingle in the multi-diverse Mediterranean and European space drawing the maps of the preferred biodiversity. The changes in the structures and meanings of typologies of families and households, highlight the food’s cultures as localized constructions of different intergenerational memories within the synchronic experiences of the modified extended families, or the nuclear household or the plurality of families-of-choice. The declinations of food’s styles represent crucial challenges for the never-ending construction of gender relationship through the everyday life practices, crossing the social and racialized stratification. The differences in the prevalence of the raw and the cooked, and in the definitions of the fresh and the rotten, with the old and new naturalized rules of separation between forbidden, allowed or obliged activities for men’s and women’s, reveal the fragmentation and the continuity in the gift economy where gender polarization around bodies and food could be reshape. This paper is based on the old women’s stories belonging to the working and peasant classes of Veneto Region (North-East of Italy). Narratives of the recent past are analysed on the perspective of the today’s assumptions on the healthy, “appropriate” and individualized diets. The use of the past allows us to consider food activities as processes of symbolization for the changes on gender division of labour, on the authority between gender and generations, on housing and the domestic technologies.

Gendered age and the Polish men's and women's attitudes towards health
Ewa MALINOWSKA (University of Lodz, Poland) | socgender@uni.lodz.pl
Emilia GARNCAREK (University of Lodz, Poland) | emilia_garncarek@poczta.fm
Krystyna DZWONKOWSKA-GODULA (University of Lodz, Poland) | krystyna.dzwonkowska@gmail.com

Results of social research show that there are differences in the way men and women in various ages evaluate their health, as well as differences in their health behaviours. We assume that these differences result among others from the influence of gender and the cultural concept of age (defined here in terms of: youth, middle age, old age). Gender, and so understood age are internalised by an individual in the process of socialisation. An individual, in assessing own health, defines him/herself as man/woman belonging to a specific age category and seeks to meet the expectations of the society placed upon people who are young, old or in middle age. At the same time cultural definitions of age are different for women and men (female and male youth, female and male middle age, female and male old age).

Our paper is based on qualitative research: individual and focus group interviews conducted with adult men and women in different ages, having a secondary or higher education and living in a large city. (Because of purposive sampling applied in the study the results cannot be referred to Polish society in general but allow for deeper understanding and explaining people’s behaviors and attitudes). For the purpose of the paper we’ve chosen two age categories: young and old. The aim is to compare attitudes towards health of young and old women and men, to determine how they perceive and evaluate their health and how they care about it.

Space as a Production of and the Re-producer of Patriarchy: the Meaning of House for Women
Gulhan DEMIRIZ (Adnan Menderes University, Turkey) | gdemiriz@adu.edu.tr
Deniz CELIK (Adnan Menderes University, Turkey) | denizcelik@hotmail.com
Space cannot be analysed apart from social structure and human practices. Therefore, modernist paradigm’s approach towards space, which is still dominant particularly in urban studies, is problematic. However, since the beginning of 1970s a neo-Marxist approach offered a new way of seeing the space not as a geographic and technical issue but as a product of the social. According to this argument it was impossible to understand the space apart from economical, social and ideological dynamics. This new understanding has a potential to offer an insight into the feminist studies. Studying and analysing the space from a gender perspective is relatively a new issue in gender studies in Turkey but is in increase even though they are still limited. Although women’s appearance especially in urban space is one of the main study area, modernist theory’s dichotomies such as rural/urban, traditional/modern and terminologies such as “adaptation”, “urban integration”, “urbanisation” still seems to be the dominant way of seeing the issue.

From the gender perspective, this paper argues that the space is a product of patriarchal ideology and while it determines different genders’ everyday life experiences it at the same time re-produces patriarchy. In addition, men and women add different meanings to space. In this respect, the main objective of this paper is to discuss the meaning of house as a space for women and for their lives by looking at their relations with and the ways of integrating themselves with the house. Data for this research was collected from in-depth interviews with women living in Tarlabasi (Istanbul/Turkey) where an urban transformation project has been carried out. It was thought that a neighbourhood in an urban transformation process had a crucial potential for providing new insights in terms of the meaning of lived space for women and for understanding space as a place of re-production of patriarchy via cultural and bodily practices.

***Data used in this paper was mainly based on some findings of Deniz Celik’s master dissertation. Research was financially supported by Adnan Menderes University, Scientific Research Projects (BAP).

RN33S06 - Care and Gender

Transnational Family Dynamics and Social Change: Migration, Care and Gender
Lise Widding ISAKSEN (University of Bergen, Norway, Norway) | lise.isaksen@sos.uib.no

This paper focuses on a case of intra-EU mobility within the EU15 – a form of mobility which for various reasons is usually considered unproblematic for families and as such has been little researched from a family perspective. The paper draws on findings from an empirical study consisting of qualitative interviews with Italian mothers who had recently moved to Norway in response to financial crisis and austerity in Italy. Norway and Italy represent two very different welfare regimes. One important difference is the central role the state plays in the production of care services for children and elderly. In Nordic societies such as Norway, children under school age attend public childcare and elderly have extended access to public care services. In the South European regime, in countries like Italy, families care for children and elderly or families outsource care to commercial care agencies or to migrant care workers with or without legal papers. While South European women often have to choose between motherhood and a professional life, most adult women in Nordic welfare societies become mothers and continue to stay integrated in the labour market. In Norway public childcare services take care of more than 90% of children under the age of 6 years while their parents work. Childcare institutions in
Norway are local systems of justice related to ideas about the meaning of social and gender equality. The central question to be addressed here is how social contracts between migrant mothers coming from gender conservative and family oriented welfare regimes based on welfare familialism are made and negotiated in Norwegian child care institutions oriented towards social justice, gender equality and feminism. Through an analysis of Italian mothers’ comparisons of the normative differences and similarities between ways of making family-work balances in Italy and Norway, the discussion explores the subjective experiences Italian mothers have when they are facing Norwegian socialization norms and values in public childcare. In addressing this question, it becomes clear that care cannot be conceptualised merely as a set of individual / family practices which are mobile; rather care practices are embedded in the spaces of nations, regions and localities within which families are materially and culturally situated.

Among nannies, au pairs and cleaners: New ways of doing family in Sweden
Sara ELDÈN (Lund University, Sweden) | sara.elden@soc.lu.se
Terese ANVING (Lund University, Sweden) | terese.anving@soc.lu.se

New possibilities for managing work/family balance have emerged for Swedish families the last decade. The former model of the Swedish welfare state, with publicly funded institutions such as daycare centres and paid parental leave (Bergqvist & Nyberg 2002), all motivated by strongly held ideals of the dual earner/dual carer model and gender equality (Lundqvist 2011; Daly & Rake 2003), is today challenged by a growing private market for care services. Since 2007, Swedish families can get tax deductions for all kinds of work carried out in the home, such as cleaning (Gavanas 2010) and childcare in the form of nannies and au pairs (Anving & Eldén 2014). The emergence of the care market can be related to a more general reshaping of national family politics towards a stress on privatization and ‘re-familialization’ (Borchorst & Siims 2009). Also, it converges with global trends of ‘care chains’, making possible the hiring of cheap (female, migrant) care labour (Ehrenreich & Hochschild 2002). In this paper, we discuss the current conditions for ‘doing family’ in Sweden, conditions that can be compared to the situation in the other Nordic countries (Bikova 2010; Stenum). The data consists of interviews with nanny-companies, nannies/au pairs, parents and children, and in focus is, e.g., the changing meaning of ‘gender equality’ (when caring shores no longer have to be negotiated between two partied in a couple, but can instead be bought as a service on the market), and the invitation of ‘ethnic others’ into the family.

Caring Masculinities: Theorising an Emerging Concept
Karla ELLIOTT (Monash University, Australia) | karla.elliott@monash.edu

The concept of ‘caring masculinities’ has started to emerge in European critical studies on men and masculinities as an emerging way forward in engaging men in gender equality. In this paper I theorise the concept of caring masculinities by constructing a practice based framework. I propose that caring masculinities are masculine identities that reject domination and its associated traits and embrace values of care such as positive emotion, interdependence and relationality. The practice based aspect of the concept stresses that the actual task of doing care work can help men to change and to develop more nurturing and caring emotions. I suggest therefore that these caring masculinities constitute a critical form of men’s engagement in gender equality and offer the potential of sustained change for men and gender relations. I draw on both critical studies on men and masculinities and feminist care theory in order to construct the framework I propose here. This contributes to addressing the “feminist theory deficit” (Berggren 2014) identified in contemporary critical studies on men and masculinities.
Through this nexus of critical studies on men and masculinities and feminist care theory I offer a feminist exploration of how masculinities might be reworked into identities of care rather than domination.

Cared-for Children as a Blind Spot in Care Work Scholarship?
Adéla SOURALOVÁ (Masaryk University, Czech Republic) | asouralo@fss.muni.cz

In her influential article on “The ‘Nanny Question’ in Feminism” Joan Tronto (2002) emphasizes three differing perspectives through which we can approach caregiving work: the perspectives of the families (mothers), the children, and the nannies. There are many research projects that focus on the perspective of employers and employees, and their relationship. However, the research on delegated care work has not paid much attention to the perspective of cared-for children: either of children currently being looked after by nannies, or of adults with the past experience of being raised by nannies. This could be due to ethical issues concerning research on children, as well as to the current paradigm, which assumes that children are passive objects in the social structure, and that their perspective can only be mediated by adults. During the last three decades (a period coincidentally marked by a boom in the literature on domestic/care work), a new approach to children in social science research has been developing in which the children are starting to be taken seriously as social actors with their own particular viewpoint and agency (for example legislation on children’s rights, including child care). Within the new sociology of childhood paradigm children are able to construct their own identities, select the influences of socialization, and create their own perspectives on social phenomena, processes, and institutions (Prout and Allison 1997). In this paper, I draw upon my qualitative research on Vietnamese immigrant families that hire Czech nannies in the Czech Republic. I argue that a focus on the perspective of children is necessary for understanding the character of caregiving, as well as the relationships knitted between children and nannies, and children and parents. In the paper I will answer following questions: What does delegated caregiving mean for the cared-for themselves? How do they make sense of the delegation of caregiving? How do they conceive of the relationship between themselves and the person who takes care of them? How do they see the difference between the role of nanny and the role of the mother or other relatives? When answering these questions, I call for the necessity to incorporate cared-for children into research on paid childcare. I will argue that this is not just to add and stir in another perspective to the already-established recipe dealing with the perspectives of employers and employees, but rather to re-think the grounds of research on care work, and formulate a new research agenda.

Re-considering the gendered social change. The case of transnational mothers from Poland (1989-2010).
Sylwia URBAŃSKA (University of Warsaw, Poland) | urbanskas@is.uw.edu.pl

The vast majority of gender and migration literature pictures the transnational mothering phenomenon as a homogenous experience, diversified only by the type of territorial distance between mother and her child/ren, or gendered distribution of care practices in families. What is missing in the existing analyses of care workers and transnational care practices, are the more complex perspectives on the phenomenon of mothering itself. Perspectives which would help to analyze and explain the roles and identities of female migrant workers in connection with various dimensions of their biographies, identities, statuses, and class positions. As a result, despite many studies, the transnational mothering phenomenon remains under-researched. In this paper I intend to discuss two issues. First, I would like to address the question whether the existing body of research captures the subversive nature and the complex structure of the
transnational mothering phenomenon? Secondly, what kind of gender revolution could we speak about, if we broadened the scope of women experiences?

The discussion is based on the results of my research, focused on the experiences of Polish transnational mothers, whose biographical experiences of migration and living long-distance lives with their children/families/local communities, span over two decades of post-socialist transformation (1989-2010). The ethnographic research was conducted in Polish rural areas (villages and small towns) and in the migrant communities in Belgium.

RN33S07 - Fatherhood and Masculinities

The Israeli Family Guy
Anat GUY (College of Management, Israel) | g1anat@colman.ac.il

The "new men" or "new fatherhood" are a well-known terms referring to men who choose to be more involved and to take greater responsibilities as fathers. In the last decade, many studies published in books, journals, conferences and websites emphasize the importance of this new fatherhood to child development, alongside its positive influence on men's well-being. The "new men", or the "new father" challenges the traditional views of gender role division in the family: he emphasize his emotional and instrumental role as a father alongside or instead of his more traditional roles as the main provider and his career. These changes may introduce men to the family – work conflict, that was, until recent years, a feminine conflict.

This study examines "new men" in Israel – men who rated family being as important, or more important as work. Findings show that these men are similar to more traditional men in their background characteristics (religiosity, education SES, etc.). Yet, they differ in their egalitarian attitudes toward women and child rearing practices and ideologies. Furthermore, this study indicates that "new men" feel more satisfied with their work and express higher self-fulfillment than traditional men. Findings may indicate the potential of role enrichment for men.

The Naturalisation of Parental Roles. Fathering in Sweden and Poland
Katarzyna SUWADA (Polish Academy of Sciences, Poland) | k.suwada@gmail.com

Research shows that there are great disparities between male and female parenting. The role of a father is often defined in contrast to the role of a mother. The definitions of fatherhood are still based on the obligation of breadwinning, whereas motherhood is mostly seen in terms of care work and emotional engagement. Yet in times of changing gender roles and greater focus on the issue of gender inequality, the traditional models of parenting are being reconstructed. The new model of fatherhood indicates men’s ability to nurturing and to overtaking traditionally female duties. The aim of my paper is to show how men in Sweden and Poland deal with their parenthood and social, often conflicting, expectations to fathers and mothers.

My analysis is based on 52 in-depth interviews conducted with fathers in Sweden and Poland in 2012 and 2013. All of men were heterosexual and middle-class, they lived together with their wives or partners and their children. Such homogenous group of men who functioned in the ‘traditional’ family settings allowed me to study how fathers perceived the gendered division of work and understand the traditional parental roles of men and women.

The relation between the nature and the society is one of the most fundamental themes in social sciences, especially when it comes to the issue of gender equality and family life. For many theories that refer to the natural difference of women and men the biology is a convenient explanation for the social order and social processes. But the critical research on gender relations shows that the problem is more complicated. As R. W. Connell (1987) underlines, the
assumption of natural dichotomy between men and women as human beings, which became a base for many theories, is fundamentally wrong. In her argument, Connell underlines that the society is unnatural, since its structures cannot be derived from the natural structures. But the unnaturalness does not mean that the society is not connected to nature at all. In fact, the society accepts its biological origin and uses the concept of nature as an explanation for the prevailing social order. Although, men and women, as representatives of one species, are more similar to each other than different, the society exaggerates and emphasises the differences between them. The reason for such exaggerations is that in many cases the biological explanations are not sufficient in explaining the unequal balance of power between men and women. Therefore, in social practices the natural dimension of social life is underlined.

Connell formulates a theory of the reproduction of gendered bodies that is based on two processes. Firstly, in the process of negation the social categories give a new meaning to human body. These new meanings are not connected to the body’s biological predispositions. The negation of body does not necessarily mean the neglect of biology, but it is rather its deformation. In this process the similarities between different bodies are marginalised and distinct social categories, as a man or a woman, are imposed on individuals. After the negation of similarities, the body is transformed through social practices. The body belongs to some extent to the natural order, but in the social practices it is transformed in a way it fits to social categories. As a consequence, the processes of negation and transformation work as a self-fulfilling prophecy that validates the initial social categories.

Using such perspective, the dichotomy between male and female parental roles can be analysed. The modern family is one of the most gendered institutions in the contemporary times. The male and female roles are differently defined within family life; the question is to what extent these differences are a result of biological differences between women and men and to what extent they are based on social categories that in the processes of negation and transformation reproduce highly gendered parents. In terms of parenthood it is an important question, since parenthood, at least at the very beginning, is regarded as a natural phenomenon. This is the core theme of my paper.

Based on my research, I distinguish two strategies that fathers might adopt facing the naturalised differences between mothers and fathers. On the one hand, they can fight with them and try to question the prevailing gender order that not always accept their high involvement in parenthood. This is a case of men who cross the traditional gender roles and overtake the obligations that might be regarded as reserved for women. On the other hand, men can accept the social expectations, and even if they find themselves in the situation in which to some extent they disrupt the traditional social order, they immediately withdraw and agree with the fact that because of biological predispositions they should not do particular things. Both of this strategies generate problems in the couple and both of them to some extent sustain the power order based on male domination and female subordination. In my paper I would try to show, based on the interviews with Swedish and Polish fathers, what the problems generated by these two strategies are and why both of them reinforce the division on male and female parental roles.

LITERATURE:

Parental constructions of masculinity at the transition to parenthood: Chance for change?
Eva-Maria SCHMIDT (University of Vienna, Austria) | eva-maria.schmidt@univie.ac.at
Irene RIEDER (University of Vienna, Austria) | irene.rieder@univie.ac.at
Rudolf RICHTER (University of Vienna, Austria) | rudolf.richter@univie.ac.at
Existing research has assumed that shared parental leave can support a more gender-equalitarian and longer-term way to divide paid and unpaid work after the transition to parenthood. However, in contrast to the mothers, the majority of fathers in Austria experience no serious shifts or breaks in their occupational careers, in order to take care for their child. The distribution of paid and unpaid work – especially when intended to be equal – is a result of negotiations between fathers and mothers starting even before the transition to parenthood, and those negotiation processes and gendered practices are guided by notions towards masculinity and fatherhood. These are the focus of this presentation: The aim is to identify the conjunctive knowledge and social constructions of masculinity within a relationship between Austrian mothers and fathers during their transition to parenthood, in order to provide a deeper understanding of why parental leave is divided unequally between them. As these notions are constructed collectively during this transition process, a multiple perspectives approach is required: We interviewed eleven couples, each mother and each father once pre-birth and once about 6 months post-birth. Based on 44 problem-centered interviews, we applied an in-depth sequential analysis following a hermeneutic approach. Preliminary results show that both mother and father jointly construct a form of masculinity that naturally comprises to care for an own child. Simultaneously, unmanageable constraints outside the private sphere are held responsible for making it hardly impossible for men to assume longer-term and full-time responsibility for unpaid child care work.

Fathers of the Great Recession: The Impact of Male Unemployment on Childcare Involvement
Tomas CANO-LOPEZ (Autonomous University of Barcelona; Pompeu Fabra University) | Tomascl010@gmail.com
Lluís FLAQUER (Autonomous University of Barcelona) | Lluis.Flaquer@uab.cat
Almudena MORENO MINGUEZ (University of Valladolid) | almudena@soc.uva.es

In the present contribution we are exploring the characteristics of Catalan couples with small children with a special emphasis on the changing role of fathers in a context of high male unemployment rates in Spain as a result of the Great Recession. Using data from a regional survey (ECVHP 2011, Catalonia) with about 2.000 respondent couples with children, we examine under what conditions the position of fathers in the labour market is determining their involvement in childcare. We also analyse other covariants such as mothers’ employment status as well as educational attainment levels of both parents trying to unveil the extent to which these characteristics are related to paternal involvement in childcare. While several studies find no association between father involvement and socioeconomic status indicators of education, income, and social class (Gerson 1993; Pleck 1983), others do find clear connections (Haas 1988). Different forms of employment (full-time / part-time, self-employment, permanent/fixed-term contracts; flexibilization, irregular working times) favour or limit parental involvement in different national contexts (Hook and Wolfe 2013). However, the results of previous research are not conclusive as yet. We hypothesize that highly educated unemployed fathers are more likely to be involved in childcare that less educated ones since, while they both enjoy a radical increase in free time, whether they spend it or not with their children may depend on their egalitarian gender values and on more positive child-friendly attitudes.

RN33S08 - Constructions of Masculinities
Masculinities of the Turkish National Police
Betul EKSI (Northeastern University, Boston, MA USA) | balkan.b@husky.neu.edu

I propose to present a chapter of my dissertation. My dissertation very broadly is about masculinities of the Turkish state. The chapter I intend to present focuses on masculinities of the police in Turkey. Studies on masculinities have problematized the construction of masculinity in various social institutions and have made men visible as a social category (Collinson and Hearn 1994). Yet scant attention has been drawn to the role of masculinities and femininities in construction of the state with the exception of the study of men in the military (Barrett 1996, Hinojosa 2010, Morgan 1994), and masculinities of the political elite (Cannen 2013, Messerschmidt 2010, Messner 2007). This paper seeks to unpack how practices and discourses of hegemonic masculinity are embedded and (re)produced at a state institution-- the Turkish National Police (TNP). This study draws from critical masculinity studies literature to understand and analyze the construction of masculinities within the Turkish National Police. Based on in-depth interviews with 30 police officers, this paper asks how does the police as a state institution reproduce an ideology of hegemonically oriented masculinity and how do male and female officers' concrete practices and discourses construct an order of gender relations within the institution? The findings of the chapter reveal that the relation between masculinity and the police is more complex than the image of the police as one of “the violent arms of the state” might suggest.

Symbolic Gender Order and Ambivalent Modernization. Disparate Constructions of Masculinity between Work and Fathering.
Bianca PRIETL (RWTH Aachen, Germany) | bprietl@soziologie.rwth-aachen.de

Rising numbers of female graduates at the one hand and a constantly high gender pay gap at the other – such more or less contradictory findings describe the current gender relations as highly disparate. How to interpret these incongruences also seems highly contest, with Gender Studies scholars drawing quite different conclusions from a "de-institutionalization" of the gender difference (Heintz/Nadai 1998), to its re-traditionalization (Koppetsch 2013) and „rhetoric modernization“ (Wetterer 2003). As in the latter thesis the disparities in gender relations are often located as differences between the level of structures and practices and the symbolic level.

From a discourse theoretical perspective that understands discursive practices as social practices this theoretical division is to be questioned. The focus of analysis is rather directed at possible disparities and contradictions within the symbolic itself and at the question of how these are to be interpreted without devaluing discourses as mere rhetoric. Following this line of reasoning, the paper exemplarily analyzes discourses on fathers’ parental leave. By taking a closer look at one of the central pillars of the gender order, disparate constructions of masculinity between work and fathering are empirically reconstructed. Following these findings it is, firstly, argued that taking into account perspectives on masculinity helps to better understand the stability, resistances and changes of the hierarchical gender order as employed work plays an important role in masculinity constructions of fathers. Secondly, it is proposed to theoretically interpret the conflicting findings in the symbolic gender order as ambivalent modernization.

The Masculine Corporeality of Blue-collar and White-Collar Workers in Russia
Alexandrina VANKE (Russian Academy of Sciences, Russian Federation) | aleksandrina.vanke@gmail.com
In the paper, I will present the results of my research conducted in 2011-2014 on the masculine corporeality of blue-collar and white-collar workers in contemporary Russian society, which experiences economic crisis and transformations in gender order. Nowadays, gender researchers observe new liberal trends in gender relations while traditional patterns continue to exit. They discuss “crisis of masculinity” characterizing by incapacity of men to correspond to classical patterns of traditional masculinity, destructive body practices, health-detrimental behavior and obsessive habits. In this context, I study meanings of the masculine corporeality in labour regimes and private sphere in correspondence with belonging to a particular social environment. I use approaches of Pierre Bourdieu and Loic Wacquant as well as Michael Meuser and Reiner Keller trying to describe the masculine corporeality through narrated discursive practices of blue-collar and white-collar workers. According to my 40 semi-structured interviews, Russian working-class men tend to demonstrate their bodily capital, physical strength and a lack of self-confidence that undermines their masculinity; they perceive themselves as “loosers”. Russian male office clerks also demonstrate their bodily capital but focus on bodily performance and bodily appearance that help them to gain professional and sexual success; they invest money in their bodies and represent themselves as “successful guys”. However, neo-liberal labour regimes in factory as well as at office regulate and exploit the corporeality of men from both social environments.

**Passion and gender equality: the New Alternative Masculinities (NAM) transforming the traditional model of sexual-affective relationships**

Marcos CASTRO-SANDÚA (Universitat de Barcelona, Spain) | marcos.castro@ub.edu
Liviu Catalin MARA (Universitat Rovira i Virgili, Spain) | liviucatalin.mara@urv.cat

The meta-research conducted by Flecha, Puigvert and Ríos (2013) identified three masculinity models. Two of them contribute to reproduce the traditional model of affective-sexual relationships defined by Gómez (2004). Oppressed Traditional Masculinities (OTM) are represented by those men who pretend to establish egalitarian relationships, “good guys”, but who are seen as boring and non-attractive. On the other side of the same coin, Dominant Traditional Masculinities (DTM) are those “bad boys” who are mainly considered as sexy and attractive, but who are dominant and sometimes also aggressive and violent. This model is built upon a double standard (goodness is separated from attractiveness) that was created by DTM men to perpetuate their domination in a patriarchal order, but it has also reproduced in the socialization process of some women regarded as “independent” (Flecha, Puigvert & Ríos, 2013). Here we can identify a convergence of gender roles that does not challenge, but reproduces the traditional model of relationships whose main feature is inequality.

On the contrary, the New Alternative Masculinities (NAM) are radically opposed to OTM and DTM, as they are represented by men who are egalitarian in all aspects of their daylife, but who are also confident, strong and courageous to confront abuses, inequalities and to reject explicitly the double standard. This is why they combine attraction with equality, ethics and desire. The convergence of gender roles in the case of NAM makes possible an alternative model of affective-sexual relationships that overcomes the traditional one.

**Political Masculinities: The Case of Greek Finance Minister Yanis Varoufakis**

Benedetta GENNARO (Technische Universität Darmstadt, Germany) | gennaro@ifs.tu-darmstadt.de

Through an analysis of social and online media, this paper seeks to discuss how the finance minister Yanis Varoufakis is re-defining (hegemonic) political masculinity. Since his appointment
as minister in the Greek cabinet lead by Alexis Tsipras, Varoufakis has been at the centre of media coverage and not only for his controversial positions on how to rescue Greece from bankruptcy. Images of Varoufakis have inundated the web: he is followed like a celebrity and his fashion style examined by even the most conservative media outlet. His untucked shirt has garnered as much attention as his financial plans.

The body of the male heterosexual politician bursts on the scene in terms similar to those used to define and describe women politicians. There is, of course, a difference in outcome: Varoufakis’ body is helping him gaining political support, and references to his sexiness contribute to make him more affable and popular. When women politicians are scrutinise for their clothing choices or for their appearance, it is usually to criticise and discredit them. In the public’s eye, fashion savviness and attractiveness cannot coexist in the same person, in particular when that person is a woman. In Varoufakis’s case, on the contrary, we witness a proliferation of images that render him not only likeable, but have also the effect of focusing the attention on his political discourse. This paper investigates what notions of masculinities are at play in the making of Varoufakis into a media sensation, and what this says about hegemonic masculinity today.

**RN33S09 - Gender and Sexuality in Practice and in Representations**

**Enduring Love? Sex, gender, intimacy and the ageing couple**

Jacqui GABB (The Open University, United Kingdom) | Jacqui.Gabb@open.ac.uk
Janet FINK (University of Huddersfield) | J.Fink@hud.ac.uk

Drawing on large scale online survey (n=5445) and qualitative research (n=50), the Enduring Love? project has been studying how couples experience, understand and sustain long-term relationships in contemporary Britain, with particular attention to the ways in which gender, parenthood and generation shape experience. In this presentation, we focus on the experiences of ‘older’ heterosexual and same-sex couples in the study (ages 45-65+), to explore how these women and men encounter and negotiate sex and intimacy within their relationships. Findings point to great diversity in relationship experience amongst this cohort, but accounts of couple intimacy and the ageing body remain often highly gendered. Couples devised a range of strategies to engage with and/or ameliorate incumbent changes in couple intimacy brought on by ageing bodies, including laughter, resignation, separate sleeping, and living together apart. Here we tease out how these different strategies work to sustain the couple relationship whilst remaining mindful of the impact of socio-cultural contexts, and the emotional and economic resources, that are involved in such decision-making. We will also demonstrate how a focus on everyday ‘relationship practices’, both as a methodological approach and as a way of understanding couples, breaks down the dichotomy between enduring relationships of quality and good enough or endured relationships, thus enabling us to better understand how partners negotiate the changes in life and bodily circumstances which accompany long-term relationships, as they are experienced over time.

**Managing Multiple Marginalization: Russian-speaking Women Doing Sex Work in Finland**

Anastasia DIATLOVA (University of Helsinki, Finland) | anastasia.diatlova@helsinki.fi

The presentation is based on research for a PhD dissertation which examines the lived experience of Russian-speaking sex workers in Finland as it pertains to their marginalized
status as both sex workers and foreigners. The study aims to understand how multiple-marginalization affects groups that already exist on the fringes of society. The personal accounts of sex works are take in tandem with the accounts of experts in the field i.e. law enforcer, policy makers, immigration officials, social workers, etc. The study examines how personal experiences of sex workers are shaped and affected by social and legal policy. Based on interview data with experts and women involved in sex work, the presentation discusses sex workers’ attitudes and understanding of their position in relation to social, political and judicial regulation as well as their experience of accessing different services. The presentation is based on an article draft.

**Life trajectories to prevent and intervene trafficking for sexual exploitation**

Ana VIDU (University of Barcelona, Spain) | ana.vidu@ub.edu
Lena DE BOTTON (University of Barcelona, Spain) | lenadebotton@ub.edu
Guiomar MERODIO (University of Barcelona, Spain) | guiomar.merodio@gmail.com
Lídia PUIGVERT (University of Barcelona, Spain) | lidia.puigvert@ub.edu

In the XXI century, trafficking for sexual exploitation constitutes a modern way of slavery which also violates the Human Rights. Despite the magnitude of the phenomenon, there is little scientific research on human trafficking for sexual exploitation; indeed there is a lack of scientific knowledge about its causes, vulnerabilities, situations and consequences for the victims. Having explored the life trajectories of girls and women, some international studies conclude that it is necessary to further examine the vulnerabilities associated with life itineraries. This paper gathers the main results achieved in the project TRATA (Life trajectories that move away or bring closer to networks of trafficking for sexual exploitation) (2013-2014), funded by the Women’s Institute, Ministry of Health, Social Services and Equality. This research provides effective strategies for prevention and response to trafficking and sexual exploitation through the analysis of life trajectories of Moroccan women and girls with a migratory project from Morocco to Spain. Using theoretical and qualitative empirical research, under the Communicative Methodology of research, cases studies have been conducted in Morocco and Spain. The analysis has identified both the factors and elements of the life trajectories of Moroccan women who have been trafficked and, life trajectories of those who have been at risk of becoming trafficked. Furthermore, the project is not only focused on the collective of victims, but also encourages actions on measures and policies for prevention and intervention against trafficking of women for sexual exploitation. This transformative approach is promoted to show a real social impact.

**Depicting Sexualized Power Relations in Magazine Advertisements Across the Atlantic**

Dalia COSTA (ISCSP - Social and Political Sciences School of Lisbon University, Portugal) | daliacosta@iscsp.ulisboa.pt
Maria Joao CUNHA (ISCSP - Social and Political Sciences School of Lisbon University, Portugal) | mjcunha@iscsp.ulisboa.pt

Governments across Europe have been stating their concerns about gender equality, especially when it comes to sexuality and cultural and symbolic body representations. Mass media, especially through images, take a strong position as dynamic agents in meaning construction for individuals and as structural constructors for societies. Currently, men and women are depicted apparently as ‘equal’, which implies the need for a more thorough and deeper analysis.
Assuming that women nowadays are still socially discriminated, for example on wages and family care, our hypothesis is that there will be evidence of this discrimination on ads, as well. Once gender politics are diverse between Portugal and Brazil we question whether media can constitute a counterbalance to the effects of economic globalisation. Using a comparative research design we will show how magazine advertisements depict gender power relations in magazine male/female figures in Portugal and in Brazil. We ask whether advertisements portray male hegemonies and/or sexualized power relations and how gender relations are depicted in media industry. The corpus of analysis (895 ads depicting male/female figures) reveals that gender relations intercept class relations (Connell), in gender identity construction and that thorough analysis is needed to capture subtle gender relations in ads.

**RN33S10 - Gender and the Labour Market**

**Myths and realities of women empowerment: Case of invisible female homeworkers in garment supply chains of Pakistan**

Farah NAZ (University of Klagenfurt, Austria, Austria) | farahnaz@uos.edu.pk

Global capitalism has not only paved the way for the geographic spread and functional integration of economic activities across national boundaries but has also extended the employment opportunities to the ‘reserve and flexible female labour force’ in many developing countries. This paper outlines the dynamics of female labour force participation and its empowering potential by focusing on female home workers in the Garment Supply Chains of Pakistan. By using a case study method, this research offers an empirical insight into female home-based work in the context of Pakistan. The analysis is based mainly on in-depth interviews and participant observation. The paper argues that women’s involvement in homework within the private sphere of the household holds implications for their empowerment and their labour and other human rights. Women’s involvement in homework has brought some positive changes in the life of female home-based workers, but the process of change is very slow and choices are limited for homeworkers in general. This research makes the case – by teasing out the structural causes of exploitation of homeworkers – that despite the limitations of homework there is also some scope for women’s empowerment through the establishment of different support mechanisms.

**In the golden cage of creative industries: Public-private valuing of female creative labour**

Valerija BARADA (University of Zadar, Department of Sociology, Zadar, Croatia) | vbarada@unizd.hr
Jaka PRIMORAC (The Institute for Development and International Relations, Zagreb, Croatia) | jaka@irmo.hr

The question of women’s labour is theoretically and empirically conceptualized through two issues: women’s entering the labour market, and work-family conflict, which are both defined by the division between public and private sphere. As women were permeating public aspect of labour, female domestic work has remained economically and politically marginalized. With the emergence of creative industries, the new level of the public and private aspect of female labour was opened. With the intensive research and policy interest for creative industries, the dictum was that creative labour will be emancipatory for both women and men. This proved to be
techno-optimistic fallacy since creative labour resulted in covert re-domestication of female creatives. Although economically independent with lucrative jobs that they consider as a personal choice, female creatives are facing the implosion of the public into the private sphere, while the social value of their work is decreasing. Female creatives’ labour is becoming a golden cage, since it encourages non-paid, underpaid and self-exploitative practices that put women in more precarious positions than men. Female labour practices become embedded into their private homes and daily activities, forging the implosion of public into the private sphere. This paper has a theoretical scope, but draws upon empirical data on women in creative industries in South-Eastern Europe, with emphasis on Croatia.

Long term unemployment of women in Turkey
Seray Neşe KURT (Kocaeli University, Turkey) | seraykurt2012@gmail.com

ABSTRACT
Most of the countries have been facing the problem of rising unemployment and its transformation into structural character. Especially recently, longer durations of unemployment are detoriating the psychological, economical and social status of people, thus leading a serious impact on society. As for Turkey, the most affected group is women in labor force since they are more prone to be excluded from labor market because of its structure, cultural prejudices and traditions as well as gender roles. Therefore, they have less chance of decent and permenant work. Moreover, women are vulnerable to be chronically unemployed once they lose or quit their job. This study aims to analyse structural properties of woman unemployment in Turkey compared to European Union (EU) countries. In this framework, we aim to explain the causes of long term unemployment of women and to evaluate current politics about solution of this situation in Turkey.
Keywords: Long term unemployment, unemployment, women, Turkey, EU.

Changes in earner models in Europe. Towards a Mediterranean version of the dual-earner?
Núria SÁNCHEZ MIRA (Universitat Autònoma de Barcelona, Spain) | nuria.sanchez.mira@uab.cat

This paper examines the evolution of earner models in European countries in recent years, focusing on the important changes that Mediterranean countries seem to be undergoing. Research on female employment patterns in Mediterranean countries has traditionally highlighted their comparatively low activity and employment rates. The combination of low fertility rates and low labour market participation has led some authors to talk about a “Mediterranean path” for women’s labour market integration (Bettio & Villa, 1993). Additionally, research has underlined the prevalence in these countries of the “male breadwinner-female caregiver” model. By means of a comparison of the evolution of the distribution of paid work between men and women within households in European countries in recent years, this paper argues that the prevalence of such “traditional” model in the Mediterranean countries nowadays should be put into question in some respects.
Several studies have addressed issues related to the sexual division of labour in Mediterranean countries in comparative perspective, albeit these have generally based their analyses on aggregated individual data. Other authors have highlighted the importance of using household-based data in order to analyse the gendered nature of employment patterns. Indeed, it is families who send their members out to work, assign household tasks and share wages and resources (Blossfeld & Drobnič, 2001; Moen & Wethington, 1992). Following these considerations, this paper uses EU-SILC data, which allows for the analysis of information of individuals from the same household. Households consisting of heterosexual couples (plus
other adults or children) are included in the analysis, in which we examine the prevalent patterns of distribution of paid labour between the two members of the couple in different countries. We use cross-sectional data for 2005, 2007, 2010 and 2012 for all available countries, in order to analyse the evolution of earner models across time as well as the impact of the crisis. Results show a clear clustering of countries according to the relevance of the different patterns of distribution of paid labour:

1. DUAL EARNER COUNTRIES (Eastern European – CZ, EE, HU, LU, LV, SI, SK, - and France): The division of paid labour in this cluster is closest to the dual-earner ideal. Countries in this group show the highest share of households were both members of the couple are employed full-time (BFT) (well above 40%), a very low percentage of households where the man is employed full-time and the woman part-time (MFT/WPT) (below 5%) and a small percentage of households where the man is employed full-time and the woman is devoted to domestic tasks (MFT/WDT) (ranging from a 1% in HU to a 8,3% in EE). Poland might also be classified into this group, despite its significantly lower percentage of BFT households (30%). The case of France is to be highlighted, since it is the only country from Western Europe that fits into this category with a 42,3% of BFT households, a 5,3% MFT/WPT households and a 5,3% MFT/WDT households.

2. DUAL EARNER, EXTENSIVE PART-TIME COUNTRIES (Nordic - DK, IS, NO, SE): This second cluster includes those countries where the majority of households have both members in paid employment (around 45-55%). This percentage is slightly higher than for the previous group of countries. However, the main difference with the first cluster is that the dual earner in Nordic countries is often based on a male full-time, female part-time employment pattern (ranging from a 13,3% of households in DK to a 23,4% in IS).

3. NEOTRADITIONAL EARNER COUNTRIES (Continental and Liberal - AT, BE, DE, IE, LU, UK): The third cluster of countries is mainly characterized by the relevance of female part-time employment (16-19% MFT/WPT households), together with a low percentage of BFT households (15-25%) and a high percentage of MFT/WDT in comparison with the first two clusters. However, the existing heterogeneity between countries regarding the importance of MFT/WDT households must be pointed out. It ranges from a 7,4% in the UK to a 23,6% in LU. Besides, the Dutch case might also be classified into this cluster, albeit it stands out for its very reduced number of BFT households (8,6%) and its very high share of MFT/WPT households (25,3%).

4. DUAL/TRADITIONAL POLARISED COUNTRIES (Mediterranean – ES, GR, IT, PT, CY– and Finland): If we look at the percentage of households where both members are employed, the countries in this fourth cluster are placed below the rest. However, if we focus on BFT households, we see that these constitute a higher percentage of households in every country in this fourth cluster (but Italy) than in any country of the neotraditional one. Indeed, the main characteristic of Mediterranean countries and Finland is a strong polarisation between BFT (30-40%) and MFT/WDT (20%) households. There is, however, some heterogeneity within this group. Portugal and Cyprus show a percentage of BFT households as high as the one of the first cluster of countries (above 40%). Greece, together with Portugal, has the lowest percentage of MFT/WDT households (6,3 and 11% respectively). Italy seems to hold the most traditional division of labour, with a 22,2% of BFT households and a 20,9% of MFT/WDT.

The paper shows that when we look at the distribution of paid labour within households in comparative perspective some mainstream classifications are nuanced, especially those who label Mediterranean countries as most traditional in terms of female labour market participation. Figures show indeed that dual-earner households are more extended in Mediterranean countries than in most liberal and continental countries within the EU, and the number of this type of households seems to been increasing. The data show particularly remarkable changes in Spain, which had the lowest percentage of dual-participant households in 1992 (Franco & Winqvist, 2002) and has since then undergone a steep increase according to our analyses.
Even during the crisis, women’s employment behaviour has followed a strong countercyclical logic, which has increased the number of households where the woman is the main or sole provider. These changes appear as particularly surprising if we take into account that they have happened in a context of increasing labour market precariousness and they have not been accompanied by public policies to promote and support such pattern of double participation. This points out to the economic necessity of families as a main driver for such increase, as well as to the key role of the extended family in supporting its viability.

Gender Patterns in youngster’s trajectories: Findings from a longitudinal study
Fátima Maria ASSUNÇÃO (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | assuncao@iscsp.ulisboa.pt
Anália Maria Cardoso TORRES (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | atorres@iscsp.ulisboa.pt
Diana MACIEL (CIEG/School of Social and Political Sciences (ISCSP-ULisboa), Portugal) | maciel.diana@gmail.com

Based on findings from a longitudinal research, “EPITeen24”, that analyzed a cohort of people born in 1990, assessed at the ages of 13, 17, 21 and 24, we develop a study of youngsters gender patterns’. We will focus on school experience, decisions on school prolonging and on entering the labor market, through the lens of intersectional analysis combing social class, social mobility and gender inequalities.

The fact that young women have in general higher educational attainment than young men has been largely discussed. It is accepted that girls have more school-orientated practices. And some authors even point out to what they call “school alienation”, especially among working class background boys. However, this effect does not extend to young men from the middle or more advantaged classes.

With regard to the transition into the labor market, other author’s research findings seem contradictory. On one hand, the change from a production economy to a service economy seems to benefit women in terms of employment opportunities. This may translate into more advantageous positions for them, in comparison to men, at least in some type of jobs. But gender inequalities persist. Women occupy more jobs in services and caring areas. Men occupy more places in positions of authority, prestige and status. Thus, inequalities in the labor market persist, women being employed in sectors of activity in general worse paid and in more precarious and unstable situations. So who is winning and where? Who is loosing and where?

RN33S11 - Gendered Organizations

"Do You Know How Many Engineers Wanted to Marry Me?": Gendered Construction of Engineering Culture in Turkey
Ezgi PEHLIVANLI-KADAYIFCI (Midle East Technical University, Turkey) | esgi.pehlivanli@gmail.com

Being addressed as the engine of modernization, professional engineering was brought to Turkey in earlier times of Republican reforms with its pregiven masculine codes. These codes articulated with Turkey’s strictly patriarchal structure. 1965 and on Turkey has witnessed the rise of male engineer as a political actor (Göle, 2007: 8). From 1965 until 2000’s engineer originated politicians had been ruling figures of Turkey’s politics. As a result, engineering was conceived as a prestigious occupation for men, since publicly known examples in Turkey became symbols of managing politics and production. Reputation of the occupation has grown
and marrying an engineer or even getting a proposal from one, is seen as a symbol of status for a women.*
This study is about gendered construction of engineering occupation in contemporary Turkey. It is a study for understanding the gendered discourse within and about engineering occupation depending on the argument that gendered aspects in engineering are ideological and are based on a complex web of general and particular discourses around traditional gender roles, technical know-how, masculine hardness and feminine softness.
In order to achieve these, a theoretical tool called "gendered engineering culture" is introduced. According to this, gendered engineering culture is the socially defined standard of behavior and interaction among engineers and is based on a stereotypical male gender role that works against women, and other masculinities that are inconsistent with the male engineer stereotype (Robinson & McIlwee, 1991). This culture is not only experienced by engineers but also its gendered codes are known, produced and reproduced by the whole society.
Thus, this study addresses experiences of forty women and men engineers with regard to their perceptions about engineering and perceptions they receive from Turkey's society, in addition to ethnographic studies in three factories in Ankara.

Lost in Translation? Tensions of inclusive teaching in the neo-liberal university.
Elisabeth Anna GÜNTHER (TU Wien, Austria) | elisabeth.guenther@tuwien.ac.at
Sabine T. KOESZEGI (TU Wien, Austria) | sabine.koeszegi@tuwien.ac.at

The neo-liberal university has to fulfil several important tasks simultaneously, e.g. being efficient, achieve high positions in rankings, and educate students. Lobbyist and government agencies make demands on universities, such as to educate more skilled workers or to promote gender equality. Key words in this context are quality of teaching, excellence and equity. Even though those key words do not necessarily have to be contradictory, it appears as if they generate uncertainty and tension that lecturers try to solve by resorting on their incorporated habitus. In a sense, they translate external demands and try to meet them as good as possible with the (limited) resources available.
In this paper we address these translations and the inscribed possibilities of inclusive scientific careers in a neo-liberal university by examining lecturers notion of students. We invited lecturers of mathematics, physics and informatics to group discussions and asked them to talk about their challenges and what they deem important skills for students. Our data unveils tensions and hurdles for inclusive, fair lecturing: for instance the lack of a common understanding on the goals, which results in uncertainty and the question who is authorised to let students fail, or a preservative, elitist notion of the own discipline and skills. Altogether the challenges are manifold and it appears as if both, lecturers and demands for equality, run the risk to get lost in translation.

Gender, accountability and leadership performances
Yvonne Due BILLING (University of Copenhagen, Denmark) | ydb@soc.ku.dk

In the paper I wish to investigate how accountability influences the performances by women managers. Accountability is central to social interaction in organizations, as we hold each other accountable for our adherence to or deviance from social norms of gender. We engage in behavior at the risk of gender assessment, therefore it is according to West & Zimmerman unavoidable to ‘do gender’. This does not mean that we are doomed to do gender, it is possible to undo gender, there is resistance and people challenging the gender norms, although it is more uncertain if it is possible to non-do gender (see Alvesson & Sandberg, 2013). In this
paper, I will show how women managers are resistant, compliant or even trying to undo gender in organizations. Furthermore, I wish to discuss the term performance from a gender perspective, what are skillful performances and how are they evaluated? It seems to be a gendered concept, in the sense that the biological sex contributes to or even some times is decisive for the expectations to the competences and performances. Women managers have experienced that they are held accountable for their performances not just as managers but as women managers (see Billing, 2006, Gherardi, 1995). Finally, I am going to discuss how and why the use of the concept of gender (cultural constructions of men and women) is unproductive when it is seen as a fixed

The right to represent – Parliamentarians talk about their representative roles.
Malgorzata FUSZARA (University of Warsaw, Poland) | mfuszara@op.pl

The right to represent – Parliamentarians talk about their representative roles. Feminist literature emphasises the fact that domination of men makes it necessary not only to eradicate discrimination, but also to equip women with power The key factor is women’s access to roles and positions that would allow them to shape and redefine these roles and the relevant norms. This can be labelled as women’s exercise of their right to represent. From this point of view not only descriptive but also substantive representation is very important. In the paper I will present results of research conducted in parliaments of 6 European countries (Great Britain, Macedonia, Latvia, Poland, Spain and Sweden) on men and women pathways to parliaments and the motivations behind them, obstacles to running for a parliamentary seat and about representing women, women’s interest and their point of view in the Parliament.

"The Unsung Heroines: Female Vietnam Veterans in American Memory
Monika ŻYCHLIŃSKA (University of Warsaw, Poland) | monika.zychlinska@gmail.com

The Vietnam Women’s Memorial Project (VWMP) was founded in 1983 as a grassroots organization to commemorate the efforts of around 265,000 American women, military and civilian, who participated in the Vietnam War. They were subjected to double marginalization – as Vietnam veterans they were stigmatized for their participation in a socially unpopular and divisive war, and as women, who constituted 0.2% of Vietnam War theater participants, they were virtually invisible within the veteran community. In raising popular awareness that “women also served,” the organization managed to garner support from predominantly male veterans, albeit with some protest and controversy. In 1993, after ten years of intense campaigning and fundraising, the Vietnam Women’s Memorial was inaugurated as part of the Vietnam Veterans Memorial in Washington, DC.

This paper explores the interrelations between identity, gender, and war remembrance from the perspective of cultural sociology. It addresses a lacunae in the vast scholarly literature on the American Vietnam veterans where relatively little attention has been given to the organizations founded and run by the veterans themselves. Contrary to the majority of the existing studies, it focuses its attention on women, not men. Its object is the formation of the public image of the American female veteran. It analyses the discursive strategies and argumentative repertoires the VWMP used in order to make their strong moral claim that although women’s experience of war was different from that of men, it was no less important or traumatic, and that it deserved equal national recognition. Specifically, the paper discusses the content of the message communicated by the VWMP – norms, values, typologies and other cognitive schemata that the organization referred to in order to persuade the general public that the category of an American national war hero should be extended to include the supportive and care-taking roles that women performed during the war.
It addresses the following questions – what claims of significance did the VWMP put forward? What already existing social representations of war and veteranship did the organization refer to? What ideas of a national war hero, American citizenship, and womanhood did it use to depict women’s experience of war? Who did it direct its message at? What groups and institutions did the VWMP treat as potential allies/opponents/rivals of their claims? The paper also discusses the mechanisms and means of symbolic production – such as methods of self-presentation, managing impressions and emotions in front of the general public – which the leaders and activists of the organization employed. It addresses questions such as - what kind of emotions did they the leaders and activists aim to evoke in their interaction partners? What means of collective presentation did they use? Finally, how did they encourage Vietnam women veterans to celebrate their identity?

The paper also takes into account how the VWMP’s narratives and actions subscribed into the general struggle to provide the Vietnam War with a socially acceptable meaning and affirm the identity and status of its veterans.

The above questions will be answered on the basis of an analysis of archival documents collected at the VWMP (statutory and program documents, minutes from meetings, newsletters, press releases, interviews with the VWMP leaders and activists, brochures, leaflets,), the documents collected at the Commission of Fine Arts and the National Archives in Washington DC, as well as twenty-two in-depth interviews with female Vietnam veterans. The research was made possible by a 5-month grant from the Kościuszko Foundation (Sep. 2012-Feb. 2013). I returned to Washington DC to do participatory observation of the 20th anniversary of the memorial’s dedication in November 2013.

**RN33S12 - Gender Regimes in Post-Socialist Countries**

**Gender and sexuality in Central and Eastern European social media discourses**

Joanna CHOJNICKA (University of Konstanz, Germany) | joanna.chojnicka@uni-konstanz.de

This presentation introduces a new postdoctoral project which offers an analysis of the ways gender and sexuality are constructed in social media discourses of Central and Eastern Europe, taking account of how these constructions reflect or foster different groups’ interests, and how these groups’ power positions affect the diffusion and propagation of their discourses and underlying ideologies.

In discourses of various social groups, a specific understanding of and attitude towards gender reveals a much broader system of normative and prescriptive assumptions regarding sex, gender and sexual desire. Here, gender in each of its possible understandings functions as a kind of code-word that activates a repertoire of associated ideas on how gender and human sexuality should be understood, what is rendered acceptable (boundaries of normativity), what is deviant, subject to shame or social stigma, how femininity and masculinity are defined, and what the place of women and sexual dissidents should be in society.

Still, this does not exhaust the meaning potential of gender. In some CEE languages where it preserves its original form, the word still sounds foreign and thus alien and threatening. Its meaning may be easily manipulated according to the needs of the moment. In radical right-wing discourse, “hating gender” combines extreme homophobia and aversion towards the European Union with a concern for family and children, surpassing the issues of sex, gender and sexual desire. In approaching such discourses in the proposed study, gender is not problematized for its own sake, but as a reflection of wider ideological systems.
Woman in contemporary Georgia - family’s breadwinner or housewife? How have changed the place of woman in Georgian society after the collapse of the USSR?
Natallia PAULOVICH (Polish Academy of Sciences, Poland) | n.paulovicz@gmail.com

Traditionally women in Georgia were involved in bringing up children and caring for families while men were breadwinners and performed only supportive role in bringing up children and keeping domestic economy. Now many women actually are breadwinners. Such position of contemporary Georgian women is largely depend on the current socio-economic situation in the country caused by the collapse of the Soviet Union, the wars in Abkhazia and South Ossetia and the civil war during this period. It is the women who begin to earn money for all of their families while men wasn’t able to deal with the “post-war syndrome” and lose a job. These problems of early 90s joined a factor of high unemployment in the country what again resulted mainly on men. In such circumstances women are working hard to support their families outside of home but also putting a lot of energy in caring for the members of the family at home put their career and taking care for other members at the center of identity claiming that these two spheres allow them to express themselves. That allow me to talk about these women as possessing agency. Activities of women (in the home and outside it) are becoming a key point of cultural production and social reproduction which allow these women to move between the household and the public sphere. I came to this statements through fieldwork in Ozurgeti, Georgia, using as a research methods participant observations and in-depth interviews.

Collective Female Identities in Discussions about Pussy Riot’s Performance
Anna AGALTSOVA (VU Amsterdam, The Netherlands) | a.s.agaltsova@gmail.com

In this paper, I address the issue of collective female identities in contemporary Russia. The Pussy Riot performance is regarded as a critical event that serves as a trigger for certain 'groupness'. Taking critical event perspectives avoids framing the respondents with the researcher’s predetermined categories. The empirical data is collected via collective interviews with the diverse group of Moscovites. Analysis highlights the domination of an authoritarian/collectivistic interpretative repertoire in older participants’ discussions about the performance, which has resulted in the articulation of the image of the disadvantaged female and the denial of women’s agency. The younger participants, being familiar with a co-existing liberal interpretative repertoire, have continued to use a conservative repertoire to discuss Pussy Riot. This and a general lack of gender problematisation in the interviews indicate that feminist discourse is not at all widespread in the Moscovites’ everyday discourse.

The Importance of Gender Sensitive Water and Sanitation Services in Women’s Empowerment in Rural Azerbaijan: a Comparative Research in Agcabedi, Balakan and Beylagan
Senem Elcin BERBER (Hacettepe University, Turkey) | senemelin@gmail.com
Anar VALIYEV (State Economic University, Azerbaijan) | anarvaliyev@mail.ru

Feminization of poverty in rural Azerbaijan is one of problems that need to be tackled in the rural Azerbaijan. Inequalities between women and men in the context of patriarchal family structure mainly effect rural women’s participation in social and economic life. Especially, women’s
insufficient access to water and sanitation services and gendered division of labour are some obstacles to achieve gendered rural development.

Gender – sensitive water and sanitation services play an important role in empowering women living in rural areas. As one of development initiatives, Asian Development Bank in collaboration with the Republic of Azerbaijan aims at improving public environment by promoting the quality, reliability, and sustainability of water supply and sanitation services in the selected secondary towns.

The main objective of this research is to determine women community members’ needs by specifying safeguard measures to provide equal utilization of water and sanitation services in rural Azerbaijan. In this context, socio – economic surveys were conducted to a total of 751 household heads and semi - structured interviews were conducted to a total of 300 women living in Agcabedi, Balakan and Beylagan Rayons in September 2011.

Based on some of findings of the study it can be concluded that women are facing a high level of patriarchy especially in terms of their employment. Unemployed women don’t have chance to work due to patriarchal family structure and traditional duties. Additionally, women suffer more than men because of bad water and they effected by its color, smell and taste. In this research, vocational trainings and raising awareness activities on gender – sensitive water and sanitation activities for women have been regarded as crucial for women’s empowerment in rural Azerbaijan.

RN33S13 - Gendered Family Relations

An Analysis of the Increasing Number of Divorce in Denizli on the Status and Gender Role of Woman
Mehmet MEDER (Pamukkale University, Turkey) | mmeder@pau.edu.tr
Zuhal CICEK (Pamukkale University, Turkey) | zcicek@pau.edu.tr

Divorce is a so complex phenomenon that cannot be analysed in a single dimension. It is a problem evaluated within the centre of changes in economic, social, cultural and political fields. In this study, the reasons of recent increase in the number of divorces in the city of Denizli, which holds a crucial point in the textile industry of Turkey, are analysed. The study aims to point to the rapid increase in the divorce ratio in Denizli by highlighting the importance of economic and cultural factors in the dissolution of marriage. Denizli has undergone a fast economic transformation after 1980s when the textile industry became the major source of economic development in the city. An important part of the population has been employed in the different positions in the textile sector. Especially, a fast increase in the ratio of women working in this sector has been observed. Women have been employed in the large, medium and small sized enterprises in different income levels and social security and status. The active participation of women in real sector paved the way of economic freedom. This study suggests that economic freedom of women and the change in their income in time are important variants in the transformation of the family structure and dissolution of marriages. Therefore, the income of the woman and her ratio in family income are deemed important as they affect the traditional role structure between the partners. Moreover, in this empiric study, it has been assumed that the divorce probability in the lower socio-economic level is higher with the changes in socio-economic status because lower income and education level limit the chances of partners to access economic, social and psychological sources. Many variants like the communication between partners, marital expectations, strategies to keep the marital relation, better economic expectations, management or use of time are limited relatively in lower socio-economic level and this causes conflicts between partners and increase the divorce possibility.
Another point analysed in this study is the increasing flexibility in marriages following the process of socio-economic transformation. Factors like cultural and institutional regulations, changes in life style, the spread of alternative life forms, relative change in sexist ideology have changed the way the marriage is perceived and, therefore, affected the divorce ratio. Compared to the past, in Turkey, divorce is not perceived as a limited situation regarding the traditional values. The fact that the individual preferences and the level of personal satisfaction has been perceived as a basic criteria is noted as an important variant causing an increase in divorce ratio.

The study includes divorced people in Denizli. The sample group consists of 354 people; 177 women and 177 men. A questionnaire is applied on the sample group and in-depth interviews were carried on 6 people. The data of the study has been analysed both qualitatively and quantitatively. The relation between the variants has been analysed using chi-square test.

**Undoing gender in the home: how does it work when the first child arrives?**

Teresa JURADO-GUERRERO (UNED, Spain) | tjurado@poli.uned.es
Marta DOMÍNGUEZ-FOLGUERAS (OSC-Sciences Po, France) | marta.dominguezfolgueras@sciences-po.fr
Carmen BOTÍA-MORILLAS (UPO, Spain) | carmenbotia@upo.es

The objective of this paper is to study undoing gender from a longitudinal perspective (two-waves-qualitative panel), a relatively uncommon aim in previous qualitative research. What enables some women to attain an equal sharing of housework, while others think it is unfair but do not manage to change it? What role do negotiation and conflict play in undoing gender? Does the arrival of the first child change housework divisions among equal-sharers? We perform a qualitative analysis on semi-structured interviews gathered in 2011 (first interview), for 33 couples with a non-traditional division of domestic work and waiting for their first child, and follow them until 2013 (second interview). We identify three different ways into equal-sharing in the first wave, describe their workings and favouring factors. Then, we observe which couples continue equal sharing, whereas others traditionalize. We conclude that, first, there is no need to undertake an explicit negotiation about how to distribute domestic chores; second, in these couples resources (in a broad sense) and attitudes are combined in a non-hegemonic way; third, certain pre-child ways to equal-sharing lead more easily to the persistence of undoing of gender in heterosexual families with a baby.

**Inequality in gender roles and professional habitus: The construction of family on the example of engineers**

Yves JEANRENAUD (Technische Universität München, Germany) | yves.jeanrenaud@tum.de

The engineering profession is suspected to be traditional, especially with regards to the attribution of gender roles and constructions of career, family and parenthood. Hence the presented doctoral thesis asked about the processes of construction of parenthood using the example of engineers and explained the effects of their traditional bourgeois professional culture and habitus on the roles and ideas of family and their expectations in relation to parenting. These research questions were investigated by a method mix of qualitative content analysis, biographical method and discourse in a Grounded Theory framework with narrative interviews. The mostly unconscious decision-making processes in individual biographical histories were examined and the inherent attitudes and expectations were investigated in order to disclose internalized and predominantly unreflective patterns of individual everyday conceptualisation, action and perception and to reconstruct subjective meaning structures about parenting.
Main findings of the study are how the professional culture and habitus of engineering structure models of family and parenthood. The findings show the choice of career and study subject can be considered a key factor in biographies to the construction of their professional identity. Based on these decision processes they construct parenting in the context of their employment history, which they maintained the separation of work and family life in a private and public sphere because of their professional habitus and therefore perpetuated the bourgeois gender order. Going on from these findings, the question of generalisation has to be proposed and how sociological imagination broadens these particular experiences in a wider social context.

New ways of parenting? Gendered mediation of children’s internet use in Estonia
Kairi TALVES (University of Tartu, Estonia) | kairi.talves@ut.ee
Veronika KALMUS (University of Tartu, Estonia) | veronika.kalmus@ut.ee

Parental mediation of children’s internet use is often considered as a ‘new’ or ‘specific’ type of parenting challenging the traditional ways of raising children. Viewing mediation as a challenge for parents stands on a widespread idea that most of today’s parents have not grown up in the internet boost period, and are thus feeling unconfident in supervising their children. This paper focuses on Estonia as a country that has gone through remarkable economic, technological and social transformations during the last decades. These changes have affected inter-generational relations, as well as parenting practices and communication patterns in family. We employ data from focus group interviews conducted with Estonian parents of 9-12 year old children in 2012 and 2014 to analyse if parents have different views on mediating (i.e. supervising, monitoring and restricting) their sons’ and daughters’ internet use and how parents’ views on mediation and their everyday practices of dealing with their children’s internet use provide a deeper insight into gendered power and socialization discourses. Our results show that in Estonia as a country with low gender equality, but high internet use, mediation strategies are reflecting the tensions between traditional and modern ideologies of parenting and parental authority. Parents’ methods in mediating boys’ and girls’ internet use differ in several aspects, thus reflecting the broader context of changing socialization practices, gender norms and the generation gap in using digital technologies.

Out of the Family – In New Forms of Family. Migrant Women into the Core of the Family Images
Tünde TURAI (Hungarian Academy of Sciences, Hungary) | tturai215@gmail.com

East European women entered the global care market after the collapse of the Iron Curtain. New patterns of migration and new patterns of family are shaped due to the gender based exodus. Housewifes and mothers leave their homes for helping their family members to reach better opportunities by the remittance they gain in the care sector. This transnational organization of work leads to new redistribution of relations and responsibilities at the interface of the global and the individual dimension. It seems the activities performed by women are strongly related to the institution of the family, either by their presence or their absence. On the one side the emigration of women is perceived as a risk for the family left behind and the transnational family is discussed in terms of danger for this sensitive institution. On the other side the integration of the migrant care workers into the receiving country and their relations with the employers and/or the person cared for are shaped by a family imagination as well. The outcome of the female migration is an intertwined process of (re)negotiation of the family institution. Women seems to be strongly connected to family images, so new alternative forms of the family comes into display on both sides. The paper presents this phenomenon based on
interviews conducted with Romanian and Hungarian women working in the elderly care in Southern and Western countries.

**RN33S14 - Gendered Violence and Institutions**

**Recasting welfare regimes for gender equality: An innovative analysis from the field of services to fight violence against women**

Consuelo CORRADI (Lumsa University, Italy) | corradi@lumsa.it

In spite of the fact that actions and services to fight violence against women exist since the 70s in Europe, research on and typologies of social welfare rarely consider them. This paper argues that analyzing this field of social and gender policies offers an innovative point of view to evaluate the role of the State, women’s movements and supra-national bodies such as the EU in reducing violence and promoting gender equality. The paper charts 10 European countries with regard to state intervention on violence against women, and it evaluates policy developments over 40 years, while focusing on the EU as an accelerating factor of change. The 10 countries under study are: Finland, France, Germany, Italy, Netherlands, Portugal, Slovenia, Spain, Sweden, and the UK. At the end, the paper argues why there is no correspondence between the country charts and classifications of Welfare regimes. It claims that the state is a powerful instrument, but only on condition that it acts under pressure from or in combination with activists and supra-national bodies.

**Understanding gender relations in intimate partner violence**

Melanie GOISAUF (University of Vienna, Austria) | melanie.goisauf@univie.ac.at

Previous research has shown that gender makes a difference when violence occurs in the public or private sphere. Women experience violence more often by their male partners, and domestic violence was long constructed as a private matter in the public discourse. When theorizing gender in intimate partner violence, the answer to the question about how gender matters in violent heterosexual relationships vary depending on which theoretical approach of understanding gendering processes is used. Connections between gender and intimate partner violence can be understood differently depending on which gender theory is applied. Divergent theoretical approaches, which could be classified as interactionist or structuralist, offer different ways to study domestic violence. Both perspectives provide fruitful approaches to understand gendered violence by focussing either on social practices in which gender is ‘done’, or put it into the context of a larger system of gender inequality and power relations. In this paper I want to address the approach of practice theories, which aims to overcome the action-structure opposition represented by the two approaches. By using qualitative empirical data, I will explore how we could analyse the complex ways in which partner violence is gendered by going beyond dichotomous constructions of ‘male perpetrators’ and ‘female victims’, and to understand how intimate partner violence is constructed as a gendered phenomenon in the private sphere.

**‘I am not a victim’: discourses and resistances to the victim figure among women who have suffered gender violence in Spain**

Maria MARTINEZ (University of the Basque Country, Spain) | maria_m_g@hotmail.com

The aim of this communication is to analyze the discourses of women who have suffered gender violence in Spain with regard to the concept and figure of victim. In the last years, we
are witnessing an increasing use of the concept of victim for several situations and causes —
victims of political violence, victims of car accidents, victims of catastrophes, victims of an
illness, even victims of evictions and the economic crisis...—. Besides there is an increasing will
to recognize one-self as victim, which becomes at some level a subject of rights and of social
recognition.
The fieldwork done with women who have suffered violence inflicted by their partners and/or ex-
partners in Spain shows a complete rejection and resistance to adopt and auto-identify one-self
as a victim at an individual but also at a collective level. The hypothesis that we want to confront
is that this rejection is due to the semantic relation of the concept of ‘victim’ and the hegemonic
and traditional form of ‘femininity’. Victims are considered as passives, without agency and that
have to be assisted and taken care of. After a general contextualization of the situation of laws
and programs against gender violence in Spain and the figure of ‘victim of gender violence’ they
produce, we will analyze the discourses of women interviewed to the victim figure with special
attention to their resistances and rejections. The resistances and rejections to the victim figure
must have effects in the processes of recovery of these women.

**Statutory rape in Brazilian Courts: intersections between discourses of gender and childhood.**

Luisa Teresa HEDLER FERREIRA (University of Brasilia, Brazil) | luisa.hedler@gmail.com
Evandro PIZA DUARTE (University of Brasilia, Brazil) | evandropiza@gmail.com

Even with Brazilian Law clearly stating that having intercourse with a person under 14 years of
age is considered rape, there are cases in which the defense argues that the sexual act was
consensual. The objective of the present work is to analyse the intertwining discourses about
childhood, gender and sexuality that arise when these cases reach the highest instances in the
Brazilian Judiciary. The way in which legal discourse is constructed, articulating these three
factors to construct the figure of the victim, is of special interest: is the childhood protection legal
framework used and strengthened in these cases, or do gender prejudices penetrate legal
discourse to an extent that the roles of victim and aggressor become reversed?. It is also
important to notice how all these factors are articulated within the criminal system, scrutinising if
the response given is satisfactory to the complexity of the situation. This will be accomplished
by an analysis of court rulings in the two high courts in Brazil in the last twenty years focusing
on the representations of childhood, sexuality and gender of statutory rape cases.

**RN33S15 - Women’s Movements**

**Rethinking Evolution of Egyptian Women’s Movement from nineteenth-century up
to the 1952 Revolution within the context of Huda Sha’rawi and Doria Shafik
leaderships**

Övgü ÜLGEN (Bogazici University, Turkey) | ovgu.ulgen@gmail.com

Egypt, having one of the longest feminist tradition in the Middle East, remains as a significant
country so as to understand its unique character with respect to feminist movement and the
notion of awakening women. Nadje al-Ali (2000: 56) asserts that “many studies dealing with the
Egyptian women’s movement begin their analysis with women’s participation in the 1919
nationalist revolution”. In order to conceptualize the twentieth-century Egyptian feminism, this
paper attempts to look at the roots of nineteenth-century feminism to see changing social and
political aspects of Egyptian culture. For this, I divide my paper into three main headings, firstly I
will describe the urban harem culture which was immanent in Egypt in nineteenth-century to better apprehend the necessity for such a feminist movement in the twentieth-century, secondly I will explain the Egyptian Feminist Union (EFU), its coming into scene under the importance of Huda Sha’rawi’s figure and Bint al-Nil Union pioneered by Doria Shafik later. Lastly, I will try to compare contents of some of the journals that raised their voices for the women’s issues in Egyptian society, two organs under the EFU, namely the L’Egyptienne and al-Misriyah; and Bint al-Nil and La femme nouvelle within Doria Shafik’s struggle. I will mainly argue that creating dichotomies through Huda’s more nationalist and indigenous leadership and Doria’s role for the Egyptian feminism that has been interpreted as west-oriented by some scholars is dangerous for the development of women’s movement in any parts of the world.

Gender and street protests in Taiwan
Yin-Zu CHEN (National Taipei University, Taiwan, Republic of China) | chenyz@mail.ntpu.edu.tw

Gathering on the street is one of the most conventional repertoires of collective action. However, it is not the preferred choice by women’s movements, due to the exclusion of women in the public sphere. Despite previous studies about gendered strategies and tactics of women’s movements, we don’t have a systematic understanding of the impact of gender on public demonstrations in general. Does women’s participation affect the tactics of protests? Why do women and men have the repertoire of possible tactics that they do? Does gender inequality structure always have the same impact on protest events? I analyze the repertoire of tactics in street protests which mostly involved women in Taiwan between 1997 and 2006 to answer those questions. This analysis compares the protests of different gender composition: events with a majority of female participants and events carried out only by men. I argue that both the institutional domain (division of labor at home and segregation of occupations) and cultural expectation (control of one’s body and gendered role) constrain the tactics used by women in street protests; but the impacts of gender structure differ according to protest situation.

What is inclusive or exclusive: Identity construction of Feminist Magazine (1988-90) in Turkey
Demet GÜLÇIÇEK (Middle East Technical University, Turkey) | gulcicek@metu.edu.tr

I have been deeply interested in the emergence of feminist movement in Turkey, which starts from 1980s and which is left as a gap never researched before. Meanwhile, I am aware of that the poststructuralist feminist/queer criticisms against identity politics have been rising worldwide based on the arguments of Judith Butler. I conducted a field research with the Feminist Magazine which is a radical feminist publication within 1987-90 by taking Butler's methodological intervention. My analysis is based on the contributions of these kind of a poststructuralist questions. During the fieldwork, one of the most important patterns I found out was the “discovery of womanhood”. I claim that the womanhood was not discovered, but constructed by the women of the magazine as Butler debates with her concept of representation. Secondly, the format of “I lived this, because I am a woman” is repetitively found in the fieldwork. According to Butler, it erases the multiple dimension of the social and political understanding. I will open up this point with her debate of reification. Finally, I will talk about the construction of normative area following Butler’s line. The ideal feminist women is constructed and the expectation from a feminist women is idealized. That is why many women had felt excluded from the area and had quit the magazine.
With this research, I conduct a sociological research to understand the inclusive and exclusive parts of feminist movement of 1980s in Turkey based on the concepts of representation, reification and normativity.

**Women's NGOs and Activism in the Current Context in Turkey**

Fatma Belkis KUMBETOGLU (Yeditepe University, Turkey) | belkiskumbetoglu@gmail.com
Bahar KIRIKER (Yeditepe University, Turkey) | baharkiriker@gmail.com
Gamze DEMIRHAN (Yeditepe University, Turkey) | demirhangamze@gmail.com
Kivanc TASKAN KIREMITCI (Yeditepe University, Turkey)

The experiences of women within the movement for democratic rights during the last twenty years' women's NGOs have grown and taking on increasingly important responsibilities. This presentation will focus on different factors behind the women NGO's which affect their organizational sustainability, efficacy of project implementation, and their struggles for strategic gender needs in the context of the expansion of civil society in Turkey. This presentation and assessment will be based on the findings of qualitative research carried out in three cities in East Marmara region in Turkey in 2014. The discussion will cover the women's narratives that reflect women's ideas, concerns, thoughts, expectations, and their collective actions in the NGO's. It will also include the issues and constraints that women face when organizing their activities as active agents and struggle for suppressive customs, traditions, and barriers. Some groups of women challenge the control of different factors (cultural, political, economical) and also challenge the reproduction of traditional gender systems (such as leadership patterns, personas, power of class positions, male processes of domination). The issues will touch upon in this presentation will be analyzed and interpreted in various ways by the contribution of women who participated and shared their views with us in the research.

**Islamic Feminisms Compared: Iranian and Turkish Experiences**

Aysegul GOKALP KUTLU (Kocaeli University, Turkey) | agokalp@gmail.com

“Turkey will not be Iran”. This was the motto of secular feminism in Turkey after the Iranian Revolution of 1979. The gender policies of the post-revolutionary Islamic Republic, especially the image of the veiled Iranian women had its repercussions in both the Islamist and secular spheres of Turkish society. While the secular Turks looked down on the Iranian women under the Islamic Republic, Islamist spheres interpreted the revolution as the independence of Islamic way of life from the imposed Western values. The increasing appearance of veiled women in public sphere in Turkey during 1980s and 1990s created fear and discussions over whether secularism, a main founding principle of modern Turkey, was in danger. With the 2000s however, the state's attitude towards the visibility of veiled women softened under the neoliberal and moderate-Islamist Justice and Development Party (AKP) rule. A new strand of feminism which is mainly supported by the AKP’s women’s branch took the guidance of Islamic principles for redefining equality and the status of women. This new feminism became vocal especially with the support of the political authorities and media. Keeping in mind that Islamic feminism in Iran has its unique roots and experiences, this paper aims at comparing and contrasting the new feminist strand in Turkey to the Iranian Islamic feminism. The paper will firstly look at the “women question” in the foundation of both Turkey and the Islamic Republic of Iran, secondly compare and contrast the ideological sources of Islamic feminism in both countries, and lastly offer guidelines for possible gains for the Islamic feminists of Turkey by looking at their Iranian counterparts.
RN33S16 - Gendered Identities in Islamic Countries

Gender Related Barriers to Physical Activity among Young Educated Saudi Women: A Qualitative Investigation
Mazna Abdulrahman ALMARZOOQI (King Saud University, College of Applied Medical Science, Riyadh, Kingdom of Saudi Arabia; The University of Adelaide, School of Population Health, Adelaide, Australia) | mazna.almarzooqi@adelaide.edu.au
Annette BRAUNACK-MAY

Introduction: Physical inactivity is an important risk factor for the long term health of young people. Health risk behaviours established during youth often persist into their adulthood resulting in potentially harmful effects on long-term health. Although research on physical activity in Saudi Arabia is limited, the few available studies reveal high rates of physical inactivity, especially among youth and women. Hence, there is an urgent need to understand the factors that may shape engagement of young Saudi women in physical activity in Saudi Arabia. This study describes and analyses the factors that hinder the engagement of young Saudi educated women in physical activity and explores the policy implications of these findings.

Methods: A sample of young Saudi educated women (YESW) aged between 18 and 24 years of age currently enrolled as undergraduate students in the Faculty of Health Sciences at King Saud University (KSU) in Riyadh was recruited. Nineteen in-depth interviews were conducted. Interviews and focus group discussions were transcribed and translated into English, coded, and themes were identified.

Results: Results have revealed several barriers for the engagement of YESW in physical activity. Some of the major themes emerging include social and cultural norms, the physical environment, and participants’ knowledge and beliefs about physical activity.

Conclusion: The findings highlight a range of individual, environmental and policy barriers to physical activity among young educated Saudi women. In addition, findings show how gender influences the barriers to engagement in physical activity. Potential intervention strategies include empowering young women in decision making, raising family and male guardians’ support for physical activity both generally and in particular for families and male guardians, and increasing affordable and accessible physical activity options at the environmental and individual levels.

Contesting the Muslim woman identity in Turkey: The controversy on the fashion magazine “Alâ”
Feyda SAYAN CENGIZ (Mardin Artuklu University, Turkey) | feydasayan@hotmail.com

This study investigates the debate revolving around the fashion magazine Alâ which addresses upper middle class women with headscarves in Turkey. While the magazine promotes consumption of luxury through the argument that Islam is not against feminine beauty and “living a good life”, it is subjected to harsh criticism by Islamist intellectuals for promoting conspicuous consumption, sexualizing women with headscarves, and setting a bad example for young Islamic women. On the other hand, staunchly secularist intellectuals argue that the consumption of luxury by Islamic women proves their “insincere” approach to Islam. Even though Islamist and secularist criticisms are seemingly articulated from contrasting points of view, they converge on
the assumption that women with headscarves should essentially be invested in the mission to “prove” their proper relation to Islam in their appearances, attitudes and lifestyles. Much has been written about the rising Islamic bourgeoisie in Turkey, and the concomitant transformation of the Islamic woman identity which manifests itself through new patterns of consumption. Yet, the scrutinization of women with headscarves for their appearances, attitudes, lifestyles remains largely normalized and unproblematized, as well as the contestations over constructing the “ideal Muslim woman” identity. The debate over the Alâ magazine reveals much about the socially and politically charged expectations loaded on women with headscarves. This study analyses this debate in order to trace the ways in which women with headscarves have become the subjects through which issues of identity and lifestyle are fiercely debated among Islamist and secularist circles in Turkey.

Urban Egyptian men and women and the negotiation of conflicting gender ideologies
Mariam Hesham NAGI (Trinity College Dublin, Ireland) | nagim@tcd.ie

New patterns of marriage and family formation are emerging across the Middle East (Rashad, Osman & Roudi-Fahimi, 2005; Singerman, 2007). Universal early marriage is no longer the standard it once was and more women in the Middle East (ME) are staying single or not marrying at all (Rashad, Osman & Roudi-Fahimi, 2005). Changes in the demographic patterns of marriage coupled with broader social, economic, and political changes and driven by globalization and information technologies have created dissonant normative expectations around gender and have led individuals to forge new rules, institutions, and identities within particular cultural and political environments (Singerman, 2007). There is meagre statistical data on the prevalence of extramarital/premarital relations and on non-traditional forms of marriage (El-Zanaty & Way, 2009; Singerman, 2007), but what there is indicates changes in marriage patterns and in the geography of gender. This indicates changing norms and practices at the level of the individual in the field of gender. The focus of this study is to uncover how individuals negotiate the dissonance between established ideologies, norms and practices on gender and newer evolving ideologies, norms and practices, and how these negotiations contribute to social change.

Singerman (2007) posits that many young people in Egypt experience “waithood” as social and economic factors have decreased the occurrence of early and universal marriage and broken the link between sexuality and marriage. In this liminal world, young men and women are expected to live by the rules and morality of their parents and the dominant values of society while the institution of marriage is changing and new marriage substitutes and sexual norms are emerging. These dissonant expectations are intensified when religious, nationalist and neoliberal rhetoric is factored in. This has led to new debates and ideologies about gender, sexuality and morality, generational conflict, a rise of a “marriage black market” and conflicts about gender identity (Singerman, 2007). This study aims to explore the refashioning and innovative negotiation of competing gender ideologies and the reconciliation of fissures that arise from this collision of ideologies.

The study will seek to answer two main research questions:
(1) How do urban educated Egyptian men and women negotiate conflicting and dissonant gender ideologies in relationships?
   a. How are these ideologies articulated in words and action?
   b. What are the strategies and bargains that arise from the negotiation of these ideologies?
(2) How does this produce, reproduce and transform the field of gender in Egypt?
Utilizing the relationship as a nexus where the negotiation of gender ideologies occurs, the study will focus on gender strategies, emotional work, and patriarchal bargains (Hochschild, 1983; Hochschild & Machung, 1989; Kandiyoti 1988).

Research Design
Based on the most recent Egypt Demographic and Health Survey 2008 there are marked differences in the age of first marriage among women according to both residence and educational attainment (El-Zanaty & Way, 2009). Early marriage is much more common in rural than in urban areas; the median age of first marriage among urban women was 22.2 years, around three years higher than the median age of first marriage among rural women (19.4 years). Large differences in age are also seen when looking at educational level. The median age of first marriage among women with a secondary education or higher was 22.9 years, more than three years higher than the median age among women who have complete the primary but not the secondary level (19.3 years) and about five years higher than among women who never attended school (18.0 years). Based on these statistics, the highest median age of first marriage is found among urban educated women. For this reason, my research participants will consist of urban educated Egyptian men and women between the ages of 20 and 35. Individuals between the ages of 20 and 35 are more likely to still in the process of developing gender strategies and negotiating competing discourses, compared to older individuals whose gender strategies may be less flexible and less malleable and not in a phase of negotiation anymore.

In addition to women my sample will also consist of men between the ages of 20 and 35, drawn from the urban educated population in Cairo, Egypt. Attempting an exploration of the current state of the field of gender in Egypt without examining men would yield an incomplete analysis. Apart from a handful of studies examining areas where masculinity is explicitly constructed such as circumcision and the military and the institutionalization of hegemonic masculinities well as the formation of masculinity in nationalist rhetoric (Ghoussoub & Sinclair-Webb, 2000), very little research has been conducted on men and their negotiation of competing gender ideologies. Research participants will be recruited through a combination of purposeful and snowball sampling, starting with personal connections and students from the American University of Cairo. Participant observation will also be conducted. Data analysis will be conducted following a grounded theory approach.

Preliminary Findings
10 pilot interviews were conducted between the months of June 2014 and August 2014 (3 males and 7 females). After the interviews were transcribed, they were preliminarily thematically analyzed to delineate salient themes and topics – 4 main strands were delineated: (1) transitions, negotiations, and bargains (2) consumption, globalization, social class, and distinction (3) rumors and judgment and (4) emotional work, economy of gratitude, and division of labor. These findings have emphasized the mutual construction of class and gender, the role globalization plays in the negotiation of gender ideologies, and the metacultural processes involved in these negotiations.

The interview script was updated to incorporate these 4 main strands and the second wave of interviews was conducted between December 2014 and January 2015. These interviews are yet to be transcribed and analyzed.

RN33S17 - Gendered Bodies and Body Politics

Professional body-objects on display. The objectification of fashion models as a multifaceted process.
Sylvia HOLLA (University of Amsterdam, Netherlands, The) | s.m.holla@uva.nl
The process of objectification is multifaceted. This paper presents the profession of fashion modeling as a case to explore the multiple dimension of objectification, as discussed by Nussbaum (1995). Based on ethnographic data, gathered through participant observation and interviewing, it is investigated how male and female fashion models are treated as ‘professional objects on display’, and how they deal with this, particularly in cases when they experience being objectified as uncomfortable or even problematic. Whereas the structure of the fashion modeling field places all models in a dominated position in which they are likely to be objectified, I argue that the particular extent to, and ways in which, objectification takes place, depends on a model’s gender, the situational context in which it occurs and, moreover, heavily relies on who is doing the objectifying. Models deal with professional objectifying circumstances through strategies of emotional labor and withdrawal. In addition, models are drawn to and draw positive energy from situations in which they are able to carve out spaces to act creatively, and hence more subjectively, as co-producers of beauty.

In and between producing profit and pampering
Päivi KORVAJÄRVI (University of Tampere, Finland) | paivi.korvajarvi@uta.fi

The use of the body and sexuality and their individual performances have become crucial requirements at work in the current economy and consumer culture. The aim of the paper is to illustrate, how gender, body, and affect related performances are used, on the one hand, and required to use, one the other hand, in service work. Through the case study of young beauty therapists the aim is to map out and to discuss the contradictory desires of the beauty therapists and the employers, when they both entangle and prioritize particular aspects of gender, body and affects in the everyday work of skin care. The starting point for the discussion is the concept of body work. However, the case shows that body work hardly grasps the desires and the aims of the beauty therapists to pamper and to relax the clients, and to produce well-being to them. The aim is to show that the conceptual view of the body work needs to be expanded towards the understanding of how affects and body are used in parallel and simultaneously both to produce pleasure and wellness to the clients and to make money within the global beauty market. Further, the aim is to show ways of doing, redoing and undoing gender through using body and affects within the tensions of promoting relaxation and profit making.

Claiming needs and confronting stereotypes of obese mothers- reframing Nancy Fraser’s theory of the politics of need interpretation
Drude Skov LAURIDSEN (University of Copenhagen, Denmark) | dl@ifro.ku.dk

Recent discourse analyses on childhood obesity in Western societies suggest that the body, actions and role of the mother becomes the object for both science and policy, which inadvertently blames the mothers for the obesity epidemic. While these studies have valid points they may unintentionally posit the mothers as lacking agency. As a result, this paper discusses how to reframe Nancy Fraser’s theory of “the politics of need interpretation” from a social policy perspective to a health policy perspective, using a heuristic case of how obese mothers are targeted in the prevention of childhood obesity in western welfare states. I propose that Fraser’s theory can provide an analytical model for investigating the interpretations of the needs of obese mothers. My discussion draws on examples from interventions aimed at obese mothers in Denmark, I highlight theoretical shortcomings and possible pitfalls when applying the theory and suggest how they might be overcome. The paper thereby debates the possibilities the theory offers of mixing socialist feminist perspectives of voicing common maternal needs due to structural inequalities, while drawing on poststructuralist points of deconstruction of group stereotypes.
Transgender women, transgender men and inequalities in fitness activities
Manola DEL GRECO (University of Milano Bicocca - Department of Sociology and Social Research, Italy) | m.delgreco1@campus.unimib.it
Vincenzo FRAUNEDER (University of Milano Bicocca - Department of Sociology and Social Research, Italy) | v.frauneder@campus

Aim of this presentation is to discuss the relationship between transgenderism and the fitness culture in Italy (the case of Milan). As Griffin (1995) writes, the presence of transgender people in fitness/sport challenges some of the foundational social functions of sport. And the inclusion of transgender people in the fitness/sport culture is one of the latest equality challenges for sport governing organizations.

The relationship between transgenderism, fitness and sport activities is still unexplored. The particular sports needs of the transgender community, for example, in terms of changing facilities, continue to be misunderstood and sidelined. Few sport institutions seem to have policies in place covering the issue of transgender people taking part in competition (Out for Sport Research-Equality Network 2013).

Our key question is the following. In a city such as Milan – one of the EU's and the world’s major financial and business centres and the most internationally oriented and global city in Italy – is the fitness culture ready to accept and support transgender people and their specific needs?

In order to answer this question, we will take into consideration three fitness clubs in Milan. Some key informants (fitness club managers) will be interviewed (semi-structured interviews) and will be asked different questions such as: are transgender rights a specific issue for your club? Are you offering specific fitness programs for transgender women and men? How might a coach or personal trainer accommodate the needs of transgender women/men workout programs? Are there in your fitness club specific facilities (such as private showers and locker rooms) for transgender women/men?

Our final aim is to understand how to guarantee full participation in fitness and sport activities for transgender people and to give recommendation on how to ensure the same rights for transgendered non-professional (and professional) athletes.

Drawing as a Method/ology: Situating and En-acting Up Taiwanese Pregnant Women’s Experience of Prenatal Screening and Testing
Li-Wen SHIH (Taipei Medical University, Taiwan, Republic of China) | lwshih33@gmail.com
There are many different qualitative methods in exploring women’s experience of reproductive technology. As some feminists scholars suggest, drawings provide graphic images that make the researchers able to explore, and participate in, the women’s experiences (Guillemin 2004; Smart 2009; Jung 2014). Employing this research method, this paper discusses how I practised this method, how drawings provide a visual context that enables me to figure the ways in which my participants (pregnant women) situated themselves in relations to the fetuses, technologies and their families, and also how this method show me an important methodology lesson. Methods always embody a particular political and epistemological location. Science, technologies and society (STS) scholars John Law and John Urry (2003) and feminist Donna Haraway (1991) remind us that methods are not innocent because they always enact and interfere with realities. The question is how do methods do this? Based on ethnographic observations, interviews with 35 pregnant women and couples, and my participants’ drawings of prenatal screening and testing, this paper extends their arguments illustrating that the way researchers see the world is situated, and that the perspective one chooses must depend on what one wants to achieve. Particularly in resonating with Haraway’s visual metaphor, my methodology re-connects with a series of important methodological writings by feminist scholars. It links to feminist technoscience studies concerned with situated knowledges, emphasising the need to be aware of the situatedness of the characters in research. I suggest using the expression “en-acting up”, which combines the idea of “en-acting” and feminist’s approach of “looking up” women’s experiences, to rethink researchers’ location and relation to participants. In this I contribute to the discussion of method and methodology in STS and feminist studies.

Theoretical Implications of the Ideal of Self-Governance of Pregnant Women: The end of repressive state?
Derya GUNGOR (Queen's University, Canada) | 13dg9@queensu.ca

Technologies of self-governance plays a significant role in constituting pregnant subjects in contemporary Western societies. Women are responsibilized to take care of their bodies and their fetuses in certain ways, from undergoing prenatal tests to avoiding alcohol and drug consumption. Drawing on governmentality literature, first, I will demonstrate how these technologies make pregnant bodies a par-excellence object of self-governance. While governmentality literature offers us important insights into understanding how these technologies of self-governance currently operate, it is indifferent to the political implications of self-governing technologies in terms of gender, race, and class. As a result, it is also indifferent to the diverse ways in which the State intervenes women’s lives. Therefore, later, I will discuss the political implications of the ideal of self-governance of pregnant women from an intersectional perspective. In so doing, I will argue that the State tends to stigmatize less-privileged women who may not embody self-governing discourses and construct them as an object for its authoritarian interventions.

Red Moon and a Cyclical Woman: new modes of femininity between de-traditionalization and re-traditionalization
Michaela ONDRAŠINOVÁ (Masaryk University, Czech Republic) | michaela.ondr@mail.muni.cz

The contribution will discuss a question what discourses are employed in the construction of „new feminities“ (e.g. Gonick 2004) in the context of discussions about menstrual cycle as a source of female spiritual and creative power. It is based on ethnographic research, especially participant observation in two Czech centres for personal and spiritual development that
organize regular circles and seminars for women. I focus on the question how are the objects of menstruation, of the menstrual cycle and of a "natural" femininity created in these settings. In relation to this aim, I explore individual and collective practices that help to discipline female bodies, establish new self-perception as a woman and create the sense of participating in a bigger interconnected collectivity of women.

This new gender identity is created while dealing with an ongoing tension between 1) the emancipation concept of a woman (as an independent, wild, "wolf" woman), connected also to a critique of gender-based inequalities in the social system, and 2) a rather traditional approach to roles of women as mothers and housewives. The emerging gender identity thus springs from a discursive mix which contains both aspects of detraditionalization and retraditionalization of gender; aspects of innovation and conformity. Thus, by analysing this specific case of construction of the “cyclical” femininity I would also like to shed light on the ways the processes of detraditionalization and retraditionalization are entangled in contemporary society.

‘Social Freezing’: risk management against ‘nature’?

Julia FEILER (Ludwig-Maximilians-Universität München, Germany) | julia.feiler@soziologie.uni-muenchen.de

‘Social Freezing’ is the phrase of reproduction-technology of egg freezing in Germany that was discussed intensively and ongoing in the last two years. It describes the freezing of female egg cells for future use without having a medical cause.

In the past years several medical practices in Germany specialized in the technology of egg freezing, now offered as an option for choosing autonomous the ideal personal date for pregnancy independent from natural female limits of fertility.

This leads to broad and heated discussions about motherhood, age and the possibility of combining (or separating) career and children. The discussion reached a peak in August, as in the US the companies Apple and Facebook announced that they would pay for their female employees which would freeze their egg cells so that they are able to focus on their career management without having to worry about their loss of fertility.

This submission is focused on the analysis of two German websites where medical practices offer social freezing. ‘The female body’/’nature’ is illustrated and described as manipulable. The message of this websites is basically to insure oneself against ‘the risk of nature’ by using the reproductive technology while the medial discourse tends to describe the phenomenon as suppression.

It is from a sociological point of view interesting to analyze the mentioned ambivalence of the phenomenon. The description of ‘the female nature’ as a kind of ‘fatefully risk’, women have to deal with, is interesting to observe because ‘nature’ is here debated on a new level.

JS_RN13+RN33a - Family Dynamics, Differences/Convergences in Gender Roles; New Inequalities and New Opportunities I

Work Arrangements and Gender Roles among Family-Farmers in Austria

Franz HÖLLINGER (Universität Graz, Austria) | franz.hoellinger@uni-graz.at
Sabine HARING (Universität Graz, Austria) | sabine.haring@uni-graz.at

Since some decades, agricultural economy in Austria is characterized by a significant increase in pluriactivity and part-time farming. This trend, in particular outside-farm employment of male farmers, goes together with a shift from male to female farm management and toward shared management. In this paper we investigate whether different work arrangements (combinations
of farming and outside farm employment) as well as different farm-management arrangements are linked to differences in regard to gender role attitudes and the division of work-tasks between the farming couple. Our findings from a questionnaire-survey of 250 Austrian farmers indicate that the division of agricultural work-tasks and the balance of power between the farming couple is more egalitarian in the case of female or shared farm management than in the case of male farm management. Different work and farm management arrangements, however, have little effect on the gender division of household tasks and childcare. A comparison of the farmer survey with a representative Austrian population survey shows that all types of farming families maintain significantly more traditional gender-role patterns than other groups of the Austrian population.

**Occupational Choice and Earnings Mobility in the Work-Life-Cycle - Empirical Evidence from Europe and the United States**

**Veronika V. EBERHARTER (University of Innsbruck, Austria) | veronika.eberharter@uibk.ac.at**

Since the mid 1990ies, the structural shifts of the labor markets in many industrialized countries are accompanied by job polarization, and heterogeneous earnings dynamics (Acemoglu 2003, Autor et al. 2006, Atkinson and Piketty 2010). Empirical evidence shows that the earnings level is determined early in the career, and earnings mobility varies with the initial position in the earnings distribution, resulting to gender differentials of earnings mobility (England et al. 2007, Joshi et al. 2007, Manning and Swaffield 2008, Lalive and Stutzer 2010, Grönlund and Magnusson 2013).

Based on longitudinal nationally representative data (CNEF 1980-2012) the paper tests the cohort replacement theory with respect to gender differentials in earnings mobility. The paper analyzes earnings profiles of different cohorts of employees in selected European countries and the United States. Due to increasing labor market participation (OECD 2014) we suppose that younger cohorts of women will acquire more work experience so that human capital characteristics are fading out as determinants of earnings mobility differentials. We employ mobility measures, and panel regression techniques to quantify the level and the determinants of earnings dynamics in the work-life course (Fields and Ok 1999, van Kerm 2003, Jenkins 2011, Shin and Solon 2011, Pavlopoulos et al. 2014). The paper is organized as follows. Section 2 provides the theoretical background and the related literature. Section 3 presents the data and the methodology used. Section 4 discusses the empirical results, and section 5 concludes with a summary of findings and future prospects for economic and social policy.

Intra-couple income distribution and subjective well-being: the moderating effect of gender norms

Gábor HAJDU (Institute for Sociology, Centre for Social Sciences of the Hungarian Academy of Sciences; MTA-ELTE Peripato Comparative Social Dynamics Research Group, Hungary) | hajdu.gabor@tk.mta.hu
Tamás HAJDU (Institute of Economics, Centre for Economic and Regional Studies of the Hungarian Academy of Sciences) | hajdu.tamas@krtk.mta.hu

In this research we examine the relationship between intra-couple income distribution and subjective well-being, using nationally representative data from Hungary (n=8012). We show that the association between the woman’s relative income (the woman’s share of the couple’s total earnings) and life satisfaction is negative not only among men, but among women. Since we control for financial disadvantages on individual and household level, socio-economic and job characteristics of the respondent and his/her partner, the result can be interpreted as the impact of traditional gender roles and the persistence of the traditional male breadwinner mentality: the higher the woman’s economic contribution the more the man’s breadwinning role is questioned, which leads to lower life satisfaction. Moreover, we show that gender norms moderate significantly this negative association: among those who prefer equal gender roles the woman’s relative income has no effect on life satisfaction, whereas among those who prefer traditional gender roles the negative association is stronger.

The practical implication of our research is that the conflict between the gender norms and economic reality reduces life satisfaction. Since in Hungary the gap between employment rates of women and men is decreasing, and education level of women have exceed recently those of men, if social values do not change, satisfaction will be lower. Thus, espousing egalitarian attitudes regarding gender roles and breaking down gender stereotypes might be important to increase subjective well-being.

Her family, his family: Married couples’ conceptions of family belonging

Aino LUOTONEN (University of Helsinki, Finland) | aino.luotonen@helsinki.fi
Anna-Maija CASTREN (University of Helsinki, Finland; University of Eastern Finland, Finland) | anna-maija.castren@helsinki.fi

The paper explores marital partners’ conceptions of family belonging and investigates the extent to which husbands and wives living in an in-tact family include same people in their family. The study draws from the configurational approach to family relationships and discusses the
gendered nature of contemporary kin relations. We ask whether personal understandings of men and women, collected in individual interviews, confine to the immediate nuclear family, and if not, who are those included: members of woman’s or man’s extended family, her or his friends, or someone else? The data includes qualitative interviews of 34 individuals, women and men from 17 married couples, aged 25–41, living in Finland. The information on research participants’ views on their family was collected with a Family Network Method (FNM) questionnaire completed in the end of each interview. Convergence / divergence in husbands’ and wives’ views on family composition informs us on the extent to which different conceptions can co-exist in a first-time family and whether there is a gendered bias in the inclusion of outside-household members. The analysis allows us to discuss the gendered characteristics of familial bonding and to see, for example, if there are differences in the ways in which transitivity shapes configurations of significant family ties. The paper presents first results of a research in progress and contributes to the understanding of contemporary family as a set of individually and/or collectively lived relationships.

**JS_RN13+RN33b - Family Dynamics, Differences/Convergences in Gender Roles; New Inequalities and New Opportunities II**

**Do 'good' jobs and gender roles matter for childbearing decisions? Evidence from the low fertility/equality context Switzerland**

Doris HANAPPI (UC Berkeley, United States of America) | dorish@demog.berkeley.edu
Valérie-Anne RYSER (FORS, c/o University of Lausanne) | valerie-anne.ryser@fors.unil.ch
Laura BERNARDI (University of Lausanne) | laura.bernardi@unil.ch

BACKGROUND: Where changes in fertility timing and sequencing do not suffice in explaining family planning, scholars typically think of socioeconomic conditions in terms of income, employment status or work hours as determinants for the formation of childbearing intentions. Yet, few studies have focused on the importance of perceived job quality and gender role attitude.

OBJECTIVE: We examine in what way perceived job quality in terms of job stability and occupational prestige is associated with the intention to have a child for men and women in the stable low fertility but high inequality context Switzerland, whether job quality matters equally for first and subsequent child intentions, and whether a gender-unequal attitude changes the effects of job quality on the childbearing intentions of men and women.

METHODS: Using data from the Swiss Household Panel (2002-2011) the authors estimate separate logit models of the childbearing intentions of men and women without children and those with at least one child.

RESULTS: We find that the intention of having a first child for women is negatively related to job instability. Our analysis suggests that the link between occupational prestige and childbearing intentions is more complex and depends on people’s gender attitude, which we argue renders job quality differentially salient for men and women.

CONCLUSIONS: Our findings provide empirical support for economic and cultural factors behind recent stable low fertility as found in many European countries and highlight the need for future research on these intervening mechanisms between the formation and realization of people’s childbearing plans.

**Involved parenting and the reprioritization of mothering activities in contemporary Singapore**
Kristina GÖRANSSON (Lund University, Sweden) | kristina.goransson@soch.lu.se

The rapid societal and demographic transformations across Asia have had a profound effect on family life and intergenerational relations. In this context, it is important to ask in what ways parenting strategies and the meaning of (having) children are reinterpreted and renegotiated, and how norms and ideals about parenthood are changing. In contemporary Singapore, the competitive education system is a major concern for families with young children. The anxieties around preparing one's children for the future, coupled with widely shared expectations as to what constitutes responsible and involved parenting, falls heavily on mothers. As educational success is perceived as the primary route to upward social mobility, mothering practices tend to move away from basic caregiving and nurturing (tasks that are increasingly delegated to domestic helpers) and instead center on supporting and coaching children in their academic activities. Based on ethnographic data, I will discuss the ways in which such material and emotional investments in childrearing are rendered culturally meaningful in middle-class families in Singapore and its consequences for family life and gender roles. Particular attention will be given to the phenomenon of ‘mumpreneurs’, which refers to (generally well educated) women who leave the traditional labor market to become entrepreneurs, as they seek more flexibility to look after their children.

Maternal imprisonment; the social inequalities on family life
Natalie BOOTH (University of Bath, United Kingdom) | n.booth@bath.ac.uk

Prison is a family experience. Currently, little research has explored the familial lives of female prisoners and their families in England and Wales. Despite this, the majority of women in prison are mothers, and many provided primary care to their children before incarceration (Caddle and Crisp, 1997). Most research attention to date has focussed on imprisoned fathers; as men constitute the majority of the prison population (Ministry of Justice, 2013). However, it is widely recognised that maternal imprisonment is different; more disruptive and distressing for families owing to the dominant, gendered roles women play in the family (see Corston, 2007; Hardwick, 2012).

This qualitative research addresses this gap by adopting a family-centred approach which privileges the perspectives of family members’ who have experienced maternal imprisonment. Theoretically drawing on Morgan’s (1999) “family practices” and Goffman’s (1961) depiction of prison as a “total institution”; the research explores how family members renegotiate ‘doing’ family during maternal imprisonment, whilst considering how processes within the penal context shape and interfere with family life. Using this sociological imagination, the research questions how these familial circumstances generates multiple, complex social inequalities for family members (both inside and outside prison) in the quality, availability and access to family life. Three groups of family members are being recruited through a purposive sampling strategy; imprisoned mothers, caregivers of female prisoners’ children, and young people (aged 15-18) with mothers in prison. Preliminary results from in-depth, semi-structured interviews with family members will reveal the most prevalent developments from the ongoing fieldwork.

Childcare, gender roles and family attitudes in six European countries
Lívia MURINKÓ (Hungarian Demographic Research Institute) | murinko@demografia.hu

Certain gender role and family attitudes may be seen as barriers to increasing the participation of men in domestic and childcare tasks and easing the burden of women, especially working mothers. Moreover, attitudes and the fit of attitudes and behaviour have important implications for relationship quality, fertility decisions, family cohesion and children's outcomes.
We look at attitudes towards gender roles and family and their relationship with the gendered distribution of child care in six European countries (Germany, France, Norway, Poland, Romania and Hungary), using data from the Generations and Gender Survey (2005/2007/2011). Countries with different welfare regimes, family policies, and employment and fertility patterns are compared.

Instead of using a simple traditional vs. egalitarian dichotomy, factor analysis is performed on ten items. Three sets of attitudes are identified: the importance of children and the two-parent nuclear family, the acceptance of gender inequalities, and the preference of domestic labour and child-rearing over paid work. The examined countries are characterized by different combinations of the three factors. Gender inequality is most accepted in the post-communist countries. The ideal of the nuclear family is important in France, Hungary and Romania. The interests of children over paid work are least emphasized in Norway and Romania. The childcare burden of Norwegian women is the lowest, followed by France, Hungary, Poland, Germany and Romania. There is a positive relationship between the acceptance of gender inequalities and the uneven distribution of child care in all the examined countries and for both sexes.

**JS_RN20+RN33 - Qualitative Enquiries into Femicide and Culture**

**Failed Femicides: Migrant Survivor Narratives**
Shalva WEIL (Hebrew University, Israel) | shalva.weil@mail.huji.ac.il

Scientific literature on domestic violence among migrant women is rare; qualitative reports on femicide among migrants in the West are rarer. A study from 2005-2007 revealed that 29% of all femicides in Israel were perpetrated among Ethiopian migrants, who constituted 1.6% of the total population. This article highlights the experiences of these migrant women, who have survived ‘failed femicides’. Thematic analysis of survivor narratives provides significant insight into the plight of the victims of extreme intimate partner violence (IPV). The analysis produced five key categories: village society in Ethiopia; cycle of domestic violence; motive; weapon; and recourse to authorities. Interestingly, the literature on survivors from Western traumas appears to be inapplicable to these non-Western female migrants.

**Femicide in Conservative and Neoliberalizing Turkey**
Nilay ÇABUK KAYA (Ankara University, Turkey) | cabukkaya@gmail.com
Haktan URAL (Ankara University, Turkey) | haktanural@gmail.com

This study examines the mechanisms giving rise to femicide in Turkey. Based on the qualitative data out of expert interviews conducted with activists in relevant NGOs, lawyers, professionals in forensic sciences and social workers serving for women’s shelters, and the analysis of juridical records of femicide cases in Diyarbakır and Ankara, we aim to shed light on the processes of femicide through the lens of gender inequality in an historical account. Drawing out the data, our study demonstrates how the manifestations of femicide address to two intermingling contexts. On the one hand side, deepening gender inequalities in globalizing and neoliberalizing Turkey provide with a convincing account to elaborate on women’s vulnerability to the lethal violence, especially perpetrated by their intimate partners and/or other family members. Concomitantly, femicide in Turkey addresses to the local cultural context of which the conservative and family-oriented value systems are deployed. These cultural patterns –in which honour-related meanings are constituted and circulated in the everyday interactions- play a decisive role to identify the social and cultural demarcations between appropriate and
inappropriate gender performativities; and thus socially and culturally legitimate certain discourses and practices leading the way to the violent acts including women’s murder.

Using qualitative research to explore femicide among migrants and culture minorities
Anita NUDELMAN (Ben Gurion University, Israel) | anitanudelman@gmail.com
Santiago BOIRA (Universidad de Zaragoza, Spain) | santiago.boira@gmail.com

Considering that rates of femicide in various European countries tend to be higher among migrant women, as well as among women from cultural minorities, an ongoing project to develop in-depth culture and gender-sensitive interview guides aimed at better understanding this phenomena and identify specific aspects of the experience of violence in a foreign scenario was initiated by researchers from two different countries. It will be developed in several stages. The first one focuses on migrant femicide survivors and on family members of migrant or culture minorities femicide victims in Spain (mainly South American, but may include participants from additional countries and minorities), in order to “hear their voices” and understand their perspectives and personal experiences on this increasing global phenomenon. The final objective is to create a standardized interview guide, which can be adapted to local socio-cultural contexts, enabling comparative studies across Europe. Progress to date will be presented, as well as the outline of the next stages of this project.

Dowry, Women Oppression and Femicide in Bangladesh
Sadikur RAHMAN (Foundation for Women and Child Assistance (FWCA), Bangladesh, People's Republic of) | sadikfwca@hotmail.com

The marriage transaction, commonly known as dowry, is a widespread phenomenon in Bangladesh, which has inevitably attracted much attention from development practitioners. This has transformed from bride wealth marriage to dowry marriage locally known “demand marriage” in the society of Bangladesh. Dowry is what the groom’s side demand of cash and kind from the bride's side to complete a marriage. It is a major cause of women’s oppression starts from diversified psychological and physical tortures and finally turns into femicide. Most of the academicians and development practitioners have addressed this as an development issue rather than a social problem. The main objective of this paper is to analyse the women’s oppression because of dowry practice through marriage system as a social problem in Bangladesh. This paper also explains the various dimension of this problem, its multiple functions in women’s oppression, natures of oppression in various stages before femicide and the nature of femicide. The paper draws on secondary data from Bangladesh. It is observed that women in Bangladesh are physically, psychologically and socially oppressed because of the dowry by their husband and his family members in many ways. The nature of oppression is divers in form but finally these oppressions turn into femicide. The nature of femicide also divers and some fire-related deaths, suicides of young married women are also believed to be related to dowry.

Cultural Issues: a critical assessment of qualitative data on patterns of intimate partner murders and other forms of femicide.
Christiana KOUTA (Cyprus University of Technology, Cyprus) | nnikolaou@cytanet.com.cy
Ksenia MESHKOVA (Humboldt University Berlin, Germany) | ksenia.meshkova@gmail.com
Anne RYEN (University of Agder, Norway) | Anne.Ryen@uia.no
The main issues of the European COST Action on Femicide is to provide knowledge and to gather data on cultural perspectives on the phenomenon of femicide, “honour killing” and intimate partner violence in relation to culture. Though often perceived as one unit, contemporary Europe is ethnically and culturally complex. This invites a wider spectre of approaches, theories and experiences to our multidisciplinary and multicultural work group. Our presentation aims at making an overview of the field of femicide research. We start up with cultural aspects of femicide as portrayed in literature. Second, based on incoming data from participating COST action countries, we will look into more country specific issues. Last, we will discuss and criticise how alternative paradigms and epistemologies invite us to see through alternative lenses, - illuminating as well as blinding. As to the latter, we argue a need to avoid the classic traps of naïve approaches that uncritically circulate accounts that see representations as mirrors of experiences, that ignore contextual sensitivity and which fail to see “culture” as a category that constructs some version of the world appropriate to what we tend to see as self-evident about the person and contexts in question.

JS_RN24+RN33a - Gender Inequalities and Differences in (Non)Academic Research Careers

Academic and Family-life Careers in a Gender Perspective: institutional, cultural and political bias. The outcomes of a survey at the University of Florence.  
Laura LEONARDI (University of Florence, Italy) | laura.leonardi@unifi.it

This contribution presents original findings from an empirical research aiming at analyzing the gender inequalities in scientific and teaching careers in the Italian Universities, focusing on the case-study of the University of Florence. The research moves from the existence of gender-based barriers to the recruitment, career progression, and imbalances in decision making processes. The surveying technique adopted in the study is the Computer-assisted web interviewing (CAWI). This technique allowed us to collect data from a sample of more than 800 researchers and teachers working at the University of Florence. The methodology chosen for the study is the "Event history analysis". The objective was to reconstruct the characteristics of the respondents, of their partners, and of the meaningful events characterizing their family-life history (marriage, civil unions, fertility, children, care, the management of domestic life), together with the main events which mark individual academic careers. The standardized questionnaire included questions on the parallel stories of scientific career – family life careers, exploring the causes of vertical and horizontal segregation in academia. Different patterns of gendered work and family-life careers emerge referring to diverse generations of researchers and teachers. In addition, different employment status emerge as meaningful: i.e. the widespread precarious work characterizing Italian Universities shows a strong influence on careers patterns of both men and women.

Recognition vs. self-fulfilment: alternative male career paths in science and research

Thomas BERGER (IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria) | thomas.berger@aau.at
Anita THALER (IFZ - Inter-University Research Centre for Technology, Work and Culture, Austria) | anita.thaler@aau.at
Gender roles are converging all over Europe and career planning seems to be less gendered for younger generations. However, the classic academic career stereotype that is still dominating the life choices of early career researchers requires certain sacrifices and life decisions (high mobility, work time flexibility, postponed family planning etc.) that where formed by decades of male dominated organisational acculturalisation.

The masculinisation of women’s careers in academic fields is a well-scrutinised area, but how do men cope with the pressure to align their professional careers if they seek alternative biographical routes? Are there hindrances for male scientists to be recognised as true and ambitious researches if they, for example, choose to work only half time to invest themselves in volunteer or leisure projects? This paper will therefore explore the interplay of competing factors such as “work-life-balance”, “family planning”, “peer recognition” and “self-fulfilment” in men’s academic career development.

The issue of alternating academic career visions by men will be analysed by drawing on empirical data from a non-university research organisation (with strong institutional ties to the Austrian university landscape) that underwent a self-evaluation program concerning its gender policies. Additional interviews with researchers in classic university career tracks amplify our analysis.

Excellence, Careers and Gender in Higher Education: The Case of Science and Engineering
Andrea WOLFFRAM (Leibniz University Hannover, Germany) | a.wolffram@ish.uni-hannover.de

Careers in higher education evolve within a tension of beliefs in the meritocratic recruitment and promotion of researchers and the subjectivity of the evaluation of “excellence” through the scientific community. (Hadjar 2008; Möller 2014) These evaluations are biased by many social factors such as homosocial cooptation, gender stereotypes, and self-presentation of the researchers who produced the achievement. (Wolffram et al. 2014) From a gender perspective, these factors become even more relevant in scientific fields that are dominated by man like the SET subjects (Kanter 1977).

Against this background, the subjectivity of "excellence evaluations" in promotion and hiring processes in academia and factors for successful careers in SET disciplines will be scrutinized. It will be shown how the demands of gender equality and the concept of excellence are negotiated in the everyday life of “doing science” in SET disciplines. The presentation will draw on empirical findings from a qualitative study that were carried out in 2012/2013 at a Technical University in Germany (RWTH Aachen). The study was conducted in the context of the European project "FESTA -Female Empowerment in Science and Technology Academia". These findings will be contrasted with another empirical study from 2011 that dealt with the question how female SET-scientists from Eastern Europe who migrated to Germany act successfully within the male culture of their disciplines. It will be analysed if these women who were socialized in a less male dominant culture with regard to SET education, could mobilize specific resources that helped them to reach leading positions in the SET field.

Mentoring relationships and gender equality in academia: a case study
Maria Carmela AGODI (University of Naples Federico II, Italy) | agodi@unina.it
Ilenia PICARDI (University of Naples Federico II, Italy) | ilenia.picardi@gmail.com

In this contribution we discuss the first results of an action research study, carried within the European Project "GENOVATE" and aimed at implementing a Pilot Mentoring Program. The results stem from a monitoring scheme of that program, designed according to realistic
evaluation methodology (Pawson and Tilley, 1997). The traditional question of experimental evaluation - does the program work? - is transformed into the one: what is it about the program that works for whom? The last one is a context sensitive research question and, in a gendered research perspective, it also results into an evaluative research strategy consistent with intersectional analysis. Twenty-one couples of mentor and mentees - recruited on a volunteering basis from senior and junior women researchers working at the Federico II University - are formed according to a multi-criteria matching scheme, to interact for a one year time period. Descriptive information about different aspects of the mentor relationship are analyzed and differences in playing the role of mentors are looked for, comparing senior researchers who have identified primary mentors in their careers versus those who have not. The underlying presupposition is that a better understanding of the exchanges embedded in the implemented mentoring scheme can help at better conceptualizing the involved relationships and lead to a better design of an extended mentoring program oriented not just to increase women advancement in academic careers, but also to transform the academic environment into a more gender-equality sensitive organizational field.

JS_RN24+RN33b - Gender Indifferences in (Non)Academic Research Between Precarious Employment and Professional Achievement

Precariousness in Academia: Prospects of employing oneself in university
Kirsti Maria LEMPIÄINEN (University of Lapland, Finland) | kirsti.lempiainen@ulapland.fi

In this paper I will present how men and women working in universities try to get on in academic career. The paper analyses how academic capital, age, gender and class orient prospects of employment. The case analysis bases on auto-ethnography and interviews done in the University of Liverpool, University of Milan-Bicocca and University of Tampere. The question is what sort of differences and similarities there are in precarious positions in these changing universities. As a result I will suggest that in precarious positions of the three locations the opportunities and prospects of employment are partly compensated by the strength and moral of academic agency which smooth out age, class and gender differences. The precariousness is found as the property of the structures of university [employment] and not as a quality of the actor her/himself.

Genderedness of Research in SET and Gendered Scientific Networks
Felizitas SAGEBIEL (University of Wuppertal, Germany) | sagebiel@uni-wuppertal.de

The construction of high output corresponds with high performance defined as having successful projects, numerous publications, successfully securing research grants and (particularly for engineers) patents; all factors are not gender neutral. A German research project (lasting 2009 to 2012) reflected the genderedness of research for successful excellent women in SET in governmental research organizations and universities. With a qualitative methodological design five interviews with women and men in leadership positions and two gender separated focus discussion groups in each organization were collected between 2010 and 2011.

A traditional masculine culture in academia in Germany affords deep professional commitment with virtually no separation between professional and private/family life (Krais, 2010). Results from European Commission tender ‘Meta-analysis of gender and science research’, the author participated, clearly reveal the gendered nature of academic careers. Research which goes
beyond universally applicable criteria and strict norms unmasks “power relations, gate-keeping practices and informal networks as a source of tacit knowledge, support and recognition… The definition and assessment of scientific excellence (the recognition of merit) is not independent of gender relations in academia and society at large” (EC, 2012: 18). Women engineers not integrated as well as men in mentoring and networks’ systems experience structural informal discrimination. As research funding (output) is a function of collaboration and competition combined with exclusion from networks women professors have to overcome barriers to succeed. Women’s networks exist and they are useful, but they are less powerful for research success. These results will be reflected on different gender theories.

Still after the neutrality ideal?
Ivett SZALMA (FORS, Switzerland) | ivett.szalma@unil.ch

Harding (1991) published a paper in which he examined whether science is neutral. In the present research we try to answer exactly the same question: still after the neutrality ideal? We collect all the qualitative publications based on two datasets (International Social Survey Program, European Social Survey) between 2008 and 2014. We make analysis in order to analyze the usage of these databases in gender approach. There are several studies which show that women are under-represented in the academic sphere, especially in (natural) science, technology, engineering, and mathematics (Goulden – Frasch – Mason 2009). However, few studies have focused on the gender gap in social sciences (Le Fleuve 2014) in spite of the fact that women are also under-represented in quantitative social science research (Breuning 2010). Most previous researchers have analyzed journal context (Le Fleuve 2014) or some of them conducted analysis based on membership of some kind of association (Hancok et al. 2013). Our research seems to be pioneering by evaluating scholarly productivity between the two genders by collecting data sets related to publications worldwide. Our findings in this survey clearly highlight the persistence of a leaky pipeline: as well as pointing out a potentially neglected causal factor which strengthens the gender gap publication productivity: survey topics are still not neutral.

JS_RN28+RN33 - Women’s and Gender Studies: Sports, Gender and Sexualities

The inclusive masculinities of Premier League academy footballers
Rory MAGRATH (Southampton Solent University, United Kingdom) | rory.magrath@solent.ac.uk

Association football has traditionally been an institution unreceptive and hostile toward sexual minorities. The case of Justin Fashanu serves as a stark reminder of the alleged incompatibility between football and homosexuality. However, by interviewing 40 academy-level footballers from two Premier League football clubs in the UK, I show that intolerant attitudes are being increasingly challenged. Results show that these young men, who are potentially on the verge of becoming professional athletes, reflect the ethos of their generation more broadly, holding inclusive attitudes toward homosexuality. This was found to be true independent of whether they maintain contact with gay men or not. Participants strongly advocated their support for gay men coming out on their team. This support includes athletes being unconcerned with sharing rooms with gay players, changing with them in the locker rooms, or relating to them on a social and emotional level. Some players – notably those with strong religious beliefs – held some reservations with same-sex marriage, yet suggested they would still support a gay teammate.
Others demonstrated concern as to how having a gay teammate might alter homosocial banter, as they would not want to offend that individual. Overall, this research supports a growing body of literature suggesting that contemporary football is no longer a bastion of homophobia in the UK, and that the next generation of potential professional footballers support equality for sexual minorities.

**Sexual Assault, Exploitation, and Interference in Youth Sport in Canada**

Curtis FOGEL (Lakehead University Orillia, Canada) | cafogel@lakeheadu.ca

This paper critically examines the processes involved in the continued perpetration and tolerance of sexual violence in amateur sport in Canada. Five main types of sexual violence are explored including: i) athlete perpetrated sexual violence against women and girls off the field, ii) athlete perpetrated gang rapes, iii) non-consensual sexual violence against peers during hazing rituals, iv) sexual assaults perpetrated by coaches, and v) sexual assaults perpetrated by sports administrators. The empirical basis of this research includes the examination of over 150 legal case files and documents, interviews with 59 athletes on their conceptions of consent, as well as the review of the existing literature on sexual violence in sport. The central question that guides this research is: why does there appear to be a disproportionate amount of sexual violence in sport according to statistical reports?

**'Born to be a Cowboy': Exploring Masculinity at Star of Texas Fair and Rodeo**

Rebecca FINKEL (Queen Margaret University, United Kingdom) | rfinkel@qmu.ac.uk

This paper explores the commodification and constructions of masculinity associated with the idealised 'American West' through examining current rodeo spaces, specifically the Star of Texas Fair and Rodeo in Austin. Framed in Bourdieu's (1998) and O'Connell's (2005) conceptualisations of male domination and symbolic structures in social life, this research seeks to understand how these constructions are reinforced with regard to issues of identity, sense of belonging to a place and a particular cultural background, and exclusion through potentially 'othering' those who do not fit into this nostalgic narrative. The commercialisation element is explored to discern if the selling of this cowboy ideal has an impact on normalising heterosexual masculine dominance, especially in a family entertainment setting. Also, it also seeks to examine how ethnic minorities, LGBTQ participants, and women navigate and participate in these spaces given the straight white male 'hero' narratives of the 'Wild West'. As Jarvie (1991) suggests, certain dominant groups define 'what sport is' or 'what sport should be like' and how it is actually experienced by various groups within various cultural contexts. Perceptions of women and LGBTQ athletes, especially those who participate in violent or traditionally 'macho' sport, are socially constructed within culture and through cultural discourses (Lenskij 2003). Research methods include semi-structured in-depth interviews with key rodeo stakeholders as well as visual ethnographic approaches. Investigation within a traditional sporting event environment can be an effective case study to discern community norms and ordering, as events most often reflect broader societal discourses and can reinforce collectively held values (Getz 1997). Although based primarily in the US, this research has implications and relevancy for comparing and contrasting attitudes and approaches surrounding gender and sexualities with regard to European sport events and informing international sociology of sport studies.

Rupturing and Recouping Femininities in School Sport
Majella MCSHARRY (Dublin City University, Ireland) | majella.mcsharry@dcu.ie

The prominence of male sport in many second level schools is often indicative of the unequal position and hypervisibility of men’s sport in wider society. This paper focuses on qualitative data gathered across three second level schools in the Republic of Ireland. These schools are recognised nationally for their success in male dominated sports such as Gaelic football, hurling and rugby. The paper examines the reality of ‘doing’ girl (Butler, 1990) within school contexts that prioritise boys’ performances and achievements in sport. The girls’ participation in non-traditional feminine sports highlights moments of resistance and challenge to hegemonic expectations. It indicates a rupturing of normative feminine discourses. However such ruptures are often fleeting. The data indicate that they frequently lead to a seemingly necessary recouping of more traditional feminine representations of ‘girl’. This paper explores the conflictual dilemmas faced by these girls, as they balance the subversion of hegemony in their quest for empowerment and equality through sport, with a requirement to maintain an acceptable identity through ‘girlie’ performances. Judith Butler’s ‘heterosexual matrix’ (ibid) is proposed as a lens through which to understand how the girls neutralise their association with subversive practices through their insistence upon heterosexual relationships and how they position themselves within these relationships in ways that confirm mainstream notions of girlhood.

Impact of Different Attitudes in Relation in Legal and Economic Aspects in Sport and Sports Organizations from Gender Balance in Republic of Macedonia
Ivan Alaksandar ANASTASOVSKI (Faculty of physical education, sport and health, Macedonia, Former Yugoslav Republic of) | prof.anastasovski@gmail.com
Lenche Aleksovska VELICHOVSKA (Faculty of physical education, sport and health, Macedonia, Former Yugoslav Republic of) | lenchealex@yahoo.com
Tatjana Stojanoska IVANOVA (Philosophical faculty Skopje) | tanjaosi@yahoo.com
Lazar NANEV (State University Goce Delcev Stip) | lazar_nanev@t-home.mk

Gender balance in the part of Balkan and Republic of Macedonia is still a topic that is weakly discussed. Social changes that took place at the end of 2000th in our country caused rapid transition and need for amendments of the policy and adjustment with the European standards in almost all areas of functioning of the society. As a result of this we have to adjust management of sport and sports events with the recent requirements and trends. We are looking for new system solutions, new sources of funding, strong relations between sport, law and economy through sponsorship, marketing and donation, TV right and fair conditions for efficient transformation of the ownership and privatization of sports organizations in the Republic of Macedonia. Our theoretical preassumption that gender of respondents might influence the perception of sport and sports organizations of citizens of the Republic of Macedonia, has been set out by differences between genders and the opinion of citizens about sports and sports organizations in our country. In this paper we surveyed 411 citizens from all regions in the Republic of Macedonia, and analyzed their attitude in terms of gender. Namely, they are aware that on the Balkans the impact of the male population still dominant which is largely confirmed in our study were the majority of respondents being supporters to (and active participants in) the sport as a game of sports organizations as a institution. For this we decided to research this gender balance as phenomena in modern age, and give right opportunity on male population to be involved in management process in sport as a game and sports organization as institution.
JS_RN33+RN34a - Gender and Religion in Times of Growing Social Inequalities and Differences I

Education and work – Women’s empowerment by a fundamentalist party
Anat FELDMAN (Achva Academic College, Israel) | afeldman@achva.ac.il

Education is the most important tool for women’s advancement in the labor market. However, fundamentalist societies tend to prevent women gaining an academic education, so as to leave them in marginal employment or the home environment. Thus, they do not harm the male hierarchy, termed the “Godly Order” in fundamentalist societies.

In my lecture, I will present the Israeli case of a religious fundamentalist party that encourages women to enroll in academic studies and professional courses, with the goal of working in senior positions in the Civil Service, even though the studies and employment are not always within the religious community. I will argue that the society’s power of faith allows its religious and political leaders to empower women through education and employment, without harming the Godly Order that sets men at the head.

The research field is women’s education and work in religious fundamentalist societies. The test case will be the fundamentalist society in Israel, led by an ultra-Orthodox political party.

Woman's Blood as Dirt in Islamic Catechism: Exclusion of Women from Religious and Social Life in Turkey
Figen UZAR OZDEMIR (Bulent Ecevit University, Turkey) | figen.uzar@gmail.com
Atilla BARUTÇU (Bulent Ecevit University, Turkey) | atikbarut@hotmail.com

This study aims to problematize gender inequality through the concept of women’s purity in the case of ilmihal (Islamic catechism) of the Directorate of Religious Affairs (DRA), the state organ representing Sunni Islam in contemporary Turkey. İlimhals are guide to living Islam according to the commands of God in the Qur’an, hadith and life of the Prophet Muhammad. Most of the ilmihals in Turkey are written by male scholars of Islam. Hence, they are often criticized by Muslim feminists because of their patriarchal stance towards women’s status within the society. We encounter this patriarchal point of view also on the issue of women’s purity which includes three concepts: menstruation blood (hayı z), post-natal bleeding (nifas) and irregular bleeding (istihaže).
İlmihal of the DRA as a certain form of Islamic interpretation providing practical answers to everyday life problems and conduct denies that Islam treats women and men unequally. However, gender inequality appears and reappears throughout this particular interpretation of Islam on issues of women’s status and purity. This study aims to demonstrate (1) how a woman’s purity and dirtiness are defined and categorized according to her physiological status namely menstruation, childbirth and other circumstances during which blood flows from the uterus; (2) how women are excluded from religious rituals and consequently social life based on this conceptualization of women’s dirtiness, and (3) the ways İlmihal of the DRA provides justifications to the contradiction on its interpretation of gender inequality in Islam.

**Inclusion and exclusion in British Muslim women case**

**Hengameh ASHRAF EMAMI** (Northumbria University, United Kingdom) | hengameh25@yahoo.co.uk

This paper aims to explore the meaning of veiling, through oral history interviews with Muslim women in two generations across Glasgow and Newcastle. Drawing on extensive fieldwork, including recorded interviews and ethnographic techniques such as participant observations with diverse British Muslim women, the paper aims to explore how Muslim women negotiate their identities through donning/ not donning the veil in their daily lives in modern Britain. The empirical research was carried through thirty oral history interviews in Newcastle-upon-Tyne and Glasgow. An epidemiological approach was combined with standpoints theory and ontological activity in order to interrogate the meaning of the veil and its relation with the identity of our research participants.

The empirical research is combined with the heated debates and discourse on veiling and Muslim women in Britain. The myth of the veil and also agency of veiling were used to explore various aspects of the identities of British Muslim women and the ways they employed the veil for their empowerment. Gender discourse will explore the religious and cultural practices of research participants and the meaning of veiling for them. Furthermore, this paper will examine the ways in which Muslim women negotiate their identities through veiling or not veiling in Britain. This paper also will highlight the impact of veiling or not-veiling on their everyday lives. Therefore the research will explore inclusion and exclusion of British Muslim women in various arena of British society.

**Shared Authority: Progressive Muslims Pursue Equality**

**Lisa Margaret WORTHINGTON** (The University of Western Sydney, Australia) | l.worthington@uws.edu.au

In response to radical interpretations of Islam numerous Muslim reform movements have emerged throughout the world in order to demonstrate that Islam can be equitable and inclusive. Although, to a large extent these movements have been coloured by local, national, and regional contexts, they also share certain commonalities, such as challenging existing structures of religious authority. This paper is focused on two progressive organisations: Muslims for Progressive Values and El-Tawhid Jumma Circle and their practice of shared authority. Shared authority necessitates that leadership responsibilities are shared among the congregation and that religious leadership positions are open to all. In practice this means that non-Muslims can also offer the sermon and allows women to assume religious leadership roles. Those who practice shared authority also report that they subscribe to the idea of fatwa of the heart – meaning that they do not approach a religious scholar for moral advice but simply do what they believe is right. Data for this paper will be drawn from observations and qualitative interviews gathered during fieldwork in the United States in 2013 and also via Skype. The data from this
research will be used to evaluate the resistance techniques employed by progressive Muslims who aim to work toward gender justice and social equality. This paper will argue that traditional Islamic authority structures are being replaced with alternative structures within progressive Muslim congregations in order to create more inclusive and egalitarian worship spaces.

JS_RN33+RN34b - Gender and Religion in Times of Growing Social Inequalities and Differences II

„Gender ideology“ as an enemy! Gender, religion, and social transformation in Croatia, Poland, and Slovakia
Siniša ZRINŠČAK (University of Zagreb, Croatia) | sinisa.zrinscak@pravo.hr
Agnieszka SZUMIGALSKA (Masaryk University, Czech Republic) | a.szumigalska@gmail.com
Miroslav TIŽIK (Comenius University, Slovakia) | miroslav.tizik@savba.sk

Equality of women and men, usually phrased as gender equality, has been a part of overall social transformation in the post-communist period. However, the path to gender equality has proved to be not only difficult but uneven and unpredictable. Many reasons are listed in the literature, like the importance of state-building process and connected national ideology, communist legacy, ideology of dominant political parties, role of dominant religions, but also the EU itself as a rather weak actor in promoting the gender equality. This paper looks more deeply into the role of the Catholic Church as the main and traditional religious actor in three countries: Croatia, Poland, and Slovakia. In all three countries the Catholic Church has been important actor in public debates about gender issues but its role has been recently intensified, particularly by construction of the so-called “gender ideology” phrase, a label used not only to question but also to ethically discredit all those who use the term gender and who, allegedly, negate “natural differences” between men and women. The paper will discuss how and in which way the Catholic Church engages in public debates, and how its engagement influences the gender equality agenda in a particular country. Similarities and differences among these countries will be examined and discussed.

The role of “agency" and "intersectionality" into the processes of gender and religious identity building
Ivana ACOCCELLA (University of Florence, Italy) | ivana.acocella@unifi.it
Silvia CATALDI (University of Cagliari, Italy) | s.cataldi@unica.it

The paper aims to illustrate how the biographical approach can be used for analysing processes of gender and religious identity building and strategies adopted by young Muslim women - who lives in Italy - in their private and public sphere. Such approach is supposed to safeguard the role of “agency" and "intersectionality" in this process of identity building. More specifically, the agency allows us to sheds light on the performative dimension of identity building and the young Muslim women’s active strategies, by identifying which "challenges" or “tensions" arise from their multi-membership (intra-ethnic and inter-ethnic, as well as intra-generational and inter-generational). By referring to “intersectionality”, the paper aims to explore the interconnection of different social categories, e.g. gender, religious beliefs, age and ethnic origins, in a dialectic or even conflictual exchange. In brief, the biographical approach will be used to identify the main ideal-typical features of such processes, thus allowing us to switch from an individual story to a sociological type into which this biographic story can be inserted.
Gender agency in religious organizations. Distancing as reproducing of patterns of femininity in the institutions of the Roman Catholic Church in Poland.
Katarzyna LESZCZYŃSKA (AGH University Science and Technology, Poland) | kaleszcz@agh.edu.pl

The aim of the paper is to analyse the discursive practices which aim the reproduction of patterns of femininity and exclusion of women from a religious power, undertaken by women in the central organizations of Roman Catholic Church in Poland, i.e. in the diocesan curia, the ecclesiastical courts, and the Conference of the Polish Episcopate. During my speech I am going to report the results of the qualitative and quantitative research undertaken by myself between 2012-2014, including 31 in-depth interviews with the women working in the above mentioned places.

The place of women in traditional religious organizations should be seen as the result of the complex conditions. On the one hand, the position of women is a consequence of the formal norms legitimized by a religious tradition, and relating to the division of labour, power, symbolic sphere. On the other hand, it is the result of informal rules and routine practices undertaken not only by men but also by women themselves. In the paper, putting the emphasis on the second kind of conditions of the position of women in the Church, I would like to answer the question: How do women at the discursive level reproduce their place in church organizations, to which patterns of femininity are they distancing themselves, how do they exclude and depreciate these patterns? The intended purpose of the research is part of the tradition of studies on agency in religious organizations (ex.Avishai,2008; Mahmood,2004; Nagar-Ron,Motzafi-Haller,2011), as well as the institutional theory of gender (see:Martin,2006; Rhoton,2011; Risman,2011).
RN34P01 - Poster Session

**Alternative Religious Memories and Contemporary Czech Society**

Dušan LUŽNÝ (Palacky University, Czech Republic) | dusan.luzny@upol.cz

The poster presents religious situation in the Czech Republic and general trends in religious life of the Czech society – continually decreasing of declared religiosity and pluralisation of religious forms. Precisely, it is a decreasing affiliation to traditional churches and a slight increase among non-traditional religious groups which characterizes religious life of the Czech society. Based on the data from the field research the presence of relevant religious minorities and non-traditional religious enclaves, e.g. Unification Movement, New Age (Biotronics), Universal People will be discussed. The conceptual background of the research lies in approaching religion as specific forms of cultural memory.

The poster also identifies relevant historical eras that lead to the contemporary situation. The most relevant constituents in the Czech religious history are: the establishment of the Czech nation and statehood (18.-19. century), the foundation of Czech Republic (1918), the fascist occupation (1938-1945), expulsion of the Germans (1945), Communist regime (1948-1989), the unfulfilled expectations of the Velvet Revolution and the socio-economic transformation after 1989. Each of these important eras in the Czech history contributed to the progressive decrease of Czech religiosity. Further it sketches out eventual future developments, while demonstrating that not only the historical roots but also today’s demographical factors lead to the significant and long-lasting decrease of traditional religious forms.

The poster shows partial results of the project “Continuity and Discontinuities of Religious Memory in the Czech Society”.

**Tradition in the presentation of the term jihad in the Czech newspapers**

Jan VANE (University of West Bohemia, Czech Republic) | vanejan@kss.zcu.cz
Veronika HASOVA (Charles University, Czech Republic) | hasova.veronika@gmail.com

This text is focused on the presentation of jihad in Czech newspapers over the course of 10 years after September 11th, 2001 in three periods – the first period runs from September 11th, 2001 to September 11th, 2002, followed by the years 2006–2007 and 2010–2011. The main aim of this work is to compare two different political journals (Lidové Noviny and Právo) and find out if there are some similarities or differences in constructing representations of Islam through the term jihad. This has been done in two steps. In the first step, the term jihad is analyzed throughout the articles. In the second step, two different theories (clash of civilization and multiculturalism), which might be implicitly involved in media discourse, are used for further analysis of these articles. The methodology combines two approaches – qualitative and quantitative content analyses. Eight different frames of jihad are defined through qualitative analysis: (1) duty, (2) defence/revenge, (3) holy war, (4) undefined, (5) jihad of sword, (6) „self-improvement“, (7) semantic shift of jihad and (8) global jihad. The most interesting is the seventh category, which uses the term out of its religious meaning, as synonymous with a fight, chaos, aggression etc. Furthermore, this work will show that left-wing and right-wing journals don’t fulfill the expectations corresponding to their political rhetoric. Articles from left-wing journals contain much more signs of the clash of civilization than they do of multiculturalism.
Thus, the main result is that the political dichotomy between the right-wing and left-wing is disappearing in the Czech Republic.

“Maybe they were monitoring us” – the case of Buddhism in normalization of Czechoslovakia
Petra TLCIMUKOVA (Palacky University, Czech Republic) | 217197@mail.muni.cz

In this paper I examine the relationship of the state and religion during the period of normalization in Czechoslovakia – a field that has not gained much attention of the scholars so far. This historical period needs to be researched in much more detail in order to explain the contemporary specific situation for religions in the Czech Republic. I focus on the case of Buddhism, often presented as non-conflicting and adaptive religion, however, since ever a minority religion with a history of local presence that goes back to the 19th century. The paper presents the outcomes of an empirical research; in particular, I examine the social praxis connected to the creation of the images of Buddhism involved by the state on one hand, and the social praxis connected to the creation of the images of the state involved by the Buddhists on the other.

God, Salazar and Human Rights in Portugal
Ana Cláudia Carvalho CAMPINA (University of Aveiro, Portugal) | ana.campina@gmail.com
Ana Filipa MAGALHÃES (University of Aveiro, Portugal) | filipa.magalhaes@ua.pt

Our work aims to analyze the role and influence of religion and state in the human rights charter in each country.
In the Portuguese case that we use as an example, religion and politics had a strong and clear influence in the definition and construction of fundamental rights. In Portugal, the state assumed for a long time, till 1976, that the Catholic religion as the official religion. This fact contributed to the close relationship between religion, politics and human rights. Under a dictatorship regime, the Governments of Salazar were, in this respect, decisive. Analyzing our fundamental law, specially the last two Constitutions, we can see how far the relation between religion and politics influenced the definition of human rights. So we can establish a link between different historical moments and political regimes and the construction of human rights and the way society respected these rights.
Indeed, religion and the state are two phenomenon with a decisive influence on the construction of fundamental rights.
Constitution, the fundamental law, is a reflection of political options, nonetheless also reflects the fundamental principles of the most representative religion. Portugal's example is a clear case of how the law didn’t represent an active changing role. The law merely reflected the status quo, which is why the study of human rights in Portugal calls for a review of the history of religion and political power in this country. This requires a careful review of the Salazar government period.

RN34S01 - Religion and Social Class in Turkey

The Conflicting Middle Classes: Religious Polarization and Search for Authenticity in Contemporary Turkey
Ban ş SANNAN (Mimar Sinan Fine Arts University, Istanbul, Turkey) | sannanbaris@gmail.com
Ondercan MUTI (Mimar Sinan Fine Arts University, Istanbul, Turkey) | ondercanmuti@gmail.com
The relative economic growth during 2000s in Turkey led to radical changes within the composition of middle classes in Turkish society. Especially, a certain vertical social mobility occurred in favor of conservative and religiously high-motivated middle classes, who are represented by the Ak Party, and with an absolute power for over a decade these middle classes have been enjoying the opportunity to emphasize their values and forms of religion in public space. The famous Gezi Park protests of 2013, taking up against the demolition of a city-park, evolved into protests against latest policies of the government which represents largely religious values and expressions of religion among the same conservative and socially climbing middle classes. During our field research on the middle classes and their lifestyles in a highly disintegrated Turkish society, we have encountered different middle class fragments which are extremely polarized in respect of the perception of the religion and religious practices. We aim to present the primary results of our research and seek to discuss how different perceptions of religion and its forms of practice can actually lead to certain lifestyle differences and spatial segregation between the established and traditional middle class members and the socially climbing middle classes of contemporary Turkey. For this purpose, we seek to make a comparison between symmetrical interpretations of the religion of socially climbing and conservative middle classes and established and mundane middle classes and to reveal the end of authenticity among both groups.

Religion and Classes in Turkey: Some Observations and Thoughts from a Representative Survey and a Qualitative Fieldwork

Kurtulus CENGIZ (Ankara University, Turkey) | kurtuloscengiz@yahoo.com

In this presentation, I will try to discuss some of my observations and thoughts from the findings of a research project called: “Religion and Social Structure in Turkey” which was conducted between 2008 and 2011 and financially supported by Turkish Scientific and Technical Research Council. Our 30-months long project, in its broadest sense aimed to understand the impact of religion on economy, politics and gender in Turkey. In particular, the research aims to answer questions such as how do the different strata/classes of people frame religion? More specifically, how do the various religious affiliations, and particular understandings affect political and economical behavior as well as gender relations? In the scope of this research, We made, three months long participant observations in 3 cities, 192 in-depth interviews in 8 cities and a representative survey with 1538 people in Turkey in 25 cities.

After shortly regarding religion and class dynamics in the last 30 years in Turkey; I will focus on the integration of the Islamist opposition into the system by both articulating the demands of lower and upper classes into their neo-liberal political program. Finally I will present and discuss some qualitative and quantitative data to elucidate the relations between religion and social classes in Turkey by giving a special emphasis on how Islam is articulated into the neo-liberal ideology for maintaining the consent of ordinary people into the capitalist system.

Consumer Society, Religious Bourgeoisie and Life Style in Turkey

İsmail DEMIREZEN (Istanbul university, Turkey; University of Maryland-College Park, United States) | demirezen@istanbul.edu.tr

AKP, a party whose leaders are religious, has been ruling Turkey since 2002 and has increased its vote as well. Because of AKP’s policies and globalization, a religious bourgeoisie has been emerging in Turkey recently. On the other hand, because of fast economic development, the establishment of culture industry and influences of mass media, Turkey became a consumer
society. Although religious bourgeoisie try to live according religious codes, they want to integrate to consumer culture as well. As a result, religious values and norms has been become symbols for social differences according to codes of consumer culture. Religious bourgeoisie wants to show off their status by using religious symbols such as brand headscarves, and going to Mecca using V.I.P. tourist agencies. Although in 1990s headscarf was a religious symbol for exclusion because of headscarf ban in universities, in contemporary Turkey headscarf has become brand and a brand headscarf has become a symbol for higher status. Some religious groups are against this trend and call themselves ant-capitalist Muslims. This paper will examine this complex relationship in Turkey. To understand this relationship, it will be explored the connection between consumer culture, lifestyle and religious bourgeoisie.

Alevi and Cemevis in Turkey: Social Capital Perspective*
Mehmet Ali BALKANLIOGLU (Department of Sociology, Marmara University) | mehmetbalkanlioglu@hotmail.com

Different social groups in Turkey exist with their intriguing characteristics. Among these groups, Alevi community is the one which reflects Anatolia’s cultural mosaic in a unique way through the centuries. In that sense, an academic inquiry into Alevi community that examines its assets with historical, religious, cultural, social, and authentic references is of a great importance. For today’s Alevi community, Cemevi is a unique house of worship place. However, Cemevis in Turkey mainly appeared around the debate as to whether it is a house of worship or not and even an alternative to a mosque. Although there are various studies in social science literature which attempt to conceptualize and measure social capital, studies directly shedding light on Cemevi as creating a social capital in Alevi community are unsatisfactory. Scales consisting of social capital indicators such as political participation, local association membership, participation in social networks, trust and solidarity are often used to measure levels of social capital in a social group. In this study, the social network and social cohesion dimensions of social capital created through Cemevis in Alevi community were examined. Data were obtained using survey, observation and interview methods. The survey was adopted from social capital literature and conducted for the first time in Alevi communities, namely associations of Şahkulu Sultan and Karacaahmet Sultan in Istanbul, Turkey. Findings will explore social network and social cohesion dimensions of social capital in detail.

RN34S02 - Religion, Charity & Social Inequality

Religion in the context of charitable food assistance: an ethnographic study of food banks in a Finnish city
Anna Sofia SALONEN (University of Helsinki, Finland) | anna.s.salonen@helsinki.fi

Against the grain of the universalist ideals of the Nordic welfare state, since the early 1990s Finland has witnessed the emergence and proliferation of food charity. The majority of the agencies providing food assistance are churches, parishes and other religious organizations. Unlike in many other countries with more institutionalized food assistance network, the field of Finnish food charity is highly scattered and unrecorded, and with the absence of coordinated policies or practices, the individual food banks can themselves decide whether and how they express their religious identity in their assistance programs. Finland therefore provides an
intriguing case for the study of charitable food assistance and its interconnections with religion. Drawing from an ethnographic study in one Finnish city, the paper explores the role of religion in the context of charitable food assistance. The study focuses specifically on the perspective of the food recipients. In the context of charitable assistance, religion can play an ambivalent role: on one hand, it has the capacity to motivate altruistic activities towards changes in society and in the lives of deprived people. On the other hand, religion can also serve as a potential source of conflict, particularly in asymmetrical power relations, which are likely to occur in the assistance work targeted to the people in vulnerable positions in society, and especially in situations where the religious aspirations of the providers of charity contradict the material need of the recipients.

**Buddhist Social Engagement in Consumer Society**  
Zuzana BARTOVA (University of Strasbourg, France) | bartovaz1@gmail.com

This paper proposes a new perspective on Buddhism social engagement in Europe based on Czech and French examples (cf. Keown, Prebish, Queen 2003). Since C. Taylor’s reflexions about “subjective turn” (Taylor, 1989, 1991) and its implications for religion in contemporary globalised, individualised, hyper-mediatised and consumer society (Gauthier, Martikainen, Woodhead 2013), we need to take the individual as a starting point for this subject. Thus Czech and French Buddhist practitioners may critique social order or values but this critique remains a rather secondary aspect of their speech, given their social status and their social context of a secularized welfare state. Nevertheless, Buddhist engagement is not selfish. So social engagement is perceived in two complementary ways. Firstly, it is a result of personal development. Through the development of life ethics, Buddhist practitioners change their social and natural environment, engaging sometimes in non-Buddhist charities or civic associations. Secondly, social engagement may be organised through particular Buddhist associations. This can take several forms. First of all, the existence of Buddhist centres, offering services to all interested people, is considered in itself a form of social engagement. By studying Buddhism, individuals are supposed to change their lives and consequently the society. This form of “expressive social movement” may be coupled with rather occasional, outwardly directed activities (Blumer 1969) organised by Buddhist associations, including conferences at various social institutions, charity initiatives and inter-Buddhist dialogues. In recent years in France, other forms of social engagement have appeared, imposed and regulated by the state, such as prison chaplaincy.

**Intersectionality Revisited: Social Position and Religious Belonging Among Highly Skilled Muslim Migrants in Geneva**  
Barbara DELLWO (University of Lausanne, Switzerland) | barbara.dellwo@unil.ch

In the aftermath of the “cultural turn”, there is a common understanding that the main fault lines dividing people are of cultural and, increasingly, of religious nature. Such a perception prevents us from considering the impact of social class on the way individuals shape and display their modes of belonging. Furthermore, when referring to inequalities, sociologists usually take into account only those at the lower end of the social ladder. Based on ethnographic fieldwork conducted within a broader project on “(In)visible Islam in the City”, the present contribution will give some different insights on these issues by discussing the everyday practices and the self-representation strategies of highly skilled Muslim migrants in the Lake Geneva area. Highly skilled migrants firstly enjoy a better image than other migrants in the Swiss knowledge-based economy. On the other hand, their social, cultural, symbolic and economic capital provides them with more resources to handle the dominant discourse on Islam in Switzerland. Therefore, by
questioning the (positive) interplay of social position with other forms of discrimination, I propose to shed a new light on the notion of intersectionality.

**Catholic religiosity and social justice in Czechia and Slovakia: Comparison of the EVS 2008 data**  
Roman VIDO (Masaryk University, Czech Republic) | vido@fss.muni.cz

The paper focuses on the relationship between individual Catholic religiosity (measured by belief and participation) and attitudes associated with social justice issues in Czechia and Slovakia. It is based on two principal assumptions: a) person’s religiosity significantly influences his/her political and social values; b) person’s religiosity is not socially/politically autonomous, it is moulded by the societal context of the place of living. Catholicism is generally conceived as socially sensitive and adopting a cautious approach to free-market economy model and (moral) individualism – contrary to Protestantism. However, its political role has been historically dependent on the particular political and cultural circumstances. After the Velvet Revolution (1989), Catholicism in Czechoslovakia got a strong anti-communist tone, which was especially manifest in the Czech part of the state. More than 20 years after the dissolution of Czechoslovakia into two independent states, differences in the character and public face of (mainstream) Catholicism – a dominant confession in both countries – seem to be even more distinguishable. While in Czechia Catholicism appears as relatively liberal, privatized and de-nationalized, in Slovakia it plays more public, conservative and nation-oriented role. Politically, Czech Catholicism is linked strongly with the right or right-centre parties, whereas Slovak Catholicism is more diffused along the political spectrum. On the ground of this, we expect that among Catholic believers in Czechia attitudes towards social justice issues will be more sympathetic to rightist, individualist views, while Slovak Catholics will be more inclined to (centre)leftist, statist views – even when other factors (age, education, status etc.) are controlled.

**RN34S03 - Religion, Social Divide & Conflict**

**Religious freedom but inequality - opposition and conflicts in a multicultural society**  
Irving PALM (Uppsala University, Sweden) | irving.palm@soc.uu.se

In the European countries is religious freedom an important cornerstone in building a society. The inhabitants have the right to practice their faith no matter religious affiliation. How is the situation look like in a Nordic country like Sweden? Are there equal conditions in the religious field or exist inequality and social differences? At macro level there are laws which regulate the situation and tell that all people shall be treated equal. Humanity and solidarity are important keywords. How is the situation at micro level? Research shows that persons with foreign background have it more difficult to get an employment and to be treated as equal. It can for example deal with persons within qualified professions as physicians. Sweden is a country which receives several immigrants in relation to the population. Because of some incidents have the question of migration and integration with connection to the question of religion got renewed topicality. A xenophobic party which looks at immigrants and in particular those with Islamic religious affiliation as a threat to the Swedish culture has had great success. Different conflicts and violent events within and outside Europe and with religious nature have produced acts of violence also in Sweden. Different studies show that a majority of the population have positive
attitudes to immigration and religious diversity. The desire is however that the integration shall be speeded up and that the differences of cultural shall be minimized.

The Unconquered Grounds: Christian Response to the Traditional Religious Discrimination Against the Osu Caste in Igboland, Nigeria
Ernest Okey ANYACHO (Federal College of Education, Obudu,Cross River State , Nigeria, Nigeria) | eanyacho@yahoo.com
Eunice Ify ANYACHO (Federal College of Education, Obudu,Cross River State , Nigeria, Nigeria) | euniceanyacho@gmail.com
Dorothy C MBAH (Federal Polytechnic, Oko, Anambra State, Nigeria) | doramba@gmail.com

The traditional religion of the Igbo of Nigeria stratified the society into two major groups namely the Free-born and the Osu. The former enjoys every right and privilege in the community while the latter has limited acceptance with respect to crucial areas of life namely politics, governance and marriage. There are also other areas of social inequality which the paper addresses as social stigmatization that make the so-called Osu second class citizens in Igboland . All these are based on Igbo Traditional Religious beliefs and /or superstitions . The continued existence of these stigmatizations in the 21st century and in the land where Christianity has stayed for more than a century is a major worry for this paper. The paper, therefore, investigates into different dimensions of the discrimination and inequality against the Osu even after they have been converted to Christianity. It further looks at the reason why these have remained unconquered grounds when writers claim that Christianity conquered Igboland many decades ago. The paper presents an ecumenical model that could be explored in handing the delicate issues so that conflicts could be avoided while trying to make the Osu assert their full fundamental rights in Igboland.

The becoming of religious peace activists using the example of Guatemala
Tamara Anja CANDELA GOMEZ DE LA TORRE (University of Bielefeld, Germany) | tamara.candela@gmail.com

The actual discourse of the mass media and in part of the peace and conflict studies manily focusses on the role and instrumentalization of religion in wars and (armed) conflicts. But religious traditions are ambivalent (Appleby 2000, Gopin 2000, Juergensmeyer 2001) and can be applied to means of violence and war or non-violence and peace. On the basis of narratives of peace activists in conflict (1960 – 1996) and postconflict (1996 until today) Guatemala, produced through Oral History-interviews, the investigation looks at the becoming of religious peace activists and to what extend (if at all) religion plays a role in this context. The research question asks in which way religious actors – in a context which is shaped by violence and repression – develop a behaviour which is directed toward non-violence and peace and which is endangering their personal lives. To answer this question the investigation focusses on the seemingly crucial factors of perception and formulation of social problems and grievances and the ascription of their underlying causes as well as resulting strategies of action on part of the actors. For the reason that peace oriented actions and social movements develop and occur in crisis-specific contexts the investigation also highlights the moment of crisis and the respective social location of social (here: religious) movements. The theoretical approach is based on a praxeological sociology (Bourdieu, Weber) and the referring concepts of habitus, social space and field as well as theories of religion, crisis and (new) social movements.
Islamic ISIS or ISISian Islam: De-historization of Islam and De-contextualization of ISIS in American Press
Mohammad Reza KOLAHI (Institute for Social and Cultural Studies (ISCS), Iran, Islamic Republic of, Institution for Cultur and Art Studies - ICAS) | reza.kolahi@gmail.com
Fatemeh GHOLAMREZAKASHI (Kharazmi University of Tehran) |
fatemeh.gholamrezakashii@gmail.com
Ebrahim MAHMOUDI (Institution for Cultur and Art Studies - ICAS) | ebi.m.09@gmail.com

The question of present paper is how American press relate Islam to ISIS? The answer has been extracted from narrative analysis of analytical articles of 6 American newspapers in a one-month time-span from both republican and democratic newspapers. Based on our findings, in most of these articles Islam has been narrated as a religion with ISIS being its representative (ISISian Islam), rather than narrating ISIS as a group which believes in their own particular way of Islam (Islamic ISIS). “De-contextualization of ISIS” and “de-historization of Islam” are two intertwined techniques through which Islam and ISIS are integrated and their difference is concealed.

De-contextualization of ISIS means to overlook ISIS as a new historical phenomenon in a specific historical setting and to consider it as a trajectory to Islamic Caliphate. In this conception the social circumstances intermediating rise of ISIS are ignored and ISIS is directly linked to Islamic ideology and is taken as its immediate consequence.

De-historization of Islam means to ignore historical variations of Islam and to consider it as a unique, rigid entity through all times and places. Historical and geographical diversity of Islam is disregarded and what is common among ISIS is defined and presented as illustration of Islam as a unified phenomenon and is extended to Islamic history and geography.

RN34S04 - Religion, State & (Identity) Politics

Cleverer Than We Thought: The Change In Discourse Of The Georgian Orthodox Church
Tornike METREVELI (University of Bern, Switzerland) | tornike.metreveli@soz.unibe.ch

This paper will focus on three episodes of contemporary church-state relations in Georgia, in particular, the conflicting interaction between law and religion in the public space. The first episode will be an open confrontation between the church and the state over the law on Registration of Religious Minority organizations (2011) which allowed the religious minorities to freely register; second: the Law on Self-governance (2013) which Georgian Orthodox Church considered “a threat to territorial integrity of Georgia”; and lastly: the Law on Anti-discrimination (2014) which was deemed “legitimization of Sodomic sin”. By reflecting on the three examples where for the first time after the collapse of Soviet Union, the Georgian state openly confronted the church and made a decision notwithstanding its position, I will attempt to argue that the role of the Orthodox Church in influencing the law making process is in gradual decline. However, on the other hand, by presenting the results of an ethnographic study conducted in 23 eparchies and parishes in 7 regions of Georgia in 2014, I will also show that church has adapted to its declining role over policy making, and to regain its political influence it gradually started to employ a civic rather than ethno nationalist discourse on matters of religious freedom while engaging with government. The paper will suggest that both unilateral decision-making of the state and civic shift in the discourse of the church constitute an important change in understanding church-state dynamics in the post-communist Orthodox Christianity dominated society.

“Traditional Islam” in Russia: establishing boundaries in the religious sphere
Lili Di PUPPO (National Research University - Higher School of Economics, Moscow, Russian Federation) | ldipuppo@hse.ru

The paper aims to explore uses of the term “traditional Islam” in Russia as a means to establish certain boundaries within the religious sphere. It draws on ethnographic research conducted in Moscow and Kazan in 2014-2015.

“Traditional Islam” has gained prominence in recent years in the religious and political discourse in Russia in association with the notion of a “home-grown” and moderate Islam. The term is often used in opposition to “non-traditional Islam” which designates a “foreign” and “alien Islam” that is represented as not being adapted to the particularities and historical legacies of Russian Muslims. The concept appears to be used as a means to establish boundaries with more transnational forms of Islam, in particular movements that are associated with Salafism or “Wahabism”, a term often used in the official discourse. Furthermore, “traditional Islam” is associated with the notion of “traditional religions” and “traditional values”, a discourse that distinguishes Russian values from a process of Westernization.

The concept of “traditional Islam” appears to serve certain purposes of fashioning an Islam that is loyal to the secular state and that promotes unity instead of religious diversity. The uniformity of religious life and the peaceful coexistence of religions are represented as means to prevent disputes. Furthermore, the uniformity of religious practices eases the state control over religious communities and activities. Thus, the term “traditional Islam” has the effect of marginalizing alternative religious practices by seeking to define a state-approved form of Islam.

Scholars’ Approach to Concept of "European Islam" in Turkey
Siddik AGCOBAN (Kirklareli University, Turkey) | s.agcoban@klu.edu.tr

Europe's cosmopolitan structure based on multi ethnic society is expanding by including the religious diversity. Muslim immigrants are not temporary population in European societies anymore, they begin to be permanent and part of the main structure of European culture, instead of being stranger where they come before almost half century.

In the main time, the issue of " Muslims integration " evolves to the stage of “how islam is we want” in Europe. Being detached from their original culture more and more in every year, Muslim immigrants reconstruct their Islamic understanding which is based on local identity, by considering the principals of secular European culture, individual choice and freedom. Fragmented collective identities are being rebuilt as a secular and an individual-centered structure. Scholars began to use the concept of "European Islam" for describing this situation, approximately a quarter century ago.

The concept of European Islam is not systematically discussed and debated yet in Turkey. However, we are able to achieve get some results from the disorganized ideas of scholars who works on this topic in Turkey. Scholars approach to the concept of “European Islam” -regarding the changes on Muslim identity in Europe- in two ways. The first group evaluates the “European İslam” as a planned policy and a new version of the old assimilation policies. The second group with an optimistic approach, considers this phenomenon as a natural process of social change and İslam will be better understood in this way.

Thinking in Religious Terms
Onder KUCUKURAL (Fatih Sultan Mehmet Waqf University, Turkey) | okucukural@fsm.edu.tr
In the near future, Middle Eastern democracy will be shaped by conflicts over the status of religion in the public sphere as well as by conflicts driven by the relationship between religion and the state. While political liberal viewpoints contend that in modern political and social life comprehensive doctrines do not accord well with the demands of pluralism, it does seem that, in their day-to-day practices, some Muslims in Turkey do manage to adequately reconcile their comprehensive doctrines with pluralism’s many demands. Based on fieldwork undertaken in nine cities across Turkey, this thesis is a study of individuals’ modes of religious reasoning. This work analyzes the ways in which Muslim citizens’ religious reasoning styles enable them to either reject or to adjust to the demands of modern social and political life. The paper compares two modes of religious reasoning: authoritarian religious reasoning and deconstructive religious reasoning. Pluralism goes hand in hand with an acknowledgement that there are multiple worlds, realities and truths; the data presented here demonstrate that pluralism is, in fact, a potentiality possessed by every individual. Pluralism emerges or retreats as part of a process of interactions with other individuals, within a context. The paper demonstrates that this flux, this dynamism, is strongly associated with individuals’ changes between different modes of religious reasoning.

RN34S05 - Crossing Religious Boundaries

Worldwide Religious Dialogue as Knowledge Transfer
Heidemarie WINKEL (Technical University of Dresden, Germany) | heidemarie.winkel@mailbox.tu-dresden.de

Worldwide religious dialogue is highly institutionalised; its an important pillar of the religious world system, but it is yet rarely examined as a case example of inter-cultural communication. This turns out to be an eye-opening approach, because this field of dialogue is not only characterised by its engagement in divergent bodies of religious knowledge. It is also distinguished by a reflection of everyday certainties and the dynamics of inter-subjective understanding: the unquestioned circumstances of worldly experience come to the fore of communication and even might become the primary focus of attention: tacit knowledge becomes explicit.

In the paper, this twofold transfer of knowledge in worldwide dialogue contexts will be discussed by means of empirical data from the women's ecumene. Object of study is their way of dealing with cultural and religious difference. The working hypotheses is that this worldwide dialogue forum includes a particular inter-cultural communication potential, because a twofold shifting of knowledge occurs: first, the common sense knowledge that is experienced as factual and pre-existing crumbles, and second, a life-worldly knowledge on mutual understanding of the other self (in terms of Alfred Schütz) is generated as a consequence of the direct inter-cultural cooperation. As a consequence, the religious reservoir of knowledge, its horizon of meaning and its social forms don't remain unaffected, particularly the orthopraxis. In the case of women's worldwide ecumene, the development of experiential knowledge in dealing with difference and diversity is framed by religious knowledge. The question is how far-reaching is this mutual transfer of knowledge and the participant's re-orientation.

This will be discussed in three steps: First I will introduce my (1) understanding of religious knowledge in contrast to everyday, experienced-based knowledge. Second I will illustrate my (2) understanding of inter-cultural dialogue and sketch a theory of understanding inter-cultural communication, which is relevant for the twofold transfer of knowledge. Third, this will be substantiated by (3) selected empirical data from narrative interviews.
Does civic engagement impact individuals’ perceptions of “ego” and “alter”? Narrative identities of two Muslims in Switzerland active in voluntary associations

Amir SHEIKHZADEGAN (University of Fribourg, Switzerland) | amir.sheikhzadegan@unifr.ch
Michael NOLLERT (University of Fribourg, Switzerland) | michael.nollert@unifr.ch

By espousing two theories on group dynamics – the theory of crosscutting social circles by Simmel (1908) and that of social identity complexity by Roccas & Brewer (2002) – the paper investigates the following questions: Do crosscutting social relations mediated by civic engagement have any impact on the way individuals perceive themselves and others? If yes, does this change imply a closure or an opening towards outgroups?

The presented data are based on narrative-autobiographic interviews with two persons living in Switzerland and regarding themselves as Muslims. Marina (59), an academic with a bicultural background (Switzerland, Pakistan), and Rostam (42), an academic who fled from Afghanistan with the age of 21. The interviews are analyzed after the method of reconstruction of narrative identity (RNI) devised by Lucius-Hoene & Deppermann (2004). As the study shows, both interviewees experience a considerable change in their perceptions of „self“ and „others“ during their civic engagement, as a result of which both show a greater understanding for the outgroups.

RNI is a specific form of narrative interview adapted to the requirements of identity research and can be regarded as the climax of a methodological development, which was triggered, in the 1980s, by the so-called "narrative turn". It is based on a constructivist understanding of identity as an interactive act of construction and expression of self through emplotment and positioning. The study is part of a bigger research project funded by the Swiss Science Foundation, which aims at shedding light on the implications of civic engagement for identity formation.

Mapping Interreligious Dialogue Activities around the World: Who, How and Where Builds the Bridges to “the Religious Other”

Jana VOBECKÁ (Czech Academy of Sciences, Czech Republic) | jvobecka@gmail.com

Growing religious plurality resulting from migration and demographic dynamic, as well as increased global attention to the violence in the name of religion after 9/11 led to a growing interest in “the religious other”. One way of approaching “the religious other” is through interreligious dialogue initiatives. They saw a dynamic increase around the world in the last decades and they span multiple forms, activities and geographical contexts. The aim of the paper is to map the current landscape of the international interreligious dialogue activities around the world and to understand, its meaning, focus and type of action. More concretely the analysis focuses on the organisations that conduct interreligious dialogue activities, their understanding of the meaning of the interreligious dialogue, the location of dialogue activities, and the agenda within which they conduct these activities. For that purpose a unique set of data of interreligious dialogue organisations developed within the KAICIID Peace Mapping Project is analysed for the first time. It allows for both qualitative content analyses (activities, dialogue understanding), as well as quantitative analyses (location, agenda). Our preliminary analysis shows that a majority of the international interreligious dialogues organizations focus on peace building. The most distinct agenda differences are between the interreligious dialogue organisations that focus on the promotion of democracy and human rights and those who do not focus on these issues.

Civic activism and religious institutions in Belarus

Aleh IVANOU (Hunter College of The City University of New York) | ai45@kentforlife.net
Nikolay ZAKHAROV (Södertörn University, Sweden) | nikolay.zakharov@sh.se
The paper aims to problematise the potential for collective action in the highly politically centralised environment of post-Soviet Belarus. In Belarus, in conditions of the overall political passivity aggravated by deficient societal solidarity and trust, belonging to a religious group provides a person with social supports and helps overcoming alienation and social fatigue. The insufficient outreach of few existing civil society organizations makes Belarusians to look for the same in parishes. Similarly to what takes place in other non-democratic regimes, religious institutions in Belarus become a platform for public interaction and a launching pad for civic initiatives. In the limiting case it might be considered as a way to conceal collective action in the space that lies in the shadows of already established organizations. The paper focuses on the intersection between the official and alternative projects that link civic and religious identities. By looking at societal engagement displayed by various religious confessions campaigning for their rights, it problematises a range of opportunities to engage in civic activism in Belarus. We argue that the religious component of the civil sphere can be seen as a unifying ground for building up of social networks and fostering grassroots activism.

RN34S06a - Religion & Identity Formation - A

Rising Global Attitudes Linking Dominant Religion to National Identity and the Effects on Uncertainty, Trust, and Confidence Toward Social Institutions

David M. BARRY (University of Wisconsin - Stevens Point, United States of America) | dbarry@uwsp.edu

The relationship between religion and nationality is not new. However, little attention has been given to the reality of global trends regarding this relationship, the social determinants that can explain it, and the effects such a relationship can have on other social issues. This paper offers two contributions.

First, the author offers a focused investigation on global trends that depict a growing attitude that link religiosity and national identity. Based on two global snapshots from the International Social Survey Programme: National Identity waves (1995 and 2003), a simple longitudinal analysis depicts a world where these relationships are increasing. Of the 23 countries included in both survey waves, 16 show positive changes among respondents who view religion as an important component to their national identity. Moreover, many of these trends show dramatic increases. In Europe alone, the importance of religion for national identity increased by 84% in the Slovakian Republic, 80% in the Netherlands, and nearly 50% in Russia and Poland. This paper further examines the determinants of this growing attitude and its impact on social issues. The second thread of this study examines the influence that the perceived relationship between religion and national identity has on other social issues, particularly attitudes of uncertainty, trust, and confidence toward social institutions across Europe. In general, most efforts in the literature focus on popular support of leaders and formal organizations or attitudes about economic (in)stability. Little attention has been given to the determinants of institutional confidence and trust. Even less attention is given to the impact that religiosity may have on such attitudes. This study explores how the relationship between religion and national identity has on other social issues, particularly attitudes of uncertainty, trust, and confidence toward social institutions across Europe. The conclusions drawn from this study are substantiated by analyses of multiple cross-national survey programmes, including waves from the World Values Survey and the International Social Survey Programme. The discussion that follows offers attention to the complicated influence of
religion on other identity formations and social attitudes, a topic that is regularly ignored. In addition, this paper contributes to the wider discourse on religion and nationality, which has become increasingly vital today.

The Role of Religion in the Identity Formation among Young Muslim People with Migration Background in Germany
Vladimir KMEC (Trinity College Dublin, Ireland; University of Cambridge, United Kingdom) | kmecv@tcd.ie

Turkish migration to Germany has been considered to be a low-wage labour migration. Turkish migrants moved to Germany as 'guest workers', while facing political and social discrimination. 'Guest workers' status and the life in 'ghettos' have become stereotypical 'labels' for first-generation Turks' identification (Mayer 2002; Helicke 2002; Caylan 2006; Dancygier 2010). Nonetheless, social, economic, legal and demographic characteristics of Turkish immigrants in Germany, have significantly changed since the 1960s, when the first wave of Turkish 'guest workers' arrived. Traditional stereotypes of viewing Turks as guest workers who live in ghetto areas are not any more typical characteristics of Turkish identity (Akçapar and Yurdakul 2009). Second- and third-generation Turks live different lives than their parents or grandparents used to. They are not only owners of döner kebab bistro but also highly educated, successful businessmen and businesswomen, and politically and civic active. Nevertheless, their access to socio-economic goods such as education, income, wealth and jobs often remain limited (Fournier and Yurdakul 2006; Akçapar and Yurdakul 2009). Most importantly, the academic research has moved from the focus on Turkish 'guest workers' to research that focuses on 'Muslim Turks' (Akçapar and Yurdakul 2009). Muslim people with migration background in Germany are often perceived as different, foreign and alien based on their ethnic and religious particularities. Despite the fact that they were born in Germany and that they did not experience actual migration, they are associated with migration background which thus becomes a category and label of difference.

Scholars observed new ways in identity construction among second- and third-generation Turks in Germany. Post-migrant population with Turkish background in Germany experiences an identity shift in a context which is shaped by their ancestral background on the one hand and by the current socio-economic situation of the German society (Nohl 2002; Sackmann, Peters, and Faist 2003; Bade 2011; Foroutan 2013). In this context, the construction of an identity is influenced not only by particularistic identifications, but also by multiple aspects of the host society and of the immediate social environment. As Beck-Gernsheim argued, Turkish migrants “negotiate their social localization not in Turkey or elsewhere, but in Germany. Their participation and/or obligation is not towards rights and duties in their country of origin, but towards those of the host country” (2009:xiv–xv). The emergence of new individual identities has been accompanied by a shift of Turkish immigrant life within Turkish immigrant communities and associations from ethnic 'enclavism', nourished by strong transnational ties, to integration efforts (Yurdakul 2009).

This paper explores how young Muslim people with migration background use their religion to cope with the negative experiences of inequality based on the ascribed associations with their migration background. The paper presents how second- and third-generation Turks in Germany perceive and understand their identity, including religious, ethnic and national identity. The paper seeks to understand to what extent their migration background and their current life in contemporary German society influence their self-identification and self-perceptions. The paper highlights that their identity is influenced by their Turkish descent, traditions and culture on the one hand, and their legal status, modern lifestyle and secular world-view within the German society on the other hand. The identity formation occurs in an attempt to react to social
inequalities and negative connotations ascribed to their migration background. The research reveals that young Germans of Turkish background seek to overlap their Turkish identity with their German identity, and at the same time their secular lifestyle with Islam. They thus construct new identities. The paper reveals that religion plays both functional and substantive roles in the lives of Muslim people with migration background. Religion becomes an identity marker while helping immigrants to overcome their experiences with discrimination and inequalities they face. People with migration background do not see their migration background as a source of an identity crisis. Instead, their religious affiliation enables them to perceive their migration background as empowerment. At the same time, their faith provides these young people with substantive religious meanings, enhancing their religious beliefs and participation.

The research presents immigrants’ individual religious perceptions and involvement in individual and collective religious activities. I look at different variables in religious behaviour: a) religious environment and circumstances that influence reasons for identifying with Islam; b) religious practices of the immigrant religious community that influence immigrants' religious perceptions and participation; c) religious motivations that stand behind religious practices and beliefs. The paper is based on a multi-sited and multi-case ethnographic research that analyses and compares the experiences of young Muslims with migration background in Germany carried out in different Muslim communities in Berlin and Göttingen. To demonstrate the interplay of functional and substantive roles of religion, I select a number of interviews with young people who are aged 18 to 36 and who come from different social backgrounds. Observations of religious activities and rituals in the studied communities inform the analysis.

Being Muslim-Turks in Germany and Almancı (Turks living in Germany) in Turkey: The Sociological Analysis of Candidates for Religious Leaders (Imam) in Germany Training in Turkey
Hafize Sule ALBAYRAK (Marmara University, Turkey) | albayraksule@gmail.com

Over the last two decades the rising numbers of Muslims and their increasing visibility in the European public sphere has led to heated debates. Germany is one country, which has a large population of citizens of Turkish origin; the Turkish population started to come to the country in the 1960s, taking advantage of economic agreements. However, the Turkish population in Germany still has multi-layer problems, including ethnic, religious, educational, economic and organizational. These are usually referred to as a single problem of integration and policy makers perceive Islam as the fundamental obstacle in this process. Moreover, religious leaders (Imams) who come from the home country have been blamed as acting as deterrents to integration. To eliminate the problems, in 2006 the Turkish government launched a project to train imams. The project offers young Euro-Turks who are already accustomed to Western life and values, and who also speak a European language in addition to Turkish, to pursue 4-5 years of religious education at some of the theology faculties of Turkish universities. This presentation focuses on the project of training Imams via a focus group of 10-12 German-Turkish students of Marmara University, Faculty of Theology. The research aims to analyze the perception of young German-Turks who are planning to be religious leaders toward the social, educational and integration problems they encounter in Germany and also in Turkey. This research will also shed light on their identity-building process as Turks in Germany and Almancı in Turkey.

Religion as Identity Politics or Resource for Social Change? Reflections from the Syrian Humanitarian Crisis on the Role of Religion in Humanitarianism
Khatereh EGHDAMIAN (University of Oxford, United Kingdom) | khatereh.eghdamian@qeh.ox.ac.uk

The Syrian humanitarian crisis, now entering its fifth year, is the largest political, humanitarian and development challenge of our time. While it is evident that religion was a significant factor in the cause and effects of the crisis, critical analyses of the role of religion and its implications have been largely absent from academic discourse. While sociological analyses of religion often delegate religion as a source of individual and collective identity, this paper argues for a need to reconceptualise religion beyond identity politics and rather as a potential resource for social change. Drawing on qualitative data obtained during two months field research in Jordan and critical sociological (primarily Foucauldian) analyses, this paper argues that the Syrian humanitarian crisis not only offers valuable lessons on the potential constructive role of religion in conflict and humanitarianism, it sheds light on the need to rethink religion beyond identity politics in such contexts. Doing so, however, requires a recasting of core assumptions in the theories and methodologies within the sociology of religion. In particular, it raises questions as to the nature of religion beyond conflict and the conceptualisation of religious plurality beyond difference. It argues towards a more holistic, inclusive, and constructive notion of religion, rather than reproducing discourse on difference through identity.

Constructing a Socio-Religious Imagination: Historical Tensions in Contemporary Selves
Burin YILDIZTEKIN (Department of Sociology & Centre for Jewish Studies, University of Toronto) | burin.yildiztekin@mail.utoronto.ca

Religious intermarriage provides one of the most sociologically illuminating intersections of modernity, secularity, and religiosity. This research destabilizes the binary approach of identities as either secular or religious in intermarriage literature and in secularization theories. In-depth interviews with Muslim-Jewish mixed-married couples in Turkey show that these individuals distinguish between “religion” as externally defined religious rules and “faith” as a relationship between God and the individual that is not mediated through external rules. They make this distinction in order to explain their connection to their religious backgrounds and to self-identify as secular. In doing so, they establish a hybrid position which I conceptualize as “faithful secularity” that incorporates both belief in God and secularity within the Turkish context. Due to the ongoing socio-historical tensions between secularity and religiosity in Turkey, the distinction between religion and faith becomes useful for these individuals to express both their secular identities and their belief in God without bringing together the concepts of religiosity and secularity. Unlike their Jewish partners who perceive Jewish identity as an identity beyond religion and/or a belonging different than a religious identity, Muslim partners have difficulty perceiving the Muslim identity as one that goes beyond the religious identity, such as ethnic identity. Thus, once the Muslim partners do not identify themselves as religious, they have difficulty situating themselves with respect to their religious backgrounds. Therefore, the concept of faith becomes particularly helpful for the Muslim partners to situate themselves with respect to their religious backgrounds and to self-identify as secular. These findings open up the way for a comparative socio-religious imagination that provides insights into the ways in which individuals reformulate their religious backgrounds while self-identifying as secular in different social contexts.
I know, therefore I am. The function of knowledge in the process of religious identity creation, expressing differences and inequalities.

Marta KOŁODZIEJSKA (Institute of Sociology, University of Warsaw, Poland) | ma.kolodziejska@gmail.com

This paper is part of ongoing research and a partial reference to an upcoming book chapter. It will focus on the function of knowledge on two Catholic internet forums- forum.wiara.pl and dyskusje.katolik.pl- and its use by forum users in the process of religious identity creation. Two main concepts will be deployed in this paper. The first one is Heidi Cambpell’s (2012) notion of storied identities, which are characteristic of networked religion. Those identities are created in the form of a narrative, a story one tells about oneself, consisting of various fragments and prone to change. The second concept is Mia Lovheim’s (2004) claim that online identities have a strong offline component- in other words, that our online selves, while malleable and partially formed through virtual interaction, have their roots in knowledge and experiences which we have amassed during our lives. Therefore, online identities aren’t autonomous, isolated creations- as some early research into CMC would suggest- but to a large degree reflect the offline selves. Knowledge contextualises and structures online identities through referring them to their offline roots.

There were four methods and analytical tools used in my research, two of which will be mentioned in more detail in the presentation: IDI interviews with most active forum users (9 users, 7 male and 2 female, invited through an online questionnaire; IDIs conducted between June and September 2014) and critical discourse analysis of forum threads (Fairclough, 1992; Lövheim, 2004). Other methods included summative content analysis and online questionnaires, but their results are not of primary focus in this paper.

Based on the results, I have concluded that knowledge, as one of Stark and Glock’s (1970) dimensions of religious engagement, is of primary importance on the analysed forums. Firstly, because it is the means to create and express both differences and similarities between users, and secondly, because it serves as a vehicle for the creation of social representations. Since forums are constituted by and for the purpose of discursive exchange, narrative and textual interaction remain the most significant ways to know other users and form alliances. The content of this interaction is based in knowledge, understood in two ways: as sources (historical, theological, ecclesial, etc.) and their interpretation, and as “life wisdom”, i.e. knowledge gathered through experience. Users exchange information, but also personal advice and support- all of which are based in those types of knowledge. For instance, a person seeking help in solving a family issue may be advised to read a passage from the Bible, will be referred to the Canon Law, or will be given advice with the teaching of the Church in mind. Others may disagree with the use and interpretation of a particular source- on this basis, alliances and distances are formed (“factions”). They are thread-specific, i.e. allies within one thread may be part of opposing factions in another. What was discovered is that both alliances and distances transcend religious and/or political differences- while there are cases of Catholics debating against atheists, this division is as common as any other. Knowledge has, therefore, both an integrating and differentiating potential- it brings together people with a similar mindset or worldview, and distances them from those representing opposing standpoints. This process will be illustrated by a sample thread and translated excerpts from IDI interviews.

The second use of knowledge, connected with the former, is observed in the process of creating social representations (Moscovici, 1963). Individuals forming alliances often create a discursive barrier between “us” and “them” (see: in-group and out-group, Tajfel and Turner, 1979). The “us” is a group not only in possession of a certain knowledge, but also interprets it “correctly” and logically, and applies it effectively, whereas “them” is formed by individuals who either do not possess the knowledge, or misinterpret and misuse it. Moreover, while “us” is seen as
manifold and heterogeneous, the representation of “them” is based on stereotypisation and generalisation. A vivid example of this process is the creation of social representation of “average Catholics”, whose attributed qualities include laziness, ignorance, lack of interest in religion, and mindless ritualism. Users who affiliate against that representation may be both Catholic and atheist, liberal and conservative, right-wing and left-wing. Interestingly, this representation characterises groups external to the forums, who therefore cannot defend themselves against accusations (which is common in the case of different fractions disputing on the forums). It is also the representation which none of the users want to accept as representing themselves- users are most likely to distance themselves from the attributed qualities. It can be concluded that in this case the integrating aspect of the use of knowledge transcends thread fractions and helps differentiate forum users, regardless of their affiliation, from groups of non-users. Again, a sample thread and quotes from IDI interviews will illustrate this use of knowledge.

To sum up, it will be shown that the analysis confirms some earlier conclusions regarding online religious identity creation: its storied, narrated form, as well as a strong bond with the offline context. The integrating and differentiating function of knowledge on the forum shows that processes of religious identity creation and expression of difference are structured partly by online interactions and alliance building, and partly by exhibited knowledge, experience, and interpretative skills.

The final questions which should be asked refers to the similarities and differences in religious identity creation online and offline, and to the connection between the abovementioned identity-building processes and postmodern sociological concepts, often depicting identity as fluid and fragmented (Bauman, 1997; Gergen, 1991). It will be shown that this fluidity is in fact limited by the context of knowledge. I hope that this analysis will be an insightful contribution to the discussion on the forming of religion-based inequalities and differences in contemporary mediatised societies.

Bisexual Christians - the identity and the lived experience
Dorota HALL (Institute of Philosophy and Sociology of the Polish Academy of Sciences, Poland) | dhall@ifispan.waw.pl

The paper draws on in-depth interviews conducted within the author’s research project among Polish LGBT Christians (the term LGBT Christians standing for those who do not wish to fight against their non-heterosexual desire or non-normative gender expression, searching instead for the integration of their sexuality/gender expression and religiosity). The paper discusses a specific situation of bisexual Christians, that is, those marginalized because of their adherence
to Christianity (within the LGBT community), because of their non-heterosexuality (within the community of Christian believers), and additionally, because of their bisexual self-declaration (within all: the LGBT community, the Christian community and the community of LGBT Christians). The presentation highlights problems that people who define themselves as bisexual Christians encounter on their way to reconcile their non-normative sexuality with religiosity. It situates these problems in the context of narration inabilities: bisexuality is difficult to articulate within the emancipatory discursive framework constructed by the LGBT activism that builds on the homo-hetero dichotomy. It is even more difficult to articulate within the activism by LGBT Christians who draw on discursive patterns of LGBT activism and strengthen the exclusion of bisexuality by insisting on the innate, God’s-given nature of the homosexual desire and the lack choice of the sex of the object of desire.

Quadruple Identity Transformation in Religiously Diverse Societies
Anneke PONS-DE WIT (KU Leuven, Belgium) | Anneke.PonsdeWit@soc.kuleuven.be
Dick HOUTMAN (KU Leuven, Belgium) | Dick.Houtman@soc.kuleuven.be

One of the most fundamental questions in the sociology of religion is how religious identities evolve in response to religious diversity. Interestingly, four strikingly different theoretical answers have been given to this question in the last half century. Firstly, a decline of religion is assumed in the secularization theory, since religious diversity allegedly undermines the plausibility of all religious traditions (e.g., Berger, 1967). Secondly, others expect similar plausibility problems to transform religious identities into highly privatized and relativistic ones (e.g., Luckmann, 1967). Thirdly, there are those who expect opposite responses of purification and exclusivism, because religious identities are assumed to experience religious diversity as a threat (e.g. Lawrence, 1989). More recently, a fourth theory has been proposed, according to which similar experiences of threat evoke anti-religious responses to religious diversity among the non-religious (e.g. Hout & Fischer, 2002). Although many empirical studies of each of these four different identity types have meanwhile been undertaken, mainly of the religious ones, it is as yet unclear whether and how religious diversity does indeed play a role in sparking the identity trajectories that have allegedly led to each of them. Because of that, today’s coexistence of a-religious, religiously relativist, religiously orthodox and anti-religious identities does not necessarily confirm these theories. Moreover, the crucial question of why and when people embark on one of these trajectories rather than another has thus far been largely neglected. This paper therefore proposes a research plan to study these vitally important questions.

RN34S07 - Youth, Religious Attitudes & Religiosity

Religiosity and anti-gay sentiment: Nuancing the relationship of negative attitudes towards homosexuality amongst Muslim and Christian youngsters in Flanders.
Filip DROOGENBROECK (Vrije Universiteit Brussel, Belgium) | filip.van.droogenbroeck@gmail.com
Bram SPRUYT (Vrije Universiteit Brussel, Belgium) | bram.spruyt@vub.ac.be
Jessy SIONGERS (Universiteit Gent, Belgium) | jessy.siongers@vub.ac.be
Lilith ROGGEMANS (Vrije Universiteit Brussel, Belgium) | lilith.roggemans@vub.ac.be
Gil KEPPENS (Vrije Universiteit Brussel, Belgium) | gil.keppens@vub.ac.be
Lauren VANDENBOSSCHE (Vrije Universiteit Brussel, Belgium) | lauren.vandenbossche@vub.ac.be
Although all great religious traditions of the world have a message of universal compassion and tolerance, research conducted from the fifties has shown that, in general, religious people report more prejudice towards several minority groups (racial, ethnic and sexual) when compared to non-religious people. This apparent paradox points to the complexity of the relationship between religion and prejudice. This paper contributes to a better understanding of this relationship by studying how religious quest orientation, self-rated religiosity and authoritarianism are related to prejudice against homosexuality among Christian and Muslim youngsters aged 14-23 in Flanders (N=2834) enrolled in secondary education. Muslim youngsters are more religious and report more prejudice against homosexuality than Christian youngsters. However, multilevel analysis also shows that several similarities between Christian and Muslim youngsters exist. For both Christians and Muslims, we found that youngsters that are male, following education in a vocational or technical track, having a higher self-rated religiosity and more authoritarian attitudes are related to negative attitudes towards homosexuality. Having a religious quest orientation on the other hand, is related to less prejudice towards homosexuality for both groups. Although Muslim adolescents report more prejudice against homosexuality, factors that predict prejudice amongst Christians – gender, educational tracks, self-rated religiosity, authoritarianism and quest orientation – apply similarly to Muslims.

First young, then Muslim: identity belonging network off an on line
Roberta RICUCCI (University of Turin, Italy) | roberta.ricucci@unito.it
Viviana PREMAZZI (Forum Internazionale ed Europeo di Ricerche sull'Immigrazione, Italy) | viviana.premazzi@fieri.it

Within a multi-cultural, multi-religious, “wired” society, the use of the Internet for religious purposes has potentially important implications for inter-ethnic and inter-religious relations, policy making and education. Furthermore, Internet has, over the past decade, provided a new platform for religious groups as a new approach and avenue for proclamation, communication and interaction, with both members and non-members of their faiths.

The presentation will be focussed on 1) how young Muslims living in Italy use Facebook for developing, managing and discussing their religious belonging and 2) the effects of this process on the relationship between first and second generations. Is Facebook use transforming religious practices developing bottom-up interpretations of the Islam, a “cut and paste” Islam, where people can take according to their religious preferences or Internet can also be seen by parents as a new and useful tool for the cultural and religious education of their children? How do second generations accommodate off-line practices and activities with on-line presence?

I believe, I doubt, I am looking for… Youth attitudes toward religion
Mirosława Helena GRABOWSKA (University of Warsaw, Warsaw; Public Opinion Research Center, Warsaw) | grabomir@is.uw.edu.pl

The secularization thesis claims that there occur directional changes concerning churches, religiosity and religions themselves. But the important question is: what do these transformations of macrostructures and institutions mean? We consider transformations of state institutions and church organizations, psychosocial and cultural changes, and their impact on the religiosity of the generation of young individuals. Are the young ones more secular, less religious? Are young people less connected with the church? Less exposed to the church’s influence and less susceptible to its influence? And if they declare themselves as believers, does it mean that their faith is more private, individualized, without consequences for the other
spheres of life? If young people declare they do not believe, does it mean a lack of religious faith, the rejection of the Church as an institution or rejection its moral teaching?

The presentation will seek a more precise and detailed answer to the above questions and the following questions specifically:
1. Are institutional religiosity and church attendance shrinking?
2. Is the private and individualized religiosity expanding?
3. How do these processes take place in the young generation? Do they depend on school religious education? On the social environment? Or do they rather evenly cover the entire young generation?
4. What are the effects of these hypothetical processes on the young generation? Rejection of faith and church? A search for something beyond their own religious traditions, or simply religious indifference?

The analysis will focus on selected European countries and, more systematically, on Poland.

**Religious Rebellion? New perspectives on religiosity among youth in East Germany.**
Yvonne JAECKEL (Leipzig University, Germany) | yvonne.jaeckel@uni-leipzig.de

Sociological descriptions of the relation between youth and religion often stay in categories of religious affiliation. In East Germany, religious membership is the particular case regarding the historical background and the resultant secular socialization of the young. While sociology of youth is describing a “generation Y”, which is questioning all existing axioms of the life sectors, it is to ask what that behaviour means in case of their relationship towards religiosity. The adolescent phase is impressed by the search for identity, which appears in a polarizing behaviour. The so-called “peergroups” play an important role and support this rebellious behaviour while giving security in a stage of segregation. In case of religiosity, three rebellious scenarios are imaginable in East-Germany: (1) Rebellion against the parental home. Whether the socialization was religious or not for the following generation the opposed interest is thinkable. (2) Rebellion against religious institution. Dependent of the socialization antireligious motivated or individual religious behaviour is thinkable. (3) Rebellion against the secular society. A scenario, that is more probable for religious adolescents and leads to rather fundamental religious positions. To operationalize a construct of religious identity that includes the illustrated perspectives of adolescent behaviour it is necessary to enlarge the often-used model of religiosity by C. Glock. The PhD-Project intends to develop further dimensions that are able to measure group behaviour in terms of identity strengthening and segregation. The paper will give an insight into the project focussing on first quantitative data analyses based on secondary data of different surveys.

**RN34S08 - Religious Gender Regimes**

Troubling unequal gender regimes in patriarchal religion: A mixed methods study of the Roman Catholic Women Priest movement
Christina GRINGERI (College of Social Work, University of Utah, United States of America) | cgringeri@socwk.utah.edu
Tara ROMNEY BARBER (College of Social Work, University of Utah, United States of America) | tara.romneybarber@utah.edu
Spurred on by centuries of entrenched hegemonic masculinity in Catholicism, seven women were ordained priests in 2002 by male Roman Catholic bishops on the Danube River, inaugurating an international feminist social movement. The women deliberately violated the Roman Catholic Church’s centuries-old canonical prohibition against the ordination of women. They claimed for Catholic women the right to equality in pastoral roles and ecclesial leadership. Their actions impact all women, as institutionalized gender asymmetry in global institutions reinforces and reproduces the devaluation of women.

More than 250 ordained Roman Catholic women priests and bishops actively minister worldwide, challenging gendered structural exclusion in Catholic teaching and practice. Because of the Vatican’s prohibition on discussing women’s ordination and punishment of works questioning the dominant discourse, women experience silencing and unequal agency. In the absence of dialogue within the institution, women experience ordination monologues on the margins.

Rooted in the 20th century resistance of the underground church in Eastern Europe, the women priests’ movement has trespassed taboos, authorized women’s vocations, and appropriated traditional symbols for inclusive ministries. The movement seeks changes beyond women’s ordination: establishing a discipleship of equals, inclusion of married priests, equality for LGBTQ people, and local governance. Applying a critical feminist theological lens and using a mixed methods approach, we analyze qualitative interviews with 100 ordained women and congregational survey data (N=256). Examining the social movement from genesis to evolution, we foreground the women priests’ praxis as strategies that resist and deconstruct heteropatriarchal metanarratives, replacing it with one of inclusion and equality.

The nexus of gender inequality, spirituality and social change: Feminist activism for women’s ordination in Catholicism and Mormonism

Tara ROMNEY BARBER (University of Utah, United States of America) | tara.romneybarber@utah.edu
Christina GRINGERI (University of Utah, United States of America) | cgringeri@socwk.utah.edu

Confronting institutionalized gender asymmetry in their faith traditions, Mormon and Catholic women are actively organizing for the ordained priesthood, challenging male “received knowledge” about gendered roles within the institutions. Ordain Women, a nascent social movement for equality and the ordination of Mormon women, works for change from within established institutional doctrines and structure. The Roman Catholic Women Priest movement has gone beyond institutional constraints, having worked from within the institution for several decades amidst increasingly prohibitive proclamations against even the discussion of women’s ordination. In both movements, women are excommunicated for their activism.

Historically, male leadership has developed doctrines excluding women from priesthood, leaving unspoken male hegemonic control and dissemination of theologically binding information. Religious leaders have buttressed exclusive practices by erasing or reinterpreting historical contributions of women as ordained priests. Patriarchal religious doctrine that promotes “separate but equal” is a tool that women must trouble, and often dismantle, in order to develop and disseminate counter-knowledge.

Mormon and Catholic women’s activism for ordination reveals how they struggle with entrenched inequality and discrimination, and empower agency in members. A comparative thematic analysis of documents, narratives, photos, and video footage from Ordain Women and Roman Catholic Women Priest movements helps foreground the strategies and tactics they use to challenge doctrine and practice as institutional tools of patriarchal exclusion. The socio-cultural and political contexts shaping the genesis of these feminist movements in different
developmental stages highlights how religious actors respond to gender role asymmetry and utilize divergent tactics to work toward similar goals.

**Can the Subaltern Speak? Revisiting Transnational Feminism and Muslim Women’s Lives in Pakistan**

Shirin ZUBAIR (University of Oslo, Norway) | shirin.zubair@iln.uio.no  
Maria ZUBAIR (Nottingham University, UK) | maria.zubair@nottingham.ac.uk

This paper reports the findings of an exploratory, qualitative study with Pakistani women who have studied and/or researched on feminist issues-- to explore how Muslim women in contemporary higher education contexts in Pakistan engage with feminist thought. The broader aim of the study was to capture the relationship between the women’s ‘secular’ education and their religious (and secular) social identities as younger, urban, working women in a Pakistani Muslim higher education context. In particular, the study set out to explore how Pakistani Muslim women at higher education institutions interact with and use ‘new’ forms of knowledges, particularly those dominated by Western frameworks of intellectual thought and reasoning, in the context of their own potentially different social lives and self-identities as Muslim women. The main objectives of the study included: (1) Understanding how younger, urban, middle class, working women of Muslim faith experience and negotiate identity shifts, if any, after taking on new public roles; (2) Exploring the role if any, of ‘new’ forms of knowledges including Western feminist thought, in how these women make sense of their own changing social locations, lives and identities as women working and interacting within a mainstream public domain; and (3) Revisiting (Western) feminist epistemology and its meaning, interpretation and relevance for these Muslim women living and working in the Pakistani context.

**The Fiction of Agency: Why Religious Majalis in Iran Has Not Led to Pious Women ’Agency’?**

Jabbar RAHMANI (Iranian Institute of Anthropology and Culture (IIAC), Iran, Islamic Republic of) | j rahmani59@yahoo.com  
Niayesh GHORBAN DOLATI (University of Tehran, Iran, Islamic Republic of) | niayesh.d@gmail.com

Religious Majalis (plural form of Majlis means meeting) in Iran are the most important communities that women gather there to observe rituals. These Majalis, which are mostly hold in its participants’ homes, have been diversified in 90’s. At that historic time, some types of Majlis emerged that went beyond common rituals and reciting Quran to create innovative forms by adding music instruments, Pop songs and even in some cases ecstatic poems or literature. These unique characteristics, along with the female speakers who increasingly gained reputation, attracted pious women with different backgrounds of religiosity to the Majalis that were not limited to orthodox Islam anymore. The facts that arouse exaggerations in describing the capacities of religious Majlis to empower women through the studies which were the first investigative confrontations with these meetings. Although these Majlis provided a significant context for religious women to engage public sphere and shape their communities, our studies shows that it doesn’t drive to problematize “gender” and “being woman” as the common concern for the audience. As an objective sign, it has not become the origin of any collective acts leads to a fundamental change to repel present masculine and unequal interpretations of Islam. Despite contributing to the widening our knowledge about Majalis in Iran, it seems the prior studies have misinterpreted individualized practices –that have remained in and depended to dominant powers- as “agency”. This
interpretation contradicts the fact that women participants of common Majlises were never vanguards of other women in the context of society of Iran. As comprehensive recognition of general conditions is required to achieve an accurate understanding of particular situation of Majlis women practices, I have studied contemporary Iran’s social-political status in addition to “participant observation” of Tehran’s female religious Majalis in two years period of 2012 to 2014. This article tends to show that why female religious Majalis in Iran has not lead to an egalitarian volition to bring pious women’s “agency” up against masculine structures, despite the potential of organizing women communities.

**RN34S09 - Religion, Education & Inequality**

**Islamic Schooling in Mali: Parental Educational Strategies and the Rise of the Médersas’ Informal Networks for Social Insertion**

Emilie ROY (Al Akhawayn University, Morocco) | e.roy@aui.ma

Based on interviews with Malian parents during a two-year stay in Bamako, this paper explains the economic and social factors influencing the choices made by parents with regards to their children's educational path. I demonstrate how parents base their decisions about schooling on subtle calculations of cost and benefit in terms of monetary investment and social capital. These parents understand education as collectively useful: education for all often means education of some for the benefit of all. Based on this conceptualization of education, parents send some children to specific schools in order to maximize the benefits (salary, perks, influence, authority) for all members of the family.

In order to understand the diversification of schooling options available in Mali, I will first discuss the failings of the public school system insofar as its demise also meant that the social capital gained from it declined. The decline of the public schools led to the rise of médersas and their dependent networks. I emphasize the new type of social capital, in terms of religion and of culturally appropriate education, offered by médersa schooling which has proved popular. The combination of an economic predicament in which schooling does not lead to employment and the availability of a more traditional and religiously-oriented education led parents to develop new strategies with respect to schooling. Making do (se “débrouiller”) with the available options, greater numbers of parents have opted for the médersas: schools that offer culturally appropriate knowledge and insertion into new networks.

**Students' religiosity: an engine or a brake of social mobility?**

Gabriella PUSZTAI (University of Debrecen, Hungary) | gabriela.pusztai@gmail.com

It is a classic idea that religiosity in itself can be beneficial to social mobility (Riesman 1983, Weber 1982), but empirical evidence has been sought after ever since by a whole range of analyses, some of which claim that academic success is promoted by religious practice, while others hold the view that it undermines high achievement (Lenski 1961). During the decades of communist rules it was common denominator of religiosity in Hungary that people who were affiliated with religious communities became under-represented in workplace leadership positions and the basic indicators of social status were very strongly and negatively interrelated with religiosity. After the political transformation in Central and Eastern Europe, one of the most important challenges of restructuring the educational system was how the different cultural groups would be able to ensure pluralism and equal opportunity in all level of education to their
children after the domination of the totalitarian ideology. Our research results have revealed that higher education studies seem to be a highly outstanding stage in the shaping of the individual's cognitive, political and religious attitudes. It is very interesting to investigate whether religiosity can act as an engine or as a brake of social mobility. To answer to these questions we analysed empirical data from three countries (Hungary, Romania and Ukraine) collected in 2014 (Comparative Student Survey N=1850). We compared low status students’ study pathways with different types of religiosity. We analysed their achievement in HE, including their study engagement and job attitudes to find out their mobility prospects.

Successful educative actions to manage religious diversity in schools
Lena DE BOTTON (Universitat de Barcelona, Spain) | lenadebotton@ub.edu
Ana BURGUÉS (Universitat de Barcelona, Spain) | ana.burgues@ub.edu

Nowadays societies are increasingly multicultural and multi-religious. In consequence it is necessary to identify those scientific evidences that allow preventing and / or resolving conflicts that may occur in different public spaces, especially in educational contexts for being privileged spaces of interaction.

Obtaining a balance between recognizing diversity and ensuring equality to children and their families requires the construction of a common political culture among all the members of a society. These actions must be based on scientific evidences to ensure their success regardless of the social context or the groups addressed.

The present paper presents the initial results of the project "Multicultural laicism and management of religious diversity in educational contexts" founded by Catalan government, which identifies those specific actions and experiences in educational contexts that are preventing the conflict resulting of the contact between a large ethnic and religious diversity. It has been carried out two case studies based on Communicative Methodology in schools with a high component of religious diversity. The results of the project are focused on the impact these experiences and actions have on the community, with special emphasis on the family and social context. The paper discusses about the need of identifying and designing a multicultural laicism at school that guarantee the freedom of expression based on the protection of universal rights.

Religious Influences on Educational Inequalities
Simon GORDT (University of Bern, Switzerland) | simon.gordt@edu.unibe.ch

During the last 200 years school as an institution has been established as a public institution for mass learning (Herrlitz et al. 1984). Thereby, mass education is as an outcome of religious, economic, and political processes as much as social power relations (Müller et al. 1997, Boli et al. 1985), which led in Europe to similar public school systems with common features (Meyer & Ramirez 2005). As a consequence school as such became next to the family the major (social) context for socialisation (Becker & Schulze 2013) and therefore for social inequality.

Educational inequality as a particular inequality results from the interaction of primary and secondary effects of social origin (Boudon 1974) in combination with institutional arrangements (Becker 2000). However, despite their common features there are differences between the European school systems in the institutional arrangements that are set up for education (Müller & Kogan 2010), which might be responsible for difference educational inequalities in Western Europe.

Based on the idea that “the religious and the secular are inextricably linked throughout modern European history” (Casanova 2009: 227; cf. Hervieu-Léger 2003 & Martin 2003) this paper argues that the institutional arrangements follow basic patterns of secularization. I.e. religious
institutions lose their social significance and their grasp on the agencies of social control and withdraw from their classical sphere of influence (Wilson 1982, Berger 1973).

Hence, this paper deals with the questions to what extent does the religious influence on the educational institutionalization differs between the European countries, how it influence the educational inequality and why there are different patterns? Several patterns in Western Europe will be expected, which are based mainly on the cultural heritage and further distinguished by the church-state nexus (Rokkan 2000, Martin 1978).

RN34S10 - Food, Popular Religion & Holistic Belief

Transnational Family and Halal Food Consumption among Muslim International Students
Hiroshi KOJIMA (Waseda University, Japan) | kojima@waseda.jp

Kojima (2013) reviewed existing studies on the correlates of halal food consumption among Muslim immigrants in the West and East Asia, but there do not seem to be any studies analyzing the effects of transnational family on halal food consumption. A preliminary logit analysis of microdata from the Muslim International Student Survey in Japan (2013-2014) revealed that the international students’ halal food consumption is affected not only by the household structure in Japan but also by the household structure at home in their home country (Kojima 2014).

A few working hypotheses have been derived from this recent study concerning the effects of family of orientation on religious identity and eating habits, but it is not certain whether it is due to the nature of peculiar subjects of international students in a non-Muslim society. Nevertheless, it may have some implications for European societies with a larger number of Muslim youth because Rodier (2014) has revealed for the second-generation Muslim youth in France that the differential patterns of halal food consumption appear partly depending on their age, sex and family configuration.

The logit analysis reveals, after controlling for basic demographic and socioeconomic variables, that being married (spouse absent) has a negative effect on the visit to halal restaurants and a positive effect on bringing boxed lunch to school. The co-residence with a wife and children has positive effects on the visit to halal shops and bringing boxed lunch to school. Living with Muslim compatriot has positive effects on the visit to halal shops, halal restaurants and school cafeteria. Having grandparents at home in the home country has similar effects as being married (spouse absent). Having brothers has a negative effect on the visit to halal shop and a positive effect on the visit to school cafeteria. Further analyses with restricted samples have been conducted and some effects get stronger or weaker.

The results suggest the effects of financial constraints for remittances, gender division of labor at home and possibly the succession of dietary tradition at home or the society of origin. But it is somewhat difficult to interpret partly because of difficulty to find an appropriate theoretical framework and partly because of lack of existing empirical studies on the effects of the family of origin in the home country on halal food consumption of international migrants. The results suggest that further studies are necessary by European sociologists observing the larger number of Muslim population.

Transition of paranormal belief from mother to her child
Michal KRATOCHVÍLA (St. Elizabeth University, Slovak Republic) | kratochvila.michal@gmail.com
Variations of belief in paranormal phenomenon are part of religiosity of adult and youth population. In our research project of religiosity between young people in Slovakia, we collected 1968 questionnaires of high school students and from a part of them, 680 questionnaires of their mothers. We measured religiosity in 5 dimensions of church religiosity and beliefs in paranormal (horoscope, reincarnation, UFO) by both groups of participants. Comparison found significant connection in beliefs in paranormal between mother and her child. Differences in transition of paranormal belief from mother to her child are significant by demographic factors like gender of child, age and education of mother, belonging to a church and practice of religion. Correlation between beliefs of mother and her child is significant by attitudes of youth to education, leisure time activities and deviant behaviour.

Veganism as implicit religion in a gender perspective
Vincenzo ROMANIA (University of Padova, Italy) | vincenzo.romania@gmail.com

Veganism is a philosophy, or in sociological terms a lifestyle, consisting in abstaining from the consumption of animal products including any animal-derived good. Contrary to common sense, the action of the movement is not simply focussed on the political and environmental consequences of food, clothing and transports consumption. Rather, it also entails a conception of peace and nonviolence and a specific ethic of non-exploitation of nature and animals, based on the religious Jain principle of Ahimsa. Like other social movements for animal rights, their messages are usually framed with moral claims (Jasper and Nelkin, 1992; Mika, 2006). Therefore, since its origins in the 60s, veganism is connected to a religious belief. In the further decades, this original spiritual concern has been transformed in an ethical issue concerning human, natural and animal respect.

As for other social movements entailing an holistic perspective, there is a statistical prevalence of women among the practicing vegans and the same prevalence can be noticed even among the users of vegan web forums, constructing a bottom-up narration about the practice of veganism.

This paper will propose an exploratory work of analysis on the diffusion, organization and rituals of the movement in Italy and on the consequences of being vegan in terms of social and personal commitment. The case study will be inquired through an innovative symbolic interactionist perspective on religion as a source of meaning in daily life (Primano, 1995; Besecke, 2001; Ecklund, 2005). In particular, I will focus, on the narrative interactions (Ammerman, 2003) between vegans hosted by the two most important forums for vegans in Italy (veganhome.it; forum.promiseland.it). My objective is to understand how this online interactions permit to create and bolster a vegan identity and a vegan belief; in what regards it constitutes a kind of implicit religions, focussing in particular on the definition of daily life practices; how symbolic borders between vegans and non-vegans are managed; how veganism and other forms of religious or non-religious beliefs are conciliated.

Halal Hunters: Food Translation and Diasporic Biopolitics among Indonesian Muslims in Taiwan
En-Chieh CHAO (National Sun Yat-sen University, Taiwan) | zolachao@gmail.com
Nathaniel Arthur TUOHY (University of Michigan, USA) | nat.tuohy@gmail.com

As the global halal food industry develops, the local networks mobilized to establish new halal foodways in non-Muslim lands raise questions about legitimate forms of power, agency and difference. In pork-craving Taiwan, a “Halal Food Card” written in Chinese quickly summarizing Islamic dietary restrictions has helped many Indonesian students in an otherwise difficult food terrain. A list of certified places and products continues to grow, and foodies’ online reviews of
new halal establishments are shared via social media and smartphone chatting apps. The concern about acceptable diets involves self-management and individualisation of responsibility, but it also helps create social networks abroad, rather than an atomisation of individuals. Drawing on interviews with Indonesian graduate students in Taipei who hold different strategies and degrees of adherence to the dietary code, this paper examines labeled certification, Buddhist/Muslim-friendly restaurants, and digitized "word of mouth" as the new nodes of the halal network in Taiwan. As the “social body” is transplanted to an alien setting, a shift in the construction of ways of being Muslim also takes place. Moreover, such food translation also helped create new food landscape and cultural imaginations about self and others in a country with a tiny Muslim population (0.3%). Theoretically, this paper intertwines an analysis of religious biopolitics with an actor-network-theory. It looks into multiple ways of cross-cultural food “translation” and creative leeway in order to articulate an account that questions overly deterministic views of both biopolitics and Islam.

RN34S11 - Shifting Traditional Religion - Religious Pluralisation

Religious Rituals and Territorial Transformations: The Case of Santa Rosalia in Palermo
Rossana Marianna SALERNO (Università degli Studi di Enna "Kore", Italy) | salerno_rossana@libero.it

SUBJECT
This type of research has developed around the case of a party known exceedingly, both in its size folklore, and in its social implications: that of Santa Rosalia in Palermo held on separate days between July and September of each year. Such an analysis is developed both through the support of documents or through a series of field observations carried from 2007 to 2013. The case of Santa Rosalia in Palermo has several special features that place it in the foreground on the issue of territorial changes. The festival brings together different expressions and turns out to be a real container in which converge religious devotion, penitential rites, local identity, ecclesial and institutional presence. The feast of Santa Rosalia is also a stage on which transit institutions and civil society, a terrace from which one can admire the society in which this Palermo and admires herself. His being part of a centuries-old tradition raises questions about its significant transformation: this road the Feast of Santa Rosalia also functions as a detector, another, of the processes of cultural change that cross the society and culture of Palermo.

The hypothesis on which orients the entire research then see the Feast of Saint Rosalia as a real container in which an institutional dimension secular converge, a playful and popular, an institutional dimension of the Church, and finally a form of devotion. These different dimensions take a dynamic and make it explicit through processions, altars, and the pilgrimage. The institutional dimension (secular and ecclesiastical) on one side and the popular play (also secular and ecclesiastical) on the other, are in mutual dependence between them and are constantly traced to a shift still provisional. For a change in institutional languages, which is expressed through a constant change of conceptual frameworks with which the event is reinterpreted, is counterbalanced by a similar transformation of languages recreational and devotional ones. This so end up opening new dimensions and new profiles constantly redrawing of the party.

CONCEPTUAL FRAMEWORK OF REFERENCE: THE PLACES AND THE SACRED.
The sites are an anthropological construction; they always have their own history, and are therefore historical. But they are also the result of the relationships between people, they are relational, and finally, possess their own lives: they are born, are well founded, modify, change, or decay may die, they are abandoned, destroyed and can be rebuilt: for this road end up being identity.

With the transformation of the place, also change the perceptions, the relationship with the space and with the past; the latter can no longer rely on visual perceptions to be remembered. Behind the culture of the place, there is the multi-ethnic identity of a society that has undergone various dominations that have fuelled the cultural richness of which today can do shows. It has passed through the popular traditions, the meaning and value of the parties and of the seventeenth-century cult of the “Feast” from Palermo to this day.

The case of Saint Rosalia, analysed in the context of territorial Palermo has significant and symbolic elements, which provide grounds for believing: the importance of the passage of the sacred in the different areas of the city, and the organizational transformations that have characterized this as a party generation to another.

The relationship with the territory acquires its physical size in the pilgrimage of the first week of September, where the logic of the event on 14th and 15th July are reversed: in a sacred function that passes in the town, and almost serves as a counterweight to “return” a city that went from the sacred space and crosses. The pilgrimage of September sets in motion a different dynamic, that of the “sacred immovable”, where is the subject, “the devotee” to move according to a specific ritual form (praying or singing) and resorting to the use of symbols specific (the lighted torch during the night pilgrimage to Monte Pellegrino, the chaplet rosary used for prayer, the “flag” of Saint Rosalia...).

“Feast” of July 14th, procession and pilgrimage of 3rd – 4th September work as expressive as many containers in which converge, in addition to widespread devotion, the visibility requirements of associations, informal groups, the brotherhoods, but also by the administrative authorities in a hierarchy of social presentation where everyone, in the end, are called to be located. Alongside these visibility requirements are clearly perceivable economic ones related to the armature of the small tourist business operators and those of cultural events: the feast of Saint Rosalia circulates private and public funding availability.

**METHOD OF RESEARCH.**

The main object of analysis is to determine the route of interaction between a territory which, through its various components, conditions - in more or less relevant - the religious ceremony and places constraints on the functions that the latter is reputed to exercise (functions that we can generally coincide with those of protection from evil and insurance of the property), and conversely, the devotional rite which, in turn, sets its constraints to the transformation of the territory, changes the path of development.

The main purpose of this research is to:
1 - Reconstruct the profile of the party (so much secular as religious).
2 - Identify and describe the socially shared vision that sets the scene.
3 - Awareness of the specific division between playful and devotional practice that is stated throughout the whole of the celebrations and at different times in these is characterized.

The research is therefore aimed at the reconstruction of specific forms of structuring of social interaction. That way the research aims to outline:
1 - The social dimension of religious expressions.
2 - The plot that combines / opposes the constituent parts of the party and sees placed on the same level on the one hand and on the other those devotional expressions playful – celebratory.
3 - Times and places.
4 - The interaction of institutional actors and laity, religious.
5 - Transformations of the rite in the various editions.
6 - The old paths and new routes.
7 - Old and new forms of celebration.
It is in this case to recover and describe the evolution of the rite both organizationally and on the
symbolic, as it has emerged since the war, to the present day. Through the use of the
documentation available at the institutional structures (example: the Theological library of
Palermo or Archive of Palermo and History Study Istitute).

Next to the collection of documents, research also intends to carry out participant observation,
the plane where the observation is not separated from the participatory dimension. It is therefore
to create a direct relationship with the social actors, staying for the fixed period of two months of
holidays.

The ethnographic method is a typical qualitative observation. With such a term can understand
the description of the life of peoples, or of specific subcultures, cultures present within a broader
cultural reality.

A staunch proponent of the qualitative approach, such as Franco Ferrarotti summarizes such a
methodological principle as follows: “Read a company through a biography”. A tale of life,
according to this view, is not limited to the history of one person because there are some other
intertwined destinies, and are also represented institutions and micro - micro and macro social
processes.

The person is considered to be the mirror of his time, his environment, and witness and be a
collective component. Roberto Cipriani points out in a methodological research: “there is only
the (representation) of a strictly statistical sample that reproduces the numeric characters in the
universe considered, but also the Thematic, which incorporates the crucial aspects of a
phenomenon through the experience of some peculiar subjects, who express their own
guidelines and behaviours that also belong to larger groups of people”. In addition, the testing of
a representative, must at the same time issue and categorical, is linked to specific problems and
specific social groups.

So you can say that about social representation, for which it is necessary to adopt a criterion of
adequacy between life and told the objectives of the research, in order to make the search for
answers to the question that arises. The scope of observation can be more or less extended,
not only by the number of people to observe, but also to the magnitude of the observed
phenomena and the duration of observation. Unit of observation is the case, which is the set of
facts that revolve around the problem in analysis. The number of people and time of the
observation depend on the circumstances and the social actors, their interactions, and attitudes
that follow. You can also use the method of observation focused compared, since we are
interested in content circumscribed by comparing times and in different contexts.

The problem of observation can often imply - and often in fact implies - a relationship with the
object observed. Not all cultural realities love to be observed. In certain cases, when the
cultures are sufficiently organized within them (Religious orders, confraternities, but also any
company or any party organization) may require approvals and permits. The problem is obvious:
.it is for them to authorize the production of an image of themselves that they cannot control an
image that does not show up as a witness private (and therefore subjective) of an observer, but
as an ethnographic account, thereby potentially objective.

It’s important to predict and understand such a difficult time building a presentation of the
research project. This allows you to have a correct approach with institutions, such as to permit
acceptance of the observer. A role that the latter, as is known, in several cases, it develops in
one of the interviewer.

The methodology to be adopted is therefore that the observation in the field through the use of
technological tools ordinary detection (camera, tape recorder). It is here that you can return as
much as possible, the spatial dimensions, symbolic and relational, a ritual event for which the
simple narrative description proves to be dramatically insufficient. Precisely because the field
observation finds the facts directly, without the mediation of the descriptions, stories and
answers to questions, it must necessarily be supported by an ethnographic and filmic.
This leads to the emergence of all the contextual elements that characterize the space and the relations regime that develops and that, more often than not, it remains overlooked by the “narrative account”. Are discovered in other words, the mode of action and expression that really exist, that people do, but for which you do not speak. This is the main advantage of the observation supported by audio-visual material.

By comparing the data obtained through interviews focused with the results of observations, there is the phenomenon in much of its range.

A particular problem when you are faced with informal groups and poorly institutionalized is the transformation of the path of acceptance. For an informal reality are necessarily linked strategies as informal. The need to be accepted by the group is a personal need of the researcher more than the necessity imposed by the group noted. In fact, a lot of information, but also many peculiarities, which do not emerge once acquired the language, knowledge and ways of relating to the group. At this level only the interactions that take place inside actually become understandable.

Usually “middlemen” can facilitate the inclusion informal learning, that is, by people who know both the researcher and the research in progress.

The realities that are beyond the narratives of the event (from the journalistic to the institutional, passing through the same financial reports that can make participants rite took place) and that the observation can reveal are of various kinds.

In general there is a process of reconstruction and representation of the event that is already a transformation to what has actually happened: it is a question of an orderly and controlled. The fundamental problem is not, as you might mistakenly think, to detect possible conflicts between the ritual and its narrative. The question is not to discover secondary aspects and possibly deviant. It is instead of retrieving the different dimensions of the rite, which may be the organizational (from the institutional and informal), the representational (narrative and symbolic at the same time) the relational between the different categories present (the organizers, the filmmakers, the viewers).

The entire research is subject to an identification of the major plans of social interaction, namely:

1 - A definition of the social space, from which you define geographical and social (social hierarchies of places, lay and ecclesiastical, the different accessibility, their placement of the joint universe ritual of celebration).

2 - A recovery of the history of recent events that govern the time of the festival, one of the two institutions (secular and civil) and the city (city of devotion / party town).

3 - The identification of the different social actors, institutional (secular and religious) and non-institutional (volunteers, members of the brotherhoods), the role they occupy, the networks of relationships and the corresponding production of meaning. It is believed that as the clergy “produce” the canonical definition of the religious festival and the political-administrative institutions “produce” the canonical definition of the public holiday, so the other associations present, the brotherhoods to street performers, to the same audience, they also produce a “reinterpretation” of both the religious holiday, because of the civil, enriching it with additional elements of devotion and spectacle.

Of people to interview (priests, fraternities in the specific day of 15th July and 3rd and 4th September artistic director of the “feast” - a term which indicates the specific day of 14th July - and collaborators) must be recognized as the position or role within the community, as detailed knowledge the issues on which they are called to cooperate;

The documentation techniques provide, in addition to the notes a final report at the end of the day. It feels so the need to keep, initially, a record of observations, where you write down the events considered, and a personal journal.

Also in this phase involves the detection and screening of audio - visual and printed documentation prior to the realization of direct interview to the institutional and social actors, I
mean doing the interview an example to the rector of the brotherhood or town to interview pastor of the church of Santa Rosalia on Monte Pellegrino.

**Parishioners in the 21st century: the case of the Catholic Church in Fribourg (CH)**
Christophe MONNOT (University of Lausanne, Switzerland; Groupe Sociétés Religions Laicités (CNRS-EPHE), France) | christophe.monnot@unil.ch

The Catholic Church in the town of Fribourg (in Switzerland) organized a quantitative survey on the attendance of the 69 Masses on the weekend of 15-16 June, 2013. The survey allowed 3,400 attendants to answer to the 46 closed questions. Investigators counted the faithful present at Mass to determine the attendance of a regular weekend. The purpose of this paper is to discuss the main results of the study: attendance, profile of the faithful, frequency, attitudes toward parish reorganization, and preferences depending of the Mass style. These results enlighten a part of the dynamic of Swiss Catholicism.
First, the style of the Masses affects the type of audience, secondly the Catholic hierarchy is open where the faithful are traditional and faithful are liberal on issues, while the Magisterium is conservative. Third, an important part of the faithful worship outside the parishes, raising new questions about the aim of reorganizing the Masses in town.

**The social representation of Christian Orthodox monasticism in contemporary Russia**
Kseniya MEDVEDEVA (Higher School of Economics, Russian Federation) | ksenia-medvedeva@yandex.ru

The article discusses the image of contemporary Christian Orthodox monasteries and monasticism in Russia. The huge increase in the number of monasteries points at the revival of Orthodox culture in Russia. If earlier they used to be centers of spiritual enlightenment, book culture, religious and political life, it is relevant to consider what prospects for the development of monasteries exist today. What do Russians think of contemporary monasticism, how do people view monasteries, and what is their opinion of present-day monks? Means of sociological imagination can help us interpret their answers.
The results of public opinion polls on this topic conducted in 2013-2014 are used for the analysis (n=1600, nation-wide representative surveys). Materials of the nationwide contest for the symbol of the country "Russia 10" as well as data collected by sociologist I.V.Aster (n=500, geography: St. Petersburg and the Leningrad region, 2009) were also employed.
The article shows that monasteries are considered by Russians to be one of the symbols of the country although they seem to be kept in a “passive cultural stock”. Thus, in the result of public voting for a visual symbol of Russia, the ancient monastery Holy Trinity-St. Sergius Lavra entered the top ten winners out of 30 sites on vote in semi-final [Оф ициальный сайт…]. At the same time, according to the results of the opinion poll, only 3% of the respondents named the Lavra as symbol of the country [Символы России…]. The reason is that in the second case people answered from memory and did not have options to choose from. To describe this situation we can use the metaphor of a “passive vocabulary” and suggest that monasteries are in a “passive cultural stock”. They seem to be located in the sphere of exclusive, festive, but not everyday.
Apart from a monastery as the symbol of the country the theme of monasticism as a way of life is also an important topic. Inmates of monasteries had a significant influence on Russian culture. What is known to Russians about monks as historical figures and what is their opinion of contemporary monastics? According to the results of the opinion poll, the name of St. Sergius of Radonezh, the founder of the already mentioned Holy Trinity-St. Sergius Lavra, is familiar to
the majority of Russians (72%). Educated and older respondents are more familiar with a famous historical monk rather than less educated and young people [Сержию Радонежскому…]. The Lavra could not but come up in the survey because it is one of the most central places topping the hierarchy of religious institutions in Russia. Starting from founding a far-away monastery, St Sergius contributed to the formation of Russian national identity [Miller, 2010].

A large part of the believers in the past and now stay in contact with monasteries: they participate in church services, religious processions, festivals; visit the most worshiped shrines and famous elders; come for some time to work in the monastery, etc. According to the survey by I.V.Aster, 37% of the residents of St. Petersburg and Leningrad region visited a monastery. On one hand, a monastery for the respondents is a place where they find “peace, silence, solitude,” get “aesthetic pleasure”, “grace.” On the other hand, it is a “gloomy place where there is a feeling of loneliness”, “boredom, death melancholy,” a feeling of an “uninvited guest.” [Астэр, 2010] The survey revealed that the most popular monasteries among the residents of St. Petersburg and Leningrad region are male. Probably they are better known, as they are often places of so-called “spiritual guidance”.

Public opinion paints a portrait of a monk, whose choice is difficult to describe. It is presented both as “leaving the world” as well as “coming to a monastery”. The reason of escaping “from the problems and hassles” was a popular one, but overall, positive motives of deciding to become a monk prevail over negative in public opinion. The activity of monks is considered to be useful by respondents: monks work and pray; more than half of Russians believe that monks save themselves, and thereby help other people. 43% of Russians would react more positively to the desire of a member of their family to become a monk [Уход в монастырь…]. This, in my opinion, is a surprisingly large number. It, along with the opinion on other issues shows that the image of a monk in the modern social and cultural space is rather positive and acceptable.

While Catholic convents in Europe are closing and selling their property, the number of Orthodox monasteries in Russia is growing year after year. As Stella Rock writes, the revival of monasteries is one of the most astonishing aspects of the process of reclaiming the pre-revolutionary past in post-soviet society [Rock, 2009]. For the purpose of further research it seems relevant to compare this imaginary public opinion of a monastery and a monk with reality in order to understand the role of contemporary monasteries in present-day Russia and the role of monasticism in modern culture on the whole.

Keeping, Making, Finding: Religion and Spatial Strategies in European cities
Irene BECCI (Unil, Switzerland) | irene.becciterrier@unil.ch
Marian BURCHARDT (MPI, Göttingen) | Burchardt@mmg.mpg.de
For sociologists of religion, religious communities and place are articulated within evolving spatial regimes. Secularization and globalization have deeply shaped these spatial regimes, but they are not linear historical processes. Historically, cities have been the stage of religious innovations, revitalizations and, more recently, of “eventization” whereby religion is articulated with leisure consumerism. Geographers have proposed the notion of “post-secular cities” suggesting that secular definitions of public space and urban administrative practices have lost their former hegemony. While we do not contest these observations we question that they are usefully summed up in the concept of post-secular cities. Rather, we argue that globalization and religious change in cities sediment in different historical layers: currently, we can observe three different ways of organizing religion and place in the urban space: For traditional religious institutions (in Casanova’s vocabulary “established religions”) the negotiation of the spatial regime follows the lines of a “place keeping” strategy. Diaspora and migrant religions adopt different „place making“ strategies, while new religious movements and contemporary spirituality are in search for a place: they are place finding. In this presentation we illustrate these categories with empirical data coming from our Spanish and German field sites.

RN34S12 - Religion as a Source of Social In- or Exclusion

Holistic spiritualities, reflexivity and agency in contexts of social exclusion: the case of volunteer yoga instructors in prison
Anna CLOT GARRELL (Universitat Autònoma de Barcelona, Spain) | anna.clot@uab.cat
Mar GRIERA (Universitat Autònoma de Barcelona, Spain) | mariadelmar.griera@uab.cat

Holistic activities like yoga or reiki are increasingly present and visible in penitentiary settings in Catalonia. Nowadays, in most of the Catalan prisons volunteer yoga instructors teach yoga to a significant number of inmates every week as a form of karma yoga. On the basis of an ethnographic research conducted in Catalan prisons, the purpose of this paper is to explore the emergence of ‘holistic volunteers’ in socially excluded environments. Particularly, we will look at the role that these practices play as non-profitable activities in a total institution (Goffman, 1970) through analysing volunteers’ biographies and trajectories as well as their involvement and role in the context of the prison. The paper answers three interrelated questions: who are these holistic volunteers? What are their motivations to become volunteers? And, what are the narratives through which they self-explain themselves and make sense of the deprived situation of inmates? Focusing on holistic volunteers is sociologically relevant since most of the research in this field has mainly centred on the presence of holistic spiritualities in commodified milieus or in its individualised and private expressions from a market perspective. This case-study reveals the emergence of a non-profitable spiritual sector that is increasingly entering into public institutions with the aim to approach holistic therapies to socially excluded groups.

Religion among Roma in Slovakia - source of social inclusion or exclusion?
Tatiana PODOLINSKA (Institute of Ethnology SAS Bratislava, Slovak Republic) | tatiana.podolinska@gmail.com

In Slovakia more and more is spoken about active missionary outreach to the Roma community. These outreaches come from the traditional churches as well as newer and less traditional churches. The contribution is based on qualitative research held by the team of experts in Slovakia in 2010-2011, under the leadership of the author. The research revealed, that in Slovak settings „traditional“ denomination has a big pro-inclusive potential when starting its outreach among Roma. The non-traditional denomination on another hand has a big potential to
produce the negative label „sect“ and „sectarian“ to its member. If we consider the combination of ethnic stigma „Gypsy“ with religious stigma the effect of positive social change may be significantly diminished. Nevertheless, the research showed that religious missions are very effective in causing social change. The author claims that it is so mainly because they come with the offer of a social network, with new kind of interpersonal ties and new possibilities for building of social capital of excluded individuals/groups.

Coming out of results of our research we consider the most important factors (with pushing up the effect) of social inclusion following factors: 1) the type of religious society (whether it has pro-inclusive or pro-exclusive potential), 2) the type of pastoral discourse (inclusive or exclusive), 3) social effectiveness (ability to cause intensive “positive” social change), 4) type of social network (primary or secondary, open or close, with weak or strong ties), 5) type of social capital (bonding, bridging or linking).

The highest potential of social inclusion would have churches with pro-inclusive potential, with inclusive pastoral discourse, that are able to produce intensive and stabile social change, that offer open secondary social network with prevalence of weak ties that enable accumulate their members bridging or linking capital. In field we can meet with various combinations of mentioned factors that lead to various forms of social inclusion or exclusion. The fact nevertheless is that religious change has a big potential to cause “positive” social change and social change has a big potential to lead toward the social inclusion. What it is “social inclusion” depends on the definition of this term. The project revealed that success of social inclusion of socially excluded individuals/groups depends also on a good will of local majority population to see the „positive“ social change and to open the group of “Us” for “Them”.

Mosques in the City. Towards a flexible "laïcité" at local level in France ?
Alexandre PIETTRE (University of Lausanne & Ecole Pratique des Hautes Etudes, France) | a_piettre@yahoo.fr

From a survey with leaders of associations managing mosques in the Parisian suburbs, this paper aims to highlight the process of legitimizing Muslim communities today at work in their institutional environment at the local and trans-local scale. Indeed, there is not only the proliferation of places of worship, but also the building of many "big" mosques, often accompanied by their "cultural center". Unlike the first mosques were built up in the 1990s, these projects are the more often carried out in full autonomy vis-à-vis foreign states and major national federations recognized by the state as part of the French Council of Muslim Worship (CFCM), but always with the assistance of municipalities. Muslim associations then manage to be recognized by getting involved in interreligious dialogue and by federating themselves at the local and inter-local level, but also through the public engagements of their stakeholders in local collective mobilizations to defend their places of worship, in non-religious associations and in local politics, including being elected in municipalities. Thus, while at the same time we are seeing the failure of CFCM to organize the "Islam of France" under the aegis of the State and a hardening of the norm of "laïcité" at national level in order to contain the public visibility of Islam, it's a flexible practice of "laïcité" which seems to prevail at the local level, with the interventions of municipalities to help the stakeholders to build a mosque or even to subsidize their social, cultural and civic activities.

RN34S13 - PhD Session
Political Theology. When Religion Influences Political Choices and When Politics Influences Theological Thought. The Case of Dietrich Bonhoeffer.
Helena Anna JĘDRZEJCZAK (University of Warsaw, Poland) | Helena.jedrzejczak@gmail.com

In the times of Nazi regime every choice made was political, obviously. It made nearly every sphere of life political (as Hobbes and Schmitt would put it). Research on the history of churches – both catholic and evangelic – clearly shows how the political ideology influenced their institutional form.

Nowadays, religious identity, which influences the political choices, is connected with the religious extremism, unwholesome lack of separation between church and state, establishing political rules due to religious norms, which leads to human rights violation. My aim is to describe opposite side of the idea of linking religion to politics.

I’ll present the theological and religious concept by Dietrich Bonhoeffer (1906-45), "Protestant saint”, member of the anti-Nazi resistance. I will put the national context - strongly rooted in the German concept of the state and law, as well as Luther’s theology and German patriotism of Bonhoeffer on one hand, and the idea of the complete irrelevance of the national question on the other. I’d like to show how politics could influence Church (i.e. Old Prussian) and how Church could make an answer for political challenges.

Bonhoeffer’s political theology is a concept created within the concrete political and historical reality and is a part of German philosophy heritage. However, answers given by Bonhoeffer, not disregarding the idea of nationality, make it completely irrelevant. I’ll present the relationship between religion, the concept of nation and political choices. Thus, I will show different from most of contemporary ideas interpretation of relationships among those categories.

Differentiation between Scholar and Religious Identities in the Process of Academic Socialization into the Study of Religions as an Example of “Making” Secular Space
Miroslav VRZAL (Masaryk University, Faculty of Arts, Czech Republic) | 178603@mail.muni.cz

Sciences and scientific disciplines taught at universities are self-organized as secular (non-religious) domains. This setting has interesting consequences in the scientific study of religions where secular-religious division is also reproduced and it is well observable. The contribution shows secular-religious division on the example of the positioning a religious studies scholar's identity and his/her own religious identity in the study of religions. As the paper demonstrates, personal religious identity is privatized and secularized from academic space through academic practices. This process will be traced on the academic socialization of students into the Study of Religions as the starting point differentiation between scholar and religious identities.

Love in the periphery: The experience of not being embraced by the Church due to one’s lifestyle choices
Angele DEGUARA (University of Malta Junior College, Malta) | angele.deguara@um.edu.mt

This paper examines the role of religion in the life of individuals involved in intimate sexual relationships which fall outside the moral boundaries of the Roman Catholic Church. It draws on preliminary findings emerging from my ethnographic doctoral research in Malta. The study approaches religion and secularisation from a social anthropological perspective by exploring the experiences of such individuals and their reactions to the Church and its teachings on matters pertaining to sexuality. The Church considers such lifestyles as morally unacceptable. Consequently individuals may be denied access to the sacred.
My research suggests that the Church’s official doctrine is often perceived as rather harsh, unrealistic, anachronistic and unfair. However, individuals deal with it in different ways. Either through individual reflexive, spiritual or rational processes or with the help of individual priests or secular sources, individuals often come to different conclusions regarding how to manoeuvre their way around the Church’s official doctrine and how to reconcile their possible internal conflicts. One way of doing this is by turning to God. Individuals tend to make a clear delineation between God, whose nature is divine and the Church, which is made up of erring human beings and does not necessarily represent the divine. Especially for those who feel rejected or judged by the Church, their relationship with God has a deeper and more profound meaning. They tend to take refuge in God’s love and perceived unconditional acceptance. This also partly legitimises their lifestyle choices.

The Figure of the European Convert in Indonesian Islam: Globalization, Race, and Religious Subjectivity
Nathaniel Arthur TUOHY (University of Michigan, Ann Arbor, United States of America) | nat.tuohy@gmail.com
En-Chieh CHAO (Sun Yat-Sen University, Kaohsiung, Taiwan) | zolachao@gmail.com

Indonesian Muslims have become increasingly concerned with the plight of Muslims worldwide. Often this concern fits narratives of a clash between Islam and the West, as reflected by Indonesians’ angry condemnation of the conflict in Gaza and dismay over the caricatures of the Prophet Muhammad. However, another parallel phenomenon complicates this picture: the intense fascination with white European converts to Islam. Islamic media in Indonesia often feature European converts and many young Indonesian Muslims now praise them as not only signs of Islam’s truth but as objects of emulation. This fascination with the heavily racialized figure of the European convert belies both the relatively small numbers of European converts and the fact that Islam has not historically emphasized the active conversion of new Muslims. Nonetheless, I argue that this fascination itself is an important phenomenon that reveals complex global inter-religious processes and their impact on the Indonesian Islamic imagination. This fascination with European converts demonstrates that growing interest in Muslims’ worldwide does not simply harden pre-existing identities, but in fact lead to reexamination of religious practice. The most consistent trope in the discourse of European converts is their extreme piety; which in turn leads Indonesian Muslims to objectify and question their own religious identity in new ways. Thus globalization leads Indonesian Muslims to reconsider religious sincerity, voluntarism, and how a Muslim becomes a Muslim. This paper draws on Indonesian media sources, interviews, and fieldwork on contemporary Islamic education in Indonesia to examine this phenomenon.

JS_RN33+RN34a - Gender and Religion in Times of Growing Social Inequalities and Differences I

Education and work – Women’s empowerment by a fundamentalist party
Anat FELDMAN (Achva Academic College, Israel) | afeldman@achva.ac.il

Education is the most important tool for women’s advancement in the labor market. However, fundamentalist societies tend to prevent women gaining an academic education, so as to leave them in marginal employment or the home environment. Thus, they do not harm the male hierarchy, termed the “Godly Order” in fundamentalist societies.
In my lecture, I will present the Israeli case of a religious fundamentalist party that encourages women to enroll in academic studies and professional courses, with the goal of working in senior positions in the Civil Service, even though the studies and employment are not always within the religious community. I will argue that the society’s power of faith allows its religious and political leaders to empower women through education and employment, without harming the Godly Order that sets men at the head.

The research field is women’s education and work in religious fundamentalist societies. The test case will be the fundamentalist society in Israel, led by an ultra-Orthodox political party.

Woman's Blood as Dirt in Islamic Catechism: Exclusion of Women from Religious and Social Life in Turkey
Figen UZAR OZDEMIR (Bulent Ecevit University, Turkey) | figen.uzar@gmail.com
Atila BARUTÇU (Bulent Ecevit University, Turkey) | atikbarut@hotmail.com

This study aims to problematize gender inequality through the concept of women’s purity in the case of ilmihal (Islamic catechism) of the Directorate of Religious Affairs (DRA), the state organ representing Sunni Islam in contemporary Turkey. İlmihals are guide to living Islam according to the commands of God in the Qur’an, hadith and life of the Prophet Muhammad. Most of the ilmihals in Turkey are written by male scholars of Islam. Hence, they are often criticized by Muslim feminists because of their patriarchal stance towards women’s status within the society.

We encounter this patriarchal point of view also on the issue of women’s purity which includes three concepts: menstruation blood (hayı z), post-natal bleeding (nifas) and irregular bleeding (istihaze).

İlmihal of the DRA as a certain form of Islamic interpretation providing practical answers to everyday life problems and conduct denies that Islam treats women and men unequally. However, gender inequality appears and reappears throughout this particular interpretation of Islam on issues of women’s status and purity. This study aims to demonstrate (1) how a woman’s purity and dirtiness are defined and categorized according to her physiological status namely menstruation, childbirth and other circumstances during which blood flows from the uterus; (2) how women are excluded from religious rituals and consequently social life based on this conceptualization of women’s dirtiness, and (3) the ways İlmihal of the DRA provides justifications to the contradiction on its interpretation of gender inequality in Islam.

Inclusion and exclusion in British Muslim women case
Hengameh ASHRAF EMAMI (Northumbria University, United Kingdom) | hengameh25@yahoo.co.uk
This paper aims to explore the meaning of veiling, through oral history interviews with Muslim women in two generations across Glasgow and Newcastle. Drawing on extensive fieldwork, including recorded interviews and ethnographic techniques such as participant observations with diverse British Muslim women, the paper aims to explore how Muslim women negotiate their identities through donning/ not donning the veil in their daily lives in modern Britain. The empirical research was carried through thirty oral history interviews in Newcastle-upon-Tyne and Glasgow. An epidemiological approach was combined with standpoints theory and ontological activity in order to interrogate the meaning of the veil and its relation with the identity of our research participants.

The empirical research is combined with the heated debates and discourse on veiling and Muslim women in Britain. The myth of the veil and also agency of veiling were used to explore various aspects of the identities of British Muslim women and the ways they employed the veil for their empowerment. Gender discourse will explore the religious and cultural practices of research participants and the meaning of veiling for them. Furthermore, this paper will examine the ways in which Muslim women negotiate their identities through veiling or not veiling in Britain. This paper also will highlight the impact of veiling or not-veiling on their everyday lives. Therefore the research will explore inclusion and exclusion of British Muslim women in various arena of British society.

Shared Authority: Progressive Muslims Pursue Equality
Lisa Margaret WORTHINGTON (The University of Western Sydney, Australia) | l.worthington@uws.edu.au

In response to radical interpretations of Islam numerous Muslim reform movements have emerged throughout the world in order to demonstrate that Islam can be equitable and inclusive. Although, to a large extent these movements have been coloured by local, national, and regional contexts, they also share certain commonalities, such as challenging existing structures of religious authority. This paper is focused on two progressive organisations: Muslims for Progressive Values and El-Tawhida Jumma Circle and their practice of shared authority. Shared authority necessitates that leadership responsibilities are shared among the congregation and that religious leadership positions are open to all. In practice this means that non-Muslims can also offer the sermon and allows women to assume religious leadership roles. Those who practice shared authority also report that they subscribe to the idea of fatwa of the heart – meaning that they do not approach a religious scholar for moral advice but simply do what they believe is right. Data for this paper will be drawn from observations and qualitative interviews gathered during fieldwork in the United States in 2013 and also via Skype. The data from this research will be used to evaluate the resistance techniques employed by progressive Muslims who aim to work toward gender justice and social equality. This paper will argue that traditional Islamic authority structures are being replaced with alternative structures within progressive Muslim congregations in order to create more inclusive and egalitarian worship spaces.

JS_RN33+RN34b - Gender and Religion in Times of Growing Social Inequalities and Differences II

„Gender ideology“ as an enemy! Gender, religion, and social transformation in Croatia, Poland, and Slovakia
Siniša ZRINIŠČAK (University of Zagreb, Croatia) | sinisa.zrinisckak@pravo.hr
Agnieszka SZUMIGALSKA (Masaryk University, Czech Republic) | a.szumigalska@gmail.com
Miroslav TIŽIK (Comenius University, Slovakia) | miroslav.tizik@savba.sk
Equality of women and men, usually phrased as gender equality, has been a part of overall social transformation in the post-communist period. However, the path to gender equality has proved to be not only difficult but uneven and unpredictable. Many reasons are listed in the literature, like the importance of state-building process and connected national ideology, communist legacy, ideology of dominant political parties, role of dominant religions, but also the EU itself as a rather weak actor in promoting the gender equality. This paper looks more deeply into the role of the Catholic Church as the main and traditional religious actor in three countries: Croatia, Poland, and Slovakia. In all three countries the Catholic Church has been important actor in public debates about gender issues but its role has been recently intensified, particularly by construction of the so-called “gender ideology” phrase, a label used not only to question but also to ethically discredit all those who use the term gender and who, allegedly, negate “natural differences” between men and women. The paper will discuss how and in which way the Catholic Church engages in public debates, and how its engagement influences the gender equality agenda in a particular country. Similarities and differences among these countries will be examined and discussed.

**The role of “agency” and "intersectionality" into the processes of gender and religious identity building**

Ivana ACOCELLA (University of Florence, Italy) | ivana.acocella@unifi.it
Silvia CATALDI (University of Cagliari, Italy) | s.cataldi@unica.it

The paper aims to illustrate how the biographical approach can be used for analysing processes of gender and religious identity building and strategies adopted by young Muslim women - who lives in Italy - in their private and public sphere. Such approach is supposed to safeguard the role of “agency” and "intersectionality" in this process of identity building. More specifically, the agency allows us to sheds light on the performative dimension of identity building and the young Muslim women’s active strategies, by identifying which "challenges" or “tensions" arise from their multi-membership (intra-ethnic and inter-ethnic, as well as intra-generational and inter-generational). By referring to “intersectionality”, the paper aims to explore the interconnection of different social categories, e.g. gender, religious beliefs, age and ethnic origins, in a dialectic or even conflictual exchange. In brief, the biographical approach will be used to identify the main ideal-typical features of such processes, thus allowing us to switch from an individual story to a sociological type into which this biographic story can be inserted.

**Gender agency in religious organizations. Distancing as reproducing of patterns of femininity in the institutions of the Roman Catholic Church in Poland.**

Katarzyna LESZCZYŃSKA (AGH University Science and Technology, Poland) | kaleszcz@agh.edu.pl

The aim of the paper is to analyse the discursive practices which aim the reproduction of patterns of femininity and exclusion of women from a religious power, undertaken by women in the central organizations of Roman Catholic Church in Poland, i.e. in the diocesan curia, the ecclesiastical courts, and the Conference of the Polish Episcopate. During my speech I am going to report the results of the qualitative and quantitative research undertaken by myself between 2012-2014, including 31 in-depth interviews with the women working in the above mentioned places. The place of women in traditional religious organizations should be seen as the result of the complex conditions. On the one hand, the position of women is a consequence of the formal norms legitimized by a religious tradition, and relating to the division of labour, power, symbolic
sphere. On the other hand, it is the result of informal rules and routine practices undertaken not only by men but also by women themselves. In the paper, putting the emphasis on the second kind of conditions of the position of women in the Church, I would like to answer the question: How do women at the discursive level reproduce their place in church organizations, to which patterns of femininity are they distancing themselves, how do they exclude and depreciate these patterns? The intended purpose of the research is part of the tradition of studies on agency in religious organizations (ex. Avishai, 2008; Mahmood, 2004; Nagar-Ron, Motzafi-Haller, 2011), as well as the institutional theory of gender (see: Martin, 2006; Rhoton, 2011; Risman, 2011).
Identity Work and Construction of Safety: in the stories of passengers in the Northern part of the Baltic Sea region
Goran BASIC (Lund University, Sweden) | goran.basic@soc.lu.se
Sophia YAKHLEF (Lund University, Sweden) | sophia.yakhlef@soc.lu.se

The purpose of this study is to map and analyze how travelers experience, interpret, and define “freedom of movement” in the Northern part of the Baltic Sea region regarding the border agencies. This qualitative study will be based on empirically gathered material such as field interviews and fieldwork observations on Stockholm’s Arlanda airport in Sweden and a Tallink Silja Line ferry between Stockholm and Riga in Latvia. The general starting point of the study was an ethno-methodologically inspired perspective on verbal descriptions and interactionist perspective, which considers interactions expressed through language and gestures. In addition to this general starting point, this study focused on actors identity work and construction of safety as a particularly relevant components in the collected empirical material. The preliminary findings of this study suggest that many passengers are positive regarding the idea of the freedom of movement in Europe, but scared of threats from outside of Europe. The actor’s identity work created and re-created the phenomenon of safety which is maintained in contrast to the others, in this case the threats from outside of Europe. Erving Goffman means that individual identity creation occurs, among other ways, through dissociation from others. The actors in this study seem to construct safety by a distinction against the others outside Europe but also through interaction with them.

Formation of solidarity in interaction "migrants – the host society ": Ethnic identity and tolerance
Vladimir Nikolaevitch PETROV (Kuban State University, Russian Federation) | degnev20@rambler.ru

At the end of XX – beginning of XXI century immigrants to Russia have become internally displaced and returning voluntarily from the Russian national republics of the former Soviet Union, millions of ethnic Armenians, Azerbaijans, Georgians, granted Russian citizenship or pending granted, millions of labor migrants from Moldova, Ukraine, Tajikistan and Uzbekistan. Mass immigration has created a new situation in the solidarity of the Russian population, largely problematic.
We talk about ethnic immigrants trying to become solidary with the host society. We view this situation as constructed relationship of the actors’ with varying degrees of tolerance to each other, which is reflected in the level of readiness and the actual practice of acceptance, acceptance of the other (individual or group of individuals) as a partner in social interaction and relationships.
Research on ethnic psychology (Soldatova) shows it as a construct in the structure of the actions that correlate with empirically verifiable features of several varieties of ethnic identity: positive ethnic identity, ethnic indifference; hypoidentity (ethnonihilism) hyperidentity (ethnoegoism, ethnic isolation and national fanaticism).
Empirical evidence from our research and their analysis suggest that the degree of tolerance and its quality are under the direct influence of the various states and forms of ethnic identity. The effective interaction for a successful solidarity of ethnic migrants with the host society is when ethnic and cultural identities being in competition with each other do not form irreconcilable oppositions.

Migrant students: between dream and reality
Marzena Sylwia KRUK (Maria Curie-Sklodowska University, Poland) | marzenkak1@gmail.com
Joanna BIELECKA-PRUS (Maria Curie-Sklodowska University, Poland) | jbprus@poczta.onet.pl

One of the priorities of the Bologna process, which began in 1999, was the internationalization of the education system, and increase of students' mobility was one of the steps of European unification. Educational migrations belong to the type of migration which is considered in a category of higher gains than losses. Benefits for the migrant student is not just the acquisition of knowledge, which allows you to find an attractive job and establish a network of contacts, but also to learn new cultures face-to-face. The criterion for the selection of the country and the university becomes crucial for many young people in a situation of future career prospects. The competitiveness of the university and openness to foreign students is now becoming one of the priorities of university education. Science and business in this dimension are related to each other. What criteria of the selection of foreign universities are important for students? To what extent are their expectations are met? What is the quality of foreign students’ lives? The paper will present the results of research on which the answers to these questions are formulated. Firstly, the results of quantitative research conducted in Ukraine, Belarus, Moldova and Georgia (N = 500) will be discussed for educational plans, their expectations of foreign universities. In addition, the analysis of 20 interviews with foreign students studying in Poland, who confront their expectations with reality, and the results of the quantitative research of foreign students (N = 150) on basic dimensions of quality of life (leisure, nutrition, risky behaviour) will be presented.

Factors, trends and potential migration from Central Asia to Russia (results of the sociological survey in Tajikistan, Uzbekistan and Kyrgyzstan)
Sergey RYAZANTSEV (Institute Social-Politic Research of the RAS, Russian Federation) | riazan@mail.ru
Marina KHRAMOVA (Institute Social-Politic Research of the RAS, Russian Federation) | kh-mari08@yandex.ru
Elena PISMENNYAYA (Financial University under Government of the Russian Federation) | nikitaR@mail.ru

The paper analyzes the direction, factors, determinants and consequences of migration from Central Asian countries to Russia. One cant deny the fact that for the time elapsed since the collapse of the Soviet Union and the formation of new independent states, the predominant direction of migration of a number of Central Asian republics was precisely Russia. At the same time in two decades there have been dramatic changes in both the scale and the causes of migration. If in the 1990th migration from the former Soviet republics wore spontaneous due to the political and socio-economic instability, by the beginning of the 2000s. began to dominate the migration to increase the human capital.

The present study is based on data from a sociological survey, which was carried out by us in Tajikistan, Uzbekistan and Kyrgyzstan. To identify and quantify the factors of migration in Russia, we used a binary choice model. As a result, were able to establish the following patterns. The most significant “ejector” factors in the country of current residence are low wages, failure to give children a quality education, as well as exacerbation of ethnic conflicts.
Among the "pull" factors in Russia begins to play a decisive role to find employment with a significantly higher salary, even for those potential migrants, level of education is very low. According to our calculations, the probability of migration is also significant influenced by gender and age of the potential migrant. On the other hand, factors such as level of education and the availability of professional work in the country of current residence are not decisive in the decision to move to Russia. Institutional barriers in Russia has a negative impact on the mobility of the population in the countries of origin and increases the risks of illegal migration.

RN35P01 - Poster Session

Local border traffic between Poland and Russia
Karol KAMINSKI (University of Warsaw, Poland) | karkam2@wp.pl

Local border traffic is a mechanism which give people who lives in borderland zone possibility to travel to another neighboring country without visa. These solutions have been introduced by Regulation 1931/2006 by European Council. Polish-Russian agreement on local borfer traffic is unique when this document is compared with those signed by different European countries. From 2012, the Polish border residents and residents of the entire Kaliningrad Region in Russia are crossing the border for trade, tourism and other reasons. These short-term migration is important not only for the local economy but also for reconciliation. After the ukrainian crisis started the situation has complicated.

The presentation focuses on showing the dynamics of the small border traffic and identifying its effects. Papers is based upon 2013/2014 panel survey, interviews, official documents and personal observation in the field.

Migrant civic engagement and its relation to “feeling integrated”
Kristyna PEYCHLOVA (Charles University in Prague, Czech Republic) | kristyna.peychlova@natur.cuni.cz

Most studies dealing with migrant integration either work with a set of pre-defined indicators of integration the occurrence or intensity of which is measured in a selected migrant sample, or analyze the character and effectiveness of integration policies. In my paper, which provides an analysis of a qualitative pilot study on the transnational and local civic engagement of Czech migrants in the United Kingdom, I explore “integration” from the perspective of the migrant individual. Based on the outcomes of my empirical research I develop a working concept of “feeling integrated” and break down the ways in which it is manifested in the narratives of migrant Czechs who have found a new home in just another EU country, the UK. In line with findings of other transnationalism scholars, I show that increased local civic engagement plays an important role in migrant “feeling integrated” in the country of settlement, but continued or intensified engagement in the country of origin does not straightforwardly work as an indicator of the migrant’s not feeling integrated in the settlement country, though it can do so. I also discuss the role that freedom of movement within the EU plays in this process.

Representations of migration and migrants in school manuals: a meta-analisis across countries in the Mediterranean area
Adriana VALENTE (CNR, Italy) | adriana.valente@cnr.it
Tommaso CASTELLANI (CNR, Italy) | t.castellani@irpps.cnr.it
Silvia CARAVITA (CNR, Italy) | silvia.caravita@irpps.cnr.it
A sample of 13 Italian Secondary School manuals of History, Geography and Civic Education has been analysed to highlight to which extent the complexity of the articulated phenomenon of migration is simplified (even stereotyped) in the didactic transposition and how this affects the representation of migrants that is conveyed to students by texts and images. Evidence of social representations instantiating explicit and implicit values was found in the Italian textbooks. It raised new questions: which aspects are peculiar of countries that are targets of current migrations in contrast with countries sites of departure of migration? Can we recognize in the didactic transposition a common stereotyping style that embeds values, which differ from the explicit values that characterize the ethics of the educational discourse? We aim to extend our study by putting our findings in perspective with the results reported by the analyses carried out on school manuals of Mediterranean countries.

The degree of polarization towards one or the other extreme poles of the following categories offers keys of interpretation for the identification of salient and even contradictory elements of the representations:
- synchronic/static vs diachronic/dynamic vision of the phenomenon
- defining vs polysemous terminology to talk about migrations and migrants
- attention on undifferentiated collective subjects of migration vs individual stories or groups determined by social dimensions such as gender, age, culture, etc.
- emphasis put on confrontation/acceptance/assimilation vs encounter/exchange
- emphasis put on moral vs political/juridical dimension
- focusing destruction of socio-economic equilibrium vs the construction of new equilibrium
- informative/descriptive vs argumentative/constructive pedagogical style

**RN35S01a - Migrations, Expectations, Self-perceptions and Belonging**

**Living with Privileges. The Politics of Belonging among returning Swedish Migrant Women**

Lena Ulrika Margareta SOHL (Linköping University, Sweden) | lena.sohl@liu.se

What are the gendered aspects of Swedish return migration? About 15,000 – 20,000 Swedes emigrate every year. Presently, up to 550,000 Swedes live abroad and most Swedes chose to return to Sweden after having lived a period abroad. This makes Swedes the largest immigrant group to Sweden.

This paper investigates reconstructions of national identity and gender among Swedish migrant women returning to Sweden after living abroad. Drawing from participant observations and individual interviews with women who can be described as an economically privileged group, gendered and class hierarchies in contemporary migration are discussed.

The aim of this paper is to develop an intersectional understanding of Swedish women's narratives of return migration. What kinds of connections are made between return migration and notions of gender and Swedishness? How do Swedish women experience re-integration, in relation to norms and values of gender equality in the Swedish society?

The paper explores the gendered dimensions of return migration and develops theoretical discussions on belonging. In order to understand these questions, I argue that the analysis of women's narratives about return migration can be developed using feminist and postcolonial theory in general and the concept of belonging in particular. This involves linking the individual narratives with larger societal processes; the lived experiences contextualized through structural processes are in focus.
Gender as a Category in Migrant Integration and Exclusion: Historical Perspectives from Switzerland
Anne KRISTOL (Université de Neuchâtel, Switzerland) | anne.kristol@unine.ch
Carolin FISCHER (Université de Neuchâtel, Switzerland) | carolin.fischer@unine.ch
Janine DAHINDEN (Université de Neuchâtel, Switzerland) | janine.dahinden@unine.ch

In this paper we examine how gender is reflected in Swiss immigration laws and integration policies. We identify the mechanisms by which gender supports the construction of communalities characterising „the Swiss“ vis-à-vis perceived foreign out-groups. More particularly we show how normative ideas of ‘gender equality’ got instrumentalised and contributed to an essentialisation of ethnic or religious difference which fuels processes of exclusion

Applying a historical perspective we explore how gender has been used in political discourses and immigration legislation to distinguish between ‘Swiss nationals’ and ‘others’ since the beginning of the 20th century. Based on a comprehensive literature review we show how gender – in combination with other categories of difference – is inscribed in Swiss immigration and integration regimes. Drawing on contributions from relational sociology and theories on social boundaries, we show that gender has become increasingly ethnicised and culturalised. Ideas of the Swiss nation state are deeply engrained in the politics of ethnic and cultural resentment that forge gendered integration discourses and policies.

The paper contributes a Swiss case study to vibrant European and international debates on the integration of difference in western societies. We argue that gender is fundamentally inscribed in integration policies. However social differences and corresponding boundary processes are historically and contextually variable. Switzerland never pursued a multicultural approach. Conversely we observe a progressive development of exclusionary boundaries. These are reflected in assimilationist policies and a ‘soft multiculturalism’ that acknowledges (essentialised) difference without granting specific rights or citizenship. It is therefore theoretically fruitful to compare findings from Switzerland with other European cases.

Policing of Migration: The Case of the Go Home Van Campaign
Vivien LOWNDES (School of Politics and International Relations, University of Nottingham, United Kingdom) | Vivien.Lowndes@nottingham.ac.uk
Roda MADZIVA (School of Politics and International Relations, University of Nottingham, United Kingdom) | Roda.Madziva@nottingham.ac.uk

The paper presents research on the British government’s 2013 Go Home Van campaign. Driving around ethnically diverse London boroughs, the vans were clad with posters instructing those living in the UK illegally to either ‘Go home or face arrest’, precisely stating: ‘106 arrests in your area last week’. With the official aim of promoting voluntary departures, the vans have since been banned by the Advertising Standards Authority on the grounds that the arrest statistics were misleading but not that the language was offensive or could harm race relations.

Our research with migrant support organisations shows, however, the long lasting and deeply negative impact of the vans upon migrants. Drawing on interviews, we explore the meanings associated with the white van itself as a symbolic object. We argue that the van is not just a ‘platform’ for the text, but is itself part of the discourse of policing. The choice of a white van is not accidental: it is a ‘deliberate metaphor’ which acts to create and sustain different publics as part of the governance of inclusion and exclusion. The van reflects, but also helps constitute, meanings associated with ‘little England’ sensibilities and prejudice (the ‘white van man’ courted by the populist right), whilst at the same time calling forth (and thus magnifying) the memory and trauma of police raids, forced deportation and original clandestine journeys among refugees and asylum seekers. Theoretically and methodologically, the paper challenges ‘linguistic
reductionism’ taking on the challenge to better understand (through empirical exploration) the role of non-linguistic policy artifacts in constituting inclusionary and exclusionary political subjectivities.

„The construction of transnational spaces by Alevi and Kurdish Migrant Organizations in Austria“
Alev CAKIR (University of Vienna, Austria) | alev.cakir@univie.ac.at

This paper examines how the transnational space is constructed by the political activities, the social relationships with state actors and civil society actors as well as the schemata of interpretation of Alevi and Kurdish migrant organizations in Austria. Political activities of Alevi and Kurdish migrant organizations from Turkey have become increasingly transnational in recent years. The so-called "ethnic revival and religious revival" of Alevi and Kurds in the late 1980s in Turkey was accompanied by a resurgence of the Alevi and Kurdish identity in Turkey as well as in Europe and led increasingly to the emergence of transnational political activities by Alevi and Kurds residing in Austria. Transnational political activities refer, on the one hand, to direct trans-border participation in the country of origin (voting, support of political parties, participation in media debates, etc.) and, on the other hand, to indirect participation via the institutions and political-institutional actors in the receiving country or participation via international organizations with the goal of policy changes in the context of origin.

While transnational political activities of migrant organizations are discussed in social sciences, the importance of social relationships and schemata of interpretation (i.e. collective action frames) in transnational space have rarely been analyzed. Moreover, often only one transnational direction, namely transnational political activities relating to the country of origin, are examined while a multi-directional analysis is rarely conducted. This paper analyzes the constitution of the transnational space through political activities of Kurdish and Alevi migrant organizations by paying special attention to different social relationships and (strategically used) schemata of interpretation.

RN35S01b - Migrations, Well-being and Inequalities

Sociability and Isolation among European Migrants
David BARTRAM (University of Leicester, United Kingdom) | d.bartram@le.ac.uk

Migration researchers and others generally find that migrants typically experience a higher degree of social isolation after migration, at least temporarily. Difficulties of language and cultural difference are said to impede the formation of social ties; at a minimum, making new friends in a new location takes time. This picture, however, emerges primarily from qualitative research projects investigating a limited range of specific migration streams. This paper develops a broader analysis of sociability among migrants moving within Europe, using data from the European Social Survey enabling comparison of migrants to stayers in the countries the migrants left. While migrants in some streams do experience lower levels of sociability and higher rates of isolation (compared to rates among stayers in the corresponding origin countries), migrants in other streams experience significantly higher sociability and lower rates of isolation. A comparison of average rates for origins and common destinations within streams suggests that migrants integrate into the patterns of sociability prevailing in the destination (as against what a "durable national character" argument might suggest). The consequences of
migration for sociability, then, are by no means as uniform as previous research might be read to suggest.

“I will have extrovert, clever and emphatic friends” Imagining a future abroad in borderless Europe

Saara Pirjetta KOIKKALAINEN (University of Lapland, Finland) | skoikkal@ulapland.fi

International migration is a phenomenon that thrives on imagination. Migrants are often forced to make the decision to move to another country or even continent with limited knowledge of their destination. The image of life in a foreign country may be based more on media imagery and emotions, than on a realistic understanding of where one will most likely live and work, and with whom interact. As the globalized media provides a constant feed of images of faraway worlds, imagination has become a collective, social fact and is now the basis of a plurality of imagined worlds. At least with voluntary migrants, the capacity to aspire a brighter and more prosperous future abroad has been linked with the likelihood of leaving. This conference presentation discusses the role of imagination – or mental time travel to one’s personal future – based on a 2010 survey (n=194) of intra-European migrants: highly-skilled Finns living in 12 different European countries. The survey included retrospective questions on the kinds of things, places, and situations the survey respondents remember thinking about prior to moving abroad. Did they imagine concrete places, such as their future home or workplace, or focus more on personal relationships? And what do they imagine in relation to a possible future move to another destination? The open-ended responses give a view to the complex nature of migration decision-making, as the respondents ponder about the pros and cons of onward migration, and describe how they see their future selves in a new location.

Searching for a better life. Migrants’ accounts on change and life satisfaction

Ionut-Marian ANGHEL (Research Institute for Quality of Life, Romanian Academy of Sciences, Romania) | ionut.anghel@iccv.ro
Alexandra DELIU (Research Institute for Quality of Life, Romanian Academy of Sciences, Romania; University of Bucharest, Romania) |

In this paper, I will analyze individual perceptions of well-being and individual accounts of migration experiences, as inter-related concepts. With a conceptual background including social remittances, transnationalism and subjective well-being, I use qualitative data in order to address the research questions: What are migrants’ lay accounts of their own experiences? and How do concepts of well-being and life satisfaction appear in migrants’ discourses? While the theoretical background includes theories of transnationalism and social remittances and authors such as Peggy Levitt and Nina Glick Schiller, the methodological perspective chooses to place individuals and individual searches and constructions of sense and social significance at its core. The empirical data is used under the recognition that interviews are special social situations in which people account for their experiences and their choices, and that social spaces of relevance are discursively constructed. This should allow for a view of migration from below, complementing the various existing approaches to the subject from structuralist, macro-social grounds. The empirical research is being carried out on a continuous basis since 2012, and consists of recurrent visits to two Romanian rural communities in which the incidence of migration is high. Here, interviews are conducted with migrants, non-migrants and formal and informal community leaders. The empirically informed answers to the research questions show migration as a decision taken in a perceived opportunity-free environment, while understandings of the social space are
mentioned to be changed by the exposure to new social practices and lifestyles. As a way of gathering resources, international migration appears to be the temporary solution chosen by individuals who, irrespective of their specific strategy or pattern of employment, envision the return home for a better life as the final result.

Refugee, migrant or world citizen? The migration/mobility debate and self-perceived migration discourses among Cape Verdeans in Portugal, Ethiopians and Eritreans in Italy
Inês VIEIRA (CICS.NOVA, FCSH/NOVA, Portugal) | ines.vieira@fcsh.unl.pt

In times of accelerated globalization and compressed views on time and space, “migration” is no longer a sufficient term to name the phenomena of mobility. Yet, despite its generalization, the right to mobility is poorly shared. If we observe the wide range of visas (so distant as from the quota of humanitarian or political refugee statuses attributed upon the Mediterranean crossing, to golden visas for priority investors in certain European countries) we can reinforce the idea of mobility as a capital which is not equally distributed. This gap poses many questions regarding the social legitimation of mobility, potential integration or resistance towards newcomers, reinforcement of securitarian messages against unprivileged migrants and diverse problems of human dignity.

How is this migration/mobility gap perceived by its protagonists? The questions “Do you see yourself as an immigrant? If so, what type of immigrant? If not, how do you see yourself in this country?” have been asked to Cape Verdeans in Portugal, Ethiopians and Eritreans in Italy. These questions were part of semi-directive interviews aimed to integrate brief biographic narratives while exploring perceptions on the reasons to migrate. These migration pathways were chosen due to their post-colonial links and reinforcement of important migration trends towards Portugal (lusophone migration system) and Italy (Mediterranean refugee pressure).

The proposal is to explore how the self-perceived migration discourses vary within this debate: from cosmopolitan, post-imperialist narratives on world citizenship, post-colonial efforts on privileged integration, mainstream economical migration, political asylum requests, up to the “illegal” unwelcome spectrum.

RN35S02 - Migrant Students: New Directions in Migration Research

Differences in cross-linkage between female and male medical students with a Turkish migration background
Gloria TAUBER (Medical University of Innsbruck, Austria) | gloria.tauber@i-med.ac.at
Heidi SILLER (Medical University of Innsbruck, Austria) | heidi.siller@i-med.ac.at
Margarethe HOCHLEITNER (Medical University of Innsbruck, Austria) | margarethe.hochleitner

The research focuses on Turkish migrants, one of the largest groups of non-German speaking migrants in Austria according to Statistic Austria. The study aims at a better understanding of gender/migration-specific aspects in medical students.

4 focus groups were conducted with medical students having a Turkish migration background. The groups were separated into a female and a male group. Each group had two 2-hour-appointments. All participants filled out a socio-demographic questionnaire. In analysis grounded theory was applied.
The female group consisted of 12 students between 18-29 years. Seven were born in Austria, three in Turkey and two in Germany (six having Austrian citizenship, five Turkish, one missing). 9 students between 19-24 years participated in the male group. Six were born in Austria, two in Turkey and one in Germany (six having Austrian citizenship, one Turkish, one German, one missing). Male students reported being more cross-linked (buddy system) than did female students. Only male students reported that seniors would help beginners in finding friends, studying for exams and on clinical traineeship. The females reported on existing friendships, however, to a lesser extent as the male group. During the discussion it was evident that all male medical students knew each other, while in the female group most of the students did not. The stronger cross-linkage in male students than in female students needs to be investigated further to deduce its advantages for medical students in their studies. Follow-ups are planned on study advancement and success in male and female focus group participants.

Dissociating middle class and reflexive migration: using highly skilled Estonians as an example
Maarja SAAR (Södertörn Högskola, Sweden) | maarjasaar@hotmail.com

Migrating for alternative lifestyles and in search for authentic identity is often considered middle class behavior. Research has gone as far to depict middle class migration as reflexive, whereas working class is considered to mainly move for economic reasons. Although lifestyle migration is considered part of middle class habitus, the explanations on how this has become part of their socialization environment are yet lacking. This article argues that the gap between classes and different migration motives is exaggerated. Based on interviews with highly skilled Estonian migrants, the article claims that more often than not, migration for the purposes of reconstructing one’s identity, was motivated by certain watershed events. Such watershed events however were not defined by class background. Still for those coming from working class background, it was more difficult to migrate for self-expression purposes due to their lacking economic resources. This led to situation where such moves were carried out later in life by those coming from working class background. Nevertheless it is premature to claim as if reflexivity as well as seeing migration as a quest for identity is only part of middle class migration behavior.

Elite or middling? International students and migrant diversification
Lucinda PLATT (London School of Economics and Political Science, United Kingdom) | l.platt@lse.ac.uk
Renee LUTHRA (University of Essex, United Kingdom) | rrluthra@essex.ac.uk

With the extensive internationalisation of higher education alongside restriction of traditional family and labour pathways to Europe from former sending countries, student migrants now form a substantial share of non-EU flows to Europe. Yet analysis of students as a migration stream is relatively underdeveloped. Using a unique data set that provides a large sample (N=500) of recent Pakistani student migrants to London who are surveyed shortly after arrival and then 18 months later, this paper provides the first examination of the early socio-cultural and structural integration process of third country nationals migrating to Europe as students. We theorise that as well as an elite migration stream, we will also find among these students a group of ‘middling’ transnationals, less highly selected and more closely embedded in ethnic networks and with more equivocal outcomes. We use latent class analysis to identify both elite and two ‘middling’ types within our student sample. That is, alongside the network driven ‘middling transnationals’ that we expected we also identify a third group, that can be linked to the expanding middle class in Pakistan and increasing access to international education. We
then ask whether the three types experience different early socio-cultural and structural integration trajectories in the ways that the elite and middling transnational literatures would suggest. We find differences in structural, but not socio-cultural outcomes. We conclude that to understand the implications of expanding third country student migration across the EU, it is important to recognize both the distinctiveness of this flow and its heterogeneity.

**Foreign students and highly qualified immigrants in Poland – a chance for development or potential source of conflicts?**

Joanna KONIECZNA-SAŁAMATIN (Institute of Sociology, University of Warsaw, Poland; Institute for Socio-Economic Enquiry, Poland) | jkonieczna@uw.edu.pl
Elżbieta ŚWIDROWSKA (Institute for Socio-Economic Enquiry, Poland) | elzbieta.swidrowska@gmail.com

Poland is usually thought to be a country of emigration, which is to a great extent true given the long tradition of geographical mobility of Poles. Now Poland still remains the important supplier of emigrants in Europe, but after 2004 it has also become a country of immigration. Most of the studies devoted to the immigrants in Poland focus on seasonal and low-skilled workers. This is only part of the picture, because one of the strategies for immigration to Poland is education - young people enrol at Polish universities, graduate, start their jobs and often stay in Poland. Act on Foreigners (from 13 December, 2013) creates the preferences for them by granting the foreigners with Polish diploma the right to work in Poland without the work permit regardless of their citizenship. The Polish employers, however, usually don’t consider foreign specialists even if they suffer from shortage of the appropriate candidates for employees. The paper presents the result of research conducted in 2014, which shows both the perspective of foreign students in Poland - their motivation to choose the country, the university etc. and the perspective of Polish employers showing their attitudes towards the employees from abroad. The question is whether this kind of immigration can be considered one of the solutions for demographic crisis in Poland or it is rather a potential source of new social conflicts.

**RN35S03 - Escaping Power Relations or Helping to Maintain Social Order? Informality in Migration Research**

European Somalis on the move: Migrants’ “mobility capital” as a marker of social differentiation

Joëlle MORET (University of Neuchâtel, Switzerland) | joelle.moret@unine.ch

Based on a doctoral research with Somali migrants who have settled in Europe for at least ten years, the paper explores what I have coined their “post-migration mobility practices”. These are understood as cross-border movements undertaken by migrants after they have settled in European country and from this country. I argue that, despite being often marginalised and stigmatised, some established Somali migrants are able to transform varied forms of mobility practices into a form of “mobility capital”. These movements include in particular secondary migration, star-shaped mobility practices, pendular movements and return visits to the place of origin. A conceptual and theoretical framework inspired by the field of “mobilities studies” allows new insights on migrants’ lives and strategies. This focus highlights that accumulating experiences and skills related to crossing borders may increase the degree of control that migrants exercise over their movements and simultaneously their potential to benefit from them.
These results justify the conceptualisation of mobility as a form of capital: it is not only something people may practice, but also something people may possess and mobilise if and when needed. While the paper deliberately stresses migrants' strategies, it also emphasises how migrants’ relationships with Nation-States influence cross-border movements and their potential in pursuing social advantages. Mobility capital can, as I argue, be considered as a marker of social differentiation, alongside with nationality or ethnicity, gender, legal status and social class. In this sense, the study contributes to recent efforts by migration scholars to “transnationalise” theories of social inequalities.

From illegality to tolerance and beyond: irregular immigration as a selective and dynamic process
Maurizio AMBROSINI (University of Milan, Italy) | maurizio.ambrosini@unimi.it

Some immigrants are labeled as illegal and thus stigmatized, even when their legal status falls within other legal categories (e.g., asylum seekers), while other immigrants, even when living in the receiving society without authorization, are neither perceived nor treated as 'illegal'. Diverse interests and social representations of irregular immigration tend to redefine it selectively. Despite the supposed universality of the rules, their effective implementation is rigid with some individuals and rather lax with others. In Southern Europe, care work for native households is a case in point: careworkers, mainly women, are considered deserving immigrants, exploited but also protected by their employers. Moreover, the transition among these categories will be discussed, in particular through regularization processes and the action of various intermediaries between the receiving societies and irregular immigrants.

Unequal Access: Survivors of domestic violence with uncertain immigration status accessing support services in the UK and Sweden
Halliki VOOLMA (University of Cambridge Centre for Gender Studies, United Kingdom) | liki.voolma@gmail.com

The research question: What are the opportunities and barriers for immigrant women’s access to domestic violence support services in the UK and Sweden?
Theoretical framework: This paper contends that borders exist not only at the edges of national territories, but also inside them. Survivors of domestic violence need to secure safe accommodation as well as practical, material, and emotional support to enable them to leave abusive relationships (Thiara & Gill, 2010). I will show how internal borders function to exclude immigrant domestic violence survivors from protection and support, and can lead to a stark choice between continuing violence or destitution and the threat of deportation (Anitha, 2008). The focus of this paper on internal borders is inspired by Linda Bosniak’s discussion of the border as a regulatory sphere. She writes: “Exclusion functions also inside the territory — most significantly through the power and practice of deportation… Through a complex regime of immigration regulation — one that includes government authorization to detain and deport noncitizens under some circumstances — the "border" — conceived as regulatory sphere — follows the immigrant into the national geographic space and shapes her experience there.” (Bosniak, 2007, p. 10).
I am employing this conceptual tool for framing my discussion of the formal and informal barriers survivors of domestic violence with an insecure immigration status face in leaving abusive relationships.
The paper also draws on Sabates-Wheeler and Devereux's (2008) argument that a ‘transformative’ element needs to be added to social protection theory and practice. The term
‘transformative’ moves away from viewing social protection as merely a form of dependent security and towards a rights-based approach where security becomes a process of gaining rights and entitlements through negotiation of the social contract, for instance, changes to the regulatory framework that protect migrants against discrimination and abuse.

Methodology: This paper draws on data from in-depth semi-structured interviews with 91 individuals from two groups of participants: volunteer immigrant women in the UK and Sweden who had experienced domestic violence and were in contact with support services (n=35), and national and international stakeholders of the issue, including support service providers and politicians (n=56).

Findings: “The rights are there for everyone and then it’s up to politicians and to the society to make it accessible to everyone” (Political advisor, Sweden Green Party)

The paper will discuss three key themes relating to the focus of access to services that have emerged from the analysis of interview data and law and policy: legal barriers, policy barriers and informational barriers that function to exclude many survivors with an insecure immigration status in the UK and Sweden from access to protection and support.

1. Legal barriers: spousal visa probationary period
If an individual enters the UK or Sweden on a spousal visa to join their partner, they are subject to a probationary period (5 years in the UK, 2 years in Sweden) during which the marriage cannot break down, otherwise the migrant spouse faces deportation. This probationary period is commonly cited in the literature as the major legal barrier to survivors of domestic violence on spousal visas seeking help, due to fear of deportation (e.g. Anitha, 2008).

   e.g. “basically he has 2 years when he can do whatever he wants... your visa is dependent on him” (Survivor, Sweden).

2. Policy barriers: restrictions on access to support services
In both the UK and Sweden, some survivors of domestic violence with an insecure immigration status are formally restricted from access to domestic violence support services, which are financed through the welfare state system. In the UK this is anyone who has insecure immigration status and thus has No Recourse to Public Funds, in Sweden it is undocumented migrants.

   e.g. “Migrants… change statuses all the time as well. It’s very easy to become an overstayer, for example. And slipping into that category suddenly changes your service access” (Policy Officer, Migration Yorkshire)

3. Informational barriers
Nearly every survivor interviewed talked about the lack of information given to them about their rights and options as a major barrier to leaving their abusive home. Some survivors explicitly said they would have left their partner earlier had they known that they have options outside the abusive home.

   e.g. “There’s nobody to guide us… If I knew my rights I wouldn’t have gone back [to my abusive husband]” (Survivor, UK)

Conclusions:
(1) Access to support services goes beyond formal eligibility, and includes the ability to prove eligibility using appropriate evidence, and the availability and accessibility (including language) of information about services.
(2) Access to domestic violence support services is based on immigration status to some extent in both the UK and Sweden, though in Sweden in it is only undocumented migrants who do not have formal access.
(3) The No Recourse to Public Funding rule in the UK, and the spousal visa probationary period in both the UK and Sweden are key barriers for survivors of domestic violence accessing protection and support.

The novel contribution of this research: This is the first comparative qualitative study of the issue of domestic violence against immigrant women in the EU. Unlike most other research on this
topic, this study does not focus on a particular migrant group based on country of origin, but examines the effect of the broad category of ‘insecure immigration status’ on domestic violence survivors' pathways out of abusive relationships, in particular their access to support services. Sabates-Wheeler and Rayah Feldman (2011) argue that what is missing from the literature is an investigation into the constraints and conditions of access to specific social protection instruments for migrants. This paper makes a contribution to filling this gap. In combining the lenses of migration, violence against women, social protection and human rights to look at this problem in a comparative context, this study is unique.

Invisible migrants and migration ‘amnesty laws’ – the case of Poland’s regularisation programme of 2012

Marta SZCZEPANIK (Graduate School for Social Research, Polish Academy of Sciences, Poland) | martasz@windowslive.com

Programmes providing opportunity for certain groups of irregular migrants to obtain stay permits have become an instrument implemented by many EU member states to address irregular migration. Even though they were meant to be one-time solutions, some countries, including Poland, have already conducted them several times. This seems to be connected with the failure of long-term state migration strategies and policies, especially those related to the economic migration.

This paper draws on the research conducted in 2014 among the beneficiaries of the regularisation programme of 2012 in Poland. The eligibility conditions for regularisation set forth in the programme included, among others, irregular stay on the day of entry of the law into force and uninterrupted stay in Poland since at least 2007. Over 4500 persons obtained a stay permit as a result of the procedure. Semi-structured in-depth interviews were collected from 45 migrants, majority of them citizens of Ukraine, Vietnam and post-Soviet countries; 70% of interviewees were migrant workers. The material collected is not only a document of migrants' precarious existence in the legal and social 'grey zones' but also of their migration patterns, adaptation strategies and attitudes towards the Polish society. It also points to the broader problem of an invisible but necessary workforce, especially in the sector of domestic services and the care of the elderly, characterised by a steady rise in demand.

RN35S04 - Migration and Social Change: European Perspectives

Diaspora formation and diaspora engagement: A multi-layered relationship between mobility and change

Carolin FISCHER (Université de Neuchâtel, Switzerland; University of Oxford, UK) | carolin.fischer@unine.ch

This paper examines the relationship between mobility and change in diaspora formation and diaspora engagement. I argue that the conditions leading to the development of diasporas, their incorporation into receiving societies and the internal dynamics unfolding among emerging communities are fundamentally intertwined. They are crucial determinants of peoples’ relationship to their country of origin and their aspirations and capabilities to engage in transnational action.

Based on a qualitative case study of Afghan populations in Britain and Germany I highlight three interrelated themes: i) diasporas as outcome of local and global transformations, ii) diasporas as changing social entities and iii) diasporas as agents of change. Relational sociology is used to
capture the interplay between drivers of migration and emerging social identities, patterns of social organisation and forms of social engagement among diasporic groups. A first basic finding is that diasporas are in ongoing formation as their situation can change in response to tumultuous events or more subtle changes in homelands and hostlands. Second, how Afghans in Britain and German engage with Afghanistan is a question of structurally constrained agency. Agency in turn is inseparable from the unfolding dynamics of the situations in which people are enmeshed. Transnational engagements not only reflect ties to the country of origin. They are also a response to the specific social and temporal environments in which people are embedded, notably their host countries and diasporic networks. A relational perspective helps specify how different dimensions of people’s social identity and instances of social engagement are shaped in interaction with various elements of changing social contexts.

**New European Rural Immigration: Questions, Confrontations, and Changes**

Johan Fredrik RYE (Norwegian University of Science and Technology, Norway) | johan.fredrik.rye@svt.ntnu.no

Following 2004’s EU enlargement, unprecedented numbers of labour immigrants from East European countries have arrived in West European rural destinations, where they often find precarious work in rural industries (e.g., agriculture and fisheries). Compared with Europe’s urban regions, these communities have less experience with receiving immigrants, while their rural sociocultural context implies conditions for immigrant integration that differ from those posed by cities. In this paper, I thus examine the dynamics of migration in rural Europe by investigating Norway’s "Coastland" region, which has seemingly overnight become multicultural as a result of labour migration. I discuss how migrants have challenged the local traditionalist social order and the community’s responses to immigrants, as well as how the immigration phenomenon questions, confronts, and changes existing structures of economic, political, social, and cultural power and inequality. Building on Buroway’s (1998) extended case method, I apply a mixed-methods approach and combine a variety of materials for analysis: statistical material and public documents, qualitative in depth-interviews with immigrants, and interviews with key informants in the local rural community. In effect, the research demonstrates how this new rural migration phenomenon prompts new processes of meso level societal change in Europe’s rural societies, in particular by reinvigorating the rural economic base, yet also promotes class conflict, social inequality, and identity struggles. As such, the phenomenon accelerates the erosion of differences between both the rural and urban and the local and global.

**Emigration and Return Migration – Reintegration Strategies of Romanian Citizens**

Georgiana-Cristina RENTEA (University of Bucharest, Romania) | georgiana.rentea@gmail.com

Return migration is an issue of interest both for Romania (with over two million citizens living in other E.U. member states) and for the main E.U. destination countries. If a sending country focuses on the high economic, demographic and social impact of the emigration process, the destination countries are interested in return migration especially in the context of the ongoing economic crisis. Although the emigration of Romanian citizens became an important process during the last years, the initiatives aiming to support their return are still rather limited in scope and effects, and that they should be expanded to address a larger variety of needs. Most affected are migrants originating from rural areas; even though their migration experience brought new skills and experience, the limits of rural settings (lack of industry, infrastructure, and employment opportunities) make it almost impossible to effectively use these. Return
migration studies also highlighted the negative consequences on children and their educational adjustment emphasizing the lack of appropriate support services.

This paper is based on data provided by a qualitative study on migrants returning to Romania aiming to understand the reasons for return and their reintegration strategies, including the role of experience acquired abroad (e.g. social remittances that migrants might bring back) or other factors at individual, familial or community level. The findings could support on the one hand the sending countries’ efforts to shape their social policies according to potential social risks facing their returning citizens. On the other hand E.U. destination countries are interested in the evolution and recurrence of the immigrants’ return decisions (i.e. under the influence of migration social networks, socioeconomic context or other factors that can reshape the migration plan of an individual or his/her family).

“Gender jihad” in Europe: Muslim women’s integration within religion

Barbara Małgorzata PASAMONIK (Academy of Special Education, Poland) | pasamon@aps.edu.pl

European young Muslim women experiment with emancipation and integration within religion. Some of them call themselves Muslim or Islamic feminists, others prefer to avoid the label of feminism. The struggle for women's rights within the Muslim community, the so called “gender jihad”, occurs on two levels: practical and theoretical. The former relies on a “ground work” i.e. prevention of cultural violence against women. The latter relies on hermeneutic and deconstruction of the fundamental texts of Islam. Muslim feminist re-read the Holy Scriptures and argue for an egalitarian message of the Koran, that was obscured by historical interpretations. Such a novel interpretation of the Koran is an intelligent sociological vehicle because it strengthens women’s position and appreciate the Koran with respect to other religion at the same time.

I want to show that Muslim women living in Western Europe, empowered by increased level of education, employment opportunities and by independent access to religious knowledge, have become important agents of transformation that places Islam in the European context. Their aim is to create a modern Euro-Islam that uncovers democratic European values in the Koran. For them, Islam is a path to individual autonomy and to integration without loss of their own culture. Emancipation via religion is more acceptable to Muslim fathers and brothers – it may be a vehicle for the integration of the entire Muslim community.

RN35S05a - Promoting Social Imagination at the Global Level: A discussion about Migration and Intercultural Integration - A

The Acculturation of Immigrant Teachers Serving Bilingual Education Students

Annette TORRES ELIAS (Texas Wesleyan University, United States of America) | atorres@txwes.edu
Patsy ROBLES-GOODWIN (Texas Wesleyan University, United States of America) | problesgoodwin@txwes.edu

This paper will present the findings from an ongoing qualitative research study that investigates the experiences of teachers migrating from Latin America and Spain, to Texas, U.S.A. These teachers are being recruited in their country of origin to serve students in bilingual education programs. There is a critical shortage of bilingual teachers due to rapid changes in the demographic composition of the school population. School districts have responded to the bilingual teacher critical shortage in innovative ways, one of which is recruiting teachers in
Spanish--speaking countries. The purpose of the study was to investigate the experiences of this group of teachers in order to inform the kinds of professional development immigrant teachers in bilingual education programs need, and to foster an effective acculturation process. This is important because bilingual teachers from Latin America and Spain are often recruited to meet the needs of schools districts needing Spanish--speaking teachers to serve a growing student population of linguistically and culturally diverse students who often struggle to meet state standards. A successful cultural, professional, and social integration of these teachers will ultimately impact the students and communities they serve.

**School Integration as a Sociological Construct: Reflections from a Survey on Multietnic Classrooms in Italy**

Maddalena COLOMBO (Università Cattolica del Sacro Cuore, Italy) | maddalena.colombo@unicatt.it
Mariagrazia SANTAGATI (Università Cattolica del Sacro Cuore, Italy) | mariagrazia.santagati@unicatt.it

Integration is a fundamental mandate of schooling and, in democratic and differentiated societies, all education institutions aim at combining social and cultural heterogeneity with equal rights for all. The paper analyses the huge change occurred within the Italian education system over the past 20yrs., caused by the increasing participation of pupils with ethnic background, which leaded to multi-ethnic and pluralistic classrooms. Once reached considerable rates of immigrant pupils (25-50% per classroom), it’s worth questioning: are these classrooms a segregated setting? Which factors affect school integration in these contexts? Is it useful measuring the degree of integration? How to do so, being integration a social construct to define theoretically and to verify empirically? The paper is based on the first survey on “high density” classrooms carried out in Italy, limited to a sample of 1,040 students in lower secondary education in Lombardy. This study identifies statistic indicators related to both the institutional dimension of integration (school access and achievement) and the relational one (well-being and absence of peer conflicts). Results highlight the complexity of factors at stake: as a matter of fact what makes critical the integration process seems to be not only the ethnic class composition, but also the lack of gender balance and the high rate of students with poor family background, neat to the nationality. These results permit to de-construct school integration, offering also elements and recommendations useful for policies.

"Always a foreigner?": A comparative approach to ethnic/national identity construction among youth in Norway

Mari RYSST (University College Lillehammer, Norway) | mari.rysst@hil.no

Based in ethnographic fieldwork and research during the period 2010-2015, this paper discusses and compares national/ethnic identity construction among children living in a place I have called Dal in the Grorud Valley in Oslo and in a local school context in the inland city of Lillehammer. Compared to other parts of Norway, the Grorud valley is particularly characterized by the immigration of people looking visually different from ethnic Norwegians, making some parts peopled by a majority of people of foreign origin. This is so for the place I have called Dal, but not Lillehammer, being a primarily white city with elements of immigrants in certain parts of the town. Children growing up in both these contexts have in common that they have to relate to cultural values from their country of origin and cultural values of the Norwegian society regarding ethnic/national identity construction, having implications for belonging and well-being in their everyday life (Jenkings, 2011). More precisely the paper addresses how being numerically in majority (Dal) and in minority (Lillehammer) impact on their ethnic/national identity
construction in the intersection of age, gender, racialised ethnicity, religion, and place. How do children at Dal and Lillehammer participate and develop competences in order to construct ethnic/national identity in relation to the categories of “Norwegian” and “foreigner”? The chapter is based on already collected data in Oslo, but seeks to do additional fieldwork in the 6th Form in a local school in Lillehammer.

Changes in Personal Networks of Young Iranians and Former Yugoslavians in Sweden
Gerald MOLLENHORST (Utrecht University, Netherlands; Stockholm University, Sweden) | g.w.mollenhorst@uu.nl
Christofer EDLING (Lund University, Sweden) | christofer.edling@soc.lu.se
Jens RYDGREN (Stockholm University, Sweden) | jens.rydgren@sociology.su.se

Research on personal networks of immigrants indicated that immigrants in general have disproportionately more co-ethnics in their network than natives, although the prevalence of such ethnic boundaries varies between, e.g., men and women, ethnic groups, and first and second generation immigrants (e.g., McPherson et al. 2001; Van Tubergen 2015). More general network studies showed that the size and composition of people’s network of close associates changes considerably over the years (e.g., Shulman 1975; Wellman et al. 1997; Degenne and Lebeaux 2005; McPherson et al. 2006; Mollenhorst et al. 2014).

At the intersection of both, we describe changes over four years in the composition of personal networks of young native Swedes, and first and second generation immigrants from Iran and Former Yugoslavia who currently live in Sweden (born in 1990; N=1537). We primarily focus on changes in the share of co-ethnic relationships in the networks of immigrants, and find that, although the share of co-ethnics in their networks may still be relatively small, it does increase over time. Assessing the causes, developments, and consequences of ethnic boundaries in networks is relevant, because ethnically segregated networks may lead to prejudice, socioeconomic inequality, et cetera, not least if it occurs among young people who are leaving school and entering the labor market. Next, we explain variations in these network changes in terms of respondents’ ethnic background, length of stay in Sweden and various other indicators for integration in the host country, next to socio-demographic characteristics, life events and changes in their social contexts.

RN35S05b - Promoting Social Imagination at the Global Level: A discussion about Migration and Intercultural Integration - B

Minority ethnic integration through higher education
Berenice SCANDONE (University of Bath, United Kingdom) | bs339@bath.ac.uk

In the last decades, the number of minority ethnic students attending UK universities has been rising substantially, at higher rates than that of White British. Within both public and policy discourse, this has been welcomed as an indicator of, and a means towards, increasing socio-economic integration of ethnic minorities. While participation in higher education can certainly be seen, at least in part, as a vehicle for integration and social mobility, its capacity to more fundamentally tackle social class and ethnic inequalities has been found lacking. Despite minority ethnic students entering HE in growing numbers, they are in fact disproportionately concentrated in “new” post ’92 institutions, and tend to achieve lower class degrees compared to White British learners, which is likely to have a considerable impact in terms of employability
and mobility prospects. In this paper, I will draw on qualitative data collected through 50 in-depth interviews with 25 British-born Bangladeshi women attending a range of both “old” and “new” universities in London, to uncover some of the dynamics involved in the reproduction of class, “race” and ethnic inequalities through higher education. I will argue that issues re-enforcing distinctions have to do with both access to and experiences of higher education, and are strictly inter-related with the interplay of class and ethnicity within secondary schooling. In doing so, I hope to challenge the notion of school “performance” measured in terms of students’ “achievement”, and to provide some points for reflection for researchers, policy-makers and practitioners.

From San Rafael del Sur, Nicaragua, to Arizona State University, USA
Carlos Julio OVANDO (Arizona State University, United States of America) | carlos.ovando@asu.edu

This paper discusses the life path that took me from my original home in Nicaragua to a successful academic career in the United States. In addition to examining the reasons why my family immigrated in the mid-1950s, I will highlight the prior knowledge and lived sociocultural, linguistic, and academic experiences that I brought with me to the U.S. society and schooling contexts. I will also share my experiences with the schools in my new country, including an unexpected spanking that I received from a seemingly well-intentioned elementary school principal in Robstown, Texas, as punishment for speaking Spanish. His reasoning was that by forcing me to improve my English language skills quickly, he could help me gain a winning edge in life. It unfortunately had the opposite effect: that early experience in my school life contributed to the negative view I developed of my sense of identity and self-worth. I was lucky, therefore, that three engaging, passionate, caring, knowledgeable, and inspirational teachers later came into my life and contributed to my academic success in the United States. I will conclude my presentation by addressing the question: What are some of the potential concerns as well as approaches to teaching that support academic success for all students—both for those who share my first language literacy and parallel schooling experience and for those who lack first language literacy, interrupted schooling, and social/economic support?

Children of Romanian Migrants between “Here” and “There”: Stories of Home Attachment
Roxana BRATU (University of Bucharest, Romania) | bratu_rox_ana@yahoo.com

A central question in the larger debate regarding the integration of migrants at destination refers to the extent to which the "transnational" attachments of the first generation of migrants are transferred to their children or, in other words, to what extent they develop or maintain any links with the country of origin.

On the one hand, a widely vehiculated hypothesis in the second generation studies is that children's involvement in transnational activities tends to be significantly less intense than that of their parents or even absent, at the same time with a weakening of their attachment to the country of origin (Portes, Fernández-Kelly, & Haller, 2009; Portes & Rumbaut, 2005; Portes, 2003). Kivisto (2001) even states that transnationalism is a “first generation phenomenon” and that the second generation transnationalism is a temporary phenomenon that will disappear as the children of migrants will fully incorporate into the host society (Kivisto, 2001). The main assumption behind this statement is that the members of the second generation or 1.5 Generation will adopt the culture of the host society as it is promoted by the educational system and is more valued in the society (Levitt & Waters, 2001).
On the other hand, other scholars argue that migrants’ attachment to the homeland can be transferred to their children. The contacts with the country of origin, no matter how limited they may be, and the exposure to transnational practices in the household or community plays an important role in the transmission of attachment to the country of origin (Fouron & Glick-Schiller, 2002; Levitt & Waters, 2001; Levitt, 2004; Somerville, 2008).

The study analyzes the concept of home attachment in terms of transnationalism understood not only as concrete practices but also as affective ties (Huynh & Yiu, 2012; Paraschivescu, 2011). According to Huynh and Yiu (2012) transnationalism understood as affective ties refers to “the lived experiences and connections – real or imagined – that immigrants maintain with the homeland” (Huynh & Yiu, 2012, p. 21). Whether or not they are involved in concrete transnational practices, migrants often experience their ties with the country of origin on an emotional level (Paraschivescu, 2011). Behind these ties lay the affiliation to a common ethnic identity and the memory or an imagined construction of the country of origin (Fouron & Glick-Schiller, 2002).

In this context, by analyzing interviews from a larger qualitative study conducted in a village (Vulturu), in South-East Romania, the paper sets out to explore the ways Romanian migrants’ children who were born in the country of origin but raised in Italy or the so-called 1.5 Generation (Rumbaut, 2002; 2012) talk about their ties with the home country. In other words, is Romania presented as more – or something else – than the original homeland? What are the forms of attachment to home country invoked in their discourses?

Methodology

The analyzed interviews are part of a larger qualitative study conducted in a Romanian village (Vulturu), in the South-East region of the country. In the summer of 2013 and 2014 I conducted 40 semi-structured interviews with adult migrants (30) and their children (10) with different periods of living abroad. The respondents were selected using a snowball method and resorting to the help of key informants from the village.

The paper focuses on the children of migrants from this village which can be considered as being part of the 1.5 Generation. What do all these youngsters have in common? They left Romania before adolescence to join their parents in Italy after they had been for several years in the care of their grandparents. At the time of the interview, all respondents were living with their parents in the family household and were still attending an educational institution (high school, college or vocational courses). Their age varied from 15 to 22 years.

Based on the accounts and assessments of the interviewees, I concluded that some transnational practices are being maintained at the household level. Such a transnational practice is the family holiday spent in the home village, which has become almost a local tradition.

Preliminary findings or conclusions:

Based on evidence from interview data a typology of attachment to the home country was outlined, further divided into strong attachment, ambivalent attachment and low attachment to home country. Strong attachment to the home country is expressed through the longing for the country, a projected return to Romania, the preference for the company of co-ethnics and a high importance given to the Romanian origin. Ambivalent attachment consists of a negotiated belonging to both societies as a result of the strong links developed at both origin and destination. Low attachment to home country is highlighted by projecting future plans in the host country, by rejecting the parental model of relating to Romania, the lack of interest in transnational practices or the refusal to socialize in groups of co-ethnics.

The results point to the conclusion that the issue of attachment to the home country is discursively constructed by respondents both explicitly and implicitly through multiple references to the family migration project and their immigrant status at destination. On the one hand, the family project of migration is called into question and the difficulties of migration are brought to
the fore. On the other hand, the lack of identification with the group of Romanian migrants in Italy reinforces the distancing from the home country for those with low attachment. Moreover, I argue that the different types of attachment identified in the interviewees’ discourses are mediated by the subjective assessment of the integration experience into the host country. Those with a low attachment to the home country position themselves as being well integrated into the host society and as being different from the “typical” Romanian migrant in Italy. In the case of those with a strong orientation towards the home country, I noticed a negative subjective assessment of the integration experience at destination, understood in terms of lack of a sense of belonging and a perceived rejection by the wider society.

**Over-education as an indicator for immigrants’ integration**
Yana LEONTIYEVA (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | Yana.Leontiyeva@soc.cas.cz

For many years, sociologists have acknowledged that education and skills are among the most important determinants of social class and upward mobility. The importance of education and skills has also been studied in the context of international migration. Labour market incorporation is generally considered a precondition for the successful integration of migrants into the host society. In turn, matching the education and skills of migrants to jobs in the destination country is often used as an indicator of labour market integration (Eurostat 2010). This article focuses on different measurements of migrants’ over-education. On the example of the Czech Republic the author critically analyses and compares different available data and measurement of mentioned phenomenon and discusses the usage of over-education indicator for measurement immigrants’ integration.

**Border Crossings, Threshold Theories, and Transnational Gendered Experiences in Higher Education in the U.S.**
Kakali BHATTACHARYA (Kansas State University, United States of America) | kakalibh@ksu.edu

Abstract for Session 5
There has been a sustained increase in the number of foreign students who arrive in the U.S. to further their education. This paper is informed by a two-year ethnographic case study of female Indian graduate students in the U.S. during their first year of education. Highlighting a need to disrupt binaried discourses such as First and Third World, civilized and backwards, liminal spaces and threshold theories are used to understand the negotiation of the participants’ experiences. Additionally, because these students also had class and religious privileges, social visibility, etc. in India, they struggle with authoring themselves, devoid of those privileges once they arrive in the U.S. Further, this study is situated in the contemporary globalized exchange of culture and people across multiple nations. These migratory movements are fertile grounds to create diverse understandings through which people author themselves and the world around them. Such authoring has direct implications for the material conditions of people’s lives produced by globalized movements, especially if they live in culturally unfamiliar spaces. The stories presented in this study are tales of contradictions, ruptures, where categories like Indian, American, us, them, and we are simultaneously blurred and maintained to demonstrate inequities informed by transnational existences.
Managing identity under circumstances of cultural and economical inequality –
study of young Kurdish migrants in Istanbul
Karol Pawel KACZOROWSKI (Jagiellonian University, Poland) | karol.kaczorowski@gmail.com

The paper will present preliminary results of project studying social construction of ethnic identity of young Kurdish migrants in Istanbul.
Istanbul is the province with the largest Kurdish population in the world. Moreover, Istanbul is of great significance for the Kurdish culture, as many Kurdish organizations were functioning in the city since the 19th century and many are active in 21st century. Despite the demographic and cultural importance of Istanbul for Kurdish culture, there are only few studies on Kurds in this city.
The city of Istanbul is also special due to domination of Turkish culture. Norms and values of the dominating ethnic (Turks) and religious group (Hanafi Muslims) are taken for granted and perceived as cultural universals. This dominance is not restricted only to culture as many Kurds in Istanbul face also economic difficulties. Furthermore the nationalistic ideology of state, which for many years sought to erase Kurdish identity (e.g. by calling them Mountain Turks) can be treated as "predatory identity" in Arjun Appadurai's sense.
Research takes into consideration respondents understandings of Kurdish culture, their histories of migration and attitudes towards the city, its multiculturalism and economic conditions. For the purpose of the research project cultural identity is understood as socially constructed, relative and processual as theorized by John and Jean Comaroff, Stuart Hall and Thomas Hylland Eriksen. Construction of collective identity described by Shmuel Eisenstadt and Bernhard Giesen is also a theoretical framework of the study.
Presented findings will base on 50 in-depth interviews with Young Kurdish migrants from different districts of Istanbul.

Creating a "diaspora" — Transnational events and media by Brazilian migrants in US, Europe and Japan
Angelo Akimitsu ISHI (Musashi University, Japan) | angelo@cc.musashi.ac.jp

In the last decades, there has been a drastic increase in the number of Brazilian migrants around the world — this new "diaspora" is said to totalize 3 million. Transnational networks and connections are increasing among Brazilians living in Japan, USA and Europe. This study examines how the so-called "ethnic events" and "community media" have bridged migrants that share similar concerns but have also diverse and sometimes contradictory interests. I identified 4 types of Brazilian diasporic events (political, cultural, business and media events) and have conducted participant observation and in-depth interviews with organizers as well as attendants of the Conference "Brazilians in the World" (Rio de Janeiro), "Focus Brasil" and "International Press Awards" (Fort Lauderdale, London and Tokyo), "Brazilian Day" by TV Globo network (Miami, Tokyo) and Expo Business (Boston and Nagoya). I argue that these events are deeply interdependent and that the synergy among them — along with the role played by media — has been decisive in the creation of a "diaspora" consciousness. I pay special attention to the case of Brazilians in Japan, who are mostly Japanese-Brazilians and have some significant peculiarities if compared to Brazilians settled in other countries.

Transcultural Education for Transnational Societies: U.S. and Italian Educators' Post-Structuralist Views on Curriculum and Integration
Mariella HEROLD (Northern Arizona University, U.S.A) | Mariella.Herold@nau.edu
Immigration has been a touchstone of the United States’ experience since the country’s founding. The U.S. remains the world’s top destination for immigrants, accounting for about 20% of all international migrants. According to estimates from the 2012 ACS, the U.S. immigrant population stood at almost 40.8 million, or 13% of the total U.S. population of 313.9 million. In Europe, Italy leads other European Union nations in terms of number of immigrants. As of January 2013, there were 4.4 million foreign nationals residents (or 7.4% of the country’s population of 59.3 million inhabitants).

The consistency and complexity of migration fluxes—characterized by the presence of various generations of migrants—in educational systems in Europe requires an urgent examination, particularly, on the type of effective educational models that could integrate student’s cultures and learning styles to the host country’s educational system.

The paper shares the perspectives of Italian educators and school administrators on the new educational challenges facing Italian schools within a new multicultural/multi-ethnic society. Particularly, in an era of new European Union’s integrationist educational policies. Teachers and practitioners who are at the forefront of these changes, share their vision on the most successful models and educational strategies to address the emerging educational challenges.

The study, then, compares the findings to the perspectives of U.S. educators’ regarding best schooling models for immigrant children. The ‘lessons learned’ serve to internationalize the issues, and take a deeper look at educational models that have proven successful.

**RN35S06a - The Inequalities Referring to the Right to Mobility in a Context of Globalization - A**

**Constructing human rights of Roma migrants in France: dimensions of inclusion and globalization**  
Chloë DELCOUR (Ghent University, Belgium) | Chloe.Delcour@UGent.be  
Lesley HUSTINX (Ghent University, Belgium) | lesley.hustinx@ugent.be

Although human rights are widely considered as the instrument ‘par excellence’ to install full and universal inclusion, it is increasingly acknowledged that more analysis is needed to explore the translation of these rights in practice. The human rights situation of Roma in particular calls for such research, as they face many persistent violations of their rights across multiple European countries. Particularly, although the right to mobility is celebrated as a core right of inclusion for European citizens, exclusionary tendencies hinder the practice of this right substantially when it concerns Roma. In order to grasp this human rights practice, we argue that we need to analyze 1) the discursive contestations around human rights and 2) by whom (which actors on which levels) these contestations are steered and dominated. Using this perspective, we look at the case of the evictions of Roma from their dwellings and their expulsions from France in the summer of 2010 (COHRE v. France), for which we analyze how different judicial, political, media and civil society actors on the local, national and transnational level employed and defended multiple meanings connected to human rights and the right to mobility in particular. In this discursive struggle, conflicting norms on inclusion in a globalized environment were balanced and negotiated. This had implications for the outcome of the incident in terms of decision by the European Committee of Social Rights but also in terms of public opinion on the Roma migrants and their inclusion in the local, national and global context.
From "la cebolla" to "la naranja": Romanian Roma families working in agricultural temporary jobs in Spain

Olga SERRADELL (Autonomous University of Barcelona, Spain) | olga.serradell@uab.cat
Teresa SORDÉ-MARTÍ (Autonomous University of Barcelona, Spain) | teresa.sorde@uab.cat
Mimar RAMIS (Autonomous University of Barcelona, Spain) | mariadelmar.ramis@uab.cat

Funded by the Spanish Ministry of Science, the TRANSROMA research project (2012-2015) provides new qualitative fieldwork with Romanian Roma families in Spain and Romania, and explores the strategies that Roma migrants have developed to travel between the two countries, considering the transnational economic and political practices. Understood in the context of other major population movements, immigration of Romanian Roma to Spain is mostly (but not only) a family-based strategy and women are rising as key subjects taking the lead in this endeavour. Drawing from a finalized set of fieldwork, we will focus on analysing the experiences of Romanian Roma migrant families working as agricultural temporary workers in the regions of Cuenca and Albacete, and whose way of making a living involve travelling from one season to another, that is from "la cebolla" (the onion season) to "la naranja" (the oranges season). These families' views, interpretations and life worlds are in contrast with the meanings and social representations of the group, which have been increasingly racialised. Based on the Communicative Methodology (CM), data analysis has been conducted following the double axis of transformative dimensions (contributing to overcome discrimination) and exclusionary dimensions (those reproducing it). The paper will be centred in exploring both dimensions shedding light to strategies involving sharing, solidarity, resistance and collective grassroots organizing. The project main findings bring about new lights to existing knowledge by proving wrong the thesis which portrays Roma constituencies as victims who are resigned to their destiny.

Living on the borders: exploring the tactics to live of undocumented Brazilians in London.

Gustavo DIAS (Goldsmiths College - University of London, United Kingdom) | tentonidias@hotmail.com

This paper attempts to discuss how Brazilians living in London have struggled and dealt with inner borders after their visa overstay (Balibar 2007, Mezzadra and Neilson 2013). Economic Brazilian migrants tend to enter into the United Kingdom holding a general visitor visa for a period up to 6 months (Dias 2014). Nonetheless, empirical findings have demonstrated that the migratory project elaborated by these migrants who moved to London for the purpose of working tend to last between 3 and 5 years. Staying without rights to live and work in the UK is classified as ‘a criminal offence’ by the Home Office. According to the British government such undocumented status can lead to prosecution and removal from the UK (2013). Hence, finding a job and accommodation in London are faced as risky everyday tasks by these Brazilians. In this presentation, I will particularly explore the role played by migrants characterized as Border People (Khosravi 2010). They are long-term migrants highly skilled at producing ‘tactics of border crossing movement’ in order to overcome the precarious livelihood caused by the lack of migratory status (Vila 2000, Mezzadra 2011). Among its tactics two gain more prominence: Becoming Southern Europeans and Living on the move. Producing bogus documents which provide South European identity and also living temporarily in rented rooms managed by other Brazilians are the features of both tactics that will be further discussed in this presentation.
The zero grade of exclusion: studies on the Roma camp
Katia LOTTERIA (University of Salento, Italy) | katialotteria@gmail.com

In Italy Roma identity is the main focus of a complex and specific debate. A case study conducted within the Xoraxane community allow us to understand its weak points. That research was the result of the comparison between different studies. Methods used were: participant observation, in depth interviews, biographies and ethnographic materials. Native people have the cultural and ethnic preconception of associating a gypsy identity to Roma people and wants a few families to act as a community. Those families were from Montenegro, they never met while they were living there and above all they were not gypsy. It's on this basis that a ghetto-camp was built, located in a rural area where they have been living for twenty years. This situation produced the building of false identities (from the point of view of natives) and the strengthening of cultural belonging, partly modified but still existing. Living in a ghetto-camp resulted in Roma exclusion from active social life. “Third generations” Roma people carried out registration to the Register Office, they go to public school, but they have not the visa. Roma child exists only as a parallel citizen thanks to school attendance and due to social service custody, but legally he is not a citizen and also his/her family doesn't exist. Institutional policies, as well as politicians' perceptions, produced false non-identities, discriminating identities and they contributed to build a distance between Roma people and natives with dichotomies such as Roma=crime, Roma=gypsy. However Roma people still preserve and protect their cultural belonging but they changed some aspects: marriage, clothing, a mixed language between parents and offspring.

RN35S06b - The Inequalities Referring to the Right to Mobility in a Context of Globalization - B

The temporal limbo of irregularity and precarious work – Moldovan female migrants working in the domestic care field in Italy as a case study
Olga COJOCARU (Centre of Migration Research Warsaw, Poland) | o.cojocaru@uw.edu.pl

The proposed paper is intended to examine the temporal peculiarities of the transient irregular nature of Moldovan migration to Italy in the past decade. More precisely, it seeks to document how legal status and certain work conditions under the framework of a certain migration regime produce specific temporalities and affect migrants' agency/capacity of decision making. It will do so by analyzing the interplay of various time categories (Cwerner 2001) and their impact on the migration experience of Moldovan female domestic workers in Italy. Following Robertson's conceptual framework (2014), various migrant time tracks across intersecting timescales will be examined: at the macro level – the temporal constraints imposed by the state/immigration controls on the migrant, at the meso level – the temporal specifics derived from the very nature of the domestic labour, and at the micro level – the life course of each migrant. Based on the survey of relevant previous studies and preliminary fieldwork data, this endeavour will document migrants' strategies to cope with uncertainty and potential time pathologies (excessive time, idleness, temporal deadlock, boredom, prolonged waiting, stasis etc), their tactics of resynchronization with the family back home as well as their negotiation between multiple temporalities.
Inequalities, mental well-being and anti-immigration views across EU regions and countries: defusing political propaganda.

Paola Eleonora SIGNORETTA (Department of Social Sciences, Loughborough University, United Kingdom) | p.e.signoretta@lboro.ac.uk
Piet BRACKE (Department of Sociology, Ghent University, Ghent, Belgium) | piet.bracke@ugent.be
Veerle BUFFEL (Department of Sociology, Ghent University, Ghent, Belgium) | veerle.buffel@ugent.be

Issues of immigration and its impact on majority communities across host countries of the European Union (EU) are highly contentious. Moreover, these issues are often hijacked by European political parties across the political spectrum. To redress the immigration debate, this paper focuses on the role that inequalities have in shaping views of immigrants in EU host countries.

While issues of mental well-being among immigrants have been the focus of recent research work, there is a dearth of studies on the association between views of immigration and the mental well-being of majority communities in EU host countries and regions. Within the context of a political economy perspective, this study hypothesizes an association between (poor) mental well-being and (negative) views of immigration at the individual level which is explained by (high) regional income inequalities and individual (un)employment status. In order to test this hypothesis, this work uses a combination of multilevel modelling and spatial analysis and secondary datasets, including the European Social Survey, the European Quality of Life Survey and Eurostat.

The findings emerging from this paper will contribute to a better understanding of the role of regional inequalities in explaining the association between the mental well-being of EU majority communities and their views of immigration. In addition, this understanding can be used to defuse political propaganda by providing strong evidence on which to build a more constructive debate on immigration issues.

Social rights and gendered experiences of refugee and migrant women in Turkey

Pinar OKTEM (Independent Researcher, Turkey) | pinaroktem@gmail.com
Ayse Emel AKALIN (Independent Researcher, Turkey) | emelakaln@yahoo.com
Ayca GELGEC BAKACAK (Hacettepe University, Department of Sociology, Ankara, Turkey) | abakacak@gmail.com

This paper addresses unequal opportunities that immigrant women in Turkey have in terms of access to health, education, employment and social life. Turkey has been a transit country for immigration to Europe, due to EU’s strict migration policies, and has become a destination country, with the recent conflicts in the region. Turkey’s immigration and refugee policy is based on the ‘geographical reservation’ in the Geneva Convention, thus non-European persons are not accepted as refugees. Migrants with different legal status - such documented or undocumented migrants, ‘conditional refugees’ and people under ‘international protection’ – all face with various forms and levels of inequalities, due to both the inadequacy in legislative framework and discrimination at micro and macro levels. Women disproportionately bear the burden of these inequalities.

Based on a fieldwork conducted in three cities between August-November 2014, this study determines the extent to which immigrant women could enjoy their human rights in Turkey. Participants were 41 women, having different immigration status, coming from 18 different countries - Western, Eastern Asian (Iran and Irak), African and former Soviet Union countries. Data were analysed comparatively, using NVivo software.
Results indicated multi-dimensional and multi-layered inequalities that immigrant women face, mostly in terms of institutional discrimination, deprived work and living conditions and poor access to healthcare. Experiences varied according to women’s country of origin, legal immigration status, race, religion, economic, employment and marital/partnership status and access to social networks and NGO support. Results are discussed in relation with the inadequacy of legislative and policy frameworks and with the gendered dimensions of migration.

**The impact of immigration policy on irregular immigration**  
Liv BJERRE (Berlin Social Science Center (WZB), Germany) | liv.bjerre@wzb.eu

In a globalized world, irregular immigrants fall short of opportunities being awarded last place in the hierarchy of mobility. Unable to obtain a valid visa, irregular immigrants often ends up in precarious life situation deprived of basic human rights. In addition to human rights concerns, the common belief that irregular immigration undermines the rule of law, fosters labour exploitation, increases poverty and puts pressure on public services has put policy makers under pressure to try to reduce irregular migration. In their attempt to curb irregular migration, a variety of different approaches have been applied by the individual EU member states – from granting of regularisation to tightening border control and selective immigration. Yet, an estimated 1.9 to 3.8 million irregular foreign residents lived in the European Union in 2008, and the effects of immigration policy are still not known. This paper closes this gap by studying the impact of immigration control policies on irregular immigration. So far, comprehensive, comparative analyses have been hampered by the lack of data. By use of the newly developed Immigration Policies in Comparison (IMPIC) Index and three different measures of irregular immigration, I will study the effect of both internal and external immigration control policies enabling me to answer the question: What works? The paper hereby contributes to the research on the impact of immigration policy needed to ensure the necessary level of knowledge in order to make sure that policy initiatives have the intended effects and to help alleviate exploited migrant’s situation.

**RN35S07a - Policing Ethnicity: Between the Rhetoric of Inclusion and the Practices and Policies of Exclusion - A**

**Policing reproductive bodies: the moral panics and border management of “birth tourism” in the US**  
Tingyu KANG (National Chengchi University, Taiwan) | tykang@nccu.edu.tw

Birth tourism is an emerging phenomenon in North America. From China, South Korea, Turkey to Mexico, pregnant women seek to sojourn in North America, California in particular, in order for their offspring to be born in the destination country and receive its citizenship. This study is based in Los Angeles. It adopts semi-structured interviews and participant observation with birth tourists, maternity hotels for birth tourists and relevant authorities. While the central government adopts a relatively neutral and inclusive discourse when commenting on this phenomenon, the findings of this paper identify surveillance of the birth tourists’ reproductive bodies in many forms. These pregnant women are subject to the policing gaze of state, civil society and family. Firstly, with regard to the state, the border management authority scrutinizes travelling women’s reproductivity and categorizes reproductive women according to their nationality and class. Secondly, civil society associations also work with local city authorities to monitor the daily
spatial experiences of the pregnant birth tourists in LA. City authorities are urged to conduct additional checks on the maternity hotels for birth tourists, thus creating two more actors participating in the surveillance of birth tourists’ bodily mobility. On the one hand, maternity hotel owners seek to limit the birth tourists’ spatial mobility to primarily privatized, consumers’ spaces. On the other hand, the family members of birth tourists reproduce the policing discourse of the state by discouraging these women from exploring the public space in the destination country based on the discursive construction of reproductive women’s vulnerability and the perceived hostility in LA.

Non accompanied minors. Active subject of their process? Not yet...
Karmele MENDOZA (Universidad Autónoma de Madrid, Spain) | karmele.mendoza.perez@gmail.com
Ione BELARRA (Universidad Autónoma de Madrid, Spain) | i.belarra@gmail.com

In our presentation we analyse the data collected through ethnographic research conducted in Bizkaia (Spain) in a Centre for “Non Accompanied Minors” (MENA in its acronym in Spanish). We explore how “Non Accompanied Minors” from Morocco are still being understood as minors who migrate alone and as a problem for the Care System that protects the rest of Biscayans minors. “Non Accompanied Minors” are comprehended as migrants to control, more than minors to protect. In Bizkaia they are taken apart from the ordinary Care System for Minors and hosted in institutions that do not incorporate their agency and treat them as objects more than as subjects. This obsession to control those minors is also palpable in how the State manipulate minors’ dependency or autonomy through social policies and political agreements, in the long run increase the tendency of minors to end on exclusion context.
In this work we theorize that “Non Accompanied Minors” are actors in constant struggle with the Alien Act and Minor Protection Act. These Acts shape their everyday life, in greater extent than other people lives, in and out the institutions where they are hosted. The Acts even penetrate the relations with their parents, their migratory processes and their vital aims. We illustrate how these laws and other structural factors limit their actions and agencies and push them into exclusion contexts where they can make decisions and act, even though their futures are most times compromised in them.
Through this work we return back the focus to minor’s agency and help to construct them as social actors full of capacities and empowerment. Using a participative methodological proposal we think that a new conception of minors as crucial migratory actors can be reached.

The biopolitical function of HIV and TB screenings in migration policies
Dennis ODUKOYA (LMU Munich, Germany) | odukoya@soziologie.uni-muenchen.de

The testing and screening of migrants for infectious diseases, such as HIV and Tuberculosis (TB), is a common practice in many European countries. As a public health measure, these practices constitute a technology of population surveillance and control and can be understood as a biopolitical function of migration regimes. The actual procedures in place, as well as the specific groups affected, vary between different national contexts. Using the examples of HIV and TB related screening of migrants in Germany and the United Kingdom, these practices can be analyzed as power effects derived from a complex interplay of legal, political and public health discourses, in which migrants are constructed as a danger to the health of nationally defined populations. Although screening is routinely performed in both countries, it remains a contested terrain. There are ongoing controversies over the ethical implications of mandatory screening practices. Furthermore, they divert from official recommendations by national and international organizations, such as the WHO and UNAIDS. These recommendations
emphasize the principle of voluntary counseling and testing, especially in the context of HIV. The discourse analysis presented in this paper contributes to this discussion and critically reflects on the medical screening of migrants as both a public health measure and an integral part of asylum and migration policies.

Neoliberal Citizenship and the Policing of Migrants
Gwyneth LONERGAN (University of Manchester, United Kingdom) | gwyneth.lonergan@manchester.ac.uk

Immigration enforcement has been a key concern of the current UK government, and the policing of migrants has become central to this. In order to, in the words of Theresa May, the Home Secretary, create a ‘hostile environment’ in the UK for ‘undesirable’ migrants, the policing of migrants has both widened and intensified. Landlords must now check a potential tenant’s immigration status; frontline NHS workers are expected to determine a patient's immigration status and charge migrants 'not settled' in the UK for their care. However, not all migrants experience this policing in the same way, as it is a highly gendered, racialised, neoliberal project. Gendered constructions of women as reproducers of the nation (Yuval-Davis 1997) can be seen in the singling out of pregnant women migrants as potential abusers of the NHS (https://www.gov.uk/government/news/ extended -nhs-charging-for-visitors-and-migrants). Similarly, whether or not a migrant is asked to produce identification by a landlord, health worker, or other authority will depend, at least in part, on whether she is perceived as 'foreign', an concept which, as Bikkhu Parekh (2001) among others has pointed out, is heavily racialised in the UK. Finally, this policing exacerbates the divide between 'desirable' migrants, who can afford the private health insurance, and can meet the increasingly neoliberal requirements of settlement in the UK, and all others. Consequently, this paper will argue that the policing of migrants is not merely about securing national borders, but about reinforcing gendered and racialised discourses of neoliberal citizenship.

RN35S07b - Policing Ethnicity: Between the Rhetoric of Inclusion and the Practices and Policies of Exclusion - B

Policing Borders through Cooperation in the Baltic Sea Area
Sophia YAKHLEF (Lund University, Sweden) | sophia.yakhlef@soc.lu.se
Goran BASIC (Lund University, Sweden) | goran.basic@soc.lu.se

This study focuses on the collaboration project Turnstone that is partly funded by the EU. The project is a joint collaboration among border organizations in Estonia, Finland, Latvia, Lithuania, and Sweden, aiming at preventing trans-boundary criminality. The abolition of EU internal borders and the implementation of the Schengen regime have entailed different methods of controlling European borders and border crossings. Borders previously guarded by passport controls must now be monitored through border officers relying on international cooperation. The present study focuses on how officers collaborate in their day-to-day management of border guarding, taking into consideration the different social and cultural backgrounds of the project participants. To these ends, this qualitative study is based on empirical material gathered from interviews with, and field observation sessions of officers working at the Baltic Sea border agencies. The preliminary findings suggest that, although collaboration is burdened with bureaucratic difficulties, there is a common understanding of purpose among the project participants. These border officers’ common declared objective is to fight criminality and create
a safer Europe. However, the participants, possessing different organizational and cultural backgrounds, have to adapt to and adopt a common language (in officers’ terms EU-English), common schemes of categorizing (inside-outside distinctions), and develop a sense of trust and identity. Collaboration, it is claimed by the informants, is best achieved through getting involved in everyday practices, working side by side, and spending free time together, rather than through following bureaucratic rules and regulations.

Riccardo ARMILLEI (Deakin University, Australia) | r.armillei@deakin.edu.au

Both Australia and Italy are increasingly major destinations for asylum seekers arriving by boat (respectively from South East Asia and North Africa). Usually these people are described as ‘waves’, ‘illegals’, ‘terrorists’, which are all terms that tend to dehumanize them. The policies adopted by these two countries have been highly criticized by a number of international organizations, NGOs and scholars. The volume of the claims recorded in Australia and Italy is below those of many other industrialized and non-industrialized countries. Nevertheless, despite asylum seekers constitute only a small percentage of the entire national populations, there is a clear tendency to address this issue using a ‘moral panic-oriented approach’ which requires the implementation of highly restrictive immigration policy measures (e.g. the practice of repelling boats carrying asylum seekers).

Australia and Italy are signatories of the 1951 Refugee Convention and of the 1967 Protocol Relating to Refugees. Despite the international agreements and the obligations under international human rights law, the solutions that over the years the Australian and Italian governments adopted in order to honour them have raised concerns among the international community. The aim of this study is thus to investigate the way ‘boat people’ are constructed as a pervasive threat to national security by the Australian and Italian governments. In particular, the following research hypothesis has been formulated: politicians refer to the idea of national ‘insecurity’ to be able to convey their political will and to implement authoritarian measures. As theorised by Agamben in 1998, with every extension, emergency measures tend to lose their initial provisional character morphing into a ‘permanent political category’, a measure designed to contain a problem rather than solve it once and for all. The research aims include the verification of this hypothesis along with the investigation of related issues.

(Re)visiting control devices in the context of immigration control policies. Practices and experiences from the detention centre for migrants of Barcelona.
Tatiana LÓPEZ GONSÁLVEZ (Universidad de Barcelona, Spain) | tatianalopezgonsalvez@gmail.com

The immigration detention centers are a cornerstone of anti-immigration EU policies. This centres are often pointed as unlawful places where there's a lack of transparency and the rights and freedoms of inmates are repeatedly violated. This paper will show how these rights are deprived in the specific case of the Immigration Detention Centre of Barcelona. To address this objective we will report some of the situations found in an ethnographic observation carried out from December 2013 to May 2014 together with the Campaign “Tanquem els CIE” (Campaign to Shutdown Immigration Detention Centers) of Barcelona. This Campaign is aimed at visiting the inmates to monitor the detention centre, denouncing the lack of transparency, the living conditions and also the very existence of these institutions that administer such practices against foreigners without papers.
The results of this research will show on the one hand, the general living conditions in this detention centres but also exceptional situations such as some episodes of violence. On the other hand, it will show the role of the organized civil society preventing the impunity of this state discriminatory device where only migrants waiting for their deportation could be deprived of freedom. Finally, we conclude revisiting the meaning of the institution in relation with the different situations that take place within.

**Border multiple, multiple borders: Registering foreign-born persons in Finland**

Marja ALASTALO (University of Eastern Finland, Finland) | marja.alastalo@uef.fi
Anitta KYNSILEHTO (The Nordic Africa Institute, Sweden) | anitta.kynsilehto@nai.uu.se

This paper discusses multiple borders and bordering practices that emerge and are enacted through an array of residence registration practices. In Finland residence registration is linked with the access to social rights as a resident in a given municipality. These practices extend to the country of departure and take place upon arrival and settlement within a municipality. The registration process may continue for years depending on the administrative positioning of the person vis-à-vis a given state and locality within that state. Building on critical border studies and ethnographic research on state bureaucracy we analyse our data gathered via multi-sited ethnography on registration of foreign-born persons in Finland. We argue that residence registration as a scattered border practice enacts different statuses for foreign-born persons and orders them hierarchically depending, for example, on the person’s migration status and nationality (EU/TCN). Furthermore, multiple regimes of knowledge production such as statistics on migrant population draw on the data recorded in the population register during the residence registration process. We show how the welfare state system that is claimed to be universal is indeed highly conjunctural depending on the person’s contacts and information received from different interlocutors and on the “policy on the fly” enacted at the registration desk. In so doing, the paper addresses questions concerning the regulatory practices that modify and indeed reinforce inequalities between foreign-born persons.

*The Impacts of Social Networks, Biographical Resources and Institutional Constraints on Transnational Marriages: Marriage Migration to Germany by Men from Morocco and Turkey*

Anil AL REBHOLZ (Okan University, Turkey) | anil.al@okan.edu.tr

Though the “imported brides” is a much discussed phenomena in the migration literature, there has been done little research on the “imported grooms”. Focusing on Turkish and Moroccan male migrants, who could migrate to Germany through marriage with a female descendant (second or third generation) of migrant families resident in Germany this paper aims looking at relations of inequality and power structures prevailing in intra-ethnic marriages. The marriage migration should be understood as a subtype of family-led migration (Kofman 2004), and in this sense it entails a gendered migration experience (Beck-Gernsheim 2007). Regarding the asymmetrical power relations and different stocks of knowledge between couples (for example with respect to the organization of work and social life in the receiving society, citizenship status of the migrating groom, knowledge of the language of the receiving society, educational level, family background, class affiliation, different types of gendered socialization norms in sending and receiving societies, and hegemonic norms regarding the different cultural, ethnic and
religions identities dominant in the receiving society) it is to expect that manhood and womanhood will be re-negotiated between the marriage partners in migratory processes. Drawing on social network analysis perspective on migration and theories on the exchange of resources, I want to focus especially on constraints, problems but also the chances which the male migrants might face in different spheres such as work, family, and social life in migration process. The paper is based on the biographical- narrative interviews conducted with Turkish, Kurdish, Moroccan male migrants and with their wives.

The emergence of a transnational habitus in the German-Turkish space
Margit FAUSER (Bielefeld University, Germany) | margit.fauser@uni-bielefeld.de
Nur Yasemin URAL (Ecole des Hautes Etudes en Sciences Sociales (EHESS)) | nur-yasemin.ural@ehess.fr

RN 35, Sociology of Migration, Session 8, Family dynamics and inequalities in migration, organized by Muriel Dudt, Elise Pape and Catherine Delcroix
The emergence of a transnational habitus in the German-Turkish space
Margit Fauser, Bielefeld University & Nur Yasemin Ural, Ecole des Hautes Etudes en Sciences Sociales (EHESS) and Bielefeld University
Abstract
For over more than sixty years migrations between Turkey and Germany have led to the emergence of dense and stable transnational spaces through the familial and social relations that people maintain across the border. Up until today economic, cultural and political exchanges take place and continuous spatial mobility occurs within this transnational space. A transnational perspective on migration has pinpointed the transnational spaces that are inhabited by those who move, those who return and those who never migrated yet entertain social ties to those who move across the border. However, when it comes to the dispositions and frames within which a person evaluates her social position the emergence of ‘dual of frames of reference’ has been conceptualized and researched almost exclusively for the migrants. Against this background, we take up the newer discussion on the emergence of a transnational habitus in the context of migration by taking into account migrants, returnees and those with whom both groups stay in touch on either side of immigration or origin.
Drawing on a multi-sited, matched sample of persons interviewed in Germany and in Turkey who are connected through their family ties and transnational exchanges, we attempt to demonstrate how transnational habitus can be understood as a complex and spatially diverging set of dispositions that our varyingly mobile interviewees share across the transnational space. Thereby settled immigrants, return migrants, and non-migrants refer to conditions, structural transformations, opportunities, and barriers in both countries when reflecting on their own and others’ lives, achievements, and failures.

Immigrant families in Italy: inequalities, needs and work-family reconciliation practices
Davide DONATIELLO (University of Turin, Italy) | davide.donatiello@unito.it
Rosy MUSUMECI (University of Turin, Italy) | rosy.musumeci@unito.it
Arianna SANTERO (University of Turin, Italy) | arianna.santero@unito.it
The objective of this paper is to analyse socio-economic and institutional conditions influencing gendered paid work and childcare reconciliation practices of immigrant families with infants or young children in Italy, from the point of view of migrant mothers and fathers. Reconciling paid work and childcare during the transition to parenthood has become a crucial issue in Western countries but little research has been addressed on parenting practices and negotiation processes among immigrant families. In Italy scholars have been interested mainly in transnational families and in "parenting at a distance", while less attention has been paid to "parenthood in place" in the hosting country. Also for the Italian context, far from being completely gender equal, it seems to be crucial to investigate problems experienced by immigrant women and men in reconciling work and family (domestic and care work), given their specific position in the social structure of their country of arrival, in order to understand whether and under what conditions the integration process of parents and children develops.

The paper is based on a qualitative analysis of semi-structured in-depth interviews addressed to: i) dual-earner couples in transition to first parenthood, interviewed before and after about 1 year and a half the child's birth (I wave n=18, 9 couples); ii) parents with children 0-6 years old (n=20). For both the groups, the main parents' countries of origin are: Morocco, Peru, Romania, three of the most numerous national groups in the territory considered (North-West Italy), with different legal status (EU and non-EU citizens).

The Social Consequences of Labor Migration to Europe: The Transformation of a Village in Turkey
Yelda OZEN (Yildirim Beyazit University) | yeldaozen73@yahoo.com

Based on face-to-face, in-depth interviews with agricultural workers and oral history with the elderly residents of a village in Ankara, this paper aims to explore how labor migration from rural areas in Turkey to European countries (especially to Germany) has transformed rural life in Turkey, including the demographic structure, family dynamics, gender roles and the structure of rural work. Labor migration from Turkey to Europe started in the early 1960s with bilateral labor recruitment treaties. During the recruitment period between 1961 and 1973, there was a mass migration specifically to Germany. Although it was expected that the migrants would be “guest workers” planning to return eventually to their homeland, they have become permanent residents of Germany. After the ban on the recruitment of foreign labour in 1973, migrants from Turkey and those who wanted to migrate sought ways to migrate and stay in Germany via asylum seeking, tourist visa applications, naturalization, family reunification and marriage. The initially planned return migration never took place.

In general, international migration literature in Turkey has focused on the various aspects of migrants' life abroad, the migration process, and reasons for migration, but not sufficiently on the social consequences that labour migration has had on the homeland. Therefore, in order to gain a better understanding of the social transformation in Turkish villages following mass labour migration to Europe, observations were carried out in a village in Ankara (capital of Turkey).

RN35S08b - Family Dynamics and Inequalities in Migration - B

Re-contextualising cross-border marriages of second generation migrants: Between transnational subjectivities and exclusive stigmatising contexts
Janine DAHINDEN (University of Neuchâtel, Switzerland) | janine.dahinden@unine.ch
Joëlle MORET (University of Neuchâtel, Switzerland) | joelle.moret@unine.ch
Shpresa JASHARI (University of Neuchâtel, Switzerland) | shrpesa.jashari@unine.ch

Based on an on-going qualitative study, the presentation will investigate the conditions under which second-generation migrants in Switzerland engage in cross-border marriages. By applying a transnational and gender perspective, together with a boundary work approach towards ethnicity and family, the paper highlights the influence of the specific political, legal, social and discursive contexts in both the country of residence and the country of origin in shaping migrants’ and their children’s strategies of marriage and partner choice. The study focuses on second-generation migrants whose parents come from a non-European country and whose partner had not been living in Switzerland until then and whose marriages are highly stigmatized in Switzerland (for example considered as ‘forced’ or sham marriages, as a sign for ‘non-integration’ etc.). Based on biographical case studies, the paper argues that external categorisations, stigmatisation and culturalisation processes experienced by migrants and their children in Switzerland participate in creating particular practices and representations about ethnicity, gender and family. In this light, cross-border marriages can be understood, at least partially, as related to subjectivities developed by actors confronted with a specific, stigmatizing, exclusive context. They are a way of strategically dealing with different forms of inequalities and exclusions and an attempt to socially position themselves.

Polish mothers in Ireland- A study of the role of social networks in managing care and employment
Sara BOJARCZUK (Trinity College Dublin, Ireland) | bojarczs@tcd.ie

This research aims to explore the role of social networks (local and transnational) in supporting working Polish mothers to combine care duties with employment in Ireland. The study compares the experiences of single and coupled mothers and investigates the functions, structure and mobilization of their support networks. The weak ties of friendship have proven of utmost importance for migrants in the host country. While weak ties available immediately for local support can be based on obligation, direct exchange or friendship- strong ties often become a virtual ties providing emotional and at distance support. This project investigates how migrant mothers structure their social networks in Ireland transnationally and locally, during the key life transitions such as migration, becoming a mother in the host country (and/or single mother) and returning to employment. To examine migrants’ experience and provide comparative and systematic insight, this research incorporates semi-structured interviews and maps of ego-centric social networks built around the support and childcare organisation. Interviews inquire about everyday practices and experience of being a migrant mother in Ireland. A map, as visual and participatory tool will systematically explore complex relationships with other people and family members.

The results of this study will allow the better understanding of the specificity of new migrant families in Ireland and to contribute to the knowledge of migrant networks. It will also enable more detailed understanding of the challenges faced by migrant mothers who want to return to employment.

Preferred partnership type for own children: changing attitudes within Turkish migrant groups
Amelie VAN POTTELBERGE (Ghent University, Belgium) | amelie.vanpottelberge@ugent.be
John LIEVENS (Ghent University, Belgium) | john.lievens@ugent.be

Literature, studying the dynamics of partner selection in migrant groups, describes a preference for a transnational partnership rather than one with a local co-ethnic partner among first and
second generation migrants. Individual preferences and several structural/contextual factors are known to explain this trend, next to the extensive parental influence in the process. Parents prefer a partner from the country of origin because of the believe they would be a better (cultural) fit for their children. Additionally, a strong feeling of commitment to the community of origin and possible obligations to kinship are important factors. However, Belgian register data shows that the proportion of Turkish migrants in a transnational partnership has dropped from 60% in 2001 to 40% in 2008. Register data, however, does not provide the needed in-depth information to test why this trend occurs. We use recent survey data that provides detailed information on the motives and social context of partner selection in Turkish migrant groups, living in Flanders. We look at which preferences second generation Turks have concerning future partners of their children, and the possible influence of their own type of partnership, the gender of the child and other socio-demographic and attitudinal characteristics. Preliminary results show a changing emphasis from the residence to other characteristics of future partners. It’s possible that the awareness of possible negative effects of transnational partnerships or a decline in commitment to the community of origin, guides the traditional marital practices into a new era, resulting in new traditions and relations.

Social Positioning and Discourses on Family Life: Viewpoints of Parents and Children with Immigrant Backgrounds in Finland
Marja PELTOLA (Finnish Youth Research Network, Finland) | marja.peltola@youthresearch.fi

In the culturally diverse societies of Europe today, family relations are interpreted and organized in diversified ways. However, the institution of family involves plenty of norms and regulation, which work in classed and ethnicized ways, giving priority to middle-class, white and heterosexual nuclear family life. Public discussions on families with immigrant background tend to use homogenizing discourses that emphasize risks and problems. An assumption present in these discussions is the susceptibility to conflicts, due to the generational and gender-based differences in accepting the 'new culture' and its practices.

In my presentation, I focus on the discursive strategies used by family members – both parents and their children of different ages – with immigrant backgrounds in Finland, when speaking about their family lives. Concentrating both on idealized descriptions of families and narrations on conflicts, I argue that the discourses used are shaped by the interviewees’ awareness of the problem-centered nature of public discussions, and while reflecting the real life experiences of loyalty and conflict, they also act as a tool for claiming more respectable social positions in the Finnish society.

Methodologically, I combine individual and group interviews with families with heterogeneous (minority) ethnic backgrounds in metropolitan area of Helsinki, thus also shedding light on how the interview composition influences the topics brought up and discourses used. The presentation draws from my PhD thesis Respectable families – Immigration, Generations and Social Position (in Finnish, Peltola 2014) and the themes of the research project Generational negotiations, social control and gendered sexualities.

RN35S09 - Migration and Multiculturalism: Making Sense of the Popular Politics of Resentment

Everyday practices and the role of sociologists
Karin PETERS (Wageningen University, Netherlands, The) | karin.peters@wur.nl
Anna HOROLETS (University of Gdańsk, Poland) | labusia@yahoo.com
Monika STODOLSKA (University of Illinois at Urbana-Champaign, US) | stodolsk@illinois.edu

In academic and societal discussions, stances on migration and multiculturalism are increasingly framed by rhetorical claims regarding what the right norms and values are supposed to be. In these discussions, tolerance and freedom of speech are not value free or neutral concepts but rather defined by the rules of dominant groups. The points of view of other groups are largely overlooked. The dilemma then is how academics should take into consideration the voices of subaltern groups without being drawn into the conflict-centred view of migrant-mainstream population interests. Some of these minority groups (e.g., ethnic minorities) might be active in debates about migration and get mobilized to advance their social, political, and economic interests. Moreover, the workings of migration regimes draw attention (1) away from deficiencies of a broader system of social, political, and economic relations and (2) closer towards inter-group conflict.

Discussing everyday practices with residents of multicultural neighbourhoods provides insights into the ways in which people position themselves inside and outside of the majority populations. It also informs our understanding of the ways in which migrants deal with issues surrounding identity, belonging, and the processes of inclusion and exclusion. However, being involved in these discussions also puts researchers in an ambiguous position. First, on the one hand, they give voice to minority populations, but, on the other, risk reproducing group thinking and focusing more on inter-group differences than on similarities. Second, in interviews with migrants and non-migrants dominant discourses are both produced and reproduced as well as challenged. These issues should be taken into account and reflected in the methods researchers use. Their limitations should also be acknowledged and discussed.

In this paper we will address these topics by reflecting on our own research practices and experiences. Questions to be addressed include: Do contemporary social scientists have a chance to ‘appear’ in public discourse? Are their voices valued? In which roles are academics framed by migrants and the mainstream population? How the commercialisation of academia influences these perceptions? How research methods can be adjusted to address the challenges posed by these perceptions and framings of the academics’ roles? What are the risks of reproducing stereotypical images?

“"I am a little racist but….": the new normal in talking about migration in Greece?
Maria XENITIDOU (Democritus University of Thrace, Greece) | M.Xenitidou@surrey.ac.uk

Title: “I am a little racist but….": the new normal in talking about migration in Greece
Maria Xenitidou (Democritus University of Thrace, Greece)

This paper aims to contribute to the stream of studies which have been conducted in the past two decades sparked by the presence of immigrants from Central and Eastern Europe and the former Soviet Republics, and, post-2005, from North Africa, South Asia and the Middle East in Greece, and, mainly, to the discourse on negotiation of identities, for both the ‘indigenous’ population and for the ‘immigrants’. In the past few years, the everydayness of Greece ‘in crisis’, a new citizenship law, public discourse that associates unemployment to immigration and the rise of the extreme right have been added to these dynamics. This paper discusses the lines of argument identified in the ways in which indigenous and non-indigenous residents in Greece negotiate (Greek) citizenship in the context of ‘the current situation in Greece’. The research is based on semi-structured individual and group interviews with indigenous and non-indigenous residents (N=50) of Thessaloniki in Greece. These were analysed based on the premises of rhetorical and critical discursive social psychology, focusing in particular on regularities in the arguments developed. The emphasis in this paper is on the ways in which research participants – indigenous and non – manage accountability in arguing for stricter migration and citizenship policies in Greece. In negotiating access to Greek citizenship and to residence in Greece, I note
that both indigenous and non-indigenous participants engage with extremist discourse in various ways, normalizing the language of prejudice and discrimination othering ‘others’ through making distinctions between migrants of different origin, between first and second generation immigrants, and between ethnic and civic belonging. We focus on the content and rhetorical structure of these distinctions, the common places around which they develop and their function in negotiating inclusion and exclusion.

**Post-multicultural societies, political activism and imaginary futures**

Suvi Päivikki KESKINEN (University of Turku, Finland) | suvkes@utu.fi

During the last decade, retreat from multiculturalism and othering narratives of Muslims and non-western minorities have characterized media and political discussions in many European countries. Racialized minorities have been framed as problematic outsiders that live in ‘parallel societies’ and enhance illiberal cultures, exemplified by the perceived subordination of women and homophobia in these communities. In such debates, notions of gender equality and sexual freedom have become boundary markers not the least in the Nordic countries that build their national identities on being world-champions in achievements in gender equality. This presentation focuses on political activism by women who identify as or are categorized as Muslims or non-western minorities. It analyzes how the activists seek to provide alternative narratives and question the hegemonic discourses of racialized femininities, masculinities, sexualities and communities circulating in the society. Based on interview and social media data gathered in Denmark, Sweden and Finland, the paper will discuss how activists (re)frame women’s rights, communities, belonging and national histories, as well as how political futures are re-imagined in activism. Building on an understanding of political imagination as both individual and collective, the paper will analyze the relationship between individual and collective elements in political activism.

**An agreed segregation. Franco-Spanish cooperation in policing Spanish immigrants' politicizacion**

Michele D'ANGELO (Universidad Autonoma de Madrid, Spain) | michele_dangelo@ymail.com

The paper intends to analyse the Spaniards marginalization’s dynamics in France in the 1960s and 1970s. Even though the migratory experience was presented by both countries as a source of cultural enrichment, we will see how the will of political and social exclusion of those workers in the French context was shared by both administrations. For Spanish dictatorship, it dealt with avoiding ideological “contamination” by the host country, while France took care to grant itself a cheap and docile labour force. These goals were reached through an intervention on the welfare – recreational side on one hand, and on the labour one on the other. Spanish consulates organized parallel welfare and leisure services, which made the Spanish community to withdraw into itself. At the same time the respective migration authorities, the ONI for the French side, and the IEE for the Spanish, took care to direct the Spanish workers toward enterprises like Citroën and Simca – Chrysler where, as we will see, union freedoms were heavily constrained by a paternalistic enterprise management and by the cumbersome presence of the enterprise labour union: CFT. In addition, within the factory, Spanish workers use to bear the functions of ouvrier spécialisé or manoeuvre, that is: semi – skilled worker or labourer that were the lowest levels in the enterprise hierarchy. This meant a spatial segregation within the factory too. At the same time was also a negative reinforcement to the xenophobic drives showed by the French working class as the trade unions CGT and CFDT denounced.
RN35S10 - Refugees’ Everyday Life Worlds and the Production of Societal Inequalities in Europe

Chechen Refugees’ Employment Trajectories. Escape and Asylum Procedure as a Double Biographic Caesura
Sabrina LUIMPÖCK (University of Vienna, Austria) | s.luimpoeck@gmail.com

The current PhD-Project is on employment histories of Chechen refugees in Austria, who had been granted asylum more than three years ago. Forced migration often entails a breaking off of employment and education in the country of origin, which marks a first biographic caesura. Difficulties regarding language, recognition of qualifications and exclusion from the labour market during the asylum procedure represent the second caesura in the country of arrival. Despite these disruptive life events, the migration process can also bring continuity into biography and escape can even function as a problem-solving caesura (Breckner, 2009: 277, 353). This perspective refers to Thomas’ and Znaniecki’s (1918-1920/1923) path breaking work “The Polish Peasant”. Yet, it has to be considered that this view on migration implies a focus on capabilities, and Breckner’s study is based on interviews with refugees from former communist countries. Refugees who had fled to Western Europe before 1989, experienced to some extent a feeling of being welcome. However, the frame conditions in the countries of arrival have changed significantly within the last two decades in nearly all Western European countries (McLaughlin, 1999). Changes in the political discourse on refugees have been especially visible in the Austrian media coverage and asylum seekers have been depicted as a threat to national security (Zierer, 1998). Most refugees from Chechnya arrived after 2000 and faced other conditions during the asylum procedure regarding social exclusion and segregation, which has implications on the search for work after being granted the right to stay.

Today’s situation of asylum seekers is characterized by organized desintegration (Täubig, 2009), by processes of segregation and racist marking due to accommodation centres in peripheral areas (Pieper, 2008) as well as by bureaucratic labelling linked to a confinement of asylum seekers’ mobility within the country of arrival (Witteborn, 2011). In Austria asylum seekers can lose their aid money when leaving the assigned accommodation or the federal state for an extended period. Furthermore, they are factually excluded from the labour market and the educational system during the asylum procedure, which can last for years.

Due lack of opportunity for interaction with the local population, an image of the asylum seeker as the total other is created because of missing contact with the local population, which facilitates racist feelings of threat (Ahmed, 2004; Ha, 2014). Thus, it can be assumed that refugees’ networks consist almost only of contacts with their own ethnic group and, to a large extent, of transnational contacts – even after their recognition. This has a large impact on job-seeking, as literature (Putnam 2007, Cederberg 2012) refers to the important role of networks for the activation of social capital for job hunting.

The ‘enforced idleness’ during the asylum process almost certainly brings about similar consequences as long-term unemployment, which have been studied decades ago (Jahoda, Lazarsfeld, & Zeisel, 2004 (1933)). It seems contradictory that refugees – after being granted asylum – are facing expectations of the receiving society to quickly access the labour market. They only receive so-called ‘Grundversorgungsleistung’ (basic services for asylum seekers) up to four months after being granted asylum. Up to now, refugees’ perspectives on challenges connected to (un)employment and the role of their social networks have been rather neglected in research. In order to find out, what refugees interpret as a successful or failed access to the labour market, an interpretative research design is required. A combination of narrative biographic interviews with unstructured egocentric network drawings facilitates the finding of
answers to questions regarding biographic breaks and their overcoming by making use of social networks. By using biographic case reconstructions, a contrasting comparison shows if escape can function as a problem-solving caesura in their employment histories, and the analysis of the collected network drawings will allow an interpretation of the role of network contacts for job-seeking. The analysis of narrative interviews as recommended by Rosenthal/Fischer Rosenthal (2000) allows a comparison of the difference between narration and actual living circumstances. The combination of biographic case reconstructions with a qualitative content analysis, as already field-tested by Vavti (2010), can identify and contrast interesting text passages regarding working life of different interviews.

Preliminary findings point to the underestimated role of operators of small accommodations for asylum seekers for finding their first jobs. Furthermore, biographies show that escape can represent a discrete phase of life and it can consist of more stages in different countries, some of which may last for months or years. In some cases, one stage of escape was turned into a problem-solving caesura for the employment trajectory, which brought upward-mobility and a higher socio-economic status, whereas the escape to Austria entailed long-term unemployment, de-qualification and a breakdown of career plans. Thus, war- and flight-related breaking off of education and work can appear as an adverse multiple caesura within one biography.

On the one hand, the war-caused absence of husbands can foster labour market participation for Chechen women. On the other hand, the war-related loss of male relatives can also force female refugees into quick marriage in the receiving country, which impedes continuity in career or education.

Literature:
Asylum Seeker Entrepreneurs in Israel
Anda BARAK-BIANCO (University of Haifa, Israel, Israel) | anda.barak@gmail.com
Rebeca RAIJMAN (University of Haifa, Israel, Israel) | raijman@soc.haifa.ac.il

Entrepreneurship among immigrants and minority groups has attracted much research attention, and the literature refers widely to diverse aspects of ethnic entrepreneurship. However, academic interest in asylum seekers and refugee entrepreneurship has been rather limited, and the impact of legal status on entrepreneurial activity has not been adequately addressed. The paper aims to fill this gap by focusing on the entrepreneurial experiences of Eritrean and Sudanese asylum-seekers, business owners in the restaurant sector in the south of the city Tel – Aviv, Israel.

The purpose of the study to examine the ways Eritrean and Sudanese asylum seekers living in a marginal and precarious situation manage to open and operate a business in a hostile socio-economic and political environment. Asylum seekers are residing in Israel under a temporary collective protection. This status does not grant any social rights but only the right not to be deported. Consequently they live in an extremely vulnerable and liminal situation. In light of this unique legal status, the motives, the difficulties and the barriers involved in setting up and managing a business are examined.

The findings show that self-employment is a way to deal with marginalization and disadvantage resulting from the legal status. However, in the absence of appropriate and sufficient resources to cope with markets and regulation, tandem with physical and social segregation from Israeli society, many of the businesses do not last. As a result, refugee entrepreneurs are experiencing substantial financial losses, confrontation with authority representatives and considerable distress.

The construction of refugees as (non-)citizens through restrictive migration policies of Western European governments. The case of Belgium.
Rachel WAERNIERS (Ghent University, Belgium) | rachel.waerniers@ugent.be
Lesley HUSTINX (Ghent University, Belgium) | lesley.hustinx@ugent.be

One of the reasons why international migration is so central to the politics of many European countries is the challenges it sets to citizenship. It uncovers the mechanisms of exclusion and the production of inequalities inherent to this modern conception of citizenship. At the same time, national governments seem to hold on to an exclusive form of citizenship and are adopting even more restrictive policies towards refugees with differential legal statuses as a response to the increasing numbers of asylum seekers. This tension raises questions about the citizenship of refugees and how this is formed on different levels. We want to contribute to the debate by empirically investigating the construction of refugees and their citizenship in policies of national governments. We assume that the way refugees and their political agency are discursively constructed in policy plays an important role in how it is received and acted upon by civil society organizations, through which many refugees gain a voice. We will study the asylum and migration policy of the Belgium government between 2011 and 2014. Belgium is an interesting case as it is one of the few countries in Europe where asylum requests are decreasing recently instead of increasing. In order to understand how refugees are constructed as (non-)citizens and how this is perceived by civil society organizations we conduct a critical discourse analysis of policy documents and perform in-depth interviews with professionals working in these organizations. In this way, insight is gained into how refugees are constructed as (non-)citizens.
Tactics of Syrian Pseudo-Refugees in Turkey
A. Çağlar DENIZ (Usak University, Turkey) | caglar.deniz@usak.edu.tr

Syria has a civil war since 2010. Because of this war, lots of people have to flee from their hometowns. Some of them came to Turkey from different points. Our research focuses on two major destinations for Syrian victims: Gaziantep and Kilis. The reason we name these people as pseudo-refugee is due to the fact that they are not regarded as official refugees by the Turkish government. They describe refugees as Guests—Misafir or Şişman in Turkish. Even their camp is not regarded as refugee’s camp by the Turkish government. The camp is called “Çadırkent”, that is Tent-city.

We will discuss the everyday life of Syrian pseudo-refugees in Antep and Kilis cities via De Certeauen toolbox, such as tactics, strategies. To give some examples of these tactics, the Syrian women shifted their headscarf style to Turkish women’s style. Syrian women said that if they went out in their original hijab style, they could be target of local men’s indecent assaults. Syrian men left wearing their traditional dress –Jallabiya- and they put Turkish flag in their stores to avoid of nationalist attacks.

In Antep and Kilis, some work areas have been completely occupied by Syrian people. Some of these activities are garbage collecting, porterage, and Syrian local products—bread, cigarette, coffee etc.-, retail dealing and unfortunately drug-dealing. On the other hand, we also witness that some Syrian entrepreneurs have opened some stores like restaurants, confectioner stores, and cell phone shops serving to their citizens.

Syrian Refugees in Turkey
Cigdem MANAP KIRMIZIGUL (Middle East Technical University, Turkey) | manap@metu.edu.tr

The purpose of this paper is to describe the Syrian refugees that reside in Turkey temporarily, from their own standpoint and from the viewpoint of workers and representatives working in the agencies and institutes involved in the field. This work focuses on the inconveniences experienced by refugees during their stay in Turkey and the reasons of these inconveniences, in the context of social exclusion. The research for this paper is based on the analysis of the in-depth interviews that were done with the Syrian refugees, representatives and workers in UNHCR, government and in several NGOs. The results of the study can be sorted as follows: Firstly, there is an increasing and visible reluctance to accept refugees in the world. Secondly, it is seen that Turkey does not have an effective asylum policy and legal arrangements on this issue. Thirdly, not only the refugees but also the officers who are dealing with them face some problems. Lastly, it had been observed during the interviews refugees are being excluded different ways during the period of living in Turkey.

'First I was there, now I am here': Refugee NGO Staff Supporting Asylum Seekers
Sara DE JONG (University of Vienna, Austria) | sara.de.jong@univie.ac.at

This paper is based on research in Austria, the UK and the Netherlands into the positionalities of staff of NGOs supporting asylum seekers and refugees, who themselves have a history of being an asylum seeker and who now have a more permanent status, such as refugee status or humanitarian protection. I situate their recruitment into these roles in the context of the obstacles refugees face in labour market access due to language barriers as well as lack of recognition of former qualifications and work experience. Employment in NGOs that support
asylum seekers, however rewarding and empowering it may also be, therefore becomes a strategic decision in the face of limited employment opportunities. Drawing on semi-structured interviews with these NGO staff members, I particularly focus on the ways in which they understand themselves in relation to their asylum clients in terms of shifting processes of identification, distancing, aligning and drawing boundaries. I analyse how they experience their own transition from being an asylum seeker and client of NGO services, to becoming a provider of services and advice for NGOs that both support as well as discipline asylum seekers. Working with the biographical narratives that the interviews provided, this paper finally considers the relation between ‘newcomers’ and ‘oldcomers’ and the way experiential knowledge of the asylum regime is transformed into professional expertise, with attention to variations in research participants’ length of stay and waiting time before they received a ‘positive decision’ on their refugee status.

RN35S11a - Inclusion, Exclusion and Precarious Employment of Migrant Workers in Europe - A

Migrant workers’ pathways to a neoliberal citizenship and its “hidden injuries”
Radoslaw POLKOWSKI (University of Strathclyde, United Kingdom) |
radek.polkowski@strath.ac.uk

Academic literature has portrayed mobile central eastern Europeans as successful EU citizens but disadvantaged labour migrants (Ciupijus, 2011). The present article further problematizes this dichotomist image by unpacking the notion of a successful citizen and a role of labour as a pathway to it. It brings together individual-level experiences of migrant workers with macro-level transformations of employment regimes and reconfiguration of the state in Europe towards a neoliberal model, focusing specifically on accompanying ideologies which have transformed a normative ideal of a citizen into the neoliberal notion of an independent and entrepreneurial self-made man. The paper discusses how these changes have affected inequalities in Europe, not only in material but also existential terms (Therborn, 2013,) and it proposes a conceptual framework for understanding multiple levels of inclusion and exclusion of migrant workers by distinguishing between citizenship as rights, as a community of value (Anderson, 2013) and emotional citizenship (Ho, 2009). The study draws on data from participatory action research and 39 semi-structured interviews with migrants from Poland to the UK: the two liberal market economies which have been affected by the aforementioned processes to a larger extent than many other European countries. On the one hand, findings illustrate how a normative ideal of a neoliberal citizen is reproduced by migration being a pursuit of valued ways of living dictated by this model. On the other hand, migrants’ life trajectories reveal “hidden injuries” (Sennett and Cobb, 1972) which challenge the very model they pursue.

On the Borders of Life and Work. Immigration controls as mechanisms of precarisation of Labour and Immigration
Jukka KÖNÖNEN (University of Helsinki, Finland) | jukka.kononen@helsinki.fi

In migration research, precarity has been mainly utilized as a generalized descriptive term for migrants' vulnerable and insecure working conditions. There is a broader tendency to analyse precarity as a specific sociological (class) category. However, the preceding discussion on precarisation in the post-operaist framework has highlighted the profound transformations in organisation of capitalist production and consequent precarisation of labour and life. In the
presentation I discuss migrants’ particular position as a part of general processes of precarisation. I argue for the importance of including the role of borders and hierarchisation of legal statuses in the discussion of precarisation and migration. The presentation is based on my PhD research, which concentrates on the interrelations between migrants' precarious legal status and precarious work in Finland. For my research, I have interviewed migrants with non-permanent legal statuses and service sector employers. Asylum seekers, non-EU students and undocumented migrants form a flexible labour force in low-paid service sector in the Helsinki metropolitan area. Work is a contradicting experience for migrants: regardless of exploitation and precarious working conditions it forms an essential means against precarity. Insecure residency status with limited social rights makes migrants more vulnerable to exploitation and increases dependency on employers. In immigration precarity is fundamentally connected to conditionality of rights and deportability. Analysis of migrants’ struggles in the context of immigration controls and differential inclusion enables a perspective to the precarisation of work and life.

**Economic crisis and migrant women’s labour careers. A comparison between Romanians and Moroccans**

Francesca Alice VIANELLO (University of Padua, Italy) | francescaalice.vianello@unipd.it
D evi SACCHETTO (University of Padua, Italy) | devi.sacchetto@unipd.it

The economic crisis began in 2008 has produced different effects on labour force according to gender, age, ethnicity and migratory status. This paper examines with a comparative approach the economic crisis implications on labour and life trajectories of migrant women with Moroccan and Romanian origins. The paper is based on quantitative and qualitative data collected among unemployed Moroccan and Romanian citizens registered in the October of 2010 in two job centres (JCs) of the Veneto region. In particular, 169 short telephone interviews (44 Moroccans and 125 Rumanians) and 58 in-depth interviews (14 Moroccans and 44 Romanians) were collected in two similar socio-economic areas of Veneto region.

The essay focuses on two issues: the first one concerns the transformations of migrant women position in the occupational structure; the second one regards the educational pathways undertaken by unemployed migrant women in order to increase their employment opportunities and to fight the forms of segregation hitting them.

The economic crisis has different implications on migrant women labour career. On the one hand, the unemployment increase among men pushes a significant quota of inactive women, mainly Moroccans, to enter the labour market, even if they reject to carry out some tasks. On the other hand, industrial workers, mainly Romanian but also Moroccans, are sent off from factories and pushed again toward the reproductive labour, paid and not-paid. Indeed, the domestic and care services sector, less touched by the crisis but in any case under pressure, return to be the first field of migrant women employment.

The unemployment period can be also lived by migrant women as a chance to undertake an educational or training pathway aimed at increasing their skills and positioning in better segment of the labour market. However, in the case of Moroccan women, the acquisition of new skills and capacities helps them also to widen their spaces of autonomy.

To sum up, the paper’s argument is that even if the crisis foster the acceleration of foreign women segregation processes, migrants seems to contrast such phenomena with educational pathways that empower them in and out the four walls.

**Transnational “cocoon communities” of Polish posted workers: negotiating the class experience between Poland and Scandinavia**

Anna Paulina MATYSKA (University of Tampere, Finland) | anna.matyska@uta.fi
Polish transnational posted workers, defined as workers posted by their regular companies or staffing agencies to work abroad on short-term projects, constitute one of the major labour forces in Europe. They fulfil the need for flexible and relatively cheap labour in the neoliberal age. This paper addresses posted work as a particular mode of transnational mobility which challenges static class categories and leads to the creation of the classed version of “cocoon communities” described by Korpela and Derwin (2013): flexible and often created ad hoc communities which respond to the current needs and possibilities of individuals. The paper shows transnational discursive and social practices through which workers create their communities and principles of inclusion and exclusion on which they are based. The paper approaches the communities as the proxy for workers’ class belonging, which escapes conventional categorization and calls for the dynamic and transnational approach to class. In the literature, transnational Polish posted workers are usually labelled as the working class – the category which leaves unspoken workers’ multiple reference points stretched across borders, and mobility as a class resource which unites and divides them from other workers. The paper is based on the ongoing (2014-2017) ethnographic research on the class-making of Polish posted workers in Scandinavia: Finland, Norway and Denmark, and their families in Poland.

RN35S11b - Inclusion, Exclusion and Precarious Employment of Migrant Workers in Europe - B

Migration, gender and work: the interconnectedness between gender roles, agency and work trajectories of female Polish migrant workers in the UK
Karima AZIZ (London Metropolitan University, United Kingdom) | k.aziz@londonmet.ac.uk

As European citizens female Polish migrant workers enjoy the freedom of movement, but often start out working in low skilled, low-paid as well as gendered employment in the UK labour market. While some women are able to overcome barriers and progress professionally, others can feel stuck in disadvantaged positions. The proposed paper examines how in the conditions of post-accession Polish migration to the UK and established gender roles, the possible dynamics of downward social mobility or moving up the occupational ladder can be mediated by different strategies found in the experiences of female migrant workers. The research question therefore asks how established gender roles, individual agency and different work trajectories are interrelated in the experiences of female Polish migrant workers in the UK labour market. In order to answer this query biographical narrative interviews conducted with the group in question in the UK as well as with female return migrants from the UK in Poland are analysed. This qualitative data is examined in the light of changes in employment and migration regimes, where liberalisation, flexibilisation and precarisation of labour spread out and migration has been conceptualised as part of those transformations.

Nina SAHRAOUI (London Metropolitan University, UK) | n.sahraoui@londonmet.ac.uk

Migration and paid care work in European capitalist economies tends to be increasingly connected in the context of ageing populations, increasing female labour market participation, greater geographical mobility, social care policies that facilitate greater private provision of care services, and most importantly global inequalities. This paper scrutinizes the experiences of
discrimination and racism of migrant care workers from outside the European Union in London, Paris and Madrid. It is based upon 97 semi-structured interviews conducted in these three cities with care workers employed in private residential and domiciliary care.

The paper’s analyses draw upon a transnational political economy of care (Williams, 2012) as theoretical framework. The paper argues that while migrant care workers face experiences of discrimination and racism in all three sites of fieldwork for this research (Paris, London and Madrid), dominant discourses and structures shape the answers to these experiences. The cross-national research design allows for a comparative analysis of how experiences of discrimination and racism are narrated, what agency workers have, and most importantly what perceived agency they possess. In particular, the paper looks at individual and collective responses to these experiences and at the role of intermediaries such as trade unions and migrant associations. The analysis is further embedded into the global political economy context, accounting as well in this regard for national divergences, through its emphasis on the specific implications brought about by the privatization of care services and the precarisation of employment terms.

Post-accession migrants’ labour market flexibility as a matter of choice?
Pathways towards creation of “flexible subjectivity”
Mateusz KAROLAK (Univeristy of Wroclaw, Poland) | m.karolak@uni.wroc.pl

One of the novelties of the internal EU migration lies in the fact, that the national states are not any more intermediaries between the mobile subjects (European citizens) and the EU labour market. As indicated by Guglielmo Meardi (2012) the most expected and desirable by the receiving countries’ governments and employers characteristic of the post-accession Central Eastern European migrants was not so much the low cost of their labour as their labour market flexibility. Indeed, many of the Poles in the UK are fully exposed to the labour market flexibility and are working below their formal qualifications, performing the low skilled, routine work, mostly in sectors such as hospitality and catering, agriculture, manufacturing or food processing (McCollum 2012).

The aim of the paper is to scrutinize the ways in which Polish migrants in the UK became flexible subjects, in some cases ready to return to their home country, once they are “not needed”. Besides the already broadly recognized structural factors leading to the labour market segmentation and precarisation, the paper concentrates on the migrants agency and focuses on the biographical processes leading to the emergence of “flexible subjectivity”. The question which is to be answered: what are the biographical circumstances leading some migrants to the voluntary acceptance of the flexible employment abroad.

The paper is based on the analysis of around 30 biographical narrative interviews with the Polish post-accession migrants, return migrants and re-emigrants, who have worked in the United Kingdom.

From ‘Old’ to ‘New’ Southern European migrants in Switzerland
Enrique ORTEGA-RIVERA (Centre for Demographic Studies, Spain) | eortega.ced@uab.es
Elena VIDAL-COSO (University of Geneva, Spain) | Elena.Vidal@unige.ch

The current economic crisis caused the return to the ‘traditional’ migration dynamics within Europe. The case of Switzerland is interesting for its long history as immigrant receiving country. Indeed, large and successive unskilled immigration entered Switzerland, mainly from Italy and Spain (from 1950s to 1970s), Portugal (1980s), and the former Yugoslavia and Turkey (1990s). Recent changes in migration policies –the Agreement on the Free Movement of Persons in 2002- and the onset of the global economic crisis, fostered the return of ‘old’
immigration in terms of origins, as reveals the huge number of entries coming from the South-European countries, albeit with a ‘new’ demographic and socioeconomic profile. Thus, we examine the socio-demographic characteristics and the labor market performance of recent inflows of Spanish and Italian immigrants from previous ones in order to understand their impact on the economy and society in both countries of origin and destination. Using data of 1980, 1990, 1990 Swiss Censuses, as well as the Swiss Structural Survey from 2010, we will firstly address the socio-demographic and educational profile of ‘old’ and ‘new’ migrants from Spain and Italy. Secondly, we will analyze the occupational distribution of ‘old’ and ‘new’ Spanish and Italian workers. Our aim is to examine whether their traditional over-representation of migrants among the lower strata of the occupational hierarchy is explained by their negative selectivity in terms of human capital. And, on the contrary, we investigate if the more privileged migrant status and an easier transferability of skills of highly educated Spaniards and Italians in Switzerland is reflected in the improvement of their occupational status.

RN35S12a - (Successful) Migrant Integration: Whose Responsibility is it? - A

Myths and Reality of being immigrant in Georgia: Policy and Societal levels
Tamar ZURABISHVILI (ICMPD, Georgia) | tamar.zurabishvili@gmail.com
Mariam CHUMBURIDZE (Innovations and Reforms Center (IRC), Georgia) | mchumburidze@gmail.com

Immigration is a relatively new phenomenon for Georgian reality - till recently the country was mainly exporting labor force rather than attracting immigrants. However, during the recent years the situation started to change with more and more immigrants arriving to Georgia not only for short-term, but for long-term residence purposes. On the one hand this was due to the liberal immigration policy of the country, and on the other hand, due to the creation of employment and educational niches. Humanitarian crises in the Middle Eastern countries also played role in increasing number of immigrants to Georgia. For Georgian population that did not have previous experience of dealing with immigrants from countries sometimes quite distant both in geographical and cultural terms, establishing effective associations with immigrants proved to create problematic. At the same time, on a policy level, there are certain discrepancies between the existing immigration provisions and necessity to accommodate immigrant integration needs. Hence the present paper will focus on the discrepancies between the declared myth of ‘hospitality’ and ‘openness’ of Georgians versus emerging xenophobic attitudes towards immigrants, and, at the same time, on the contrast between the existing Georgian immigration policy open that does not account for existing needs of immigrant integration and increased need to facilitate effective integration of immigrants.

Present paper is based on an analysis of immigration policy of Georgia, and on the analysis of a study of immigration in Georgia, which surveyed 600 Tbilisi residents on their attitudes towards immigrants, and collected 44 in-depth interviews with immigrants currently living in Georgia for more than 9 months. (The fieldwork was conducted with the support of EU in terms of XXX project in Summer, 2014). The paper argues that 1) despite the discourse of ‘hospitality’, a significant part of the Tbilisi population holds xenophobic attitudes towards immigrants coming from culturally, religiously and geographically distant countries, and 2) the Georgian immigration policy does not acknowledge the existing need to tackle the issue of integration of immigrants and necessity to implement cultural diversity programs for local population.
The Role of Personal Networks of Ageing Non-EU Migrants in Labour Market Participation and Access to Pension
Jonnabelle Vidal ASIS (University of Brescia, Italy) | jonnabelle.asis@gmail.com

Demographic changes brought about by improved life expectancies, decreasing fertility rate, and increasing migration to more developed countries all happen within the context of growing social inequality. Against this background, it becomes important to study the situation of the ageing migrant who encounters a double jeopardy: dealing with social consequences of relocating to a new country, and renewed insecurity and risks that accompany the ageing process.

The research investigates ageing non-EU migrants’ labour market participation and access to pension, and the role that personal networks play in enhancing or inhibiting these. Strong ties based on homophily are fundamental to access information and various resources for migrants, but can also constrain access to more diverse information and resources (which weak ties can bring) since they serve more bonding than bridging function. While networks play a positive role of offering employment possibilities, they also restrict them to the same labour market and hence limit the possibility of pension entitlement. Through social network analysis, the study seeks to answer which network typologies give rise to certain types of work trajectories/histories.

Data comes from a face-to-face personal network survey and qualitative interviews of over 100 non-EU migrants, 50 years old and above, and residing in Brescia. Brescia is an important field site since it is one of the Italian cities which has a good number and diversity of migrants. It ranks fourth in terms of the number of migrants, after Rome, Milan, and Torino (ISTAT 2012). Studying migrants’ personal networks and labour participation is also interesting because of Italy’s high labour market segmentation. Parts of the questionnaire were adopted from EU Labour Force Survey’s Ad-hoc Modules on “Labour Market Situation of Migrants and their Immediate Descendants” (2008, 2014) and “Transition from work to retirement” (2012). A social network component was added to capture the respondent’s job search history and persons who helped them land the job throughout their working life, and their social support network.

Citizenship in a migration context: a case of Polish immigrants in Reykjavik.
Monika Ewa NOWICKA (Collegium Civitas, Poland) | monika.nowicka@collegium.edu.pl

The aim of the paper is to discuss citizenship in a migration context. In many sociological discussions citizenship is still firmly attached to the national state. However, Europeanization processes along with migration movements show that the context of the state is not sufficient anymore to analyze migration and citizenship, therefore citizenship needs to be broadened to both local and supranational level. The broadening has also its consequences, which can be easily observed in a migration context. Citizenship in such a context has always been the final stage of integration or assimilation process. Moreover, it was a tool for receiving society to protect its politics and culture from the Strangers. Nowadays, getting citizenship is not only an act of becoming a member of a community as it used to be in many cases. Polish immigrants in Iceland, as holders of EU citizenship, are a new type of immigrants, whose attitude towards citizenship is much more different than the immigrants who are from third countries. It can be observed in their reasoning that justify applying for Icelandic citizenship which range from “getting a good Icelandic passport for travelling without visa” to “willingness to participate in my new community life”. Finally, the paper discusses citizenship-national identity relation of Polish immigrants while applying for Icelandic citizenship. The paper is based on almost 50 interviews carried out in Iceland in May, July and December 2014.
Combating unequal inclusion of immigrants: policy responses of Paris and Montreal compared
Marketa SEIDLOVA (Charles University in Prague, Czech Republic) | mseidlova@seznam.cz

This paper analyses the attitude of local governments to combating ethnic inequalities in France and in Canada. Moreover, as the cities are often seen as the “machines of integration” and the integration of immigrants itself is happening on the local level, everyday practise in Paris and in Montreal is studied.

The research has shown that in Paris the policy of studied city districts was influenced by the existing policy on the whole city level, governed by left-wings politicians and applying significantly multicultural measures. However, the observation of everyday practice (during the legislature of Sarkozy) reflected also other influences, like for example the national policies which are primarily oriented on “assimilation” of immigrants. The concrete local initiatives for immigrants have also proved to be dependent on the personal visions of the leaders of the city/city district. The importance of other considered factors has not been confirmed.

In Montreal, many local actions are encountered in the absence of a centralized policy statement on this issue. The approach of the leaders of the city is more pragmatic than in Paris, although many statements of philosophical principles exist. The province of Quebec is as itself the major actor in the integration and being further from the local measures reflects more the political speech towards the assimilation, while the municipal level is marked more by the “intercultural negotiation”.

The study based on a large number of detailed discussions with municipal officials in the above mentioned localities allows illustrate and support these general observations through concrete examples.

The Strategy of Adaptation in France: The Case of Ağrı Migrants
Hasan GÜLER (University of Uşak, Turkey) | gulerhas@gmail.com

In this study, we try to analyze Ağrı (the city of turkey, east side) migrants to Paris and their migration process as well as their adaptation strategies. We refer the this study the result of the academic literature on immigration and the findings from the interviews date discussed. Study consist of five sections. Research methodology and problematic is mentioned in the introduction part. In the second section, migration to France, we discuss a brief historical reviews on the phenomenon of migration in Turkey and study on immigration to France and how people coming from Ağrı adopt this process are explained. In the third section, we made a critical reading of the theory of "communitarian closure" which covers an important place in the literature of migration to France and we also show shortcoming of French republican model of integration. The last section, based on the findings of our field study the strategy that people coming from Ağrı used while they try to adopt the life of Paris and study concluded with general overview.

RN35S12b - (Successful) Migrant Integration: Whose Responsibility is it? - B

Foreigners, integration and sport in the Czech Republic
Marina LYUBENOVA (Faculty of Social Studies MU Brno, Czech Republic) | 431913@mail.muni.cz
Natalia ONOFREI (Faculty of Social Studies MU Brno, Czech Republic) | natasha.onofrei@mail.muni.cz
Michal RES (Faculty of Social Studies MU Brno, Czech Republic) | 432429@mail.muni.cz
Many international researches focused on sport activities build on the assumption that sport promotes the integration process and intercultural communication of foreigners in the hosting countries (e.g. Gasparini and Cometti, 2010). Most studies approach the problem of integration from a more general perspective (e.g. Drbohlav 2003, Diehl and Blohm 2003), but there are also authors, who include sport as an explanatory variable in their investigations (e.g. Bijl and Verweij, 2012). Although the topic of sport, as part of the integration scheme of foreigners into different societies, has been under investigation for some time, we cannot say that the literature provides a unified view on this relationship. Due to globalization and outsourcing, the number of foreigners moving to the Czech Republic increased as well as the interest of scientists in examining the process of their integration in the society. The aim of this paper is to study the relationship between sport activities and the integration of foreigners in the Czech society. The basic research questions are: Is sport (sport activities) one of the factors facilitating foreigners' integration into the Czech society? If so, how? What is the role of sport among other determinants of integration? Data is collected in the population of foreigners working for more than one year in the Czech Republic in international/multinational companies by use of mixed methods design. Factors such as the length of stay, habits associated with sports activities, language skills, social solidarity and the level of integration are assessed and integrated in the analysis.

**Socioeconomic Integration of Migrant Domestic Workers**

Lenka PAVELKOVA (Charles University in Prague, Czech Republic) | lenka.pavelkova@natur.cuni.cz

Domestic work has become globalized and it is done mostly by migrant workers. These workers migrate from villages to cities, but also from one country to another (very often far away) to work at some other people’s home. Developed countries rely increasingly on the work of these migrants who offer cheap and flexible solution to shortages of institutional and other measures. The phenomenon of domestic work performed by migrants has been spreading also in Central European countries, including Czechia.

In my contribution, I will discuss the situation of migrant domestic workers – how do they arrive and find work and what are their working conditions. The special focus will be given to role of social networks in finding a job and negotiating working conditions. The summary of situation in several countries will be accompanied by results of a pilot survey among migrant domestic workers in the Czech Republic.

**“Waiting for the German Obama?” - An Empirical Study On Politicians with Migration Background**

Damir SOFTIC (Westfalian Wilhelms University Münster, Germany) | dr.softic@yahoo.de

About five million Germans with migration backgrounds – eight percent of the total voting population – are enfranchised, yet such numerical strength has not yet been translated into representation at the national level. Of the 631 members in the Parliament (2013), only 37 have a migratory background. By focusing on the modes of representation in the political field, this paper will investigate strategies, roles, and career paths followed by these exceptional political actors.
The preponderance of research on migration to Germany focuses mainly on labor market inclusion and education: migrants are less likely to obtain higher education, trainee positions, or a steady job. Most of the research disregards the emerging new dynamics of political and social representation and participation. Changing patterns of political representation can be found. What explains political incorporation of migrants when it does occur? What chances do immigrants have to act in the political field as “insiders”? How and to what extent are they able to influence the field?

The paper will explore these questions by examining immigrants operating in the field of politics — prototypical examples of successful upward mobility. The answer to these questions, I suggest, can be found by critically re-evaluating Bourdieu’s concept of habitus to take into account border-crossing phenomena. Going beyond the national embeddedness of the original Bourdieusian concept to incorporate a transnational perspective, renders visible the mechanics of how a trans-national habitus operates within a national context. Based on semi-structured interviews with 13 politicians elected to state and federal parliaments (2009), I show that the parliamentarians utilize diverse political styles, which vary according to their migratory context, namely, their age at immigration, social ties among the relevant ethnic group, and experience with discrimination and stigmatization influence their attitude towards their own migratory background and the political style.

The results will cumulate in two typologies that illustrate different attitudes towards the migratory background and distinct political styles. The results reveal the ways in which a migratory background serves as a resource rather than a disadvantage to the upwardly mobile, and demonstrate the integrative effect of political participation.

What does integration mean? Exploring public opinion on immigrant integration: a bottom-up perspective
Silvia GALANDINI (University of Manchester, United Kingdom) | silvia.galandini@manchester.ac.uk
Laurence LESSARD-PHILLIPS (University of Manchester, United Kingdom) | laurence.lessard-phillips@manchester.ac.uk

Integration of ethnic minorities has never been given more attention. As our society is growing ever more diverse, successful integration is becoming a key to social cohesion and a prerequisite for a fair and equal society and is increasingly becoming a term defined by researchers and academics. Some argue that this departs from people’s understanding of what it means and involves and that more attention should be paid to the public opinion on this process and its complexity (Saggar and Somerville, 2012).

In this paper, we explore how integration is understood by people in Britain. We present the findings of a series of focus groups that we conducted with members of the public of various migrant and ethnic backgrounds in Manchester and Glasgow. During the focus groups, we enabled participants to discuss what they think integration is; what it involves; how it can be achieved and who (e.g. the government, migrants and minorities themselves, the wider society) should be responsible for it.

The data collected represent a unique opportunity to shed new light on people’s views about integration and to reflect on the extent to which and how these views do or do not differ from the current political and policy debate on integration. The study also provides helpful insights into how people perceive and discuss about integration and what are the main positive and negative aspects that ‘naturally’ emerge from this discussion. As the focus groups were conducted with participants from different ethnic and migrant backgrounds, this allows us to reflect on how having experienced migration more or less directly influences people’s understandings of integration.
Integration-chances of immigrants in the German labour market
Alexandra MERGENER (Federal Institute for Vocational Education and Training (BIBB), Germany) | mergener@bibb.de
Tobias MAIER (Federal Institute for Vocational Education and Training (BIBB), Germany) | tobias.maier@bibb.de

The labour market participation is one of the most effective integration-factors, in general and especially for immigrants. Besides the individual qualification of the foreigners, a successful integration depends to a great extent on the companies. In this regard, our paper intents to analyse recruiting strategies and skill requirements of German firms in different industries when it comes to hiring immigrants, specifically people that obtained their qualifying degree abroad. In order to investigate the actual labour market chances of immigrants it is necessary to isolate the different influencing factors that are suspected to lead to discrimination. It is quite difficult, though, to isolate the effects by means of sociological surveys, because treatment and control variables cannot be randomly varied as in an experiment. We therefore introduce a vignette study (factorial survey) during an online-interview. In this way, we present decision makers in companies several descriptions of recruiting situations. The relevancy of specific characteristics of an applicant is judged by varying the description of the applicant in the vignettes that are presented to the respondent. We can therefore control how nationality, language skills, vocational degree, sex and experiences of the foreign applicants influence their hiring and – related therewith – their integration chances. Additionally, we focus on sector and the influence of occupation specific skill shortages in Germany.

We implement this stratified random online-survey in more than 2000 companies in Germany. Based on this strong evidence we are able to present new data to inform about possible discriminations in the recruitment processes of companies.

‘Broken promises’: The false expectations of first and second generation Africans in a southern European country (Greece)
Apostolos G. PAPADOPOULOS (Harokopio University of Athens, Greece) | aospapa@hua.gr
Loukia - Maria FRATSEA (Harokopio University of Athens, Greece) | fratsea@hua.gr

For the past five years Europe has been amidst the most severe recession since the Second World War. In such an economic situation migrants are among the most vulnerable groups and usually the hardest hit by the economic crisis. Although the impact of recession on migrant employment differs between sectors, rising unemployment rates are often accompanied by rising anxiety about the availability of labour market opportunities. The economic crisis has had a severe impact on migrants’ settlement and integration. While the first generation of migrants tries to cope with the impact of economic recession; the second generation faces similar problems with their parents but also new ones.

The paper is based on empirical research carried out in the period 2011-2012 and aimed at investigating the integration prospects of first and second generation sub-Saharan Africans in Greece. 530 questionnaires were collected concerning first generation Africans, while a qualitative research was conducted with second generation Africans (20 interviews) who were either born in the country or arrived as children.

Through the analysis of the qualitative data the paper will illustrate the challenges that young Africans are facing in the context of the current economic crisis; whereby the official migration policy have become particularly ineffective. Young Africans are left alone to decide whether they would like to become “Greeks” or else they will be considered as “foreigners” in a period when
racist incidents become more pronounced. The integration prospects of Africans are juxtaposed against the xenophobic and racist incidents that they face daily.

RN35S13 - Access to Fair and Transparent Qualifications Recognition – a Right or a Privilege?

The violence of the collective knowing-it-all-better - Classification struggles over the recognition of foreign qualifications in Germany
Ilka SOMMER (Humboldt-University of Berlin, Germany) | ilka.sommer@gmail.com

Taking the German practices of institutionally assessing foreign qualifications as an empirical example, the paper argues that recognition is not a question of objective information with information barriers as its main obstacle. Similarly it is not only a problem of social cohesion for European societies, but of relevance for worldwide understanding and appreciation. It is necessary to analyse the social construction of these judgements in a conflict theoretical framework including a reflection of power relations between actors and institutions. Being based on Pierre Bourdieu's notions of the social field and symbolic violence, the paper asks for the invisible mechanisms (re-)producing symbolic differences of qualificational value through legislation, executive practices and habitus. Beside document and literature analysis it is empirically based on narrative interviews with bureaucrats who are in charge of the assessment procedure as well as group discussions with tenants of foreign qualifications. They were analysed with the help of the Documentary Method (Ralf Bohnsack) being based on Karl Mannheim’s concept of atheoretical (or implicit) knowledge. As hypothesis I propose that even though social classifications such as citizenship and ethnicity tend to be discursively delegitimized and replaced by categories such as merit and capacities, access to the procedure as well as actual assessment of foreign qualifications continues to depend on categories reproducing symbolically mediated inequalities such as being educated by a certain state as well as national labour demand and therefore the type of qualifications. Recognition is highly selective in the German context. The maximum that can be achieved is an exchange rate of 1:1. In this case a qualification is considered to be of equal value (»gleichwertig«) to a particular German qualification and is incorporated as »better knowledge« into »the collective«. In other cases the qualification is judged to be under this value and therefore remains »foreign«.

Recognition of Spanish qualifications in Germany and the UK – a barrier or a bridge in the Common European labour market?
Christiane HEIMANN (Otto-Friedrich-Universität Bamberg, Germany) | christiane.heimann@uni-bamberg.de
Oliver WIECZOREK (Otto-Friedrich-Universität Bamberg, Germany) | christiane.heimann@uni-bamberg.de

This analysis offers insights into the procedures of the recognition of Spanish qualifications in Germany and the UK to benefit from inner-European mobility. In order to examine the rules, chances and difficulties concerning recognition of qualifications, labour mobility from the main emigration country Spain to the main immigration countries Germany and the United Kingdom (Bräuninger 2014) is observed. The question we adress is: Do recognition procedures facilitate or prevent inner-European mobility? A combination of Bourdieu’s theory of fields and the center-periphery approach is applied to describe either the role of institutions and actors involved as well as the inequalities and
dependencies produced. About 65 qualitative interviews in Spain, Germany and the UK provide the main data basis. Interviewed experts are private and public job agencies/recruitment services, politicians, non-profit organisations, labour and employer associations, universities and training organisations, labour migrants in certain sectors and scientific experts. The information derived from the interviews is verified and bolstered by participating observations and content analysis of university curricula. The results indicate that recognition procedures may either prevent or facilitate mobility, which depend on different causal mechanisms observed. First, the institutional collaboration in and between the member states influences the availability of information. Second, the labour market situation influences which qualifications are „easier“ to recognise. Third, the power structures in and between the member states define the procedure of recognition.

Scope and limitations in the recognition of foreign qualifications in Austria
Isabella SKRIVANEK (Danube University Krems, Austria) | isabella.skrivanek@donau-uni.ac.at
Thomas PFEFFER (Danube University Krems, Austria) | thomas.pfeffer@donau-uni.ac.at

Formal qualifications are of high relevance in the Austrian labour market, which has a strong focus on skilled workers and comprehensive professional qualifications (“Berufe”) instead of certain levels of a qualification. Furthermore, pay is often linked to formal qualifications in collective agreements, which cover more than 90% of wage and salary earners in Austria. Moreover, formal qualifications are central for access to regulated professions and they have an important signalling function to communicate skills. This paper analyses what and how foreign qualifications are recognised in Austria. It explores the measures in place and analyses their scope and limitations. The analysis is based on a desktop research, review of literature and expert interviews. We find that Austria has highly differentiated measures in place. However, the overall system of recognition is very fragmented due to many competent authorities and no general coordination and monitoring scheme. Furthermore, traditional recognition focuses on the equivalence of curricula and is limited to regulated professions in case of vocational qualifications. Thus, there are a number of gaps in the current system. While there has been progress in the provision of information and counselling services for foreign trained individuals, we conclude that more substantial measures are required in order to improve their labour market position and to better use their skills potential. This comprises a right to the assessment of foreign qualifications, an overall approach to recognition, better bridging programmes (availability, financial support) and coherent measures for the validation of non-formal and informal learning.
RN36 - Sociology of Transformations: East and West

RN36P01 - Poster Session

New possibilities of work for persons with Down syndrome

Elżbieta ZAKRZEWSKA-MANTERYS (University of Warsaw, Poland) | ezakrzewska@isns.uw.edu.pl
Agnieszka KUMANIECKA-WIŚNIEWSKA (University of Warsaw, Poland) | akw32@wp.pl
Malgorzata DRUS (University of Warsaw, Poland) | m.drus@onet.pl

The aim of the presentation is to show new possibilities of work for intellectually disabled young people. These possibilities were tested in the EU Project “The Helping Hand. Verification of mentoring system as a process enabling intellectually disabled persons to take up employment on the Polish labor market”. The leader of the Project was University of Warsaw. The project was directed towards persons with Down syndrome.

In European countries an official politics dealing with intellectually disabled people says about integration and inclusion. All people are equal, they are all citizens of the world and have rights to lead as “normal” life, as possible. This is an official way of thinking, according to the political correctness. But these days in Poland, for the first time in history, there growing up a new generation of persons with Down syndrome whose life expectancy is similar to the whole population (in 1961 the average life expectancy of people with Down syndrome was 18 years).

There is an urgent need to create a new way of social policy dealing with the problem of satisfying work for people with Down syndrome. The project “The Helping Hand” is treated as a new proposal for persons with Down syndrome: they will not have to follow up in the workplace the patterns of behavior of “normal” population, but they can be themselves and treat their specific traits as advantages. The work offered to them is a work in a social sector, in which they are not treated as inmates (as it has been since now), but as workers - helpers of caretakers of elderly people.

Since the work proposal for persons with Down syndrome described above is very new and spectacular, our team would like to present also a Poster Session. Main part of the session will be photos showing workers with Down syndrome at work and comments of inmates of the institution, co-workers, job couches, parents of persons with Down syndrome. Dr Malgorzata Drus and dr Agnieszka Kumaniecka-Wisniewska will prepare the session.

RN36S01 - Transformations in CEE: Developmental Successes or Traps?

Growth after Crisis: Are Former Communist Countries Facing (Another One) Middle Income Trap?

Zenonas NORKUS (Vilnius University, Faculty of Philosophy, Sociology Department, Lithuania) | zenonas.norkus@fsf.vu.lt
For long time, development sociology and economics was concerned with the “poverty trap” (or “vicious poverty circle”) facing late developing countries. During last decade, the discussion shifted to “middle income trap” precluding middle income countries to catch up with the affluent countries. This convergence can only occur, if the GDP growth rate exceeds for longer time steady state growth rate, characteristic for technological frontier countries with U.S. as exemplary case. The troubling experience is that the growth of the most of the late developing countries slows down after they escape from poverty trap and become middle income countries. Mainstream research currently focuses on the still nominally communist China, attempting to guess whether the future growth of this country will resemble this typical development trajectory. Taking guidelines from the research on the China case, the presentation will examine growth performance of the former communist countries. Ominously, growth slowdown may be tantamount to the repeated convergence failure, because most of them already were at least once in the middle income trap – during the time of the terminal crisis of communism.

The end of ‘success story’ of Slovenian transformation in a systems perspective: towards a fuzzy sets based comparative approach
Tea GOLOB (School of Advanced Social Studies, Slovenia) | tea.golob@fuds.si
Matej MAKAROVIČ (School of Advanced Social Studies, Slovenia) | matej.makarovic@fuds.si

We intend to contribute to the explanation of the initial success of the Slovenian post-communist transformation and its subsequent shortcomings after the 2008 crises through the conceptual apparatus of Luhmann’s social systems theory, which sees increasing functional differentiation in terms of subsystems’ self-reference and autopoeisis as the key aspect of post-communist transformation. Moreover, since the functional subsystems are also significantly interdependent their autonomy should be balanced by contextual interventions, systemic discourses and macro-level strategies derived from them. This may be reflected in neo-corporatist dialogue between the representatives of different subsystems. From this aspect, the neo-corporatist nature of Slovenian transformation seemed to be a proper solution. However, in the context of comparatively low functional differentiation based on the lack of structural reforms and privatisation, insufficient economic openness, ideological polarisation (Kulturkampf), the lack of liberal-democratic traditions, as well as elite and systemic continuity from the former communist regime, the consequences in the Slovenian case have been quite different. The supposed assets of the good starting position, negotiated transition and ‘consensual’ approaches have turned out to be major liabilities during the subsequent stages of transformation. Finally, a broader comparative model of factors impacting both the early and the post-crisis stages of transformations in East-Central Europe is presented for the East-Central European new democracies and tested through the application of the fuzzy-sets analysis demonstrating that insufficiently flexible systems are hardly able to cope with the complex challenges such as the ones generated by the post-2008 crises.

Innovations as a Policy Tool for Societal Transformations
Victor CEPOI (School of Advanced Social Studies, Slovenia) | victor.cepoi@fuds.si
Tamara BESEDNJAK VALIČ (School of Advanced Social Studies, Slovenia) | tamara.besednjak@fuds.si
Borut RONČ EVIČ (School of Advanced Social Studies, Slovenia) | borut.roncevic@guest.arnes.si

In this paper we focus on the role that social and technological innovations can play in enhancing or hindering transformative social processes in regions of Central and Eastern Europe (CEE). Our research question is whether we can use innovations as a policy tool for semi-peripheral and peripheral regions and what are the specific mechanisms that can be
purposefully utilized to influence individual and collective actors’ choices. For that purpose we will analyze, first, the necessary and sufficient conditions of successful transformations on a sample of selected CEE regions and secondly, search for variety of causal combinations, which can lead to desired outcomes. Our analysis begins with conceptual debate with the purpose to develop theoretical concepts. These concepts do not only serve the purpose of developing relevant theoretical foundation for our analysis, but also enable us to determine relevant ‘fuzzy-sets’ (i.e. variables) and relevant domains (i.e. cases). Our analysis is based on qualitative and quantitative data on CEE regions’ developmental performance, innovative processes and policies and socio-cultural factors that constitute the ‘soft’ regional infrastructure. On the basis of fuzzy-set analysis we present a model, which has not only heuristic purpose, but also strong potential for application in developmental policy for semi-peripheral CEE regions.

Quarter of Century since ‘the End of History’: What Happened and Why?
Borut RONČEVIC (School of Advanced Social Studies, Slovenia) | borut.roncevic@gmail.com
Jana SUKLAN (School of Advanced Social Studies, Slovenia) | jana.suklan@gmail.com

Quarter of century since ‘the end of history’ we can observe that contrary to the initial naïve expectations semi-peripheral and peripheral Eastern and Central European (ECE) countries have not converged with the European core. Furthermore, variety of data indicates that some ECE countries have performed much better than the others. In our paper we are tackling the question of the reasons for these developments. We are searching for answers in the analysis of necessary and sufficient conditions of developmental performance, utilizing the model of socio-cultural factors of development as developed by Adam et al. In the beginning of the paper European countries are systematically grouped as part of core, semi-periphery and periphery in two points of time: mid-1990s and after 2010. We group countries by applying multivariate analysis of data on developmental performance. In the second part of the paper we search for factors of development that have contributed to some countries’ stagnation or even regression, and look for answer why some countries are more successful. In this part we group countries on the basis of multivariate analysis of indicators of specific factors of development. In the final part of the paper we search for specific necessary and sufficient conditions of regression, stagnation and development by application of fuzzy-set analysis.

RN36S02 - Social Stratification and Class Identities

The middle class or intelligentsia? Social position and identity of Youth in Central and Eastern Europe
Hubert KOTARSKI (University of Rzeszow, Poland) | kotarski@ur.edu.pl

The purpose of this article is to confront the theory of cultural capital and social capital social reality in cross-border regions of three countries: Polish, Slovakia and Ukraine, with particular emphasis on the role played by the intelligentsia and middle class in these societies. This confrontation will include both theoretical reflection on the nature, focusing on the problem of the application of the theory of cultural and social capital to describe societies of Central and Eastern Europe, and also the results of empirical studies carried out among the students of universities in Poland, Slovakia and Ukraine. The specific objective of the article is to analyze the concept of cultural capital and social capital as a factor of identity and social position and political youth Poland, Slovakia and Ukraine, for example, the youngest generation - college students.
Class positions and class identities: an analysis of their relationship in post-socialist and capitalist countries
Elena SIMONCHUK (Institute of Sociology of NAS of Ukraine, Ukraine) | elena@simonchuk.kiev.ua

This report presents the results of an empirical study of class identities according to two research traditions. Firstly, the analysis of data from the project «Social Inequality» in the 2009 International Social Survey Programme (ISSP) was carried out within the tradition of studying the relationship between class positions and class identities [Centers, 1949; Hodge, Treiman, 1968; Evans, 1993, 1998; Wright, 1997]. (Objective class positions were determined according to the EGP class scheme, while class identity was determined by the respondent's identification with one of the six class categories.) It allowed to state that the majority of the population of Ukraine, as well as of a number of other post-socialist and capitalist countries, has an adequate awareness of their class position. In particular, about two-thirds of respondents from working and middle classes identify themselves with their corresponding class position. The correlation between the objective and subjective class is quite strong in all the countries under comparison (and is higher in post-Soviet Ukraine than in the developed capitalist societies). Secondly, within the tradition of typological analysis, typologies of class identities of the middle and working classes in Ukraine were designed based on in-depth interviews. In particular, the basis of allocation of the three types of identities of the middle class ("Western", "Ukrainian" and "Status-mismatched") was the consistency of self-assessment of the occupational and financial status. Consequently, the results of typological analysis allowed to specify the conclusions drawn on the basis of the mass survey data.

Factors of subjective social stratification in the post-transitional Estonian society
Marju LAURISTIN (University of Tartu, Estonia) | marju.lauristin@ut.ee
Peeter VIHALEMM (University of Tartu, Estonia) | peeter.vihalem@ut.ee

Analyzing patterns behind self-assessment on the 10-point scale of social position, our paper explores social, economic, cultural factors of subjective social stratification in the post-transitional Estonian society. The analysis is based on the data of national surveys made in 2002, 2005, 2008, 2011 and 2014. The main hypothesis is that patterns of subjective social stratification represent not only economic and social inequalities but also differences in adaptation to structural and technological changes, created by rapid digitalisation and globalisation. These changes are opening new opportunities for some groups but at the same time are creating new difficulties for the others. Special attention is in the analysis paid to the ethnic and generational dimensions of these new inequalities.

Trans-gender strategies. Feminist approach towards mechanisms of social distinction and articulation of class interests.
Mieszko HAJKOWSKI (Jagiellonian University, Poland) | mieszkoh@wp.pl

In my view, contemporary class analysis in Poland overlooks intersectional approach to the research on social stratification. Polish scholars following Pierre Bourdieu masterpiece "Distinction" (1984) are focused on coding the behaviour "in a cold and mechanical classificatory manner which does not bring out the pleasures and pain associated with gender, class and sexuality" (Skeggs 1997: 10). This attitude brings the excessive focus on cultural and economical capital of social actors. In my PhD thesis (entitled “The Analysis of the Relationship System of Gender Identity and Class Membership Based on the Extended Case Method in
Polish Cosmetics Company”) I postulate greater consideration on the role of conversion patterns and symbolic capital as a final type of capital, accountable for power relations. From this perspective, gender appears to be the main catalyst of capitals conversion process leading to the symbolic one.

The feminist approach towards mechanisms of social distinction and articulation of class interests provides deeper insight into the class formation processes. The use of the feminist ethics to develop and enrich class theories will be the core of my presentation. Achievements of scholars like Joan Acker, Beverly Skeggs or Michele Lamont, point out lacks and neglects of Western contemporary class theories, particularly those ones adapted to Polish socio-historical conditions. Furthermore, I will devote my speech to the part of my PhD research based on the interviews as well as secondary source materials and my analysis of women trans-gender strategies. By them I mean the strategies of distinction or strategies providing upward mobility, which involves partial transformation of habitus and taking advantage of features culturally ensign to males.

Initial bibliography:
RN36S03 - Trends in Political Identities and Activities

Mass activity and political transformation: institutional model of mass politics
Sergey PATRUSHEV (Institute of Sociology, Russian Academy of Sciences, Russian Federation) | patrushev2009@hotmail.com
Tamara PAVLOVA (Institute of Sociology, Russian Academy of Sciences, Russian Federation) | tamarapavlova@mail.ru
Liudmila PHILIPPOVA (Institute of Sociology, Russian Academy of Sciences, Russian Federation) | ludmila_filippova@hotmail.com

The phenomenon of mass politics is historically associated, as shown by Seymour Lipset and Stein Rokkan, with the emergence of political field, the unfolding of political process, and the formation of political systems. Their structural and qualitative characteristics are determined by the content and direction of mass activity.

To analyze the process of mass involvement in politics, we propose to differentiate between two concepts – "mass politics" (= political action and participation shaping / reproducing modern democratic institutions) and "politics of masses" (= direct mass intervention into politics, spontaneous, often violent mass action). Separating politics of masses from mass politics, one can not dismiss any mass activity as potentially dangerous, but should analyze its various forms in terms of normative foundations, intentions and consequences.

The main hypothesis is that mass politics, being an essence of democratic political process, is defined by the aims of individuals involved in politics, namely, to exercise civil rights and liberties (or to fight for implementation / extension of these rights). This is the main criterion to differentiate mass politics from politics of masses.

The empirical data on the mass activity in modern Russia is analyzed according to this conceptual framework. It allows to assess the level of structuring of country’s political space, and to show the trends in its political development (towards mass politics or politics of masses).

Forms and perspectives of mass political activity in contemporary Russia
Olga MIRYASOVA (Institute of Sociology of Russian Academy of Sciences, Russian Federation) | taoom@seu.ru

We can classify political activity into 4 segments. The first one is the segment of non-institutionalized opposition activity. It includes citizens who have skeptical attitude to elections, sympathize towards informal political initiatives and direct democracy, are ready to protest and believe in possibility of mass protests.

The second one is the segment of institutionalized opposition activity. It unites citizens of liberal political views who support “Yabloko” or new right-wing political parties. They actively participate both in election procedures and in mass protests and other forms of political activity (sign petitions, visit political debates and finance political organisations).

The segment of “ritual” support for the opposition consists of followers of old parliament “opposition” parties. These people actively vote but they are poorly involved in other kinds of political activity.

The segment of the loyalty to the authorities includes active government supporters and passive citizens who only regularly vote “for the stability”. Against expectations there are plenty of people involved in protests. We can suppose that these citizens support the authorities in general but protest against specific problems. People in this sector most actively use the institutionalized forms of political participation (observation of the elections, working in common councils, consumer boycotts).
Mobilization into protest movements can be based on three strategies: 1) civic, 2) deprivational, 3) political. The first and the third strategies are important for people who are already involved in protests or allow such a possibility. The second one will be the most significant for politically passive citizens in Russia.

**Trends of collective identifications in Poland**

Krzysztof KOSEŁA (University of Warsaw, Poland) | kkosela@is.uw.edu.pl

Sociologists are interested in the parallelism of humans’ living conditions and their experienced worlds. In 2014 the fifth survey of collective identification has been carried out on random national sample with the use of standardized procedure (first measurement in 1998). Respondents reacted to the question - who you are. Results of cohort analysis (generation effects) and of maturation (effect of relative time) will be presented to show that the most appealing are trends subsequent to successful transformation.

- The legitimacy of political system is uttered in increasingly common declarations: my important feature is that I am a supporter of democracy and in decreasingly popular declaration: I am an advocate of strong-arm rule.
- The growing prosperity of Polish society can be seen in the decreasingly common declarations: my important feature is that I am a poor.
- The decreased yearnings for the communist past is evidenced by a decreased universality of identification: my important feature is that I am a man of Polish People's Republic, and of the declaration I am a victim of reforms performed after 1989.
- The measurements also reveal some shifts in the social structure. But the most interesting result of repeated measurements is that the economic and political transformations are not accompanied by an equally profound change of Poles' belongings to a variety of communities. There are surprisingly few trends and unexpectedly many important belongings remained unchangingly common.

**The personalization of electoral politics and leader characteristics in the Eastern post-communist bloc**

Andrei GHEORGHITA (Lucian Blaga University of Sibiu, Romania) | andrei.gheorghita@ulbsibiu.ro

Mircea COMSA (Babes-Bolyai University of Cluj-Napoca, Romania) | mircea@mmt.ro

Political leaders are credited with a significant and growing impact on the election results in a general political environment dominated by catch-all partyism. Although debated in the literature, this evolution is expected to have a negative impact upon the quality of democratic representation by stimulating demagoguery and political extremism (Dalton and Klingemann 2007) or depoliticisation of elections (Lobo and Curtice 2014). These likely consequences have highly raised the interest for the investigation of leader effects in the recent years. Although extensively studied for the case of Western politics, the scenario of a similar shift from parties to leaders as main actors of the electoral scene has been largely ignored for the Eastern post-communist bloc.

As empirical studies identified significant variations in the magnitude of leader effects across contexts, several voices in the literature suggested the hypothesis of a ‘conditionality’ of leader effects (Barisone 2009) that should be investigated: there might exist some particular conditions moderating the manifestation of leader effects, acting as stimuli or inhibitors. The literature suggested several such conditions: voter characteristics, leader characteristics, party-related or system-specific factors. This paper aims to explore the extent to which the characteristics of political leaders influence the personalization of electoral politics across several new
democracies in Central and Eastern Europe. It investigates variations in leader effects in relation to several characteristics of political leaders: age, gender, time in office, political experience, incumbency, etc. For this purpose, it employs data from the modules 1, 3, and 4 of the CSES for CEE countries.

**RN36S04 - Youth: Political Participation and Attitudes**

**Orientation Towards Accession to Eu and Existence of Euroidentity – Are These the Same Issue: Case of Serbian Students**

Uros Vojislav SUVAKOVIC (University of Pristina, Faculty of Philosophy, Kosovska Mitrovica, Serbia) | uros-s@eunet.rs

The paper is based on the empirical research conducted among students in Serbia, at two universities: Belgrade University, which is the greatest, located in the capital, where students from all parts of Serbia are studying, but also students from abroad; and University in Pristina, moved to the northern part of Kosovska Mitrovica, where students or Serbian nationality are dominant and who are within the “frozen conflict” resulting as the consequence of Yugoslavia’s disintegration.

Obtained results show that the issue of accession to EU and the feeling of Euro identity are not the same thing. Students constantly show a pro-European orientation, while the percentage of backup varies due to the influence of various factors (happenings at Kosovo and Metohija, various statements of the EU representatives that seem conditional in relation to Serbia). However, when they were asked if they had some over-national identification, i.e. if they felt like Europeans, small number of them identified themselves like that. Such a finding on the European identity absence and simultaneous existence of positive orientation regarding the accession to the EU confirm the thesis of Brzezinski in interview with D. Rothkopf (July 2014) that the “EU then turned out to be, in the end, essentially a distributed arrangement in Brussels involving money and quid pro quos, but very little sense of common purpose”. The reasons for such an attitude of students are numerous; some of them are discussed in the paper, and the author arguments that all of them can be reduced to one – utilitarianism.

**Youth in Croatia before and after the postsocialist transition: from convergence to convergence?**

Mirko PETRIC (University of Zadar, Croatia) | mpetric@unizd.hr
Inga TOMIC-KOLUDROVIC (Institute of Social Sciences Ivo Pilar, Croatia) | inga.tomic-koludrovic@pilar.hr

This paper discusses values and lifestyles of Croatian youth after the period of postsocialist transition as compared with those expressed in the pre-transition context. The starting point for this discussion are the results of the all-Yugoslav survey of youth carried out in the late socialist period, a noted interpretation of which suggested that postmaterialist values were consistently present among youth in the northern republics of Slovenia and Croatia (Ule, 1989). Ecological concerns, lifestyle resemblances and even an entrepreneurial propensity could also be interpreted as the elements of convergence with their contemporary Western counterparts. In the period of postsocialist transition, marked at its beginning by the wars of Yugoslav succession, the social contexts of youth in the mentioned parts of Yugoslavia began to differ significantly. While in Slovenia a partial convergence with the West continued, in Croatia a post-war “skeptical generation” developed idiosyncratic lifestyles reflecting the complexities of their
The analyses presented in this paper show that the convergence is in the Croatian case at best partial. This is revealed by inconsistencies in value orientations when set against the framework posited in Inglehart-Welzel’s revised modernization theory, as well as in lifestyle divergences suggesting a model of “traditional youth” with even less autonomy than the usual Southern EU model entails.

**Engaged and critical: young generations’ political participation in EU countries**  
Maie KIISEL (University of Tartu, Estonia) | maie.kiisel@ut.ee  
Külliki SEPPEL (University of Tartu, Estonia) | kulliki.seppel@ut.ee  
Marianne LEPPIK (University of Tartu, Estonia) | mari19@ut.ee

The paper problematises young people’s expectations of and their immediate experience in political participation. It has been claimed that the distanciation of political agenda from young people’s practical life experience has raised their criticism and disappointment in traditional political participation. We ask what are the major predictors for the new, network-based and horizontal political practices among young people. We emanate from Russel Dalton’s (2008) differentiation between old (duty-citizenship) and new (engaged citizenship) types of political participation and problematise these based on the analyses of the empirical data of European Social Survey from 2006 and 2012. By exploring country and age group differences within EU we look for structural reasons for the trends in duty- and engaged citizenship. The results show that duty-citizenship is decreasing and engaged citizenship increasing among youth. Both types of political participation are related to the critical perception of country’s political performance. The new type of participation (engaged citizenship) is one-sidedly related to critical attitude towards the political performance of one’s country whereas duty-citizens are polarised (both critical and positive). Engaged citizenship seems to have a democratising effect as the role of education and social status play smaller role in the prediction of participation.

**Polish youth and support for democracy after 25 years of transition. Dynamic analysis of the survey data**  
Krystyna Ewa SIELLAWA-KOLBOWSKA (Instytut Badań nad Podstawami Demokracji, Poland) | ewa.kolbowska@gmail.com

Did the 25 years of political transformation in Poland persuaded youth towards democracy? Who in this persuasion plays the most important role? School, family, peers, the media, the politicians? Today, the opinions of young Poles (18-19 years old) are highly divided and critical about democracy. Trend analysis (seven measurements in the period from 1994 to 2013) shows that in 2010, for the first time, group of respondents declaring the pro-democracy attitude ceased to dominate - the majority of respondents chose the option "do not know" (36% in 2010 and 33% in 2013). Now, with the statement that democracy has an advantage over all other forms of governments, agrees up to 29%. In last three years, proportion of young people choosing to answer that sometimes undemocratic governments may be more desirable than democratic (an increase from 21% to 24% ) has slightly increased. In addition, the criticism of the functioning of democracy in Poland has never been expressed by young people so commonly as in 2013 (70%). Only one in six respondents (16%) is satisfied with it. Weak support for democracy correlates with a low interest of politics, the lack of identification with political parties and low participation or weak willingness to participate in the elections. An analysis of data from surveys in years 1994, 1996, 1998, 2003, 2008, 2010 and 2013, carried
out by CBOS, will be presented. The study was carried out on a nationwide random sample of different types of secondary schools.

**RN36S05 - Institutional and Organizational Structures Under Transition**

**Projects in an academic institution: between bureaucracy and post-bureaucracy**  
Gražina RAPOLIENĖ (Vilnius University, Lithuania) | grazina.rapoliene@fsf.vu.lt  
Aurelija JAKUBĖ (Vilnius University, Lithuania) | aurelija.jakube@cr.vu.lt

Modern bureaucratic organisations are characterised by hierarchical structure, control and accountability. Post-bureaucratic organisations, which are widely established in the postmodern world, encourage empowerment, initiative, creativity and responsibility of their members while transferring control functions to the corporate culture and a clearly defined and comprehensible mission of their organisation. Despite the fact that the postmodern, or post-bureaucratic, type of an organisation that came into being in the 1960s is being increasingly integrated in various aspects and areas of society, including public institutions and universities, the question whether this type of organisation gains ground over the modernist type is still yet to be answered. This paper has been written on the basis of the materials from 3 discussion groups, representing administration and departments of one university, that summarise their seven-year experience of EU Structural Funds project management. The paper presents insights into the issues arising due to the interplay between different corporate values and cultures and considers alternatives of solving these issues.

**Changes in the Structure of Resources and Production of Non-profit Organizations in the Czech Republic**  
Laura FONADOVA (Masaryk University, Faculty of Economics and Administration, Czech Republic) | laura@econ.muni.cz  
Jiří ŠPALEK (Masaryk University, Faculty of Economics and Administration, Czech Republic) | spalek@econ.muni.cz  
Zuzana PROUZOVA (Masaryk University, Faculty of Economics and Administration, Czech Republic) | prouzova.z@gmail.com

Non-profit institutions are characterized by their multi-source funding. There are numerous publications on this issue, including discussions on the public financing impact on the NPO behaviour. The situation in (post)transformation countries might be different. The ongoing process of re-definition of the role NPI play and consecutive issue of the public support is not acquainted with appropriate data.

After we explored absent places in the realm of existing data on the Czech non-profit sector, we designed a survey by which we map how the amount (and structure) of resources and funds of the non-profit organizations has changed in the Czech context between 2008 a 2013. The main research question is whether resp. how the changes from public sources revenues affect production (and sustainability) of the Czech non-profit organizations. Our hypotheses is that the changes in the internal structure of income of non-profit organizations will vary by organizational type, mainly by organizational size, age of organization and primary area of activity according to ICNPO classification.

We obtained data directly from the NPOs registered in the Czech Republic by quantitative research (survey). While using the retrospective method of study we compared the data from
2013 with year 2008. In our contribution we introduce main findings with the ambition to verify resource dependence theory. Research in this range has not been implemented yet in the Czech context thus our results has a potential to become a significant contribution to understanding the role public income play in total income of NPOs in (post)transformation country.

Employees of transitioning Polish companies towards organisational change: results from case studies
Witold NOWAK (Adam Mickiewicz University in Poznań, Poland) | wnowak@amu.edu.pl

Economic, legal, and political transformations that have started in 1989 in Poland influenced contemporary social reality on macro, meso and micro levels. The transformations, inter alia, resulted in a massive emergence of new companies and a necessity for existing companies to adapt to new operating conditions. Organisations that were state-owned followed various paths of transition in the new system. Whatever path was followed by a particular company, beyond a doubt, the process influenced its organisational culture, intraorganisational relations and, last but not least, employees (David Ost, Elizabeth Dunn). Apart from the long-term transition processes going on, Polish companies obviously need to react to current changes in their organisational fields what often results in implementation of organisational change initiatives. Generally, the processes can be described as an accelerating transition from the Weberian model of bureaucracy to Toffler's/Mintzberg’s adhocracy model.

The aim of this paper is to present the chosen results of the conducted research on employees' attitudes towards organisational change. Results of case studies of organisational change conducted in four pre-1989 state-owned companies following various patterns of transition will be discussed. The fieldwork was based on a mixed methods research design concept. Particular attention will be put to the analysis of two areas of the research. First, an insight into how the history of companies’ transitions is represented in the discourse on ongoing organisational changes will be given. Second, the discursive practices concerning social differentiation’s influence on organisational behaviour compared to the results of employees' surveys will be presented.

Emigration in the Perspective of the Transitions from Education to First Job in Bulgaria
Rumiana STOILOVA (Bulgarian Academy of Sciences, Bulgaria) | Rumiana.Stoilova@gmail.com

This research aims to investigate emigration in the context of transitions from completion of formal education to first job among young people in Bulgaria in the last five years. The theoretical framework of analysis is based on theories of individuals’ life transitions and the status changes that define the trajectories of an individual’s life. The authors use empirical data obtained from a representative survey on young people in Bulgaria, conducted in 2014, which includes a detailed calendar of education-to-work transitions made by young people in the preceding five years. The survey is focused on a specific age cohort (people born between 1989 and 2004) and on the transition – an important one for young people – from education to work.

The research interest is aimed at the analysis of differences, by education, gender, age, social origin (including ethnic origin), settlement and region, among young people who have had experience with emigration. The questions addressed in the study are: What kind of young people travel more – the better or the less educated, those from the capital, from the district central cities, or from smaller settlements? Are there significant differences in this respect related to gender or ethnic origin? The aim has been to clarify the factors leading to the decision
to emigrate; to model the impact of various social-demographic characteristics on migration attitudes and behavior of young persons, and to outline the dimensions of insecurity of the transition to first job under conditions of economic crisis. For this purpose, the authors have used descriptive analysis and logistic regressions with the variables “emigration attitudes” and “actual experience with emigration”.

The preliminary results of the analysis indicate that the probability of emigration aimed at finding a job tends to grow with every consecutive transition to first permanent job, and yet emigration is not the large-scale choice of youths in Bulgaria in the consecutive steps they take from education to employment. Emigration is a potential option, to which young people are open; they take advantage of shorter or longer sojourns abroad in order to work. The lack of work restrictions for Bulgarians, in the context of the country’s integration in the EU, and the awareness of this opportunity explain the higher quantitative levels of willingness to emigrate among young people compared with their actual experience with emigration. People with lower than secondary education, the unemployed, people from smaller settlements, and those not of Bulgarian ethnicity emigrate at a higher rate than other young people. Among youths, emigration leads to postponement of starting a family of one’s own but is a favorable factor regarding separation from parents, transition to independent life and, hence, acquiring the status of young adults.

**RN36S06 - Around the Ukrainian Crisis: Ideologies and Perceptions**

**Constructing a ‘New Cold War’: From Confrontation to Interaction and Back**  
Klaus MUELLER (AGH University of Science & Technology, Krakow, Poland) | mueller@agh.edu.pl

In June 1990 the confrontation between the West and the East came to an end when U.S. President G.H. Bush declared: “The Cold War Is Over”. This surprising turn of history has been portrayed as a learning process from an essentialist to an interactionist perspective: The Soviet Union was no longer regarded as an essentially totalitarian state which could only be ‘contained’ by military means and eventually ‘rolled back’; the Soviet government was understood as one of the players in a costly threat game which was finally defused by mutual concessions.

All this changed in 2013. With the advent of the Ukrainian crisis, the old repertoire of Cold War stereotypes is back. The uprising on Kiev’s Maidan, a local event, has been framed as a clash of ‘European values’ and the expansionary nature of a revived ‘Russian autocracy’. The danger of a new great war is written on the wall.

While it seems that Samuel Huntington’s prognosis of civilisational faultlines between Western Europe and Russia came true, it will be argued that more can be learned from his warnings of triumphalist conclusions from the ‘End of the Cold War’.

**In search of Central Europe – young Polish travelers visiting Ukraine**  
Marta COBEL-TOKARSKA (The Maria Grzegorzewska Academy of Special Education, Poland) | mcobelto@gmail.com

In my project I describe the phenomenon of Central Europe, understood as the former Eastern bloc countries; both in terms of ideas and social practices. In the first part of my work, presented at ESA11th, I focused on ideas of Central Europe emerging in several discourses in Poland. Now I would like focus on another issue: the reception and forming the idea of Central Europe by people travelling across this region. In my researches I investigated how young Polish travellers perceive Central Europe, why they choose this direction, what they are thinking about it.
For this session I prepared the case study: I selected stories about travelling to Ukraine, in order to show the meanings and senses connected with the travels to this country. My interlocutors – ten women and seven men – visited mainly Lviv and the Ukrainian Carpathians (Gorgany, Chornohora, Eastern Beskids). Several people were in the Crimea, Odessa, Chernivtsi, Kyiv, Ivano-Frankivsk, Drohobych. Firstly I show how the Ukraine is received by travellers. The key component of Ukraine image is its exoticism (poverty, adventure, extremism, unknown rules, freedom). Secondly, I focus on the travellers' attitudes – a sense of superiority and admiration. I analyse the tales of travellers in the context of the postcolonial theory. On the basis of perception and reflections of Polish travellers visiting Ukraine we can observe emerging of new definitions of East and West, as well as meanings attributed to those terms.

**Stereotypes, Prejudices, and Attitudes towards Eastern Europeans**

Antanina SIAMIONAVA (Polish Academy of Sciences, Poland) | antalina1@gmail.com

Introduction: The attitude towards Eastern Europeans (here and later by the Eastern Europe we understand Russia, Ukraine, and Belarus) in many states is, generally, rather negative, and much worse than those regarding many other nations (e.g. Americans or Western Europeans). Moreover, all of the Eastern Europeans are often put in the same group of “East”, “Russian”, or “Soviet” people. That kind of thinking is spread not only in the Western Europe, but also in the neighbouring Poland, Slovakia, Lithuania, and others. Neighbouring countries have often more stereotypes, prejudices, and common beliefs about each others due to the large number of contacts they usually have. (Lazari & Rogińska, 2006). That's why in present research we decided to focus on Polish attitude towards Eastern Europeans. Long and rich historical contacts and/or conflicts of Poland with the target states substitutes a background for a great number of stereotypes and common believes about those nations. Nowadays the eastern border of Poland is also the border of EU, so the attitude of Poles towards their Eastern neighbours is of high importance due to the political factors (especially after the Ukrainian revolution in 2014 and the steps towards the integration of Ukraine with EU).

Methodology: The target group of the research encompassed two different generations of Poles: students aged 18-27 and the elderly people aged 65 and over. Such a sample allowed see differences between Poles raised during different historical contexts – Soviet and post-Soviet. Research questions: 1) What is the contemporary attitude towards Russians, Ukrainians, and Belarusians in among the elderly and university students’ adults in Poland? 2) Compared to the past, what is the current tendency in those attitudes? 3) With which characteristics do Poles mostly associate Russian, Ukrainians, and Belarusians? Research methods: analysis of the secondary data and focus group interviews.

Research reports providing the Polish attitude towards the other nations over the last twenty years have been analyzed. Five focus group interviews (three with university students and two with elderly Poles) were conducted and analyzed.

Secondary data analysis: As various investigations have shown (Roguska, 2014) the nations of Eastern Europe are still rather among the least liked in Poland. While the first data are available form 1970th, we particularly concentrated on the last two decades, since the three target nations as well as Poland became independent states. Since that time there were some general tendency to evaluate nations with a higher living standards in a more positive lights that those with relatively low (at least lower than in Poland) socio-economic status. However, the level of positive attitude towards the rich Western countries has been gradually decreasing over last years, while the attitudes towards Eastern European Slavic states has been increased twice. The other important factor is current socio-political situation. Shortly after the integration of Poland with EU in 2004 the positive attitude towards almost all nations (including Eastern European) has been increasing, what was probably connected with the feeling of political
stability in Poland and lower level of fear in front of the other states (e.g. Russia). Ukrainian aspiration towards democracy and western values, embodied in the Orange Revolution in 2004 and Ukrainian revolution in 2014 have had a significant impact on the perception of Ukrainians and Russians by Poles. Both Ukrainian revolutions were followed by the increase of sympathy towards Ukrainians and decrease of sympathy towards Russians, which were seen in a role of oppressors and/or aggressors.

Focus group interviews: The attitude towards the target nations was quite ambiguous in both groups. Participants revealed both positive and negative characteristics of the target nations. However, there were some significant differences between two generations of Poles. For the young people the image of target states and their nations was shaped through their economic and political development, and was mainly associated with strikes, corruption, an oppressive political system, and poverty. They did not have much information or general interest about Eastern Europeans. They built their opinions rather on the information provided by media. Shaping their opinions about the other nations, young generations of Poles often recall the practical benefits arising from it. Thus, they underline the low socio-economic status of Eastern European countries in contrary to the EU.

Elderly Poles had revealed more knowledge and experience about the target nations (mostly from the post-war communist times). For them Eastern Europe was mostly associated with historical events, Soviet Union, WWII, and post-war conflicts. Elderly Poles more often provided the psychological characteristics of the Eastern Europeans (such as emotional, cordial, helpful, hostile to Poles, lazy, drinkers, people with the minimal living requirements) – which were almost never mentioned by the university students. Interesting is the fact that elderly Poles, in contrary to university students, often underline the common Slavic roots with unite Poland with Eastern Europe.

Conclusion: The attitude towards Eastern Europeans had been gradually improving since the last twenty years; nowadays it is still slightly negative, with a tendency for a more positive changes. The old stereotype of “Russian soul” is still alive especially among the old generation of Poles; Ukrainians are mostly portrayed by their current political event; and Belarusians appeared to be the less known. Participants of both age cohorts revealed positive and negative associations; hence it’s rather ambiguous with a slight bias toward the negative one. However, elderly Poles had much more stereotypes and prejudices about Eastern Europeans, based on the history, but also on the common Slavic roots. University students, in contrary, were more neutral towards Russians, Ukrainians, and Belarusians. They mostly based their evaluations on the socio-economic development of those states.

RN36S07 - Puzzles of Russian Transformations

Informal networks as a way of adaptation of population to the economic reforms in Russia*

Roman ANISIMOV (Russian State University for the Humanities, Russian Federation) | ranisimov@list.ru

Reformation of Russian economics was marked by liberal reforms. As a result of these changes social expenditures (education, health) have considerably reduced, export of goods with the high added cost (machinery, precision equipment) has decreased, the proportion of government officials has grown, the state has remained dependent on oil prices. Also, there have been significant changes in the social structure of the population; the share of employment in the primary and secondary economic sectors has declined, but the share of employment in different services has increased. In assessments of the people, market reforms have not overcome the
problems of a planned economics other than the eliminating of deficit. However, in general, compared to the Soviet period, the population expresses its satisfaction on the economic situation in Russia.

When analyzing the socio-economic situation in Russia, we can conclude that the liberal model of the Russian economy as a whole has not met its mission. This was due to a simplified approach to the Russian society. As a result, society has developed its own protective mechanisms in the form of informal networks against the devastating effects of ill-conceived economic liberalization. Subsequently, these networks have grown into corruption, bribery, quasi-feudal relations that hinder economic development of the country, but at the same time contribute to the economic adaptation of the population. Thus, informal networks perform the latent function of adaptation of population to liberal reforms, so they are systematic and have the social nature of their origin, not psychological or historical roots.

* This speech was prepared by the grant from the Russian Science Foundation (project № 4-18-02016 «Lifeworld of Russians and the evolution of the forms of their participation in the implementation of state and social transformation (1990-2010-ies")

The Unjust Society: Unequal Inclusion as Institutional Failure
Mikhail Feodorovitch CHERNYSH (Institute of Sociology, Russian Academy of Sciences, Russian Federation) | mfche@yandex.ru

The problem of justice is becoming an increasingly hot subject in contemporary sociology. The level of inequality is rising across the world. The population of post-Soviet countries has been facing injustice as a lived experience since 1991 or earlier. There are two basic components of the injustice condition in the mentioned societies. Firstly, it is the stark inequality that is rampant in all spheres of life. The inequality is manifest as inequality of income, inequality of life chances, inequality of participation in decision-making and territorial inequality. The survey on social justice conducted by the Russian society of sociologists explored the inequality as unequal inclusion resulting from malfunctioning institutions. It made respondents face a number of cases in which the personality, wealth, power of individuals involved came against the functioning institutions. It appears that a consensus exists in society that in critical situations the individual cannot rely on institutions and must employ personal resources whatever they are. The most popular response to injustice would be the “exit” option precisely because in the formal institutional framework citizens suffer from unequal inclusion. A closer look at the institutional structure of contemporary Russian society reveals that unequal inclusion in the network of formal institution is compensated by the existence of informal institutions on a micro-level whose power can be easily reversed in favor of those with authority and wealth. The equilibrium between formal macro institutions that are ineffective and micro institutions helps maintain the existing system of inequality.

The "Russian World": How Do Russians See it Nowadays?
Mikhail Konstantinovich GORSHKOV (Institute of Sociology of the Russian Academy of Sciences, Russian Federation) | irina1-tiourina@yandex.ru

Modern socio-political coordinates of the world force us to call attention to strategic policy projects applying for civilization specificity and integrative cultural intentions as a kind of “soft power”. The concept of the “Russian World” is one of the ways we can follow in order to employ such logic of using civilization mechanisms. This concept suggests ideological and political grounds of modern Russian policy, designed for use those with a Russian civilization identity as a “soft power”. Its content is stated as a right and duty of Russia to become an independent and equal subject of international relations, since historically it is not only one of the countries of the
world, but also a separate and special civilization community. Russian cultural dominant bringing together large numbers of people is an integrative framework and a value substance of the concept. The problem of image of the Russian world as it is in the public consciousness of Russians correlates with the nature of above geopolitical project and raises the question of how the meaning and content of this project penetrates into the mass consciousness and behavior, as well as some others. Sociologists study the concept of the “Russian World” in order to analyze deeply the social transformations in post-Soviet Russia. Research findings show that a clear majority of Russians demonstrates sustainable Russian civic consciousness combined with an ethnic identity and growing “Russianness”. And this majority tends to be stronger. Russians bid to return to super-power status, however mainly through promoting economic development and high quality of population standards of living (over 50%). Only one third of Russians believes it can be achieved through culture and “revival of the national spirit”. By now it is clear that the desired goal, i.e. the recovery of a super-power status, as it is in mass consciousness has no external aggressive orientation and is connected somehow with the nostalgic mood and the unequal status in the world aversion. Some Russians share the elements of imperial mentality. However above manifestations do not dominate and are aimed at domestic targets, rather than outside. The inner orientations of such sentiments is stressed by public opinion about the reference points of the Russian state which are related to ensuring equal rights for all Russian citizens or allowing some advantages for those who is Russian by nationality. The ambiguity in the “Russian World” perception and diffusiveness of its image as it is in the public consciousness are a logical consequence of the ambiguity of this strategic project conceptualization, as well as of debates around this very concept. It is difficult to say how effective this geopolitical project will be, however even now we can talk about its interpretation which is the most appropriate and supported by the society and treated “Russian World” as special and in some way unique civilization with its own historically developed traditions and values. Civilization content of this image and its conceptualization in the theoretical and political discourses actualize perspectives on research in the field of the nature and models of Russian socio-political and sociocultural transformations. As well as on multidimensional understanding of identity and its impact on modernization and political development of the society under the conditions of modernity, on in-depth study of new strategies of megaprojects and their correlation with public expectations.

Social Transformations in Russia in the Context of New National and International Realities
Irina Olegovna TYURINA (Institute of Sociology of the Russian Academy of Sciences, Russian Federation) | irinaolegovna.tyurina@yandex.ru

The paper is based on the results of empirical study conducted by the Institute of Sociology of the Russian Academy of Sciences within the framework of monitoring project "Dynamics of Social Transformation of Modern Russia in Socio-economic, Political, Socio-cultural and Ethno-religious Contexts" at the end of 2014. Based on a complex analysis of the results of the first "wave" of sociological monitoring, assessments and conclusions of socio-diagnostic character were formulated, defining quantitative and qualitative parameters of the state and dynamics of Russian society at the present stage of experienced transformational changes. It has been established that the ups and downs of Russians’ social well-being are practically simultaneous (with a slight time lag) with periods of stabilization and destabilization of the situation in the country and the world, and populations’ confidence in the future is largely connected with an understanding of the co-dependence of external and internal factors. Mixed views that Russians have on account of currently happening socio-economic and political processes indicate dominating uncertainty in public opinion about the trends and prospects of the country's
development. The picture of social diagnostics is complicated by deep social inequalities that, combined with regional inequalities in different settlement structure, further increase income inequalities, inequalities in access to quality healthcare and education. The empirical evidence has shown that in general at the end of 2014 Russians are more satisfied with their lives than not satisfied with it. A mixed picture of Russians’ self-assessments of various aspects of their own life is revealed. On the one hand, positive assessments continue to prevail over negative in most aspects of their lives, and for some of them (satisfaction with their own social status, level of personal security) differences between positive and negative ratings have even increased. On the other hand, assessments of the situation at work, opportunities for recreation during the holidays, leisure, etc. have noticeably decreased. Analysis of the current socio-economic and domestic political context clearly showed the complex interaction of multi-level factors that have different vectors and dynamics. Their resulting effect is manifested in a particular combination of social stratification and integration processes taking place in Russian society. In actual multistructurality of socio-economic relations, major factor of Russian society consolidation is support of population for public institutions and, first of all, the president. At the same time, current state of relations between Russian society and government represent a “mosaic” fragments of which do not form an interconnected and sufficiently broad communicative space. Social strata and groups that demonstrate positive or, conversely, negative attitude toward authority are not connected to each other due to deep economic, territorial, settlement, social, cultural, generational and other differences. Positive attitude to the president of the country provides stability of the existing socio-political regime. However, in the long run this does not preclude the emergence of social and political conflicts in situations of possible aggravation of the international situation and the consequent actualization of domestic social and economic problems. Research work done in 2014 recorded a high differentiation of Russian society in regards to the norms, values and attitudes that guide daily lives of Russians. However, despite the fact that gradual movement of Russians from inertia towards activism was revealed, "active" and "inert" groups of our fellow citizens are currently similar in size and comprise about 40% of population. Another 20% of Russians can be described as representatives of mixed type, whose views are not fully balanced and combine both active and inert attitudes and values simultaneously. General trends and socio-cultural features of norms and values systems of Russians in the ethnic and cultural context were analyzed. Sociological evidence showed that the current system of value orientations of Russians, regardless of their ethnicity, is based on traditionalist foundations. Reliance on tradition is common to all population of the country (in terms of “traditional” for the post-Soviet period) and does not conflict with ethno-cultural variability of the contents of specific traditions, but suggests respect for the traditional foundations of the existing lifestyle and practices of social interaction in the regional spaces of Russia as a nationwide value.

RN36S08 - Communities and Local Spaces in the Focus of Transformations

Transforming Communities: The example of community broadband initiatives.
Claire WALLACE (University of Aberdeen, United Kingdom) | claire.wallace@abdn.ac.uk

Community empowerment is seen as an important aspect of community development and there are positive examples where communities have taken over local shops, local pubs or even bought their own land. This is seen as good initiatives from both the left and the right (building on the “Big Society” arguments). However, these examples are uneven and many communities
fail to be empowered in this way, leading to growing inequalities. This paper looks at the example of community broadband initiatives in the UK as a source of local empowerment and factors that help their success. The factors identified are human, social and technological capital and the ability to deploy a variety of resources. It considers the rather weak organisational model on which these initiatives are based, making them vulnerable to changes in funding and in community leadership. It argues that these initiatives can only supplement state funding and policies under some circumstances, rather than replace them.

Transformation of recreational space: Russian and European patterns
Anna SHEVCHENKO (Southern Federal University, Russian Federation) | anna_isir@mail.ru

In the context of cultural, economic and political transformations in modern society there is an increasing interest in such field of research as the sociology of space. It studies social phenomena and processes of a particular territory. Recreation is a kind of activities strongly connected with space. It either depends on spatial conditions or creates and changes it by tourist practices.

Recreational activity is the subject of study of many disciplines (sociology, psychology, economics, geography). The interdisciplinary character of this phenomenon results from great range of factors, which influence it (amount of free time, place of residence, opportunity for spatial mobility, affluence and other indicators). Despite the significance of outdoor recreation for the life of people, sociological studies focus mostly on recreational space of a city and don’t analyze it on regional or national levels. Though, such point of view may be useful in implementation of development strategies of territories and social construction of reality.

The aim of the paper is to analyze fundamental approaches of studying social space in Russia and Europe. Also, specific practices of transformation of recreational space in Russian regions are compared with the European models. In conclusion the author gives some ideas for future study of regional development in the sphere of tourism and recreation.

Mechanisms through which locally/regionally specific electoral behaviour is sustained or changed over time – the case of eight Czech municipalities/regions
Renáta MIKEŠOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | renata.mikesova@soc.cas.cz
Tomáš KOSTELECKÝ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | tomas.kostelecky@soc.cas.cz

The aim of the paper is to analyse mechanisms through which locally/regionally specific electoral behaviour is sustained or changed over time. There are several cities and regions in the Czech Republic where voting behaviour could be considered locally/regionally specific. In some cases territorially specific electoral behaviour simply reflects specific socio-demographic characteristics of population like education, age, religion or employment structures of voters. In other cases, however, territorially specific voting behaviour cannot be explained by specific structures of population and have to be attributed to other underlying factors. First we have identified eight model municipalities/regions that are specific in terms of voting behaviour based on the statistical analysis of electoral results from 1992 to 2013 parliamentary elections. Each of the chosen cities/regions represent different type main party families (social democratic, radical left or communist, fiscally conservative and Christian democratic). Then we have conducted eight focus groups interviews in the model municipalities/regions specifically aimed at exploring various possible mechanisms though which electoral behaviour are sustained or changed. The presentation will try to answer following questions: What are the main reasons that a region/city constantly keeps its specific electoral behaviour and differs from others in terms of the election
results? Does any family political tradition exist in these localities or are there any significant historical events which influenced political development of this municipality region? Are there any significant opinion leaders or organizations that influence voters’ behaviour in the municipality/region?

**Urban Grassroots Initiatives and the Transformation of Public Space in a Post-Soviet City: the Minsk Case Study**

Ianina KAZACHUK (University of Edinburgh, United Kingdom) | yanina.kazachuk@gmail.com

The topic of the transformation of public space in post-soviet cities is currently gaining more and more attention of social researchers. Following the fall of the Soviet Union, post-soviet states have been undergoing major social and political transformations, which have also had an enormous impact on urban space. The very image of the city has changed significantly: whereas earlier it was mainly determined by official urban planners, the new epoch enabled new actors, including the city dwellers themselves, to take an active part in the process and alter the urban space, filling it with new meanings and interpretations.

My research project aims to explore the role of citizens’ grassroots initiatives in the transformation of public space in the post-soviet city in the recent decades. I draw on Minsk as a case study and focus in particular on public spaces that have appeared there as a result of citizens’ association. While analysing various non-formal urban projects in Minsk, such as the newly emerged squats, art spaces, anti-cafés, etc., I aim to explore how the younger post-soviet generation of Minsk citizens is challenging and reinterpreting the inherited urban environment to make it fit with the new times and with their own aspirations for (creative) self-expression.

**RN36S09 - Cultural Dimension of Transformations: Senses of Belonging and Pride**

The sense of belonging in a cross border area

Albertina PRETTO (University of Trento, Italy) | albertina.pretto@unitn.it

The aim of my paper is to present a case study carried out in Gorizia, an Italian town in the region of Friuli-Venezia Giulia, and Nova Gorica, in the Slovenian region of Goriska. The particularity of these two towns resides in the fact that they used to belong to the same nation, whereas now they are separated by a national border.

Gorizia was part of the Habsburg empire since the beginning of the 16th century and, in 1921, after World War I, it was annexed to Italy. At the end of World War II, Tito’s Yugoslav army occupied it but, in 1945, Gorizia was assigned to Italy again. The Paris peace treaty in 1947 defined the border line between Italy and Yugoslavia. In order to establish a local political and administrative entity, the Yugoslav regime created and built the city of Nova Gorica in the urbanised part of Gorizia under its control.

The study explores the socio-territorial belonging in these two towns: since their separation, their history and social processes took different paths, but the two towns are located along the same border area. My research question (in particular but not only) focuses on the sense of socio-territorial belonging in the Gorizia and Nova Gorica residents toward their respective towns, country and Europe.

A particular type of qualitative interview with photos was applied to carried out this research: the bipolar photo elicitation.
Representing the common past: analysis of history museums in former Yugoslavian countries

Alina ZUBKOVA (School of Advanced Social Studies, Slovenia) | alzubkovych@gmail.com

The dissolution of socialist regime in ex-Yugoslavian republics has led to forming the new national focused narratives that led to the re-interpretation of past and the role of the newly-born countries in it. The process of disintegration, relatively quick and peaceful in Slovenia or Macedonia, had differed dimension in BiH, Croatia and Kosovo. The long term clashes, ethnic cleansings, violence and urbicides are ‘in the past’ and the new countries have gone through the number of transformations in defining the past from the new national perspectives. The proposed research aims to analyze how socialist period is reflected and represented in the history museums of the ex-Yugoslavian capitals. We use the history museums as the space for analyzing the common trends and national unique differences in dealing with the same period. As a result of our research, we show how different strategies of governments in different countries contribute to construction of the final product in the history museum. Thus, the actualization of the victimization discourses in Macedonia with implementation of ‘antiquisation’ politics of memory is one of the examples. The revisionism of the Second World War period in Serbia or appearance of private initiatives to organize the Yugonostalgic exhibitions in Serbia and Slovenia is another example.

We use visual analysis and semi-structured interviews with the curators, directors or the guides of chosen museums as the main methods.

The museum as an object of social analysis is grounded in the idea of the functioning of the given institutions in a political field. Such institution function not only for displaying the material and preservation objects chosen as the heritage objects, but also as the space, which helps different groups of interest to use it for ideological purposes and to compete with each other (Crane, 2000). We define museum as a place of the concurrences of the power and meanings (Williams, 2007).

Another important aspect needed to be mention is the fact that the individual memories are usually substituted by the official interpretation or the “official history” in the museums (Kavanagh (1996): 2). In contemporary museum practice such exhibitions when the individual memory are encouraged to be represented are rising, however, the successful cases of transmitting the material through the personal hi (stories) are still rare phenomenon and our research will show how the history is displayed in two main history museums located in Skopje. The reason to use museum space as the sphere of sociological analysis is related to the fact of its interdependency to the state policy, its involvement in the construction and fixation of the national narratives and shared national, local, transnational or any other type of collective identity (Watson (2007): 160). The physical dominance and monumental appearance of the given buildings signal about its importance, the content “materialize the nation” (Bouquet (2012): 34). Through the construction of the “focalized normative code of practices and values out of peculiarly arranged displays with historical artifacts” museums, and history museums in particular, have materialized ideological narrative (Luke (2002): 228) tied with the state ideology (Bouquet (2012): 36).

The exhibitions as the main product of the museum policies “have almost always been the result of considerable negotiation” of different professionals like designers, curators, managers, historical consultants involved in the decision-making process” (Liddiard (1996): 167). As the consequence, the material represented at the museum always goes together with the selectivity of information and visual artifacts being used.

The political nature of the museum is another reason of keen scientific interest. The display in some sort of museum natural, art or history is involved in constructing the national myths,
sometimes class dominance (Barrett (2010): 57) or post imperial Western supremacy (Luke (2002)). We understand museum as a place of the concurrences of the power and meanings (Williams, 2007); secondly, as the place where the material talks not only about the history, but also about the actors, involved in creating the meanings (Bennett, 2008).

We are applying method of visual analysis by which it is relevant to see the ways by which the material is sorted and visualized. The titles of the plaques and any other auxiliary material are also taken into account. The overall view, image framing and actualization of the nodal points through the events or main heroes is taken into account when doing such visual observation. The field trip was conducted in December 2013, January and summer 2014 and the visual material supporting the given article consists of the personal “photo notes”.

**Rational and Normative Pride in Comparative Perspective: the East, the West, and the Rest**

Vladimir MAGUN (Institute of Sociology of the Russian Academy of Sciences; National Research University Higher School of Economics, Russia) | maghome@yandex.ru

Marharyta FABRYKANT (National Research University Higher School of Economics, Russia) | marharyta.fabrykant@gmail.com

Nationalism is usually seen as universal, unpredictable, and irrational. Our study challenges all the three assumptions for at least one component of nationalism – national pride. Based on the ISSP data from 2003, we discovered that national pride does not vary between higher or lower rationality, but simultaneously exists in two distinct types, which are only moderately correlated.

The rational national pride rests on country’s specific achievements and is strongly related to objective indicators of country’s performance, such as the GDP per capita. The normative national pride, instead, reflects ready-made nationalist propaganda and does not depend on a country’s actual success, but is positively related to religiosity as a proxy for suggestibility.

Multilevel regression analysis revealed some predictors for rational and normative pride to be not universal, but regionally specific, especially for the Eastern Europe. Controlled for other variables, Eastern European countries score on both rational and normative pride significantly lower than Western European and high and middle-income non-European countries. Besides, the Eastern Europe differs from the rest of the world in the impact some individual-level predictors. In particular, the subjective, self-evaluated social status is stronger positively related to rational, but not normative national pride in the Eastern Europe than in other regions, and the education level is less strongly negatively related in the Eastern Europe than other regions to both rational and normative national pride. Thus, national pride appears a multidimensional outcome of combined influences of the nation’s actual achievements, propaganda of these achievements, as well as imaginary successes, and the level of demands against which achievements are evaluated.

**The Forgotten, the Ostracized, the Lost or the Exotic? In Search of Lieux de Mémoire Referring Back to Socialist past in the Post-soviet Cultural Spaces**

Liena GALEJA (Latvian Academy of Culture, Latvia) | liena.galeja@gmail.com

The concept of lieux de mémoire, suggested by Pierre Nora, can be attributed to any meaningful entity which has become a symbolic element of the memorial heritage of some community by purposeful human performance or the work of time. Lieux de mémoire functionates as an array of mnemonic techniques which is set into action when the „real”, „true” memory dies out, and a necessity arises for constructing a network structure of referring back to past, thus sustaining the actual identity of a community and laying a solid foundation for developing the existing identity or re-shaping it. In the post-Soviet transition societies lieux de
mémoire referring back to the Soviet past can be regarded from several points of view, among which the predominating aspects are, first, a tendency to disassociate and forget the past; second, deliberate ostracism; third, a nostalgic yearning for the „lost paradise”; fourth, exoticization the past as a marketing strategy. The research paper gives a broader insight into these aspects and role they play in the transition societies by searching for samples at the post-Soviet cultural spaces, as well as driving parallels among the phenomena of Ostalgia in the former East Germany, Yugonostalgia in the former Socialist Federal Republic of Yugoslavia, post-Soviet nostalgia in the Russian Federation and, specifically, the post-Soviet nostalgic phenomena in the cultural space of the Baltic states, marked as a particular case due to their long occupation history and being situated on the crossroads between the East, the West and the North.

Ethnic Stereotypes of University Students in North Kosovo
Snežana POPIĆ (University of Pristina with temporary head office in Kosovska Mitrovica, Faculty of Philosophy, Department of Sociology, Serbia) | snezanapopic@gmail.com

The social attitude of an ethnic group expressed toward members of the other ethnic group can be observed through its triple structure composed of cognitive, emotional and conative components. The phenomenon of negative ethnic stereotypes is often observed in regions of long-term instability and historic struggle for the defense of "blood and soil". This paper presents the results of sociological research of ethnic stereotypes of students at the University of Pristina, whose head office is temporarily settled in the region of so-called “frozen conflict”. Research was conducted with a representative sample in four time section, 2009th, 2011th, 2013th and 2014th. Respondents were requested to make statements about 50 possible (identical) stereotypes towards ex-Yugoslav nations, as well as the other major European and outside European nations. This study started from the assumption that students would uncritically express negative stereotypes towards those nations with whom Serbia has been in conflict. Nevertheless, the results show that university students in North Kosovo have built awareness of the benefits of living in a multicultural society.

RN36S10 - Sociology and Discourses in Central and Eastern European Context

East-European differences or European unification? In search of the dominant narrative in Polish sociological discourse A.D.2015.
Agnieszka KOLASA-NOWAK (Marie Curie-Sklodowska University, Lublin, Poland) | ag-kol@wp.pl

The main issue concerns the state of sociological discourse in Poland. After 25 years of dealing with systemic change Polish sociology has travelled a long way. Is there still a need for using the transformation paradigm or are there any new ideas and interpretations of the main developmental and social problems in post-communist realm? What are the main intellectual challenges in sociological analyses and what are the connections with Polish public discourse? In the beginning post-communist transformation was seen as a part of a historical process of modernization of backward society and catching-up after the communism. In Poland the idea of westernization has been widely accepted. Now it is seen more as a particular, history-based modernization of a relatively underdeveloped and peripheral society from the post-communist region. It raises the problem of permanent differences and durable inequalities between Western and Eastern Europe.
Finally there is an interesting question of changing role of sociological diagnoses in recent years. Do still Polish sociologists, especially form younger generation, have interest in thinking and conducting research on macro-level? What are the most popular attitudes in dealing with problems and challenges of “post-communist singularity”?

**Media, Social Sciences, and Power. The Symbolic Construction of Inequalities.**

Tomasz WARCZOK (Pedagogical University of Cracow, Poland) | tomaszwarczok@gmail.com

The symbolic plane is an important, but often poorly recognised dimension of social inequalities. It refers to collective representations (mental categories), which legitimize the order of social classes and global inequalities based on the division between the world core and (semi)periphery. These types of symbolisation are created in fields of social production (the media, social sciences, politics, etc.), in order to finally trickle down to the everyday life and to function as dichotomous cultural codes.

The paper shows structural conditions of formation of these symbolisations, more specifically, the configuration of social fields in Poland. As such, it is possible to present the hidden but the key role of social sciences in the reproduction of dominant ideologies. This role is particularly important in semi-peripheral countries, in which the lack of local bourgeois, causes that the intelligentsia (intellectuals) with the entire field of social sciences occupy a dominant position and determine the direction for ‘modernisation’. In practice, this means introducing arbitrary social divisions into ‘winners’, (‘cosmopolitans’), tout court members of the ‘western civilisation’, and ‘losers’, (‘locals’), whose alleged personal traits remove them from the ‘civilisation’. Similarly, culturalisation and individualisation of social inequalities is strengthened by, on the one hand, the proximity of social sciences and media fields (presenting only common-sense visions of the world), and, on the other hand, the supremacy of methodological realism (in local sociology, economy, and political sciences), which is designed to perceive rational individuals, while omitting the hidden emergent structural conditioning.

**From East to West or from West to West? International influences on Czech sociology in the transition period**

Marek SKOVAJSA (Faculty of Humanities, Charles University Prague, Czech Republic; Institute of Sociology, Czech Academy of Sciences) | marek.skovajsa@soc.cas.cz

The sweeping societal transformations in Eastern Europe after 1989 have not avoided the discipline of sociology. This paper investigates the changing set-up of principal foreign influences on Czech sociology in the decade before and after 1989 using citation analysis as its main instrument. While a general understanding exists that sociologies in CEE countries made a radical turn from East to West after 1989, this claim has only rarely been confronted with objective data. This study analyzes the changing international influences on Czech sociology by examining the references to various sources in the national sociological journal, Sociologicky casopis (SC). The types of intellectual influence studied in the periods before and after 1989 include: Western European and US sociology, Soviet and Russian sociology, Polish and other Eastern European sociologies, the Marxist-Leninist canon, the works funded by US philanthropic foundations, Western transitology literature. The citation analysis discloses also the changing influence of certain Western sociologists, e.g. T. Parsons, P.F. Lazarsfeld, Ch.W. Mills, R. Aron, P. Bourdieu, or Z. Bauman. Another topic is how frequently the “core” American journals, ASR, AJS and Social Forces, as well as the Soviet/Russian journal Socs were cited in SC in different periods. The picture of international influences on Czech sociology will be complemented by an analysis of citations of SC in foreign journals based on enhanced data
from the Web of Science. Where data or studies are available, the Czech results will be compared with corresponding trends in sociology in Slovakia, Poland or other countries.

**How far 'civil' means 'civilized'? The Eliasian civilizing process as a perspective for the research of civil society development in Central-Eastern Europe.**

Arkadiusz PEISERT (Gdańsk University, Poland) | zorgus2@wp.pl

The aim of the paper is to put forward a systematic treatment of the concept of civilizing process which has been introduced (in sociological term) by Norbert Elias. He examined, how manners in the French Court have been developed during centuries. In spite of the popular meaning, Elias considered this process on very general terms (not only limited to the manners of good behavior). In contradiction to medieval France (the main subject of the Eliasian opus magnum The Civilizing Process), in England and Scotland the civilizing process had led to the development of civil society in the shape which has been conceptualized by John Locke, the witness of his age.

According to Elias, the civilizing process is the essence of the development of civilization of western Europe. In fact, this idea comes at least from Adam Ferguson. I bring up a topic of social capacity to build civil society in that sense

I consider the level of ‘civility’ as an important factor of the development of civic participation after the collapse of communism. Authors such as Etzioni, Touraine, Sennet and Putnam have made a point about the meaning of the specific individual attitude being essential in the emergence of true civil society.

Central and East European countries are often characterized by weak sense of civic virtues. But what it really means? On the one side, we can observe much of quarrels and conflicts in everyday public life, on the other – intensive mobilization of these societies in the case of dangers, crisis, natural disasters, etc. Theoretical works based on the concept of social capital (in the Putmanian sense) seem to be not able to explain it. The concept of civil society is to be used as an alternative

I would like to present some results of my research, conducted during the winter and spring in Polish local democratic bodies in cooperatives and local communities,

**RN36S11 - Monitoring Social Changes: Politics and Economy**

**A fuzzy line between success and survival in ‘Gazpromland’: conclusions from an ethnographic study on the everyday practices of business in Siberia**

John KENNEDY (University of Birmingham, United Kingdom) | jak945@bham.ac.uk

In this paper I share preliminary conclusions from my ethnographic fieldwork into the everyday practices of three entrepreneur-businessmen in Siberia. My objective is to demonstrate the constancy of uncertainty arising from regulatory and bureaucratic circumstances (in addition to general uncertainty resulting from economic crises) in the country, while arguing that success can still be achieved. To do this I outline the historical development of each business and describe their current status in order to discuss the factors that have determined their success or failure.

In the first case study I examine how a business with financial and ideological support from outside Russia quickly grew but recently fell victim to suspicion and aggression from official and unofficial sources, and is now in crisis. In the second case study I describe how an early post-Soviet business developed to dominate its regional market, but whose director has successfully
steered a fine line between cooperation with, and subversion of, the local bureaucracy. In the third case study, I describe how a former factory worker became a city oligarch but later fought a battle with the local administration, lost his empire, went to prison, and is now rebuilding his life and business.

I discuss the everyday practices – attitudes and behaviours – that each businessman takes in response to their situations, and find that Russian business conditions are peculiarly challenging because of their inherent duality: their simultaneously benign and malign character. Through empirical examples, I draw conclusions on the contemporary state of political-economic transformation in Russia.

Precarious prosperity in Romania and Switzerland: A longitudinal qualitative analysis of strategies improving the quality of life of households
Rebekka SIEBER (University of Neuchâtel, Switzerland; University of Fribourg, Switzerland) | rebekka.sieber@unine.ch
Ionela VLASE (“Lucian Blaga” University of Sibiu, Romania) | ionela.vlase@ulbsibiu.ro

The socio-economic situation, the households’ resources and constraints and their subjective assessment are key components of quality of life. We argue that the experienced quality of life depends not only on living conditions and the evaluation of these, but also on the opportunities people and households perceive they dispose of to maintain or improve their situation. Such opportunities may be provided on the micro and on the macro level of society.

Our analysis of the quality of life of households in “precarious prosperity” in urban regions of Romania and Switzerland is based on qualitative interviews carried out within an ongoing comparative research project on strategies of households in precarious living conditions, financed by the Swiss National Science Foundation (SNSF) and the UEFISCDI Romania. The longitudinal and comparative design allows new insights into the dynamics of the situation of population groups in between poverty and secure prosperity and shows similarities and differences between East and West.

Building on the analysis of purposefully selected cases, the present paper focuses on strategies to improve the household's quality of life and takes into account the interaction between structure and agency. Results show the impact of the opportunity structures, the perceived scope of agency, the people's position within the life course and their strategies (as acting, adaption, reframing) on the experienced quality of life. The focus on households experiencing improving quality of life over time reveals, what strategies are helpful, depending on the context they are living in.

Between Connections and Meritocracy: Dynamics of Public Opinion on Determinants of Success in Poland (1988 -2013)
Ilona WYSMULEK (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland) | ilona.wysmulek@ifispan.waw.pl
Anna BACZKO-DOMBI (Institute of Philosophy and Sociology, Polish Academy of Sciences, Poland) | anna.baczko@gmail.com

What do we need to succeed? Some say that this is hard work and talent, others claim that knowing the right people and just a little bit of luck. For sociologists, the subjective assessment of the main determinants success in life offers a rich source of information about society. It is a kind of litmus test of changing social structure and social reality in general (Janicka, Słomczyński 2007; Firkowska-Mankiewicz, Zaborowski 2002).

In this presentation we plan to investigate how the views on the path to success have changed in Poland over the last 25 years – starting from the communist era, through the turbulence years
of transition, first years of membership in European Union, and up till the last years of economic crisis. For our analysis we use the Polish Panel Survey POLPAN data (1988-2013), which is a unique program of panel surveys that has been carried out since 1988 in 5-year intervals; it focuses on describing social structure and its change during the last 25 years in Poland. We will present the stability and change in the strength of broader dimensions visible in data structure, depicting meritocratic attitudes in Poland. We will also check how socio-economic determinants influence opinion of respondents. We aim not only to make our analysis from the cross sectional perspective, but also to use the panel character of POLPAN data and to look deeper into patterns of dynamics at the level of individual respondents.

Old-New Problems of Housing 36 Years after Transformation
Grażyna WORONIECKA (University of Warsaw, Poland) | gworoniecka@wp.pl

In 1987 deficit of dwelling places in Poland was evaluated on 1.5 mln digs. In 2014 it was... also 1,5 mln deep and one still had to wait for a social housing no less than 10 years. I will present some possible reasons why changes in Polish housing policy (from 1980-ties till now) could not reduce existing deficit. General direction of changes is radically liberal: as far as there were 4 per cent of private living quarters in 1988, there is only 2 per cent of newly built social digs nowadays. It is an extensive strategy which causes long-term financial pitfall for buyers who practically cannot change or sale their abode without costs they cannot afford. Phrase 'to buy lodging' preplaced terms like 'capture' or 'pull off lodging' used before 1989 in everyday conversations. Standard and size of quarters are dependent of the buyers' creditworthiness, not of their needs or style of life. Communist 'normatives' strictly limited size of apartments according to number of relatives living together; now, dwelling places are also overcrowded because of their costs.

Housing development is decelerated in spite of engaging giant private money (debts mostly). There are some cultural and ideological reasons of that. Ideology of private owning is negatively correlated with culture of renting flats. Uniformed, expensive technologies and 'family topos' make housing offer poor. Apartments are not differentiated technologically, in their size, standard and functions to current needs of mobility, ecology, new patterns of family life.

RN36S12 - Visual Media Representations of Social Transformations

25 years of Polish transition. The history in pictures.
Maciej Andrzej MYSLIWIEC (AGH University of Science and Technology, Poland) | maciej.mysliwiec@agh.edu.pl

In year 2015, over twenty five years after changes which took place in 1989 there is no clear opinion about those events. In a public discourse there are many views, which are connected with political ideologies. Those views have a strong influence on polish society which is day by day more and more divided. And what is dangerous, people's opinions are getting more radical and political discourse is getting more aggressive. Common, years ago, acceptation for polish transition, is no longer common and what may be alarming it causes social conflict based on different views for transition.

Present polish society is mostly satisfied with changes which took place in 1989, but there are people deeply disappointed and with strong feeling of harm, who think that post-transition Poland is not hospitable country for them anymore. In social discourse society is divided for those, who "won" and those who "lost". It leads to conflicts and feeling of deprivation in groups where people recalls communism as a system where everybody has the same chances to reach the success.
In my presentation I would like to detach from the common theories and social conflict. Basing on the visual sources I would like to describe how did people, everyday life and urban landscape has changed in last 25 years. Basing on the historical photographs, and documentary film I will prepare the comparison of the life before and after the transformation to present the differences in the main areas of everyday life.

Fashion images as indicators of social change
Alicja Katarzyna RACINIEWSKA (Adam Mickiewicz University, Poland) | alicjar@amu.edu.pl

My presentation concerns a dramatic economic, political and cultural transformations of the former socialist countries and what a study of fashion representations in print magazines reveals about that transformation. Following Herbert Blumer (1968, 1969) I would argue that studying fashion and popular culture produces insight into contemporary attitudes and sensibilities, and fashion representations are indicators for the analysis of social change in modern societies. My presentation will be focused on a systematic analysis of the images and adverts in polish fashion magazines in 1945-2014 which reveals patterns in production of cultural and ideological constructions of East and West.

Cementing the capitalist discursive hegemony through a "leftist" talkshow. "Večera s Havranom" as a case study
Tomas PROFANT (Institute of International Relations, Czech Republic) | profant@iir.cz

The aim of this paper is to analyze how the Slovak public television talkshow “Večera s Havranom” frames important political issues and excludes particular opinions. By being represented as a counterweight to the talkshow “Lampa” moderated by the conservative journalist Štefan Hríb, the impression is created that “Večera s Havranom” represents the left political specter. The analysis of the discourses and practices that create a particular frame shows that whereas the talkshow opens a space for moderate leftist ideas, it prevents more radical leftist ideas from appearing in public broadcasting. It thereby cements the current discursive hegemony that postulates liberal democracy as a natural political space for a discussion between center-right and center-left ideas. The show thus fits the thesis about the end of Post-Communism and its neoliberal hegemony that is being replaced by a more open hegemony that includes perspectives that seemingly oppose each other, but have common liberally-democratic roots. The analysis will analyze six shows that touch upon (or exclude) the question of political economy.

Framing post/socialist cities: visual materials as ideological constructions and their transformation
Petr GIBAS (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | petr.gibas@soc.cas.cz
Blanka NYKLOVÁ (Institute of Sociology of the Czech Academy of Sciences, Czech Republic) | blanka.nyklova@soc.cas.cz

Throughout the state socialist period in Czechoslovakia (1948-1989), emphasis was put on industrial production. This resulted in focusing on coal and steel producing cities such as Kladno and Ostrava as vanguards of progress. Unsurprisingly, the cities figured heavily in official visual state discourse about the successful socialist present and happy communist future facilitated by urbanisation and industrialisation. After the fall of state socialism, the visual discourse on the very same places radically transformed and has kept doing so until present.
The visual statements about the cities prior 1989 were collected in many high-quality official photographic books while similar books, but this time more often produced for profit, started to be published after 1989. They comprise the material under study in this paper. Using visual discourse analysis, we explore the rich visual material depicting socialist industrial cities prior and post 1989 using two different lenses within the interpretive framework, that of geography and gender studies. This double approach to the same visual material then allows us to explore in depth the complexities of how socialist cities were (re)presented and branded by means of a carefully carved visual discourse and how the geopolitical change has affected their image, brand and visuality more generally. Such an approach helps us not only to uncover and engage with a wider thematic field of the change brought about by the demise of socialism, but, most importantly, to critically assess and potentially broaden each other’s approach while exploring the transformation of the ideological construction of urban space.

**RN36S13 - Transformations in Social Welfare and Housing**

**Informality and the Welfare State in Eastern Europe**

Abel POLESE (Dublin City University, Tallinn University) | ap@tlu.ee  
Borbála KOVÁCS (Central European University) | kovacsb@ceu.hu  
Jeremy MORRIS (University of Birmingham) | j.b.morris@bham.ac.uk  
Oleksandra SELIVERSTOVA (Tallinn University, Vrije Universiteit Brussel) | alekseli@tlu.ee

Debates on the post-socialist welfare state have evolved in two main directions. While some scholars have maintained that these would eventually converge with Western European models, others have pointed at the need for a more ‘particularist’ approach, seeking to demonstrate that post-socialist welfare states might follow a different, non-traditional path, individually or as a region in terms of welfare provision. This paper contributes to debates on the mode and direction of post-socialist welfare state adaptation by engaging with corruption and failure in social welfare provision / the public sector. In particular, emphasis is put on the tactics and strategies used by public sector workers and citizens to cope with incomplete and inadequate public social welfare provision. Drawing on three case studies constructed with ethnographic material collected on access to public childcare in Romania and to social transfers in Russia and Ukraine, the paper explores how informal practices re-chart the relationship between the public welfare sector and service users in the context of economic transition. We argue that where the welfare state does not penetrate, welfare might be spread also through informal channels and this formal-informal complementarity might redefine the very dynamics underpinning society. The commonality represented by informal tactics in negotiating access to scarce public social services allows us to argue that post-socialist welfare states, penetrated by formally regulated and informally practiced exchanges, represent one facet of an alternative to the neoliberal capitalist model that has been seen as the only option for some time.

**Changes in welfare regime and discourse of social justice in Russia**

Elena DANILLOVA (Institute of sociology, Russian Federation) | endanilova@gmail.com

The paper investigates the main trends in the welfare state developments of the Russian Federation and their correspondence to the discourses of social justice during Soviet time and after the fall of communism. It argues that debates around social justice occur explicitly when there is a public need for justification and legitimation of the changes targeted at social inequality issues. The paper also identifies periods of the welfare policy and social justice discourse developments due to a variety of different, but equally important, endogenous and exogenous factors that have influenced the social policy developments such as the presence of
national economic vulnerabilities and/or strengths in global economy, presence of informality in the welfare state organization, as well as to non-contingent decisions taken by governments.

**Housing inequality: The case of vulnerable groups in Latvia**

Līga RASNAČA (University of Latvia, Latvia) | liga.rasnaca@lu.lv

Provision of adequate housing is a major challenge for development of today’s society, and especially among people living on the fringes of society and close to the threshold of poverty. Vulnerable groups experience higher risk of housing deprivation (ex-offenders, unemployed, etc.). This study aims at analyzing how fears of inability to pay for housing are spread among different social and territorial groups, are these groups recognized in socially unequal situation within Latvian housing policy framework.

It is a common practice for central or local governments in EU to intervene and to provide housing functions for vulnerable groups. This public intervention can result in benefits or disadvantages for vulnerable groups.

Latvia is among EU member states where significant part of population is affected by the lack of adequate housing and, hence, over the years Latvia has obtained remarkable social knowledge in the field. The provision of social housing assistance in Latvia is among the functions of local governments; however, this assistance covers only minor part of population that is deprived of housing. This has some adverse consequences on the inequality.

The results of interviews with housing policy experts reveal an illusion that the problem will disappear with the growth of economy. The issue of inequality is being greatly undervalued.

**RN36S14 - Controversies of Institutional and Cultural Changes**

**A move to modernity: Women in Croatia after the postsocialist transition**

Inga TOMIC-KOLUDROVIC (Institute of Social Sciences Ivo Pilar, Croatia) | inga.tomic-koludrovic@pilar.hr
Mirko PETRIC (University of Zadar, Croatia) | mpetric@unizd.hr
Zeljka ZDRAVKOVIĆ (University of Zadar, Croatia) | zzdravko@unizd.hr

The paper is an attempt to summarize the changes in values, attitudes and practices of women in Croatia that have taken place in the period of postsocialist transition. Based on the discussion of empirical evidence extending from the mid-1980s to the present day, the paper calls into question the “retraditionalization thesis”, prominent in the social science accounts of the social and cultural trends in Central and East European countries at the beginning of the transition period. In the case of Croatia, the discussion of primary data from 1999, 2005 and 2015 surveys suggests that – in spite of various retraditionalization pressures – the process of modernization of Croatian women continued uninterruptedly in the postsocialist period. However, the analysis also suggests that the modernization process in question has evolved in a non-linear fashion, as it has resulted in seemingly contradictory replies of the surveyed women, in which traditional and even pre-modern values, attitudes and practices frequently coexist with modern and reflexive ones. Such results are interpreted as an outcome of a partial acquisition of values that a linear modernization process would be expected to entail and related both to the specificities of Yugoslav “third way” socialism and of the “second modernity” context toward which the Croatian society has moved in the period of postsocialist transition. The theoretical framework of the interpretation is informed by the tenets of newer modernization theories (Beck, Giddens,
Touraine, Inglehart-Welzel), and discussed survey results relate to the fields of family, work, religion and politics.

**Controversies of Post-Soviet European Identity: Baltic Patterns of Exclusion and Inclusion**

Triin ROOSALU (Tallinn University, Estonia) | triin.roosalu@tlu.ee  
Maaris RAUDSEPP (Tallinn University, Estonia) | maaris@tlu.ee

While ever closer union is the shared political goal in EU, EU member states and their citizens struggle with meaningfully filling the terms „European identity” and “European citizenship”. For post-socialist Europeans the urge to be included in the decision-making processes within EU indicated their readiness to break off from the past experience under the Soviet influence. Participation in EU was relevant to become accepted again as individual, „serious” countries with the will and decision-making power of their own. These processes are suggested to have been even stronger for the countries with so called post-colonial past: those that were part of Yugoslavia, Czechoslovakia, and the Soviet Union (see Bunce 1999, 2003). Controversy between previous inclusive „imperial” identity and contemporary exclusive ethno-national identity is a challenge for the development of common European identity in such countries. For EU-15, the gradual and phased integration builds on different logic than for the new member states. The latter rushed into accession under the guidance of their political elites at the time and took over the acquis communitaire all at once, without much discussion within the countries and leaving no room for developing (rather than deciding for) the sense of Europeanness among their populations. How does this experience shape the understanding of national identities, be they layered or flowing, fixed or bounded? This is our research question for this paper.

To answer the question, we will take Latvia and Estonia as our cases, two EU member states with the legacy of Soviet past. The paper is based on empirical material from cross-sectional cross-national quantitative survey on national identity, carried out in 2013 within the International Social Survey Programme. Comparative analysis of Estonian and Latvian respondents’ answers to the questions about „true” Estonianness/Latvianness will be explored. The criteria of inclusion and exclusion of new immigrants will be presented, with special focus on similar and different patterns between and within countries (comparing majorities and linguistic minorities). Then the connection between the respondents’ sense of The Other and her perceptions of the role of EU will be explored. Similar data on 2003 is available for Finland and Sweden, who had joined EU in 1995 and thus had by then been part of the EU 8 years - for about the same time as Estonia and Latvia, who joined EU in 2004, by 2013. The procedural logic, political context and socioeconomic conditions of the two accessions were rather different, but at the same time the geographically and culturally the countries are rather similar, this comparison may provide useful insight in the understanding of socio-cultural geopolitics of EU. The implications of such in-depth insight are relevant for conceptual comparisons with other regional alliances: how do EU and US identity, or those of EU and USSR, compare, for example? These are predominantly empirically grounded theoretical questions, and our study will contribute to those discussions.

**Civilizational differences of multiple social inequalities in modern societies**

Vladimir KOZLOVSKI (Saint Petersburg State University, Russian Federation, Sociological Institute of the Russian Academy of Science) | vvk_soc@mail.ru

Social inequalities in modern societies have their own integrated into flows of multiple modernities dynamics. This process is conceptually developed in the framework of civilizational
Analysis S. Eisenstadt, J. Arnason, P. Wagner etc. Configurations and constellations of inequalities, on the theory of N. Elias, are being formed under influence structural changes as well as cultural practices. Mechanism of changes in social inequalities is actually a way of civilizational dynamics of contemporary societies. Civilizational differences of social inequalities does not usually stand out because they do not characterize a social hierarchy, positions and resources whereas they emphasize institutional specificity, network, and architecture of the cultural autonomy of different countries and unions. The question is certainly not in a dilemma of East and West as a civilizational contradiction that poorly reflects the socio-structural differentiation within the modern nation-states and associations, and between them. In particular, it would be a mistake to assess political tensions, financial and economic aggravation between the West (the New and Old World) and Russia as civilizational confrontation that can radically change a system of social inequalities in Russian society. Social stratification in Russian society has several civilizational differences and similarities with them developed countries. These civilizational differences have especially cultural, religious, institutional character. Social inequalities are determined by institutional factors, cultural traditions, and values, ethnic and religious identity. Shifts in the flows of social inequality in modern societies are due to figurations of basic elements of civilized order, which should also include properties, government's regimes, economic, cultural practices, and forms of everyday life.

Postcommunism diversified. Agency, transparency, inclusiveness and reflexivity, and the trajectories of postcommunist transformation

Grażyna SKAPSKA (Jagiellonian University, Poland) | g.skapska@iphils.uj.edu.pl

After 30 years of postcommunist transformation in East Central and Eastern Europe, one can identify various trends and counter-trends in the trajectories of changes and establishment of democracy and rule of law after communism. Taking as analytical framework concepts of agency, transparency, inclusiveness and reflexivity this paper argues for a diversified conceptualization of postcommunist changes, and argues that the region of Eastern Europe, or rather as the Eastern and East Central Europe, can not be conceptualize as homogenous, but rather as reflecting many ways of social change and institution-building.
Tourism without Gentrification? Obstacles to achieve a “happy medium”

Maria ANDRADE (Universidade da Coruña, Spain) | mandrade@udc.es
Carmen LAMELA (Universidade da Coruña, Spain) | lamela@udc.es

Urban spaces are breeding grounds for the reproduction of social inequality. An example of this is the gentrification process that occurs when degraded spaces are intervened, showing class tensions in every time and place. The role of tourism in these cases has been signaled often. For instance, in order to enhance cultural tourism, buildings and spaces are preserved and restored then, at the same time, gentrification dynamics, comprising the displacement of residents from historical centres, are permitted. That “theme park” effect has also been denounced for having a negative effect on the same tourism industry on the long run. To escape this dilemma, local governments are looking for some multi-functionality strategies that may combine urban, touristic, and cultural demands. The goal is developing intervention policies and plans to achieve a “happy-medium”, combining and reconciling tourism with housing. This paper is intended to set out the hindrances toward that goal in a case study: The historical centre of the city of Lugo (Spain). This city is completely surrounded by a Roman age wall that was declared a UNESCO World Heritage Site in the year 2000. This analysis will focus on the recurring challenges for implementing measures aimed at stopping the accelerated neglect of the urban center as a dwelling place and the configuration of areas with a high concentration of especially vulnerable population and marginal activities.

Strategies of Invisibilisation: Findings from a Comparative Analysis of Managing Social Inequality on Public Spaces in Brno and Hamburg

Sandra Isabelle SCHINDLAUER (Bauhaus-University, Germany) | sandra.schindlauer@uni-weimar.de
Pavel POSPĚCH (Masaryk-University, Czech Republic) | pavel.pospech@gmail.com

Diversity and representativeness are the most distinguished qualities of public spaces in the European city. However, the meanings of these terms have changed in the course of the neoliberalization of the city, affecting the cohesion of the urban society as such. With regard to public spaces, diversity has been adjusted to an understanding of representativeness that focuses on the transformation of public spaces as being suitable for serving as a business card, while no longer reflecting the whole range of diversity including poverty and other social mischiefs.

When walking through the city, however, a visible evidence of urban poverty and social problems is often suppressed in an effort to create an illusion of an urban environment without poverty and social problems. In a comparative analysis of public spaces in Hamburg (Germany) and Brno (Czech Republic), this paper focuses on the means of invisibilisation as a tool of suppressing the visible traces of urban poverty. The authors discuss the means and strategies which the two cities use to deal with homelessness and urban poverty in public spaces,
including municipal ordinances and their enforcement, modifications of the built environment, technical installations etc.

Through a comparison of the experience of a West European city with that of an Eastern, post-communist city, the authors will elaborate on the concept of invisibilisation and its various facets and stress the importance of this process for the diversity and representativeness of public spaces and its implications for the urban society.

**Making Visible: Irregular Immigrants’ Uses of Urban Public Space**

Lilika TRIKALINOU (Goldsmiths University of London, United Kingdom) | liktrik@gmail.com

The paper examines irregular immigrants’ experiences of ‘institutional invisibility’ that are combined with their in-between socio-economic and political condition, reflecting, partly, immigration’s transnational character, drawing from the case study for the thesis “Making Visible: The inhabitation of urban public space by irregular immigrants” that took place in Athens, Greece in 2011-2012.

Irregular immigrants’ social reproduction is dependent, partly, on informal, often illegal, means to sustain a living linked to their usage of urban public space. Their everyday experiences, and the ways they negotiate their institutional invisibility and irregularity, are investigated as a means to explore the appropriation of urban public space in relation to the conditions of their habitation, thus opening up issues relating to their right(s) and claims to space.

The data show that urban public space is the primary means of survival and social reproduction for irregular immigrants, with it acting as both shelter and a place to network. Invisibility and irregularity are used as means to conceal immigrants’ marginal ways of securing basic needs away from the eyes of the State. However, their uses of public spaces are usually at odds with official, ‘legitimate’, governmental discourses about what public spaces are or ought to be. This opposition emphasizes the role of everyday activities in the production of space, but also the right to space - in the absence of other rights - by the plain instantiation of bodily existence of the institutionally invisible, irregular, immigrants in urban public space.

**Publics’ Movements vs. the Occupation of Living Spaces**

Pinar KARABABA KAYALIGIL (Middle East Technical University, Turkey) | pinarkarababa@hotmail.com

During the last twenty years new city policies appeared in Turkey with the rise of neo-liberal Islamist local governments. These policies bring the transformation of the city as a unit of consumption rather than production. Cities started to exhibit a Sunni-Turkish identity via the use of monumental structures and tradition even though not all the publics*share this identity. As a result, divisions between people increased. The nodes opened for a certain denomination sometimes occupies places owned by other denominations, religions or socialist groups and they bring gender segregation with the increase of separate places for gender groups. These developments are analyzed in this paper on their reflection on Sivas Turkey, where the biggest Islamist assault in Turkey happened in 1993 where 35 people murdered which was followed by a gradual Islamization and neo-liberalization of city politics. The focus is on how different publics and groups challenge this transformation by creating their own heterotopia and developing spatial tactics which are unique for each heterotopia. This paper analyzes four heterotopia – those of shopkeepers, Alevi public, secluded women and groups organized after 1993 event- to understand the dynamics of opposition and discusses the possibility of a united grassroots movement.

*Publics are deliberately considered multiple.
Public Spaces. Theoretical Approaches and Sociological Research
Antonietta MAZZETTE (University of Sassari, Italy) | mazzette@uniss.it
Sara SPANU (University of Sassari, Italy) | saraspanu@uniss.it

Discussion about the meaning of the public space is rich and complex. It comes through different areas of sociology, from the theoreticians of the modernity to the urban visionaries of the so-called post-modernity. The public space idea overlaps very little with the reality: any “ideal kind” of public space was strongly mythicised as referred to by scholars like Jane Jacobs, Nancy Fraser, Margaret Crawford, Sharon Zukin.

The paper focuses on three aspects: a) the nature of public space should be checked from time to time, in terms of accessibility, social mix and freedom of expression; b) public space is no longer considered an exclusively publicly owned space accessible to all; c) similarities between Italian and North America cities emerge, regarding the idea of public spaces as “hybrid spaces” that lie along a private-public/controlled-free continuum that people use in an undifferentiated way, until they perceive signs of disorder and explicit exclusions. These issues emerged from a study in 20 Italian cities within the years 2011-2013.

The actual trend looks oriented towards an increasing privatization of public spaces, where the need for social safety and the pervasiveness of consumerism play a central role. This trend would guarantee access to the public space only to some classes of people. That doesn’t mean that the request for public spaces is decreasing: though it is no longer a place where the community civic culture is created, it still reflects urban society, mirroring conflicting interests and few common values.

RN37S02 - Inequalities and Mobilities in Urban Spaces

Brain Drain: the case of Portugal
João Teixeira LOPES (Arts Faculty of Oporto University, Portugal) | jmteixeiralopes@gmail.com

The literature review allows us to conclude that the traditional perception of the brain drain has no empirical evidence on the aggregate level, being necessary the understanding of the circumstances and factors that influence the process in each country. This research aims to make a study of this type in the Portuguese context, still innovating in conceptual and methodological terms: first, refusing the logic of globalizing assumptions of human capital theory, guessing that migration can be caused by factors other than not pay gap by analysing the set of factors of attraction-repulsion; on the other hand, guessing that the international job system is not a space entirely free and therefore is not only dependent on the free play of supply and demand, is also necessary to observe the biographical trajectories in order to understand the reasons and destinations of migration.

In this presentation we will discuss the results of the analysis of 50 sociological portraits (Lahire, 2002), that will draft the life trajectories, the differential effects of socialization on the biographical dispositions and the strategies of improving the educational capital in a context of crisis.

The sociological portraits assume the existence of multi socialized individuals, plural agents who, throughout their pathways, have acquired a wealth of predispositions, often contrasting and even contradictory, which in a way reflects both the complexity of contemporary societies and the multidimensional nature of projects and constraints associated with these migratory flows.

Unpacking urban life in a global age: The case of Moroccan residents in Istanbul
Based on empirical research into urban neighbourhoods of the Turkish metropolis Istanbul, this paper explores how Moroccan-born residents perceive and use urban spaces in the city. Following the free trade agreement between Morocco and Turkey in 2006, increasing numbers of Moroccan nationals traveled to the Turkish metropolis Istanbul and some settled in various neighbourhoods of the mega city. The purpose of this paper is to further understanding of globalization processes in contemporary urban spaces which are often intertwined with digital spaces.

Combing semi-structured interviewing with participant observation, I examine how urban spaces are stratified in Istanbul and how unequal access to services and information affects the endeavours of newcomers. In doing so, I will discuss how urban life unfolds between real world places, such as a street café, and digital spaces, such as social networking sites. Drawing on assemblage theory, the exploration is situated in the wider context of a globalised world society.

Transnational flows of people, objects, information, and capital manifest themselves in political constellations that can be conceptualised as assemblages. Studying Moroccan residents in Istanbul through this theoretical lens sheds light on political decision-making and power relations in the global migration systems. The analysis of the Moroccan case in Istanbul indicates how differences and inequalities are created and upheld in the global city. However, the study also unveiled tactics that challenge the existing social divide.

Reproduction of gender inequality through urban planning: The case of Novi Sad
Ana PAJVANČ IĆELJ (University of Novi Sad, Faculty of Philosophy, Serbia) | pajvana@gmail.com

In this paper, we try to perceive the classic sociological critique of urban planning (H. Lefebvre) from a gender perspective. We are expanding the questions about who has a "right to the city", who is planning the city and for whom, with question of whether the city is adapted to gender-related differences between its residents and whether the current urban planning practices are gender-sensitive?

We recognize that the key relationship between gender roles and urban planning is in the spatial differentiation of production, consumption, and reproduction. It transforms urban everyday life making it torn between the tasks related to household and formal employment in the labor market. Social effects of such spatial strategies have a clear gender dimension. Besides formal employment, women often perform the tasks related to the care (for children, the elderly, etc.) that makes their daily routes through the city more complex. We are also considering gender dimensions of leisure spatial planning (especially sports activities) and trying to find out whether current planning practices reproduce, reduce or increase gender inequality in this domain.

The analysis of the current spatial plans developed by the Institute of Urban Planning in Novi Sad, showed that the urban planning practice in Serbia is "gender-blind". Behind the manifest motto - "We are planning for all" - lies the latent prejudice resulting from lack of knowledge about the social context ("users") and its gender characteristics. Thus, urban planning practice becomes an important but under-recognized, mechanism of gender inequality reproduction.

Living among equals in a city of inequalities: examples from Lisbon
Maria Assunção GATO (Instituto Universitário de Lisboa, Portugal (Dinâmia'Cet)) | magoo@iscte.pt
Agreeing with the evidence presented by Lefebvre in his book The Right to the City, the preponderance of economic value at the expense of social and human values accentuates social inequalities, hinders access to the city, reduces social diversity and fragments urban space according to a categorized hierarchy of places. On the one hand, the economic and financial performance of the real estate market has notable impacts on a more unequal access to the city, leading to fragmentation and categorization of urban spaces in accordance with a socially directed and differentiated hierarchy. But on the other hand, these same categorizations also contribute to a certain revival of the city as a whole, even through a network of specific places.

Taking the city of Lisbon as scenery, this presentation aims to explore how a set of values assigned to different urban spaces can attract several investors, interests and residents and how these urban spaces make use of these values to differentiate and promote themselves in various ways. Trying to cross several inequalities, the main focus will be the urban middle classes, their residential spaces and selective belonging strategies.

**Tracking migrant artists in the city: Configuration of migrant artists' circuits in Portugal**

Lígia FERRO (CIES-IUL, IS-UP, Portugal) | ligia.ferro@iscte.pt
Otávio RAPOSO (CIES-IUL, IS-UP, Portugal) | raposao78@gmail.com

This proposal aims at presenting the research undertaken within the project “The work of art and the art of work: creative circuits of education and labour integration of immigrants in Portugal” (ACM-FEINPT) and is focused on the circuits of migrant artists working in Portugal. Efforts were expended to systematize the social networks at stake and the importance of circulation itineraries to the working conditions of immigrant artists, as well as the patterns regarding their trajectories, future life projects and experiences of civic participation. Techniques of extensive and intensive analysis were brought together, benefiting from the experience of a multidisciplinary team specialized in Sociology and Anthropology, following the proposal of Weber (1995) consisting of building ethnographies armed with statistics.

The seminal results indicate that mobility is a condition for being successful in the artistic career, and also that nowadays artists draw benefits from easier and cheaper mobility conditions. The configuration (Elias, 1980) of the existing circulation networks of migrant artists in Portugal has a relevant impact on their living and working conditions; in addition, it is a key element to advance our understanding of how these actors contribute to social and economic enrichment, as well as to build urban communities in the contexts of Europe and a globalized world. Recent events show that the integration of immigrants in Western societies can be a challenge of greater complexity than previously thought. Their integration in the realm of employment is crucial to the construction of local communities in urban contexts.

**RN37S03 - Urban Social Movements**

**The Right to the City: Struggle against the Urban Transformation in Limontepe, İzmir.**

Secil OZDEMIR METLIOGLU (Sociology, Turkey) | ozdimirsecil@gmail.com

Urban transformation projects are seen as a main tool for creating more opportunities for market actors and forces. Those urban transformation projects poor, proletariat and marginal groups to
move to new living areas constructed recently at the outskirt of the cities and seem to be primarily concerned with opening up the attractive urban space to the use of the wealthy and market actors. Urban transformation projects could also be said to involve attacks on the housing rights of almost all citizens, but particularly the poor and marginal groups. Within this framework, the aim of the my article is to put forwards the effects of the urban transformation project in İzmir Limontepe suburb on the residence and environmental quality, the idea and the reflexes and also the participation and the support of the locals to this project and evaluate and analyse these and to develop proposals.

Istanbul between ex-Islamists constructors and a new urban movement
Ferhat KENTEL (Istanbul Sehir University, Turkey) | ferhatkentel@gmail.com

AKP, the leading party of Turkey, using occasionally Islamic rhetorics, is becoming a party fighting for a limitless development and for the instauration of a new capitalist class commending this development. The struggle for establishing and maintaining this emerging class rule by means of mass housing projects and high-rises, and the sacrosanct discourse of developmentalism rejected any criticism at all costs. Thus, people were displaced and green fields were sacrificed in the name of urban transformation.

Under the rule of AKP, the decision for the construction of a shopping mall on one of the last remaining green spaces within central Istanbul, Gezi Park, provoked a very radical movement, “Occupy Gezi”. The Gezi protests questioned the developmentalist discourse which encompassed all political currents and this new-generation social movement stood and voiced the “right to the city”, in line with Henri Lefebvre and David Harvey’s works.

In my paper I will try first to comprehend how a political party, AKP, issued from the Islamic movement turned into an authoritarian capitalist party after its “anti-modern” and “anti-capitalist” past. My second attempt will be about the new urban social movement issued from secular segments of society, i.e. the earlier protagonists of the “development”. In order to link these two aspects, I will try to grasp the role of the “Islamic threat” on secular groups’ “life styles” and the burning question of inequality in urban spaces.

The conceptualization of justice in urban space: The case of public transport in Brno
Gaby KHAZALOVÁ (Masaryk University, Faculty of social studies, Czech Republic) | gabykhazalova@gmail.com

The paper seeks to contribute to the discussion of urban process under capitalism, revealing the importance of conceptualization of space as an integral part of any proposal for remedy of not only spatial, but also social injustice. It deals with a theoretical conceptualization of spatial justice primarily based on a contemporary reinterpretation of Henri Lefebvre’s writings. It explores the dispute over relationship between the production of social and spatial injustice in the city presented among others by E. Soja and P. Marcuse. The reason why this relationship should be conceived dialectically – based on the analysis of socio-spatial dialectics – is being argued. The process of producing injustice is being exposed using the specific example of transformation of space: implementation of so-called „prevention officers“ in public transport in the city of Brno, Czech Republic. This example is considered as urban injustice drawn from the normative concepts of right to the city and right to the difference. The case study reveals modes of justification used by public transport company such as increase of profit or ensuring of security and comfort, claiming to solve problems with homeless people. Analyzing the way various actors perceive and appropriate a transformed space enables to conclude that space is not only produced by social processes, but in turn, reflecting, reproducing or transforming them.
In conclusion, the paper raises questions about potential remedy of injustice by transforming not only social processes (e.g., capitalism), but also spatial relations.

**As a Tool of Political and Economic Struggle, Housing Question in Germany and Turkey: a Comparative Analyses**

Cansu TEKIN (Akdeniz University, Turkey) | cansutekin89@hotmail.com

In Turkey, looking at the statistics, construction sector became an invisible tool for providing economic growth. When comparing to Turkey, on the other hand, Germany has an incredibly static housing sector. Those differences cause different social actions to make decision about housing issues in these two countries. At the same time, housing sector could be also seen as a tool for political and sociopolitical struggle in both counties.

Modern urban theories suggest a framework for comparing housing problem in Turkey and Germany. Firstly, we can argue that economic growth and capitalist production in Turkey are mostly provided by construction sector and those intensive construction activities represent to production of consumption spaces. Also, Harvey’s creative destruction approach seems a proper way when Turkey’s progress in housing sector is evaluated. Secondly, application of TOKI project in Germany is another major point of that work. Correspondingly, solutions of housing oversupply problem in Turkey and housing deficit problem in Germany while taking account of the housing projects and their targeting social groups in both countries could also be seen from the point of this theoretical framework.

For this work, comparative-analytical approach will be applied. Since the major emphasis point of the work is the housing question, this concept will be examined with both historical socio-economical aspects.

In the first part, rent, social justice and capitalist accumulation in cities are our fundamental analyses point. In the second and third chapter it is dealt with historical development of urbanization and housing policies in Turkey and Germany.

**RN37S04 - Inequalities and Diversity in Urban Spaces**

Social awareness in multicultural and unequal peripheral areas of large urban areas in Europe.

Juan Jose VILLALON_OGAYAR (UNED, Spain) | jvillalon@poli.uned.es

The last stage of suburbanization into the metropolitan area of Madrid has tended to divide the outlying towns internally into three main parts: the downtown, the poorest inner town and the new rich areas in the periphery. We wonder what tensions and conflicts tends to produce this new division of space and how it affects the living of these areas about how people manage their social identities in family and work spaces, in relation to territory and look at yourself. These questions arise within the framework of methodological individualism that implies to consider the social stratification as a structuring process with three dimensions: the objective structure, awareness of differences and social action. In our last piece or research, we found that two types of social identities have become the strongest in social consciousness: that differences in terms of economic and labor imbalances and ethno-cultural differences. But these things are not alone. And, there is greater homogeneity in the newer and wealthier neighborhoods around the economic and labor issue and greater heterogeneity in the oldest and poorest neighborhoods. We think that this could
generate new conflicts between the richest and homogeneous areas of expansion and the more fragmented and poorest zones, or, outright abandonment of the latter by town halls.

**Attitudes towards Residential Space: The Case of Belgrade**

Mina PETROVIĆ (Faculty of Philosophy, University of Belgrade, Serbia) | mipetrov@f.bg.ac.rs

The paper aims at presenting if and how attitudes towards residential and public space differentiate depending on class, age, gender and values (materialistic or post-materialistic). The analysis is informed by questionnaire research data obtained on sample of 545 respondents in different residential areas, chosen according to location, individual or collective type of housing and social composition, in order to reflect variations typical for Belgrade metropolitan area. Data analysis, based on logistic regression, shows that values are the most discriminative variable regarding four dimensions for which separate models are developed: symbolic meaning of residential area; importance of privacy in residential areas; appreciation of social heterogeneity in residential areas; and importance given to public space in residential areas. In accordance to the starting hypothesis that class as a separate variable has no significant direct influence on examined attitudes, due to still relative social heterogeneity of residential areas in Belgrade, values proved as important intermediate variable. Differences in age appeared important predictors in all models, while differences according the gender confirmed that women give more importance to social heterogeneity and public space than men. Concluding discussion is focused on meanings that obtained results have for understanding the social production of residential space and its sustainability.

**Leveling the playfield: emerging urban movement as a new actor in the unequal urban context.**

Anna DOMARADZKA (University of Warsaw, Poland) | anna.domaradzka@gmail.com

Recently, major Polish cities have become the sites for the emergence of a dynamic urban movement. Both conceptual and symbolic “battles for space” were crucial for this wave of new urban grassroots’ initiatives. The paper argues that urban space can be understood as a “common-pool resource”, in line with the classical debate around "the commons" and their alleged tragedy (Harding 1968; Ostrom 1990). It aims at explaining how the urban movement is shaped in a meeting between the engagement of neighbourhood activists around “concrete narrative” of particular space and local needs (Mergler 2008), and the inspiration of internationally connected “norm entrepreneurs” (Finnemore & Sikkink 1998), linking local inequality issues to the global dispute over right to the city.

Although diverse in nature, this process can be described and explained within the recently developed framework of Strategic Action Fields (Fligstein & McAdam 2012). Therefore, paper illustrates how urban space is at stake in the “game of the city” – with urban activists re-negotiating the boundaries of urban politics field situated in-between a retreating city-level public sector and the expansion of transnational corporations.

The paper also explains how the visibility of this new movement is a result of growing severity of urban problems as well as raising awareness of cities’ residents, willing to participate in city governance and striving to become an important actor at the “urban scene”. This phenomenon is described as both a reaction to a dominance of neo-liberal rules of city planning and an example of global trends adapting to local needs through civic engagement.

Using qualitative data from observations, content analysis and in-depth interviews with both local and international urban activists, the paper examines the processes that shape the emerging movement, explaining possible consequences of its mobilization in the context of growing inequalities in urban context.
Towards A Counter-history of Slum: The Right to Housing From the Urban Poor Perspective
Jessica VILIRAN (Polytechnic University of the Philippines, Philippines) | viliran.jess@gmail.com

In the Philippines it is estimated that 1 in 4 residents of Metro Manila are in fact informal settlers. A holistic, structural point of view is imperative for full grasp of the problem. Neoliberal economic programs that are in place for more than fifty years became factors in the creation as well as demolition of slums in the urban center of Manila. As big capital owners and their national bourgeois-partners benefit in a capitalist scheme of profit accumulation, human labor is pegged at very low prices. The respective economies of satellite countries continually bear a feudal character as key raw materials are also bought cheaply and the lives that people lead are very vulnerable, enough so that they are easily lured to migrate in the urban centers such as Manila where so-called development is found. At the same time that the city attracts rural migration, the subsequent ballooning of population and problems of unemployment is being dealt with trivially. The “bulimic behavior” of attracting people from the rural and eventually flushing them out displayed by the state adds in the contradictory steps as manifested in the policies or actions regarding the tenure of urban informal settlers. Knowledge should be based on experience and the experiences of the urban poor in communities can serve as the starting point in coming up with epistemologies which are lacking in various fields and which are necessary in better understanding the problems in the first place.

Designing Urban Policies: an Evaluation Assessment about Their Rationality and Coherence
María Jesús RODRÍGUEZ-GARCÍA (Centre for Urban Political Sociology and Policies. Universidad Pablo de Olavide, Spain) | mjrodgar@upo.es

The literature on public policies sustain that ‘policy design’ is a critical issue in order to analyse and evaluate them. Nevertheless, the analysis of urban policies normally pays little attention to this aspect. The aim is this paper is to introduce this important issue in the analysis and evaluation of urban policies. The paper present a proposal to analyse the design of urban policies oriented to improve socioeconomic profile of neighbourhoods and reduce their imbalance regarding other neighbourhoods. First, different indexes are proposed and validated in order to measure three main aspects of policies: diagnosis, objectives, and policy tools designed to accomplish objectives. Second, these indexes are used to analyse two main aspects of policies design that normally help to explain their implementation, results, and impact: ‘rationality’ (coherence between diagnostic and objectives), ‘coherence’ (the correspondence between objectives and policy tools). The analysis is applied by using content-analysis of documentation from 80 projects of urban generation projects in Spain. Results show that there is a high level of variability in the levels of quality in the design of urban regeneration project that could affect the quality of their implementation, results and impacts. Thus, main results show that urban policies could pay more attention to policy design issues.

RN37S05 - Inequalities and Social Movements in Urban Spaces

Sociological research on the city of Brno (Czechoslovakia) from 1947 and possibilities of its processing at present
Dušan JANÁK (Silesian university in Opava, Czech Republic) | janak@fvp.slu.cz
Václav KULHAVÝ (Silesian university in Opava, Czech Republic) | vkulhavy@gmail.com

In 1947 an extensive sociological research was conducted in Brno (the second largest city in former Czechoslovakia and now in the Czech Republic). Its purpose was to provide a comprehensive sociological report on the life of the population of this industrial city. In February 1948 the communist coup took place in Czechoslovakia, sociology was labelled a bourgeois pseudo-science and its study was abolished on a mass scale. Many sociologists emigrated, others faced persecution. The questionnaires as one of the data collection techniques survived in the municipal archives, without having been examined as yet. They contain a unique report on the society of the typical Central European city after WWII and before the onset of communist rule, enormous in size. 22 000 questionnaires are of three types (breadwinners, adult inhabitants, elementary and secondary school students), including over 700 indicators. The paper follows three aims: 1. It presents the preserved data file and summarizes partial results corresponding with the conference focus: social inequalities and differing lifestyles of the main socio-economic groups. 2. It discusses methodological problems relating to the present processing of the historical data and a heuristic potential of the city's historical sociology for the research on the city today. 3. The author would like to learn within discussion whether a similar data file (or its analysis) exists elsewhere in Europe or in the world for potential comparison.

Transport and spatial mobility as an important tool for investigating urban space.
Adam Piotr ZAJAC (Phd Student, Department of Sociology, University of Warsaw, Poland) | a.zajac@is.uw.edu.pl

Social mobility remains one of important points of interest of sociology. However, as John Urry (2009) stated, transport and spatial mobility are still not fully discovered by sociologists. Meanwhile growing interest of public opinion in urban mobility gives new, fresh perspective on everyday functioning of the city.
Growing spatial mobility in modern cities creates new challenges both for urban researchers and citizens, the biggest dilemma being further improvement of quality of urban commuting and at the same time reduction of environmental damage. Development of public transportation and further restrictions on car users seem to be universal solution of this problem in the developed world. This approach leads to profound and complex changes in cities, such as transformations of public spaces, new infrastructure, and public campaigns aiming at changing people’s commuting habits. These phenomena are still scantily analyzed by sociologists.
The aim of this paper is to present ideas on including transportation into contemporary sociological reflection about city and on possible outcomes of such approach. Stronger regulations and management of city mobility result in growing inequalities between users of different means of transport. At the same time transformations of public spaces (i.e. streets, squares etc.), often due to transportation reasons, change hierarchy and relations between public space users. Current trends, include reducing role of private cars and efforts for increasing quality of life in urban areas by adjusting public spaces. Nevertheless limitations of the interdisciplinary approach in describing the modern cities?? are still not clear. Social analyses of spatial mobility of city dwellers/users can give answers about existing constraints in transforming cities and way we live nowadays.

The Social Geography of Educational Achievement. Untangling the spatial structure of inequality using spatial econometrics
Christoph Thomas ZANGGER (University of Bern, Switzerland) | christoph.zangger@edu.unibe.ch
The increasing amount of research on neighborhood effects on a variety of outcomes impressively underlines the relevance of the spatial context (or more generally, the social space) for the reproduction of social inequalities (Sampson et al., 2002; Galster, 2012). However, evidence of such effects remains rather controversial. This undesirable situation can be explained – at least partially – by the employed statistical method (Galster & Hedman, 2013). Besides the adequate operationalization of the spatial scale of "neighborhood", the lack of an explicit formulation and empirical identification of the mediating social mechanisms presents a major challenge in the field of neighborhood effects.

This paper addresses not only the methodological challenges (i.e., the unobserved selection into neighborhoods and the presence of endogenous effects – Heckman, 1979; Manski, 1993) but also the identification of the mediating social mechanisms. Using data on the educational performance of 6th grade elementary students in Zurich, Switzerland, compositional effects according to the epidemic and collective socialization theory are examined. Thereby, the mediating mechanisms (the adaption of deviant norms and the social integration and interaction in a neighborhood network, respectively) are directly modeled. Using a counterfactual approach as well as spatial regression techniques to adequately address the theoretically implied interdependence of observations, heterogeneous neighborhood effects on students' educational achievement are revealed. Taken together, the prevalence of cross-pressures for disadvantaged students as well as the beneficial effects for well integrated, more advantaged children stress the striking relevance of the neighborhood context for the reproduction and reinforcement of social inequalities.

Cracow a city without barriers? Negotiating accessibility through community video.

Agnieszka KRÓL (Jagiellonian University, Institute of Sociology, Poland) | a.krol@uj.edu.pl
Anna WRÓBLEWSKA (Jagiellonian University, Institute of Sociology, Poland) | anna.wroblewska89@gmail.com

The aim of this presentation is to discuss the outcomes of the research project in the field of disability studies conducted in Cracow, Poland in 2012-2013. Based on biographical interviews and participatory methods a community video tackling spatial exclusion of people with disabilities was created. Taking the problems mentioned by women with disabilities during qualitative research (which sample exceeded 100 women with disabilities) as a departing point the focus was put on the most important barriers preventing people with disabilities from participation in public sphere and from enjoying their citizens' rights in the city. Participants of community video project tried to negotiate with public administration solutions that would change the city and diminish inequalities based on ableizm.

Although recent years introduced implementation of large infrastructure projects that aim at making urban space more egalitarian still different levels of accessibility and barriers limit access of people with disabilities to health care, public services, schools etc. It results in invisibility of people with disabilities in public sphere.

During the presentation we would evaluate implemented solutions from the perspective of quality of life of people with disabilities taking into account intersection of gender and disability. We will also discuss diverse levels of urban accessibility: procedural, physical, economical, attitudinal, communicational. Finally we will discuss the impact of the research process on participants of the study.

RN37S06 - Public Policies and Inequalities in Urban Spaces I
Urban inequalities and social prevention in context of the sociology of architecture

Magdalena Łukasiuk (University of Warsaw, Poland) | mlukasiuk@wp.pl

The unequal urban lives are widely diagnosed and described in urban studies. From this point of view social relations in the developed space contain differences and inequalities treated as a 'natural' character of the urban space. On the other side, contemporary discourses of the social prevention do seldom include space into consideration. In this prospect do factors like social environment, poverty, low educational standards etc. produce and reproduce risk in lower social classes.

In my presentation I would like to connect phenomena from both the urban studies and the social prevention using the theoretical prospect of sociology of architecture (comp. Schäfers 2006; Fischer, Delitz eds. 2009). In this approach the material shape of the city (buildings, streets, squares, private and public spaces) plays the role of an active non-human (comp. Latour 2005) and co-determines the social behavior. The influence is mutual: the space is shaped by the tenants with their discourses and everyday practices, and at the same time the social practices and meanings are shaped according to the space. This process takes place on both the material and the communicational level, rather unconsciously.

I would like to draw a mechanism of this mutual influence in context of the reproducing of urban inequalities. My study bases on the empirical scrutiny conducted in contemporary Warsaw as well as the analysis and synthesis of the over mentioned theoretical approaches.

In search of collective efficacy: an alcohol abuse prevention project in the San Donato neighborhood of Bologna

Gabriele MANELLA (Università di Bologna, Italy) | gabriele.manella@unibo.it

The aim of my contribution is using the concept of collective efficacy to consider an alcohol abuse prevention project in a Bologna neighborhood. Robert Sampson, who proposed this concept in continuity with the Chicago School urban studies, wanted to stress the importance of the organizational dimension in city neighborhoods. Efficacy can contribute to assure a higher quality of services and a higher level of security and social control. In other words, it is a discriminating variable for a better neighborhood. On the other hand, it is threatened by all the problems and inequalities that characterize that territory.

I take these issues into account through the case of San Donato, a neighborhood in the northern outskirts of Bologna where, about a year ago, a project of environmental prevention started from the collaboration between the University of Bologna and the NGO Cadca (Community Anti-Drug Coalition of America). This project aims to enable a bottom up strategy to prevent alcohol abuse through the work of a community coalition to identify the most urgent problems and prepare some strategies to address them.

In the last part, I present the first results of this project. I point out some activities of the community coalition, but also some problems which emerged in making it a tool of collective efficacy. I stress in particular the difficulty in finding data about the problems addressed, as well as the one in involving some sectors of local community and some parts of that neighborhood.

URBAN REGENERATION PROCESSES AND HEALTH

Angel Ramón ZAPATA (Centre for Urban Political Sociology and Policies.Universidad Pablo de Olavide, Spain) | arzapmoy@upo.es

Regeneration processes are one of the main urban policies in order to improve quality of life in deprived neighbourhoods. This paper analyse the impact of urban regeneration processes on
health, one of the main aspects of quality of life. Using a quasi-experimental design the paper compare the change on mortality rates between 80 ‘experimental’ neighbourhoods and 80 ‘equivalent’ neighbourhoods between 2001 and 2009 in Andalusia (Spain). The dependent variable is measured as standardized mortality odds for several mortality causes. Based on the theory of fundamental causes proposals in sociology of health, the main hypothesis sustain that regeneration process should impact more on preventable causes of mortality than on non-preventable causes of mortality because these processes promote capabilities and resources among resident that improve their health behaviours. Main results show that change on preventable causes of mortality have a great change in experimental neighbourhood than in equivalents ones, whereas non-preventable causes have a similar trend among them.

**Between social integration and class abject. Postindustrial urban development and the debate on social inequalities in Poland**

Magdalena REK-WOZNIAK (University of Lodz, Poland) | magdaer@tlen.pl

The argumentation of the proposed paper is grounded in the conviction that public debate, dominated by the elite discourses, creates the space for legitimization of policies crucial for the social order in general and specifically, for the shape of the social structure. The decline of post-war consensus concerning the relationship between the market, the state and the society reinforced a belief in pro-market utopia, where rising inequalities were easily justified as inevitable for all the “post-industrial” societies, which were assumed to consist mostly of the middle classes. While the social structure is generally constructed on the macro level, the processes occurring in local political and welfare arenas seem to play a key role in shaping both living conditions and opportunities of the citizens. However, these local contexts seem particularly under-studied.

The paper will based on a case study and will aim at reconstructing class narratives emerging from purposely selected debates surrounding the strategies of local development emerging since 2010 in one of the Polish post-industrial cities (Łódź). It will focus on the understanding of such key notions as modernization, revitalization, social integration and citizenship shared by the actors active in the local welfare arena, as well as on articulation of the interests of the subsequent social groups and categories.

**RN37S07 - Difference and Diversity in Urban Spaces**

**Neighbourhood effect: How does it work? A suggestion of a model**

Sebastian KURTENBACH (University of Cologne, Germany) | kurtenbach@wiso.uni-koeln.de

The influence of a context, like a neighbourhood, on individual behaviour is a key interest of the urban sociology of the last twenty years. In their research, especially Sampson (Harvard), Friedrichs (Cologne) or Galster (Detroit) are describing differed types, requirements, mechanisms and effects of the context. Even if the findings are different they point in the same direction: Poor Neighbourhoods disadvantage their inhabitants in differed ways. But the research makes also clear that the effects are non-linear and vary in their strength over the diverse groups. Nevertheless, different findings and more and more complex research-designs take place in the discussion, but the process of individual acceptance of behaviour is not targeted. In general, the research does not doubt the hypothesis that neighbourhoods influence children during their socialization. The situation is different with the group of new inhabitants. Therefore, the submitted contribution suggests a model to close this “research gap”. A five step-
A model to explain the takeover of deviant behaviour is derived from the literature about context effects, environment-fit-models and cognitive dissonance. It is also based on qualitative interviews (N=10) and a quantitative survey (conducted in April 2015) in a highly segregated neighbourhood in Cologne (Germany). The contribution ends with a suggestion of developing the model and gives an outlook to further research.

**Is there any future for urban planning**  
M. Victoria GOMEZ (Universidad Carlos III, Spain) | mgomez@polsoc.uc3m.es

In the last decades urban planning has been widely criticised. Much of this criticism has encountered remarkable ideological support in the deregulatory thesis of the neoliberal theory. Neoliberal ideas are being questioned since the outbreak of the recession but far from what could be expected, they have not been abandoned. The communication will pay attention to some of the discourses that economic liberalism uses to rescue its doctrine and the coincidence between the latter’s deregulatory principles and some lines of resistance to urban planning. In doing that, the paper identifies a set of ideas that emerged with the postmodern thought, were functional to neoliberal practices and continue in force in the interpretation of the urban fabric.

**The materiality of social dumping: Evictions, housing and the war on poor in Bucharest**  
Irina Maria ZAMFIRESCU (University of Bucharest, Romania) | irina.zamfirescu@sas.unibuc.ro

As in most post-socialist countries where a super-home ownership has emerged, the percentage of social housing in Romania is close to 2%. Since mid-2000s, a wave of evictions affected thousands of families who lived in downtown Bucharest. Driven out by the restitution of nationalized houses, such families encountered the cumulative effects of 20 some years of systematic bypassing of any discussion of the issue of social housing. Based on participant observation carried out in 2014 among 50 households evicted to the streets of Bucharest, among activists, social workers, riot police, garbage collectors from the area and local administration, I will describe the material dimension of social dumping. I will focus on how the possessions of such poor, mainly Roma families are handled after eviction, both by the families themselves by the public services. Instead of searching alternative solutions for the evictions, the authorities confiscated personal belongings moved to the sidewalk and called the sanitary municipal department to destroy the improvised dwellings created with the help of activists. The ethnographic gaze will bear on the materiality of conflicting visions of housing, development and poverty in contemporary Bucharest.

**Next-door strangers? Ethnic difference and neighbourly contact in a Central European context**  
Aleksandra WINIARSKA (University of Warsaw, Poland) | aa.winiarska@gmail.com

Contemporary urban spaces constitute sites of encounter with difference where strangers meet and interrelate. These encounters can lead both to ‘meaningful contact’ (Valentine 2008) as well as indifference or hostility, where individuals remain strangers regardless of their spatial proximity and everyday interactions (Bauman 2003). This paper will focus on the role of social contacts in urban neighbourhoods in the overcoming of ethnic difference in Warsaw, Poland. The Central European (and post-socialist) context, where immigrant integration policy is still practically non-existent, while ethnic difference is only becoming visible, is substantially different.
from those of post-colonial multicultural Western European metropolises, where residents often experience 'commonplace diversity' (Wessendorf 2014). Urban neighbourhoods are regarded as especially significant arenas of interethnic integration between representatives of host societies and immigrants (Phillips et al. 2014). Such local settings – as sites of everyday banal encounter – 'frame experiences of ethnicity' which in turn importantly influence whether others "are seen as culturally compatible and capable of sustaining a common or shared sense of space" (Amin, Thrift 2002: 292). Neighbouring inherently involves some form of interconnectedness, whereas mutual perceptions, emotions and interactions in the place of residence constitute an important element of interethnic understanding. The paper will aim to present a typology of interethnic neighbourly relations based on qualitative research conducted in Warsaw with Poles and immigrants from three distinct ethnic groups – Vietnamese, Turks and Africans. The significance of interethnic neighbouring will be defined in reference to van Leeuwen's (2010) concept of side-by-side citizenship in an intercultural urban setting.

RN37S08 - Urban Experiences

Negotiating urban uses in Cascais. The case of everyday life experience in the Beach of Carcavelos.
Pedro Miguel ALMEIDA (CICS.NOVA FCSH-UNL, Portugal) | pedro.m.almeida@fcsh.unl.pt

This paper aims to analyze urban segregation among leisure practices and between its practitioners and, therefore, the distinct appropriation of territories. It is based on a case study of the Beach of Carcavelos in Cascais, which is a major destination for tourism and leisure since the late XIXth century. This territory was initially programmed, both by entrepreneurs and public policies, for the elites but recently uses become democratized and open to mid-income and working classes.

Its seafront boosted the appropriation of places especially directed for leisure practices and summering (Urbain, 2002; Stranger, 2011). Although summering should be considered a more seasonal practice, the leisure related ones occur during all the year. Due to the distinct appropriation by the different classes in the social structure, this territory in many ways mirrors what we can call the everyday life of the Lisbon metropolitan area. Rich in social interactions regarding not only but in an intense way to leisure practices, the Beach of Carcavelos is deeply and densely appropriated by different groups of social actors by day but it also presents itself with an intense nightlife.

Not only, but particularly using the extended case method (Burawoy, 2000; 2009), we realize tensions between different social actors are still a visible reality in the everyday life of the space. That can be particularly observed in the symbolic segregation and segmentation of territory and users, virtually creating separate realities with no or lean connections, with struggles of power that dictates distinct experiences of the urban space (Marcuse, 1989; Wacquant, 2006).

On the nature of the socio-spatial experience of urban conversion
Katrin PAADAM (Tallinn University of Technology, Estonia) | katrin.paadam@ttu.ee
Kristel SIILAK (Tallinn University of Technology, Estonia) | kristel.siilak@ttu.ee
Liis OJAMÄE (Tallinn University of Technology, Estonia; Tallinn University, Estonia) | liis.ojamae@ttu.ee

The paper contributes into theoretical discussion on conversion of former industrial spaces into modern multifunctional residential and (semi-) public spaces by asking a question whether and
how can this phenomenon be conceptualised in the context of urban gentrification process, especially, in terms of creating urban inequalities. Should conversion be claimed evincing a universal character or rather rethought within transforming socio-spatial metaphors in the cultures of specific cities? Conceptualising conversion as a mode of gentrification is considered to require a certain degree of subtlety in regard to time-specific spatiality and the related structural circumstances seen in a broader historical perspective of societal, cultural, economic and political transformations. Drawing on the recent, about a decade-long research in Tallinn, Estonia, it is observed that conversion is a complex and controversial phenomenon in view of its merits as well as its backlashes in the city’s development. The paper elucidates the phenomenon of conversion at five interconnected instances: first, as contextualised in the historical phase of gentrification related to the last societal transformation, second, as to its specific developer-led mode of production, third, as to its capacity for reinventing public space, fourth, as symbolic restructuring of the city and constructing collective identities and, fifth, as to further area-based urban renewal strategies. The analysis allows to detect social injustice of distinct nature at different phases of urban transformation, indirectly or more directly connecting the conversion with the past and future of gentrification, though saving the residents in converted buildings of no problems.

Urban encounters
Femmianne BREDEWOLD (University of Humanistic Studies, Netherlands, The) | f.bredewold@uvh.nl
Evelien TONKENS (University of Humanistic Studies, Netherlands, The) | e.tonkens@uvh.nl
Margo TRAPPENBURG (University of Humanistic Studies, Netherlands, The) | m.trappenburg@uvh.nl

People with intellectual disabilities and/or psychiatric illness – are no longer put away in large institutions. Instead many of them live in ordinary neighborhoods in urban areas. However, previous research has shown that their social integration leaves much to be desired: former residents of institutions have a small network consisting of care professionals, family members and fellow former residents. This study in the Netherlands, aimed to find out whether citizens with disabilities can have contacts with citizens who do not belong to the usual categories in their network, a question partly inspired by governmental policy which expects citizens to look after ‘vulnerable neighbors’.

We found out that many citizens did not have any contact with their neighbors with disabilities and others had only negative contact. However, we also found that light and superficial contacts do occur between them. Citizens with and without disabilities meet and greet at the streets, at the shopping center, at dog-walking areas and at distinct social places. Although these contacts remain light and superficial, they are very important for neighbors with and without disabilities, because they represent bridges between two mostly separated worlds and can reduce inequalities. This study pointed out that the urban neighborhood is an important place to bring people with and without disabilities in contact with each other, because It is a natural place where people can meet without too many obligations. The seemingly superficial encounters create a meaningful and substantial ensemble of interactions that contribute to the social inclusion of people with disabilities.

Perceptions and experience of ethnic discrimination in social and private rented housing over the 2000s
Nissa FINNEY (University of Manchester, United Kingdom) | nissa.finney@manchester.ac.uk
Stephanie Julia WALLACE (University of Manchester, United Kingdom) | stephanie.wallace@manchester.ac.uk
The broad aim of this research is to identify whether ethnic discrimination in rental housing is evident in England and Wales. This study explores how levels of reported experiences of discrimination vary, how perceptions of housing discrimination vary for different ethnic groups and also how these experiences and perceptions of housing discrimination has changed over the 2000s. Data from all seven years of the Citizenship Survey facilitate this work. Binary logistic regression is conducted for each year of the survey, with perceptions of discrimination for both social and private rented housing modelled separately, while controlling for a number of independent variables. The results suggest that perceptions of discrimination are very different for social and private rented housing. In general a perception of discrimination in both sectors has declined but still remains quite high for some groups. White respondents are more likely to believe they would be discriminated against in social rented housing but least likely to be discriminated against in private rented housing. Whereas Black Caribbean and Black African respondents are more likely to believe they would be discriminated against in private rented housing.

RN37S09 - Urban Exclusions

The Nexus City Model, Bridging the Local, Regional, National, and International Contexts
A.J. JACOBS (East Carolina University, United States of America) | drajjacobs@yahoo.com

Human settlements come in all shapes and sizes, from sparsely populated areas to gigantic megalopolis of 35 million residents, encompassing hundreds of municipalities. Why do some areas grow so big and others do not? Why do certain areas continue to expand while others decline? Why are some places diverse socially and economically, while others not? Research on city-regions conducted from a variety of theoretical perspectives suggest that a multiplicity of local, regional, national, and international forces influence a city’s growth path. In essence, the city is the nexus point, both a core of, and means of connection or bridge for, the political, economic, social activities taking place on all spatial tiers. While there are countless determinants that can impact an area’s growth trajectory, drawing upon the histories of city-regions in Europe, North America, and Asia, this paper examines how the dynamic interplay among 12 contextual factors help explain much of the continued diversity of growth outcomes in the world’s city-regions. For example, it will discuss how certain attributes, such as the existence of raw materials, infrastructure, and proximity to other urban areas, have created comparative advantages for certain cities over others. These advantages may have then promoted expanding foreign trade, exports, and the enlargement in the population number and size of manufacturing firms in the area. In the process, the paper will introduce the author’s own theoretical lens: The Nexus City: A Contextualized Model for Urban and Regional Development, which melds aspects of global city, nested/embedded city, and agglomeration/localization theory into one integrated prototype theoretical paradigms on urban and regional development. The ultimate goal of the paper is to offer urban sociological scholars and students a basic, yet multifaceted framework for understanding how local, national, and international factors impact urban and regional development. It also supplies them with a toolkit to utilize in their comparisons of city-regions, within the same or different nations. In closing, it is hoped that the model offered will not only provoke others to add input to it, but to also think out of the box in their analyses urban development in both the Global North and South.
From Spatial Exclusion to Digital Exclusion: ‘Smart City’ as a New Form of Urban Inequality
Aysu KES-ERKUL (Hacettepe University, Turkey) | aysukes@hacettepe.edu.tr

Smart Cities are defined in various ways as it is becoming widely popular. Some definitions emphasize the existence of Information and Communication Technology (ICT) infrastructure, while others focus on smart urban growth (Hollands, 2008). The common point of different definitions is the use of e-governance tools to improve the interaction between urban residents and local governments in the process of communication and service provision. This approach to local government basically means the use of up-to-date ICTs such as broadband Internet, smart phones and other mobile devices, at the very least. On the other hand, the related literature assumes that smart cities always improve the quality of life for the urban residents, as well as increasing participation. However there are no established criteria to determine the effectiveness of ‘smartness’ of a city other than benchmarking. This paper examines smart cities in terms of inclusion/exclusion in these ‘virtual cities’ created by use of integrated apps and devices, since existing literature does not cover this specific issue. The discussion and analysis of different cases reveal the limitations of smart cities in terms of the assumptions mentioned above and how they create a new form of inequality in urban areas. So it can be argued that the spatial exclusion from urban public services is expanded towards ‘digital exclusion’ via digitalization of service provision and local participation.

"Social, communicative and status inequality in contemporary Russia"
Valentina Aleksandrovna SHILOVA (Institute of Sociology Russian Academy of Sciences, Russian Federation) | vshilova@yandex.ru
Evgeniy Mihailovich AKIMKIN (Institute of Sociology Russian Academy of Sciences, Russian Federation) | akimkin@isras.ru
Kirill Vladimirovich BYKOV (Institute of Sociology Russian Academy of Sciences, Russian Federation) | 1096232@mail.ru

The analysis of the modern management model of urban decision-making in Russia showed that reorganization of the legal field of urban development and municipal government in the last 15 years contains anti-democratic tendencies, such as follows: (1) restriction of the human right to participate in administration. Moscow town-planning code admits the right of citizens to make comments and suggestions, but does not oblige to take them into consideration in the process of a decision-making because it is not necessary procedures and standards; (2) participation of the socio-humanitarian knowledge in the management decisions was not developed; (3) the inequality of urban planning subjects fixed in the legal field (the violation of the balance between government branches, the strengthening of executive power, the weakening of population position and also position of representative power and municipal authorities); (4) the conciliation of the interests lost content, organizational and procedural mechanisms.
There are several reasons. Firstly, the historically inequality. During the Soviet era and at the present stage characterized by the acquisition of the citizens of a sufficiently broad package of rights, the alienation of population from management has not been overcome. Secondly, in the social management concept the control object (or the controlling subsystem) is an individual or social group and as subject of management is the power structure (authorities). Thirdly, the legislation imperfection in respect of citizens participation in administration (legal inequality). Fourth, the inequality in access to information. Fifth, the status inequality leading to inequality in authorities affected the decision-making process. Sixth, social and psychological problems and barriers emerged during the discussion. Another factor shaping communicative inequality i the
communicative skills of the social control subjects as well as emerging communication barriers. Employed in management the Internet technologies, on the one hand, play a positive role, but on the other hand, conceal the listed trends, social and communicative inequality.

**Situational domestication: Public privacy in the café-as-office**
Ida Marie HENRIKSEN (Norwegian University of Science and Technology (NTNU), Norway) | ida.marie.henriksen@svt.ntnu.no
Aksel TJORA (Norwegian University of Science and Technology (NTNU), Norway) | aksel.tjora@ntnu.no

Cafés offer more than just a cup of coffee and something to eat: they also have social potential. They may also reduce the problem of lost social capital in the American suburbs, as identified by Robert Putnam in 2000, and contribute to communal processes as ‘third places’, as suggested by Ray Oldenburg in 1999. With the ubiquity of wireless Internet zones and laptops, tablets and smart phones, we observe a transformation in which cafés are increasingly serving as work spaces, in addition to social spaces.

On basis of depth interviews and observation studies in Norway and the UK, we study in very detail the development of (distributed) work within urban ‘café communities’. We ask several questions, including (1) what it is about cafés that makes people visit them for work purposes, and (2) how individual ‘laptop work’ changes the experience of the social life of cafés. Connecting our analysis to theories of communal processes and domestication of technologies, we suggest the concept of situational domestication to describe aspects of socially embedded individual work. Domesticating specific work tasks, with specific technologies at specific localities (cafés/tables) is transforming both public spaces and work life, into dedifferentiation between both the public/private and work/leisure. Consequently, the close study of café spaces used for work provides an insight into how an increasingly technological mediation of work changes the meaning of work and leisure at a broader societal level.

**RN37S10 - Public Policies and Inequalities in Urban Spaces II**

**The principle of "fair city" in the context of the assumptions of the National Urban Policy in Poland**
Anna KARWINSKA (Cracow University of Economics, Poland) | karwinsa@uek.krakow.pl

Achieving justice, one of the four cardinal virtues, is examined for ages by various disciplines, including sociology. The problem of justice is considered at different levels of society, from the individual action to the collective functioning of smaller and larger social units. Issue of the fair city is rooted in the ancient’s philosophy of polis. The idea has been developing since then add different practical approaches were undertaken to implement these concept.

Proposed paper has three parts. First presents certain characteristics of the fair city, including the issue of equality of the different groups creating urban community. The second part presents the context of socio-cultural changes that take place in the Polish cities as human habitant environment. It is important to draw attention to some of the residues of the socialist past, both in spatial and social areas of the city. Another important element in this context is the issue of the new urban movements, which are becoming increasingly important actors in the processes of the functioning of cities. Finally, it is important to identify new needs and expectations of the urban population, including groups that till now were "inaudible" and "invisible".

The last part of the paper analyze the assumptions of the National Urban Policy presented to the public and academic debate. Main questions raised refer to the issue of equitable access to
the resources of the various groups and benefits offered by the city, the degree of sensitivity to
the interests of various groups and the general vision of the city (in these assumptions).

Should I stay or should I go? Social and infrastructural aspects of urban life
affecting thoughts on leaving Kiruna and Gällivare
Eugenia SEGERSTEDT (Luleå University of Technology, Sweden) | eugenia.segerstedt@ltu.se
Mats JAKOBSSON (Luleå University of Technology, Sweden) | Mats.Jakobsson@ltu.se

In the Swedish context Kiruna and Gällivare are middle-sized municipalities in the rural region of
the arctic north where a major urban transformation due to mining activity has started. The
average income in those municipalities is high but depopulation remains a problem. The aim of
this paper is to analyse the effects of social inclusion, urban infrastructure and municipality
services on the probability that citizens consider leaving the municipalities.
The study is based on a survey with representative sampling, 10 % of each population
responded. Indexes measuring social inclusion, perception of the build environment and
community services have been constructed. Logistic regression analysis is applied to see how
these indexes affect the probability of wanting to leave the community within different age,
gender and income groups. The results show that the build environment index has the greatest
effect on the probability of leaving. When the social inclusion index is added, gender differences
become insignificant. Considering age groups, the probability of young adults to consider
moving is affected the most. These results are partly interpreted within the social context. Open
comments received in an unusually high amount are used to analyse the meaning of the
findings but further qualitative analysis is required to acquire a deeper understand citizens
preferences.
The urban transformation of Kiruna and Gällivare is unique in that large parts of the towns are
being moved. It gives a possibility to find new patterns in social, infrastructural and service
aspects of urban life affecting people in middle-sized towns.

Cohesions and separations. Social and symbolic inequality in urban
neighborhoods in Oslo.
Oddrun Kristine SÆTER (Oslo and Akershus University College, Norway) | oddrun.sater@hioa.no

Abstract
The paper is based on a comprehensive qualitative study of residential moving in Oslo city, and
between Oslo and some towns in the region. A research team has interviewed more than 230
persons on the move to and from neighborhoods of different kinds. Initially we wanted to study
why people move between places because of the media discussions of increase in social
segregation in Oslo. We have interviewed persons from mixed neighborhoods in suburbs, some
with overweight of immigrants; neighborhoods of white middle class in central city areas, old
and new built; and neighborhoods of more wealthy families, living in areas of villas and big
gardens. We have contacted persons through what is called “the snowball method”, where one
person suggests a next one, and by small flyers in postboxes in different chosen areas. We
have been aware of choosing (as far as possible) a mixture concerning age, gender, single
persons/families, housing types, and neighborhood types, both factual, and constructed by
media narratives. The data will be discussed in perspectives of “forces of moving”, from elective
belonging (Savage et al) to gentrification (ex. Lees et al), and in perspectives of different capital
forms (Bourdieu). In the inhabitants’ narratives of moving, we find patterns of both productions
and reproductions of spaces of inequality, socially and symbolically. Urban politics will be
discussed, i.e. public intervening with intentions of creating “liveable neighborhoods”, aiming at
cohesion, diversity and sustainability through creating new meeting places and public participation in urban development, with artists and social researchers also involved.

Different logics of local belonging in Helsinki, Madrid and New York City
Kaisa KETOKIVI (University of Helsinki, Finland; New York University, United States) | kaisa.ketokivi@helsinki.fi

This paper considers the different ways in which residents of three desirable, active neighborhoods in Helsinki, Madrid and New York City (Brooklyn) form local attachments to their neighborhood. The studied neighborhoods are historic and started largely out as working class neighborhoods, experiencing then decades of decay and social problems, and finally a rapid economic and social change, as living in the neighborhood got increasingly expensive. Currently, the neighborhoods are known for their sociability, grass-root participation and locally organized activities celebrating the neighborhood or parts of it. All three neighborhoods have an economically and socially mixed local community, picturesque houses and streets. The paper draws on on-going multi-method ethnographic field work, including a systematic mapping of residents’ significant social bonds and use of their neighborhoods as well as, observation and qualitative interviews. It analyzes the ways in which local bonds and belonging develop and are organized in resident’s – both old and new – lives.

Urban lives develop a local focus in various ways. Some residents have always lived in the neighborhood and have via personal history a strong sense of local belonging. Some spend most of their daily lives in the neighborhood (e.g. residents working in the neighborhood, stay-at-home mothers and retirees) and are hence quite concretely embedded in local relations and places. Some are active participants in local activism and finally, some simply enjoy their neighborhood and its social and physical attractiveness. The local sociability and community are not one, but consists of a cluster of various attachments, figurations and orientations. In many cases, the different logics of local belonging are overlapping, creating a ‘communal’ local figuration. However, some residents simply live there without an interest in the local. The paper presents material from the fields to lay out the key features of each logic of belonging. It asks: What kind of ‘local community’ is possible in an urban plurality and what happens to local bonds and belonging in face of economic and social change?

The Impact of Urban Policies: the Missing Link of Exposure
Clemente J. NAVARRO (Centre for Urban Political Sociology and Policies. Universidad Pablo de Olavide, Spain) | cnavan@upo.es
Angel Ramón ZAPATA (Centre for Urban Political Sociology and Policies. Universidad Pablo de Olavide, Spain) | arzapmoy@upo.es
María Jesús RODRÍGUEZ-GARCÍA (Centre for Urban Political Sociology and Policies. Universidad Pablo de Olavide, Spain) | mjrodgar@upo.es

According to the literature on urban inequalities exposure is a main factor in order to explain urban inequalities and its reproduction. From this perspective, the impact of urban regeneration process oriented to reduce urban inequalities could be explained according to residents’ exposure to them. First, according to ‘contextual exposure’: the duration of regeneration process in the neighbourhood, because some activities could have a contextual impact (service improvement, urban environment …). Second, according to ‘individual exposure’: time individuals are living in the neighbourhood, and as well as to become a beneficiary and/or an user of urban regeneration activities and/o services.

This paper tries to evaluate the impact of exposure using a ‘natural experiment’ and multi-level analysis. A survey among 6500 resident in two kind of neighbourhoods in 10 cities have been carry out: ‘experimental neighbourhoods’ (where regeneration policies have been applied) and
‘control neighbourhoods’ (where regeneration policies have been not applied, but they have similar socioeconomic characteristic than experimental ones at the start of the regeneration process).

Three main aspects have been analysed as dependent variables in multi-level models: a standard quality of life scale, evaluation of neighbourhoods’ improvement, and citizen participation. The main independent variables are contextual and individual exposure to regeneration process. First, exposure is measured as a contextual variable: the time span of the project in the neighbourhood (that range from 0 in the control neighbourhoods to 15 years in some experimental ones). Second, as individual exposure: time living in the area and to have been an user of the regeneration programme (house renewal, participation in programmes and activities, receive a service or an economic help,…). Main socioeconomic variables at the individual level are used as control variables.

RN37S11 - Governance Urban Processes

Social Disorder in Finnish Suburban Housing Estates: a Multilevel Study on Collective Efficacy Combining Survey and Register Data
Teemu Tapio KEMPPAINEN (University of Helsinki, Finland) | teemu.t.kemppainen@helsinki.fi

1 Introduction
Social order and cohesion have been central topics in urban sociology since its early roots in the Chicago tradition. These same topics are currently of acute significance in Nordic welfare states. Deindustrialisation has hit the post-war housing estates (‘lähiö’) of Finland quite seriously in the form of high and seemingly permanent unemployment. However, the implications of spatially concentrated social disadvantage for the local social life in the context of deindustrialisation has not been thoroughly examined so far.

Case studies suggest that social disorder is a problem for the well-being of the residents of these estates. In addition, research literature suggests that the problems of social order may cause selective moving behaviour, which could deepen segregation. The societal importance of the topic is thus evident. However, there is scarcity of evidence on what differentiates housing estates in terms of social disorder. Estates differ from each other in socio-economic terms, which is likely to be of significance for social order. The relationship of local social disadvantage and social order was, after all, the founding question of urban sociology. Furthermore, social disorganisation theory suggests that the local capacity of social control would be of key importance in this respect. Neighbourhoods with efficient informal social control are likely to suffer less from social disorder.

This background paves way for our research questions:
1) Is perceived social disorder follow related to local social disadvantage, as suggested by the social disorganisation tradition?
2) To what extent do informal social control and social cohesion, as defined by Robert Sampson et al. (1997), help us understand why some estates suffer more seriously from disorder than others? More specifically, do they mediate the effect of contextual social disadvantage?

With the help of our unique dataset, we can address these questions. The results have theoretical importance, because they provide understanding concerning the applicability of the concept of collective efficacy in the Nordic context, which is, after all, very different from Chicago. From the practical point of view, the answer sheds light on the mechanisms that generate socio-spatial inequalities on well-being and deepen segregation.

2 Central concepts
2.1 Suburban housing estate
A recent definition of suburban housing estate by Stjernberg (2013) is used in the study. For Stjernberg, suburban housing estate is a residential area built during the 1960s and 1970s, "which mainly consists of multi-story housing and which [is] located outside of the immediate city center" (Stjernberg 2013). In this study we adopt Stjernberg’s definition and term, which in our opinion quite well captures the key characteristics of the Finnish 'lähiö'.

2.2 Social disorder
In urban studies, the concept of social disorder – like the related concepts, such as incivilities, neighbourhood disorder, non-normal appearances, social disturbances and urban unease – refers to breaching of the norms regulating behaviour in urban space, where everyday life is conditioned by physical promixity and social distance. These breaches, perceived as disturbing, threatening or bothersome, are interpreted as signs of inefficient social control. We measure perceived social disorder by using a factor score variable extracted from a pattern of eight questions measuring the amount (4-point scale, from “none” to “a lot”), tapping the perceptions of the tangible manifestations of disorder (public drunkenness, vandalism, drug use, threatening behaviour and the like).

3 Data
In this study we will use a dataset combining survey information on individuals who are nested in neighbourhoods. Technically, the sample is a stratified cluster sample. The data design is a classic multilevel one, with 70 neighbourhoods, sampled from the stratified pool of all Finnish suburban housing estates of certain minimum population size (300). The stratification was made by cross-tabulating the size of the city and unemployment level of the estate. Some theoretically interesting estates were made strata of their own. The goal of our stratification was to make sure that the number of estates of different kinds would be large enough. The gross sample of around 20,000 was allocated to these neighbourhoods on the basis of their population size. The response rate is 40 %, and a detailed non-response analysis will be made on the basis of individual and neighbourhood auxiliary information. Eventually, the details of sampling and non-response pattern will be integrated to analysis via weighting. The data were collected in 2013.

The data on estates comes from the Grid Database (Ruututietokanta), aggregating social, demographic and economic individual and household information to statistical grids of 250 m * 250 m. The estates were constructed from the grid data and housing register data by construction time (60s and 70s) and physical structure (not a central area, multi-storey domination), by M. Stjernberg.

4 Models
The analysis will be carried out by means of a standard linear multilevel model, to account for the intra-cluster correlation (to obtain more correct estimates) and to grasp the between-clusters variation – and how it is explained by individual predictors (“composition”) and estate variables (“context”).

5 Preliminary findings
Based on a preliminary analysis with no weights, it is found that the between cluster variance is about 25 % of the total variance in the factor score variable on perceived social disorder (PSD from now on). This implies that there are considerable neighbourhood differences in PSD. Furthermore, there is a clear, expected and statistically significant gradient in PDS according the unemployment rate of the estate: the higher the unemployment, the more PSD. Bivariate analysis suggests that PSD is negatively related to informal social control and social cohesion of the estate. In addition, these two components of Sampson et al. (1997) collective efficacy are negatively related to unemployment rate.

Hence, it seems that spatially concentrated social disadvantage predicts problems of order. Collective efficacy seems to enhance social order. Model elaboration by means of linear multilevel model indicates that the association of local unemployment and PSD diminishes considerably once the aggregated measures of collective efficacy are included in the model. In brief, this supports the interpretation that low collective efficacy mediates the impact of local
social disadvantage on problems of order. Looking at the variance components we observe that local unemployment explains about 10 percent of the between variance. Collective efficacy explains alone over 50% of this variance.

I wish to remind here that these findings are preliminary and need more elaboration. At the ESA workshop a more nuanced analysis will be presented.

Narratives on rental housing policy
Hanna KETTUNEN (University of Turku, Finland) | hanna.kettunen@utu.fi

The lack of affordable rental housing in the urban areas is an ongoing debate in Finland. Housing policy is not a separate policy field, but it is influenced by general political and social trends. One major change in the Finnish housing policy has been the deregulation of private rental housing in the beginning of the 1990s. Before, Finnish private rented sector was controlled and regulated by the state for decades. After deregulation private rental housing has operated on market economy principles. There is social rental housing in Finland, but private rented sector has a significant role in providing rental housing in the urban areas. Housing policy is often described as path dependent. In a broad sense path dependence means that the nature of an institution or policy is to a great extent determined by its history. Still, housing policies change, but the change is not always sudden; it can also happen for instance through drift, conversion or layering.

I have collected interviews from politicians and civil servants who took part in the preparations of legislative proposals and political negotiations on rental market issues in the 1990s. I approach these interviews from narrative perspective. My research question is how changing housing policy is represented by those who made the change. The interviewees give meaning to housing policy actions and rent regulation removal and build narratives on “how it all happened”. The narratives that the interviewees produce aim at explaining and understanding choices and actions of the past rental housing policymaking.

Mediating Structures at Local Level: Albania and Macedonia in a Comparative Perspective
Orsiola KURTI (Scuola Normale Superiore, Italy) | orsiola.kurti@sns.it

Administrative and territorial reforms generate various democratic deficit challenges at local level. Specifically, local citizens, especially residents in the remote areas, encounter difficulties in accessing local administration; non-representation risks evolve in the ways how demands for capital investments are channeled; responsibility and accountability of the new local government units and citizens’ control on decision making is needed. Mediating structures and mechanisms are deemed necessary and take a great importance to address the critical issue of local democratic deficit since they help the functioning of a vital democratic society. Berger and Neuhaus (1977:2) consider mediating structures as “those institutions standing between the individual in his private life and the large institutions of public life”. Though it is admitted by these authors (ibid) that the list is not exhaustive, four main broad categories of mediating structures are: neighborhood, family, church and voluntary associations.

This paper aims at understanding and examining the role and functioning of mediating structures at local level, focusing on community liaisons in Albania and Macedonia after having undergone two waves of territorial consolidation. Community liaisons, as a new category of mediating structures will be brought as an added value to the list provided by Berger and Neuhaus. Through an in-depth legal review and comparative case study analysis, the paper will try to shed light on the following dimensions of community liaisons: (i) mission, (ii) structure, (iii)
Formal and informal governance in the urban policies
Paola DE VIVO (University of Naples Federico II, Italy) | padevivo@unina.it

One of the most important efforts made by governments and official institutions (World Bank, European Union) to create social capital in less developed countries or in underdeveloped areas of developed countries consists in specific territorial or urban programs aimed at implementing participatory governance. The basic idea is to devolve political and administrative responsibilities to the periphery of the national systems, entrusting local actors with the task of addressing and implementing the development of the place where they live.

In the paper, the critical role played by the local institutions and citizens in the process of urban transformation and its impact on the city will be discussed. The literature on the topic recognizes that the role of local government in the development of the new urban space is often direct and forceful. In this perspective, urban governance becomes a collective action based on cooperation and coordination among many actors, both ‘vertically’ and ‘horizontally’: referring respectively to multi-layered relationships of governance from the local to the European and national level, and to the relations among local actors. Coordination between these vertical and horizontal relationships should lead to a coherent integration of responsibilities, competences and visions - although the concept of governance is actually revised by scholars, who try to show the differences existing between the “old” and the “new” way of interpreting the theoretical and practice meaning of the governing and the dilemmas which they give rise to. Drawing on the theoretical framework of territorial and urban governance, the paper focuses on changes in urban policies in Naples. Naples, after Rome and Milan, is the third Italian city for number of inhabitants, just over one million people (and three million considering its metropolitan area). In the ranking of the Italian cities, Naples is in the lowest positions for GDP per capita, occupation, and in the highest for poverty, unemployment, and criminality. The city is currently in search of a new urban vision capable of overcoming the decline of its recent history. In spite of a continuous supply of proposals, ideas and projects to resume its competitive race with other Italian and European cities, the aim has become increasingly unclear and the economic revival and social development of the city is out of sight. The City government, however laboriously, has offered a large number of tools for steering and addressing the urban complexity and the backwardness of the economy, but the results of its political and administrative action have been limited.

Porous Borders: LGBTI's Place on Urban Space
Neyir ZEREY (Middle East Technical University, Turkey) | neyirzerey@gmail.com

The way LGBTI is located in the city has always been of great importance to evaluate its politics, current networking strategies, geographical positioning and its future endeavors. The criticism brought at the beginning of 1990s upon the lack of geographical focus on LGBTI community have been surmounted so far; many geographers tried to locate the community, the movement and they made sense of the creation of new spatialities. Consequently the focus of the literature on “lesbian and gay” geographies that has once been on understanding the creation on gay villages started moving towards making sense of the bigger picture portrayed as “ambiguous contingent sexualized spatialities” (Lauria and Knopp 1985; and Bell et al. 1994; Phillips et al. 2000 cited in [Binnie and Valentine 1999], Duncan 1996).
Depending on which dynamics does the LGBTI community locate itself in the city? How does LGBTI locate itself in the urban space accordingly? How can we make sense of this geographical positioning? Making sense of the tangible fractions, that this minority group runs into while (most of the time) they are being forcefully positioned in some remote parts of the city or while trying to find a safe haven in urban localities, would not only unfold concrete surviving strategies of the LGBTI community but at the same time it would lay down the discursive patterns of the LGBTI social movement in the given context.

Space is a socially produced (Lefebvre 1976, 1991) and it is constructed and reconstructed regarding the hegemonic power’s own rules, tending to discard all those who do not fit the necessary standards. The most common ground among perspectives on space relies on the social constructivist approach which indicated a conception of space produced through social relationships that furthermore becomes an entity of that created space (Harvey 1989, Lefebvre 1996). In any perspective taken, theorizing on urban spaces have brought along the discussion on equal access to the city, equal access to economic and cultural resources and the power dynamics that fluidly goes around public and private spheres (Castells 1983; McDowell 1995; Binnie and Valentine 1999).

Public places have been considered as heteronormative spaces, which are formed as an outcome of repetitive acts of heterosexuality confirming the constitution of “normal and proper” behavior’s repetitive outcome (Valentine, 1996: 146). Through this perspective, geographers began to explore the way that LGBTI sexual identities are made and remade in both private and public spaces (Hubbard 2007). So far, the literature had suggested that both public and private places were operated through homosexuality; which means that homosexuality has been used as a benchmark to differentiate the level of behaviors; homosexuality is -more or less- accepted in private places (e.g. homes) but it is not when it is out in public (e.g.: the city as a whole, streets, parks, schools, etc) (Namaste 1996; Valentine 1993). The urban space deemed to be heterosexual, monolithic and patriarchal does not seem to leave enough space for LGBTI individuals to survive. Moran and Skeggs (2004) portray that urban space is connected with defenselessness and with the possibility of being attacked and being subject to violent and dangerous behavior if the non-conforming sexual orientation or gender identity is deployed in anyway.

As Bell and Binnie (2000:869) cited in their article “debates about sexual citizenship have also been debates about space” and this debate is concerned with “making visible identities that are discriminated against” (Fraser 1999:115). Gay rights have been attributed to be of revolutionary character (Weeks 2002). LGBTI organizations make their claims through rights that are rooted in features of identity and difference in contemporary political movements (Staeheli 2008). These declarations clear the way to access public spaces that have been forbidden for non-conforming gender identities (Watson 2006). The discussions upon the city brings the discussion of dualities (such as urban/rural,private-public etc). The tight and intricate relationship between the struggle for the city and LGBTI rights is precisely situated right at the heart of this study that would discuss this topic through the web of these vanishing dualities.

Investigating the private sphere of LGBTI appears like a much more intertwined analysis of the two sides of the asserted duality: the private sphere of LGBTI becomes also subject to public inspection (in most of countries, topics related to sexual orientation and gender identity are still operated through juridical decisions). The private read through the layer of gender and sexuality has two meanings. The first one is portrayed as a secondary spatiality, an inferior material shelter for non-conforming gender identities that are not accepted in the public realm. In the second place, the private is understood as a safe environment where LGBTI individuals can find themselves, where they can stay free from social stigmatization and express their gender identity and sexual orientation as they want to (Valentine & Skelton 2003; Holt & Griffin 2003). However, the private site, which is supposed to be seen as a shelter, a “safe haven” from the outside world is not completely free from violence either. The private site of LGBTI individual
becomes also a site for resistance and struggle as is the public (heterosexual) realm). Therefore the private space becomes also subject to violence both externally and internally (Myslik 1996) and this makes the questions on permeability between private and public sphere’s so-called rigid borders even more valid. As a consequence, the private sphere becoming a site for resistance transforms into a newly produced space defined by political and societal struggles and contentions. These new definitions for both parts not only change their nature, but these struggles upon which new spatialities are produced give also birth to newly defined borders, that are not so rigid at all. How could these new borders be defined? Do they create privately public spaces for LGBTI? Or do they completely erase privacy that has once been granted? These questions that will be answered in this theoretical study will be soaked deep into urban politics and LGBTI's place at the urban space.

**Perceived insecurity in a city with low-crime rates: the case of Barcelona**

Riccardo VALENTE (University of Barcelona, Spain) | valente_riccardo@hotmail.it

When comparing police recorded crime statistics and victimization data referring to the city of Barcelona a paradox arises since available data outline a scenario where, despite a decreasing trend in crime, people feel more insecure. According to the Municipal Service Survey (2014), insecurity is ranked as the second most important problem, whereas the latest statistics indicate that the number of crimes recorded by the police is decreasing.

In order to explore the significance of the mismatch between crime and perceived insecurity, a survey (N=185) was designed to enable a more comprehensive assessment of insecurity in the context of Barcelona. The specific objective was to test the hypothesis of radical theories on fear of crime, that is to say that insecurity is mainly social and economic insecurity in disguise. By introducing the concept of social insecurity the survey aimed to provide a broader conceptualization of fear of crime including contextual factors such as economic context or demographic characteristics of the population.

Consistent with previous research, the statistical analysis showed that insecurity perception has an unequal impact on social groups. Being a woman, an older person, unemployed, or having a low level of education is associated with highest levels of insecurity. Furthermore, results show that the highest levels of fear emerge in neighbourhoods with a huge presence of residents at risk of poverty and social exclusion. Therefore, social insecurity seems to be a clear multiplier of perceived insecurity in Barcelona.

**The marketers of dreams vs. romantic gentrifiers – reflections on space production and space consumption in Polish city.**

Jacek GĄDECKI (University of Science and Technology AGH, Poland) | jgadecki@agh.edu.pl

The aim of the paper is to present a particular element of the market economy in a post-socialist context, the housing market, from a critical perspective, through the eyes of marginal gentrifiers of former ideal socialist city of Nowa Huta in Krakow. Although both processes of ghettoziation and gentrification seem to work as universal and international phenomena, the studies suppose to understand how they are embedded in the local (material and social) landscape. The first is a quite evident marker of new class identity for most Poles but looses its distinctive power, the latter, as a marginal process could be perceived as a way of finding the authenticity in divided post socialist city.

The paper summarises two independent (qualitative-quantitative) projects realised in last 5 years and offers a dynamic overview of urban forms of the post-socialist city and explain how new, emerging social divisions and new identities in the urban realm are constructed.

**Socio-spatial urban patterns: Toward a generalization and a typology drawn from the study of the upper classes in the metropolitan areas of Madrid and Barcelona**

Miguel RUBIALES PÉREZ (University of Barcelona, Spain) | mrubiale@gmail.com

This contribution presents the results of an empirical study analyzing the data of Madrid and Barcelona in the light of the concept of socio-spatial pattern and combining qualitative and
quantitative research practices. The qualitative approach analyzes 23 semi-structured interviews addressing five major topics: city, neighborhood, residential choice, urban facilities and political positioning. The quantitative approach resorts to census tract data to calculate segregation indices, factorial and cluster analysis, and to draw a social cartography of cities. Occupational category, sector of activity, level of unemployment, nationality, and household size are the variables that establish a socio-spatial characterization of metropolitan regions divided in eight major types. Subsequently, in-depth interviews focus on the three socio-spatial types associated with the upper classes: congregation, seclusion and gentrification. Finally, the contribution presents the results in light of the concept of socio-spatial pattern. In other words, it is an attempt to generalize on the notion of ghetto presented by Wacquant in Urban Outcasts (2008) and in Territorial stigmatization in action (Wacquant, Tom Slater and Borges Pereira, 2014). The aim is to put forward the existence of three other socio-spatial institutions similar to the concept of ghetto: Citadel, Residence and Barrio. Those three socio-spatial patterns are related to the voluntary segregation of the upper classes. The notion of socio-spatial pattern is a theoretical construction drawn from the generalization of the common traits of Ghetto, Citadel, Residence and Barrio. The notion of socio-spatial patterns combines the conceptual tools used by Bourdieu (La Distinction, 1979) and the notion the centrality of territory introduced by Soja (Postmetropolis: Critical Studies of Cities and Regions, 2000).

From the urban edge to a central place: ethnographic approaches to the Portuguese hub of Boston
Graça Índias CORDEIRO (ISCTE-Instituto Universitário de Lisboa, Portugal) | graca.cordeiro@iscte.pt

The east side of the small city of Cambridge (Massachusetts, USA), near MIT and Harvard University, has been the scene of intense transformations over the past decades. Since the late nineteenth century Portuguese, mostly Azoreans, arrived to work for industries that existed there and occupy the edge of the city; more recently, a Brazilian flow of immigrants come to this area and changed the traditional Portuguese taste with its own restaurants, beauty salons, Brazilian mass and festivities in the Portuguese church. Despite the most recent residential dispersion of former residents to suburban towns, due to gentrification, we can say that the Portuguese label got reinforced with these new arrivals. This area seems to attract Portuguese American and Brazilian events and public sociability, largely polarized by some former institutions rooted on previous local networks of families and neighbors. Based on an ethnographic study still in progress, this communication aims to analyze as an urban edge can be at the same time, a central place in the ethnic landscape of a metropolis - and wants to discuss how urban meanings of the place should be read at different temporal and spatial scales

RN37S13 - Gentrification and Diversities II

Social Exclusion as a Result of Gentrification - The Case of Tarlabasi, Istanbul
Aysegul CAN (University of sheffield, United Kingdom) | trp11ac@sheffield.ac.uk

This research will focus on the renovation and regeneration projects, and also on the gentrification concept, social exclusion of the old inhabitants in gentrified areas in the historic neighbourhoods of Istanbul. To investigate these points, gentrification concept will be examined in the first part of the paper. State-led gentrification will be an important issue to examine to
understand the social exclusion in gentrified areas. Afterwards, changes in Turkish economic and housing system will be studied to understand the dynamics that affect Istanbul. In this part, also, a particular attention will be provided to the gentrified neighbourhoods in the historic part of Istanbul. Investigating these points will help to understand (i) interventions of the state, (ii) organisations that have been operating in these processes and (iii) association between work and social life with the effect of gentrification.

Demonising the current inhabitants is a commonly used strategy by the local governments to form a public opinion in a way that would help them implement their projects. However, this strategy not only accelerates the process of gentrification, but also creates social exclusion for the old inhabitants of the neighbourhoods. For that reason social exclusion will be examined in regards to gentrification process. Besides this, the effects on the society, urban space and forms resistance by the inhabitants of the neighbourhoods will be investigated as well. To investigate these points the case of Tarlabasi in Istanbul will be used as an example. This case study will analyse effects of gentrification process on the social dynamics of the city and the links between larger-scale authorities such as local or national state and inhabitants of the neighbourhoods.

Self-exclusion of residential community as a reaction to environmental conflict in the city
Robert Michal BARTŁOMIEJSKI (University of Szczecin, Poland) | robert_bartlomiejski@poczta.onet.pl

Local environmental conflicts in cities are strongly related to urban development plans. The theoretical framework is based on the paradigm of urban political economy in particular urban regime theory. The purpose of this work is the question about the importance of determinants for housing estate residents’ attitudes of opposition to compromise environmental conflict resolution and its dynamic. The research was based on case study method and triangulation of research techniques on representative samples. It was found that the perception of conflict depends on profit and lost account, lack of trust to investor and fear of loosing control over natural resources in housing estate for the benefit of holders of capital. It was concluded that residential community is not a single group of interest, but it is divided to territorial neighborhoods and sub-neighbourhoods subsystems. It has been shown that local environmental conflicts are conditioned not to environmental risks, but especially economic interests. Basing on researched case study, growth machine coalition regime have driven a selective application to the principles of sustainable development, especially violating social inclusion principle in the name of introducing so called “green economy”. Unequality lives in urban spaces manifested itself in a situation of local environmental conflict in the city. In the name of public consultation and conflict resolution, urban regime coalition makes arrangements leading to self-exclusion of residential community, protesting against unwanted land-use. As indicated above, the thesis refers to articulated social risk of inequality in controll of access to public goods, such as natural resources and space of neighborhood.

Unofficial lines in the cityscape: exploring the rat trails of Brasília
Emerson Rodrigo ALMEIDA (Faculdade de Mauá, Brazil) | emerson_erfa@yahoo.com.br
Gustavo DIAS (Goldsmiths College - University of London, United Kingdom) | tentonidias@hotmail.com

This paper explores the popular rat trails which informally coexist with the linear footpaths in Brasilia. As the inhabitants comment, the planned Brazilian capital is notorious for its anti-pedestrian layout. It is a place made for cars. Wandering through the footpaths, foot-walkers
daily experience how fragmented they are, longer than necessary and, in most of the cases, dependent on the rational automotive geography which orchestrates the mobility of people, information and goods. Alternatively to these hardened pathways, over the years pedestrians have created unconventional trails across the green city blocks. The effect is a myriad of sinuous lines drawn by footprints. Known as rat trails, these temporary trails come and go depending on the need of those who experience Brasilia by walking. Through a fieldwork examining the official architecture – designed by the urban planner Lúcio Costa and the architect Oscar Niemeyer – and the rat trails, we explore in this presentation how these innumerable beaten trails promote new and unofficial lines in the planned cityscape. As a main research orientation, we draw the theoretical framework from the concepts of mobility, and spaces as approached by scholars who reflect on the movement of people through an interwoven perspective, where places are connected in their journeys not as arenas of fixed rootedness, but as flexible spaces which have also been transformed and shaped through mobility (de Certeau 1997, Cresswell 2006, Massey 2005, Ingold 2011, Knowles 2010).

RS01S01 - General Session

A new model for the arts at county level in Ireland: Transitioning the role of the arts centre in the community
Elizabeth WHYTE (Wexford Arts Centre, Ireland) | elizabeth@wexfordartscentre.ie

The purpose of this research is to explore how an arts centre in Ireland can transition its role in the county and how a new arts model for the county may evolve as a result of this transition. The new Local Government reform act 2014 resulted in the abolition of certain town councils and the formation of municipal districts as well as regional assemblies within the counties across Ireland. This is an opportune time for arts centres to review their services as a support service to county arts and community development plans. The dissertation focuses on how the art centre has evolved to date and how it can evolve further delivering a professional arts management service for ongoing sustainability. Wexford Arts Centre is the case study representing an arts centre based in a town due to be merged into a municipal district within the county.

An inductive approach through qualitative action inquiry theory research is completed through six in depth interviews with major arts centre stakeholders. The research produced a number of key findings: arts centres’ could transition their role within the county as a centralised professional arts management service through further partnerships with local authorities, arts centres should be involved in development of county arts and community plans and establishment of an arts centre/venues association could deliver a support service and lobbying voice for arts centres at national level. The research will be of value to arts centres, stakeholders and for the national and international arts sector in general.

The Relationship between Cultural Policy and Arts Management
Victoria Catherine DURRER (Queen’s University Belfast, United Kingdom) | v.durrer@qub.ac.uk
Melissa NISBETT (King’s College London) | melissa.nisbett@kcl.ac.uk

This paper presents new empirical research regarding how arts management educators, arts managers and cultural policy makers interpret the relationship between arts management and cultural policy. Connections between policy and practice are visible through initiatives within specific localities, nations (Nisbett 2013) and at international scale (UNESCO 2013; Eurobarometer 2013; Bamford and Wimmer 2012). Yet, there is little scholarship that develops our understanding of how these two areas interact, how ideas are exchanged and implemented, and where the power is located within this relationship.
In the UK, studies reflecting on these fields tend to either focus on the impact of policy on practice (Kawashima 2000; Belfiore 2004) or call for a rethinking of cultural policy agendas for practice (Miles and Sullivan 2012). Only recently has research (Woddis 2014; Nisbett 2013)
considered practitioners’ potential ‘power and agency in the policy process’ (Bell and Oakley 2014: 59).

This paper presents data from an audit of arts management and cultural policy programmes within UK universities and interviews with UK arts managers, educators and cultural policymakers. Outcomes reveal how educators and individuals practicing in both fields perceive the relationship of policymaking to the work of management and how new arts managers are being trained to consider this relationship. The findings provide insight into how the relationship of arts management to cultural policy practice is understood, articulated and enacted by the individuals involved in shaping those practices.

**Arts management as a career choice: how structural factors increase class and gender gaps. Evidence from the French case**

Vincent DUBOIS (University of Strasbourg, France) | vincent.dubois@misha.fr

Careers in arts management attract a growing number of graduates. In this paper, I show that the reasons for this attraction are also factors for more inequality among the applicants to such positions. Competition has raised the requirements at the entry level, and a high volume of a full range of capitals (Bourdieu) is now necessary: cultural capital, university degrees, social capital of relationships, specific capital of experiences, international experience and language skills. Arts management is no longer envisioned in the perspective of upwards social mobility. Conversely, it now pertains to strategies of social reproduction, or to strategies against social downgrading. This results in the exclusion of individuals issued from the lower middle class and from the lower class, and in the selection of applicants from privileged educational and family backgrounds. This elitization process goes with a feminization process, adding a gender gap to a class gap. After describing and explaining these increasing gaps, I will elaborate on their effects on arts management.

This paper is based on research on the applicants to cultural management training programs in France, mainly consisting in a questionnaire (n=654), in 20 interviews, in the analysis of a sample of 45 application files, and in around 50 observations of selection interviews.

**RS01S02 - Arts Management: Differences, Inequalities, and Sociological Imagination**

**An Acoustic Panopticon? Exploring the Power/Knowledge Base of Orchestra Conductors’ Leadership**

Emmanuel COBLENCE (Institut Supérieur de Gestion Paris, France) | emmanuel.coblence@isg.fr

Cyrille SARDAIS (HEC Montreal, Canada) | cyrille.sardais@hec.ca

“Transformational” (Boerner 2005), “interactive” (Atik 1994), “covert” and “inspirational” (Mintzberg 1998): numerous accounts in arts management have framed the orchestra conductor as a skilled leader. Other scholars explain conductors’ leadership through the pre-formatted relation (Drucker 1988): musicians play to a sole conductor, because they all have the same score, which specifies what and when to play. Conductors are thus like “high-intensity” “supervisors” (Arian 1974) of a linear and flat knowledge-based organization.

Yet, little is known on the set of material devices, technologies and knowledge fields that actually enable the conductor to exert a power on a population of autonomous experts. Building on Foucauldian concepts such as “dispositif” (Foucault 1973), “power/knowledge” (Foucault
“panopticon” (Foucault 1975), this article explores how a single person can actually lead such a group.

We ground our theoretical contributions in qualitative empirical data, collected through interviews with 12 professional and apprentice conductors, and more than 100 hours of rehearsals observation (within 8 orchestras in Canada and France, offering variety in size, repertoire and professionalism).

Three contributions are expected:
- First, we conduct an archeology of orchestra conducting, that demonstrates a huge expansion and enrichment of the prerogatives and functions of the conductor since the 17th century;
- Second, our data suggests that an orchestra stage can be analyzed as an “acoustic panopticon”, allowing one individual to lead hundreds of professionals with hardly no intermediaries;
- Finally, this paper discusses the constitution of a specific knowledge supporting conductors’ leadership and power.

Invisible Friends: An investigation into the underlying social justice dimensions within philanthropic support for US international cultural engagement
Aimee R. FULLMAN (University of Westminster, United Kingdom) | a.fullman1@westminster.ac.uk

The power of international cultural engagement is in its ability for create and accelerate change on an individual, group and global level. These programs are often celebrated for their potential and ability to “win hearts and minds,” and to create deeper relationships leading to increased mutual understanding through shared experiences between artists, arts managements and their collaborators and audiences. However, in reality, these relationships are often embedded with unspoken inequalities of resources, power and social change or policy expectations. These underlying dynamics in U.S international cultural engagement often explicitly or implicitly include social justice aspects including arts education, civic engagement, economic development, artist equity, peace/conflict, women and girls, and human or civil rights. This paper will build on previous quantitative research by the author on ten years (2003-2013) of U.S philanthropic support for “international exchange, arts” to identify and analyze these additional social justice lenses present within programming by overlaying the classification system of social justice issues developed by the Foundation Center and adapted by the Animating Democracy project in 2014. It will then further consider the results of this inquiry and the evident social justice priorities within the context of current domestic and international policy and development goals to answer the question: To what extent are international cultural engagement and social justice invisible friends?

Visiting Bucharest museums. Transition from the discourse of equality to unequal chances in access to culture
Anda Georgiana BECUȚ (National Institute for Research and Cultural Training, Romania) | anda.becut@culturadata.ro
Bogdan PALICI (National Institute for Research and Cultural Training, Romania) | bogdan.palici@culturadata.ro

The discourse of equality was one of the main pillars of the communist ideology and it was translated into practice by means of levelling the bodies, minds and souls. Access to culture was not only a right during the communist period, but also a duty for the party and an instrument of political education. The communist Cultural Revolution granted free access to all cultural forms, which enabled the education of social classes previously excluded from cultural production and consumption. In the process of the working classes’ enlightenment, visiting the
museums was a duty that came along with the educational programme. Moreover, museums were part of the propaganda system and their discourse was nationalistic and ideological, highlighting the importance of the communist party, of the Romanian nation and the unique elements of the Romanian culture. All kinds of minorities were unacknowledged, such as ethnic groups or people with disabilities. During the transition to democracy, their acknowledgment and the respect for diversity got through a long distance and this is reflected also in the museums discourse. In the last 25 years the social inequalities have increased and this changed the profile of visitors. Our paper will highlight the visiting practices in Bucharest museums, depending on household income, level of education, cultural and social capital. We will analyze the management of Bucharest museums, from the viewpoint of facilities for disabled people and free entrance for special categories of visitors. Moreover, we will analyze how diversity is presented in the museums’ exhibitions.

RS01S03 - Theories and Methods in Arts Management

Relational Boundaries in Cultural Governance Processes
Robert PEPER (Leuphana University Lueneburg, Germany) | robert.peper@leuphana.de

Social Network Analysis (SNA) can be seen both as a theory and a method. In the past people talked about SNA as a „method in search of a theory“. Today, most scholars have acknowledged it as a theory in its own right. The strength of the methodological approach is based on its ability to reveal hidden network structures that lie beyond our awareness. By quantifying network measures it becomes possible to visualize a network picture that helps us to understand the constellations between different stakeholders. This can be very important when it comes to the exploration of decision making in cultural governance-processes or to understand the power structures of a given field.

Often, arts managers face the challenge of making existing cultural structures visible and help local people to better combine their resources. Especially in rural districts, where large parts of the cultural work are based on volunteerism, creative people do not have time for active networking. On the occasion of the first cultural workshops in the region of south Thuringia (“Thüringen”), participants discussed the assumption that there is a deficit of reliable network and decision-making structures – one of the most important topics of contemporary culture development planning. Due to this fact, there is a need for the installation of new governance structures that could be organized by counties or even county boundaries. In addition, the participants expressed a desire for individuals in larger communities to take over responsibility. As a method for collecting network data I will present the Net-Map interview. This method is part of a “visual network research”, a discipline that has recently gained attention in the network science community. The great advantage of the method is the relatively low survey effort to collect data about the core structures of a network which can be further processed quantitatively. The procedure runs very participatory, because the researcher creates a network card together with the interviewee. Retrospectively, the researcher reviews which actors play a central role in the process of decision making. Considering network-theoretical approaches, it is of particular interest how these actors make contacts (relations), with whom they establish the appropriate contacts and why they avoid certain contacts (structural holes). It is also possible to talk about existing conflicts between stakeholders. At the beginning of the process, the interviewed person is asked to mention an unspecific number of actors with whom he has interacted in a specific period of time. Here, the standardized settlement of a stimulus will call a greater number of actors which are then marked on a network interface card.

Entrepreneurship and the Narratives of Sacred Origin
Constance DEVEREAUX (Colorado State University, United States of America) | constance.devereaux@colostate.edu

Culturally sustainable entrepreneurship is a model developed by DeVereaux and Swanson (2012) both as an investigative tool and as a framework for practice. The model has been applied to case study research of the Hopi of Arizona and the intentional community, Arcosanti in Arizona, and led—in both cases—to concrete recommendations for tourism management of historic/culture-centric sites. Culturally sustainable entrepreneurship draws on theories of sustainable entrepreneurship, cultural sustainability, and cultural citizenship in adopting methods for cultural management that consider social, economic, and cultural impact, and indigenous ways of knowing and doing as sources for development of entrepreneurial methods suited to cultural environments. Great emphasis is placed on indigenous values, skills, and knowledge. This paper reports on a new case study extending work in culturally sustainable entrepreneurship to a population in QwaQwa, a former bantustan (homeland) in central eastern South Africa. Granted self-government in 1974, the area suffers from widespread poverty and underdevelopment, which have contributed to cultural compromise as individuals and communities seek economic betterment. The present study reports on a project to assist one village envision the repair and revitalization of a museum located on a sacred site. Using the above-named model as the framework for research and recommendations the paper details a process of engagement with this community for ensuring the cultural integrity of the site, linking narratives of sacred origin to culturally sustainable entrepreneurial methods.

Managing the new arts of new data models
Susan OMAN (University of Manchester, United Kingdom) | susan.oman@gmail.com
Mark Richard TAYLOR (The University of Sheffield, United Kingdom) | m.r.taylor@sheffield.ac.uk

Current ‘austerity’ culture in England and the UK has left its arts and cultural sectors under increasing threat of heavy central government funding cuts. The sectors have responded by ‘attaching’ to work claiming to articulate the value of participating in the arts and related activities, expressed as improvements to well-being. This corresponds to a wider strategy of claiming economic validity to the Treasury and related government departments. However, much of the work done in this area, often funded by government departments, paints a partial view of well-being and participation benefits. This paper attempts to replicate existing estimates of the relationship between arts and culture and well-being using publicly available data sources, and shows X things: (1) existing assessments of the relationship between the arts and wellbeing do so on the basis of financial estimates, exaggerating the relationship between income and wellbeing in the process; (2) these estimates also fail to take into account several significant variables in estimating wellbeing, exaggerating their conclusions; (3) treatment of "arts and culture” misleadingly biases conclusions towards the funded sector; (4) in contrast with the existing literature, these estimates elide gender differences, and (5) the data used for these evaluations are inappropriate for a number of reasons. While our modelling does not call into question the relationship between the arts and culture and well-being per se, we question the climate in which existing approaches are considered to be worthwhile and helpful to the community of arts management.

Conceptualizing Self-Conception - An Ethnographic Case Study on the Functioning of Cultural Organizations
Laura Sofia SALAS (Zeppelin University, Germany) | l.salas@zeppelin-university.net
Marie ROSENKRANZ (Zeppelin University, Germany) | m.rosenkranz@zeppelin-university.net
Cultural organizations combine techniques from fields like art, administration, economy, law and politics, in order to provide a framework for the production, the reproduction and the communication of art and culture. This interdisciplinary approach in practice has led to a patchwork theory, with its respective advantages and disadvantages for the field. The present investigation aims to understand the overall functioning of a specific cultural organization – a national museum in Austria – from its practical operation, with the goal of comparing the observed structures with existing theories (see Mintzberg 1980; Weick 1985; Luhmann 1988; Tröndle 2006; Klein 2007; Baecker 2009; Chen, 2009; DeVeraux 2009). The results show that system-theoretical approaches offer a solid framework when trying to understand demarcation, communication and decision-making processes. However, it fails in the explanation of the process where differentiation of organizational self-conception takes place, among people, topics, functions, as well as artistic and managerial leadership.

RS01S04 - Sociology of Arts Management

Birds of a Feather? an analysis of arts participation and taste in Ireland
Kerry MCCALL MAGAN (Institute of Art, Design and Technology, Ireland; Institute for Creative and Cultural Entrepreneurship, Goldsmith's, University of London, UK.) | Kerry.McCall@iadt.ie

Bourdieu demonstrated that aesthetic sensibilities and engagement were distinctly homologous with an individual's location in the social space and were used as a tool of symbolic violence by dominant social class groups (Bourdieu, 1984). Often criticised for being overly reductive, his theories still offer a powerful lens with which to consider aesthetic taste and its manifestation through arts participation. Through the Bourdieusian frame, this research paper considers the Irish case of distinction and if the patterning of arts taste and participation in contemporary Irish society parallels Bourdieu's empirical analysis of the social space of French society in the 1960s. This research paper seeks to identify if individuals cluster in a stratified homologous relational similarity or in a differential heterogeneous association in relation to arts taste and participation in Ireland. By drawing on data from the Public and the Arts survey (Arts Council of Ireland, 2006), this research will use Multi Correspondence Analysis (MCA) to articulate this data. This methodology provides a representation of geometric data analysis via the relational technique of the Euclidean cloud. In this methodology, 'a family of statistical observations' are conceptualized as points in a multi-dimensional space allowing a visual rendering of relational similarity and dissimilarity (Le Roux, & Rouanet, 2004). MCA therefore, inductively agglomerates data to represent in clusters or 'clouds', individual taste and participation by using a differential association technique. This method offers a vehicle with which to explore the arts taste and participation patterns in the social field in Ireland.

On the power(lessness) of cultural managers
Goran TOMKA (Faculty of sport and tourism, Serbia) | goran.tomka@tims.edu.rs
Ivana ANDELOVIĆ (Independent researcher) | ivana.andjelkovich@gmail.com

Stemming from the American tradition of arts management research, arts managers have been mostly portrayed as authoritative decision-makers: influential founders and entrepreneurs (DiMaggio), gatekeepers (Becker; Hirsh) and negotiators between markets, governments and businesses (Mulcahy). European continental approach (Bourdieu; Molard) differs only for it sees managers as representatives of the powerful state who set rules and engineer cultural fields. In all these instances managers in cultural field are powerful social agents. However, in many
countries all over the world, (as well in many marginalized fields in the West), states are lacking clear cultural policy, philanthropy is weak and markets are not interested in arts (Dragićević, Dragojević). Theories that understand cultural managers as powerful are virtually meaningless in such contexts.

A theoretical framework offered by deCerteau, that of tactics and strategies can, with some adjustments, offer much better analytical framework. By constructing a continuum of tactics/strategies and classification system, we can place cultural managers on it, explain various power positions and better understand their decisions. We can also look for other tactics/strategies in the field and better understand their relationships. Approach is tested in the empirical research encompassing interviews and focus groups with 23 cultural managers in Serbia in relation to the upcoming candidacy of their cities for the European Cultural Capital. Findings show that the amount of power determines the ability to articulate their position, to make independent decisions and act according to a long-term mission.

Sense and Nonsense in Cultural Organizations - Towards a sensemaking perspective on cultural organizations.
Julian STAHL (Zeppelin University, Germany) | j.stahl@zeppelin-university.net

The present paper examines the role of sensemaking in cultural organizations as a mediating function. Starting with the assumption that cultural organizations are dealing with a complex environment, two main challenges of the organizations are outlined. It is suggested that the organization has to develop a high level of internal differentiation to be compatible for a variety of organizational circumstances (Ashby 1965, Baecker 1999). As a consequence the internal complexity within the organization rises and, therefore, the risk of the inability to act increases as well. But how can cultural organizations handle both of these opposing challenges? The paper discusses the approach of organizational sensemaking as a possibility to observe possible relations between the two challenges (Weick, Sutcliffe et al. 2005). Finally, an experimental field study in two important german concert halls examines the relevance of the developed theoretical perspectives.

postaffirmative arts management revisited
Christian KLEINDIENST (Leipzig University, Germany) | christiankleindienst@hotmail.com
Julia RÜHR (Leipzig University, Germany) | rruehr@gmail.com
Sarah DOCKHORN (Leipzig University, Germany) | sa.dockhorn@gmail.com
Maria BRAUNE (Leipzig University, Germany) | mariia.braune@gmail.com
Luise BLECHSCHMIDT (Leipzig University, Germany) | blechschmidtluise@gmail.com
Franz WINKLER (Leipzig University, Germany) | winkerfranz.fw@gmail.com
Lars KELEVRA (Leipzig University, Germany) | larsscheideler@gmail.com
Lisa KÖNIG (Leipzig University, Germany) | lisakoenig@posteo.de
Christina SCRIBA (Leipzig University, Germany) | christinascriba@gmail.com

Within arts management discourses 'culture' mostly is understood as cultura animi, as 'autonomous' field of art or high culture (Klein 2011: 1).

However, this concept of culture has become historically untrue by the “dissolution of boundaries between its media as well as between art and other cultural productions” after World War II (Stakemeier 2012: 4). In this regard, current arts management reproduces existing social
Identity on the Stage: The relevance of plays to young adults in a modern society
Emelie Annette BORELLO (Colorado State University, United States of America) | e borello@gmail.com

Participation in the performing arts has declined for several decades, and continues to do so across all adult age groups (NEA, 2012). As U.S. nonprofit theatre organizations attempt to reinvigorate their audience base, they also face the question of where future donors will come from and how they can increase sustainability. Arts management leaders question how to attract the young adult audiences and keep them interested in theatre for years to come. Many questions have been explored relating to participation in the arts, but the literature is sorely lacking on one relevant point: do young adults (18-24) identify with the characters and relationships represented in theatre today? Many theatre organizations continue to present works from the classical era or early 20th century, while playwrights construct contemporary works built around these older social construct models. With the shifting nature of social identity in today’s network society, do young adults find the same relevance in the theatre of the past to their own life situations? While this question may seem rhetorical, the current literature does not answer this in a satisfactory way. Using a constructivist design, this study seeks to understand views and perceptions of young adults disinclined to attend theatre through attendance of live productions and a post-interview process. This research provides an opportunity to inform the programming decisions of theatre managers, while opening the discourse to another segment of audience engagement studies.

Liberals vs. Conservatives: The Breakdown of American Partnerships and the Arts as a Catalyst for Political Change
samantha ROSE (Colorado State University, United States of America) | samantha.k.rose@gmail.com

The arts, as defined by theatre and visual arts instruction, find inspiration and creation through diversity. This diversity challenges political and socioeconomic classes and by enlightening people of different ideologies through artistic engagement. Evidence for this is theatre and its ability to create a point of view from or about individuals in marginalized communities and with different problems and ideologies than their own. The purpose of this study is to test Robert Putnam’s social capital theory by applying his ideas on heterogeneous communities to the case...
of arts and social inclusion in communities that lack diversity due to the split homogeny of political communities. The community in question for this paper is Denver, Colorado. The division between liberal and conservative is marked and intense. Can the arts and social inclusion bridge the separation of political ideology to create common civic goals and balance in service of both local and national civic responsibilities? If they can and it is measureable, how do current arts leaders, educators, and managers tap into these tools to create stronger community engagement?

The role of Sociologists in a designed world: some reflections from the wikirate project
Stefano DE PAOLI (Abertay University, United Kingdom) | s.depaoli@abertay.ac.uk

The goal of this presentation is to reflect on the changing role of the sociologist in a world which is increasingly designed. I will argue that role of the sociologist is under transformation and that sociologists need to have a proactive role in the design of technological systems supporting social transformations. This requires an articulation of sociological theory and design research aimed at designing social action rather than just understanding it (Verstehen). This active role also breaks with the value-neutrality perspective of Sociology (Weber, 1922). I will discuss the changing role of sociologist by using my direct experience of working in a research project called Wikirate (http://wikirate.org), funded by the European Commission under the initiative Collective Awareness Platforms (CAPS).

CAPS are pilot web platforms whose goal is to offer citizens opportunities for engaging in bottom-up processes of social innovation (Arniani et al. 2014). The Wikirate project, for example, is a web platform where citizens can contribute to rate the ethical behaviour of companies. CAPS are also interdisciplinary research laboratories. Sociologists take an active role in designing CAPS platforms: they work actively with engineers and computer scientists in constructing the web elements and technology features for supporting the activities of citizens. I will discuss the changing role of sociologist in a designed world the Wikirate case: a web platform where we design features supporting citizens in rating the ethical behaviour of companies.

Design as a socio-cultural phenomenon:"epistemic" analysis
Liubov BRONZINO (Peoples' Friendship University of Russia, Russian Federation) | lbronzino@gmail.com
Helena KURMELEVA (Peoples' Friendship University of Russia, Russian Federation) | soc_phil@mail.ru

An increasing number of aspects of human activity are now being interpreted through the prism of design as a conceptual framework. There is no general theoretical approach in the social sciences concerning the concept of design, which allows it to be unambiguously interpreted. Consequently, it seems logical to appeal to the concept proposed by B. Latour, who has suggested the idea of universalization of design and proposes that there are “Five advantages of the concept of design”.

Another promising approach concerning the study of the concept of design comes from the scholarship of Michel Foucault. On the one hand, Foucault proposes that we can integrate the
"words and things" (material objects and methods of their narration) into the concept of discourse. However, on the other hand, he constructs a theory of a sequential change of "epistemes", in which the relationship of words and things becomes the ultimate determinant in shaping the character of discourse.

Following on from these two concepts, research was conducted to study design as a social practice, which possesses special communicative elements. We investigated the existence of design in each of the epistemes described by Foucault—these were the Renaissance, classical and modern. In addition we looked at the features of design as a sphere of co-existence, or constituting a space" of words and things." This are a backbone element in helping to determine there relation between man and nature (i.e. material objects, terrain, etc.). Foucault's scheme was further supplemented by two more epistemes in order to have the opportunity to reflect on the design in the pre-Renaissance time—a kind of prototype design stage—and the operation of the concept of design in the contemporary postmodern epoch, that Foucault considered as being in the process of formation.

For each of the epistemes, key components were identified. These were the specific cultural phenomena and conceptual schemes, which manifested the features off functioning of design specific to that particular epoch. This approach allows us to identify the specificity of social interactions, as implemented and organized by the objects and related cultural practices prevalent in the episteme.

**Design for Empowerment of Youngsters’ Competencies for Meaningful Participation**

Olga GLUMAC (Faculty of Fine Arts, University of Porto / ID+ Research Institute for Design, Media and Culture, Portugal) | olga.glumac@gmail.com

The Global Youth Wellbeing Index (Goldin 2014) outlines that youngsters are about to develop their voices independently from their families and their community, when in transition from childhood to adulthood. Today young people are faced with many challenges that influence their wellbeing (self-esteem, self-development). More than 2.9 billion of people in the world are under the age of 25. Therefore, it is crucial to incorporate their voices in a discourse of how to design strategies of global development.

To make them “feel that they are a genuine part of the process, young people must have their needs specifically acknowledged,” ("Development Progress" 2015). Education plays a critical role in youth wellbeing and has an impact on employment, health and civic participation (Goldin 2014). School is a very important context for learning and experiencing citizenship and it should provide any youngster with learning and practice of different dimensions of transversal Citizenship Education (Portuguese Ministry of Education and Science 2012).

This paper describes and critically shows an ongoing design action research located in Porto (Portugal) that investigates how design supports the empowerment in meaningful participation of Portuguese youngsters (age 12-15). Design is perceived as a means for creating new methods and methodologies that could be applied in inclusive learning within the existing educational public system. Creating situations where young people with different backgrounds can come and share designing and co-ownership experience allows stimulation of their initiatives and "learning by doing" (Kolb 1984). Youngsters in Porto are currently learning how to pioneer the co-development of creative social initiatives.
The question of shape, experiences and meanings of the city. The cases of Tróia and Condado in the Lisbon metropolis.

Manuela DE VINCENZI (CICS.NOVA / FCSH-UNL, Portugal) | m.devincenzi@fcsh.unl.pt

The contemporary metropolis tends to seem mostly affected by phenomena of social disintegration and inequalities. The promise lying in the modernist utopia of progress, freedom and equality was broken, and the several urban outskirts throughout the world which continue to grow and experience situations of isolation from the rest of the city and show signs of deterioration are there to prove it.

Given this context, the focus of this paper will be put on Tróia's urban project and the Condado neighbourhood in Lisbon, where both cases present the same morphological design, based on the concept of Garden City, although with totally different results in terms of uses.

On one hand there is Tróia, built and designed for the vacations of the upper-middle class, and on the other there is the Condado Neighbourhood, representing one of the most stigmatised areas of Lisbon, particularly due to deviant behaviour, criminality and environmental degradation.

The first question that immediately comes to mind is: how can the same project, in different contexts, produce such different results?

In the case of Condado's neighbourhood, some people, like the architect Teresa Valsassina Hector, attribute the cause of deviant behaviours mainly to its urban design and "misconceived" configurations, while others hold the inhabitants of these places solely responsible for their deterioration and marginalisation.

Can the urban design, in this regard, influence the behaviour and degradation present in these places?

To what extent should the needs of the inhabitants be interpreted? And at which point can suggestions be made without falling into imposition?

Measuring, mending and managing inclusive design

Kim KULLMAN (Goldsmiths, University of London, United Kingdom) | k.kullman@gold.ac.uk
Rob IMRIE (Goldsmiths, University of London, United Kingdom) | rob.imrie@gold.ac.uk

Drawing on a European Research Council funded, international study, this paper engages with a neglected question in current research on the social shaping of design: how are inclusively designed environments maintained once they have been, however temporarily, completed? As the paper demonstrates, present and future forms of inclusive design cannot be seen as separate from issues of maintenance. Describing various practices of measuring, mending and management that seek to sustain inclusively designed buildings and spaces, the paper traces the doings of an unacknowledged group of professionals that maintains inclusive design, from council workers to building inspectors and planning officials. The attention that such practitioners direct to inclusive design serves as a reminder that design is an inherently incomplete process that is open to renegotiation and reconfiguration. This, as the paper argues, enables an exploration of potential ways of placing design at the centre of public life, because it invites recognition of the intricate, but also highly fragile, relations that constitute design and the constant maintenance that these relations require. The paper then discusses how more collectivised and socially responsible forms of design maintenance might be elaborated as well as how, in different parts of the world, such developments are already in progress.

Approaching vernacular design – a real life example

Ewa ZIELIŃSKA (Culture-making Association Miastodwa, Poland) | kontakt@miastodwa.org
Jan Franciszek CIEŚLAK (Culture-making Association Miastodwa, Poland) | kontakt@miastodwa.org

Ewa Zielińska – Institute for Applied Social Sciences, University of Warsaw, PhD student
Jan Franciszek Cieślak – Culture-making Association Miastodwa

Approaching vernacular design – a real life example.
The term "vernacular design" refers to all of design practice undertaken by non professionals. Its output is the temporary architecture and shabby, amateur advertising, commonly seen especially in the urban environment of post socialist countries. Practiced by amateurs, it exists in opposition to the established language of professional marketing, it disregards official regulation, and often, common sense. Vernacular design is characterised by tactical approach – it is created on the spot, as a response to the momentary needs and it freely uses the techniques available at hand. By many, it is seen as an ugly problem – it invades the public space and defies the rules of a well planned urban environment. In the same time it is an example of truly local aesthetics, a visual language developed outside of the ubiquitous discourse.

We can specify two opposing approaches to the vernacular design. In the modernist rhetoric, it seen only as something that need to be eliminated, uprooted and repaired. The other position is taken by those who see it as a manifestation of a genuine local culture, who view it as something that needs to be understood, and to some extent, protected.
The question that arises, is how to practically approach the vernacular design in rapidly developing cities, which seek to reestablish their own visual identity. We will explore this topic on the example of a real life project – a revitalisation of an old, post communist shop pavilion in Warsaw.

Towards the intercultural citizenship with the up-to date design
Katerina Sidiropulu JANKU (Masaryk university, Czech Republic) | katerinasj@fss.muni.cz

In 2014, the street exhibition "Khatar san? How Slovak Roma came to the Czech lands for work and what was happening next" took place in three biggest Czech cities, Ostrava, Brno and Prague. The innovative form of street exposition of life narratives of Slovak Roma was based not only on the stories told by the witnesses, but also on the whole process of co-operation of academic and non-academic team members. Thus the designer Jiri Janicek put the ideas of participative researching, intercultural dialog and empowering civic competences into the stylized flat that he closed up in the neutral wooden mass.
The paper shows diverse reactions (that were generally more positive than expected) on the chosen material concept. By public administrative, witnesses and team members, random visitors, professional audience and media. Thus it discusses, how quality and up-to-date design may empower civic mode of existence, but also work towards safety and regardful behavior. In the same time, the custodian experience from the street exhibitions shows, that there is no winning without taking a risk and stepping out of the comfort zone in the sphere of democratic civic dialogue. However, the thoughtfully prepared design may well channel taking these minor everyday risks and discomfort in a way that the authors of the Leperiben project consider to be functional.

Some of the pictures from all three street exhibitions may be found on the project Facebook profile at https://www.facebook.com/leperiben?ref=ts&fref=ts. The project web page in Czech language is www.leperiben.cz.
RS03P01 - Poster Session

From ecological crisis to public debt: does « europeanization » represent an outcome for the Notav movement?
Anahita GRISONI (ENS de Lyon, France) | anahitagrisoni@gmail.com

As many other social initiatives in Southern Europe, the Italian Notav movement has been described by Donatella della Porta and Manuela Caiani through the concept of europeanization (della Porta et Caiani, 2014). The fact is that this twenty-five years old « popular movement », opposed to the construction of the rail line between Lyon and Torino, has been the starting point for the circulation of numerous social stakeholders and claims through Europeans trouble spots. The homogeneity of those social movements has been legitimated by reappropriating institutional discourses about ecological and financial crisis and by the formulation, on those territories, of an « alternative and sustainable » way of life, promoted as a resilient solution. Since 2010, a yearly event is organized by one movement of this network through the association Presidio Europea, in order to gather all the stakeholders.

However, due to the heterogeneity, not only of situations and conflicts, but also of the social groups represented in those social movements, the different challenges linked to the general concept of europeanization should be clarified. Beyond the appearance of an alternative European project from bellow project, it seems necessary to define the manners in which it becomes real for different kinds of social stakeholders. If the European scale represents one the protest level, this communication aims to disveal the ambiguities of this project through a multilevel analyse.

RS03S01 - Europeanization? Practices and Identifications

Pluriform Europe: the identity of Europe through the eyes of „European“ nations
Richard NIKISCHER (Institute of Sociology of the Czech Academy of Sciences) | richard.nikischer@soc.cas.cz

From a social constructivist viewpoint, the identities of the regions are represented by images of corresponding socio-spatial units. The images of regions are always variable in time and space, and in this respect, Europe is an exemplary case. The identity (image) of Europe is characterized by a high degree of spatial variability, especially at the level of individual nation states. However, in contrast to the international disparities in the degree of European consciousness, the international or other spatial differences in the perception of Europe have seldom been subject of analyses. But if we want to be able to adequately interpret the current spatial differences in European consciousness, we need to begin to pay closer attention to spatial disparities in the perception of Europe. After all, our relationship to a particular region depends on how we perceive it. In this contribution, drawing on data from the Eurobarometer 73.3 survey, I will examine the differences in the perception of the identity of Europe across individual European Union countries and their groups. Special attention will be paid to the relationship between the identities of individual nation states and the particular national...
perceptions of Europe. It can be assumed that the inhabitants of individual „European” countries attribute to Europe such qualities that are also typical for their own countries.

From “their Union” to “our Europe”? Dynamics of attitudes towards the European Union in Poland
Katarzyna ANDREJUK (Polish Academy of Sciences, Poland) | kandrejuk@ifispan.waw.pl

European Union has changed radically in the last eleven years – both in terms of geographical expansion and the competences. Significant alterations have also been noted in the sphere of social attitudes towards the EU, which will be examined on the example of Polish society during the decade 2004-2014. The presentation will explore the patterns of these changes and the most important turning points which influenced Polish attitudes towards the European Union. The topic will be analysed on the basis of the data from the Polish Panel Survey 1988-2013 – longitudinal survey conducted in Poland on the same sample of respondents since 1988, in five-year intervals. In order to maintain representative character of the survey, in each edition new respondents (from the missing age categories) were added to the sample; however, the core of the sample are respondents interviewed regularly in each wave. As it has been observed, the attitudes towards the EU changed to more positive after Poland’s accession to the EU in 2004. Moreover, more positive opinions about the integration are declared by the respondents who have various transnational experiences – such as migration episodes or even family and friends abroad. The advantages of the membership in the EU are perceived as bigger for the country than for respondents themselves. The presentation will examine and interpret the dynamics of these opinions in the light of current rise of popular Euroscepticism in various EU member states.

Europe between mobility and sedentarism: Patterns of cross-border practices and their consequences for European integration
Justyna SALAMONSKA (European University Institute, Italy) | Justyna.Salamonska@EUI.eu
Ettore RECCHI (Sciences Po) | ettore.recchi@sciencespo.fr

In this paper we explore to what extent mobilities shape everyday lives of Europeans. We map out the patterns of physical and virtual mobilities, including intra-European migrations, international travels, but also individual networks across borders and online transactions. In particular we outline how free movement within the EU, one of the basic rights of EU citizens, is part and parcel of a broader ‘mobility mix’ of transnational practices. By applying LCA (latent class analysis) to a random sample of 6000 resident nationals in six EU member states (Germany, UK, Italy, Spain, Denmark and Romania: the EUCROSS survey of 2012) we build a typology of European cross-border practices, drawing a diversified picture of mobilities between two extreme positions of transnationalism and immobility. We describe in detail the typical configurations of social transnationalism in the light of their structuration on the basis of macro and micro categorical differences. Finally, we ask about the consequences of these mobilities for the European integration project by linking different mobility patterns identified with LCA analysis to identifications with Europe.

László LETENYEI (Corvinus University of Budapest, Hungary) | llet@uni-corvinus.hu
András MORAUSZKI (Hungarian Academy of Sciences Centre for Social Sciences, Hungary) | morauszki.andras@gmail.com

Every year the European Union spends millions of euros to promote cross-border cooperation among its member states. The efficiency of these expenditures is measured with indicators, such as:

- the number of enterprises in the region increases
- the number of jobs along the border increases
- there are two women among the project management staff (indicator of equal opportunities)

All in all, we argue, that the indicators demanded by the EU are not suitable to measure how efficiently the funds assigned to Cross-border Cooperation were spent.

The present paper aims to create a direct measurement of the efficiency of Cross-border cooperation programmes, based on:

- mental mapping (how do people see the other side of the borders, the towns and villages, services and opportunities)
- language skills (how much do people speak the language of the neighbouring country, how functional are these language skills)
- and position generator (how much does their social network reach across the state border)

This proposed research tool is suitable for both a cross-sectional analysis of a given geographical region (e.g. the two cross-border regions of Hungary and Slovakia that were examined in the pilot study), as well as a longitudinal analysis and measurement of the impact of Cross-border Cooperation programmes.

RS03S02 - Children and Europe

Europeanization from below – The case study of a Cameroonian family in Europe
Elise PAPE (EHESS, France) | elise.pape@ehess.fr

This paper deals with the way migrants coming from former colonized countries explore, define and re-define Europe. The links discussed in social sciences between Europe and colonization are manifold. Colonization has frequently been evoked as a central process through which Europe merged (Cooper and Stoler 1997). Furthermore, it is striking that the first Community agreements were established during the period of decolonization (Dard 2008).

This paper will treat the case of migrants coming from Cameroon, a country colonized by Germany from 1884 to 1918, and by France and Great-Britain from 1918 to 1960. The Cameroonian migrants who have arrived in Europe since the 1950’s thus already spoke, at the time of their arrival, European languages such as French and English and were familiar with the school, the health or the judicial systems of their host country.

Departing from an intergenerational case study of a Cameroonian family living in Eastern France, whose children have migrated to countries such as Norway and England, this presentation will treat the following questions: How did the family members define and perceive Europe before their arrival in France, through their contact to Europeans from different countries living in Cameroon during colonization? How has their perception of Europe evolved through their daily life course, practices and experiences? What strategies of geographic mobility within Europe have the family members developed in order to overcome racist prejudice and achieve social mobility? Special attention will be paid to the way Europe may here become a space of opportunities and of limitations.

Migrant Parents and School Achievement of Left Behind Children
Paula Andreea TUFIS (Department of Sociology and Social Work, University of Bucharest) | paula.tufis@gmail.com
Monica SERBAN (Research Institute for the Quality of Life, Romanian Academy of Sciences) | monica_serbanus@yahoo.com

Even with a decreasing emigration (according to Eurostat estimates), Romania continues to be one of the most important source countries for intra-European mobility. Peaking in 2007-2008, the bulk of this outflow was mainly low and middle skilled (Sandu, 2006). Leaving the country to work elsewhere, many migrants left their children behind.

Starting from the idea that education is one of the main vehicles for upward mobility, the paper analyzes the school performance of Romanian migrants’ children who were left behind at home. We compare school achievements of children with migrant and non-migrant parents, focusing on how various factors influence academic success within each of the two groups. We concentrate on analyzing factors with positive and negative influences on academic performance among children with migrant parents, using a 2007 survey (“Effects of Migration: Children left at Home”) on Romanian school children. Most migrants in our sample are part of the outflow of low and mid-skilled migration. As such, their social status resources (or lack thereof) come into play in the schooling career of their children.

Our preliminary results suggest that children whose parents are abroad have slightly lower academic achievement compared to their peers. Most of the gap in academic performance between the two groups of children can be accounted for by the socio-economic profile and the demographic structure of their families of origin, suggesting that, at least in the case of mid- and low skilled migration, migration does not necessarily promote upward social mobility among the children of migrants.

How migrant parents help their children to become European citizens
Catherine DELCROIX (Université de Strasbourg, Laboratoire Dynamiques Européennes, France) | catherine.delcroix@misha.fr

For twenty-five years I worked on several research projects in France, Belgium and the Netherlands that focused on migrant families originating from Morocco, Algeria or Tunisia. Besides meeting hundreds of them I followed a few ones over long periods as ethnographic observer and biographical-narrative interviewer. I was interested in their parenting work, and especially on what they did to get their children to keep their self-esteem in front of stigmatization and discredit. I observed how intra-family relationships continuously changed, and how their creativity in parenting changed along. Their children face a double bind: the French, the Belgian and the Dutch societies ask them, albeit differently, to ‘get integrated’: to get a job (economic integration), to leave their ‘community’ and to melt into the majority way of life (social and cultural integration). On the other hand teachers, employers, the police and media keep considering them somehow as aliens: yesterday as ‘Arabs’, nowadays as ‘Muslims’. Set in such a difficult situation, they show amazing creativity in trying to help their children - boys and girls differently - to cope with this double bind. Also, as members of kinship networks, parents maintain transnational relations with family members in other European countries. They constantly exchange with them comparative information about job opportunities, availability of housing, the quality of healthcare and schooling, level of discrimination and many other local characteristics which might be useful for their children. This contributes to transform their children into European citizens

Unaccompanied minors in France and Belgium: the race against the clock
Dieudonné KOBANDA (Université de Strasbourg, France) | dieudokobanda@yahoo.fr
Unaccompanied minors coming from the wide ‘South’ are being smuggled in ever greater numbers across the European Union’s borders. How did they leave their country of origin? What happens when they are ‘discovered’ in the host country? Do they get taken care of, and how well, knowing that when they get 18 they may be expelled from the EU? During the past years we have met roughly 250 of them (80 % of boys) in the Paris area in our job of educator, then director of a centre. We were able to build relations of trust with and interview at length 33 of them (Congolese, Angolese, Guineans, Indians, Armenians, Afghans, Albanians…), reconstructing with them their life course. We also compared the conditions of their reception in France and in Belgium. We observe how invaluable is, besides institutional help in housing and schooling, the work of voluntary associations. 75 % of these minors are older than 15 when they land in France; therefore they have only a couple of years to learn French, study as pupil or apprentice, and find support to help them resist expulsion. We have observed deep differences between those who were still living with their parents before they were sent to France, and those who were already on their own, finding ways to survive: the latter have greater maturity and more ‘survivor’ skills. But almost all of them have strikingly high motivation and will to learn; almost all are great achievers.

RS03S03 - Intra-European Migrations

New European citizens? The Erasmus generation between awareness and scepticism
Francesca IERACITANO (Lumsa University of Rome, Italy) | f.ieracitano@lumsa.it

A recurring criticism of the European Union is that it focuses mainly on political and economic factors while neglecting the development of a common European culture and sense of European citizenship. However we can find signs of cultural transformation in the way that Europeans use their borders as a physical, social and symbolic space. Usually nowadays, the term “frontier” is replaced by “boundary” as an elastic and extendible meeting space. The aim of this paper is to analyse the relationship between the concepts of boundaries, mobility and integration and the notions of European identity and citizenship. To understand the meaning these concepts have for people who live in the trans-national European dimension, opinions of Italian and foreign students who took part in the Erasmus exchange programme were gathered. The in-depth interviews were focused on the meanings, the expectations and the real experiences that the concept of European citizenship presents for Erasmus students and also whether European citizenship really exists for them. The opinions of the respondents helped highlight the symbolic potential for European citizenship rights to serve as a vehicle of new integration strategies. The way Erasmus students reinterpret the concept of European citizenship and how its symbolic potential could help the European integration process was also analysed.

From south to the north: sociological portraits of Portuguese high qualify emigration
Rafaela GANGA (University of Porto, Portugal) | rafaela.ganga@gmail.com
Henrique VAZ (University of Porto, Portugal) | henrique@fpce.up.pt
Rui GOMES (University of Coimbra, Portugal) | rmgomes@gmail.com
Sílvia SILVA (University of Coimbra, Portugal) | ssilva@uc.pt
Paulo PEIXOTO (University of Coimbra, Portugal) | pp@fe.uc.pt
João TEIXEIRA LOPES (University of Porto, Portugal) | jmteixeiralopes@gmail.com
Lurdes MACHADO-TAYLOR (University of Porto, Portugal) | lmachado@cipes.up.pt
Portugal is identified as one of the European countries where the brain drain is more pronounced, in the last decade. The proportion of workers with higher education degree who emigrated in recent years is 19.5%. That is to say, that since the 1990s Portugal will have lost about a fifth of their more skilled workforce (Docquier & Marfouk, 2007).

Drew on the research project BRADRAMO (Brain Drain and Academic Mobility from Portugal to Europe), the aim of this proposal is to discuss the outcomes of nearly fifty sociological portraits (Lahire, 2002) of high qualify Portuguese that emigrate to Europe, that were interviewed during 2014.

The portraits of these Europeans tell a story of individuals and families that have a common trait: resist the loss of value created by the investment in their education. Not resigning themselves to the status of unemployment or underemployment chose the bitterness and the freedom to change their lives to another European country.

They are also the expression of a very deep discomfort that is spreading across Europe, making the peripheral countries most qualified human resources to migrate to central countries. Attracted by the resources, those human capitals formed by the peripheral countries seems to be a way to finance centrals countries development, leaving less developed countries handed over to a lacking in knowledge and innovation economy.

Therefore, these migration paths tend to increase inequalities within the European space, as opposed to the rhetoric of building a more unison Europe.

Is European identity in checkmate? Italian and Spanish migrants in Germany during the contemporary economic crisis
Simone CASTELLANI (University of Genoa, Italy) | castellani@us.es

The contemporary economic crisis has produced an increasing unemployment in the EU. Nevertheless, the crisis did not affect all EU countries equivalently. Youth unemployment and GDP rates show an increasing difference among EU countries (Eurostat, 2014), leading to strong core-periphery dynamics (King et al., 2014). For instance, Germany has returned to being one of the privileged destinations for Southern European workers (DESTATIS, 2014).

Being EU citizens, they should enjoy the same rights and opportunities as German nationals in terms of labour insertion and access to the welfare system. However, the political demands to minimise the access to the German welfare provisions of EU citizens are becoming stronger. Drawing from an ethnographic study, conducted in two German regions between July and December 2014, with Italians and Spaniards aged 20-35 years who moved to Germany since 2008, this communication aims question the validity of the category of “EU citizens” to identify these people. Based on the subjects’ experiences, in terms of insertion in the German labour market and welfare system, the communication proposes to articulate the category of “EU citizen” with that of “migrant” (Sayad, 2002). On the one hand, this would permit to move the focus of the analysis towards the patterns of subordination and exclusion which these workers could take during their socio-cultural insertion in Germany. On the other hand, the category of “migrant” emerges as a self-definition which the subjects often use to describe their own experience and to fight for the recognition of a plenty European citizenship.
RS03S04 - European Migrants in the UK

Reluctant communities? Exploring the social implications of raising a bilingual family for European movers living in Manchester

Benedicte Alexina BRAHIC (Manchester Metropolitan University, United Kingdom) | b.brahic@mmu.ac.uk
Rowenna Jane BALDWIN (Manchester Metropolitan University, United Kingdom) | r.baldwin@mmu.ac.uk

This paper explores the social implications of bilingual and bicultural parenting for European movers living in Manchester (UK), highlighting issues of difference, integration and well-being for parents and children alike. More than 20 years after the liberalisation of movement within the European Union, many European movers have settled in the UK. A significant fraction of them have now started a family, often choosing to give a bilingual upbringing to their children. In order to succeed in their bilingual project, a growing number of parents enrol their children in supplementary schools managed by volunteers and serving their language and/or national community. These schools encourage extra-curricular activities and general sociability in the minority language, which has led many European movers to adopt (reluctantly?) communitarian strategies to help sustain their bilingual family project. As a result, movers’ communities are emerging concomitantly with the development of these schools, with the schools themselves becoming community ‘hubs’ that provide support networks, friendships and a dedicated space for parents to speak their native language and express their cultural/linguistic self.

Using Manchester as a base, this paper draws on 42 semi-structured interviews with Finnish, French and Polish speaking parents, practitioners and supplementary school staff; observations in supplementary schools supporting these three languages as well as an online survey answered by 167 parents of bilingual (English with Finnish, French or Polish) children. The data collected provide useful insights into the ambivalences and contradictions lying at the heart of everyday processes of ‘Europeanization from below’.

Intra-European migration and European identity - the case study of Germans living in the United Kingdom

Miriam WLASNY (University of Surrey, United Kingdom) | m.wlasny@surrey.ac.uk

With the recent rise in anti-EU sentiment and support for the UK Independence Party, debates about Europe and the interconnectedness of nations achieved through EU membership at present remain a constant cause for public discussion. In light of the prevalence of negative reports, how are EU citizens living in multicultural Britain experiencing these developments and how do they view themselves and their status as EU citizens? Using the case study of Germans living in Britain, this paper will explore the human face of Europeanisation by discussing findings from a piece of ethnographic research which focuses on the experiences, aspirations, and sense of belonging and identity of EU nationals living in the UK, based on in-depth interviews, participant observations and documentary analysis.

At the centenary of World War One, when the UK appears to be at a crossroads in its relationship with the European Union, the case of Germans living in the UK is of particular saliency given the two countries’ history and considering that most of the existing academic literature on the experiences of Germans living in Britain focuses on conditions around the time of the First and Second World Wars. This particular case study is of great sociological value in our evaluation of how successful the European project has been in bringing not only peace and
reconciliation at the national level but, beyond that, at the individual level of EU movers which helps to establish how successful it has been in nurturing a joint sense of identity.

‘Cheap Labour and Benefit Tourists’: The Rhetoric of Resisting Mobility in Europe
James MOIR (Abertay University, United Kingdom) | j.moir@abertay.ac.uk

This paper considers the debate and political controversy in the UK concerning immigrants from East European countries. The popularity of the United Kingdom Independence Party (UKIP) has ridden a wave of populist resistance to these immigrants that shows no sign of abating. They typically characterised as either a source of cheap labour that undermines the employment of ‘British’ workers, or worse, as ‘benefit tourists’ who seek to exploit state welfare benefits. This issue to set within a wider debate about the economic contribution of East European immigrants to the UK and the claim and counter-claim over the effects they have on local employment, housing provision and other services such as English language support in schools. The mainstream political elite are viewed as either being hopelessly unaware of these issues or part of the EU apparatus that UKIP seeks to free the country from. These issues recently came to the fore with the lifting of restrictions of freedom of movement for EU citizens from Bulgaria and Romania on 1st January 2014. This has provoked a response from the Conservative-Liberal Democrat Coalition Government centred on altering the rules on the payment of welfare benefits to potential new EU immigrants such that they would not be entitled to claim these benefits for three months after entry. Reactions to this proposal are brought out in the paper through an examination of the responses to the issue on the BBC news website. These responses are analyses to show the rhetoric of resistance against European mobility.

RS03S05 - Attitudes of Minorities towards the European Union

Migrants’ Identification with Europe: Does EU Citizenship Make a Difference?
Steffen POETZSCHKE (GESIS - Leibniz Institute for the Social Sciences, Germany) | steffen.poetzschke@gesis.org
Michael BRAUN (GESIS - Leibniz Institute for the Social Sciences, Germany) | michael.braun@gesis.org

The proposed presentation will explore the question whether the possession of EU citizenship influences the degree to which migrants residing within EU countries identify with Europe. The assumption is that political rights accorded to individuals will impact national and supra-national identifications and attitudes toward integration in supra-national units, such as the European Union. We compare intra-EU migrants from Romania with third country migrants from Turkey. Whereas Romania has already been a EU member country for some time, its citizens were granted the full set of rights and opportunities of borderless mobility in the European Union only in January 2014. Turkish migrants, however, are still deprived of these rights. Besides political rights, it could be assumed that prolonged residence in EU countries, social integration in their societies and transnational relations or activities which encompass different EU regions could also have a strong impact on migrants’ stance towards the European Union.

Using data from the EUCROSS survey we analyse migrants from Romania who have moved to Denmark, Germany, Italy, Spain and the United Kingdom, as well as migrants from Turkey who have moved to Denmark, Germany, Italy, Romania and the United Kingdom (approximately 250 migrants for each group).

Migrants and their descendants on the path to EU integration
While EU system integration has been moving forward top-down à marche forcée, the pace of social integration seems not only slower and highly diversified, according to social class for instance, but also in some contexts going backwards, with the development of anti-European feelings and movements. Then there is the ‘issue’ of migrants and their descendants: how fast and how well - or how badly - do they get integrated in their host society? While this issue was previously analysed in terms of ethnicity and racism, class and mobility chances, it got re-coded during the ’90s onwards in terms of religion and potential conflictuality. Let us not forget however that if, among the 500 millions members of the EU, a huge majority has been raised as Christians, those among them believing in God are either a minority in several countries (such as in Czech Republic, Sweden, France…) or a short majority. As for Muslims, numbering 15 to 20 millions now in the EU, not all are strong believers; and a huge majority of them, in spite of enduring discrimination, are only looking forward to more integration into EU societies. Now in the present and rather tense context, what is the main threat to social peace and EU social integration: a handful of deadly illuminati, or the dangerous, mutually reinforcing and ultimately much deadlier dynamics between their media-hungry attacks and a spectacular growth of anti-Muslim feelings, that could easily be metabolized into anti-EU discontent?

The Roma self-proclaimed definition as a unique people without a territory is somehow contributing to the construction of the EU from below. Based on a Spanish RTD research, TRANSROMA (2009-2015), which studies Romanian Roma immigration to Spain, in this paper we present empirical data to show how the Roma represent an example in which nation building is not attached to a territorial basis: Roma live in different countries and maintain as a unique people. In this sense, through qualitative fieldwork carried out in Spain (host country) and Romania (home country) we have identified how Roma share cultural aspects (e.g.: ways of experiencing maternity, family relations; importance of the music; shared history of racism and persecution). These shared values and tradition contribute in turn to the development of strategies and actions of solidarity which although speaking different languages or having different nationalities, make them feel belonging to the same people. In all, we argue that the Roma transterritoriality becomes therefore a much interesting topic of sociological analysis as it can shed light to one of the biggest challenges of the EU, which is, its construction from below.

RS03S06 - Mixed and Mobile Families in Europe

Binational and mixed families. Old social texture and new challenges of Europeanization from Below.
Laura ODASSO (Université Libre de Bruxelles, Belgium) | laura.odasso@ulb.ac.be

Some researchers have pointed out to what extent intra-European binational families and their children embody the European motto “unity in diversity” (cf. Favell). Nevertheless, mixed families formed by a European Union citizens and a Third Country national are differently depicted by politicians, mass media and public opinion especially since the 1990s. Family
migration restrictions, the economic crises, the growth of consent towards right wing parties contribute to feed suspicion towards these unions. The regard on them changes according to the national origin, religion and social class of the third country national, affecting the European partner too. These families question the meaning of “otherness” in Europe bringing the public debate about who is European inside the private sphere.

Based on a number of mixed family récits de vie and on participant observations in some associations in Belgium, France and Italy, the paper investigates if and how individual and collective actions of (and on) binational families are a form of Europeanization from below. “Being European” in practice and in discourse will be discussed analysing: 1) the participation of family’s members in association of defence of binational family rights and 2) the in-between position of the children of these couples (legally European).

The aim is to provoke a debate on the “meaning of Europe” considering the impact of its borders and boundaries on the members of binational families, both parents and children, and vice versa.

Love and Ryanair: Academic Researchers relocating
Alberta GIORGI (University of Coimbra, Portugal, GRASSROOTSMOBILISE - Eliamep) | alberta.giorgi@gmail.com
Luca RAFFINI (University of Florence, Italy) | lucaraffini@gmail.com

Academic researchers are a good test for European citizenship. Their intra-European mobility increased in the last decades, also thanks to European incentives. The importance and the prestige of internationalization and experiences abroad slowly penetrated even in the most protectionist systems. They are likely to experience fewer difficulties in relocating, with respect to other job categories, because of the powerful infrastructure of European research. Last, but not least, they have high levels of education, which surveys positively correlate with the feeling of ‘being a European citizen’. In other words, Europe comes with the job. On the other side, intra-European mobility also bears some difficulties: couples living apart, the decrease of permanent positions, which results in frequent relocations, problems in accessing local welfare systems and the nightmare of organizing a pension scheme. That is, Ryanair comes with the job, too.

In this paper, we firstly analyse the discourse on Academic mobility, internationalization, and ‘brain drain’. Then, we present some statistical and survey data on University researchers Europeanization. Finally, drawing on an original database of in depth interviews addressing female researchers who experienced intra-European mobility, we discuss the experience of Europe of Academic researchers.

La place des questions religieuse et communautaire en France : l’exemple de deux associations de protection de l’enfance.
Sarra CHAÏEB (Université de Strasbourg, France) | chaieb.sarra@gmail.com

Fait relativement rare en Europe, la France est un pays dont la Constitution, depuis 1905, précise que les croyances religieuses relèvent du domaine privé. L’Etat français est “laïc et républicain” : il respecte ces croyances mais ne s’en occupe pas. Et il n’a absolument pas le droit de financer les activités religieuses. Pourtant quand il s’agit de protection sociale les associations religieuses ont joué un rôle social considérable ; et les frontières entre espace privé et espace public deviennent objectivement perméables. Deux associations de protection de l’enfance, nées respectivement d’initiatives catholique et juive, ont été étudiées dans une perspective sociohistorique (archives, entretiens avec des responsables, récits de vie d’adultes passés par ces institutions). La première est une association créée d’abord en Russie en 1912
par des médecins juifs, puis transférée à Paris en 1933. Elle a d’abord recueilli des enfants orphelins de Juifs européens émigrés en France (Russes, Polonais...), et a ensuite accueilli des enfant issus de familles juives d’Afrique du Nord au moment et après les indépendances. La seconde association, une « Œuvre d’Eglise » (catholique), s’est développée autour de l’accueil et de l’instruction des enfants orphelins ou vagabonds ; elle a joué un rôle important dans l’accueil d’enfants issus des anciennes colonies de l’Empire français, et s’est peu à peu ouverte à l’accueil d’enfants de toutes origines et religions (principalement issus de parents des couches populaires, aujourd’hui une majorité de ces enfants sont des enfants d’immigrés africains).
RS04S01 - Religious and Solemn Celebration

Why don’t Croatian citizens celebrate their national days?
Tijana TRAKO POLJAK (Faculty of Humanities and Social Sciences, University of Zagreb, Croatia) | ttrako@ffzg.hr

This paper will examine the reasons behind current lack of active involvement of Croatian citizens in private or public celebrations of their national days, such as the Days of Independence or Statehood. This is particularly surprising considering the fact that Croatia is a relatively young democracy, which gained its sovereignty by popular support of its citizens in the 1990s, many of whom have witnessed first-hand the dramatic period of the War for Independence that these days commemorate.

Firstly, we will briefly give a more general theoretical discussion on the crucial role that rituals such as national days play in the legitimization of a nation and nation-state among its members. They present an important opportunity for the nation to symbolically and physically come together and be reminded of their shared identity through social interaction and common symbols. Therefore, citizens’ lack of interest in the participation in such celebrations can have serious consequences for social solidarity.

Secondly, we will examine the specific example of Croatia by discussing the official discourse surrounding the celebration of national days and how it changed over the past 20 years. We will then present the results from empirical, qualitative research conducted in February-May 2013 on a purposive sample of 85 Croatian citizens (semi-structured in-depth interviews). The results reveal: 1) meanings Croatian citizens today attribute to official national days; 2) their perception of the importance of national days for them personally, for other citizens (the collective) and Croatian state in general, as well as 3) issues surrounding the celebration of national days that prevent Croatian citizens’ more active involvement.

When the Mosque Goes Beethoven: Expressing Religious Belongings through Music
Monika SALZBRUNN (University of Lausanne, Switzerland) | monika.salzbrunn@unil.ch

Religious belonging can be expressed through ritual practices, celebrations, food or clothing. Each of its forms contains various elements of belonging (gender, cultural origins or customs, age etc.). Celebrations which are performed in public are situated and linked to the environment (space, public, legislation of the country etc.). As part of a broader research project on "(In)visible Islam in the city", we have observed various forms of celebration in which Muslim citizens are involved - religious and secular festive events. The present contribution will give some insights on music as a vector of religious belonging: a female choir of a mosque in Lake Geneva Metropolitan Region has interpreted Beethoven’s Ode to Joy with a new text about the glory of the messenger; a regional event on the edge of political and religious expression has united music from Syria, Kosovo and Tunisia in order to put on stage the cosmopolitan characteristics of Swiss Muslims. To whom are these musical performances directed? Can we really separate an analysis of religious belongings from an analysis of political and/or cultural performances?
Celebrating the Royal Liturgy within the National Calendric Memory – The Politics of Commemoration in Romanian Kingdom
Mihai Stelian RUSU (Babes-Bolyai University, Romania) | mihai.rusu@ubbcluj.ro

The paper strives to shed some light onto the mechanisms of memory and identity building by focusing on how the royal cult has been established through a program of national celebrations. The paper argues that, in the aftermath of Romania’s adoption of a foreign Prince (1866) and developing into a dynastic monarchy (1881), the entire national identity has been reconfigured around the royal idea and dynastic principle. Of cardinal importance in this process of identity re-making was the celebrative program ritually played out on annual basis in 10th of May – the “Day of the King” celebrated as the National Day. After showing how the 10th of May has been set out as the royal pillar of the new temporal order and center of the calendric memory of the Romanian kingdom, the paper goes on to address how the succeeding postwar republican political regimes tried to efface the royal dimension of Romanian national memory and identity by deconstructing the century old pattern of celebrations centered on the day of 10th of May. In the concluding part, the paper advances a revised model of the Halbwachsian “law of concentration” of memory by distinguishing between the law of spatial concentration (the only one mentioned by Halbwachs) and the law of temporal concentration. The results of our study underline the supreme importance of the latter in the politics of symbolic time.

The X-Rust Organization – 20 Years of Purism
Soile Marjaana RAJAMÄKI (University of Turku, Finland) | rajamakisoile@gmail.com

The X-Rust Organization, founded in 1993 in Turku, is the oldest organization for electronic music in Finland. The X-Rust Organization concentrates on keeping electronic music and the culture around it alive and kicking through activities such as organizing events, offering information and equipment as well as releasing music. In every activity it concentrates on marginal genres of electronic music. Genres, that are often absent at more commercial events. I will approach this organization with some basic sociological questions. I am interested in how this particular organization is formed and how it defines itself. What brought all the members together and how do they function – or do they? How members maintain and pass on its culture? The other side to the social cohesion, feeling of togetherness, is ruling something and someone out. With that the organization makes a distinction – us versus they. In this distinction the key concept is purism. How does this organization define purism? How and why do they use it? What and whom does it mark and exclude? My material consists of theme interviews with two founding members of the organization and it's current chairman of the board – who was also rewarded as the Purist of the Year in organization's New Year's Gala. In addition to the interviews there has been two different questionnaires online. One public and other directed to members only.

RS04S02 - Irreligious and Secular Celebration

Running Re-discovered: Celebrating Barefoot to Re-connect with Nature
Jarkko Michael BAMBERG (University of Tampere, Finland) | jarkko.bamberg@uta.fi

This paper deals with the celebration of barefoot running. Recently, different types of running shoes have mushroomed into market, which challenge the conventional wisdom about what
type of shoes runners should use. ‘Less shoe is better’ type of mentality has gained particular support lately. The phenomenon is not only related to performance in athletic terms. Instead it carries other, perhaps more fundamental, meanings. It seems that barefoot runners (or runners using so called minimalist shoes) celebrate their increased awareness of their body and the bodily connection to the ground and landscape. I focus on identifying aspects of these celebrations, some of which touch upon such fundamental questions as: what we are as human beings and how should we move about. Barefoot runners can be quite categorical when proclaiming the benefits of running barefoot. According to some, it is the only way one should run. Yet at the same time, barefoot runners often need some type of shoes to be able to celebrate the feeling of re-connecting with nature. One can find a growing line of barefoot or minimalist shoes in retail stores, many of them high-tech designs made by well-known global brands in the sports industry. A useful analytical lens for discussing these aspects of celebration is provided by Antoine Hennion, who suggests that taste (for music, wine...barefoot running) is an activity, which depends on 1) a collective, 2) situations and material devices, 3) the body that tastes, and 4) the tasted object.

Intense sociality: party rituals and the formation of friendship amongst university students
Tobias BORNAKKE (Department of Sociology, University of Copenhagen, Denmark) | tbo@soc.ku.dk
Anders BLOK (Department of Sociology, University of Copenhagen, Denmark) | abl@soc.ku.dk

Amongst students attending higher-education institutions, partying is an important and recurring form of collective celebration, serving both as a means of reaffirming existing friendships and of extending the network of friends. In this paper, we analyze large-scale transactional data gathered via mobile phones amongst an entire freshman class (N≈1000) at a Danish technical university, in order to trace the effects of party sociality on the dynamic development of friendship and other social relations in this population. In methodological terms, we show how large-scale transactional data allows for novel ways of engaging the role of partying in social life, affording dynamic views of aggregate social network ties at different scales for entire (sub-)populations. In particular, drawing on Randall Collins’ theory of interaction ritual chains, we seek to quantify the micro-social accumulation and distribution of emotional energy amongst participants in party sessions, using Bluetooth-based measures of relative bodily closeness as proxy. During parties, small units of interaction partners form ‘bubbles’ of varying sizes (dyads, triads etc.) to demarcate intermittent membership from non-membership, thereby enabling particularly intense forms of joint attention, shared mood, and collective effervescence. Such intense moments of shared party sociality, we seek to show, exert clear but differentiated effects on subsequent friendship formation and social contact patterns, as gauged from a combination of Facebook, SMS, and call log data. We conclude by discussing the future potential of transactional data formats, in terms of affording the tracing of socio-affective ‘contagion patterns’ stemming from various micro-social interaction rituals in everyday life.

Mega-ceremonials of Routinized Carnival: Post-transformation Changes in Poles’ Participation in Culture
Krzysztof OLECHNICKI (Nicolaus Copernicus University, Poland) | ko@umk.pl
Tomasz SZLENDAK (Nicolaus Copernicus University, Poland) | szlendak@umk.pl
This paper is an attempt to describe one of the new cultural activity models which have developed in Poland after 1989 when Poles found themselves in a situation of strong dominance of the consumer culture and the pressure of a new cultural time model. The evolution of cultural behavior has a two-direction character. One concentrate on the activities of inter-virtual cultural sub-worlds, while the other – which is our main field of interest – reflects a multi-sensual consumption of popular culture during various kinds of secular festivals, the characteristic features of which include a paradoxical “routine-approach” to carnival culture, creating multi-sensual spaces, closing in cultural time capsules, and focusing on efficient free time management (resulting in placing strong emphasis on eventfulness).

The carnivalization and festivalization of cultural practices of Poles is becoming a dominant form of participation in culture in Poland, replacing earlier forms such as concentration and promotion of highbrow culture. In our paper we are going to present qualitative data from nationwide ethnographic fieldwork we conducted in 2013 and 2014 (participant observation, in-depth interviews, shadowing, analysis of visual data) and some most recent quantitative data from nationwide survey of cultural practices in Poland.

‘A social whirlwind of a week’: disruptions of place and people at two festivals
Bernadette Mary QUINN (Dublin Institute of Technology, Ireland) | Bernadette.quinn@dit.ie
Linda WILKS (Open University, Milton Keynes, UK) | lindajwilks@yahoo.co.uk

This paper takes as its starting point Quinn and Wilks’ (2013) study, which asks how social capital operates amongst the range of actors within a festival setting. A clear sense is gained that a festival setting enables social connections to be made and remade. Furthermore, it supports Rutten et al’s (2010) ideas about the important role that the specificities of place can play in shaping social connections.

The role of social capital (Arcodia and Whitford, 2007) is increasing in prominence in the festival literature in recent years. Simultaneously, there has been a constant interest in how festivals create ‘an atmosphere of potentials’ (Pløger, 2010: 853). Johnson (2013), drawing on Foucault, defines heterotopias as sites which are embedded in aspects and stages of our lives and which somehow mirror and at the same time distort, unsettle or invert other spaces. This paper picks up on the idea that festivals trigger a distorting, disruptive force on place and people. The intensity of the ‘time-out-of-time’ moment within which they occur can set in motion a concentrated set of social interactions.

This research investigates the Sidmouth Folk Week (Southern England) and Feakle Festival (Western Ireland), to try to understand the heterotopic quality of the spaces, moments and encounters identified. A total of 92 in-the-moment interviews were carried out with the festivals’ social actors during festival time.

Analysis of the data suggests that the two festivals activated whirlwinds of disarrangement, disturbance and dislodgement resulting in the creation of heterotopias. These were found to have mainly positive effects: they were energising for the locals, despite the disruptions to their routines; festival visitors were sucked in from their distant homes and became temporary ‘locals’; they re-arranged places such as schoolrooms, churches and sports grounds into ‘other’ spaces where festival activities could happen; locals, both permanent and temporary, were remade as organisers, volunteers and artists. These research findings will add further depth to the festivals literature in relation to place and social capital.

The Holiday Spirit - Cliché or Indicator of the Social Values Symbolic Assertion?
Ozana Marina CUCU-OANCEA (Institute of Sociology, Romanian Academy, Romania) | ocucuoancea@yahoo.com

From the sociological point of view, holidays are social-cultural constructions resulted from people’s need of identity definition and legitimation, as well as from the need to organise one’s existence at social and spiritual level. Holding a double role - as depository of the socio-cultural values of a community, but also as active agents of social change - the holidays are a particularly useful tool for sociological analysis of communities. This paper will attempt to bring conceptual and methodological clarifications about one of the central concepts of sociology of celebration, that is the holiday spirit. Being a part of the conceptual arsenal of the modern Christmas, dating back to the era of the 19th century Victorian festive sentimentalism, the syntagm holiday spirit is a global cliché nowadays. Behind this cliché is, however, a multidimensional ensemble of social values shared by the individuals/communities in a certain space, in a certain time period, and manifested through specific attitudes and behaviours, setting up the manner of reporting one’s self to the holiday, whether religious or secular. The configuration of the holiday spirit will implicitly create a set of expectations which, confronted to the reality and depending on each individual’s/collectivity’s tolerance level, will generate, in the personal/public consciousness, the idea of success or unsuccess (failure) of a holiday. The configuration, stability through time/space/culture of this multidimensional value pattern defined by the holiday spirit, but also the social risks caused by potential repeated festive failures will be the topic of this paper.

New union form, new rituals? Celebrations of the French Civil Partnership
Wilfried RAULT (Institut national d'études démographiques, France) | wilfried.rault@ined.fr

Individual behaviours with regard to types of union have changed considerably in France over the past four decades. Marriage, once mandatory, has declined, free unions have become a long-term choice. In November 1999 this diversity was further reinforced with the creation of the registered civil union, the Pacte civil de solidarité (known as PACS). This was the French answer to a demand for recognition from same-sex couples, but was also designed for heterosexual couples wanting to benefit from a legal framework for their union without getting married.
As awareness of the PACS as an option for heterosexual couples grew and legal changes were implemented — notably concerning taxation — the number of different-sex PACS registrations grew far beyond expectations to reach 160,000 in 2013 (verses 250 marriages for the same year).
In this paper, we analyse the actual content of the PACS celebration. Does it differ from a wedding? In what ways? The PACS is sometimes considered as a “private” form of union whereas marriage is seen as more “public”. Is this distinction also observed in the way the PACS is celebrated? For instance, are family network members becoming increasingly autonomous, in the sense that the celebration is no longer a direct concern of the future partners’ parents? If so, are parents replaced by friends, or is the celebration a more private affair?

We will use the "Study of Individual and Conjugal Trajectories" survey conducted by INED and INSEE in 2013 on a representative sample of 8,000 persons aged 25-64. Focusing specifically on the couple formation process, the survey includes a specific set of questions on rituals to permit detailed study of wedding and civil partnership celebrations.

Live concert as carnivalistic space
Satu Maaret SOUKKA (University of Turku, Finland) | satu.soukka@gmail.com

Live performances are a fundamental basis of musician’s work, but at the same time they are a celebration. As work, concerts are planned and rehearsed beforehand, but when executed in immediate contact with an audience, there is also room for improvisation. A concert can be defined as a carnivalistic space, where the action and ambience may turn into communal ecstasy or “communitas” as in Victor Turner’s terms. Music itself along with the interaction between the artist and the audience are the most necessary components of possible communitas, but there’s more to it. The whole of the concert is built up by several different elements, such as external structures (e.g. decoration, technology), artist related features (e.g. image, skills) and genre conventions.

In my presentation I ask, how is the carnivalistic space created? What are the means the artist uses in order to arouse interaction and the possible communal ecstasy? To do this, I will examine live concerts of popular music artists from different genres. The data consists of my own fieldwork observations and live show documentaries online and DVD. My presentation is based on my doctoral dissertation about touring as musician’s work, which I am currently working on.

Dance, partying, celebration, and meditation as historical constituents of jazz
Ismo Juhani KANTOLA (University of Turku, Finland) | ikantola@utu.fi

Based on a re-analysis of historical interviews with jazz musicians (Shapiro & Hentoff 1955; Jost 1982) the paper focuses on the role and reciprocal interplay of dance in the concerts or gigs, having parties between jazz musicians, celebrating renown fellow jazz musicians, and the meditative artistic work, in the historical constitution of jazz as a cultural institution and art form. The interviews corroborate that these practices had the potential of empowerment as well as disruption for both individual and group. Why did dance disappear from the jazz scene? Why did avant garde jazz confront an impasse? Theories of mass production (Adorno) and everyday rituality (Goffman; Collins) will be exploited to further elaborate these questions.
RS05 - Sociology of Knowledge

RS05S01 - Sociology of Knowledge: Theories, Paradigms and Approaches

Phenomenological Sociology of Knowledge
Thomas S. EBERLE (University of St. Gallen, Switzerland) | thomas.eberle@unisg.ch

Thomas Luckmann interpreted Schutz’s structures of the life-world as a proto-sociology. This interpretation is seen in the structure of Berger & Luckmann’s Social Construction of Reality, and it is widespread among German sociologists because of the eminent influence of Luckmann in Germany. In this interpretation, phenomenology is a philosophy and, as such, presociological or a proto-sociology, while sociology is an empirical enterprise explaining the features of society. The two can be related, but in essence they are two completely different enterprises. George Psathas, one of the most prominent representatives of a phenomenological sociology, can be seen as an antipode to Thomas Luckmann. He was strongly influenced by ethnomethodology and described ethnomethodology as a phenomenological approach in the social sciences. Of course, he was aware of the differences between the two approaches, but he preferred to emphasize the commonalities. He understood phenomenological analysis as an empirically oriented research enterprise and conducted his own analyses within that framework. The goal of my paper is to discuss the methodological implications of these two positions and ponder the question how phenomenology can contribute to interpretive research. My thesis is that the sociology of knowledge can benefit greatly if it is intimately tied to a phenomenological perspective, which can be illustrated by the approaches of phenomenological hermeneutics as well as of life-world analytic ethnography and ethnophenomenology.

Understanding (in) Public Sociology - comparable, compatible and contrastive stocks of knowledge
Manfred PRISCHING (University of Graz, Austria) | manfred.prisching@uni-graz.at

(A) During the last years, there is an animated discussion in sociology about the public presentation of the discipline. Sociologists think that they have much to tell to the public, but nobody listens.

a. The discussion seems to be shaped by two insufficient arguments. The first is Michael Burawoys vision of “committed sociology”: public sociology (PS) as dedication to enlighten and lead discriminated people. The second is the wide-spread simple “complexity argument”: Sociologists necessarily generate very complicated facts expressed in complicated language, and people are not able to understand them.

b. The real problem is that (1) one has to specify completely different situations, occasions, frames for communicating sociological insights; (2) one has to reflect the commonality for understanding as well as the drastic differences in the repertories of knowledge that are typical for different audiences. Therefore we need the resources of the sociology of knowledge when we consider options for public sociology. What can it provide?

(B) A trivial fact: Communication needs common ground, but there are at the same time divergent perspectives, perceptions, appresentations... What does this mean for PS?
a. There are different interests of the audience, especially distinct views about usefulness and entertainment and (in the case of media) views about “news”. (There is no place for simple proof of erudition, sophistication or for “insider-problems”.)
b. There are different “genres” (and “frames”) for lectures: festive ceremonies, serious workshops, the opening address of a conference etc. One has to meet different expectations and use different “languages”. (PS is not only a simplification problem.)
c. There are different intellectual and emotional preconditions for understanding messages: e.g. the difference between a general audience or diverse professional publics (from different disciplines or occupations). They can only perceive what they can perceive: PS is a clash of subcultures and mentalities.

(C) Another trivial fact: Communication is not independent of the “speaking situation”. What does this mean for PS?

a. One needs a situation-dependent rhetoric: three sentences for the TV news (a “headline”-problem), five minutes for a podium statement (a selection-problem: an “interesting” message without well-known basics), one hour lecture (a structuration problem: maintain thrill)...
b. One has to balance the clear thesis/focus/message with temptations of therapy, ideology or know-it-all attitude. Transmitted information depends also on the staging, e.g. the habitus of the speaker – not to speak about the sensitive handling of bluff, ideologies or taboos.

Socializing natural sciences (physics and biology): a third ontology
Giampietro GOBO (University of Milan, Italy) | giampietro.gobo@unimi.it

In the 19th century arose the idea that the (emerging) social sciences should conform to the natural sciences (Comte).
After the German historicism (Dilthey and Windelband) put into question this proposal, arguing that the two disciplines are different (in their epistemology and methodology), because different is the nature of their objects of study.
From the epistemological perspective, this position is still dominant in the social sciences (although not always by the methodological one – e.g. the survey).
According to a phenomenological and deconstructionist glance, the paper proposes a third way or ontology: it challenges the historicism (second ontology), without falling back into the positivism (first ontology).
In other words, natural and social sciences are not at all so different (second ontology); however, they are not even similar (first ontology).
One of the main differences between the two sciences lies in the type of credit that scientists give to their objects, the expectations that put on them, thinking them capable or not of agency (and therefore also of criticism).
This issue can be indexed as the ‘problem of the audience’: social scientists’ findings are criticized and questioned even by their objects of study (e.g. migrants, gays, etc.), because researchers assign agency to them; while this does not happen in the natural sciences.
According to Montagnier (the cells and water have memory), Latour (non-human agents), Tompkins and Bird (experiments on plants), Capra (the Tao of physics), Panikkar (teo-physics), Mary Hesse (socializing epistemology), etc., the paper will outline this third ontology.

The New Sociology of Knowledge
Hubert KNOBLAUCH (Technical University of Berlin, Germany) | Hubert.Knoblauch@tu-berlin.de
Bernt SCHNETTLER (University of Bayreuth, Germany) | schnettler@uni-bayreuth.de
Michaela PFADENHAUER (University of Vienna, Austria) | michaela.pfadenhauer@univie.ac.at
In recent years, we have been witnessing a rapid rise of the sociology of knowledge, particularly in German speaking countries. In our introductory presentation we aim to sketch some of the basic propositions of this sociology of knowledge which take the view that the sociology of knowledge is not just a sociological sub-discipline but a basic theoretical approach in General Sociology. Based on the „neoclassical sociology of knowledge“ by Berger and Luckmann, a third and fourth wave of studies have been burgeoning which have come to be known by the label of „communicative constructivism“. As the sociology of knowledge proves particularly successful in a huge variety of empirical studies on a range of topics, we will provide a rough survey on the major areas of research of the sociology of knowledge, indicate ist contributions to methodology, particularly on qualitative methods, and finally hint at some of the current developments and future tasks.

RS05S02 - Experts and Intellectuals

**Neoliberalism and the Diagnostic and Statistical Manual of Mental Disorders: A case study in the sociology of knowledge**

Bruce COHEN (University of Auckland, New Zealand) | b.cohen@auckland.ac.nz

The American Psychiatric Association’s (APA) Diagnostic and Statistical Manual of Mental Disorders (DSM) has become the most authoritative text on defining what is and what is not a mental illness in western society. The psychiatric profession claim that this document reflects the advancement of scientific knowledge in the area and is unaffected by subjective and politically-motivated value judgements. In this paper I aim to question the assumption of an objective and rational system of knowledge-production through presenting a textual analysis of mental illness classifications and symptomologies presented in each edition of the DSM, from the first edition published in 1952 to the latest DSM published in 2013. It will be demonstrated that, over time, the language employed by the APA in their mental diagnoses has increasingly conformed to the development of wider neoliberal values and the closer surveillance of the self – this is an expert discourse where words and phrases such as ‘productivity’, ‘employment’, ‘school’, ‘leisure’, ‘play’ and the ‘home’ have taken on greater meaning and been enshrined in typologies of mental illness. The presentation will take time to consider the theoretical implications from this case study for understanding the wider forces which may aid or hinder the construction and reproduction of expert knowledges within neoliberal society.

**Lights and Sedition: the intellectual field and the arise of the Brazilian Aufklärung (1750-1808).**

Paulo Cesar FERNANDES (University of Brasilia (UnB), Brazil) | pacefern@gmail.com

This comparative study between two different intelligentsias: the one from the province of Minas Gerais, where Brazilian archaism in literature was born, and where the first national attempt of independence took place under the decisive influence of seditious artists; and the one from Bahia, where the intellectuals were members of the portuguese government, albeit concurrently with close ties to social demands and struggles against the portuguese crown. In this peculiar environment, and with the aid of important portuguese figures such as the Marquis du Pombal, national intelligence started not only as a movement, but specially as a field. This research aims at showing how these actors dealt with European ideas – the philosophy and politics of the enlightenment, archaism in literature and art - and mixed them with their own, and the Brazilian
colonial culture of the XVIII century. The main goal is to show how politics, philosophy and art were intertwined with our culture in a very peculiar way: differently from what is commonly said about the production of knowledge broadly in the “South”, there was a native enlightenment field in Brazil. The European movement was a major reference, although sometimes our Aufklärung moved apart the Brazilian ideas from these references to forge its own path, with its own dynamics.

**Librarianship Inheritance Taken over from Ottoman Empire to Republic: Corporatization of Librarianship in Republican Period**

Hülya BIÇER (Hacettepe University, Turkey) | hlybcr@gmail.com

In this study, we examined the librarianship inheritance taken over from Ottoman Empire to Republic / corporatization of librarianship in Republican Period. In traditional Ottoman, Westernization and Republican periods, librarianship understanding and library types varied according to the political preference of the state. Together with the modernization efforts of Westernization Period realized at state level, the content of libraries belonging to state organization changed. The total Westernization policy of Republican Period and the effort for changing the identity of the community caused the librarianship inheritance taken over from Ottoman Empire to be preserved as a frozen inheritance / museum library and the accumulation of knowledge taken over from Ottoman Empire to become inexpressible and incomprehensible. Due to the failure in utilization of Ottoman accumulation of knowledge, there is a problem of contact between Turkish community considerations with their sources.

Libraries are important places where knowledge is stored, generalized and its continuity is ensured. Libraries also play an important role in classification of the knowledge as well as preserving and reproducing it. The value and classification of the stored knowledge allows evaluations to be made about the structuring and systematic of community consciousness and identity. As systemization of the knowledge / consciousness is the common interest of sociology as well as information and document management librarianship is the common subject of both scientific fields. Librarianship understanding in the Republican Period expresses not only disengagement but also certain continuity. The basics which will introduce this continuity came out according to the political preference of the state. In our study we tried to ground this opinion of us.

**RS05S03 - Social Knowledge, Experience and Imagination**

**Doing Knowledge: Synthesizing Realism and Relativism to Explain Cultural Differences in Knowledge**

Chantelle P MARLOR (University of the Fraser Valley, Canada) | Chantelle.Marlor@ufv.ca

This paper addresses the question “How can we theoretically acknowledge that empirical knowledge corresponds to ‘reality’ while also being culturally embedded?” To do so, I answer a related question: “Why can Indigenous and scientific knowledges about the same subject be different and yet equally plausible (or effective), even if they appear oppositional or incompatible?” To answer both these questions, I present a theoretical framework I refer to as Doing Knowledge. Specifically, I argue that knowledge-making is an active, relational process that occurs within a promiscuous, dynamic, pluralistic empirical world. Practitioners construct knowledge in specific times, places, and contexts through specific practices and conceptual lenses. As such, what becomes known does not directly reflect the subject, but the relationships
between the subject and the practitioner who studies it. Culture acts to systematically dampen or amplify these differences in relationships, and affect whether practitioners' consider these differences to result in compatible or incompatible knowledges. A practitioner's cultural background affects the classification schemes and cultural models she uses, her metaphysical, ontological, epistemological, and moral positions, her selection filters, practices, tools, interests, indicators, and the ways in which she socially positions and coordinates herself with her peers. The result is that a practitioner's cultural background directs the way in which she weaves her relational web within our promiscuous, dynamic, pluralistic empirical world as she creates knowledge. Both realism and cultural relativism are needed to understand why Indigenous and scientific knowledges can differ and be compatible.

The future today: myths within contemporary sociological imagination
Andrea CERRONI (University of Milano-Bicocca, Italy) | andrea.cerroni@unimib.it

The paper aims at illustrate three couple of solutions historically developed, respectively in Antiquity and Modernity, to answer some existential questions, starting from the three dimensions of Sociological imagination along C.W.Mills, ie biography, society and history. This three-dimensionality of social reality is in close analogy with K.Marx “three lives”, ie individual, social and general. In joining the two formulas, we find three great existential thèmata: the position of individual within his/her own environment, the relationship between the individual and the other individuals, the knowledge surviving individuals' idiosyncrasies. In Antiquity, we find three myths personifying the three solutions, showing what were estimated as social values: Gaia (the Beautiful, a pathos as harmonious individual existence within nature); Kronos (the Good, an ethos as respect of the historical order constituted); and Athena (the True, a logos as the divine sight thrown over the world). In Modernity, these myths were countered and de-personalized in three other myths. The first one is reductionism, along which the totality (brain, knowledge, matter, organism, society) is nothing more than a sum of its single parts (neurons, bits, genes). The second one is narcissism, as it is well described by both C.Lasch, and by N.Elias. The last one is relativism as it can be traced from authors as Montesquieu, Pascal to the romanticism and contemporary cultural relativism. All in all, the three couples of myths can unveil implicit models in public policies and innovation and understand the drivers of the public perception of science and technologies.

Mediatization: The Socially Constructed Experience of Being Told a Story
Greti Iulia IVANA (Universitat Oberta de Catalunya, Spain) | igreti_iulia@uoc.edu

This paper focuses on the experience of passively receiving already crystallized narratives through the media. The specific instances I insist upon are: news, reality television, movies and non-interactional surveillance of peers online. All these stories are accounts of actions and interactions, in which given actors engage and which follow a minimal set of principles compatible with quotidian familiar logic. Post-modern narratives which challenge the taken for granted ways of making sense of an occurrence are considered to stimulate a different type of experience and will not be included in this framework.

Whether we refer to fictional situations or representations of actual events in which real people were involved, as long as they are not experienced here and now by the subject, they are exterior narratives. They have the potential of being brought back to experience through imagination. The starting point is Schütz's work on the spatio-temporal conditioning of social interactions and on contemporaries (as opposed to consociates) becoming part of one's stock of knowledge without being part of their world within reach. Drawing upon these ideas, I argue that, through
mediatized narratives, the absent or fictional character enters our stock of knowledge not as immediately typified, but as a subject of an imagined experience in a different here and now. Furthermore, the construction of this imaginary is strongly interrelated with the characteristics of the medium through which the narrative reaches the subject, the interpretative frames provided within the narrative and the previous experience with situations that are read as similar.

Hermeneutics of imagery. Epistemological and empirical reflections
Gregor Jonas BETZ (TU Dortmund University, Germany) | gregor.betz@fk12.tu-dortmund.de
Babette KIRCHNER (TU Dortmund University, Germany) | babette.kirchner@fk12.tu-dortmund.de

In our increasingly mediatized world, pictures are gaining more importance for the imagination and representation of the socially constructed reality. Since the ‘visual turn’ was proclaimed in social sciences in the 1990’s, various methods of interpreting visual documents have been established. The concepts can be roughly divided into iconographic-iconological methods and comparative methods. Even though the question on how to cope with the simultaneity of visual impressions (meaning that everything is shown at once) is widely discussed within the methodological discourse, the procedural character of understanding – especially sociological understanding (which is interpreting step by step) – is neglected. Scientists never (re-)construct meaning in a simultaneous manner. By not reflecting this, established research methods include moments of arbitrariness.

Based on assumptions of the sociology of knowledge, we propose a method of interpreting visual documents that tries to embrace the complex and simultaneous character of pictures, to enable a sequential process of understanding. With the introduction of ‘hermeneutics of imagery’, we suggest an approach, in which a sequential interpretation is developed out of the specific composition of the document itself, not on a standardized pattern. Nonetheless, we integrate other methods of visual sociology as long as they are useful to understand the specific document. With the ‘hermeneutics of imagery’ we aim to provide a methodically controlled and traceable method to analyse images that does not leave pictoral aspects unnoticed.

RS05S04 - Knowledge Society, Science and Social Inequalities

How does the hybridisation of knowledge production influence the development of Social Indicators within evidence-based-policy making processes? The Case of the „European Expert-Group on Youth Indicators“
Jean Philippe DECIEUX (Université du Luxemburg, Luxembourg) | jeanphilippe.decieux@uni.lu

As mentioned in the call, “SoK has developed into a field...that is lively and flourishing.” As pointed out further, the SoK no longer focuses on high-level theoretical thinking, instead concentrates on typifications of everyday-life.

My project illustrates this change and focuses on developments in the area of policy-making. In this area decisions increasingly base on knowledge/evidence produced by external experts. This knowledge is used to reduce uncertainties by calculating the risks involved in the final decision and by this to legitimize political decisions by delivering hard-facts in the argumentation (e.g. “evidence-based-policy-making”). A consequence of this decision-making process is the authoritative implementation of theoretical knowledge and direct application into the context of everyday-life.

Furthermore, studies show changes in the process of knowledge production for the recent eras of ‘knowledge- or rather risk-society’. Instead of linear-ordered knowledge-production, hybrid
Differentiation of knowledge in dementia care? The stock of Knowledge on Dementia in the Qualification of “additional care workers” in the context of professionalization.

Christoph DUKAT (Karlsruhe Institut of Technology, Germany) | christoph.dukat@kit.edu

In 2008 a new type of worker has been introduced to the field of caring people with dementia diseases in nursing homes, defined in the “Richtlinien nach § 87b Abs. 3 SGB XI”. The function of these so called “additional care workers” is to perform different kinds of measures to motivating nursing home residents to undertake activities of daily living, with the declared aim to positively influence their “well-being”. Becoming an “additional care worker” needs to absolve a qualification, that is a combination of education on several topics, e.g. the communication with people with dementia, and internships in nursing homes. The Qualification lasts only several weeks without requiring any caring background. Different from the common understanding of professionalism linked to a long term professional education and practical training, this new kind of occupational work has to be seen as semi-professional, located between volunteer work and professional Care. When it comes to knowledge, their stock of knowledge might be located between general and special knowledge. Against this background my talk will deal with the question, which kind of dementia related knowledge is – communicatively – transferred (and learned) in the qualification measures for “additional care workers”. Can there be observed an evolution of a novel stock of special knowledge? In which way is this special knowledge deduced from stocks of knowledge of physicians, gerontologists, activation therapists, occupational therapists, care-workers in dementia care? All processes of differentiation are closely linked to dynamics of demarcation: Are there any tendencies of differentiation in this meaning observable? Since the transfer of knowledge has to be viewed as communicative action, the considerations on the evolution of differentiated stocks of knowledge in additional dementia care are to be embedded within the concept of the communicative construction of reality.

Abstract for the
RS5 – Sociology of Knowledge

Overcoming epistemic inequalities grounded in disciplinary methodologies: the case of climate research

Luka JAKELJA (Alpen-Adria-Universität Klagenfurt, Austria) | luka.jakelja@aau.at

Interdisciplinary research requires communication about one’s own disciplinary specific knowledge to other researchers with different academic backgrounds. Economists stand out in
this regard for various reasons. In their work they apply a specific methodology (both in empirical and theoretical research) that is borrowed from the sciences. By that the boundaries between economics (seen as part of the sciences) and the social sciences are established and perpetuated. Mathematical modeling (understood as a kind of language, to describe the object of interest) plays a major role in this regard. Using the language of mathematics is necessary for natural scientists, however, in the case of economics it is a choice that creates boundaries of knowledge and leads to a rise of ignorance in the context of interdisciplinary research. The paper looks at two interdisciplinary research institutes in the field of climate research. I investigate the ways in which researchers of these institutes communicate disciplinary specific knowledge claims and thereby aim to overcome the boundaries of ignorance, produced by disciplinary epistemologies based on specific methodologies. I focus especially on economic modeling in this process.

Self-Positioning of Semi-skilled Workers in the ‘Knowledge Society’
Sasa BOSANCIC (University of Augsburg, Germany) | sasa.bosancic@phil.uni-augsburg.de

In the past decades large-scale changes reshaped the labor market of the industrial societies turning them into a so called knowledge-based society. Taking Germany as a case, my research project tries to shed new light on the issues of the cultural and economic marginalization of unskilled work. In particular it asked whether and what consequences these transformations had on the identities of semi-skilled male workers in the industrial sector. The methodological groundings for the underlying research design derives from Kellers’ Sociology of Knowledge Approach to Discourse. Keeping G.H. Meads concept of the Self in mind as well as its further elaborations by Strauss and Goffman, and considering the actor concept in the hermeneutic tradition of the sociology of knowledge (Hitzler, Reichertz), I argue that the reaction of social actors to discursively generated unequal identity offerings has to be better grasped as a non-deterministic process of self-positioning. Using self-positioning as a “sensitizing concept” (Blumer 1954, p. 7) I suggest several “directions along which to look” (ibid.) in order to examine the specific entanglement of the workers’ self-narratives and discourses of labor. My findings show that semi-skilled workers position themselves in a creative practice of redefining and undermining the identity offerings in the prevalent discourses on ‘Knowledge Society’. Finally I argue that the proposed heuristic model of self-positioning permits a more differentiated analysis of social inequalities than most of the empirical studies that are based on habitus or intersectionality concepts.

RS05S05 - Empirical Research in the Sociology of Knowledge

Using the body to understand the environment: the production and assessment of knowledge by environmentally hypersensitive persons
Maël DIEUDONNÉ (Centre Max Weber, France) | mael.dieudonne@univ-lyon2.fr

For this 12th conference, we propose to study the attribution process at the outcome of which certain persons come to regard themselves as hypersensitive to chemicals or electromagnetic fields in their environment. This entails a radical transformation of their representations of the world, as well as a complete reorganization of their everyday life. In this process, the construction and bringing to the test of knowledges about the environment play a crucial role. We therefore propose to describe carefully the various approaches implemented by these persons to produce new knowledges, e.g., searching for technical and medical information,
monitoring simultaneously their environment and bodily reactions, using measuring devices and practical know-how to reveal the presence of chemicals or electromagnetic fields in their surroundings, conducting supposedly blind experiments, socializing their perceptions by sharing their illness narratives, etc.

We also propose (which we believe is more innovative in the perspective of the sociology of knowledge) to analyse how these knowledges are assessed by the subjects: when are they judged convincing enough for them to update their representations and lifestyle? How do they reason and what types of proof do they favour? In so characterizing their epistemology, we will pay close attention to the interactions between four aspects of the human experience: perception, cognition, emotion, and imagination.

Our presentation will draw upon interviews with sixty people having come to regard themselves as electro-hypersensitive or multiply chemically sensitive, conducted in France between 2012 and 2014, and observations realized during various meetings of support groups.

**Fitting into academia – the role of knowledge genres and social inequalities in higher education. An interpretive research approach**

**Florian ELLIKER (University of St.Gallen, Switzerland) | florian.elliker@unisg.ch**  
**Niklaus REICHLÉ (University of St.Gallen, Switzerland) | niklaus.reichle@unisg.ch**

In this conceptual paper, we aim to develop an interpretive research agenda for the study of a higher education institution that is situated in a context marked by distinct social inequalities. The institution of interest operates in a ‘western’ tradition of academia and scientific research, but draws many students from non-academic families, with educational biographies in disadvantaged institutions, and/or with an ethnocultural background in which ‘western’ academia is not rooted. These students struggle with what could be called a partial ‘misfit’ in the academic field. Research that examines situations in which such ‘structural’ inequalities are enacted often employs concepts in the tradition of Pierre Bourdieu (habitus, field) and Amartya Sen and Martha Nussbaum (capabilities). To theoretically ground our interpretive research agenda, we intend to tentatively translate the concepts of habitus, field and capabilities to the sociology of knowledge in the tradition of Alfred Schütz, Thomas Luckmann and Peter L. Berger. We aim at developing a conceptual apparatus capable of distinguishing different genres of knowledge that are relevant for a student’s (mis)fit in the academic field, with a particular focus on habitualized knowledge and ‘learning’ in terms of socialization into academic plausibility and opportunity structures. Moreover, we are interested in what favors or hinders the distribution or development of these specific genres of knowledge and hence influences to a certain degree the above mentioned fit.

**Models of knowledge: theoretical and methodological differences in information society analysis**

**Viktorija ZILINSKAITE-VYTIE (Vilnius University, Lithuania) | viktorija.zilinskaite@gmail.com**

The presentation will be based on research of the project “Information Society Research: a New Methodological Paradigm?” (MIP-072/2014) financed by Lithuanian Research Council. While being frequent basis for political decisions knowledge of social sciences have constructed its image (at least outside the social science itself) as objective knowledge gathered by precise tools. The statement is not new, but it grounds analysis of information society research. While stating emergence of new methodological paradigm a lot of researchers applied classical research methodology and methods. Paradox of information society analysis reveals understanding about knowledge of social science as such – tested ‘objective’ tools (usually quantitative unified measures) that may find...
qualitatively different social reality. Do contemporary information and communication tools change amount of interactions in society, or do they change interactions as such? If it is just quantitative, does it form circumstances for new quality? If change is qualitative, does it impact society members for qualitative change, does it change society, and does it impact both humans and society? What measures and researches have image as trusted ones?

The analysis of the presentation will be focused on correlation between peculiarities of information society model applied by researchers and their used methodology (both theoretical and empirical). Metatheoretical analysis, done during the research project “Information Society Research: a New Methodological Paradigm?” (MIP-072/2014) financed by Lithuanian Research Council, allows discussion about information society as exceptional methodological paradigm.

Is knowledge power (experiences of immigrants in the Republic of Cyprus)?
Bozena SOJKA (University of Bath, United Kingdom) | b.i.sojka@bath.ac.uk

There has been growing recognition that the power is associated with the possession of certain kinds of knowledge. Knowledge plays a significant role in shaping immigrants’ experiences of mobility. However, there is an increasing tendency within research on this phenomenon to focus on immigrants empowerment shaped by the knowledge of their legal rights. This tendency simplifies the realities of immigrants’ experiences. This paper shows how the knowledge of legal rights not only does not empower immigrants in the Republic of Cyprus, but more importantly, make them even more vulnerable to institutional forms of racism. This paper is based on recent qualitative research undertaken for a PhD project on the racialisation of immigrants in the Republic of Cyprus which explores the experiences of immigrants living in Nicosia and reports on findings drawn from seventy three semi-structured interviews and ten focus groups held between late 2012 and early 2013. In conclusion, this paper casts new light on the little recognised subject of intersections between power and knowledge that shapes immigrants experiences.

RS05S06 - The Relationship between Science and Religion from a Sociology of Knowledge Perspective

Constructing Universes in the Field of Stem Cell Research: Case Studies in the United States and Germany
Silke GUELKER (WZB Social Science Research Center Berlin, Germany) | silke.guelker@wzb.eu

“Religion has played a decisive part in the construction and maintenance of universes”, Berger and Luckmann claimed in their 1963 paper “Sociology of Religion and Sociology of Knowledge.” (p. 422) The early Enlightenment narrative was about science overtaking and fulfilling this function of constructing universes. Meanwhile, models on the relationship between science and religion have become more complex. Despite decades of work on the social construction of scientific knowledge, however, the idea of mutual independence of science and religion is still prominent, at least in Western Europe.

The aim of my paper is to challenge this idea empirically. Based on two in-depth case studies in the field of stem cell research in the United States and Germany, I analyze how the observed researchers legitimate their construction of universes. Only around one third of these researchers describe themselves as non-religious or atheist. Two thirds describe themselves as religious or undecided. Constructing universes in the field of stem cell research occurs on two levels: First, and in line with Berger/Luckmann, the researchers construct their universes by
selecting a certain perspective towards the objects of their research. Second, they do so in a physical sense: With genetic engineering, they intervene in biological development. First analyses show that religious researchers do indeed refer to their faith and their God when legitimating their construction of universes. My paper reconstructs in how far legitimating processes of religious and non-religious researchers differ and how greatly the potential differences have an effect on research strategies.

**Investigating the relationship between science and religion: preliminary empirical findings and analysis**

Tom KADEN (York University, Canada) | tomkaden@yorku.ca

The relationship between science and religion has been an issue in many recent debates within sociology of religion and beyond. Most prominently, discussions surrounding the so-called New Atheism have sparked renewed interest in the analysis of the apparently conflictual nature of the relationship. On the other side of the spectrum, proponents of creationism and Intelligent Design continue to call into question the social predominance of naturalistic concepts that they consider as being against religion. Public discourse about the relationship between science and religion is often shaped by these fringe positions, leaving little room for a broad range of intermediate positions to be heard.

Burgeoning empirical sociological analysis of the relationship between science and religion suggests that the public narrative of a necessary clash between science and religion is indeed only one aspect of a much broader variety of positions among the general population and among many scientists.

The proposed paper will examine preliminary results of the ongoing project "Clash Narratives in Context: Uncovering the Social and Cultural Drivers of Contemporary Science vs. Religion Debates" situated at the University of Coventry and York University, Toronto. The project aims to map a broad range of positions on the relationship between science and religion among religious and non-religious members of the public and life scientists, historically as well as in the contemporary world. Sample analysis of semi-structured interviews with members of these groups will be presented, and preliminary conclusions for a revised conceptualization of the relationship between science and religion

**Enchanting the Soul? Understanding the Popular Religious Psychology Books in Turkey**

Berna ZENGİN ARSLAN (Ozyegin University, Turkey) | berna_zengin@yahoo.com

During the last decade, along with the rise of Islam in Turkey, we have observed a rise in the popularity of ‘religious psychology’. On the one hand, increasing numbers of religious psychology books and articles, which integrate Islam with the concepts and the frameworks of modern psychology, have been published. On the other hand, pious psychologists, who defended the importance of providing psychological consultancy within an Islamic framework, have become increasingly visible in the national media, and popular in psychology circles. More importantly, the perspectives of these ‘religious psychologists’ have begun to be incorporated into the services of the state’s institution of Diyanet - originally founded to provide religious services to Sunni Muslims in 1924 - in providing psychological consultancy services to women at local levels. The sociological influences of ‘religious psychology’ can also be seen in the children’s and pedagogical books of religious groups, such as the Gulen community. This paper is an introductory study of the ‘religious psychology’ in Turkey. For this purpose, I will analyze the books of three well-known names of this field, Nevzat Tarhan, Erol Goka and Kemal Sayar and ask how these writers peacefully bring together the secular concepts and frameworks of...
modern psychology with Islam. In reference to Hacking’s (Rewriting the Soul, 1995) argument that the emergence of scientific concepts in 20th century and their intervention in ‘making up people’ caused the ‘secularization of the soul,’ the research will question whether these books can be considered as attempts of ‘enchanting the soul.’

**RS05S07 - Scientific Knowledge and Academia**

**Eurocentrism in the language(s) of academia – Does knowledge in mandarin remain voiceless in a global academic system?**
Yvonne BERGER (LMU Munich, Germany) | yvonne.berger@soziologie.uni-muenchen.de

My presentation will discuss the question of hegemonic language(s) of publication in a globally connected academic world. This question will be discussed on the basis of interviews which were conducted with social scientists from China (PRC) for an ongoing Ph.D. project. I will argue that a linguistic eurocentrism in social sciences produces a structural voicelessness of the ‘other’ in academia. On the basis of the empirical data I will discuss the role of eurocentric practices of publication in a system of global knowledge production. In the presented empirical data the social scientists talk about their challenge how to voice their academic findings on a global level. The interviewees link this question essentially to their choice of language in their publications. In their view English is required as a hegemonic means of communication to be recognised in a global academic system. The discussion of these empirical findings raises more general questions of language and knowledge legitimization, their embeddedness in a neoliberal exploitation logic and the question if English is the hegemonic language of academia. Therefore I want to link my empirical data to questions of how this hegemony in academia makes certain knowledge unheard and therefore voiceless. And how this practices of publication reinforce hegemonic power relations in global knowledge production.

**Social morphology and disciplinary differentiation in the human and social sciences. The case of Sweden 1945-2005**
Tobias DALBERG (Uppsala University, Sweden) | tobias.dalberg@edu.uu.se

Since it was first launched, the Durkheimian hypothesis of a correspondence between the social organisation of a society and its classification schemes has been both heavily criticised and further developed. Taken up and modified by, among others, Pierre Bourdieu, it has through application to e.g. sociology of education shown that it is still a potent theory of social organisation and corresponding classification. It is the aim of this paper to explore this hypothesis of a correspondence between the social morphology and the classifications in the human and social sciences in Sweden. These fields of sciences are chosen because they are fairly recently institutionalised. For instance, several of the so called core social sciences were more or less institutionalised in mid 1900s. Choosing these fields allows for an empirical study that compares phases of varying disciplinary differentiation in the human and social sciences from ca 1945 to the present, i.e. during a period when the system of higher education went through transitions from elite to mass and universal access. Departing from a macro perspective, the classifications studied in this paper are some of the most basic, namely the classifications of scientific (and educational) fields into disciplines. From this follows the empirical question of whether the social morphology varies across disciplines, and whether there is a correspondence between the social morphology and the classifications. This hypothesis will be explored by
statistical data on the disciplines on different levels (teachers, PhDs, students) and the social properties of the people in different disciplines.

How does scholarly cooperation occur and how does it manifest itself? Evidence from Poland
Dominika CZERNIAWSKA (Interdisciplinary Centre for Mathematical and Computational Modelling, University of Warsaw, Poland) | d.czerniawska@icm.edu.pl
Wojciech FENRICH (Interdisciplinary Centre for Mathematical and Computational Modelling, University of Warsaw, Poland) | w.fenrich@icm.edu.pl
Michał BOJANOWSKI (Interdisciplinary Centre for Mathematical and Computational Modelling, University of Warsaw, Poland) | m.bojanowski@uw.edu.pl

In recent decades doing science has become more and more a collective endeavor requiring cooperation crossing institutional and disciplinary boundaries. Although this phenomenon has been defined and described on macro level, the knowledge about individual motivations, norms and values fostering scholarly communication is limited. Evidence brought by scientometric studies misses out cooperation which is not related to co-authorship. Moreover, since scholarly community varies greatly in co-authorship norms, this kind of information have different meaning varying from field to field, especially in the case of Poland, where recent reforms of legal and financial framework were meant to encourage researchers to intensify cooperation within and outside academia. Questions like: “How does scientific collaboration is initiated?”, “What are the motivations to engage in new collaborations?” or “Under what conditions do collaborations last in time?”, demand different, qualitative tools. Our study, based on 30 IDI’s with Polish scholars representing various disciplines and research centers of different quality and size, revealed the existence of important differences in initiating and conducting teamwork activities. Teams are built in different ways: by seeking a new collaborator with rare set of skills, reviving existing but temporarily inactive network of researchers known from earlier projects, or simply engaging in-house subordinates. Motivations and rewards important to team members playing particular roles also differ significantly. Gathered qualitative material will help interpreting the results of future quantitiative studies and inspire new hypotheses that can be tested using large datasets.

RS05S08 - Discourses and Politics

Discourse analysis in the sociological research on knowledge production
Ewa GLAPKA (University of the Free State, South Africa) | glapkae@ufs.ac.za

The paper presents findings from a study among South African women of various ethnicities in which their subjective ideas and experiences of the body and beauty are examined intersectionally. Related with the production of knowledge and power in society, intersectionality informs the study that differences in participants’ understandings and practices of the body may reveal antagonisms, discrepancies and inequalities that run deeper in society and become sedimented in various forms of understanding. This intersectional examination of femininity is particularly interested in the linkage between lived experience and knowledge. The relationship is not conceptualized as merely projections of dominant discourses on the praxeological level. The study approaches knowledge as a process, not product, of understanding, experiencing and knowing, in which people use socio-culturally available information in their intersubjective relationships with others. The paper presents how discursive analytical methodology aids the sociological understanding of the process. Narrative and positioning analyses are selected as means of exploring the ways in which individuals work the normative, higher-level forms of
knowledge through their embodied experience of the world. As regards embodied knowing, individuals’ sense-making practices are examined with reference to the affective implications of experiencing femininity in the context of the increased aesthetization of culture and the contested nature of feminine beauty. The methodological challenge posed by the non-semantic aspects of embodiment is addressed in the study by applying visual prompts and visual narratives.

**Imagining the future in the present: Applying imaginary future to present biomedical discourse that relates to Personalized Medicine network**

Agate Nira KRAUSS (Ben-Gurion University, Israel) | agate13@gmail.com

It's a common knowledge that science in general and technoscience-biomedicine in particular are based on evidence. Evidently, the dominant school of biomedical knowledge is constructed by evidence-based medicine. However, in recent years we have witnessed a different trend in the development of new fields of knowledge in science and medicine. These fields are future projections that create a new type of imaginary knowledge or anticipatory knowledge. One of these new types of technoscience-biomedical fields is 'Personalized Medicine' model. This model is reputed to be one of a few new paradigms that will change the face of medicine, and yet there is no clear and accepted definition for it.

As in other fields, the Personalized Medicine knowledge derives from future knowledge based practices, which generate and regulate various possible futures. This knowledge does not exist in intrinsic manner or in itself, but in light of and in relation to imagination, expectations and vision that formulate their potential. These are all being used as a generative motive for activities, the creation of a structure, legitimacy, creating interest, encouraging investment and providing hope to patients.

In this lecture, I will present part of the structuring processes of the Personalized Medicine knowledge that Integrate imagination and biomedical discourse. The findings are based on a qualitative analysis of interviews that I have conducted with professionals in the field. These are initial findings from my PhD study that focuses on mechanisms of knowledge transmission and dissemination, from the laboratories to bedside medicine.

It's a common knowledge that science in general and technoscience-biomedicine in particular are based on evidence. Evidently, the dominant school of biomedical knowledge is constructed by evidence-based medicine. However, in recent years we have witnessed a different trend in the development of new fields of knowledge in science and medicine. These fields are future projections that create a new type of imaginary knowledge or anticipatory knowledge. Truth production: Foucauldian analysis of the Polish discourses about the 2010 Tu-154 plane crash
Karolina KUKLA (Jagiellonian University, Poland) | kaarolinakukla@wp.pl

I would like to present the results of my research on the Polish discourses about the 2010 Tu-154 plane crash in Smolensk, in which 96 state officials, including the Polish president, died. Contrary to previous investigations on the aftermaths of the Smolensk plane crash which focused on the phenomenon of national mourning, my study examines the political and social division in Poland which allowed for the constitution of truth about the crash. With the use of a Foucauldian conceptual framework, I investigate two major discourses on the crash: the national and liberal discourses. Whereas, the former constructed the catastrophe as a result of an intentional action by employing conspiracy theories, the latter defined the crash as an outcome of contingencies. It is argued that these explanations could have had occurred due to the specific relations between various institutions and phenomena such as the media, political scene, collective memory and social divisions in Poland. The major focus of my research is the process through which one of these explanations, namely the accidental one, was established as the official and true. The findings of my research are based on a discourse analysis of media coverage on the crash, participant observation of so called “cross defenders”, as well as on my interviews with the members of “Solidarni 2010” association. My genealogical analysis of the interplay between the state, the media, the Polish Catholic Church, expert institutions, and Poland-Russia relations reveals the mechanisms whereby the truth on Smolensk crash was constituted.

Reconstructing Discontent: Occupy Wall Street’s and the Tea Party’s Political Habitus
Nils C. KUMKAR (Universität Leipzig, Germany) | nc.kumkar@uni-leipzig.de

The social movements that arose in response to the world economic crisis after 2007 have confronted researchers and onlookers with a series of puzzles - one of the most persistent being the seeming opacity of their actual goals or demands. This paper argues that the interpretative and reconstructive approach of the documentary method (Bohnsack) can help to better understand the immanent social logic of the articulated protest of these movements. It presents the results of the reconstruction of the political habitus documented first in group discussions conducted with activists in both the Tea Party and Occupy Wall Street and secondly in the artistic images used in two pamphlets of the movements. It shows that some of the riddles posed by the movements' articulation of discontent can be understood as resulting from the encounter of class specific interpretative dispositions of their respective core-constituencies with a socio-symbolic crisis that undermines the very basis of these dispositions.
RS06 - Sociology of Morality

RS06S01 - General Session: Sociology of Morality – Old New Discipline of Sociology

Moral Laws and Game Rules: Figurational Perspective
Marta BUCHOLC (University of Warsaw, Poland) | bucholcm@is.uw.edu.pl

Norbert Elias’s contribution to sociology covered a discussion of the genesis and sources of the binding force of norms, which the author of "On the Process of Civilisation" analyzed chiefly, though not exclusively, in his writings on sports and leisure (including some co-authored by Eric Dunning). The purpose of my paper is to present this original inquiry into figurational sources of normativity. I will focus on the distinction between moral laws and game rules as two models of norms, in order to discuss its applicability to contemporary debates on normative pluralism and its socio-cultural consequences. I will draw on the later philosophy of Ludwig Wittgenstein to illustrate and, as the case may be, refine Elias's points regarding origins of and limitations to morality, thus stressing interdisciplinary character and theoretical potential of sociology of morality as a sociological sub-discipline.

Theorizing Movements of Moral Regulation: the Status Anxiety Mechanism
Hannu RUONAVAARA (University of Turku, Finland) | hanruona@utu.fi

This paper contributes to the research streams of moral regulation studies and analytical sociology, which can benefit and complement each other. Movements of moral regulation concern themselves with morally charged issues. They attempt to influence both the people who engage in behavior the movements disapprove of and the society that tolerates such behavior. Joseph Gusfield’s status politics theory, presented in his analysis of the American temperance movement, The Symbolic Crusade (1963), provides a potential explanation of such movements. The paper analyzes the general logic of status politics theory. In line with analytical sociology’s emphasis on explanation by mechanism, the explanatory social mechanism inherent in the theory is explicated. Some problems concerning explanation in terms of status anxiety mechanism are discussed: the reasonableness of assuming status anxiety, the problem of third person explanation, and the problem of proof in social explanations with regard to the postulating of unconscious collective anxieties.

Recognising different ways of 'doing recognition'
Melissa SEBRECHTS (University of Amsterdam, Netherlands, The) | m.j.p.f.sebrechts@uva.nl

This contribution focuses on how young adults diagnosed with a mild intellectual disability (MID) can experience recognition in interactions with their daily (work) environment. On the basis of my fieldwork, I will present how their daily interactions often revolved around being tough, hard-hearted, aggressive and promiscuous. Those ways of being together are easily labelled ‘deviant’ or ‘bad’: other people are hurt, things are destroyed, people are humiliated. Nevertheless this seems to be one of the ways through which young adults with MID can experience recognition and self-esteem in their daily context. Whereas many of them ‘fail’ when it comes to more ‘legitimate’ ways of enjoying recognition or success (education, job, family,
house), this might then be another way of 'doing recognition'. If we recognize that experiencing recognition is important for every human being, and maybe even more so for people who are labelled as 'disabled', and... if we recognize that the search for recognition is not always as harmonious as the theoretical literature pretends it to be, a few (moral) questions arise: which ways of searching for recognition are acceptable and which ones are not? Who defines this and how? What options are there for young adults with MID to experience recognition? How does (Dutch) society make recognition (im)possible for them? By discussing these questions, I hope to get insights not only on what recognition might mean for young adults with MID in practice, but also on how we can make space (or not) for ‘other ways’ of be(hav)ing.

Sociological Morality: The Search for Moral Phronesis
Todd Andrew HECHTMAN (Eastern Washington University, United States of America) | thechtman@ewu.edu

Although truth and consensus are never fully attainable, we share Zygmunt Bauman’s concern about the tragedy of “moral blindness.” Inspired by Bent Flyvbjerg's application of the concept of phronesis to the social sciences, we develop the idea of "moral phronesis" as a guide for moral life grounded in the virtuosity of practical wisdom. For us, a "sociological morality" involves perpetual seeking of concrete truths rather than proselytizing one absolute truth. We insist that the ultimate purpose of sociology is to take moral stances in specific situations.

The problem is that sociology tends to underappreciate everyday politics. While most sociologists recognize the "personal as political," it's equally vital to focus on the "political as personal." Failing to scrutinize how routine actions are always value-laden can unwittingly lead people to engage in "evil banality," thereby reinforcing the scourge of Arendt's "banality of evil." As Foucault emphasized, understanding institutional power is crucial for inventing and enacting forms of resistance and change through "technologies of the self."

A sociological morality is a call for sociology to engage morally, but even more, to demonstrate the necessity of sociological insight for any worthwhile morality. Our presentation offers theoretical tools drawing on ethnographic vignettes of moral phronesis in local contexts.

RS06S02 - Solidarity and Migration

The (Im)possibilities of the Politics of Solidarity: Undocumented Migration and Humanitarianism
Priscilla Maria SOLANO (Lund University, Sweden) | Priscilla.Solano@soc.lu.se

The securitisation of borders and criminalisation of migration throughout the 20th century has come accompanied by humanitarian crisis-like occurrences. The moral imagination of humanitarians has not operated in a vacuum in this realm, as in others, and is shaping and helping rethink the ethics of care. The field of care for undocumented migration has only recently received any attention. In this context of undocumented migration important expressions of solidarity have been predominately presented through a resurgence in appeals based on human rights for undocumented migrants and the provision of humanitarian aid. Like in other traditions of moral discourse, social solidarity in the case of care for the undocumented migrant situation is filled with conflicting arguments. The main purpose of this paper is to identify the loci of the politics of social solidarity in regards to its contribution in (re)shaping the undocumented migrant ‘subject’. Bearing this in mind I will explore and analyse the governance, cooperation and coordination of shelters and the moral discourses and testimonies used in the
name of humanity regarding the undocumented migrant situation. I will focus on outlining the decision-making process of moral dilemmas by human rights defenders and humanitarian action actors that have to do with (i) freedom of movement and (ii) saving lives. Is solidarity living in the abstract of moral vocabulary in this case? This paper is based on extensive qualitative research for my PhD thesis, including eight months of fieldwork, ethnography in assistance-based places and 32 interviews conducted with key humanitarian actors.

How formerly belligerent groups construct meanings of intergroup apology and forgiveness? A qualitative study

Kruno KARDOV (University of Zagreb, Croatia) | kkardov@ffzg.hr
Dean AJDUKOVIC (University of Zagreb, Croatia) | dajdukov@ffzg.hr
Dinka CORKALO BIRUSKI (University of Zagreb, Croatia) | dinka.corkalo@ffzg.hr
Ajana LÖW STANIC (University of Zagreb, Croatia) | ajana.low@ffzg.hr
Marina STAMBUK (University of Zagreb, Croatia) | mstambuk@hrstud.hr

Official apologies in post-conflict societies have over the past few decades become a social norm in dealing with past injustices. Although it is held that apology contributes to social reconciliation and amends the past so it does not serve as an obstacle for peaceful intergroup relations, research of local understandings of the significance of apology in everyday life remains scarce. The aim of this paper is to explore different understandings and perceived modes of apology that are possible among members of the local post-war communities. The paper is based on 11 focus groups discussions undertook in Vukovar and Knin, two ethnically divided Croatian cities with different war histories. In each city groups of Serbs and Croats - the post-war youth, war victims, and people with no personal losses - discussed their perspectives of intergroup apology and forgiveness. Additionally 12 semi-structured interviews were conducted in both cities with Serbs and Croats who actively fought in the war on competing sides. The analysis focuses on the participants’ understandings of the meaning and performing apology, i.e. who should apologize and how, is it possible to apologize in the name of an ethnic group, are there any conditions to be met before the apology can be given or accepted, what are the preferred modes of apology in different communities and among different groups, and what is the relationship between apology and forgiveness. The results will be discussed by unfolding the meanings of intergroup apology and forgiveness in everyday life of the formerly belligerent groups.

Intergenerational Social Mobility and Preferred Distributive and Redistributive Justice Principles

Alexi GUGUSHVILI (Oxford University, United Kingdom) | alexi.gugushvili@sant.ox.ac.uk

Some recent studies have identified the relationship between intergenerational social mobility and general preferences towards redistribution. The mechanism would be that social mobility brings about the idea that society rewards individual success, making those who experience upward mobility less likely to favor egalitarian social policies. Yet, social science research has somewhat ignored testing the assumption that undergirds this causal reasoning, namely that intergenerational social mobility is related with (1) preferences for distributive equity (i.e. whether individual talents should be rewarded), and (2) preferences for redistributive justice principles – equity, equality, or need. We employ an important social-psychological concept that may explain why socially mobile individuals differ in their understanding of preferred distributive and redistributive justice principles. The self-serving bias in causal attribution implies that people are more likely to attribute failure to factors that are beyond their control and more likely to explain successes by pointing to their own merits, abilities and effort. Depending on their origin,
individuals start with an initial set of attitudes, but over the years these preferences are amended based on their experience of intergenerational mobility. What this means is that regardless of one’s cultural context, individuals who experience upward social mobility will be more likely than non-mobile individuals to make internal attributions to describe individual success. In order to answer our research questions, we employ the fourth wave of European Social Survey (ESS 2008), which specifically questioned representative samples of European nations on their opinions toward distributive equity and redistributive justice principles.

**Culture wars over family matters: the three grammars of commonality in the plural and their interplay in the disputes over the Slovak „anti-liberal“ referendum.**

Ivana RAPOSOVA (Masaryk University, Czech Republic) | ivnaka@mail.muni.cz
Adam GAJDOS (Masaryk University, Czech Republic) | adam.gajdos@mail.muni.cz

Based on the analysis of the recent Slovak referendum concerned with issues of “traditional family”, this paper explores the possibilities of finding common ground in public disputes involving disparate systems of moral evaluations. The February 2015 referendum, initiated by an alliance of conservative civic organizations with the intention to conserve the legal privileges currently enjoyed by the traditional heterosexual family model, gave rise to discussions rich in moral claims and resulted in a massive polarization of the Slovak society. Using the theoretical framework of pragmatic sociology (Thévenot), we examine how the different grammars of commonality in the plural and forms of engagement interplay in the heated public debates over conflicting notions of family and over the role of the state in its regulation. Following closely the argumentation of the proponents, as well as the opponents of the referendum, we examine how beliefs about intimate family life were translated into publicly justifiable claims aiming towards common good. The pragmatic perspective helps us to shed light on the ways emotionally invested non-civil discourses enter the public domain and gain legitimacy. Drawing on the Slovak case, the paper elaborates on the mechanisms used by populist political agents to exploit democratic processes and on the counter-strategies available for a defense of inclusive concepts of civil rights and freedoms.

**RS06S03 - Charity – Social Phenomenon of Helping Each Other**

**Charity in Russia: History and Current Trends**

Tatiana Nikolaevna SEMENOVA (D. Mendeleev University of Chemical Technology of Russia, Russian Federation) | statiana1326@gmail.com

This article discusses the historical precondition of the beginning of charity in Russia. Since ancient times in Russian traditions the understanding of wealth was not cultivated in man without understanding of moral and ethical values. The acquisition of wealth in excess of more than necessary did not fit into the values of Russian people’s life. In the system of values of the Russian people were dominated by moral rather than material values. «To live happily ever after» was meant not only accumulating a wealth, but also to do good deeds. The human greed, acquisitiveness, hoarding, stinginess and unrighteous wealth were condemned. People’s minds were tolerant of the poor and sympathized with them. The poor man’s way was more conform to people’s ideals than the image of a rich man. Nowadays there are different strata of Russian society, which participates in charity. The aim of article is to consider the factors and the main directions of charitable activity in Russia at present. The study descriptions of people’s attitudes
to participate in charitable activities; motives and socio-cultural factors of people’s participate in charitable activities; preferable forms and directions of charity.

**Constituting ‘volunteering’ as a desirable activity: a reflexive meta-analysis of recent research**

Itamar SHACHAR (Ghent University, Belgium) | itamar.shachar@ugent.be
Johan VON ESSEN (Ersta Sköndal University College, Stockholm, Sweden) | johan.von-essen@esh.se
Lesley HUSTINX (Ghent University, Belgium) | Lesley.Hustinx@UGent.be

‘Volunteering’ is ideally depicted as an altruistic engagement to help others. While philanthropy entails material contributions to charitable causes, ‘volunteering’ is identified with the dedication of time and efforts to the benefit of others. The engagement of individuals in such activities is classically perceived by social scientists as driven by altruistic tendencies and moral determination, sharing the popular notion that volunteering is a good and desirable activity. Most studies in the field of volunteering research are focused on the antecedents of volunteering: examining individual-level and country-level variables and constructing a ‘social profile’ of the volunteers. Scholars are gradually paying attention also to the consequences of volunteering (see reviews by Wilson 2000; 2012).

This paper aims to provide an alternative perspective on volunteering by leaving the well-trodden path of more positivist approaches. In spite of their dominant status and explanatory power, these theories fail to critically examine the notion and practice of volunteering itself. Foucauldian-inspired reflections on the production of knowledge may assist in opening up the ‘black box’ (cf. Latour 2005) of ‘volunteering’. We therefore understand volunteering not as a fixed, unproblematic reality but as a phenomenon of which the boundaries can be managed and used by a variety of actors. Following Latour (1993), we will attempt to uncover contemporary mechanisms of ‘purification’ and ‘hybridization’ that enables ‘volunteering’ to be created and to proliferate. We will do that by reviewing emerging critical trends in the field of volunteering research, and by presenting some examples from our own empirical work.

**Social origin of charity: Russian Orthodox parishes’ case**

Polina VRUBLEVSKAYA (St.Tikhon’s Orthodox University, Russian Federation) | bloodstonished@gmail.com

Speaking about charity in sociological perspective, I would like to touch upon moral issues which underlie it. Why do some people help each other? What force them to initiate mutual aid? Coming up to the idea of morality, I propose to refer to sociology of Emile Durkheim. From the durkheimian point of view, in its origin, morality has a community. It should mean that every kind of moral behavior is formed by social relations which, in turn, constitute communality. Hence charity can be seen as a specific form of moral behavior, too. In this way, study of charity should begin with question to community as moral unit: What are social relations which constitute it? Drawing on empirical data from a study of Russian Orthodox parishes, I would like to concentrate on moral nature of mutual aid between its members. Precisely, I’ll try to demonstrate why and how do parishioners exchange kid’s items like clothes and prams. There is a long tradition in anthropological theory devoted to phenomenon of gift exchange. Marcel Mauss and Bronislaw Malinowski place these practices at the core of communal life. Both authors recognize symbolic meanings of gifts integrated in social interactions of individuals and reflected in their collective representations. In my report I’ll make an assumption that kid’s items exchange not only can be described in terms of classic anthropology, but plays the same
key role within parish community. After all, practices of gift exchange become real help for its members.

**RS06S04 - Inequality**

Reflections on the history of the role and place of disability in the moral economy

Bill HUGHES (Glasgow Caledonian University, United Kingdom) | W Hughes@gcu.ac.uk

It becomes desirable from an ableist perspective to think of disabled people as good to mistreat. This is so of the disabled scapegoat (pharmakos) violently sacrificed in the name of the health of the community in Ancient Greece or the disabled person purchased in the monster market (teraton agora) as an entertainment in ancient Rome. Eugenics legitimates the extermination of disabled people in antiquity and modernity. Demonic theology in the reformation drew disability into the nets of witch-hunters. Disabled people in the contemporary neoliberal moral economy are characterized as ‘false mendicants’ and ‘counterfeit citizens’ feloniously misappropriating welfare benefits.

Disability can, however, also be good to be good to. When disability is organized by systems of charity that posit disabled people as ‘deserving’ they move (from disposable uselessness – the view from Antiquity) to the heart of the moral economy, not necessarily, however, to live lives of value as categorical ends (Kant) but, more likely, as instruments that enhance the cultural, social and spiritual capital of non-disabled people. The system of Christian charity that dominated the moral economy of the Middle Ages in Western Europe provided the wealthy elite with the opportunity to use disability to buy redemption. In the middle ages, the stairway to heaven is built on indulgences – the privileged trample on the backs of disabled people all the way to the pearly gates. In this paper I will explore the shifting history of the role and place of disability in the moral economy.

**The Sociology of Favouritism**

Svetlana Pavlovna PARAMONOVA (Perm National Scientific Research Polytechnical University, Russian Federation) | spp45@mail.ru

Favouritism which is on the junction of rational and emotional spheres is a new problem in sociology. It could have been possible to place favouritism in the sphere of social-psychological studies had it not been for the multiple atrocities caused by the favourites’ ideas and assessment like the atrocities in St. Bartholomew Night or in Great Novgorod under Ivan the Terrible, had it not been for the sacrifices of Saddam Hussein, Muammar Caddafi or popular levy fighters in Novorossia.

The objective of this research is the institution of favouritism and role relationships of smaller groups in bigger collectives (in social space and time). The communication-type system in a social group is determined by the symbiosis of a leader and a favourite. It is consolidated by a weighty mass of conformists and marginal groups, undermined by the opposition of outsiders and outcasts.

The empirical analysis of social, typological and role groups revealed the allocation of favouritism in the Russian Federation, spreading from Siberia and the Urals and intensifying towards the centre (Sarov, Moscow).

Favouritism is personified. A questinnaire poll was a basic investigation method (N = 1680). Gender favourite relationships represent historically heterogenous type.
However, common characteristic features can be traced through the roll-call of the centuries. Temporal changes in the relation to the historical and contemporary favourites – military, political, religious figures (2003 – 2012) revealed the increase of dissatisfaction with political elite activity, self-consciousness growth of a social subject as a political figure.

“Are some people less equal than others?: The economic collapse and its impact on people with disability; A case study from Iceland”.
Helena ONNUDOTTIR (University of Western Sydney, Australia) | h.onnudottir@uws.edu.au
Mary Louise HAWKINS (University of Western Sydney, Australia) | m.hawkins@uws.edu.au

During the last six years, since the economic collapse in Iceland and subsequent strategic attempts at recovery, all Icelanders have experienced impact on their personal, emotional, physical, material and moral ways of being in the world. Inevitably, some individuals have suffered more than others, and in some cases whole groups have fallen victim to regulations, policies and legal changes which have been thrust upon the people of Iceland. In some cases such regulations derive from the stringent conditions, controls and ‘restructuring’ actions that have been stipulated by those institutions controlling external financial support to Iceland. In other instances, inequality and impact on personal lives has its roots in actions and inactions of local governing bodies. This paper concentrates on one group - people with physical disabilities – and recent challenges which have arisen for many of them as a ‘post-economic crash mentality’ and a recent, and a very problematic, overhaul in everyday services have come to impact on their lives. The particular focus of this paper will be on a few case studies, which provide insight into the subject’s own activities and critical challenges to these changes, specifically through their use of both public media and social networking cites. It will explore social action and social cohesion in a society where public empathy and agency are undergoing rapid changes.

Respect, moral suffering and the understanding of inequality
Macarena ORCHARD (University of Nottingham, United Kingdom) | lqxmao@nottingham.ac.uk

This paper argues that in order to have a better understanding of inequality sociology should develop a systematic inquiry on the phenomenon of “respect”. Respect has been a central topic in moral philosophy, but it has not received enough attention in sociological research. This is a relevant failure considering that, as it has been argued by Lamont et. al. (2014), one of the missing links in the explanation of inequality might be related to the development of classification schemas, such as valuation (i.e.: who deserves respect and who does not). Certainly, sociology has addressed some dimensions of respect through the analysis of the concept of status (Ridgeway, 2014) and more recently through the analysis of the problem of identity politics and recognition (Honneth, 1995, 2009). However, the analysis of the several dynamics involved in the granting and neglecting of respect to others at the level of everyday life is still a pending task. This paper proposes an analytical framework for the sociological study of respect at the everyday level. In order to show the performance of this approach, the paper discusses some preliminary findings of a qualitative study carried out by the author in Chilean society. Finally, the paper argues that studying respect is relevant in explanatory terms, but also in normative terms. By highlighting how and why the experience of lack of respect is unequally distributed and how it produces moral suffering to people, sociology has an opportunity to put the problem of inequality into the front.

RS06S05 - Moral Dilemma
Retribution as the way to elaborate moral economy of land at the globalisation period: the case of Kinmen
Ming-Feng LIU (National Quemoy University, Taiwan, Republic of China) | mf60129@gmail.com

Land has been not only considered as one of the three fictional commodities of the modern political economy by Karl Polanyi, but also a critical factor to provoke the inequality of wealth at the globalisation period: those who control land become richer, and with speed much more faster than the previous time, while those who have little or no land become poorer. In this regards, the 'fictionality' of land becomes more real at the present time, because the land could not nurish the solidarity, and even worst, play the role to aggravate the social disparity. By taking the case of Kinmen, an island which was not removed its military control until 1992, this research aims at illustrating that the newly circulating religious retribution (Bao-yin, 報應) in the daily life plays a role to elaborate moral economy of land at the globalisation period. Seeing Kinmen has experienced a rapidly and intensively commodification of land in recent years because of its nodal position between China and Taiwan, 'retribution legacy' demonstrates its discouraging power in the commodication of land by resorting the the traditional moral discourse in the course of modernisation.

Nordic model: morally laden ideal or value-free example to follow?
Jan PEŠL (Masaryk university, Czech Republic) | pesl.jan@gmail.com

Even though many scholars spent considerable effort to map, where lies the success of the Nordic model, most of the analyses rests on the macro-level and gives no insights into how is the model enacted into being. In my paper I am trying to fill this blank space using the analytical framework recently presented by Laurent Thévenot. Instead of relying on the Value Survey data, I suggest to look into the ways people relate to each other, their societies and environment. By juxtaposing cases of the struggles against changing mining limits of brown coal in Czech republic and petroleum production nearby Lofoten, Vesterålen and Senja islands in Norway, I demonstrate the heuristic scope of the french sociology of engagements, practicality of this additional analytical dimension for understanding social bonds connecting people in studied communities, and uncover a new piece of the Nordic model puzzle. As I focus on the dynamics of the two public spheres, it becomes clear, that each population has its own moral expectations towards which voices should take part in the public discussion and which are deemed as irrelevant. Such discrepancy can present an obstacle for making welfare policies inspired by Nordic model legitimate in the Czech context.

How to avoid moral dilemma: examination of the displays of loyalty to the authorities of modern Russia
Aleksandra LOZINSKAIA (Memorial International, Russian Federation) | lozinskaya@gmail.com

In this paper I question loyalty as the analytical concept. Current research is focused on the integrated knowledge about institutional behavior of “being loyal” to the authorities and empirical part of the examination is based on data gathered during the four-month participate observation of being employed at the organization which non officially described itself as the pro-governmental.
The point of departure for this examination was the question which Hannah Arendt proposes in her “Personal responsibility under Dictatorship.” Emphasizing the distinction between obedience to authority and support of the authorities, Arendt reframes the traditional question of Holocaust researchers “Why did you obey?” into her “Why did you support?”

To make this question sociologically relevant I draw on Simmel’s “How is society possible?” to focus on the “how” and to further reframe the question into “how do you support?” This question is central to the idea of studying loyalty to authorities in modern Russia.

Loyalty as both analytical and practical term most frequently belongs to the scope of organizational and labor studies, e.g., consumer loyalty and employee loyalty. These are almost effortlessly operationalizable and measurable, e.g., through the number of consumer operations, money spent on services, brands or products of a company, years spent by the employee at the company, or through evaluations of being part of the team.

It could even be said that loyalty has never really been a problematic category. Even Hirschman's argument, which involves loyalty as a concept, has not been applied in studies of political regimes other than democracy. However, some political theories embrace “loyalty” as a term for investigations related to problems of “non-liberal world”.

Loyalty is a feasible concept to analyze GONGOs (government organized non governmental organizations). Russian GONGOs are single-purpose organizations which in themselves do not make the concept of loyalty problematic.

They hold the events and action of single-purpose, one-dimensional explicit gestures of support and approval of the authorities. Available researches of Russian GONGOs employing loyalty concept leave it unquestioned.

Russian GONGOs pretend to use the same framework as the protesters use, such as mass demonstrations and actions against concrete politicians. This caused confusion even between the researchers, as I could meet the paper comparing ethnography of self-representations of both protesters and supporters of the current political regime in Russia. I suggest the argument that the displays of loyalty and moral choices people make to display loyalty are of the different framework than displays and moral choices of protest. Loyalty is not displayed on the streets, but demonstrated within routine work of governmental (or pro-governmental) organizations.

Loyalty has nothing in common with the written, described in details set of rules and standards that people are indoctrinated with. Instead, its mainstay lies on its non-transparency.

So to present the empirical part of the research I examine how people act in the situations of the demands for the loyalty to the authorities, how this situations are recognized and what regimes of justification are chosen to avoid moral dilemma in such situations.

Vicious Circle of Mass Killing
Izabela SAKSON-SZAFRAŃSKA (Institute of Applied Social Sciences of the University of Warsaw, Poland) | sara2000@hoga.pl

As we know from the history, many of destructive collective violence acts has been perpetrated not by the barbarians or people with serious mental illness as we would like to see them but by ordinary people, who see themselves as protectors of their cherished values, defenders fighting ruthless oppressors and preserve world peace, usually in the name of righteous ideologies, religious principles and nationalistic imperatives. How well socialized people became ruthless murderers able to commit mass crimes. As we can consider G. Anders the Nagasaki syndrome which means “what has been done once can be repeated over again, with ever weaker reservations with each successive case, more and more ‘matter-of-factly, casually, with little deliberation or motive”. The Holocaust and other mass crimes were not merely aberrations, but each time opening new universe whose boundaries are crossed. Radical shifts in destructive
behaviour through moral justification could be observed during the mass crimes, when the moral characters were reversed.

**RS06S06 - Morality**

**Ethics versus Pseudo-Ethics: How to improve ethical reasoning skills in a classroom?**

Turkan FIRINCI ORMAN (✓) | turkanfirinci@gmail.com

The development of ethical reasoning abilities is vitally important in teaching - both for living an ethical everyday life and creating an ethical world. However most people confuse ethics with behaving in accordance with social conventions, religious believes, and the law. Moreover egocentrism as a fundamental barrier can easily deteriorate student's ethical perspective. This paper, deferring ethical concepts and principles as universal in its theoretical frame, basically aims to measure the ethical reasoning skills of teaching students with the assumption that student's ethical reasoning skills could be improved by implementing such programme. Thus, five module ethical reasoning programme was developed and implemented on a volunteer group of teaching students in order to observe the effectiveness of the programme. In accordance to the pretest- posttest design, Defining Issues Test (DIT-I) which is based on Kohlberg's moral development theory and focuses on everyday life's ethical dilemmas had been used for data collection whereas Paired Samples T-Test and Chi-Square for the analysis. Students' scores were significantly different ($t(19)=-4.99; \ p<.01$) after they completed the programme and students with lower ethical reasoning skills improved their skills at the level of 61% per cent. These positive results show that such programmes could be useful to gain an ethical perspective in the field of education and possibly in other social spheres as well.

**Modern man and a moral crisis.**

Dina TANATOVA (Russian State Social University, Russian Federation) | dktanatova@mail.ru

For the modern man lost credibility justice, patriotism, love of country, sacrifice, duty, respect, spirituality. There was the threat from confrontation, crisis of human relationships in a global sense.

1. The principle of double standards. In modern life, the principle was modified in the saying "if you really want, you can", indicating that the dual of the prohibitions. There was absolute conviction formal ban, it is not only in the cultural practice of society, but, and - legal.

2. The principle of moral instability. The modern human range of moral, moral notions lives separately from the actions. Yes, it is impossible, but I can / or now you can. Motivation can be any number: there were circumstances, life is made, it is the last time. Frailty close to cynicism, but not identical to it. It is usually good to get used to human societies, which spelled out the fear, uncertainty, complexes, and weakness.

3. The principle of mistrust. Trust in modern society has become scarce as a human being. Complex mechanisms of competition, leadership, ambition, credibility, create a multiplex, the result of which is the level of mistrust going wild. Say one thing, I think - more, we mean - the third.

4. The principle of distortions and lies. Man lying to family, friends, colleagues, superiors. He used to live a lie. He says, at best, half-truths, ie, like the truth.
Internally, people can not help but think about it the wrong stream of words and actions. But justification is always easier to find than to be known as a man of truth. Lies replaced by a new formula, which bears more attractive wording - compromise.

5. The principle of cultural nihilism. High served as the low and high as low. Reliable - ambiguous, unambiguous unreliable. Nonsense, surrogate simulacrum in creativity is encouraged and declared the philosophy of a new culture. Denied the story, experience, continuity, tradition.

**Morality vs ethics, duty vs feelings: The Greek tragedy and the birth of the ethical person**

Mariolina GRAZIOSI (Università Degli Studi di Milano, Italy) | mariolina.graziosi@unimi.it

In my paper, I consider the roots of morality in the western world, focusing on the relationship between Greek Tragedy and the birth of the ethical person. My thesis is that in the western process of civilization, morality and ethics coincided in the first types of society (primary society and Egyptian society). The differentiation between the two occurred in ancient Greece with the development of tragedy and the birth of the tragic man. In particular, I explore the relationship between feelings and ethics. My thesis is that feelings play a central role in the formation of the ethical man, while duty plays a central role in the formation of the moral man. My analysis is within the philosophical and sociological tradition whose main contributions have been those of Emile Durkheim, Max Weber and Friedrich Nietzsche. For instance, the tension between feelings and duty in the formation of the moral man was already underlined by the French sociologist Emile Durkheim, who saw at the roots of the moral man both feelings of gratitude and the duty to obey the morality of the group. Nevertheless, Durkheim did not distinguish between the ethical person and the moral man. Friedrich Nietzsche in his book Genealogy of Morality explores in depth the relationship between feelings and duty comparing the protestant ethic and the heroic morality of old Greece. Max Weber also considers the Protestant ethic and the development of mundane asceticism both seen as the main trait of the spirit of capitalism.
RS07S01 - Session I

**Capacity building for ocean and coasts**

Ulrike KRONFELD-GOHARANI (Institute of Social Sciences, University of Kiel, Germany) | kronfeld@ips.uni-kiel.de

The ocean forms the world’s largest ecosystem providing humankind with a multitude of services: food production, minerals, energy, nutrient circulation and climate regulation. More than 90 per cent of international trade is done by shipping. Fish is for more than 1.5 billion people an important resource and more than 45 per cent depend on fisheries. In addition, 150 million people are working in fisheries industries.

Having taken oceans’ services for granted and ignoring that a productive and healthy ocean is essential for wealth and well-being of the present and future generations, the marine ecosystem is increasingly threatened by climate change, unsustainable fishing practices, pollution and waste, a loss of habitats and biodiversity and invasive species.

The conservation and protection of marine ecosystems urgently demand a more careful use of marine resources and dealing with pollution and waste. The transformation towards a more sustainable society places high demands in our dealings with consumption and production patterns, the participation and collaboration with different stakeholders, the building of consensus and partnerships and collective agreements. In this context, the concept of ‘sustainability’ can provide a conceptual basis for integrating these requirements.

At present, there is still little public recognition of the benefits marine ecosystem services offer for livelihoods, business and culture. Against this background the paper discusses approaches and strategies how to increase capacity building for the necessity of a more sustainable dealing with our ocean and coasts.

**The status of the maritime sociology - maritime sociology as a sub-discipline of sociology**

Arkadiusz KOLODZIEJ (Szczecin University, Poland) | kolodziej.socjologia@gmail.com

Extracting sub-discipline of sociology, as a relatively independent field of sociological investigations, always involves some methodological and theoretical doubts. What is interesting, this concerns also apply to those areas of sociological investigations, which have relatively rich research tradition. In the sociological considerations we can find eg. The question of the base (the validity) of isolating the sociology of sport as a separate sub-discipline of sociology. Maritime sociology has already some theoretical and empirical achievements. Relatively frequently (eg. within the framework of the ESA conferences) meetings of "maritime sociologists" take place. There is also a journal (Annuals of Marine Sociology) devoted directly to this issue. One can speak of elements (about the process of) institutionalization of maritime sociology. However, the recognition of maritime sociology as a separate sociological sub-discipline remains problematic. The main problem here is the question of justification for the existence of a separate subject of that study; can maritime sociology be reduced to the sociology of work or urban sociology?
In his speech the author will focus on the basic problems (theoretical, methodological and empirical) related to the recognition the maritime sociology as a "full-fledged" sociological subdiscipline.

**Fishing under Neo-liberal Management Regimes: Economic Benefits and Socio-cultural and Economic Costs**

Rob VAN GINKEL (University of Amsterdam, Netherlands, The) | r.j.vanginkel@uva.nl

Departing from my own long-term ethnographic fieldwork in Dutch fishing villages, this paper compares several West-European fishing communities' experiences with the neo-liberal policies and fisheries management regimes that came about as of the 1990s. In particular, it focuses on the economic benefits assumed by neo-classical economists and the socio-cultural consequences of such regimes, which sociologists and anthropologists have observed and analyzed. In many instances, fishermen and their families would seem to face huge problems in trying to survive in their métier. To do so requires formidable adaptations. The measures of European and national institutions have given rise to an elite of fishing entitlement holders ('owners'), making economic survival for small-scale or marginal units increasingly difficult. Neo-classical economists have endorsed such measures as being "rational" in that they stimulate the survival of the fittest units, and thus reduce overcapacity and overcapitalization. In fact, however, the paper will argue that such measures are irrational and tragic not only from a socio-cultural point of view, but also in several economic respects.

**The Changing Maritime Industry Sector in Poland: Organizational Field and Organizational Culture**

Agnieszka KOŁODZIEJ-DURNAŚ (Szczecin University, Poland) | akodu@whus.pl

After the Second World War maritime industry became a significant sector of a new national economy in Poland. It also served as an ideological tool to support the new communist system introduced in Poland as it legitimized the "recovery" of Western Territories and extended access to sea. During almost half a century maritime professions gained the social prestige and maritime industry companies were treated as national treasure. After the collapse of a socialist political and economic system in 1989 both maritime workers and companies lost its high position in the social structure. In this paper the author analyses the changing situation of the maritime industry sector in Poland from the point of view of two concepts: organizational field and organizational culture. Organizational field as defined by DiMaggio and Powell (1983) means organizations which together constitute recognizable areas of institutionalized life: key suppliers, consumers, control agencies, competition. Organizational culture as a very broad and differently defined concept is presented here in the perspective of Cameron and Quinn's (1998) model of competing values and the matrix of two dimensions resulting in four types of cultures. The author using the two concepts shows how the maritime industry sector transformed through almost half a century of communism, 25 years of democracy and free-market economy and a decade after joining the European Union.

**Birds of a feather at sea? Homophily and frequency of communication in multinational shipping crews**

Michael BRENKER (Friedrich Schiller University Jena, Germany) | michael.brenker@uni-jena.de
Stefan STROHSCHNEIDER (Friedrich Schiller University Jena, Germany) | stefan.strohschneider@uni-jena.de
Sarah MÖCKEL (Friedrich Schiller University Jena, Germany) | sarah.moeckel@uni-jena.de
Although the world’s economy is to a large degree dependent of transportation by sea, little is known about the work and life of the workforce of 1.2 million seafarers from all over the world. While there is a long tradition of seafaring and the self-perception of having a strong occupational culture that serves as an integrating factor for multinational crews, there are also reports on social isolation, depression, and suicides at sea. We propose that the occurrence of relations at sea can be explained using the principle of homophily.

We analyze the effects of personal factors (age, number of languages spoken, having the same mother tongue) as well as structural factors (similar hierarchical level, same working area) on the self-reported frequency of communication of 120 seafarers of all ranks with their fellow crew-members while they are on duty and during their off time.

Frequency of communication is to a large degree determined by working within the same area, yet frequency of communication off duty is dependent of speaking the same language and being on a similar hierarchical level.

Our results confirm the effects of homophily on the frequency of communication within shipping crews. They reveal the importance of taking into account interpersonal factors as well as structural features when analyzing social relations in complex working worlds.

The 'other' man at sea: Performing masculinity on-board merchant vessels
Nelson Nava TURGO (Cardiff University, United Kingdom) | TurgoN@Cardiff.ac.uk

To claim that merchant vessels are a masculine space is to state the obvious. Currently, only 2% of the 1.3 million active seafarers at sea is female and the rest is male. On-board, masculine culture pervades the everyday working and living lives of seafarers. In the mess room and officers’ day room, when seafarers converge for meals or socialization, banter almost always involves women and seafarers' 'sexploits' during shore leaves, and stories of accidents at sea are traded casually, amongst many. Hard physical work in the engine room (where average temperature hovers around 35 degrees), in tanks and cargo holds is an everyday routine. In their nine-month contract (for ratings and three to four months for officers), seafarers have to have a steely resolve as they battle mental, psychological and physical stresses brought about by the harsh conditions of their work, their isolation and being separated from their loved ones. However, such depiction of the masculine world on-board proposes a reductive epistemology of masculine life on-board and does not capture the nuances and dynamism of masculine display that seafarers perform in their everyday life at sea. Drawing from field observation and in-depth interviews of seafarers on-board two merchant vessels that lasted for a month each and complemented by further interviews of seafarers in seafarer centres in the UK and European ports, this presentation provides a glimpse on how merchant vessels could also be a staging point where 'other' masculine performances are put on display such as 'emotive-emotional' masculinity and 'homosocial' masculinity. The presentation, thus, furthers our understanding of the many facets of masculinity-in-display in today's world's unique work/living spaces such as ocean-going vessels.

Women and Social Cohesion: Preliminary Findings in Fishing Communities in Four EU Countries
Esther COPETE (University of Greenwich, United Kingdom) | esthercopete@gmail.com

Worldwide, women play a wide range of roles in fisheries, making significant contributions to the industry across sectors from a variety of roles. However, the existing knowledge about women in today’s European fisheries is inadequate and fragmented. The proposed paper intends to contribute to knowledge in this aspect.
This paper aims to assess the contribution made by women in fisheries by investigating women's work and life in Four EU countries: England, Belgium, France and the Netherlands. In particular, the research will use social cohesion indicators identified by the Council of Europe to understand women’s roles within their communities and analyse the way these in turn affect women's ability to contribute to social cohesion, and ultimately their community’s well-being. Key preliminary findings will be discussed in this paper.

Narratives and Counter-Narratives Underpinning the Construction of Maritime Stowaways
Amaha Feleke SENU (Seafarers International Research Centre, Cardiff University, United Kingdom) | SenuAF@cardiff.ac.uk
Iris ACEJO (Seafarers International Research Centre, Cardiff University, United Kingdom) | AcejoI@cardiff.ac.uk

This paper explores some of the various narratives that are employed in reference to maritime stowaways by various practitioners in the maritime industry on one hand and the counter-narratives employed by the stowaways in describing themselves on the other. In doing so, the paper aims to demonstrate how the conjunction or disparity between the narratives and counter-narratives contribute in shaping relationships and outcomes between the stowaways and industry practitioners that range from sympathetic to cooperative and even more so to antagonistic. The paper draws from data collected through interviews with maritime stowaways as well as with various practitioners in the maritime industry. It also draws from ethnographic field notes taken on board a container ship as well as data generated through consulting various relevant documents.

RS07S03 - Session III

Integration of fishers' traditional knowledge in fisheries management. A case study
Emmánuel LIZCANO-FERNÁNDEZ (Universidad Nacional de Educación a Distancia) | elizcano@poli.uned.es
Luis MIRET-PASTOR (Universidad Politécnica de Valencia, Spain) | luimipas@esp.upv.es
Paloma HERRERA-RACIONERO (Universidad Politécnica de Valencia, Spain) | paherra@esp.upv.es

The strong social and environmental crisis at the Spanish Mediterranean Sea reveals the failure of usual fisheries policies that are mostly based on biological and economic criteria. New approaches are focusing the fisheries system as a social and ecological complex system that, as well as its own activity, should involve the existing links between people and their environment, to set out collaborative models in order to integrate fishermen as central actors of a process of change that guarantees seas and shore sustainability.

In the case of Spain, new more sustainable forms of management are facing the existing lack of attention, at the academic and administrative fields, to the traditional ecological knowledge of fisheries on a small scale, and to the role that fishermen and their institutions play regarding the management of sea resources. Considering this situation, it becomes necessary to study in depth and to appreciate not only the local traditional knowledge, but also possible models of co-management which take it into account.

This paper analyses, using a qualitative methodology, the specific characteristics of the traditional knowledge and practices of artisanal fishermen at the Spanish Mediterranean Sea,
and contrast them with expert knowledge, particularly with marine biologists’ work on that field. The aim is to achieve a further integration between both forms of knowledge and experience, in order to produce more sustainable and efficient forms of collaborative management among fishermen, experts and administration.

Small scale fisheries and fish selling: governance challenges and market opportunities
José J. PASCUAL-FERNÁNDEZ (Universidad de La Laguna, Instituto de Ciencias Políticas y Sociales, Spain) | jpascual@ull.es
Carmelo DORTA-MORALES (Universidad de La Laguna, Instituto de Ciencias Políticas y Sociales, Spain) | cdorta@telefonica.net
Raquel DE LA CRUZ-MODINO (Universidad de La Laguna, Instituto de Ciencias Políticas y Sociales, Spain) | raquelmodino@gmail.com
Salvador MELGAR-RAMIREZ (Universidad de La Laguna, Instituto de Ciencias Políticas y Sociales, Spain) | salvamelgar@gmail.com
Agustín SANTANA-TALAVERA (Universidad de La Laguna, Instituto de Ciencias Políticas y Sociales, Spain) | asantana@ull.es

Small scale fisheries (SSF) involve 90% of all the fishers globally; 54.8 million people live directly from fisheries and aquaculture, and between 660 and 820 millions of people depend, in one way or another, from these activities (FAO, SOFIA 2012). Small-scale fisheries make an important contribution to nutrition, food security, sustainable livelihoods and poverty alleviation. Several factors affect the ability of small-scale fishers (SSF) to secure their livelihoods, being especially relevant their capacity to sell their fish, and add value to their catches. Small-scale fisheries catches have a superior quality and freshness, in general, but this does not always facilitate a better price or higher demand.

In this context, we have recently carried out detailed research into SSF fish labeling in Spain, as this strategy is increasingly being used for the promotion of the sector. We have discovered that only those initiatives integrated into well-functioning SSF organizations have been successful. Innovation in this area looks linked to the strength of SSF organizations, and this poses interesting governability challenges.

Learning from these experiences, we are trying to implement new fish marketing strategies in Tenerife (Spain) combining the capacity of a local producers’ organization with SSF labeling initiatives. This has been linked with the development of alliances with other players in the value-chain, specifically restaurants, supermarkets, collective consumers and luxury hotels. This initiative poses relevant challenges to organizations, which need to innovate in their functioning and governance. Our proposal elaborates on the issues that this applied research need to to cope with.

MS4 - Marine Protected Areas: Integrating Local Knowledge in Governance Frameworks
Andy THORPE (University of Portsmouth, United Kingdom) | andy.thorpe@port.ac.uk

The regulation of fishing activity is centuries old (Thorpe et al., 2012). However, recognition of the importance of preserving marine ecosystems is a more contemporary phenomenon with the number of marine protected areas (MPAs) growing sharply – from just 118 in 1970 to more than 6,500 (encompassing 2%+ of the world’s oceans) today. MPAs are legal constructions, created by government (or other agencies) for the purpose of regulating human activity in specific geographical areas. Law – or law-like phenomena – provide the means for creating the contours of a PA and also ensure its functioning; they constitute an important part of the governance
framework. But governance is more than law alone: governance is the aggregate of mechanisms utilized for steering the development and continuance of PAs in space and time. Christie and White (2007:185) therefore refer to PAs as “management interventions that are spatially organized.”

In this sense the personal and communal is important too – as changes in resource access rights that are occasioned by MPA establishment are also likely to affect individual, household or community wellbeing too. Sanchirico et al. (2002:12), for example, suggest occupational risk may increase if fishers are displaced from their traditional fishing grounds - and are obliged to voyage to unfamiliar waters in vessels unsuited for the task. This paper explores ways in which MPA governance arrangements have engaged with local practices and tacit knowledge – and the consequences thereof.

Artisanal Fishers and the Common Fisheries Policy – an Irish Perspective
Vincent FAHY (National University of Ireland, Galway, Ireland) | vincent.fahy@nuigalway.ie

Fisheries governance in Europe under the aegis of the Common Fisheries Policy (CFP) has drawn criticism that it favours industrial fleets over small-scale or artisanal fishers. This criticism stems in part from the top-down governance of the CFP, with senior decision-making civil servants depending on economic and scientific data in shaping policies, with scant regard to stakeholder input or socio-cultural parameters. This is particularly problematic for the small-scale fisher. Whereas many members of the industrial fleet belong to fisheries organisations and may have agents actively lobbying in Brussels on their behalf, the small-scale fishers are typically a disparate group and are usually only active on a localised level. In looking at the Irish example, there is an active fishing fleet of 2125 boats, with 86% of these meeting the CFP metric for “small-scale”, i.e. 12m or under. This paper will examine apparent disparities between the quota allocations for the industrialised fleet and the small-scale fishers, focusing specifically on Ireland. The efficacy of the relatively new initiative of the FLAGs (Fisheries Local Action Groups) as set up by BIM (Bord Iascaigh Mhara/Irish Sea Fisheries Board) to encourage development and diversity with the inshore fleet will also be examined.

The challenge of co-management in a new protected area in the Aegean Sea: Researching local stakeholders and fishermen in two islands
Loukia - Maria FRATSEA (Harokopio University of Athens, Greece) | fratsea@hua.gr
Apostolos G. PAPADOPOULOS (Harokopio University of Athens, Greece) | apospapa@hua.gr

Despite that protected sites in coastal and/or island areas appear as windows of opportunity to policy makers and NGOs caring for sustainable development, they also pose challenges for local stakeholders and fishermen who need to adjust their activities and life modes to the top down priorities set by governmental decisions and NGO interests.

Environmental NGOs have acquired valuable expert and scientific knowledge on marine ecosystems which are essential for natural resource management. However, such expert/scientific knowledge is often in conflict with the local population and fishermen interests who are often qualified with tacit and/or lay knowledge and which is rarely taken into consideration when designing and promoting environmental protection actions in coastal and island areas. This is especially true in Mediterranean marine environments where local populations and stakeholders are more prone to support economic development activities which are considered part and parcel of their livelihoods.

This paper aims at discussing the challenge of eco-based management of the Gyaros island which is located in the Northern Cyclades in the Aegean Sea. This island is the base for a large colony of sea-monks and is promoted as a protected area by the Greek state and environmental
NGOs. The paper is based on empirical material collected in the neighbouring islands of Andros and Syros during field work. The empirical material includes survey data collected from local population and (professional/artisanal and amateur) fishermen in July-November 2014 and qualitative data collected in the same period from 25 local stakeholders in the two islands.

RS07S04 - Session IV

The Re-Invention of the European Port-City - Adaption or Individuality?
Guenter WARSEWA (University of Bremen, Germany) | gwarsewa@law.uni-bremen.de

The type of port-city we once knew was characterised by a typical and coherent constellation of economic and social structures, institutional arrangements and a particular mentality and culture. During the recent decades port-cities in the western world were strongly affected by industrial decline and had to re-invent themselves fundamentally: In many cases the port disappeared or was relocated while high-tech production, research institutions, tourism, leisure, knowledge industries and modern services emerged. One of the most important challenges was to change thinking and mentalities: The more distinctive the port-city, the more exclusive and specialised its profile, culture and character - the legacy of maritime-trading, seafaring, shipbuilding and all related capacities - the greater the difficulty of responding to these challenges.

Despite all differences, the process of regeneration also seems to have some common characteristics in many European port cities: All port cities try to diversify their economic and social structures while maintaining a maritime character as unique selling point. And while “hard” structures declined and institutional capacities eroded, local culture (i.e. the locally specific ensemble of practices, symbols and artefacts, but also underlying values, norms and expectations) took over the function of a steering mechanism and worked as a resource for social and economic processes and as a potential for regeneration.

Based on studies about several European port-cities, the contribution will give an overview of the transformation process of European port-cities and how it is affected by local culture. It will demonstrate that the various functions of local culture are a determining factor for the specification and variation of trajectories. Finally, it will unveil that the re-invention of the European port-city is not only an adaptation to global dynamics but is an expression of a certain individuality and common identity of the European port-city.

Where islanders and transnational border-crossers meet - An ethnographic approach to refugees on Sylt
Silke Mirjam BETSCHER (University of Bremen, Germany) | betscher@uni-bremen.de

Since 2013 refugees from Syria, Eritrea, Somalia and Armenian have been housed on the North Sea island of Sylt. Due to its geography as an island, Sylt can be described a relatively closed community. Nevertheless after 1945 so-called expellees were integrated into Sylt society and doubled the number of inhabitants on the island. Many of these newcomers worked in the tourism sector and helped to expand tourism massively during the 1950s and 1960s. Sylt has attracted tourists since the early 20th century and today there are ca. 850,000 guests/year.

Based on the nationwide ratio of distribution of refugees in 2013 the state of Schleswig-Holstein has decided to place up to 80 refugees on Sylt.

What happens in this specific contact zone? What do we learn about flexibilities and adaptabilities of a society characterized by traditionalism, regionalism and conservatism on the
one hand but with a great deal of economic dependency on hospitality on the other hand? What does it mean to refugees stranded on this North Sea island who do not have a lot of opportunities for outside contact?

My talk is based on ethnographic fieldwork (interviews and participatory observation). I will investigate how the presence of refugees has led to reconfigurations of social relations and to transformation of concepts of globality and locality on the island. Furthermore, I will show to which extent the presence of refugees offered an increase in employment opportunities besides tourism and led to new networks of actors and institutions where new battles over institutional entitlements and resources are being fought out.

Bayu Asih YULIANTO (Indonesia Defence University, Indonesia) | b.asyou@gmail.com
Amarulla OCTAVIAN (Indonesia Defence University, Indonesia) | rosseauherve@gmail.com

In the context of Indonesia, colonialism is considered as one of the important thesis of the fading of maritime culture in the archipelago. As a society that historically have experienced a phase of strong maritime trade, this decay has been dramatic. There are a continuity between what was run by the colonial regime to what is done by the national post independence government until today.

This paper investigates how the region of Banten which has been historically recorded and recognized by international community as a strong maritime empire has gradually fade as the Dutch colonialism reigned in Indonesia. It also explore how the decay of maritime culture that continues to day manifested in daily marine social practices of the community. What are the main constrains of marine social practice itself?

This paper integrates issues at the macro and micro level through elisionistic perspectives and combines a qualitative approach with a case study through literature research of Banten Kingdom history, and field research during 2013 - 2104 in three coastal villages in Pandeglang district, Banten Province. As the historical research describes the glory of maritime trade in Banten in the 16th century and begin to decay in the beginning of 17th century, this paper present an empirical construction related to marine social practices.

This paper shows how four important keys namely the knowledge of fishing and sea, the economic condition of maritime communities, the natural distance to the sea, identity group that has cultural closeness to the sea, are the major constraints of marine social practices in society. Those elements are mutually associated each other and manifested in the coastal communities in Banten through a complicated and continued social processes.

The maritime communities would be need to further research as contextually in line with Government’s goal to accomplish Indonesia as a world maritime axis.

Recreational fishing and challenges for coastal and maritime governance
Inés CHINEA-MEDEROS (Institute of Social and Political Sciences, Universidad de La Laguna, Tenerife, Spain) | ichinea@ull.es
José J. PASCUAL-FERNÁNDEZ (Institute of Social and Political Sciences, Universidad de La Laguna, Tenerife, Spain) | jpaschool@ull.es

Economic development has entailed a loss of relevance of traditional activities such as small-scale fishing, while tourism development in coastal areas has displaced fishing communities. In this context, marine recreational fishing has become increasingly important. This has biological and social consequences, not sufficiently studied, and has significant implications from a governance perspective.
In Tenerife, Canary Islands, 4.4% of the population is licensed to practice recreational fishing. Requested by the local government we developed an extensive study on recreational fishing in the island based on quantitative and qualitative methodologies, with more than 1,000 face-to-face surveys and a phone panel with 500 fishers during one year. Thus we have analyzed how the label 'recreational fisher' brings together a variety of practices. We have observed a huge heterogeneity, remarking differences between anglers and boat fishers or spearfishers. A key element in this area is the low level of participation in organizations (around 4% of the fishers), that makes their involvement in coastal governing processes particularly challenging, as the potential leaders have a limited representativeness. This invites our reflection on the role that recreational fishers can play in maritime and fisheries governance. The participation of different stakeholders in governance processes is desirable, but the involvement of recreational actors, like anglers or scuba divers, pose challenges that need to be taken into account. Funding to support the ULL Granted by the ACISII, 85% funded by the European Social Fund, is gratefully acknowledged.
Other Sessions

OS00 - Pre-conference Event: New Perspectives on Pluridisciplinarity in Central and Eastern Europe

New Perspectives on Pluridisciplinarity in Central and Eastern Europe
Benjamin TALLIS (Institute of International Relations, Prague, Czech Republic)

The panel, which will be comprised of leading scholars from the New Perspectives editorial board, will explore the added value that interdisciplinary perspectives bring to understanding the politics and international relations of CEE. The panel, in line with the rationale of the journal, will show how combining different explanatory and interpretive frameworks, from different disciplines compensates for their respective blindspots, helps challenge their various assumptions and questions what they each consider as matters of ‘fact’. This critical interlocution between disciplines which have their own established traditions and methods can help enhance the ontological, epistemological and methodological sophistication of CEE scholarship. The panel also examines how such approaches can not only help to develop standards of scholarship in and on the region, but also equip scholars to intervene in the political, social and cultural issues of the region, not (to paraphrase Bruno Latour) because they are matters of fact, but because they are matters of concern.

Participants:
Benjamin Tallis (Chair), Institute of International Relations, Prague
Jan Drahokoupil, European Trade Union Institute, Brussels
Pelin Ayan, Anglo-American University, Prague
Ľubomír Lupták, University of West Bohemia
Tomáš Profant, Institute of International Relations, Prague

OS01 - Routledge Workshop

Publishing in the ESA journal European Societies: A session with the editor
Routledge WORKSHOP (Routledge)

A session with the new editor of the journal Michalis Lianos, discussing how best to publish your research in the age of bibliometrics and assessments. From norms and schools of thought to originality and interdisciplinarity, the choices for both authors and editors have significant consequences. Cultural and linguistic hegemony - albeit unfair - is omnipresent, but a journal that represents the entire European sociological community must find ways to achieve all possible plurality. European Societies aims to combine openness, speedy reviewing and high quality. Discuss your expectations and experiences and see how an established journal can publish your work

OS02 - RN34 Informal PhD Meeting

Phd Informal Meeting
Networking informal PhD meeting.

**OS03 - adMeter: Passive Electronic Measurement in Media and Social Research**

adMeter: Passive Electronic Measurement in Media and Social Research  
Josef FIŠER (MEDIAN, Czech Republic)

Surveys based on declarative statements are facing increasing reluctance to answer, problems of unreliable memory and social desirability. In some research areas passive electronic measurement may be its successor. MEDIAN has developed and uses adMeter mobile applications to measure TV and radio audience, web sites visit, print readership and outdoor advertising exposure. In combination with surveying the panelists the project allows the measurement of actual effectiveness of advertising campaigns in terms of recall and impact on attitudes and consumer behavior.

However, the technology based on audiomatching, GPS localization and URL tracking is suitable only for market and media research but can also contribute in exploring many social research questions.

How does the media and political campaigns exposure relates to voting behavior and preferences and its changes? Can we use combination of passive measurement and tracking attitudes to differentiate agenda setting processes from the reinforcement theory and impact of audience on media contents?

How does the electronically measured behavior and media consumption relate to respondents’ work activity? Can we use electronic measurement to predict macro-economic changes and phenomena?

How do people move around their towns and neighbourhoods and what are their probable social interactions? Can we use passive electronic measurement in measuring social and spatial exclusion or social capital more precisely?

What levels of noise pollution are people exposed to and how does it affect their well-being?

What health-related topics can be studied using passive electronic measurement of respondents?

If you are interested in cross-media planning, measuring campaign effectiveness and the possibility of using passive electronic measurement in social science, please come and join MEDIAN research agency for a presentation and discussion about adMeter technology.

About MEDIAN

MEDIAN is a “full service” research agency with an important position in the research market in the Czech Republic, with a high standard of provided services. MEDIAN conducts all types of qualitative and quantitative market research, sociologic research, media research and opinion polls.

MEDIAN has its own software department that prepares special algorithms for analyzing data from market research, public opinion polls and special research. MEDIAN also provides the development and the distribution of new, special and original software and program’s applications.

Speaker Josef Fišer studied sociology at the Faculty of Social Sciences of Charles University, where he continues his PhD studies now. He has worked in market and public opinion research for 8 years and has profound experience with quantitative research from research agencies, media and political polling. He mainly focuses on media research and political sociology. Since
April 2014 he has been working in MEDIAN as an account manager of crossmedia research project adMeter.
